VMware Cloud Foundation with NetApp All-Flash SAN Arrays	
Technology Overview	
Solution Overview 6	

VMware Cloud Foundation (VCF) is an integrated software defined data center (SDDC) platform that provides a complete stack of software-defined infrastructure for running enterprise applications in a hybrid cloud environment. It combines compute, storage, networking, and management capabilities into a unified platform, offering a consistent operational experience across private and public clouds.

Author: Josh Powell

# VMware Cloud Foundation with NetApp All-Flash SAN Arrays

This document provides information on storage options available for VMware Cloud Foundation using the NetApp All-Flash SAN Array. Supported storage options are covered with specific instruction for deploying iSCSI datastores as supplemental storage for management domains and both vVol (iSCSI) and NVMe/TCP datastores as supplemental datastores for workload domains. Also covered is data protection of VMs and datastores using SnapCenter for VMware vSphere.

### **Use Cases**

Use cases covered in this documentation:

- Storage options for customers seeking uniform environments across both private and public clouds.
- Automated solution for deploying virtual infrastructure for workload domains.
- Scalable storage solution tailored to meet evolving needs, even when not aligned directly with compute resource requirements.
- Deploy supplemental storage to management and VI workload domains using ONTAP Tools for VMware vSphere.
- Protect VMs and datastores using the SnapCenter Plug-in for VMware vSphere.

### Audience

This solution is intended for the following people:

- Solution architects looking for more flexible storage options for VMware environments that are designed to maximize TCO.
- Solution architects looking for VCF storage options that provide data protection and disaster recovery options with the major cloud providers.
- Storage administrators wanting specific instruction on how to configure VCF with principal and supplemental storage.
- Storage administrators wanting specific instruction on how to protect VMs and datastores residing on ONTAP storage.

### **Technology Overview**

The VCF with NetApp ASA solution is comprised of the following major components:

### **VMware Cloud Foundation**

VMware Cloud Foundation extends VMware's vSphere hypervisor offerings by combining key components such as SDDC Manager, vSphere, vSAN, NSX, and VMware Aria Suite to create a software-defined datacenter.

The VCF solution supports both native Kubernetes and virtual machine-based workloads. Key services such as VMware vSphere, VMware vSAN, VMware NSX-T Data Center, and VMware Aria Cloud Management are integral components of the VCF package. When combined, these services establish a software-defined infrastructure capable of efficiently managing compute, storage, networking, security, and cloud management.

VCF is comprised of a single management domain and up to 24 VI workload domains that each represent a unit of application-ready infrastructure. A workload domain is comprised of one or more vSphere clusters managed by a single vCenter instance.

For more information on VCF architecture and planning, refer to Architecture Models and Workload Domain Types in VMware Cloud Foundation.

### **VCF Storage Options**

VMware divides storage options for VCF into **principal** and **supplemental** storage. The VCF management domain must use vSAN as its principal storage. However, there are many supplemental storage options for the management domain and both principal and supplemental storage options available for VI workload domains.

### Principal Storage for Workload Domains

Principal storage refers to any type of storage that can be directly connected to a VI workload domain during the setup process within SDDC Manager. Principal storage is deployed with SDDC manager as part of cluster creation orchestration and is the first datastore configured for a workload domain. It includes vSAN, vVols (VMFS), NFS and VMFS on Fibre Channel.

### Supplemental Storage for Management and Workload Domains

Supplemental storage is the storage type that can be added to the management or workload domains at any time after the cluster has been created. Supplemental storage represents the widest range of supported storage options, all of which are supported on NetApp ASA arrays. Supplemental storage can be deployed using ONTAP Tools for VMware vSphere for most storage protocol types.

Additional documentation resources for VMware Cloud Foundation:

- \* VMware Cloud Foundation Documentation
- \* Supported Storage Types for VMware Cloud Foundation
- \* Managing Storage in VMware Cloud Foundation

### NetApp All-Flash SAN Arrays

The NetApp All-Flash SAN Array (ASA) is a high-performance storage solution designed to meet the demanding requirements of modern data centers. It combines the speed and reliability of flash storage with NetApp's advanced data management features to deliver exceptional performance, scalability, and data protection.

The ASA lineup is comprised of both A-Series and C-Series models.

The NetApp A-Series all-NVMe flash arrays are designed for high-performance workloads, offering ultra-low latency and high resiliency, making them suitable for mission-critical applications.

C-Series QLC flash arrays are aimed at higher-capacity use cases, delivering the speed of flash with the economy of hybrid flash.

For detailed information see the NetApp ASA landing page.

### **Storage Protocol Support**

The ASA supports all standard SAN protocols including, iSCSI, Fibre Channel (FC), Fibre Channel over Ethernet (FCoE), and NVME over fabrics.

**iSCSI** - NetApp ASA provides robust support for iSCSI, allowing block-level access to storage devices over IP networks. It offers seamless integration with iSCSI initiators, enabling efficient provisioning and management of iSCSI LUNs. ONTAP's advanced features, such as multi-pathing, CHAP authentication, and ALUA support.

For design guidance on iSCSI configurations refer to the SAN Configuration reference documentation.

**Fibre Channel** - NetApp ASA offers comprehensive support for Fibre Channel (FC), a high-speed network technology commonly used in storage area networks (SANs). ONTAP seamlessly integrates with FC

infrastructure, providing reliable and efficient block-level access to storage devices. It offers features like zoning, multi-pathing, and fabric login (FLOGI) to optimize performance, enhance security, and ensure seamless connectivity in FC environments.

For design guidance on Fibre Channel configurations refer to the SAN Configuration reference documentation.

**NVMe over Fabrics** - NetApp ONTAP and ASA support NVMe over fabrics. NVMe/FC enables the use of NVMe storage devices over Fibre Channel infrastructure, and NVMe/TCP over storage IP networks.

For design guidance on NVMe refer to NVMe configuration, support and limitations

### Active-active technology

NetApp All-Flash SAN Arrays allows for active-active paths through both controllers, eliminating the need for the host operating system to wait for an active path to fail before activating the alternative path. This means that the host can utilize all available paths on all controllers, ensuring active paths are always present regardless of whether the system is in a steady state or undergoing a controller failover operation.

Furthermore, the NetApp ASA offers a distinctive feature that greatly enhances the speed of SAN failover. Each controller continuously replicates essential LUN metadata to its partner. As a result, each controller is prepared to take over data serving responsibilities in the event of a sudden failure of its partner. This readiness is possible because the controller already possesses the necessary information to start utilizing the drives that were previously managed by the failed controller.

With active-active pathing, both planned and unplanned takeovers have IO resumption times of 2-3 seconds.

For more information see TR-4968, NetApp All-SAS Array – Data Availability and Integrity with the NetApp ASA.

### Storage guarantees

NetApp offers a unique set of storage guarantees with NetApp All-flash SAN Arrays. The unique benefits include:

**Storage efficiency guarantee:** Achieve high performance while minimizing storage cost with the Storage Efficiency Guarantee. 4:1 for SAN workloads.

**6 Nines (99.9999%) data availability guarantee:** Guarantees remediation for unplanned downtime in excess of 31.56 seconds per year.

Ransomware recovery guarantee: Guaranteed data recovery in the event of a ransomware attack.

See the NetApp ASA product portal for more information.

### NetApp ONTAP Tools for VMware vSphere

ONTAP Tools for VMware vSphere allows administrators to manage NetApp storage directly from within the vSphere Client. ONTAP Tools allows you to deploy and manage datastores, as well as provision vVol datastores.

ONTAP Tools allows mapping of datastores to storage capability profiles which determine a set of storage system attributes. This allows the creation of datastores with specific attributes such as storage performance

and QoS.

ONTAP Tools also includes a **VMware vSphere APIs for Storage Awareness (VASA) Provider** for ONTAP storage systems, which enables the provisioning of VMware Virtual Volumes (vVols) datastores, creation and use of storage capability profiles, compliance verification, and performance monitoring.

For more information on NetApp ONTAP tools see the ONTAP tools for VMware vSphere Documentation page.

### SnapCenter Plug-in for VMware vSphere

The SnapCenter Plug-in for VMware vSphere (SCV) is a software solution from NetApp that offers comprehensive data protection for VMware vSphere environments. It is designed to simplify and streamline the process of protecting and managing virtual machines (VMs) and datastores. SCV uses storage based snapshot and replication to secondary arrays to meet lower recovery time objectives.

The SnapCenter Plug-in for VMware vSphere provides the following capabilities in a unified interface, integrated with the vSphere client:

**Policy-Based Snapshots** - SnapCenter allows you to define policies for creating and managing applicationconsistent snapshots of virtual machines (VMs) in VMware vSphere.

**Automation** - Automated snapshot creation and management based on defined policies help ensure consistent and efficient data protection.

**VM-Level Protection** - Granular protection at the VM level allows for efficient management and recovery of individual virtual machines.

**Storage Efficiency Features** - Integration with NetApp storage technologies provides storage efficiency features like deduplication and compression for snapshots, minimizing storage requirements.

The SnapCenter Plug-in orchestrates the quiescing of virtual machines in conjunction with hardware-based snapshots on NetApp storage arrays. SnapMirror technology is utilized to replicate copies of backups to secondary storage systems including in the cloud.

For more information refer to the SnapCenter Plug-in for VMware vSphere documentation.

BlueXP integration enables 3-2-1 backup strategies that extend copies of data to object storage in the cloud.

For more information on 3-2-1 backup strategies with BlueXP visit 3-2-1 Data Protection for VMware with SnapCenter Plug-in and BlueXP backup and recovery for VMs.

### **Solution Overview**

The scenarios presented in this documentation will demonstrate how to use ONTAP storage systems as supplemental storage for management and workload domains. In addition, the SnapCenter Plug-in for VMware vSphere is used to protect VMs and datastores.

Scenarios covered in this documentation:

- Use Ontap Tools to deploy iSCSI datastores in a VCF management domain. Click here for deployment steps.
- Use Ontap Tools to deploy vVols (iSCSI) datastores in a VI workload domain. Click here for deployment steps.

- Configure NVMe over TCP datastores for use in a VI workload domain. Click here for deployment steps.
- Deploy and use the SnapCenter Plug-in for VMware vSphere to protect and restore VMs in a VI workload domain. Click here for deployment steps.

In this scenario we will demonstrate how to deploy and use ONTAP Tools for VMware vSphere (OTV) to configure an iSCSI datastore for a VCF management domain.

Author: Josh Powell

## Use ONTAP Tools to configure supplemental storage for VCF Management Domains

### Scenario Overview

This scenario covers the following high level steps:

- Create a storage virtual machine (SVM) with logical interfaces (LIFs) for iSCSI traffic.
- Create distributed port groups for iSCSI networks on the VCF management domain.
- Create vmkernel adapters for iSCSI on the ESXi hosts for the VCF management domain.
- Deploy ONTAP Tools on the VCF management domain.
- Create a new VMFS datastore on the VCF management domain.

### Prerequisites

This scenario requires the following components and configurations:

- An ONTAP ASA storage system with physical data ports on ethernet switches dedicated to storage traffic.
- VCF management domain deployment is complete and the vSphere client is accessible.

NetApp recommends fully redundant network designs for iSCSI. The following diagram illustrates an example of a redundant configuration, providing fault tolerance for storage systems, switches, networks adapters and host systems. Refer to the NetApp SAN configuration reference for additional information.

NetApp ASA controller-1

NetApp ASA controller-2

For multipathing and failover across multiple paths, NetApp recommends having a minimum of two LIFs per storage node in separate ethernet networks for all SVMs in iSCSI configurations.

This documentation demonstrates the process of creating a new SVM and specifying the IP address information to create multiple LIFs for iSCSI traffic. To add new LIFs to an existing SVM refer to Create a LIF (network interface).

For additional information on using VMFS iSCSI datastores with VMware refer to vSphere VMFS Datastore - iSCSI Storage backend with ONTAP.

In situations where multiple VMkernel adapters are configured on the same IP network, it is recommended to use software iSCSI port binding on the ESXi hosts to ensure that load balancing across the adapters occurs. Refer to KB article Considerations for using software iSCSI port binding in ESX/ESXi (2038869).

### **Deployment Steps**

To deploy ONTAP Tools and use it to create a VMFS datastore on the VCF management domain, complete the following steps:

### Create SVM and LIFs on ONTAP storage system

The following step is is performed in ONTAP System Manager.

Complete the following steps to create an SVM together with multiple LIFs for iSCSI traffic.

1. From ONTAP System Manager navigate to **Storage VMs** in the left-hand menu and click on **+ Add** to start.

ONTAP System Manager			
DASHBOARD	Storage VMs		
INSIGHTS	+ Add		
STORAGE ^	Name		
Overview	EHC_iSCSI		
Volumes	EHC		
LUNS			
Consistency Groups	HMC_187		
NVMe Namespaces	HMC_3510		
Shares	HMC_iSCSI_3510		
Buckets			
Qtrees	infra_svm_a300		
Quotas	JS_EHC_iSCSI		
Storage VMs	OTVtest		
Tiers			

2. In the Add Storage VM wizard provide a Name for the SVM, select the IP Space and then, under Access Protocol, click on the \*iSCSI tab and check the box to Enable iSCSI.

SVM_ISCSI			
IPSPACE			
Default		~	
Access Protoco	ol		

3. In the **Network Interface** section fill in the **IP address**, **Subnet Mask**, and **Broadcast Domain and Port** for the first LIF. For subsequent LIFs the checkbox may be enabled to use common settings across all remaining LIFs or use separate settings.

For multipathing and failover across multiple paths, NetApp recommends having a minimum of two LIFs per storage node in separate Ethernet networks for all SVMs in iSCSI configurations.

NETWORK INTERFACE

### Set up networking for iSCSI on ESXi hosts

The following steps are performed on the VCF management domain cluster using the vSphere client.

Complete the following to create a new distributed port group for each iSCSI network:

 From the vSphere client for the management domain cluster, navigate to Inventory > Networking. Navigate to the existing Distributed Switch and choose the action to create New Distributed Port Group....

$\equiv$ vSphere Client $Q$ Search in a	all environments	
<ul> <li>Image with the second se</li></ul>	<	Switch Details
<ul> <li>vcf-m01-cl01-vds01</li> <li>vcf-wkld-vc01.sddc.netapp.com</li> </ul>	Actions - vcf-m01-cl01-vds01	Manufacturer VMwa
	Distributed Port Group	> 🏾 🖄 New Distributed Port Group
	Add and Manage Hosts. Edit Notes Upgrade	S Import Distributed Port Group
		Virtual machines 8

- 2. In the **New Distributed Port Group** wizard fill in a name for the new port group and click on **Next** to continue.
- 3. On the **Configure settings** page fill out all settings. If VLANs are being used be sure to provide the correct VLAN ID. Click on **Next** to continue.

### Deploy and use ONTAP Tools to configure storage

The following steps are performed on the VCF management domain cluster using the vSphere client and involve deploying OTV, creating a VMFS iSCSI datastore, and migrating management VM's to the new datastore.

ONTAP tools for VMware vSphere (OTV) is deployed as a VM appliance and provides an integrated vCenter UI for managing ONTAP storage.

Complete the following to Deploy ONTAP tools for VMware vSphere:

- 1. Obtain the ONTAP tools OVA image from the NetApp Support site and download to a local folder.
- 2. Log into the vCenter appliance for the VCF management domain.
- 3. From the vCenter appliance interface right-click on the management cluster and select **Deploy OVF Template...**

	<	( VCf-n Summary	01-cl01 Monitor
<ul> <li>vcf-m01-vc01.sddc.net</li> <li>vcf-m01-dc01</li> </ul>	app.com	Cluster	Details

9. Review all information on the Ready to complete page and the click Finish to begin deploying the OTV appliance.

Complete the following to use OTV to configure a VMFS iSCSI datastore as supplemental storage on the management domain:

1. In the vSphere client navigate to the main menu and select **NetApp ONTAP Tools**.

G	Home
\$	Shortcuts
옯	Inventory
	Content Libraries
%	Workload Management
	Global Inventory Lists
	Policies and Profiles
N	Auto Deploy
6	Hybrid Cloud Services
<>	Developer Center
8	Administration
	Tasks
	Events
0	Tags & Custom Attributes
0	Lifecycle Manager

2. Once in **ONTAP Tools**, from the Getting Started page (or from **Storage Systems**), click on **Add** to add a new storage system.

In cases where it is preferred to use ONTAP storage to protect the VCF management VM's vMotion can be use to migrate the VM's to the newly created iSCSI datastore.

Complete the following steps to migrate the VCF management VM's to the iSCSI datastore.

- 1. From the vSphere Client navigate to the management domain cluster and click on the VMs tab.
- 2. Select the VMs to be migrated to the iSCSI datastore, right click and select Migrate...

For information on configuring ONTAP storage systems refer to the ONTAP 9 Documentation center.

For information on configuring VCF refer to VMware Cloud Foundation Documentation.

### Video demo for this solution

#### iSCSI Datastores as Supplemental Storage for VCF Management Domains

In this scenario we will demonstrate how to deploy and use ONTAP Tools for VMware vSphere (OTV) to configure a **vVols datastore** for a VCF workload domain.

**iSCSI** is used as the storage protocol for the vVols datastore.

Author: Josh Powell

## Use ONTAP Tools to configure supplemental storage (vVols) for VCF Workload Domains

#### Scenario Overview

This scenario covers the following high level steps:

- Create a storage virtual machine (SVM) with logical interfaces (LIFs) for iSCSI traffic.
- Create distributed port groups for iSCSI networks on the VI workload domain.
- Create vmkernel adapters for iSCSI on the ESXi hosts for the VI workload domain.
- Deploy ONTAP Tools on the VI workload domain.
- Create a new vVols datastore on the VI workload domain.

#### **Prerequisites**

This scenario requires the following components and configurations:

- An ONTAP ASA storage system with physical data ports on ethernet switches dedicated to storage traffic.
- VCF management domain deployment is complete and the vSphere client is accessible.
- A VI workload domain has been previously deployed.

NetApp recommends fully redundant network designs for iSCSI. The following diagram illustrates an example of a redundant configuration, providing fault tolerance for storage systems, switches, networks adapters and host systems. Refer to the NetApp SAN configuration reference for additional information.

NetApp ASA controller-1

NetApp ASA controller-2

For multipathing and failover across multiple paths, NetApp recommends having a minimum of two LIFs per storage node in separate ethernet networks for all SVMs in iSCSI configurations.

This documentation demonstrates the process of creating a new SVM and specifying the IP address information to create multiple LIFs for iSCSI traffic. To add new LIFs to an existing SVM refer to Create a LIF (network interface).

In situations where multiple VMkernel adapters are configured on the same IP network, it is recommended to use software iSCSI port binding on the ESXi hosts to ensure that load balancing across the adapters occurs. Refer to KB article Considerations for using software iSCSI port binding in ESX/ESXi (2038869).

For additional information on using VMFS iSCSI datastores with VMware refer to vSphere VMFS Datastore - iSCSI Storage backend with ONTAP.

### **Deployment Steps**

To deploy ONTAP Tools and use it to create a vVols datastore on the VCF management domain, complete the following steps:

### Create SVM and LIFs on ONTAP storage system

The following step is performed in ONTAP System Manager.

Complete the following steps to create an SVM together with multiple LIFs for iSCSI traffic.

1. From ONTAP System Manager navigate to **Storage VMs** in the left-hand menu and click on **+ Add** to start.

ONTAP System Manager						
DASHBOARD	Storage VMs					
INSIGHTS	+ Add					
STORAGE ^	Name					
Overview	EHC_iSCSI					
Volumes	EHC					
LUNS						
Consistency Groups	HMC_187					
NVMe Namespaces	HMC_3510					
Shares	HMC_iSCSI_3510					
Buckets						
Qtrees	infra_svm_a300					
Quotas	JS_EHC_iSCSI					
Storage VMs	OTVtest					
Tiers						

2. In the Add Storage VM wizard provide a Name for the SVM, select the IP Space and then, under Access Protocol, click on the iSCSI tab and check the box to Enable iSCSI.

SVM_ISCSI					
PSPACE					
Default		~			
			]		
Access Protoco	bl		]		

3. In the **Network Interface** section fill in the **IP address**, **Subnet Mask**, and **Broadcast Domain and Port** for the first LIF. For subsequent LIFs the checkbox may be enabled to use common settings across all remaining LIFs or use separate settings.

For multipathing and failover across multiple paths, NetApp recommends having a minimum of two LIFs per storage node in separate Ethernet networks for all SVMs in iSCSI configurations.

#### Set up networking for iSCSI on ESXi hosts

The following steps are performed on the VI Workload Domain cluster using the vSphere client. In this case vCenter Single Sign-On is being used so the vSphere client is common across the management and workload domains.

Complete the following to create a new distributed port group for each iSCSI network:

1. From the vSphere client , navigate to **Inventory > Networking** for the workload domain. Navigate to the existing Distributed Switch and choose the action to create **New Distributed Port Group...**.

$\equiv$ vSphere Client Q Searc	h in all environments

7. Repeat this process to create a VMkernel adapter for the second iSCSI network.

#### Deploy and use ONTAP Tools to configure storage

The following steps are performed on the VCF management domain cluster using the vSphere client and involve deploying OTV, creating a vVols iSCSI datastore, and migrating management VM's to the new datastore.

For VI workload domains, OTV is installed to the VCF Management Cluster but registered with the vCenter associated with the VI workload domain.

For additional information on deploying and using ONTAP Tools in a multiple vCenter environment refer to Requirements for registering ONTAP tools in multiple vCenter Servers environment.

ONTAP tools for VMware vSphere (OTV) is deployed as a VM appliance and provides an integrated vCenter UI for managing ONTAP storage.

Complete the following to Deploy ONTAP tools for VMware vSphere:

- 1. Obtain the ONTAP tools OVA image from the NetApp Support site and download to a local folder.
- 2. Log into the vCenter appliance for the VCF management domain.
- 3. From the vCenter appliance interface right-click on the management cluster and select **Deploy OVF Template...**

$\equiv$ vSphere Client $$ (	$\lambda$ Search in all environi	ments

Storage capability profiles describe the features provided by a storage array or storage system. They include quality of service definitions and are used to select storage systems that meet the parameters defined in the profile. One of the provided profiles can be used or new ones can be created.

To create a storage capability profile in ONTAP Tools complete the following steps:

1. In ONTAP Tools select **Storage capability profile** from the left-hand menu and then press **Create**.

$\equiv$ vSphere Client C	Search in all environments

### Additional information

For information on configuring ONTAP storage systems refer to the ONTAP 9 Documentation center.

For information on configuring VCF refer to VMware Cloud Foundation Documentation.

In this scenario we will demonstrate how to configure NVMe/TCP supplemental storage for a VCF workload domain.

Author: Josh Powell

## Configure NVMe/TCP supplemental storage for VCF Workload Domains

#### **Scenario Overview**

This scenario covers the following high level steps:

- Create a storage virtual machine (SVM) with logical interfaces (LIFs) for NVMe/TCP traffic.
- Create distributed port groups for iSCSI networks on the VI workload domain.
- Create vmkernel adapters for iSCSI on the ESXi hosts for the VI workload domain.
- Add NVMe/TCP adapters on ESXi hosts.
- Deploy NVMe/TCP datastore.

#### Prerequisites

This scenario requires the following components and configurations:

- An ONTAP ASA storage system with physical data ports on ethernet switches dedicated to storage traffic.
- VCF management domain deployment is complete and the vSphere client is accessible.
- A VI workload domain has been previously deployed.

NetApp recommends fully redundant network designs for NVMe/TCP. The following diagram illustrates an example of a redundant configuration, providing fault tolerance for storage systems, switches, networks adapters and host systems. Refer to the NetApp SAN configuration reference for additional information.

NetApp ASA controller-1

NetApp ASA controller-2

For multipathing and failover across multiple paths, NetApp recommends having a minimum of two LIFs per storage node in separate ethernet networks for all SVMs in NVMe/TCP configurations.

This documentation demonstrates the process of creating a new SVM and specifying the IP address information to create multiple LIFs for NVMe/TCP traffic. To add new LIFs to an existing SVM refer to Create a LIF (network interface).

For additional information on NVMe design considerations for ONTAP storage systems, refer to NVMe configuration, support and limitations.

#### **Deployment Steps**

To create a VMFS datastore on a VCF workload domain using NVMe/TCP, complete the following steps.

#### Create SVM, LIFs and NVMe Namespace on ONTAP storage system

The following step is performed in ONTAP System Manager.

Complete the following steps to create an SVM together with multiple LIFs for NVMe/TCP traffic.

1. From ONTAP System Manager navigate to **Storage VMs** in the left-hand menu and click on **+ Add** to start.

■ ONTAP Sy	stem Manager
DASHBOARD	Storage VMs
INSIGHTS	+ Add
STORAGE ^	Name
Overview	EHC_ISCSI
Volumes	EHC
LUNS	
Consistency Groups	HMC_187
NVMe Namespaces	HMC_3510
Shares	HMC_iSCSI_3510
Buckets	infer
Qtrees	infra_svm_a300
Quotas	JS_EHC_iSCSI
Storage VMs	OTVtest
Tiers	

2. In the Add Storage VM wizard provide a Name for the SVM, select the IP Space and then, under Access Protocol, click on the NVMe tab and check the box to Enable NVMe/TCP.

TORAGE VM NAME		
VCF_NVMe		
PSPACE		
Default	~	
Access Protocol SMB/CIFS, NFS, S3 iSCSI FC	S NVMe	
SMB/CIFS, NFS, S3 iSCSI FC		
эмрустэ, wrэ, ээ тэсэг РС		

3. In the **Network Interface** section fill in the **IP address**, **Subnet Mask**, and **Broadcast Domain and Port** for the first LIF. For subsequent LIFs the checkbox may be enabled to use common settings across all remaining LIFs, or use separate settings.

For multipathing and failover across multiple paths, NetApp recommends having a minimum of two LIFs per storage node in separate Ethernet networks for all SVMs in NVMe/TCP configurations.

NVMe namespaces are analogous to LUNs for iSCSi or FC. The NVMe Namespace must be created before a VMFS datastore can be deployed from the vSphere Client. To create the NVMe namespace, the NVMe Qualified Name (NQN) must first be obtained from each ESXi host in the cluster. The NQN is used by ONTAP to provide access control for the namespace.

Complete the following steps to create an NVMe Namespace:

1. Open an SSH session with an ESXi host in the cluster to obtain its NQN. Use the following command from the CLI:

```
esxcli nvme info get
```

An output similar to the following should be displayed:

```
Host NQN: nqn.2014-08.com.netapp.sddc:nvme:vcf-wkld-esx01
```

- 2. Record the NQN for each ESXi host in the cluster
- From ONTAP System Manager navigate to NVMe Namespaces in the left-hand menu and click on + Add to start.

4. On the **Add NVMe Namespace** page, fill in a name prefix, the number of namespaces to create, the size of the namespace, and the host operating system that will be accessing the namespace. In the **Host NQN** section create a comma separated list of the NQN's previously collected from the ESXi

hosts that will be accessing the namespaces.

Click on **More Options** to configure additional items such as the snapshot protection policy. Finally, click on **Save** to create the NVMe Namespace.

+

image::vmware-vcf-asa-image93.png[Click +Add to create NVMe Namespace]

#### Set up networking and NVMe software adapters on ESXi hosts

The following steps are performed on the VI workload domain cluster using the vSphere client. In this case vCenter Single Sign-On is being used so the vSphere client is common to both the management and workload domains.

Complete the following to create a new distributed port group for each NVMe/TCP network:

1. From the vSphere client , navigate to **Inventory > Networking** for the workload domain. Navigate to the existing Distributed Switch and choose the action to create **New Distributed Port Group...**.

$\equiv$ vSphere Client Q Searc	h in all environments		
Image: Second state of the second s	n Actions - vcf-wkld-01-IT-INF- WKLD-01-vds-01 Distributed Port Group Add and Manage Hosts Edit Notes	Summary M Switch Det	D-01-vds-01 : Actions Permissions Ports Hosts VMware, Inc. 8.0.0 3 4 1 21
	Settings	2	

- 2. In the **New Distributed Port Group** wizard fill in a name for the new port group and click on **Next** to continue.
- 3. On the **Configure settings** page fill out all settings. If VLANs are being used be sure to provide the correct VLAN ID. Click on **Next** to continue.

New Distributed Port Group	Configure settings Set general properties of the new port group		
1 Name and location	Port binding	Static binding ~	
2 Configure settings	Port allocation	_Elastic >	
3 Ready to complete	Number of ports	8 🗘

	VLAN		
	VLAN type	VLAN ~	
	VLAN ID	3374	
	Advanced		
	Customize default policies configuration		
		CANCEL BACK	NEX

- 4. On the **Ready to complete** page, review the changes and click on **Finish** to create the new distributed port group.
- 5. Repeat this process to create a distributed port group for the second NVMe/TCP network being used and ensure you have input the correct **VLAN ID**.
- 6. Once both port groups have been created, navigate to the first port group and select the action to **Edit settings...**.

Each ESXi host in the workload domain cluster must have an NVMe over TCP software adapter installed for every established NVMe/TCP network dedicated to storage traffic.

To install NVMe over TCP adapters and discover the NVMe controllers, complete the following steps:

1. In the vSphere client navigate to one of the ESXi hosts in the workload domain cluster. From the **Configure** tab click on **Storage Adapters** in the menu and then, from the **Add Software Adapter** drop-down menu, select **Add NVMe over TCP adapter**.

# Additional information

For information on configuring ONTAP storage systems refer to the ONTAP 9 Documentation center.

For information on configuring VCF refer to VMware Cloud Foundation Documentation.

In this scenario we will demonstrate how to deploy and use the SnapCenter Plug-in for VMware vSphere (SCV) to backup and restore VM's and datastores on a VCF workload domain. SCV uses ONTAP snapshot technology to take fast and efficient backup copies of the ONTAP storage volumes hosting vSphere datastores. SnapMirror and SnapVault technology are used to create secondary backups on a separate storage system and with retention policies that mimic the original volume or can be independent of the original volume for longer term retention.

iSCSI is used as the storage protocol for the VMFS datastore in this solution.

Author: Josh Powell

# Use SnapCenter Plug-in for VMware vSphere to protect VMs on VCF Workload Domains

# Scenario Overview

This scenario covers the following high level steps:

- Deploy the SnapCenter Plug-in for VMware vSphere (SCV) on the VI workload domain.
- Add storage systems to SCV.
- Create backup policies in SCV.
- Create Resource Groups in SCV.
- Use SCV to backup datastores or specific VMs.
- Use SCV to restores VMs to an alternate location in the cluster.
- Use SCV to restores files to a windows file system.

# Prerequisites

This scenario requires the following components and configurations:

- An ONTAP ASA storage system with iSCSI VMFS datastores allocated to the workload domain cluster.
- A secondary ONTAP storage system configured to received secondary backups using SnapMirror.
- VCF management domain deployment is complete and the vSphere client is accessible.
- A VI workload domain has been previously deployed.
- Virtual machines are present on the cluster SCV is designated to protect.

For information on configuring iSCSI VMFS datastores as supplemental storage refer to **iSCSI as supplemental storage for Management Domains** in this documentation. The process for using OTV to deploy datastores is identical for management and workload domains.

In addition to replicating backups taken with SCV to secondary storage, offsite copies of data can be made to object storage on one of the three (3) leading cloud providers using NetApp BlueXP backup and recovery for VMs. For more information refer to the solution 3-2-1 Data Protection for VMware with SnapCenter Plug-in and BlueXP backup and recovery for VMs.

# **Deployment Steps**

To deploy the SnapCenter Plug-in and use it to create backups, and restore VMs and datastores, complete the following steps:

#### Deploy and use SCV to protect data in a VI workload domain

Complete the following steps to deploy, configure, and use SCV to protect data in a VI workload domain:

The SnapCenter Plug-in is hosted on the VCF management domain but registered to the vCenter for the VI workload domain. One SCV instance is required for each vCenter instance and, keep in mind that, a Workload domain can include multiple clusters managed by a single vCenter instance.

Complete the following steps from the vCenter client to deploy SCV to the VI workload domain:

- 1. Download the OVA file for the SCV deployment from the download area of the NetApp support site HERE.
- 2. From the management domain vCenter Client, select to **Deploy OVF Template...**.

$\equiv$ vSphere Client ${\sf Q}$ Search in all environment	its

3. In the **Deploy OVF Template** wizard, click on the **Local file** radio button and then select to upload the previously downloaded OVF template. Click on **Next** to continue.

- 4. On the **Select name and folder** page, provide a name for the SCV data broker VM and a folder on the management domain. Click on **Next** to continue.
- 5. On the **Select a compute resource** page, select the management domain cluster or specific ESXi host within the cluster to install the VM to.
- 6. Review information pertaining to the OVF template on the **Review details** page and agree to the licensing terms on the **Licensing agreements** page.
- 7. On the Select storage page choose the datastore which the VM will be installed to and select the virtual disk format and VM Storage Policy. In this solution, the VM will be installed on an iSCSI VMFS datastore located on an ONTAP storage system, as previously deployed in a separate section of this documentation. Click on Next to continue.

Once the SnapCenter Plug-in is installed complete the following steps to add storage systems to SCV:

1. SCV can be accessed from the main menu in the vSphere Client.

-0- JII	ortcuts
옲 Inv	rentory
🗇 Co	ntent Libraries
% W	orkload Management
🐻 Glo	obal Inventory Lists
围 Po	licies and Profiles
ଯ Au	to Deploy
🕞 Ну	brid Cloud Services
De	veloper Center
🍪 Ac	ministration
) Ta	sks
🗐 Ev	ents
О Та	gs & Custom Attributes
🗘 Lif	ecycle Manager

2. At the top of the SCV UI interface, select the correct SCV instance that matches the vSphere cluster to be protected.

📃 vSphere Clien	it Q Search in all environments
SnapCenter Plug-in f	or VMware vSphere INSTANCE 172.21.166.148:8080
Dashboard	Dashboard
👩 Settings	

3. Navigate to **Storage Systems** in the left-hand menu and click on **Add** to get started.

Dashboard	Storage Systems	
📴 Settings	👍 Agd 🥖 Edr	t 🗙 Delete 🕞 Export
🔠 Resource Groups	Name	Display Name
🍓 Policies	$\sim$	
Storage Systems		
👩 Guest File Restore		

4. On the **Add Storage System** form, fill in the IP address and credentials of the ONTAP storage system to be added, and click on **Add** to complete the action.

# Add Storage System

Storage System	172.16.9.25	
Authentication Method	Oredentials	O Certificate
Username	admin	
Password		
Protocol	HTTPS	
Port	443	
Timeout	60	Seconds
Preferred IP	Preferred IP	
Event Management System	(EMS) & AutoSupport Setting	
Log Snapcenter server e		
Send AutoSupport Notific	ation for failed operation to sto	orage system
		CANCEL ADD

5. Repeat this procedure for any additional storage systems to be managed, including any systems to be used as secondary backup targets.

 $\times$ 

For more information on creating SCV backup policies refer to Create backup policies for VMs and datastores.

Complete the following steps to create a new backup policy:

1. From the left-hand menu select **Policies** and click on **Create** to begin.

SnapCenter Plug-in for	VMware v	Sphere	INSTAN	VCE 172.21.16	6. <mark>148:8080</mark> ×
🟠 Dashboard	Policie	s			
📴 Settings	<b>4</b> C	ir <b>re</b> te	/ Edit	🗙 Remove	Export
🔃 Resource Groups	-Na	1m	5	- 515	VM Consistency
Policies	-				10

2. On the **New Backup Policy** form, provide a **Name** and **Description** for the policy, the **Frequency** at which the backups will take place, and the **Retention** period which specifies how long the backup is retained.

**Locking Period** enables the ONTAP SnapLock feature to create tamper proof snapshots and allows configuration of the locking period.

For **Replication** Select to update the underlying SnapMirror or SnapVault relationships for the ONTAP storage volume.

SnapMirror and SnapVault replication are similar in that they both utilize ONTAP SnapMirror technology to asynchronously replicate storage volumes to a secondary storage system for increased protection and security. For SnapMirror relationships, the retention schedule specified in the SCV backup policy will govern retention for both the primary and secondary volume. With SnapVault relationships, a separate retention schedule can be established on the secondary storage system for longer term or differing retention schedules. In this case the snapshot label is specified in the SCV backup policy and in the policy associated with the secondary volume, to identify which volumes to apply the independent retention schedule to.

Choose any additional advanced options and click on Add to create the policy.

**`Q**`

For more information on creating SCV Resource Groups refer to Create resource groups.

Complete the following steps to create a new resource group:

1. From the left-hand menu select **Resource Groups** and click on **Create** to begin.

SnapCenter Plug-in for	VMware v	/Sphere		NCE 172.21.1	166.148:808	0 ~
🏠 Dashboard	Resou	irce Gro	ups			
😰 Settings	4	Create	/ Edit	🗙 Delete	🙆 Run Nov	6
🛗 Resource Groups	Ne	<sup>d</sup> m				escripti
🍓 Policies		U				
🚐 Storage Systems						
👩 Guest File Restore						

- 2. On the **General info & notification** page, provide a name for for the resource group, notification settings, and any additional options for the naming of the snapshots.
- 3. On the **Resource** page select the datastores and VM's to be protected in the resource group. Click on **Next** to continue.

Even when only specific VMs are selected, the entire datastore is always backed up. This is because ONTAP takes snapshots of the volume hosting the datastore. However, note that selecting only specific VMs for backup limits the ability to restore to only those VMs.

#### Use SCV to restore VMs, VMDKs and files

The SnapCenter Plug-in allows restores of VMs, VMDKs, files, and folders from primary or secondary backups.

VMs can be restored to the original host, or to an alternate host in the same vCenter Server, or to an alternate ESXi host managed by the same vCenter or any vCenter in linked mode.

vVol VMs can be restored to the original host.

VMDKs in traditional VMs can be restored to either the original or to an alternate datastore.

VMDKs in vVol VMs can be restored to the original datastore.

Individual files and folders in a guest file restore session can be restored, which attaches a backup copy of a virtual disk and then restores the selected files or folders.

Complete the following steps to restore VMs, VMDKs or individual folders.

Complete the following steps to restore a VM with SCV:

1. Navigate to the VM to be restored in the vSphere client, right click and navigate to **SnapCenter Plug**in for VMware vSphere. Select **Restore** from the sub-menu.

ONTAP Tools allows full restore of VMDK's to their original location or the ability to attach a VMDK as a new disk to a host system. In this scenario a VMDK will be attached to a Windows host in order to access the file system.

To attach a VMDK from a backup, complete the following steps:

1. In the vSphere Client navigate to a VM and, from the **Actions** menu, select **SnapCenter Plug-in for VMware vSphere > Attach Virtual Disk(s)**.

2. In the **Attach Virtual Disk(s)** wizard, select the backup instance to be used and the particular VMDK to be attached.

Attach Virtual Disk(s)

- 3. After selecting all options, click on the **Attach** button to begin the restore process and attached the VMDK to the host.
- 4. Once the attach procedure is complete the disk can be accessed from the OS of the host system. In this case SCV attached the disk with its NTFS file system to the E: drive of our Windows SQL Server and the SQL database files on the file system are accessible through File Explorer.

ONTAP Tools features guest file system restores from a VMDK on Windows Server OSes. This is preformed centrally from the SnapCenter Plug-in interface.

For detailed information refer to Restore guest files and folders at the SCV documentation site.

To perform a guest file system restore for a Windows system, complete the following steps:

 The first step is to create Run As credentials to provide access to the Windows host system. In the vSphere Client navigate to the CSV plug-in interface and click on Guest File Restore in the main menu.

Dashboard	Guest File Restore
Settings	Guest Configuration
<ul> <li>Policies</li> <li>Storage Systems</li> <li>Guest File Restore</li> </ul>	Guest Session Monitor •
Guest His Restore	Run As Credentials

- 2. Under Run As Credentials click on the + icon to open the Run As Credentials window.
- 3. Fill in a name for the credentials record, an administrator username and password for the Windows system, and then click on the **Select VM** button to select an optional Proxy VM to be used for the restore.

image::vmware-vcf-asa-image85.png[Run as credentials window]

4. On the Proxy VM page provide a name for the VM and locate it by searching by ESXi host or by name. Once selected, click on **Save**.

Proxy VM	
VM Name	SQLSRV-01
Search by ESXi	Host
ESXi Host	vcf-wkld-esx04.sddc.netapp.com
Virtual Machine	SQLSRV-01
O Search by Virtu	al Machine name

X

•

- 5. Click on Save again in the Run As Credentials window to complete saving the record.
- 6. Next, navigate to a VM in the inventory. From the **Actions** menu, or by right-clicking on the VM, select **SnapCenter Plug-in for VMware vSphere > Guest File Restore**.

7. On the **Restore Scope** page of the **Guest File Restore** wizard, select the backup to restore from, the particular VMDK, and the location (primary or secondary) to restore the VMDK from. Click on **Next** to continue.

1. Restore Scope	Backup Name	Start Time	End Time	
2. Guest Details	SQL_Servers_04-16-2024_13.52.3	4/16/2024 1:52:34 PM	4/16/2024 1:52:40 PM
