Products out of scope include:

1. Contracts or benefits that are subject to VM-21 (such as variable annuities and RILAs)
2. GICs
3. Synthetic GICs
4. Stable Value Contracts
5. Funding Agreements

~~The company may elect to exclude one or more groups of contracts from the stochastic reserve calculation in certain situations, pursuant to the exclusion test requirements defined in Section 3.E of VM-22.~~

B. Effective Date & Transition

Effective Date

These requirements apply for valuation dates on or after January 1, 2024.

Transition

A company may elect to establish minimum reserves pursuant to applicable requirements in VM-A and VM-C for business otherwise subject to VM-22 PBR requirements and issued during the first three years following the effective date of VM-22 PBR. If a company during the three-year transition period elects to apply VM-22 PBR to a block of such business, then a company must continue to apply the requirements of VM-22 PBR for future issues of this business. Irrespective of the transition date, a company shall apply VM-22 PBR requirements to applicable blocks of business on a prospective basis starting at least three years after the effective date.

Commented [X151]: We suggest moving or deleting the sentence "The company may elect to exclude one or more groups of contracts from the stochastic reserve calculation in certain situations, pursuant to the exclusion test requirements defined in Section 3.E of VM-22." from this section as it does not seem fitting here.

Commented [VM22152R151]: Edits to address this comment will be reflected in next exposure

Commented [CD153]: self-referencing "VM-22" is not necessary

Commented [VM22154R153]: Edits to address this comment will be reflected in next exposure

Commented [X155]: Does this belong in Scope? Do these still follow the other VM-22 requirements (if the old VM-22 interest rate determinations are left in the same chapter as the VM-22 PBR requirements)?

It is normal to then list what requirements such excluded contracts would follow. However, the statement here is more problematic because you can be excluded from the SR but still subject to VM-22.

Commented [VM22156R155]: Edits to address this comment will be reflected in next exposure

Commented [CD157]: again, suggest numbering the paragraphs within this section

Commented [VM22158R157]: Edits to address this comment will be reflected in next exposure

Commented [X159]: We still have a question about whether RBC factors are still at an appropriate level, if principles-based capital is not developed. Were they set assuming that this reserve was at a CTE(70) level in the first place, or were they dependent on the prior framework?

Commented [X160]: Need to clarify what is meant by "VM-22 PBR Requirements". Add specific section references, or update proposal to have the PBR and non-PBR sections of this VM-22 draft in different chapters ... [49]

Commented [X161]: To be more clear, recommend adding "transition period" to "the three years".

Commented [VM22162R161]: Edits to address this comment will be reflected in next exposure

Commented [X163]: Can a company wait until the end of the transition period to start PBR, but then apply PBR to all issues from during the transition period? This was ... [50]

Commented [VM22164R163]: Discussed with Subgroup and decided to keep the VM-22 language silent on th ... [51]

Commented [CD165]: Will we (or should we) allow for any early adopters (like we did for VM-21)? It would seem reasonable to us to consider accommodating early adopters.

Commented [VM22166R165]: Discussed with Subgroup and decided to not have early adoption before the start of the three year transition period.

Section 3: Reserve Methodology

A. Aggregate Reserve

The aggregate reserve for contracts falling within the scope of these requirements shall equal the ~~stochastic reserve~~SR (following the requirements of Section 4) ~~plus the additional standard projection amount (following the requirements of Section 6) plus the DR for those contracts satisfying the Deterministic Certification Option,~~ less any applicable PIMR for all contracts not valued under applicable requirements in VM-A and VM-C, plus the reserve for any contracts valued under applicable requirements in VM-A and VM-C.

Guidance Note: Contracts valued under applicable requirements in VM-A and VM-C are ones that pass the exclusion test and elect to not model PBR ~~stochastic reserves~~SRs, per the requirements in Section 3.E.

B. Impact of Reinsurance ~~Ceded~~

All components in the aggregate reserve shall be determined post-reinsurance ceded, that is net of any reinsurance cash flows arising from treaties that meet the statutory requirements that allow the treaty to be accounted for as reinsurance. A pre-reinsurance ceded reserve also needs to be determined by ignoring all reinsurance cash flows (costs and benefits) in the reserve calculation.

~~C. To Be Determined~~The Additional Standard Projection Amount

D. The Stochastic Reserve

~~The stochastic reserve~~

The additional standard projection amount is determined by applying one of the two standard projection methods defined in Section 6. The same method must be used for all contracts within a group of contracts that are aggregated together to determine the reserve. The company shall elect which method they will use to determine the additional standard projection amount. The company may not change that election for a future valuation without the approval of the domiciliary commissioner.

D. The SR

1. The SR shall be determined based on asset and liability projections for the contracts falling within the scope of these requirements, excluding those contracts valued using the methodology pursuant to applicable requirements in VM-A and VM-C, over a broad range of stochastically generated projection scenarios described in Section 8 and using prudent estimate assumptions as required in Section 3.GF herein.
2. The ~~stochastic reserve~~SR amount for any group of contracts shall be determined as CTE70 of the scenario reserves following the requirements of Section 4, with the exception of groups of contracts for which a company elects the Deterministic Certification Option in Section 7.E, which shall be determined as the ~~scenario reserve~~DR following the requirements of Section 4.
3. The reserve may be determined in aggregate across various groups of contracts within each Reserving Category as a single model segment when determining the ~~stochastic reserve~~ if the business and risks are not managed separately or are part of the same integrated risk management program. Aggregation is permitted if a resulting group of contracts (or model segment) follows the listed principles:SR. However, groups of contracts within different Reserving Categories may

Commented [X167]: Reinstate and modify later as needed - SPA being developed in separate workflow.

Commented [VM22168R167]: To address SPA later in the VM-22 development process.

Commented [X169]: One of the most confused parts of the draft was referring to a DR as the SR for certain contracts. Need to handle and refer to separately.

Commented [VM22170R169]: Edits to address this comment will be reflected in next exposure

Commented [X171]: Guidance is needed on how a pre-reinsurance reserve is to be determined.

Commented [X172]: Reinstate and modify later as needed - SPA being developed in separate workflow.

Commented [VM22173R172]: Edits to address this comment will be reflected in next exposure

Commented [CD174]: Should this be Section 3.G?

Commented [VM22175R174]: Edits to address this comment will be reflected in next exposure

Commented [X176]: Recommend replacing “the scenario reserve” with “the deterministic reserve”. Note that we also disagree with calling the deterministic reserve a stochastic reserve (later in draft), which adds a good deal of confusion.

not be aggregated together in determining the SR. For the purposes of VM-22, Reserving Categories are classified as the following:

- a. The “Payout Annuity Reserving Category” includes the following categories of contracts, certificates and contract features, whether group or individual, including both life contingent and term certain only contracts, directly written or assumed through reinsurance, with the exception of benefits provided by variable annuities:
 - i. Immediate annuity contracts;
 - ii. Deferred income annuity contracts;
 - iii. Structured settlements in payout or deferred status;
 - iv. Fixed income payment streams resulting from the exercise of settlement options or annuitizations of host contracts issued;
 - v. Supplementary contracts, excluding contracts with no scheduled payments (such as retained asset accounts and settlements at interest);
 - vi. Fixed income payment streams attributable to guaranteed living benefits associated with deferred annuity contracts, once the contract funds are exhausted;
 - vii. Certificates, emanating from non- variable group annuity contracts specified in Model #820, Section 5.C.2, purchased for the purpose of providing certificate holders fixed income payment streams upon their retirement; and
 - viii. Pension Risk Transfer Annuities; and
 - ix. Longevity Reinsurance.
- b. The “Accumulation Reserving Category” are all annuities within scope of VM-22 under Section II of the NAIC Valuation Manual that are not in the “Payout Reserving Category”.

Drafting Note: Additional feedback is welcome for whether to permit optionality for categorizing guaranteed living benefit contracts with depleted fund value as either in the payout or accumulation reserving category.

Commented [VM22177]: Include in deferred annuities with depleted fund value in payout reserving Category or accumulation reserving category.

Commented [VM22178R177]: The Subgroup has elected to leave these contracts in the payout annuity reserving category, but is adding to a drafting note to welcome feedback.

Using prudent actuarial judgement, consider the following elements when aggregating groups of contracts: whether groups of contracts are part of the same portfolio (or different portfolios that interact), same integrated risk management system, administered/managed together

- 4. Do not aggregate groups of contracts for which the company elects to use the Deterministic Certification Option in Section 7.E with any groups of contracts that do not use such option.

54.7 To the extent that these limits on the aggregation results results in more than one model segment, the stochastic reserve SR shall equal the sum of the stochastic reserve SR amounts computed for each model segment and scenario reserve DR amounts computed for each model segment for which the company elects to use the Deterministic Certification Option in Section 7.E.

E. Exclusion Test

- 1. To the extent that certain groups of contracts pass one of the defined the stochastic exclusion tests in Section 7.B, these groups of contracts may be valued using the methodology and statutory maximum valuation rate pursuant to applicable requirements in VM-A and VM-C, with the statutory maximum valuation rate for immediate annuities specified in and Section 13.

- a. For dividend-paying contracts, a dividend liability shall be established upon following requirements in VM-A and VM-C, as described above, for the base contract.

Guidance Note: The intention of contracts that pass the stochastic exclusion test is to provide the option to value contracts under VM-A and VM-C. This may apply to pre-PBR CARVM requirements in accordance with Actuarial Guideline XXXIII (AG33) methodology with type A, B, C rates for SPIAs issued before 2018; AG33 methodology with pre-PBR VM-22 rates for SPIAs issued on/after 2018; Actuarial Guideline XXXV (AG35) pre-PBR methodology for Fixed Indexed Annuities; and AG33 methodology (with interest rate updates for modernization initiatives on new contracts) for non-SPIAs.

- 2. The approach for grouping contracts company may not group together contract types with significantly different risk profiles when performing the exclusion tests should follow the same principles that underlie the aggregation approach for model segments discussed for Stochastic Reserves in Section D above test.

F. Allocation of the Aggregate Reserve to Contracts

The aggregate reserve shall be allocated to the contracts falling within the scope of these requirements using the method outlined in Section 4.213, with the exception of contract following Section 3.E which are to be calculated on a seriatim basis.

G. Prudent Estimate Assumptions

- 1. With respect to the Stochastic Reserve SR in Section 3.D, the company shall establish the prudent estimate assumption for each risk factor in compliance with the requirements in Section 12 of Model #820 and must periodically at least every 3 years review and update the assumptions as appropriate in accordance with these requirements.
- 2. The qualified actuary, to whom responsibility for this group of contracts is assigned, shall annually review relevant emerging experience for the purpose of assessing the appropriateness of the anticipated experience assumption. If the results of statistical testing or other testing the review indicate that previously anticipated experience for a given factor is inadequate, then the qualified actuary Company shall set a new, adequate, anticipated experience assumption for the factor.

3. To determine the prudent estimate assumptions, the stochastic reserve SR shall also follow the requirements in Sections 4 and general assumptions including Section 9 for asset assumptions, Section 10 for contract policy holder behavior assumptions, and Section 11 for mortality assumptions, and Section 12 for general guidance and expense assumptions.

Commented [CD215]: should this be "contract holder"?

Commented [VM22216R215]: Edits to address this comment will be reflected in next exposure

Commented [X217]: Need a new section for the general assumptions, including specifics for the expense assumptions. APF currently exposed for VM-21. We should be consistent with any edits.

Commented [VM22218R217]: Edits to address this comment will be reflected in next exposure

H. Approximations, Simplifications, and Modeling Efficiency Techniques

A company may use simplifications, approximations, and modeling efficiency techniques to calculate the SR and/or the additional standard projection amount required by this section if the company can demonstrate that the use of such techniques does not understate the reserve by a material amount, and the expected value of the reserve calculated using simplifications, approximations, and modeling efficiency techniques is not less than the expected value of the reserve calculated that does not use them.

Guidance Note:

Examples of modeling efficiency techniques include, but are not limited to:

1. Choosing a reduced set of scenarios from a larger set consistent with prescribed models and parameters.
2. Generating a smaller liability or asset model to represent the full seriatim model using grouping compression techniques or other similar simplifications.

There are multiple ways of providing the demonstration required by Section 3.H. The complexity of the demonstration depends upon the simplifications, approximations or modeling efficiency techniques used. Examples include, but are not limited to:

1. Rounding at a transactional level in a direction that is clearly and consistently conservative or is clearly and consistently unbiased with an obviously immaterial impact on the result (e.g., rounding to the nearest dollar) would satisfy 3.H without needing a demonstration. However, rounding to too few significant digits relative to the quantity being rounded, even in an unbiased way, may be material and in that event, the company may need to provide a demonstration that the rounding would not produce a material understatement of the reserve.
2. A brute force demonstration involves calculating the minimum reserve both with and without the simplification, approximation or modeling efficiency technique, and making a direct comparison between the resulting reserve. Regardless of the specific simplification, approximation or modeling efficiency technique used, brute force demonstrations always satisfy the requirements of Section 3.H.
3. Choosing a reduced set of scenarios from a larger set consistent with prescribed models and parameters and providing a detailed demonstration of why it did not understate the reserve by a material amount and the expected value of the reserve would not be less than the expected value of the reserve that would otherwise be calculated. This demonstration may be a theoretical, statistical or mathematical argument establishing, to the satisfaction of the insurance commissioner, general bounds on the potential deviation in the reserve estimate rather than a brute force demonstration.
4. Justify the use of randomly sampling withdrawal ages for each contract instead of

following the exact prescribed WDCM method by demonstrating that the random sampling method is materially equivalent to the exact prescribed approach, and the simplification does not materially reduce the Additional Standard Projection Amount and the final reported reserve. In particular, the company should demonstrate that the statistical variability of the results based on the random sampling approach is immaterial by testing different random sets, e.g., if randomly selecting a withdrawal age for each contract, the probability distribution of the withdrawal age should be stable and not vary significantly when using different random number sets.

Commented [X219]: Specific example should be tailored based on the SPA developed.

Commented [X220]: Added consistent with VM-21 Section 3.H, which was added to the 2022 VM.

Commented [VM22221R220]: Edits to address this comment will be reflected in next exposure

Section 4: Determination of Stochastic Reserve SR

A. Projection of Accumulated Deficiencies

1. General Description of Projection

The projection of accumulated deficiencies shall be made ignoring federal income tax in both cash flows and discount rates, and it shall reflect the dynamics of the expected cash flows for the entire group of contracts, reflecting all product features, including any guarantees provided under the contracts using prudent estimate liability assumptions defined in Sections 10 and 11 and asset assumptions defined in Sections 4 and 9.D. The company shall project cash flows including the following:

- a. ~~Revenues~~ Gross premium received by the company including gross premiums received from the ~~policyholder~~ policyholder contract holder (including any due premiums as of the projected start date).

Guidance Note: If due premiums are modeled, the final reported reserve needs to be adjusted by adding the due premium asset.

- b. Other revenues, including contractual fees and charges, and revenue-sharing income received by the company (net of applicable expenses).
- c. All material benefits projected to be paid to contract policyholders including, but not limited to, death claims, surrender benefits and withdrawal benefits—reflecting the impact of all guarantees and adjusted to take into account amounts projected to be charged to account values on general account business. Any guarantees, in addition to market value adjustments assessed on projected withdrawals or surrenders, shall be taken into account.

Guidance Note: Amounts charged to account values on general account business are not revenue; examples include rider charges and expense charges.

- a.d. Non-Guaranteed Elements (NGE) cash flows as described in Section 10.II.
- b.e. Insurance company expenses (including overhead and investment maintenance expense), commissions, contractual fees and charges, and revenue sharing income received by the company (net of applicable expenses) other acquisition expenses associated with business inforce as of the valuation date.
- e.f. Net Cash flows associated with any reinsurance.
- d.g. Cash flows from hedging instruments as described in Section 4.A.4.

Commented [NJ222]: Consider including stochastic mortality in the SR for longevity reinsurance

Commented [CD223]: Should this refer to Section 4 and Section 9?

Commented [VM2224R223]: Edits to address this comment will be reflected in next exposure

Commented [CD225]: "contract holder"?

Commented [VM2226R225]: Edits to address this comment will be reflected in next exposure

Commented [X227]: If due premium as of the projected start date is included in the modeling, the final reported reserve should be adjusted by adding the due premium, otherwise there would be a double counting of the due premium asset. This needs to be clarified - see guidance note added below.
Recommend specifying the revenue in this bullet to be gross premium since there are other revenue items that are discussed in other bullets.

Commented [VM2228R227]: Edits to address this comment will be reflected in next exposure

Commented [CD229]: "contract holders"

Commented [VM2230R229]: Edits to address this comment will be reflected in next exposure

Commented [X231]: The purpose of this guidance note is not clear as these charges would be reflected in the cash flows.

Commented [VM2232R231]: Edits to address this comment will be reflected in next exposure

Commented [CD233]: should this be Section 10.I?

Commented [VM2234R233]: Edits to address this comment will be reflected in next exposure

Commented [X235]: Changed investment expense to be maintenance expense so that it does not repeat what is included in bullet h.

Commented [VM2236R235]: Edits to address this comment will be reflected in next exposure

Commented [X237]: Added acquisition expenses.

Commented [VM2238R237]: Edits to address this comment will be reflected in next exposure

Commented [X239]: Take out the revenues that covers the investment expenses and added a separate bullet under bullet "a" for other revenues.

Commented [VM2240R239]: Edits to address this comment will be reflected in next exposure

Commented [CD241]: Both net and gross cash flows have to be considered, so I don't agree with the addition of "Net" here

Commented [VM2242R241]: Edits to address this comment will be reflected in next exposure

e-h. Cash receipts or disbursements associated with invested assets (other than policy loans) as described in Section 4.D.4, including investment income, realized capital gains and losses, principal repayments, asset default costs, investment expenses, asset prepayments, and asset sales.

f.i. If modeled explicitly, cash flows related to policy loans as described in Section 10.I.2, including interest income, new loan payments and principal repayments.

Guidance Note: Future net policy loan cash flows include: policy loan interest paid in cash plus repayments of policy loan principal, including repayments occurring at death or surrender (note that the future benefits in Section 4.A.1.b are before consideration of policy loans), less additional policy loan principal (but excluding policy loan interest that is added to the policy loan principal balance).

Guidance Note: Section 4.A.1 requires market value adjustments (MVAs) on liability cash flows to be reflected because in a cash flow model, assets are assumed to be liquidated at market value to cover the cash outflow of the cash surrender; therefore, inclusion of the market value adjustment aligns the asset and liability cash flows. This may differ from the treatment of MVAs in the definition of cash surrender value (Section 1.D), which defines the statutory reserve floor for which the values must be aligned with the annual statement value of the assets.

Commented [X243]: Guidance Note regarding the market value adjustment seems still applies and should not be deleted. We reinstated the guidance note.

2. Grouping of Index Crediting Strategies

Index crediting strategies for fixed indexed annuities may be grouped for modeling using an approach that recognizes the investment guidelines and objectives of each index crediting strategy. In assigning each index crediting strategy to a grouping for projection purposes, the fundamental characteristics of the index crediting strategy shall be reflected, and the parameters shall have the appropriate relationship to the stochastically generated projection scenarios described in Section 8. The grouping shall reflect characteristics of the efficient frontier (i.e., returns generally cannot be increased without assuming additional risk).

Commented [X244]: Suggest editing the first sentence to note scope is FIAs and to avoid confusion regarding the term "investment guideline" as follows: "Index crediting strategies for fixed indexed annuities may be grouped for modeling using an approach that recognizes the investment guidelines and objectives of each index crediting strategy."

Commented [VM22245R244]: Edits to address this comment will be reflected in next exposure

Index accounts sharing similar index crediting strategies may also be grouped for modeling to an appropriately crafted proxy strategy normally expressed as a linear combination of recognized market indices, sub-indices or funds, in order to develop the investment return paths and associated interest crediting. Each index crediting strategy's specific risk characteristics, associated index parameters, and relationship to the stochastically generated scenarios in Section 8 should be considered before grouping or assigning to a proxy strategy. Grouping and/or development of a proxy strategy may not be done in a manner that intentionally understates the resulting reserve.

3. Model Cells

Projections may be performed for each contract in force on the date of valuation or by assigning contracts into representative cells of model plans using all characteristics and criteria having a material impact on the size of the reserve. Assigning contracts to model cells may not be done in a manner that intentionally understates the resulting reserve.

4. Modeling of Hedges

a. For a company that does not have a future hedging program ~~hed directly to supporting~~ the contracts falling under the scope of VM-22 stochastic reserve SR requirements:

- i. The company shall not consider the cash flows from any future hedge purchases or any rebalancing of existing hedge assets in its modeling.
- ii. Existing hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the starting assets. ~~The hedge assets may then be considered in one of two ways:~~
 - a) ~~Include the asset cash flows from any contractual payments and maturity values in the projection model; or~~
 - b) ~~No hedge positions in which case the hedge positions held on the valuation date are replaced with cash and/or other general account assets in an amount equal to the aggregate market value of these hedge positions.~~

Guidance Note: If the hedge positions held on the valuation date are replaced with cash, then as with any other cash, such amounts may then be invested following the company's investment strategy.

~~A company may switch from method a) to method b) at any time, but it may only change from b) to a) with the approval of the domiciliary commissioner.~~

b. For a company that has a future hedging program ~~hed directly to supporting~~ the contracts falling under the scope of VM-22 stochastic reserve SR requirements:

- i. For a hedging program with hedge payoffs that offset interest credits associated with indexed interest strategies (indexed interest credits):
 - a) In modeling cash flows, the company shall include the cash flows from future hedge purchases or any rebalancing of existing hedge assets that are intended solely to offset interest credits to ~~policyholders~~ contract holders.
 - b) Existing hedging instruments that are currently held by the company for ~~this purpose offsetting the indexed credits~~ in support of the contracts falling under the scope of these requirements shall be included in the starting assets. Existing hedging instruments that are currently held by the company ~~not for any other purpose offsetting the indexed credits~~ should be modeled consistently with the requirements of Section 4.A.4.a.ii.
 - c) An Index Credit Hedge Margin for these hedge instruments shall be reflected by reducing index interest credit hedge payoffs by a margin multiple that shall be justified by sufficient and credible

Commented [X246]: Given that Section 9 covers hedging, we would suggest considering moving parts of Section 4.A.4 to that section.

Commented [X247]: VM-22 took out the CDHS requirement and replaced it with "future hedging program". Future hedging should not materially reduce reserves or TAR if it is not well documented. The hedging DG is currently working on this for VM-20/VM-21. We will work with VM-22 subgroup to edit VM-22 accordingly.

Commented [X248]: Suggest rewording "Future hedging program" to "hedging program with future transactions" to avoid ambiguity.

Commented [CD249]: The word "future" to describe the "hedging program" here is confusing. What about current hedging programs with expected future hedge purchases? Why not just say "hedging program"? Also, I wanted to note that removing the concept of CDHS creates inconsistency with both VM-20 and VM-21. Why not retain it?

Commented [CD250]: same comment as above, about the word "future" being confusing

Commented [CD251]: "contract holders"

Commented [VM2252R251]: Edits to address this comment will be reflected in next exposure

Commented [X253]: "Any other purpose" in the last sentence seems overly broad and should be narrowed.

Commented [VM2254R253]: Edits to address this comment will be reflected in next exposure

Commented [X255]: Specify "for this purpose" as "for offsetting the indexed credits", specify "for any other purposes" as "not for offsetting the indexed credits".

Commented [VM2256R255]: Edits to address this comment will be reflected in next exposure

Commented [X257]: We believe the company should determine the appropriate margin based on their demonstration of effectiveness. Any guardrails on these undetermined values should be minimal, including as low as possible, subject to the appropriate demonstration of effectiveness. Further, we believe that documentation of effective product management should be contemplated in addition to historical effectiveness.

Commented [VM2258R257]: Subgroup agreed to revisit this discussion after field testing.

Commented [CD259]: clarify verbiage by saying "hedge instruments" or "derivative instruments"

Commented [VM2260R259]: Edits to address this comment will be reflected in next exposure

company experience and be no less than [X%] multiplicatively of the interest credited. In the absence of sufficient and credible company experience, a margin of [Y%] shall be assumed. There is no cap on the index credit hedge margin if company experience indicates actual error is greater than [Y%]. It is permissible to substitute stress-testing for sufficient and credible experience if such stress-testing comprehensively considers a robust range of future market conditions.

- ii. For a company that hedges any contractual obligation or risks other than indexed interest credits, the detailed requirements for the modeling of hedges are defined in Section 9. The following requirements do not supersede the detailed requirements.
 - a) The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the projections used in the determination of the stochastic reserve SR.
 - b) The projections shall take into account the appropriate costs and benefits of hedge positions expected to be held in the future. Because models do not always accurately portray the results of hedge programs, the company shall, through back-testing and other means, assess the accuracy of the hedge modeling. The company shall determine a stochastic reserve SR as the weighted average of two CTE values; first, a CTE70 (“best efforts”) representing the company’s projection of all of the hedge cash flows, including future hedge purchases, and a second CTE70 (“adjusted”) which shall use only hedge assets held by the company on the valuation date and only future hedge purchases associated with indexed interest credited. These are discussed in greater detail in Section 9.
 - c) Consistent with Section 4.A.4.b.i., if the company has an indexed credit hedging program, the index credit hedge margin for instruments associated with indexed interest credited shall be reflected by reducing hedge payoffs by a margin multiple as defined in Section 4.A.4.b.i.c); in both the “best efforts” run and the “adjusted” run.
 - d) The use of products not falling under the scope of these VM-22 PBR Section 1 through 13 requirements (e.g., variable annuities) (e.g., equity indexed annuities) as a hedge shall not be recognized in the determination of accumulated deficiencies.

Commented [X261]: It is not clear how the stress testing can be used to support the index credit hedge margin. It is a test of the modeled strategy not actual performance and does not reflect any model error. We suggest that both back testing and stress testing be required and elaborated further:
Clearly specify method and metrics used for the back testing with focus on all available recent relevant history, not limited to 12 months
Recommend defined stress periods for stress testing, e.g., 2008 financial crisis, 2020 COVID impaired market conditions.

Commented [X262R261]: We will repeat the comment from our first letter: "Regarding hedge breakage expense assumptions, are both sources of error reflected here - error in the hedging itself, and error in the ability to accurately model it? Should we be separately considering the two limitations to make sure they are both clear: 1) the real-world hedging error and 2) the modeling error in reflecting the future hedging? Current error factor discussions seem muddled."

Commented [X263]: Again, need to coordinate with Hedging DG.

Commented [X264]: Margins are discussed in a different section, so recommend deleting.

Commented [X265]: Edits were made to provide context and clarification for the requirements.

Commented [VM22266R265]: Edits to address this comment will be reflected in next exposure

Commented [X267]: Clarify that “these requirements” should be specified as “VM-22 PBR requirements”. Again, we suggest reconsidering the use of “VM-23”, though.

Commented [VM22268R267]: Edits to address this comment will be reflected in next exposure

Commented [CD269]: It might be helpful to keep the parenthetical statement, with “variable annuities” as the example

Commented [VM22270R269]: Edits to address this comment will be reflected in next exposure

Guidance Note: Section 4.A.4.b.i is intended to address common situations for products with index crediting strategies where the company only hedges index credits or clearly separates index credit hedging from other hedging. In this case the hedge positions are considered similarly to other

fixed income assets supporting the contracts, and a margin is reflected rather than modeling using a CTE70 adjusted run with no future hedge purchases. If a company has a more comprehensive hedge strategy combining index credits, guaranteed benefit, and other risks (e.g., full fair value or economic hedging), an appropriate and documented bifurcation method should be used in the application of sections 4.A.4.b.i and 4.A.4.b.ii above for the hedge modeling and justification. Such bifurcation methods may quantify the specific risk exposure attributable to index credit liabilities versus other liabilities such as guaranteed living benefits, and apply such for the basis for allocation.

Guidance Note: The requirements of Section 4.A.4 govern the determination of reserves for annuity contracts and do not supersede any statutes, laws or regulations of any state or jurisdiction related to the use of derivative instruments for hedging purposes and should not be used in determining whether a company is permitted to use such instruments in any state or jurisdiction.

5. Revenue Sharing

If applicable, projections of accumulated deficiencies may include income from projected future revenue sharing, net of applicable projected expenses (net revenue-sharing income) if each of the following requirements are met:

Commented [X271]: Unclear why Revenue Sharing is considered for non-variable products, can probably delete.

6. Length of Projections

Projections of accumulated deficiencies shall be run for as many future years as needed so that no materially greater reserve value would result from longer projection periods. Obligations remain at the end of the projection periods. Company can choose to run a shorter projection period but not shorter than 20 years and include the present value of the terminal benefits and expenses in the accumulated deficiency calculation.

Commented [X272]: Clarify that for revenue sharing, the entire subsection of VM-21 Section 4.A.5 applies.

Commented [VM22273R272]: Edits to address this comment will be reflected in next exposure

Commented [CD274]: The "requirements are met" list is only in Section 4.A.5.a. Was the intent also to define the amount of net revenue-sharing income allowed in the projections? If so, will need to add verbiage to reference VM-21 Section 4.A.5.a through 4.A.5.f.

Commented [VM22275R274]: Edits to address this comment will be reflected in next exposure

7. Interest Maintenance Reserve (IMR)

The IMR shall be handled consistently with the treatment in the company's cash flow testing, and the amounts should be adjusted to a pre-tax basis.

Commented [X276]: We recommend that the projection period requirement be in line with that of VM-20. Instead of meeting the immateriality requirement, calculate the present value of the terminal benefits and expenses and include it in the accumulated deficiency calculation.

B. Determination of Scenario Reserve

1. For a given scenario, the scenario reserve shall be determined using one of two methods described below:

Commented [VM22277]: See Bill Wilton's comment letter, expressing opposition to inclusion of pre-tax IMR.

a) The starting asset amount plus the greatest present value, as of the projection start date, of the projected accumulated deficiencies; or

Commented [CD278]: should we consider these changes to VM-21 as well, for consistency?

Commented [VM22279R278]: Edits to address this comment will be reflected in next exposure

Guidance Note: The greatest present value of accumulated deficiencies can be negative.

Commented [X280]: Section does not specify what the "greatest present value" means for contracts without cash surrender value.

b) The direct iteration method, where the scenario reserve is determined by solving for the amount of starting assets which, when projected along with all contract cash flows, result in the defeasement of all projected future benefits and expenses at the end of the projection horizon with no positive accumulated deficiencies at the end of any projection year during the projection period.

Commented [VM22281R280]: Academy will work on developing a "working reserve" concept for products without cash surrender value, though the issue may be minimized given that payout annuities cannot be aggregated with accumulation annuities.

The scenario reserve for any given scenario shall not be less than the cash surrender value with market value adjustment in aggregate on the valuation date for the group of contracts modeled in the projection.

2. Discount Rates

In determining the scenario reserve, unless using the direct iteration method pursuant to Section 4.B.1.b, the accumulated deficiencies shall be discounted at the NAER on additional assets, as defined in Section 4.B.3.

3. Determination of NAER on Additional Invested Asset Portfolio

a. The additional invested asset portfolio for a scenario is a portfolio of general account assets as of the valuation date, outside of the starting asset portfolio, that is required in that projection scenario so that the projection would not have a positive accumulated deficiency at the end of any projection year. This portfolio may include only (i) General Account assets available to the company on the valuation date that do not constitute part of the starting asset portfolio; and (ii) cash assets.

Commented [X282]: For products that do not have a cash surrender value, it is recommended that VM-22 use a "working reserve" concept, similar to VM-21 Section 3.1.2 requirement. Otherwise, there will be an issue agreement issue with and without CS.

Commented [VM22283R282]: Academy will work on developing a "working reserve" concept for products without cash surrender value, though the issue may be minimized given that payout annuities cannot be aggregated with accumulation annuities.

Commented [X284]: For products with market value adjustment, needs to be floored at cash surrender value with MVA.

Commented [X285]: We believe that assets held in the separate account with performance not impacting policyholder benefits should be modeled consistent with how the business is managed.

Guidance Note:

Additional invested assets should be selected in a manner such that if the starting asset portfolio were revised to include the additional invested assets, the projection would not be expected to experience any positive accumulated deficiencies at the end of any projection year.

It is assumed that the accumulated deficiencies for this scenario projection are known.

- b. To determine the NAER on additional invested assets for a given scenario:
 - i. Project the additional invested asset portfolio as of the valuation date to the end of the projection period,
 - a) Investing any cash in the portfolio and reinvesting all investment proceeds using the company's investment policy.
 - b) Excluding any liability cash flows.
 - c) Incorporating the appropriate returns, defaults and investment expenses for the given scenario.
 - ii. If the value of the projected additional invested asset portfolio does not equal or exceed the accumulated deficiencies at the end of each projection year for the scenario, increase the size of the initial additional invested asset portfolio as of the valuation date, and repeat the preceding step.
 - iii. Determine a vector of annual earned rates that replicates the growth in the additional invested asset portfolio from the valuation date to the end of the

projection period for the scenario. This vector will be the NAER for the given scenario.

- iv. If the depletion of assets within the projection results in an unreasonably high negative NAER upon borrowing, the NAER may be set to the assumed cost of borrowing associated with each projected time period, in accordance with Section 4.D.3.c, as a safe harbor.

Guidance Note: There are multiple ways to select the additional invested asset portfolio at the valuation date. Similarly, there are multiple ways to determine the earned rate vector. The company shall be consistent in its choice of methods, from one valuation to the next.

Commented [X286]: The wording “unreasonably high” is not clear or appropriate. Recommend this requirement be revised as part of a holistic fix to address extreme outliers in NAER both on the low and high side to handle anomalies for all of VM-20, VM-21, and VM-22. Some upper/lower cutoffs could be used that depend on scenario returns.

Commented [CD287]: “unreasonably high” is not well defined. Also, do we need to consider guardrails in the case of “unreasonably high” positive NAERs, not just negative NAERs?

C. Projection Scenarios

1. Number of Scenarios

The number of scenarios for which the scenario reserve shall be computed shall be the responsibility of the company, and it shall be considered to be sufficient if any resulting understatement in the ~~stochastic reserve~~ SR, as compared with that resulting from running additional scenarios, is not material.

2. Economic Scenario Generation

Treasury Department interest rate curves, as well as investment return paths for index funds, equities, and fixed income assets shall be determined on a stochastic basis using the methodology described in Section 8. If the company uses a proprietary generator to develop scenarios, the company shall demonstrate that the resulting scenarios meet the requirements described in Section 8.

D. Projection of Assets

1. Starting Asset Amount

- a. For the projections of accumulated deficiencies, the value of assets at the start of the projection shall be set equal to the approximate value of statutory reserves at the start of the projection plus the allocated amount of PIMR attributable to the assets selected. Assets shall be valued consistently with their annual statement values. The amount of such asset values shall equal the sum of the following items, all as of the start of the projection:

- i. Any hedge instruments held in support of the contracts being valued; and
- ii. An amount of assets held in the general account equal to the approximate value of statutory reserves as of the start of the projections less the amount in (i).

- b. If the amount of initial general account assets is negative, the model should reflect a projected interest expense. General account assets chosen for use as described

above shall be selected on a consistent basis from one reserve valuation hereunder to the next.

2. Valuation of Projected Assets

For purposes of determining the projected accumulated deficiencies, the value of projected assets shall be determined in a manner consistent with their value at the start of the projection. For assets assumed to be purchased during a projection, the value shall be determined in a manner consistent with the value of assets at the start of the projection that have similar investment characteristics. However, for derivative instruments that are used in hedging and are not assumed to be sold during a particular projection interval, the company may account for them at an amortized cost in an appropriate manner elected by the company.

Guidance Note: Accounting for hedge assets should recognize any methodology prescribed by a company's state of domicile.

3. General Account Assets

- a. General account assets shall be projected, net of projected defaults, using assumed investment returns consistent with their book value and expected to be realized in future periods as of the date of valuation. Initial assets that mature during the projection and positive cash flows projected for future periods shall be invested in a manner that is representative of and consistent with the company's investment policy, subject to the following requirements:
- i. The final maturities and cash flow structures of assets purchased in the model, such as the patterns of gross investment income and principal repayments or a fixed or floating rate interest basis, shall be determined by the company as part of the model representation;
 - ii. The combination of price and structure for fixed income investments and derivative instruments associated with fixed income investments shall appropriately reflect the projected Treasury Department curve along the relevant scenario and the requirements for gross asset spread assumptions stated below;
 - iii. For purchases of public non-callable corporate bonds, follow the requirements defined in VM-20 Sections 7.E, 7.F and 9.F. The prescribed spreads reflect current market conditions as of the model start date and grade to long-term conditions based on historical data at the start of projection year four;
 - iv. For transactions of derivative instruments associated with fixed income investments, reflect the prescribed assumptions in VM-20 Section 9.F for interest rate swap spreads;
 - v. For purchases of other fixed income investments, if included in ~~the model~~ modeled company investment strategy, set assumed gross asset spreads over U.S. Treasuries in a manner that is consistent with, and results

Commented [X288]: This change was adopted for VM-20 and VM-21 for the 2022 VM.

Commented [VM22289R288]: Edits to address this comment will be reflected in next exposure

in reasonable relationships to, the prescribed spreads for public non-callable corporate bonds and interest rate swaps.

- b. Notwithstanding the above requirements, the modeled aggregate reserve shall be the higher of that produced by the modeled company investment strategy and any non-prescribed asset spreads shall be adjusted as necessary so that the aggregate reserve is not less than that which would be obtained produced by substituting an alternative investment strategy in which all the fixed income reinvestment assets are have the same weighted average life (WAL) as the reinvestment assets in the modeled company investment strategy and are all public non-callable corporate bonds with gross asset spreads, asset default costs, and investment expenses by projection year that are consistent with a credit quality blend of:

- i. ~~5%~~ Treasury
- ii. ~~15%~~ 20% PBR credit rating 3 (Aa2/AA)
- iii. ~~40%~~ 80% PBR credit rating 6 (A2/A)
- iv. ~~40%~~ 40% PBR credit rating 9 (Baa/BBB)

- c. Any disinvestment shall be modeled in a manner that is consistent with the company’s investment policy and that reflects the company’s cost of borrowing where applicable, provided that the assumed cost of borrowing is not lower than the rate at which positive cash flows are reinvested in the same time period, taking into account duration, ratings, and other attributes of the borrowing mechanism. Gross asset spreads used in computing market values of assets sold in the model shall be consistent with, but not necessarily the same as, the gross asset spreads in Section 4.D.4.a.iii and Section 4.D.4.a.iv, recognizing that initial assets that mature during the projection may have different characteristics than modeled reinvestment assets.

Guidance Note: This limitation is being referred to Life Actuarial (A) Task Force for review. The simple language above “provided that the assumed cost of borrowing is not lower than the rate at which positive cash flows are reinvested in the same time period” is not intended to impose a literal requirement. It is intended to reflect a general concept to prevent excessively optimistic borrowing assumptions. It is recognized that borrowing parameters and rules can be complicated, such that modeling limitations may not allow for literal compliance, in every time step, as long as the reserve is not materially affected. However, if the company is unable to fully apply this restriction, prudence dictates that a company shall not allow borrowing assumptions to materially reduce the reserve.

4. Cash Flows from Invested Assets

- a. Cash flows from general account fixed income assets, including starting and reinvestment assets, shall be reflected in the projection as follows:

Commented [CD290]: should this be "stochastic reserve", since this is within Section 4: Determination of Stochastic Reserve

Commented [VM22291R290]: Edits to address this comment will be reflected in next exposure

Commented [X292]: This change was adopted for VM-20 and VM-21 for the 2022 VM.

Commented [VM22293R292]: Edits to address this comment will be reflected in next exposure

Commented [CD294]: Suggest making this plural ("Treasures") to be consistent with Section 13.B.9

Commented [VM22295R294]: Edits to address this comment will be reflected in next exposure

Commented [X296]: The proposed reinvestment mix comes from a different assumption context in current VM-22, i.e., it is designed to calculate the maximum allowed valuation interest rates, while the reinvestment mix for VM-22 PBR draft is to put a guardrail around the fixed income reinvestment assets. A guardrail is not intended to identify outliers and should not be tied to an average. The biggest concern is with the higher allocation percentage in BBB assets. The valuation manual should build an appropriate level of conservatism in the valuation standards instead of reflecting industry trends. By moving from VM-20 and VM-21 required mix of 50%/50% AA/A to the proposed mix, the gross spreads increased by 20-30 bps for almost all WAL. We do not object to using a lower credit quality guardrail to get rid of any excessive conservatism. We recommend considering and comparing with other alternative allocations, something between the current and the proposed, e.g., 20% AA and 80% A. This will help regulators make informed decisions. In any case, we should be consistent with VM-20 and VM-21. If a change is made, it needs to be for all three.

Commented [VM22297R296]: Varying opinions among the Subgroup. Voted to revisit and determine the guardrail after the field test.

Commented [CD298]: These references should be Section 4.D.3.a.iii and 4.D.3.a.v

Commented [VM22299R298]: Edits to address this comment will be reflected in next exposure

- i. Model gross investment income and principal repayments in accordance with the contractual provisions of each asset and in a manner consistent with each scenario.
- ii. Reflect asset default costs as prescribed in VM-20 Section 9.F and anticipated investment expenses through deductions to the gross investment income.
- iii. Model the proceeds arising from modeled asset sales and determine the portion representing any realized capital gains and losses.
- iv. Reflect any uncertainty in the timing and amounts of asset cash flows related to the paths of interest rates, equity returns or other economic values directly in the projection of asset cash flows. Asset defaults are not subject to this requirement, since asset default assumptions must be determined by the prescribed method in VM-20 Sections 7.E, 7.F and 9.F as noted in 4.a.ii above.

b. Cash flows from general account index funds and general account equity assets—i.e., non-fixed income assets having substantial volatility of returns, such as common stocks and real estate—including starting and reinvestment assets, shall be reflected in the projection as follows:

- i. Determine the grouping for asset categories and the allocation of specific assets to each category in a manner that is consistent with that used for index crediting strategies, as discussed in Section 4.A.2.
- ii. Project the gross investment return including realized and unrealized capital gains in a manner that is consistent with the stochastically generated scenarios.
- iii. Model the timing of an asset sale in a manner that is consistent with the investment policy of the company for that type of asset. Reflect expenses through a deduction to the gross investment return using prudent estimate assumptions.

c. Cash flows for each projection interval for policy loan assets shall follow the requirements in Section 10.H.

E. Projection of Annuitization Benefits

1. Assumed Annuitization Purchase Rates

- a. For payouts specified at issue (such as single premium immediate annuities, deferred income annuities, and certain structured settlements), such purchase/payout rates shall reflect the payout rate specified in the contract.
- b. For purposes of projecting future elective annuitization benefits (including annuitizations stemming from the election of a GMIB) and withdrawal amounts from GMWBs, the projected annuitization purchase rates shall be determined

Commented [X300]: Correct an inaccurate VM section reference. The prescribed asset default spreads assumption should be referred to VM-20 Section 9.F. VM-20 Section 7.E and 7.F are requirements for reinvestment assets, disinvestment and cash flows for invested assets. In 7.F, VM-20 just refers to 9.F for defaults.

Commented [VM22301R300]: Edits to address this comment will be reflected in next exposure

Commented [X302]: Request clarification around the meaning of "general account index funds".

Commented [VM22303R302]: Edits to address this comment will be reflected in next exposure

Commented [CD304]: should this reference Section 10.H?

Commented [VM22305R304]: Edits to address this comment will be reflected in next exposure

Commented [CD306]: is there a difference between "purchase rates" and "payout rates"? Both terms are used, so that makes the language unclear. If they are the same, suggest sticking with "purchase rates".

Commented [VM22307R306]: Edits to address this comment will be reflected in next exposure

Commented [X308]: Suggest deleting "In contrast, for payouts specified at issue, the payout rates modeled should be consistent with those specified in the contract." as it appears to be covered by E.1.a.

Commented [VM22309R308]: Edits to address this comment will be reflected in next exposure

Commented [X310]: Reinstate the parenthetical content "(including annuitizations stemming from the election of a GMIB)" since there are GMIB riders attached to fixed annuity products.

Commented [VM22311R310]: Edits to address this comment will be reflected in next exposure

assuming that market interest rates available at the time of election are the interest rates used to project general account assets, as determined in Section 4.D.4. ~~In contrast, for payouts specified at issue, the payout rates modeled should be consistent with those specified in the contract.~~

Commented [X312]: Delete sentence since it repeats 4.E.1.a.

Commented [VM22313R312]: Edits to address this comment will be reflected in next exposure

2. Projected Election of GMIBs, GMWBs and Other Annuitization Options

- a. For contracts projected to elect future annuitization options (including annuitizations stemming from the election of a GMIB) or for projections of GMWB benefits once the account value has been depleted, the projections ~~may~~ shall assume the contract will stay in force, the projected periodic payments are paid, and the associated maintenance expenses are incurred.

Commented [X314]: Suggest deleting "may" as there appears to be only option.

Commented [VM22315R314]: Edits to address this comment will be reflected in next exposure

F. Frequency of Projection and Time Horizon

- 1. Use of an annual cash-flow frequency ("timestep") is generally acceptable for benefits/features that are not sensitive to projection frequency. The lack of sensitivity to projection frequency should be validated by testing wherein the company should determine that the use of a more frequent—i.e., shorter—time step does not materially increase reserves. A more frequent time increment should always be used when the product features are sensitive to projection period frequency.

Commented [X316]: Projection Period is already covered in 4.A.6. Should not be in two places with different guidance.

Commented [VM22317R316]: Edits to address this comment will be reflected in next exposure

Care must be taken in simulating fee income and expenses when using an annual time step. ~~For example, recognizing fee income at the end of each period after market movements, but prior to persistency decrements, would normally be an inappropriate assumption.~~ It is also important that the frequency of the investment return model be linked appropriately to the projection horizon in the liability model. In particular, the horizon should be sufficiently long so as to capture the vast majority of costs (on a present value basis) from the scenarios.

Commented [X318]: Reinstate the deleted example of "For example, recognizing fee income at the end of each period after market movements, but prior to persistency decrements, would normally be an inappropriate assumption."

Commented [VM22319R318]: Edits to address this comment will be reflected in next exposure

Guidance Note: As a general guide, the forecast horizon should not be less than 20 years.

G. Compliance with ASOPs

When determining a stochastic reserve SR, the analysis shall conform to the ASOPs as promulgated from time to time by the ASB.

Under these requirements, an actuary will make various determinations, verifications and certifications. The company shall provide the actuary with the necessary information sufficient to permit the actuary to fulfill the responsibilities set forth in these requirements and responsibilities arising from each applicable ASOP.

Section 5: ~~Reinsurance Ceded and Assumed~~

A. Treatment of Reinsurance ~~Ceded~~ in the Aggregate Reserve

1. Aggregate Reserve Pre- and Post-Reinsurance Ceded

As noted in Section 3.B, the aggregate reserve is determined both pre-reinsurance ceded and post-reinsurance ceded—i.e., the ~~stochastic reserve~~ ~~additional standard projection amount~~, the SR, DR, and/or the reserve amount valued using requirements in VM-A and VM-C, as applicable—on both bases. Sections 5.A.2 and 5.A.3 discuss adjustments to inputs necessary to determine these components on both a post-reinsurance ceded and a pre-reinsurance ceded basis. ~~Note that due allowance for reasonable approximations may be used where appropriate.~~

2.
2. Stochastic Reserve

Reflection of Reinsurance Cash Flows in the DR or SR

- a. In order to determine the aggregate reserve post-reinsurance ceded, accumulated deficiencies, scenario reserves, and the resulting ~~stochastic reserve~~ SR and DR shall be determined reflecting the effects of reinsurance treaties that meet the statutory requirements that would allow the treaty to be accounted for as reinsurance within statutory accounting. This involves including, where appropriate, all projected reinsurance premiums or other costs and all reinsurance recoveries, where the reinsurance cash flows reflect all the provisions in the reinsurance agreement, using prudent estimate assumptions.

i. ~~In this section, reinsurance includes retrocession, and assuming company includes retrocessionaire.~~

ii. All significant terms and provisions within reinsurance treaties shall be reflected. In addition, it shall be assumed that each party is knowledgeable about the treaty provisions and will exercise them to their advantage.

Guidance Note: Renegotiation of the treaty upon the expiration of an experience refund provision or at any other time shall not be assumed if such would be beneficial to the company and not beneficial to the counterparty. This is applicable to both the ceding party and assuming party within a reinsurance arrangement.

iii. If the company has knowledge that a counterparty is financially impaired, the company shall establish a margin for the risk of default by the counterparty. In the absence of knowledge that the counterparty is financially impaired, the company is not required to establish a margin for the risk of default by the counterparty.

iv. A company shall include the cash flows from a reinsurance agreement or amendment in calculating the ~~stochastic~~ aggregate reserve if such qualifies for credit in compliance with Appendix A-791 of the Accounting Practices and Procedures Manual. If a reinsurance agreement or amendment does not qualify for credit for reinsurance but treating the reinsurance agreement or amendment as if it did so qualify would result in a reduction to the company's surplus, then the company shall increase the ~~minimum~~ aggregate reserve by the absolute value of such reductions in surplus.

Commented [X320]: The wording and titling may need to be tightened due to clarify which items apply to assumed and ceded reinsurance in the text.

Commented [VM22321R320]: Edits to address this comment will be reflected in next exposure

Commented [X322]: Delete and just have title be "Reinsurance". Should structure be more like VM-20?

Commented [X323R322]: I, II (and III –VM-21 needs edits)

Commented [VM22324R322]: Edits to address this comment will be reflected in next exposure

Commented [CD325]: "and Assumed" is added here, but there is still only a subsection 5.A that addresses reinsurance ceded (at least in the section header).

Commented [VM22326R325]: Edits to address this comment will be reflected in next exposure

Commented [CD327]: need to add "and Assumed" here?

Commented [VM22328R327]: Edits to address this comment will be reflected in next exposure

Commented [X329]: reinstate

Commented [VM22330R329]: Edits to address this comment will be reflected in next exposure

Commented [X331]: Can take out vague approximation references, since now have a general allowance for appropriate approximations.

Commented [VM22332R331]: Edits to address this comment will be reflected in next exposure

Commented [X333]: Consistent with VM-20

Commented [VM22334R333]: Edits to address this comment will be reflected in next exposure

Commented [X335]: VM-20 Section 8.A.1 makes sense here as well.

Commented [VM22336R335]: Edits to address this comment will be reflected in next exposure

Commented [CD337]: should this be "stochastic reserve"?

Commented [VM22338R337]: Edits to address this comment will be reflected in next exposure

Commented [X339]: VM-22 draft so far uses aggregate, not minimum.

Commented [VM22340R339]: Edits to address this comment will be reflected in next exposure

- b. In order to determine the stochastic reserve SR and DR on a pre-reinsurance ceded basis, accumulated deficiencies, scenario reserves, and the resulting stochastic reserve SR and DR shall be determined ignoring the effects of reinsurance ceded within the projections. Different approaches may be used to determine the starting assets on the ceded portion of the contracts, dependent upon the characteristics of a given treaty:
 - i. For a standard coinsurance treaty, where the assets supporting the ceded liabilities were transferred to the assuming reinsurer, one acceptable approach involves a projection based on using starting assets on the ceded portion of the policies that are similar to those supporting the retained portion of the ceded policies or supporting similar types of policies. Scaling up each asset supporting the retained portion of the contract is also an acceptable method.

Guidance Note: For standard pro rata insurance treaties ~~(does that do not~~ include experience refunds), where allocated expenses are similar to the renewal expense allowance, reflecting the quota share applied to the present value of future reinsurance cash flows pertaining to the reinsured block of business may be considered as a possible approach to determine the ceded reserves.

Commented [X341]: Correct phrasing.

Commented [VM22342R341]: Edits to address this comment will be reflected in next exposure

- ii. Alternatively, a treaty may contain an identifiable portfolio of assets associated with the ceded liabilities. This could be the case for several forms of reinsurance: funds withheld coinsurance; modified coinsurance; coinsurance with a trust. To the extent these assets would be available to the cedant, an acceptable approach could involve modeling this portfolio of assets. To the extent that these assets were insufficient to defease the ceded liabilities, the modeling would partially default to the approach discussed for a standard coinsurance treaty. To the extent these assets exceeded what might be needed to defease the ceded liabilities (perhaps an over collateralization requirement in a trust), the inclusion of such assets shall be limited.

Guidance Note: Section 3.5.2 in ASOP No. 52, *Principle-Based Reserves for Life Products under the NAIC Valuation Manual*, provides possible methods for constructing a hypothetical pre-reinsurance asset portfolio, if necessary, for purposes of the pre-reinsurance reserve calculation.

- c. An assuming company shall use assumptions to project cash flows to and from ceding companies that reflect the assuming company’s experience for the business segment to which the reinsured policies belong and reflect the terms of the reinsurance agreement.
- d. The company shall assume that the counterparties to a reinsurance agreement are knowledgeable about the contingencies involved in the agreement and likely to exercise the terms of the agreement to their respective advantage, taking into account the context of the agreement in the entire economic relationship between the parties. In setting assumptions for the NGE in reinsurance cash flows, the company shall include, but not be limited to, the following:
 - i. The usual and customary practices associated with such agreements.
 - ii. Past practices by the parties concerning the changing of terms, in an economic environment similar to that projected.
 - iii. Any limits placed upon either party’s ability to exercise contractual options in the reinsurance agreement.
 - iv. The ability of the direct-writing company to modify the terms of its policies in response to changes in reinsurance terms.
 - v. Actions that might be taken by a party if the counterparty is in financial difficulty.

Commented [X343]: VM-20 Section 8.C.7 seems particularly applicable. We encourage others to also review VM-20 Section 8 for other sections that should also apply. VM-20 Section 8 is much more developed than VM-21 Section 5 with many more considerations for assumption setting, and we would suggest the VM-22 subgroup consider rewriting starting with VM-20 instead of VM-21.

Commented [VM22344R343]: Subgroup agreed with reflecting this language in the VM-22 draft

3. Reserve Determined Upon Passing the Exclusion Test

If a company passes the stochastic exclusion test and elects to use a methodology pursuant to applicable Sections VM-A and VM-C, as allowed in Section 3.E, it is important to note that the methodology produces reserves on a pre-reinsurance ceded basis. Therefore, the reserve must be adjusted for any reinsurance ceded accordingly. In addition, reserves valued under applicable Sections in VM-A and VM-C, unadjusted for reinsurance, shall be applied to the contracts falling under the scope of these requirements to determine the aggregate reserve prior to reinsurance.

It should be noted that the pre-reinsurance-~~ceded~~ and post-reinsurance-~~ceded~~ reserves may result in different outcomes for the exclusion test. In particular, it is possible that the pre-reinsurance-~~ceded~~ reserves would pass the relevant exclusion test (and allow the use of VM-A and VM-C) while the post-reinsurance-~~ceded~~ reserves might not, or vice versa.

4. Additional Standard Projection Amount

Where reinsurance is ceded, the additional standard projection amount shall be calculated as described in Section 6 to reflect the reinsurance costs and reinsurance recoveries under the reinsurance treaties. The additional standard projection amount shall also be calculated pre-reinsurance ceded using the methods described in Section 6 but ignoring the effects of the reinsurance ceded.

- Commented [X345]: Both referring to reinsurance ceded. Should be clarified.
- Commented [VM22346R345]: Edits to address this comment will be reflected in next exposure
- Commented [X347]: ~~ceded~~
- Commented [VM22348R347]: Edits to address this comment will be reflected in next exposure
- Commented [X349]: ~~ceded~~
- Commented [VM22350R349]: Edits to address this comment will be reflected in next exposure
- Commented [X351]: Opposite could also be true.
- Commented [VM22352R351]: Edits to address this comment will be reflected in next exposure
- Commented [X353]: The current VM-21 language here looks to work for VM-22 without needing to know the specific assumptions, etc., for the SPA.
- Commented [VM22354R353]: Edits to address this comment will be reflected in next exposure

Section 6: Standard Projection Amount To Be Determined

Commented [VM22355]: NY Comment Letter: Current CARVM standards should be a minimum floor for VM-22 policies, and only the stochastic reserve should permit grouping whereas the minimum floor should be seriatim.

Commented [X356]: SPA Section placement here still makes sense, but SPA under development.

Commented [VM22357R356]: Edit to update the title of this section will be reflected in next exposure

Commented [VM22358]: Refer to equitable comment letter, which expresses support for the standard projection amount as a binding floor, with the suggestion to rely on company-specific assumptions for insignificant assumptions that are difficult to develop.

Commented [NJ359]: Once this is written, the language from 4.A.1.a for longevity reinsurance could be added here as well, i.e. the standard projection would use net premiums based on the k factor approach, using the standard projection prescribed assumptions. Floor on std projection is at the contract level

~~Section 6: To Be Determined~~

Section 7: Exclusion Testing

A. Stochastic Exclusion Test Requirement Overview

1. The company may elect to exclude one or more groups of contracts from the stochastic reserve SR calculation if the stochastic exclusion test (SET) is satisfied for that each of the group of contracts. The company has the option to calculate or not calculate the SET.
 - a. If the company does not elect to calculate the SET for one or more groups of contracts, or the company calculates the SET and fails the test for such groups of contracts, the reserve methodology described in Section 4 shall be used for calculating the aggregate reserve for those groups of contracts.
 - b. If the company elects to calculate the SET for one or more groups of contracts, and passes the test for such groups of contracts, then for each group of contracts that passes the SET, the company shall choose whether or not to use the reserve methodology described in Section 4 for those groups that group of contracts. If the reserve methodology described in Section 4 is not used for one or more groups of contracts, then the company shall use the reserve methodology pursuant to applicable requirements in VM-A and VM-C to calculate the aggregate reserve for those groups of contracts.
 - c. A company may not exclude a group of contracts from the stochastic reserve SR requirements if there are one or more future hedging programs associated with supporting the contracts, with the exception of hedging programs solely supporting index credits as described in Section 9.A.1.
 - d. A company may elect to automatically exclude one or more groups of policies from the stochastic reserve calculation without passing the stochastic exclusion test (SET) if all of the following are met for all contracts in the group or groups:
 - i. All of the contracts are either:
 - Single Premium Immediate Annuities,
 - Term Certain Payout Annuities, or
 - Structured Settlement Contracts;
 - ii. None of the contracts are pension risk transfer annuities (PRT) or are covered under a longevity reinsurance agreement;
 - iii. Future payout benefits are either level or stay within 5% of the initial payout benefit amount over time;
 - iv. There is either no or an immaterial level of policyholder options permitted within the contracts; and
 - v. The average [Macauley duration] of the liabilities of the contracts as measured from the issue date (or premium determination date) is less than [X].

B. Requirement to Pass the Types of Stochastic Exclusion Tests

Groups of contracts pass the SET if one of the following is met:

1850 M Street NW Suite 300 Washington, DC 20036 Telephone 202 223 8196 Facsimile 202 872 1948 www.actuary.org

Commented [X360]: Need to modify exclusion testing section to reflect SPA.

Commented [NJ361]: Longevity reinsurance likely to be scoped out of the stochastic reserve unless the stochastic reserve includes consideration of stochastic mortality. If it stays as stochastic interest only, then it probably does make sense that it would meet the exclusion testing. For exclusion testing, the k factor approach should continue to apply, and it should not be combined with other blocks of business

Commented [X362]: Inconsistent groups vs. group references.

Commented [VM22363R362]: Edits to address this comment will be reflected in next exposure

Commented [CD364]: should this be "stochastic reserve", since Section 4 is about determining the stochastic reserve.

Commented [VM22365R364]: Follow Section 4 method of stochastic reserve for Section 3 aggregate reserve if not using the SET

Commented [X366]: Decision is independent for each group the SET is performed on.

Commented [VM22367R366]: Edits to address this comment will be reflected in next exposure

Commented [CD368]: suggest deleting this highlighted part of the sentence

Commented [VM22369R368]: Edits to address this comment will be reflected in next exposure

Commented [CD370]: see earlier comment about the phrase "future hedge program" being confusing.

Commented [X371]: Is "associated with the contracts" the same as the earlier use of "supporting the contracts"? Should the same verbiage be used here? If there is asset hedging for the assets supporting the contracts, it should be included. Need to define "solely supporting" index credits, and also have criteria on the effectiveness/error and documentation of any such hedging that is allowed for excluded business.

Commented [VM22372]: Subgroup voted to permit PRTs below a certain duration to automatically pass the exclusion test, assuming there is limited optionality level/near-level payments, and not PRT or longevity reinsurance. The Academy has agreed to develop a proposed duration threshold

Commented [VM22373]: New language drafted by select Subgroup Members to provide certain conditio... [85]

Commented [CD374]: Suggest renaming this section header/name to "Requirements to Pass the SET". There is only 1 SET, but 3 ways to pass it (SERT, Demonstratio... [86]

Commented [VM22375R374]: Edits to address this comment will be reflected in next exposure

1. Stochastic Exclusion Ratio Test (SERT)—Annually ~~within 12 months before the valuation date~~ ~~within 12 months before the valuation date~~ the company demonstrates that the groups of contracts pass the SERT defined in Section 7.C.
2. Stochastic Exclusion Demonstration Test—In the first year and at least once every three calendar years thereafter, the company provides a demonstration in the PBR Actuarial Report as specified in Section 7.D.
3. ~~SET~~ Certification Method—For groups of contracts that do not have guaranteed living benefits, ~~future hedging programs, or pension risk transfer business~~, in the first year and at least every third calendar year thereafter, the company provides a certification by a qualified actuary that the group of contracts is not subject to material ~~aggregate risk levels across interest rate risk, mortality and/or longevity risk, or asset return volatility risk~~ (i.e., the risk on non-fixed-income investments having substantial volatility of returns, such as common stocks and real estate investments). ~~The company shall provide the certification and documentation supporting the certification to the commissioner upon request.~~

Guidance Note: The qualified actuary should develop documentation to support the actuarial certification that presents his or her analysis clearly and in detail sufficient for another actuary to understand the analysis and reasons for the actuary’s conclusion that the group of contracts is not subject to material interest rate risk, mortality and/or longevity risk, or asset return volatility risk. Examples of methods a qualified actuary could use to support the actuarial certification include, but are not limited to:

- a) ~~A demonstration that, using requirements under VM-A and VM-C for the group of contracts, reserves calculated using requirements under VM-A and VM-C are at least as great as the assets required to support the group of contracts and certificates using the company’s cash-flow testing model under each of the 4648 scenarios identified in this section Section 7.C.1 or alternatively each of the New York seven scenarios-economic scenarios, under each of the three mortality adjustment factors identified in Section 7.C.1.~~
- b) A demonstration that the group of contracts passed the SERT within 36 months prior to the valuation date and the company has not had a material change in its interest rate risk, mortality and/or longevity risk, or asset return volatility risk.
- c) A qualitative risk assessment of the group of contracts that concludes that the group of contracts does not have material interest rate risk, mortality and/or longevity risk, or asset return volatility. Such assessment would include an analysis of product guarantees, the company’s non-guaranteed elements (NGEs) policy, assets backing the group of contracts, the company’s longevity risk, and the company’s investment strategy.

C. Stochastic Exclusion Ratio Test

1. ~~In order to exclude a group of contracts from the stochastic reserve SR requirements under the stochastic exclusion ratio test (SERT), a company shall demonstrate that the ratio of (b-a)/a is less than the greater of [x]% where~~ and the percentage change that would trigger the company’s materiality standard, where:

- Commented [VM22410R409]: Consensus to us ... [111]
- Commented [X411]: The variability should be as ... [112]

- a. a = the adjusted scenario reserve described in Paragraph 7.C.2.a below using economic scenario 9- and 100% as the adjustment factor for mortality, the baseline economic scenario, as described in Appendix 1.E of VM-20.
- b. b = the largest adjusted scenario reserve described in Paragraph 7.C.2.b-a below under any of the other 1516 economic scenarios described in Appendix 1.E of VM-20 under both [95]%, 100%, and [105]% of anticipated experience mortality excluding margins. Because mortality variability may differ by company, if the magnitude of the company’s margin for mortality exceeds 5%, then the company shall use the baseline mortality and the mortality augmented by plus and minus the company’s margin for this exercise.

Guidance Note: Note that the numerator should be the largest adjusted scenario reserve for scenarios other than the baseline economic scenario, minus the adjusted scenario reserve for the baseline economic scenario and 100% as the adjustment factor for mortality. This is not necessarily the same as the biggest difference from the adjusted scenario reserve for the baseline economic scenario and 100% as the adjustment factor for mortality, or the absolute value of the biggest difference from the adjusted scenario reserve for the baseline economic scenario and 100% as the adjustment factor for mortality, both of which could lead to an incorrect test result. There are 47 (=16x3-1) combined economic and mortality scenarios that should be compared for the determination of b.

2. In calculating the ratio in subsection (Section 7.C.1) above:

- a. The company shall calculate an adjusted scenario reserve for the group of contracts for each of each of the 16 scenarios economic scenarios using the three levels of mortality adjustment factors that is equal to either (i) or (ii) below:
 - i. The scenario reserve defined in Section 4, but with the following differences:
 - a) Using anticipated experience assumptions with no margins, with the exception of mortality factors described in Paragraph Section 7.C.1.b of this section.
 - b) Using the interest rates and equity return assumptions specific to each scenario.
 - c) Using NAER and discount rates defined in Section 4 specific to each scenario to discount the cash flows.
 - d) Shall reflect future mortality improvement in line with anticipated experience assumptions.
 - e) Shall not reflect correlation between longevity and economic risks.
 - ii. The gross premium reserve developed from the cash flows from the company’s asset adequacy analysis models, using the experience assumptions of the company’s cash-flow analysis, but with the following differences:
 - a) Using the interest rates and equity return assumptions specific to each scenario.

- b) Using the mortality scalars described in ~~Paragraph~~ Section 7.C.1.b of this section.
 - c) Using the methodology to determine NAER and discount rates defined in Section 4 specific to each scenario to discount the cash flows, but using the company’s cash-flow testing assumptions for default costs and reinvestment earnings.
- b. The company shall use the most current ~~16~~ available baseline economic scenario and the 15 other economic scenarios published by the NAIC. The methodology for creating these scenarios can be found in Appendix 1 of VM-20.
 - c. The company shall use assumptions within each scenario that are dynamically adjusted as appropriate for consistency with each tested scenario.
 - d. The company may not group together contract types with significantly different risk profiles for purposes of calculating this ratio.
 - e. If the company has reinsurance arrangements that are pro rata coinsurance and do not materially impact the interest rate risk, longevity risk, or asset return volatility in the contract, then the company may elect to not conduct the stochastic exclusion ratio test ~~under only a pre-reinsurance ceded single basis upon determining the, either pre-reinsurance ceded basis upon determining the prior post-reinsurance reserve ceded aggregate reserve.~~
3. If the ratio calculated in this section is less than [x]% pre-non-proportional reinsurance, but is greater than [x]% post-non-proportional reinsurance, the group of contracts will still pass the SERT if the company can demonstrate that the sensitivity of the adjusted scenario reserve to economic scenarios is comparable pre- and post-non-proportional reinsurance.
- a. An example of an acceptable demonstration:
 - i. For convenience in notation • SERT = the ratio (b–a)/a defined in Section 7.C.1 above
 - a) The pre-non-proportional reinsurance results are “gross of non-proportional,” with a subscript “gn,” so denoted SERT_{gn}
 - b) The post-non-proportional results are “net of non-proportional,” with subscript “nn,” so denoted SERT_{nn}
 - ii. If a block of business being tested is subject to one or more non-proportional reinsurance cessions as well as other forms of reinsurance, such as pro rata coinsurance, take “gross of non-proportional” to mean net of all prorata reinsurance but ignoring the non-proportional contract(s), and “net of non-proportional” to mean net of *all* reinsurance contracts. That is, treat non-proportional reinsurance as the last reinsurance in, and compute certain values below with and without that last component.

Commented [X440]: Be consistent with standard VM references

Commented [VM22441R440]: Edits to address this comment will be reflected in next exposure

Commented [CD442]: better to reference the full Section

Commented [VM22443R442]: Edits to address this comment will be reflected in next exposure

Commented [X444]: No reason for change/inconsistency with other chapters - reject edit.

Commented [VM22445R444]: Edits to address this comment will be reflected in next exposure

Commented [X446]: Clarification is needed around reference to “significantly different risk profiles”.

Commented [VM22447R446]: Subgroup voted to use the “significantly different risk profiles” language for the exclusion test, consistent with VM-20.

Commented [CD448]: to be more specific, say “stochastic exclusion ratio test”

Commented [VM22449R448]: Edits to address this comment will be reflected in next exposure

Commented [X450]: Original did not make sense. Also, the point is that you just need one basis, either pre-reinsurance or post-reinsurance.

Commented [VM22451R450]: Edits to address this comment will be reflected in next exposure

Commented [X452]: We request clarification or definition of the term “non-proportional reinsurance”.

Commented [X453]: Does this make sense for VM-20 as well?

Commented [VM22454R453]: Subgroup to only focus on VM-22 for now

iii. So, if $SERT_{gn} \leq [x]_{t-1}^g$ but $SERT_{nn} > [x]_{t-1}^n$, then compute the largest percent increase in reserve (LPIR) = $(b-a)/a$, both “gross of non-proportional” and “net of non-proportional.”

$$LPIR_{gn} = (b_{gy} - a_{gy}) / b_{gn} - a_{gn} / a_{gn}$$

$$LPIR_{nn} = (b_{ny} - a_{ny}) / b_{nn} - a_{nn} / a_{nn}$$

Note that the scenario underlying b_{gn} could be different from the scenario underlying b_{nn} .

If $SERT_{gn} \times LPIR_{nn} / LPIR_{gn} < [x]_{t-1}^g$, then the block of contracts passes the SERT.

- b. Another more qualitative approach is to calculate the adjusted scenario reserves for the 1648 combined economic and mortality scenarios both gross and net of reinsurance to demonstrate that there is a similar pattern of sensitivity by scenario.
- 4. The SERT may not be used for a group of contracts if, using the current year’s data, (i) the stochastic exclusion demonstration test defined in Section 7.D had already been attempted using the method in this section of Section 7.D.2.a or Section 7.D.2.b and did not pass; or (ii) the qualified actuary had actively undertaken to perform the certification method in this section and concluded that such certification could not legitimately be made.

D. Stochastic Exclusion Demonstration Test

- 1. In order to exclude a group of contracts from the stochastic reserve SR requirements using the methodology in this section, the company must provide a demonstration in the PBR Actuarial Report in the first year and at least once every three calendar years thereafter that complies with the following:
 - a. The demonstration shall provide a reasonable assurance that if the stochastic reserve SR was calculated on a stand-alone basis for the group of contracts subject to the stochastic reserve SR exclusion, the resulting stochastic reserve for those groups of contracts would not be higher than the statutory reserve determined pursuant to the applicable requirements in VM-A and VM-C. The demonstration shall take into account whether changing conditions over the current and two subsequent calendar years would be likely to change the conclusion to exclude the group of contracts from the stochastic reserve SR requirements.
 - b. If, as of the end of any calendar year, the company determines the aggregate statutory reserve determined pursuant to the applicable requirements in VM-A and VM-C for the group of contracts no longer adequately provides for all material risks, the exclusion shall be discontinued, and the company fails the SERT for those contracts.
 - c. The demonstration may be based on analysis from a date that precedes the valuation date for the initial year to which it applies if the demonstration includes an

Commented [X455]: We believe subscript “gy” should be “gn”.

Commented [VM22456R455]: Edits to address this comment will be reflected in next exposure

Commented [X457]: % missing

Commented [VM22458R457]: Edits to address this comment will be reflected in next exposure

Commented [X459]: Note that LPIR is just the SERT using the VM-22 formulation (b-a)/a.

Commented [VM22460R459]: Edits to address this comment will be reflected in next exposure

Commented [X461]: The first and last terms on the left side of this equation cancel out, so it just ends up with needing to pass the SERT on the net basis again. This worked when (c) was the denominator, but now with (a) in the denominator this adjustment is meaningless. Take out the whole example, or revise the SERT to use benefits in the denominator again. Or some new formulation for SERT.

Commented [VM22462R461]: Updated denominator, addressing this issue

Commented [X463]: In VM-20, it is only prohibited for the clearly sufficiently robust attempts of the demonstration method where failing shows the SR would be greater. The other two options could have been incomplete demonstrations and not necessarily imply the SR would be dominant.

Commented [X464]: Clearer language

Commented [VM22465R464]: Edits to address this comment will be reflected in next exposure

Commented [X466]: Does this statement imply a floor reserve of VM-A and VM-C? VM-20 does require the NPR as the floor of the reserve but as written, VM-22 does not require a floor reserve. Recommend removing 1.a. Same statement with the 2.a statement demonstration. This requirement does not apply to the other permitted tests, which seemed counterintuitive.

Commented [CD467]: should this, instead, refer to the statutory reserve determined pursuant to the applicable requirements in VM-A and VM-C?

Commented [VM22468R467]: Edits to address this comment will be reflected in next exposure

Commented [X469]: Typo is also in VM-20

Commented [VM22470R469]: Will follow-up upon addressing VM-30 disclosure requirements

explanation of why the use of such a date will not produce a material change in the outcome, as compared to results based on an analysis as of the valuation date.

- d. The demonstration shall provide an effective evaluation of the residual risk exposure remaining after risk mitigation techniques, such as derivative programs and reinsurance.
2. The company may use one of the following or another method acceptable to the insurance commissioner to demonstrate compliance with ~~subsection~~Section 7.D.1 above:
- a. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the ~~stochastic reserve~~SR calculated on a stand-alone basis.
 - b. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the scenario reserve that results from each of a sufficient number of adverse deterministic scenarios.
 - c. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the ~~stochastic reserve~~SR calculated on a stand-alone basis, but using a representative sample of contracts in the ~~stochastic reserve~~SR calculations.
 - d. Demonstrate that any risk characteristics that would otherwise cause the ~~stochastic reserve~~SR calculated on a stand-alone basis to exceed the statutory reserve calculated in accordance with VM-A and VM-C, are not present or have been substantially eliminated through actions such as hedging, investment strategy, reinsurance or passing the risk on to the ~~contract~~policyholder by contract provision.

Commented [CD471]: should say "Section"

Commented [VM22472R471]: Edits to address this comment will be reflected in next exposure

E. Deterministic Certification Option

- 1. The company ~~has the option to may~~ determine the ~~stochastic reserve~~SR for a group of contracts using a single deterministic economic scenario, subject to the following conditions.
 - a. The company certifies that economic conditions do not materially influence anticipated contract holder behavior for the group of ~~policies, contracts and certificates~~. Examples of contract holder options that are materially influenced by economic conditions include surrender benefits, recurring premium payments, and guaranteed living benefits.
 - b. The company certifies that the group of ~~policies, contracts and certificates~~ is not supported by a reinvestment strategy that contains ~~future hedge purchases~~.
 - c. ~~The company must perform and disclose results from the stochastic exclusion ratio test following the requirements in Section 7.C, thereby disclosing and the scenario reserve volatility across various company must pass the SERT when considering only the 16 economic scenarios, paired with the 100% mortality scenario.~~

Commented [CD473]: "contract holder"

Commented [VM22474R473]: Edits to address this comment will be reflected in next exposure

Commented [X475]: Need SPA for DR as well as SR

Commented [CD476]: suggest saying "may" instead of "has the option to"

Commented [VM22477R476]: Edits to address this comment will be reflected in next exposure

Commented [CD478]: "contracts"

Commented [VM22479R478]: Edits to address this comment will be reflected in next exposure

Commented [X480]: Clarify if this was the intent to exclude contracts supported by index hedging.

Commented [X481]: This is needed to assure the SR is not needed. Otherwise this section is incomplete and does not support using a DR

Commented [VM22482R481]: Subgroup agrees with including the 100% mortality scenario.

- d. The company must disclose a description of contracts and associated features in the certification.

Drafting Note: Consider revisiting Paragraph E.1.c to possibly either require i) falling below a preset threshold for the exclusion ratio test under a single longevity/mortality scenario; or ii) to pass the exclusion test if longevity is not included as part of the ratio test.

Commented [X483]: Agree with drafting note. Ed

Commented [VM22484R483]: Subgroup agrees with including the 100% mortality scenario.

- 2. The stochastic reserve SR for the group of contracts under the Deterministic Certification Option is determined as follows:

- a. Cash flows are projected in compliance with the applicable requirements in Section 4, Section 5, Section 10, and Section 11 of VM-22 over a single economic scenario (scenario 12 found in Appendix 1 of VM-20).
- b. The stochastic reserve SR equals the scenario reserve following the requirements for Section 4.

Guidance Note: The Deterministic Certification Option is intended to provide a non-stochastic option for Single Premium Immediate Annuities (SPIAs) and similar payout annuity products that contain limited or no optionality in the asset and liability cash flow projections.

Commented [X485]: It may not be appropriate to use scenario 12 to calculate the scenario reserve for SPIA. See this article <https://www.soa.org/sections/financial-reporting/financial-reporting-newsletter/2021/july/fr-2021-07-su/>

“in an increasing interest rate environment for business where policyholder behavior is sensitive to prevailing interest rates, life insurers may face an increase in disintermediation risk (i.e., the risk of having to sell assets, potentially at a loss, to fund policyholder surrender benefits) For example, rising interest rates, particularly sudden jumps (e.g., New York 7 pop-up scenario with an immediate interest rate increase of 3 percent), may lead to higher actual and projected policyholder surrenders as policyholders seek out higher yielding investment opportunities. These increasing cash demands may require fixed income assets to be sold at depressed prices, and resultant projected losses (or lower gains) may result in reserve insufficiencies, necessitating the need for AAT reserves.”

Commented [X486]: Recommend deleting guidance note, as it doesn't provide full or clear scope of what may be excluded, so could be misread to either guarantee option for certain products or exclude the option for other products.

Section 8: To Be Determined (Scenario Generation for VM-21)

Section 9] Modeling Hedges under a ~~Future~~ Non-Index Credit Hedging Strategy

A. Initial Considerations

- 1] This section applies to modeling of hedges other than situations where the company (a) only hedges index credits. ~~If the company, or (b) clearly separates index credit hedging from other hedging, then only the section only pertains to the other hedging if the index hedging follows.~~ In those situations, the modeling of hedges supporting index credits can be simplified including applying an index credit hedge margin, following the requirements in Section 4.A.4.b.i.
- 2. The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the calculation of the ~~stochastic reserve~~SR, determined in accordance with Section 3.D and Section 4.D.
- 3. The company shall take into account the costs and benefits of hedge positions expected to be held by the company in the future along each scenario. Company management is responsible for developing, documenting, executing and evaluating the investment strategy for future hedge purchases. ~~Prior to reflection in projections, the strategy for future hedge purposes shall be the actual practice of the company for a period of time not less than [6] months.~~ including the hedging strategy, used to implement the investment policy
- 4. For this purpose, the investment assets refer to all the assets, including derivatives supporting covered products and guarantees. This also is referred to as the investment portfolio. The investment strategy is the set of all asset holdings at all points in time in all scenarios. The hedging portfolio, which also is referred to as the hedging assets, is a subset of the investment assets. The hedging strategy is the hedging asset holdings at all points in time in all scenarios. There is no attempt to distinguish what is the hedging portfolio and what is the investment portfolio in this section. Nor is the distinction between investment strategy and hedging strategy formally made here. Where necessary to give effect to the intent of this section, the requirements applicable to the hedging portfolio or the hedging strategy are to apply to the overall investment portfolio and investment strategy.
- 5. This particularly applies to restrictions on the reasonableness or acceptability of the models that make up the stochastic cash-flow model used to perform the projections, since these restrictions are inherently restrictions on the joint modeling of the hedging and non-hedging portfolio. To give effect to these requirements, they must apply to the overall investment strategy and investment portfolio.]

B. Modeling Approaches

- 1. The analysis of the impact of the hedging strategy on cash flows is typically performed using either one of two types of methods as described below. Although a hedging strategy normally would be expected to reduce risk provisions, the nature of the hedging strategy and the costs to implement the strategy may result in an increase in the amount of the ~~stochastic reserve~~SR otherwise calculated.
- 2. The fundamental characteristic of the first type of method, referred to as the “explicit method,” is that hedging positions and their resulting cash flows are included in the stochastic cash-flow model used to determine the scenario reserve, as discussed in Section 3.D, for each scenario.

Commented [X487]: Section 4.A.4 (Modeling of Hedges) has some relationship with this section, we request clarification around the applicability of these two areas of hedge guidance.

Commented [VM22488R487]: Edits to address this comment will be reflected in next exposure

Commented [CD489]: see previous comments about use of the word "future" to describe "hedging strategy"

Commented [X490]: We seek clarification of this text: if a company only hedges indices or separates index crediting from other hedges, does this apply, or does it only apply to any other hedging?

Commented [VM22491R490]: Edits to address this comment will be reflected in next exposure

Commented [X492]: The sentence "Prior to reflection in projections, the strategy for future hedge purposes shall be the actual practice of the company for a period of time not less than [6] months." seems to suggest you would do something other than the actual hedging strategy after [6] months. In this case, what are you assuming for modeling? We suggest clarification of this sentence.

Commented [VM22493R492]: Edits to address this comment will be reflected in next exposure

Commented [CD494]: is this a typo? should this be "purchases"?

Commented [VM22495R494]: Edits to address this comment will be reflected in next exposure

Commented [X496]: This 6 month exclusion creates unintended optionality for inclusion/exclusion based on whether a hedge strategy is considered "new". Instead, this should be addressed through the Error factor for new programs being temporarily larger.

Commented [VM22497R496]: Edits to address this comment will be reflected in next exposure

Commented [X498]: Reinstate the original sentence which puts the reflection of hedging into the greater context of reflecting the company's investment policy.

Commented [VM22499R498]: Edits to address this comment will be reflected in next exposure

Commented [X500]: Agree that the uncertainty associated with new strategies should be handled via the E factor, not through blanket exclusion.

Commented [VM22501R500]: Edits to address this comment will be reflected in next exposure

3. The fundamental characteristic of the second type of method, referred to as the “implicit method,” is that the effectiveness of the current hedging strategy on future cash flows is evaluated, in part or in whole, outside of the stochastic cash-flow model. There are multiple ways that this type of modeling can be implemented. In this case, the reduction to the ~~stochastic reserve~~SR otherwise calculated should be commensurate with the degree of effectiveness of the hedging strategy in reducing accumulated deficiencies otherwise calculated.
4. Regardless of the methodology used by the company, the ultimate effect of the current hedging strategy (including currently held hedge positions) on the ~~stochastic reserve~~SR needs to recognize all risks, associated costs, imperfections in the hedges and hedging mismatch tolerances associated with the hedging strategy. The risks include, but are not limited to: basis, gap, price, parameter estimation and variation in assumptions (mortality, persistency, withdrawal, annuitization, etc.). Costs include, but are not limited to: transaction, margin (opportunity costs associated with margin requirements) and administration. In addition, the reduction to the ~~stochastic reserve~~SR attributable to the hedging strategy may need to be limited due to the uncertainty associated with the company’s ability to implement the hedging strategy in a timely and effective manner. The level of operational uncertainty varies indirectly with the amount of time that the new or revised strategy has been in effect or ~~mode~~ tested.

Guidance Note: No hedging strategy is perfect. A given hedging strategy may eliminate or reduce some but not all risks, transform some risks into others, introduce new risks, or have other imperfections. For example, a delta-only hedging strategy does not adequately hedge the risks measured by the “Greeks” other than delta.

5. A safe harbor approach is permitted for those companies whose modeled hedge assets comprise only linear instruments not sensitive to implied volatility. For companies with option-based hedge strategies, electing this approach would require representing the option-based portion of the strategy as a delta-rho two-Greek hedge program. The normally modeled option portfolio would be replaced with a set of linear instruments that have the same first-order Greeks as the original option portfolio.

Commented [X502]: Is delta-only hedging common in VM-22 hedging? Could the example be replaced with something more relevant to VM-22 hedging?

C. Calculation of ~~Stochastic Reserve~~SR (Reported)

1. The company shall calculate CTE70 (best efforts)—the results obtained when the CTE70 is based on incorporating the modeling of hedges (including both currently held and future hedge positions) into the stochastic cash-flow model on a best efforts basis, including all of the factors and assumptions needed to model the hedges (e.g., stochastic implied volatility). The determination of CTE70 (best efforts) may utilize either explicit or implicit modeling techniques.
2. The company shall calculate a CTE70 (adjusted) by recalculating the CTE70 assuming the company has no ~~future hedging purchases~~strategy, except those to hedge interest credits and hedge assets held by the company on the valuation date, therefore following the requirements of Section 4.A.4.a and 4.A.4.b.i.
3. Because most models will include at least some approximations or idealistic assumptions, CTE70 (best efforts) may overstate the impact of the hedging strategy. To compensate for potential overstatement of the impact of the hedging strategy, the value for the ~~stochastic reserve~~SR is given by:

Commented [X503]: The Hedging DG is currently working on language and we will want to be consistent across VM-20, VM-21, and VM-22.

Commented [CD504]: perhaps better to say “no future hedge purchases...”

Commented [VM22505R504]: Edits to address this comment will be reflected in next exposure

$$\text{Stochastic reserve SR} = \text{CTE70 (best efforts)} + E \times \max[0, \text{CTE70 (adjusted)} - \text{CTE70 (best efforts)}]$$

4. The company shall specify a value for E (the “error factor”) in the range from 5% to 100% to reflect the company’s view of the potential error resulting from the level of sophistication of the stochastic cash-flow model and its ability to properly reflect the parameters of the hedging strategy (i.e., the Greeks being covered by the strategy), as well as the associated costs, risks and benefits. The greater the ability of the stochastic model to capture all risks and uncertainties, the lower the value of E . The value of E may be as low as 5% only if the model used to determine the CTE70 (best efforts) effectively reflects all of the parameters used in the hedging strategy. If certain economic risks are not hedged, yet the model does not generate scenarios that sufficiently capture those risks, E must be in the higher end of the range, reflecting the greater likelihood of error. Likewise, simplistic hedge cash-flow models shall assume a higher likelihood of error.
5. The company shall conduct a formal back-test, based on an analysis of ~~at least the most recent~~ available relevant period of data (but no less than 12 months), to assess how well the model is able to replicate the hedging strategy in a way that supports the determination of the value used for E .
6. Such a back-test shall involve one of the following analyses:
 - a. For companies that model hedge cash flows directly (“explicit method”), replace the stochastic scenarios used in calculating the CTE70 (best efforts) with a single scenario that represents the market path that actually manifested over the selected back-testing period and compare the projected hedge asset gains and losses against the actual hedge asset gains and losses – both realized and unrealized – observed over the same time period. For this calculation, the model assumptions may be replaced with parameters that reflect actual experience during the back-testing period. In order to isolate the comparison between the modeled hedge results and actual hedge results for this calculation, the projected liabilities should accurately reflect the actual liabilities throughout the back-testing period; therefore, adjustments that facilitate this accuracy (e.g. reflecting actual experience instead of model assumptions, including new business, etc.) are permissible.

To support the choice of a low value of E , the company should ascertain that the projected hedge asset gains and losses are within close range of 100% (e.g., 80–125%) of the actual hedge asset gains and losses. The company may also support the choice of a low value of E by achieving a high R-squared (e.g., 0.80 or higher) when using a regression analysis technique.
 - b. For companies that model hedge cash flows implicitly by quantifying the cost and benefit of hedging using the fair value of the hedged item (an “implicit method” or “cost of reinsurance method”), calculate the delta, rho and vega coverage ratios in each month over the selected back-testing period in the following manner:
 - i. Determine the hedge asset gains and losses—both realized and unrealized—incurred over the month attributable to equity, interest rate, and implied volatility movements.
 - ii. Determine the change in the fair value of the hedged item over the month attributable to equity, interest rate, and implied volatility movements. The hedged item should be defined in a manner that reflects the proportion of risks hedged (e.g., if a company elects to hedge 50% of a contract’s market risks, it should quantify the fair value of the hedged item as 50% of the fair value of the contract).

Commented [X506]: We have been getting weak E factor support, with minimum backtesting due to the current phrasing.

Commented [X507R506]: Recommend adding stress testing language similar to Section 4.A.4.b.i.c) but with edits based on TDI’s comments/suggestions to Section 4.A.4.b.i.c).

Commented [VM22508R506]: Edits to address this comment will be reflected in next exposure

Commented [X509]: Recommend adding reporting requirement to VM-31 to disclose if company has switched between explicit method and implicit method, discuss rationale of the change and the change impact.

Commented [VM22510R509]: Edits to address this comment will be reflected in next exposure

- iii. Calculate the delta coverage ratio as the ratio between (i) and (ii) attributable to equity movements.
 - iv. Calculate the rho coverage ratio as the ratio between (i) and (ii) attributable to interest rate movements.
 - v. Calculate the vega coverage ratio as the ratio between (i) and (ii) attributable to implied volatility movements.
 - vi. To support the company's choice of a low value of E, the company should be able to demonstrate that the delta and rho coverage ratios are both within close range of 100 % (e.g., 80–125%) consistently across the back-testing period.
 - vii. In addition, the company should be able to demonstrate that the vega coverage ratio is within close range of 100 % in order to use the prevailing implied volatility levels as of the valuation date in quantifying the fair value of the hedged item for the purpose of calculating CTE70 (best efforts). Otherwise, the company shall quantify the fair value of the hedged item for the purpose of calculating CTE70 (best efforts) in a manner consistent with the realized volatility of the scenarios captured in the CTE (best efforts).
- c. Companies that do not model hedge cash flows explicitly, but that also do not use the implicit method as outlined in Section 9.C.6.b above, shall conduct the formal back-test in a manner that allows the company to clearly illustrate the appropriateness of the selected method for reflecting the cost and benefit of hedging, as well as the value used for E.
7. A company that does not have 12 months of experience to date shall set E to a value that reflects the amount of experience available, and the degree and nature of any change to the hedge program. For a material change in strategy, with ~~no less than 6 months of history~~, E should be ~~at least 1.0-50~~. However, E may be lower than ~~1.0-50~~ if ~~some~~ at least 6 months of reliable experience is available and/or if the change in strategy is a minor refinement rather than a substantial material change in strategy.

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily large (e.g., $\geq 50\%$) for substantial changes in hedge methodology (e.g., moving from a fair-value based strategy to a stop-loss strategy) where the company has not been able to provide a meaningful simulation of hedge performance based on the new strategy.
- A temporary moderate increase (e.g., 15–30%) in error factor should be used for substantial modifications to hedge programs or modeling where meaningful simulation has not been created (e.g., adding second-order hedging, such as gamma or rate convexity).
- No increase in the error factor may be used for incremental modifications to the hedge strategy (e.g., adding death benefits to a program that previously covered only living benefits, or moving from swaps to Treasury Department futures).

Commented [X511]: 6 month restriction should be handled in the error factor. Other language for clarity. Edited guidance note below to be consistent with this.

Commented [VM22512R511]: Edits to create consistency with recently adopted APF 2020-12 will be considered for the next exposure

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily large (e.g., $\geq 50\%$) for substantial changes in hedge methodology (e.g., moving from a fair value based strategy to a stop-loss strategy) where the company has not been able to provide a meaningful simulation of hedge performance based on the new strategy.
- A temporary moderate increase (e.g., 15–30%) in error factor should be used for substantial modifications to hedge programs or modeling where meaningful simulation has not been created (e.g., adding second-order hedging, such as gamma or rate convexity).
- No increase in the error factor may be used for incremental modifications to the hedge strategy (e.g., adding death benefits to a program that previously covered only living benefits, or moving from swaps to Treasury Department futures).

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily 100% for material changes in hedge methodology (e.g., moving from a fair-value based strategy to a stop-loss strategy).
- An increase in the error factor may not always be needed for minor refinements to the hedge strategy (e.g., moving from swaps to Treasury futures).

8. The company shall set the value of E reflecting the extent to which the future hedging program is clearly defined. To support a value of E below 1.0, there should be very robust documentation outlining the future hedging program. To the extent that documentation outlining the future hedging program is incomplete, the value of E shall be increased. Any increases required to the value of E to reflect that documentation is not available to support that the future hedging program is clearly defined shall be in addition to increases to the value of E to reflect a lack of historical experience or to reflect the back-testing results.

E. Additional Considerations for CTE70 (best efforts)

If the company is following a CDHS, the fair value of the portfolio of contracts falling within the scope of these requirements shall be computed and compared to the CTE70 (best efforts) and CTE70 (adjusted). If the CTE70 (best efforts) is below both the fair value and CTE70 (adjusted), the company should be prepared to explain why that result is reasonable.

For the purposes of this analysis, the SR and fair value calculations shall be done without requiring the scenario reserve for any given scenario to be equal to or in excess of the cash surrender value in aggregate for the group of contracts modeled in the projection.

D. Specific Considerations and Requirements

1. As part of the process of choosing a methodology and assumptions for estimating the future effectiveness of the current hedging strategy (including currently held hedge positions) for purposes of reducing the stochastic reserve SR, the company should review actual historical hedging effectiveness. The company shall evaluate the appropriateness of the assumptions

Commented [X513]: Work is being done by the hedging DG. This is a placeholder. Need to reflect how clearly defined and well documented the hedge program is, to be able to rely on the backtesting provided. To the extent that hedge programs are not clearly defined, E should be increased to reflect that the backtesting cannot be relied on as an indicator of future effectiveness.

Commented [X514]: [Redacted] create this disclosure from within a rough responsibility check for regulatory review/information on the modeled hedge and add an [Redacted] prompt further discussion.

Commented [VM22515R514]: Subgroup voted in favor of retaining the fair value disclosure wording here, which is only subject to non-index credit hedges at this point

Commented [CD516]: [Redacted] get sure why this section is being deleted. Perhaps references to CDHS could be deleted, but otherwise this section still seems applicable.

Commented [VM22517R516]: Subgroup voted in favor of retaining the fair value disclosure wording here, which is only subject to non-index credit hedges at this point

on future trading, transaction costs, other elements of the model, the strategy, the mix of business and other items that are likely to result in materially adverse results. This includes an analysis of model assumptions that, when combined with the reliance on the hedging strategy, are likely to result in adverse results relative to those modeled. The parameters and assumptions shall be adjusted (based on testing contingent on the strategy used and other assumptions) to levels that fully reflect the risk based on historical ranges and foreseeable future ranges of the assumptions and parameters. If this is not possible by parameter adjustment, the model shall be modified to reflect them at either anticipated experience or adverse estimates of the parameters.

2. A discontinuous hedging strategy is a hedging strategy where the relationships between the sensitivities to equity markets and interest rates (commonly referred to as the Greeks) associated with the guaranteed contract holder options embedded in the variable fixed indexed annuities and other in-scope products and these same sensitivities associated with the hedging assets are subject to material discontinuities. This includes, but is not limited to, a hedging strategy where material hedging assets will be obtained when the fixed indexed annuity and other in-scope products account balances reach a predetermined level in relationship to the guarantees. Any hedging strategy, including a delta hedging strategy, can be a discontinuous hedging strategy if implementation of the strategy permits material discontinuities between the sensitivities to equity markets and interest rates associated with the guaranteed contract holder options embedded in the variable fixed indexed annuities and other in-scope products and these same sensitivities associated with the hedging assets. There may be scenarios that are particularly costly to discontinuous hedging strategies, especially where those result in large discontinuous changes in sensitivities (Greeks) associated with the hedging assets. Where discontinuous hedging strategies contribute materially to a reduction in the stochastic reserveSR, the company must evaluate the interaction of future trigger definitions and the discontinuous hedging strategy, in addition to the items mentioned in the previous paragraph. This includes an analysis of model assumptions that, when combined with the reliance on the discontinuous hedging strategy, may result in adverse results relative to those modeled.
3. A strategy that has a strong dependence on acquiring hedging assets at specific times that depend on specific values of an index or other market indicators may not be implemented as precisely as planned.
4. The combination of elements of the stochastic cash-flow model—including the initial actual market asset prices, prices for trading at future dates, transaction costs and other assumptions—should be analyzed by the company as to whether the stochastic cash-flow model permits hedging strategies that make money in some scenarios without losing a reasonable amount in some other scenarios. This includes, but is not limited to:
 - a. Hedging strategies with no initial investment that never lose money in any scenario and in some scenarios make money.
 - b. Hedging strategies that, with a given amount of initial money, never make less than accumulation at the one-period risk-free rates in any scenario but make more than this in one or more scenarios.
5. If the stochastic cash-flow model allows for such situations, the company should be satisfied that the results do not materially rely directly or indirectly on the use of such strategies. If the results do materially rely directly or indirectly on the use of such strategies, the strategies may not be used to reduce the stochastic reserveSR otherwise calculated.

Commented [X518]: Suggest replacing "indexed" with "fixed" since this would apply to all fixed annuities.

Commented [VM22519R518]: Edits to address this comment will be reflected in next exposure

Commented [X520]: Editorial change of "variable fixed indexed annuity" to be "fixed indexed annuity and other in-scope products".

Commented [VM22521R520]: Edits to address this comment will be reflected in next exposure

Commented [X522]: Recommend deleting "including a delta hedging strategy" as it is already covered by "any hedging strategy" and it is not clear if delta hedging strategy is the most common strategy in VM-22 hedging to be used as a general example.

Commented [VM22523R522]: Edits to address this comment will be reflected in next exposure

6. In addition to the above, the method used to determine prices of financial instruments for trading in scenarios should be compared to actual initial market prices. In addition to comparisons to initial market prices, there should be testing of the pricing models that are used to determine subsequent prices when scenarios involve trading financial instruments. This testing should consider historical relationships. For example, if a method is used where recent volatility in the scenario is one of the determinants of prices for trading in that scenario, then that model should approximate actual historic prices in similar circumstances in history.

Section 10: Guidance and Requirements for Setting Contract Holder Behavior Prudent Estimate Assumptions

A. General

Contract holder behavior assumptions encompass actions such as lapses, withdrawals, transfers, recurring deposits, benefit utilization, option election, etc. Contract holder behavior is difficult to predict accurately, and variance in behavior assumptions can significantly affect the ~~results~~ reserves level. In the absence of relevant and fully credible empirical data, the company should set behavior assumptions as guided by Principle 3 in Section 1.B and Section 12.

In setting behavior assumptions, the company should examine, but not be limited by, the following considerations:

1. Behavior can vary by product, market, distribution channel, index performance, interest credited (current and guaranteed rates), time/product duration, etc.
2. Options embedded in the product may affect behavior.
3. Utilization of options may be elective or non-elective in nature. Living benefits often are elective, and death benefit options are generally non-elective.
4. Elective contract holder options may be more driven by economic conditions than non-elective options.
5. As the value of a product option increases, there is an increased likelihood that contract holders will behave in a manner that maximizes their financial interest (e.g., lower lapses, higher benefit utilization, etc.).
6. Behavior formulas may have both rational and irrational components (irrational behavior is defined as situations where some contract holders may not always act in their best financial interest). The rational component should be dynamic, but the concept of rationality need not be interpreted in strict financial terms and might change over time in response to observed trends in contract holder behavior based on increased or decreased financial efficiency in exercising their contractual options.
7. Options that are ancillary to the primary product features may or may not be significant drivers of behavior. Whether an option is ancillary to the primary product features depends on many things, such as:
 - a. For what purpose was the product purchased?
 - b. Is the option elective or non-elective?
 - c. Is the value of the option well-known?
8. External influences may affect behavior.

Commented [X524]: Editorial clarification

Commented [VM22525R524]: Edits to address this comment will be reflected in next exposure

Commented [X526]: Need general assumption setting section, see APF 2021-11.

Commented [VM22527R526]: Edits to address this comment will be reflected in next exposure

Commented [X528]: We would suggest rewording this section to be considerations rather than posed as questions.

Commented [X529]: Editorial clarification

Commented [VM22530R529]: Edits to address this comment will be reflected in next exposure

Commented [X531]: Recommend adding some examples here if this is included.

Commented [VM22532R531]: Edits to address this comment will be reflected in next exposure

B. Aggregate vs. Individual Margins

1. Prudent estimate assumptions are developed by applying a margin for uncertainty to the anticipated experience assumption. The issue of whether the level of the margin applied to the anticipated experience assumption is determined in aggregate or independently for each and every behavior assumption is discussed in Principle 3 in Section 1.B.

2. Although this principle discusses the concept of determining the level of margins in aggregate, it notes that the application of this concept shall be guided by evolving practice and expanding knowledge. From a practical standpoint, it may not always be possible to completely apply this concept to determine the level of margins in aggregate for all behavior assumptions.
3. Therefore, the company shall determine prudent estimate assumptions independently for each behavior (e.g., mortality, lapses and benefit utilization), using the requirements and guidance in this section and throughout these requirements, unless the company can demonstrate that an appropriate method was used to determine the level of margin in aggregate for two or more material behavior assumptions, if relevant to the risks in the product, and thus the approach will not understate the reserve.

C. Sensitivity Testing

The impact of behavior can vary by product, time period, etc. For any assumption that is not prescribed or stochastically modeled, ~~the company qualified actuary to whom responsibility for this group of contracts is assigned~~ shall use sensitivity testing to ensure that the assumption is set at the conservative end of the plausible range. The company shall sensitivity test:

- Surrenders.
- Partial withdrawals.
- Benefit utilization.
- Account transfers.
- Future deposits.
- Other behavior assumptions if relevant to the risks in the product.

Sensitivity testing of assumptions is required and shall be more complex than, for example, base lapse assumption plus or minus X% across all contracts. A more appropriate sensitivity test in this example might be to devise parameters in a dynamic lapse formula to reflect more out-of-the-money contracts lapsing and/or more holders of in-the-money contracts persisting and eventually using the guarantee. The company should apply more caution in setting assumptions for behaviors where testing suggests that stochastic modeling results are sensitive to small changes in such assumptions. For such sensitive behaviors, the company shall use higher margins when the underlying experience is less than fully relevant and credible.

The company shall examine the results of sensitivity testing to understand the materiality of prudent estimate assumptions on the modeled reserve. The company shall update the sensitivity tests periodically as appropriate, considering the materiality of the results of the tests. The company may update the tests less frequently (but no less than every 3 years) when the tests show less sensitivity of the modeled reserve to changes in the assumptions being tested or the experience is not changing rapidly. Providing there is no material impact on the results of the sensitivity testing, the company may perform sensitivity testing:

1. Using samples of the contracts in force rather than performing the entire valuation for each alternative assumption set.

Commented [X533]: Clarification

Commented [VM22534R533]: Edits to address this comment will be reflected in next exposure

Commented [X535]: Suggest updating bullet to "Other material behavior assumptions if relevant to the risks in the product."

Commented [VM22536R535]: Edits to address this comment will be reflected in next exposure

Commented [X537]: Sensitivity testing is covered by the submitted APF 2021-11 for VM-21, and we should be consistent. VM-21 is currently lacking on sensitivity testing.

Commented [VM22538R537]: Make edits to be consistent with VM-21 APFs prior to adoption of VM-22

Commented [VM22539R537]: Edits to address this comment will be reflected in next exposure

Commented [CD540]: why assign this specifically to the QA rather than leaving it as the responsibility of "the company", like we do elsewhere in the requirements?

Commented [VM22541R540]: Edits to address this comment will be reflected in next exposure

Commented [X542]: include for completion

Commented [VM22543R542]: Edits to address this comment will be reflected in next exposure

Commented [X544]: Consistent with APF 2021-11.

Commented [VM22545R544]: Edits to address this comment will be reflected in next exposure

- 2. Using data from prior periods.

D. Specific Considerations and Requirements

- 1. Within materiality considerations, the company should consider all relevant forms of contract holder behavior and persistency, including, but not limited to, the following:
 - a. Mortality (additional guidance and requirements regarding mortality is contained in Section 11).
 - b. Surrenders.
 - c. Partial withdrawals (systematic and elective).
 - d. Account transfers (switching/exchanges).
 - e. Resets/ratchets of the guaranteed amounts (automatic and elective).
 - f. Future deposits.
 - g. Income start date for the benefit utilization.
 - h. Commutation of benefit (from periodic payment to lump sum) or vice versa.
- 2. It may be acceptable to ignore certain items that might otherwise be explicitly modeled in an ideal world, particularly if the inclusion of such items reduces the calculated provisions.

For example:

- a. The impact of account transfers (intra-contract index “switching”) might be ignored, unless required under the terms of the contract (e.g., automatic ~~asset~~ re-allocation/rebalancing,) or if the contract provisions incentivize the contract holders to transfer between accounts.
- b. Future deposits might be excluded from the model, unless required by the terms of the contracts under consideration and then only in such cases where future premiums can reasonably be anticipated (e.g., with respect to timing and amount).
- c. For some non-elective benefits (nursing home benefits for example), a zero incidence rate after the surrender charge has ended, or the cash value has depleted, may be acceptable since use of a non-zero rate could reduce the modeled reserve.

~~Guidance Note: For some non elective benefits (nursing home benefits for example), unless relevant company experience exists to the contrary, the use of incidence rates greater than zero after the surrender charge has ended, or the cash value was depleted might be inappropriate may not be prudent since it would reduce the modeled reserve.~~

- 3. However, the company should exercise caution in assuming that current behavior will be indefinitely maintained. For example, it might be appropriate to test the impact of a shifting asset mix and/or consider future deposits to the extent they can reasonably be anticipated and increase the calculated amounts.

Commented [X546]: Clarification

Commented [VM22547R546]: Edits to address this comment will be reflected in next exposure

Commented [X548]: Clarification

Commented [VM22549R548]: Edits to address this comment will be reflected in next exposure

Commented [CD550]: delete this word

Commented [VM22551R550]: Edits to address this comment will be reflected in next exposure

Commented [X552]: Reviewing, this guidance note does not exist in the 2019, 2020, 2021, or 2022 versions of VM-21. Where is this from? Should this be added to VM-21?

4. Normally, the underlying model assumptions would differ according to the attributes of the contract being valued. This would typically mean that contract holder behavior and persistency may be expected to vary according to such characteristics as (this is not an exhaustive list):
 - a. Gender.
 - b. Attained age.
 - c. Issue age.
 - d. Contract duration.
 - e. Time to maturity.
 - f. Tax status.
 - g. Account value.
 - h. Interest credited (current and guaranteed).
 - i. Available indices.
 - j. Guaranteed benefit amounts.
 - k. Surrender charges, transaction fees or other contract charges.
 - l. Distribution channel.
5. Unless there is clear evidence to the contrary, behavior assumptions should be no less conservative than past experience. Margins for contract holder behavior assumptions shall assume, without relevant and credible experience or clear evidence to the contrary, that contract holders' efficiency will increase over time.
6. In determining contract holder behavior assumptions, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience), whether or not the segment is directly written by the company. If data from a similar business segment are used, the assumption shall be adjusted to reflect differences between the two segments. Margins shall reflect the data uncertainty associated with using data from a similar but not identical business segment.
7. Where relevant and fully credible empirical data do not exist for a given contract holder behavior assumption, the company shall set the contract holder behavior assumption to reflect the increased uncertainty such that the contract holder behavior assumption is shifted towards the conservative end of the plausible range of expected experience that serves to increase the stochastic reserve. SR. If there are no relevant data, the company shall set the contract holder behavior assumption to reflect the increased uncertainty such that the contract holder behavior assumption is at the conservative end of the range. Such adjustments shall be consistent with the definition of prudent estimate, with the principles described in Section 1.B, and with the guidance and requirements in this section.
8. Ideally, contract holder behavior would be modeled dynamically according to the simulated economic environment and/or other conditions. It is important to note, however, that contract holder behavior should neither assume that all contract holders act with 100%

Commented [X553]: This also applies to VM-21, as there are fixed accounts. Is there any reason not to be consistent?

Commented [VM22554R553]: Only to focus on VM-22 for now

Commented [X555]: This is not a synonym (perhaps transfer fees is a subset of transaction fees) - why would transaction fees apply for VM-21, but only transfer fees for VM-22?

Commented [VM22556R555]: Edits to address this comment will be reflected in next exposure

Commented [X557]: This section states that "contract holder behavior should neither assume that all contract holders act with 100% efficiency in a financially rational manner nor assume that contract holders will always act irrationally." This text seems to directly contradict Section II. Reserve Requirements 6.H.2 which states "When advantageous, policyholders will commence living benefit payouts if not started yet.". We suggest revising 6.H.2 to align with the text of 10.D.8.

efficiency in a financially rational manner nor assume that contract holders will always act irrationally. These extreme assumptions may be used for modeling efficiency if the result is more conservative.

E. Dynamic Assumptions

1. Consistent with the concept of prudent estimate assumptions described earlier, the liability model should incorporate margins for uncertainty for all risk factors that are not ~~dynamic (i.e., the non-scenario tested assumptions) and are assumed not to vary according to the financial interest of the contract holder~~ stochastically modeled.
2. ~~The company should exercise care in using static assumptions when it would be more natural and reasonable~~ appropriate to use a dynamic model or other scenario-dependent formulation for behavior. ~~With due regard to considerations of materiality and practicality~~ allowance for appropriate simplifications, approximations and modeling efficiency techniques, the use of dynamic models is encouraged, but not mandatory. ~~Static assumptions~~ Risk factors that are not scenario tested but could reasonably be expected to vary according to a stochastic process, or future states of the world (especially in response to economic drivers), may require higher margins and/or signal a need for higher margins for certain other assumptions.
3. Risk factors that are modeled dynamically should encompass the plausible range of behavior consistent with the economic scenarios and other variables in the model, including the non-scenario tested assumptions. The company shall test the sensitivity of results to understand the materiality of making alternate assumptions and follow the guidance discussed above on setting assumptions for sensitive behaviors.

Commented [X558]: Recommend replacing “dynamic” with “stochastic.” Risk factors with dynamic assumptions still need margins (although for an assumption that was part fixed and part dynamic, only one piece may have the margin but still the risk factor would have a margin).

Commented [VM22559R558]: Edits to address this comment will be reflected in next exposure

Commented [X560]: Suggest replacing “Risk factors that are not scenario tested but” with “Static assumptions that” to improve clarity in the wording.

Commented [VM22561R560]: Edits to address this comment will be reflected in next exposure

Commented [X562]: Get rid of some of the vague adjectives and be consistent with VM framework for simplifications.

Commented [VM22563R562]: Edits to address this comment will be reflected in next exposure

F. Consistency with the CTE Level

1. All behaviors (i.e., dynamic, formulaic and non-scenario tested) should be consistent with the scenarios used in the CTE calculations (generally, the top 30% of the loss distribution). To maintain such consistency, it is not necessary to iterate (i.e., successive runs of the model) in order to determine exactly which scenario results are included in the CTE measure. Rather, in light of the products being valued, the company should be mindful of the general characteristics of those scenarios likely to represent the tail of the loss distribution and consequently use prudent estimate assumptions for behavior that are reasonable and appropriate in such scenarios. For ~~non-variable~~ fixed annuities, these “valuation” scenarios would typically display one or more of the following attributes:
 - a. ~~Declining-, increasing~~ and/or volatile index values, where applicable.
 - b. Price gaps and/or liquidity constraints.
 - c. ~~Rapidly changing~~ Volatile interest rates ~~or~~ persistently low interest rates.
 - d. ~~Volatile credit spreads.~~
2. The behavior assumptions should be logical and consistent both individually and in aggregate, especially in the scenarios that govern the results. In other words, the company should not set behavior assumptions in isolation, but give due consideration to other elements of the model. The interdependence of assumptions (particularly those governing customer behaviors) makes this task difficult and by definition requires professional judgment, but it is important that the model risk factors and assumptions:

Commented [CD564]: “non-variable”?

Commented [VM22565R564]: Edits to address this comment will be reflected in next exposure

Commented [X566]: Editorial clarification to cover scenarios for all products/guarantees in scope

Commented [VM22567R566]: Edits to address this comment will be reflected in next exposure

Commented [X568]: Editorial for consistency with (a) above

Commented [VM22569R568]: Edits to address this comment will be reflected in next exposure

Commented [X570]: Suggesting deleting as we are not aware of dynamic credit spreads typically being modeled.

Commented [VM22571R570]: Edits to address this comment will be reflected in next exposure

- a. Remain logically and internally consistent across the scenarios tested.
 - b. Represent plausible outcomes.
 - c. Lead to appropriate, but not excessive, asset requirements.
4. The company should remember that the continuum of “plausibility” should not be confined or constrained to the outcomes and events exhibited by historic experience.
 5. Companies should attempt to track experience for all assumptions that materially affect their risk profiles by collecting and maintaining the data required to conduct credible and meaningful studies of contract holder behavior.

G. Additional Considerations and Requirements for Assumptions Applicable to Guaranteed Living Benefits

Experience for contracts without guaranteed living benefits may be of limited use in setting a lapse assumption for contracts with in-the-money or at-the-money guaranteed living benefits. Such experience may only be used if it is appropriate (e.g., lapse experience on contracts without a living benefit may have relevance to the early durations of contracts with living benefits) and relevant to the business.

H. Policy Loans

If policy loans are applicable for the block of business, the company shall determine cash flows for each projection interval for policy loan assets by modeling existing loan balances either explicitly or by substituting assets that are a proxy for policy loans (e.g., bonds, cash, etc.) subject to the following:

1. If the company substitutes assets that are a proxy for policy loans, the company must demonstrate that such substitution:
 - a. Produces reserves that are no less than those that would be produced by modeling existing loan balances explicitly.
 - b. Complies with the contract holder behavior requirements stated in Section 10.A to Section 10.G above in this section.
2. If the company models policy loans explicitly, the company shall:
 - a. Treat policy loan activity as an aspect of contract holder behavior and subject to the requirements above in this section.
 - b. Assign loan balances either to exactly match each policy's contract's utilization or to reflect average utilization over a model segment or sub-segments if the results are materially similar.
 - c. Model policy loan interest in a manner consistent with policy contract provisions and with the scenario. Include interest paid in cash as a positive policy loan cash flow in that projection interval, but do not include interest added to the loan balance as a policy loan cash flow. (The increased balance will require increased repayment cash flows in future projection intervals.)

- Commented [CD572]: Okay to keep the term "Policy Loans"
- Commented [VM22573R572]: Edits to address this comment will be reflected in next exposure
- Commented [X574]: Clarify reference to be more specific
- Commented [VM22575R574]: Edits to address this comment will be reflected in next exposure
- Commented [X576]: Editorial - VM-22 should consistently use contracts
- Commented [VM22577R576]: Edits to address this comment will be reflected in next exposure
- Commented [CD578]: "contract's"
- Commented [VM22579R578]: Edits to address this comment will be reflected in next exposure
- Commented [X580]: We have concern that reflecting average utilization may have material impact on benefit projections. Recommend adding "if the results are materially similar". This change is also applied to VM-20 and added to VM-21.
- Commented [VM22581R580]: Edits to address this comment will be reflected in next exposure
- Commented [X582]: Editorial - VM-22 should consistently use contracts
- Commented [VM22583R582]: Edits to address this comment will be reflected in next exposure
- Commented [CD584]: "contract"
- Commented [VM22585R584]: Edits to address this comment will be reflected in next exposure

- d. Model policy loan principal repayments, including those that occur automatically upon death or surrender. Include policy loan principal repayments as a positive policy loan cash flow, per Section 4.A.1.h.
- e. Model ~~additional~~ policy loan principal. Include additional policy loan principal as a negative policy loan cash flow, per Section 4.A.1.h (but do not include interest added to the loan balance as a negative policy loan cash flow).
- f. Model any investment expenses allocated to policy loans and include them either with negative policy loan cash flows or insurance expense cash flows.

I. Non-Guaranteed Elements

Consistent with the definition in VM-01, Non-Guaranteed Elements (NGEs) are elements within a contract that affect ~~policy contract~~ costs or values and are not guaranteed or not determined at issue. NGEs consist of elements affecting contract holder costs or values that are both established and subject to change at the discretion of the insurer.

Examples of NGEs specific to ~~non-variable~~ fixed annuities include but are not limited to the following: ~~fixed~~ the credited rates on fixed accounts, index parameters (caps, spreads, participation rates, etc.), rider fees, rider benefit features being subject to change (rollup rates, rollup period, etc.), account value charges, and dividends under participating policies or contracts.

- 1. Except as noted below in Section ~~10.H.5~~ 10.H.5, the company shall include NGE in the models to project future cash flows beyond the time the company has authorized their payment or crediting.
- 2. The projected NGE shall reflect factors that include, but are not limited to, the following (not all of these factors will necessarily be present in all situations):
 - a. The nature of contractual guarantees.
 - b. The company’s past NGE practices and established NGE policies.
 - c. The timing of any change in NGE relative to the date of recognition of a change in experience.
 - d. The benefits and risks to the company of continuing to authorize NGE.
- 3. Projected NGE shall be established based on projected experience consistent with how actual NGE are determined.
- 4. Projected levels of NGE in the cash-flow model must be consistent with the experience assumptions used in each scenario. Contract holder behavior assumptions in the model must be consistent with the NGE assumed in the model.
- 5. The company may exclude any portion of an NGE that:
 - a. Is not based on some aspect of the ~~policy’s or~~ contract’s experience.
 - b. Is authorized by the board of directors and documented in the board minutes, where the documentation includes the amount of the NGE that arises from other sources.

However, if the board has guaranteed a portion of the NGE into the future, the company must model that amount. In other words, the company cannot exclude

Commented [CD586]: The wording of "additional" is unclear. Does this mean maintaining a certain level of policy loan utilization throughout the projection (i.e., adding principal as repayments are made), or actually increasing policy loan utilization (i.e., adding more principal) over time? The former would seem more appropriate than the latter.

Commented [VM22587R586]: Edits to address this comment will be reflected in next exposure

Commented [X588]: Clarification

Commented [VM22589R588]: Edits to address this comment will be reflected in next exposure

Commented [CD590]: suggest: "contract holder"

Commented [VM22591R590]: Edits to address this comment will be reflected in next exposure

Commented [X592]: Editorial - VM-22 should consistently use contracts

Commented [VM22593R592]: Edits to address this comment will be reflected in next exposure

Commented [CD602]: delete "policy's or"

Commented [VM22603R602]: Edits to address this comment will be reflected in next exposure

Commented [X604]: Why does being authorized mean it can be excluded? This seems backwards. Does this mean it has already transpired?

from its model any NGE that the board has guaranteed for future years, even if it could have otherwise excluded them, based on this subsection.

- 6. The liability for contract holder dividends declared but not yet paid that has been established according to statutory accounting principles as of the valuation date is reported separately from the statutory reserve. The contract holder dividends that give rise to this dividend liability as of the valuation date may or may not be included in the cash-flow model at the company’s option.
 - a. If the contract holder dividends that give rise to the dividend liability are not included in the cash-flow model, then no adjustment is needed to the resulting ~~aggregate stochastic reserve~~SR.
 - b. If the contract holder dividends that give rise to the dividend liability are included in the cash-flow model, then the resulting ~~aggregate stochastic reserve~~SR should be reduced by the amount of the dividend liability.
- 7. All projected cash flows associated with NGEs shall reflect margins for adverse deviations and estimation error in prudent estimate assumptions.

Commented [CD605]: delete "aggregate"

Commented [VM22606R605]: Edits to address this comment will be reflected in next exposure

Commented [CD607]: delete "aggregate"

Commented [VM22608R607]: Edits to address this comment will be reflected in next exposure

Section 11: Guidance and Requirements for Setting Prudent Estimate Mortality Assumptions

A. Overview

1. Intent

The guidance and requirements in this section apply to setting prudent estimate mortality assumptions when determining the stochastic reserve. The intent is for prudent estimate mortality assumptions to be based on facts, circumstances and appropriate actuarial practice, with only a limited role for unsupported actuarial judgment. (Where more than one approach to appropriate actuarial practice exists, the company should select the practice that the company deems most appropriate under the circumstances.)

Commented [X609]: Specific requirements will require further discussion, particularly what if any industry experience is identified for the SPA. Ideally, updated and appropriate assumptions should be used for better alignment and to avoid any false positives flagged as an outlier by the SPA.

Commented [VM22610R609]: Will address SPA separately

2. Description

Prudent estimate mortality assumptions shall be determined by first developing expected mortality curves based on either available experience or published tables. Where necessary, margins shall be applied to the experience to reflect data uncertainty. The expected mortality curves shall then be adjusted based on the credibility of the experience used to determine the expected mortality curve. Section 11.B addresses guidance and requirements for determining expected mortality curves, and Section 11.C addresses guidance and requirements for adjusting the expected mortality curves to determine prudent estimate mortality.

Commented [X611]: Recommend removing reference to actuarial judgment being "unsupported" from VM-21 and VM-22 because actuarial judgment should always be supportable - it is "judgment" not an arbitrary decision.

Finally, the credibility-adjusted tables shall be adjusted for mortality improvement (where such adjustment is permitted or required) using the guidance and requirements in Section 11.D.

3. Business Segments

For purposes of setting prudent estimate mortality assumptions, the products falling under the scope of these requirements shall be grouped into business segments with different mortality assumptions. The grouping, at a minimum, should differentiate between payout annuities or deferred annuity contracts that contain GLBs, and deferred annuity contracts with no guaranteed benefits or only GMDBs. Where appropriate, the grouping should also differentiate between segments which are known or expected to contain contract holders with sociodemographic, geographic, or health factors reasonably expected to impact the mortality assumptions for the segment (e.g., annuitants drawn from different countries, geographic areas, industry groups, or impaired lives on individually underwritten contracts such as structured settlements). The grouping should also generally follow the pricing, marketing, management and/or reinsurance programs of the company.

Guidance Note: This paragraph contemplates situations where it may be appropriate to differentiate mortality assumptions by segment or even by contract due to varying sociodemographic, geographic, or health factors. Particularly, though not exclusively, in the context of group payout annuity contracts, companies may have credible, contract-specific mortality experience data or relevant pooled data from annuitants drawn from similar industries or geographies that may be used to sub-divide inforce blocks into business segments for purposes of setting prudent estimate mortality assumptions.

For example, a company may sell group PRT contracts both to union plans in the U.S. and to private single-employer plans in another country. While both are "PRT contracts," it would be appropriate to differentiate them for mortality assumption purposes, similar to

how payout annuities vs. deferred annuities are distinguished.

Guidance Note: Distinct mortality or liability assumptions among different contracts within a group of contracts does not in itself preclude the group of contracts from being aggregated for the purposes of the broader stochastic reserve calculation.

4. Margin for Data Uncertainty

The expected mortality curves that are determined in Section 11.B may need to include a margin for data uncertainty. The margin could be in the form of an increase or a decrease in mortality, depending on the business segment under consideration. The margin shall be applied in a direction (i.e., increase or decrease in mortality) that results in a higher reserve. A sensitivity test may be needed to determine the appropriate direction of the provision for uncertainty to mortality. The test could be a prior year mortality sensitivity analysis of the business segment or an examination of current representative cells of the segment.

For purposes of this section, if mortality must be increased (decreased) to provide for uncertainty, the business segment is referred to as a ~~plus (minus)~~ mortality (longevity) segment.

It may be necessary, because of a change in the mortality risk profile of the segment, to reclassify a business segment from a ~~mortality (longevity) plus (minus)~~ segment to a ~~longevity (mortality) minus (plus)~~ segment to the extent compliance with this section requires such a reclassification. For example, a segment could require reclassification depending on whether it is gross or net of reinsurance.

Commented [X612]: Recommend deleting this guidance note since it is unnecessary - there is no such restriction for any of VM-20, VM-21 or VM-22. It would be an absurd level of granular distinction, such that it is not clear you could actually perform the projection, given that assumptions vary by attained age, etc.

Commented [VM22613R612]: Edits to address this comment will be reflected in next exposure

Commented [X614]: Terming the segments "mortality (longevity) segments" would be easier to understand than "plus (minus) segments".

Commented [VM22615R614]: Edits to address this comment will be reflected in next exposure

B. Determination of Expected Mortality Curves

1. Experience Data

In determining expected mortality curves, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience). See Section 11.B.2. for additional considerations. Finally, if there is no data, the company shall use the applicable table, as required in Section 11.B.3.

Commented [X616]: It is unclear how to interpretate the statement and how to review it for both VM-21 and VM-22. If a company reinsures GMWB riders, then does it mean that on a net basis the segment would no longer be considered as minus? So, there would be distinct designations for the pre and post reinsurance runs? Recommend discussing the statement and adding additional language or a guidance note to make it clear.

2. Data Other Than Direct Experience

Adjustments shall be applied to the data to reflect differences between the business segments, and margins shall be applied to the adjusted expected mortality curves to reflect the data uncertainty associated with using data from a similar but not identical business segment.

To the extent the mortality of a business segment is reinsured, any mortality charges that are consistent with the company's own pricing and applicable to a substantial portion of the mortality risk also may be a reasonable starting point for the determination of the company's expected mortality curves.

Commented [X617]: Delete period, it is a typo

Commented [VM22618R617]: Edits to address this comment will be reflected in next exposure

3. ~~No~~ Data Requirements

Commented [X619]: Does this need to be edited to be consistent with "little or no" data?

- i. When little or no experience or information is available on a business segment, the company shall use expected mortality curves that would produce expected deaths no less than:

[2021 SOA Deferred Annuity Mortality Table] with [Projection Scale G2] for individual deferred annuities that do not contain guaranteed living benefits

$$q_x^{20XX+n} = q_x^{20XX}(1 - G2_x)^n$$

- ii. When little or no experience or information is available on a business segment, the company shall use expected mortality curves that would produce expected deaths no greater than:

- a. [The appropriate percentage (F_x) from Table 11.1 applied to the 2012 IAM Basic Mortality Table] with [Projection Scale G2] for individual payout annuity contracts and deferred annuity contracts with guaranteed living benefits

$$q_x^{2012+n} = q_x^{2012}(1 - G2_x)^n * F_x$$

- b. [1983 Table "a"] for structured settlements or other contracts with impaired mortality
- c. [1994 GAR Table] with [Projection Scale AA] for group annuities

$$q_x^{1994+n} = q_x^{1994}(1 - AA_x)^n$$

Table 11.1

Attained Age (x)	F_x
<=65	80.0%
66	81.5%
67	83.0%
68	84.5%
69	86.0%
70	87.5%
71	89.0%
72	90.5%
73	92.0%
74	93.5%
75	95.0%
76	96.5%
77	98.0%
78	99.5%
79	101.0%
80	102.5%
81	104.0%

Commented [X620]: Section 11.B.3.i only has one item "a". There is no need to specifically have a single item "a". Recommend delete the notation "a" and have "Section 11.B.3.i" only.

Commented [VM22621R620]: Will be updated upon SPA assumption development

Commented [X622]: For PRT an assumption based on a third-party data provider would be better than the industry table to get contract specific mortality assumptions. Is this permitted? The guidance note in A.3 seems to get at this, but it's not clear in B.3 ii c whether this is allowed. This is an important distinction as PRT population can vary from those populations the tables are based upon.

Commented [VM22623R622]: Subgroup voted to only allow a prescribed table (to be determined upon SPA development) and not permit the use of third-party data provider upon a limited credibility

Commented [X624]: The 1983 Table "a" and 1994 GAR are used for structured settlements and group annuities, respectively. These tables seem to be out of date. If Standard Projected Amount work develops more granular and up to date tables, should these tables be updated to use consistent tables?

Commented [VM22625R624]: Will be updated upon SPA assumption development

Commented [X626]: The percentage factors (F_x) are over 100% from attained age 79 to age 104. Is it appropriate to set the factors above 100% for the older ages with no credibility?

Commented [VM22627R626]: Will be updated upon SPA assumption development

Commented [CD628]: does the F_x factor need any consideration for FIAs with GLBs?

Commented [VM22629R628]: Will be updated upon SPA assumption development

82	105.5%	
83	107.0%	
84	108.5%	
85	110.0%	
86	110.0%	
87	110.0%	
88	110.0%	
89	110.0%	
90	110.0%	
91	110.0%	
92	110.0%	
93	110.0%	
94	110.0%	
95	110.0%	
96	109.0%	
97	108.0%	
98	107.0%	
99	106.0%	
100	105.0%	
101	104.0%	
102	103.0%	
103	102.0%	
104	101.0%	
>=105	100.0%	

iii. For a business segment with non-U.S. insureds, when little or no experience or information is available on a business segment, an established industry or national mortality table and mortality improvement scale may be used, with approval from the domiciliary commissioner.

4. Additional Considerations Involving Data

The following considerations shall apply to mortality data specific to the business segment for which assumptions are being determined (i.e., direct data discussed in Section 11.B.1 or other than direct data discussed in Section 11.B.2).

a. Underreporting of Deaths

Mortality data shall be examined for possible underreporting of deaths. Adjustments shall be made to the data if there is any evidence of underreporting. Alternatively, exposure by lives or amounts on contracts for which death benefits were in the money may be used to determine expected mortality curves. Underreporting on such exposures should be minimal; however, this reduced subset of data will have less credibility.

b. Experience by Contract Duration

Experience of a plus segment shall be examined to determine if mortality by contract duration increases materially due to selection at issue. In the absence of information, the company shall assume that expected mortality will increase by

Commented [X630]: The phrase "When little or no experience or information is available on a business segment" is not included, unlike in (i) and (ii) of the same sub-section. It appears to be the intent that this is the only situation in which this would apply, but it would be helpful to make this explicit.

Commented [VM22631R630]: Edits to address this comment will be reflected in next exposure

Commented [X632]: Reference to the MI scale missing for international business

Commented [VM22633R632]: Edits to address this comment will be reflected in next exposure

contract duration for an appropriate select period. As an alternative, if the company determines that mortality is affected by selection, the company could apply margins to the expected mortality in such a way that the actual mortality modeled does not depend on contract duration.

c. Modification and Relevance of Data

Even for a large company, the quantity of life exposures and deaths are such that a significant amount of smoothing may be required to determine expected mortality curves from mortality experience. Expected mortality curves, when applied to the recent historic exposures (e.g., three to seven years), should not result in an estimate of aggregate number of deaths less (greater) than the actual number deaths during the exposure period for plus (minus) segments.

In determining expected mortality curves (and the credibility of the underlying data), older data may no longer be relevant. The “age” of the experience data used to determine expected mortality curves should be documented.

d. Other Considerations

In determining expected mortality curves, consideration should be given to factors that include, but are not limited to, trends in mortality experience, trends in exposure, volatility in year-to-year A/E mortality ratios, mortality by lives relative to mortality by amounts, changes in the mix of business and product features that could lead to mortality selection.

C. Adjustment for Credibility to Determine Prudent Estimate Mortality

1. Adjustment for Credibility

The expected mortality curves determined in Section 11.B shall be adjusted based on the credibility of the experience used to determine the curves in order to arrive at prudent estimate mortality. The adjustment for credibility shall result in blending the expected mortality curves including margins for uncertainty with the mortality assumption assumptions described in Section 11.B.3. The approach used to adjust the curves shall suitably account for credibility.

Guidance Note: For example, when credibility is zero, an appropriate approach should result in a mortality assumption consistent with 100% of the industry mortality assumption described in Section 11.B.3 ~~table~~ used in the blending.

2. Adjustment of ~~Statutory Valuation~~ Industry Mortality for Improvement

For purposes of the adjustment for credibility, the ~~industry~~ mortality table for a plus segment may be and the ~~industry~~ mortality table for a minus segment must be adjusted for mortality improvement. Such adjustment shall reflect the mortality improvement scale described in Section 11.B.3 from the effective date of the respective ~~industry~~ mortality table to the experience weighted average date underlying the data used to develop the expected mortality curves.

3. Credibility Procedure

The credibility procedure used shall:

- a. Produce results that are reasonable.

Commented [X634]: Both plan and industry data should be weighted for business such as PRT. This text says blend with prescribed tables, but that might not make sense unless additional experience data was unavailable.

Commented [VM22635R634]: Subgroup voted to only allow a prescribed table (to be determined upon SPA development) and not permit the use of third-party data provider upon a limited credibility

Commented [X636]: Clarification

Commented [VM22637R636]: Edits to address this comment will be reflected in next exposure

Commented [X638]: Editoria

Commented [VM22639R638]: Edits to address this comment will be reflected in next exposure

Commented [X640]: The “statutory valuation” is struck but in the guidance note. Recommend replacing “statutory valuation” with either “reference of Section 11.B.3” or “industry”. Otherwise, it is a vague reference since we have both a company mortality table and an industry mortality table.

Commented [VM22641R640]: Edits to address this comment will be reflected in next exposure

Commented [CD642]: need to reference “the mortality assumption described in Section 11.B.3” here? Otherwise, the sentence is unclear.

Commented [VM22643R642]: Edits to address this comment will be reflected in next exposure

Commented [X644]: Mortality improvement should be consistent with the underlying tables used, so we would suggest this being based on available experience subject to appropriate guardrails.

Commented [X645]: “Statutory Valuation” was stricken from all the body, but left in this title. Consider replacing with “industry”.

Commented [VM22646R645]: Edits to address this comment will be reflected in next exposure

Commented [CD647]: for consistency, need to delete this reference to “Statutory Valuation”

Commented [VM22648R647]: Edits to address this comment will be reflected in next exposure

- b. Not tend to bias the results in any material way.
 - c. Be practical to implement.
 - d. Give consideration to the need to balance responsiveness and stability.
 - e. Take into account not only the level of aggregate claims but the shape of the mortality curve.
 - f. Contain criteria for full credibility and partial credibility that have a sound statistical basis and be appropriately applied.
4. Further Adjustment of the Credibility-Adjusted Table for Mortality Improvement

The credibility-adjusted table used for plus segments may be and the credibility adjusted table used for minus segments must be adjusted for mortality improvement using the applicable mortality improvement scale described in Section 11.B.3 from the experience weighted average date underlying the company experience used in the credibility process to the valuation date.

Any adjustment for mortality improvement beyond the valuation date is discussed in Section 11.D.

D. Future Mortality Improvement

The mortality assumption resulting from the requirements of Section 11.C shall be adjusted for mortality improvements beyond the valuation date if such an adjustment would serve to increase the resulting ~~stochastic reserve~~SR. If such an adjustment would reduce the ~~stochastic reserve~~SR, such assumptions are permitted, but not required. In either case, the assumption must be based on current relevant data with a margin for uncertainty (increasing assumed rates of improvement if that results in a higher reserve or reducing them otherwise).

Section 12: Other Guidance and Requirements for Assumptions

A. Overview

This section provides guidance and requirements in general for setting prudent estimate assumptions when determining either the SR or DR. It also provides specific guidance and requirements for expense assumptions.

B. General Assumption Requirements

1. The company shall use prudent estimate assumptions for risk factors that are not stochastically modeled by applying margins to the anticipated experience assumptions if such risk factors have been categorized as material risks by following Section 1.B Principle 3 and requirements in Section 12.C.
 2. The company shall establish the prudent estimate assumptions for risk factors in compliance with the requirements in Section 12 of Model #820 and must periodically review and update the assumptions as appropriate in accordance with these requirements.
 3. The company shall model the following risk factors stochastically unless the company elects the stochastic modeling exclusion defined in Section 7:
 - a. Interest rate movements (i.e., Treasury interest rate curves).
 - b. Equity performance (e.g., Standard & Poor’s 500 index [S&P 500] returns and returns of other equity investments).
 4. If the company elects to stochastically model risk factors in addition to the economic scenarios, the requirements in this section for determining prudent estimate assumptions for these risk factors do not apply.
- Guidance Note:** It is expected that companies will not stochastically model risk factors other than the economic scenarios, such as contract holder behavior or mortality, until VM-22 has more specific guidance and requirements available. Companies shall discuss with domiciliary regulators if they wish to stochastically model other risk factors.
5. The company shall use its own experience, if relevant and credible, to establish an anticipated experience assumption for any risk factor. To the extent that company experience is not available or credible, the company may use industry experience or other data to establish the anticipated experience assumption, making modifications as needed to reflect the circumstances of the company.
 - a. For risk factors (such as mortality) to which statistical credibility theory may be appropriately applied, the company shall establish anticipated experience assumptions for the risk factor by combining relevant company experience with industry experience data, tables or other applicable data in a manner that is consistent with credibility theory and accepted actuarial practice.

Commented [X649]: We believe discussion of allocation of aggregate reserves should be analyzed as part of the field study.

Commented [VM22650R649]: The VM-22 Subgroup has no objections to waiting until after the field study to determine the allocation approach

Commented [X651]: Need to add a Section 12 for general guidance on prudent assumption setting and on expenses. For VM-21, APF 2021-11 is currently exposed. Should be consistent with that APF, after any tweaks are made. <https://content.naic.org/sites/default/files/inline-images/APF%202021-11%20VM21%20Assumptions%2010012021.pdf>

Commented [VM22652R651]: Subgroup agreed on adding this as a new Section 12

- b. For risk factors (such as utilization of guaranteed living benefits) that do not lend themselves to the use of statistical credibility theory, and for risk factors (such as some of the lapse assumptions) to which statistical credibility theory can be appropriately applied but cannot currently be applied due to lack of industry data, the company shall establish anticipated experience assumptions in a manner that is consistent with accepted actuarial practice and that reflects any available relevant company experience, any available relevant industry experience, or any other experience data that are available and relevant. Such techniques include:
- i. Adopting standard assumptions published by professional, industry or regulatory organizations to the extent they reflect any available relevant company experience or reasonable expectations.
 - ii. Applying factors to relevant industry experience tables or other relevant data to reflect any available relevant company experience and differences in expected experience from that underlying the base tables or data due to differences between the risk characteristics of the company experience and the risk characteristics of the experience underlying the base tables or data.
 - iii. Blending any available relevant company experience with any available relevant industry experience and/or other applicable data using weightings established in a manner that is consistent with accepted actuarial practice and that reflects the risk characteristics of the underlying contracts and/or company practices.
- c. For risk factors that have limited or no experience or other applicable data to draw upon, the assumptions shall be established using sound actuarial judgment and the most relevant data available, if such data exists.
- d. For any assumption that is set in accordance with the requirements of Section 12.B.5.c, the qualified actuary to whom responsibility for this group of contracts is assigned shall use sensitivity testing and disclose the analysis performed to ensure that the assumption is set at the conservative end of the plausible range.
- e. The qualified actuary, to whom responsibility for this group of contracts is assigned, shall annually review relevant emerging experience for the purpose of assessing the appropriateness of the anticipated experience assumption. If the results of statistical or other testing indicate that previously anticipated experience for a given factor is inadequate, then the qualified actuary shall set a new, adequate, anticipated experience assumption for the factor.
6. The company shall sensitivity test risk factors that are not stochastically modeled and examine the impact on the stochastic reserve. The company shall update the sensitivity tests periodically as appropriate. The company may update the tests less frequently, but no less than every 3 years, when the tests show less sensitivity of the stochastic reserve to changes in the assumptions being tested or the experience is not changing rapidly. Providing there is no material impact on the results of the sensitivity testing, the company

may perform sensitivity testing:

- a. Using samples of the contracts in force rather than performing the entire valuation for each alternative assumption set.
- b. Using data from prior periods.

Guidance Note: Sensitivity testing every risk factor on an annual basis is not required. For some risk factors, it may be reasonable, in lieu of sensitivity testing, to employ statistical measures for margins, such as adding one or more standard deviations to the anticipated experience assumption.

7. The company shall vary the prudent estimate assumptions from scenario to scenario within the stochastic reserve calculation in an appropriate manner to reflect the scenario-dependent risks.

C. Assumption Margins

The company shall include margins to provide for adverse deviations and estimation error in the prudent estimate assumption for each risk factor that is not stochastically modeled or prescribed, subject to the following:

1. The level of margin applied to the anticipated experience assumptions may be determined in aggregate or independently as discussed in Section 1.B Principle 3. It is not permissible to set a margin less toward the conservative end of the spectrum to recognize, in whole or in part, implicit or prescribed margins that are present, or are believed to be present, in other risk factors.

Risks that are stochastically modeled (e.g., interest rates, equity returns) or have prescribed margins or guardrails (e.g., assets, revenue sharing) shall be considered material risks. Other risks generally considered to be material include, but are not limited to, mortality, contract holder behavior, maintenance and overhead expenses, inflation and implied volatility. In some cases, the list of material risks may also include acquisition expenses, partial withdrawals, policy loans, annuitizations, account transfers and deposits, and/or option elections that contain an element of anti-selection.

2. The greater the uncertainty in the anticipated experience assumption, the larger the required margin, with the margin added or subtracted as needed to produce a larger Sr or DR than would otherwise result. For example, the company shall use a larger margin when:

- a. The experience data have less relevance or lower credibility.
- b. The experience data are of lower quality, such as incomplete, internally inconsistent or not current.
- c. There is doubt about the reliability of the anticipated experience assumption, such as, but not limited to, recent changes in circumstances or changes in company policies.
- d. There are constraints in the modeling that limit an effective reflection of the risk factor.

Commented [X653]: Edit for VM-22 vs. VM-21?

Commented [VM22654R653]: Will include this language in the next exposure and will solicit any comments

3. In complying with the sensitivity testing requirements in Section 12.B.6 above, greater analysis and more detailed justification are needed to determine the level of uncertainty when establishing margins for risk factors that produce greater sensitivity on the stochastic reserve.
4. A margin is permitted but not required for assumptions that do not represent material risks.
5. A margin should reflect the magnitude of fluctuations in historical experience of the company for the risk factor, as appropriate.
6. The company shall apply the method used to determine the margin consistently on each valuation date but is permitted to change the method from the prior year if the rationale for the change and the impact on the stochastic reserve is disclosed.

D. Expense Assumptions

1. General Prudent Estimate Expense Assumption Requirements

In determining prudent estimate expense assumptions, the company:

- a. May spread certain information technology development costs and other capital expenditures over a reasonable number of years in accordance with accepted statutory accounting principles as defined in the Statements of Statutory Accounting Principles.

Guidance Note: Care should be taken with regard to the potential interaction with the inflation assumption below.

- b. Shall assume that the company is a going concern.
- c. Shall choose an appropriate expense basis that properly aligns the actual expense to the assumption. If values are not significant, they may be aggregated into a different base assumption.

Guidance Note: For example, death benefit expenses should be modeled with an expense assumption that is per death incurred.

- d. Shall reflect the impact of inflation.
- e. Shall not assume future expense improvements.
- f. Shall not include assumptions for federal income taxes (and expenses paid to provide fraternal benefits in lieu of federal income taxes) and foreign income taxes.
- g. Shall use assumptions that are consistent with other related assumptions.
- h. Shall use fully allocated expenses.

Guidance Note: Expense assumptions should reflect the direct costs associated with the block of contracts being modeled, as well as indirect costs and overhead costs that have been allocated to the modeled contracts.

- i. Shall allocate expenses using an allocation method that is consistent across

company lines of business. Such allocation must be determined in a manner that is within the range of actuarial practice and methodology and consistent with applicable ASOPs. Allocations may not be done for the purpose of decreasing the stochastic reserve.

- j. Shall reflect expense efficiencies that are derived and realized from the combination of blocks of business due to a business acquisition or merger in the expense assumption only when any future costs associated with achieving the efficiencies are also recognized.

Guidance Note: For example, the combining of two similar blocks of business on the same administrative system may yield some expense savings on a per unit basis, but any future cost of the system conversion should also be considered in the final assumption. If all costs for the conversion are in the past, then there would be no future expenses to reflect in the valuation.

- k. Shall reflect the direct costs associated with the contracts being modeled, as well as an appropriate portion of indirect costs and overhead (i.e., expense assumptions representing fully allocated expenses should be used), including expenses categorized in the annual statement as “taxes, licenses and fees” (Exhibit 3 of the annual statement) in the expense assumption.

- l. Shall include acquisition expenses associated with business in force as of the valuation date and significant non-recurring expenses expected to be incurred after the valuation date in the expense assumption.

- m. For contracts sold under a new policy form or due to entry into a new product line, the company shall use expense factors that are consistent with the expense factors used to determine anticipated experience assumptions for contracts from an existing block of mature contracts taking into account:

- i. Any differences in the expected long-term expense levels between the block of new contacts and the block of mature contracts.
- ii. That all expenses must be fully allocated as required under Section 12.D.1.h above.

2. Margins for Prudent Estimate Expense Assumptions

The company shall determine margins for expense assumptions following Section 12.C.

Section 13: Allocation of Aggregate Reserves to the Contract Level

Section 3.F states that the aggregate reserve shall be allocated to the contracts falling within the scope of these requirements. That allocation should be done for both the pre- and post-reinsurance ceded reserves. Contracts that have passed the stochastic exclusion test as defined in Section 7.B will not be included in the allocation of the aggregate reserve. For the purpose of this section, if a contract does not have a cash surrender value, then the cash surrender value is assumed to be zero.

Contracts for which the Deterministic Certification Option is elected in Section 7.E are intended to use the methodology described in this section to allocate aggregate reserves in excess of the cash surrender value to individual contracts.

The contract-level reserve for each contract shall be the sum of the following:

- A. The contract’s cash surrender value.

Drafting Note: The American Academy of Actuaries Annuity Reserves and Capital Work Group is including two potential options for allocating the excess portion of the aggregate reserve over cash surrender value: (1) Use the same approach as VM-21 (2) Allocate based on an actuarial present value calculation.

The Work Group did not reach a consensus between these two approaches, so wording for both is included in the text below. The Work Group recommends field testing both approaches and considering the results in determining future decisions.

Option 1: VM-21 Approach

- B. An allocated portion of the excess of the aggregate reserve over the aggregate cash surrender value shall be allocated to each contract based on a measure of the risk of that product relative to its cash surrender value in the context of the company’s in force contracts (assuming zero cash value for contracts that do not contain such). The allocation shall be made separately for DR and SR. The measure of risk should consider the impact of risk mitigation programs, including hedge programs and reinsurance, that would affect the risk of the product. The specific method of assessing that risk and how it contributes to the company’s aggregate reserve shall be defined by the company. The method should provide for an equitable allocation based on risk analysis.

Commented [X655]: This method only makes sense if done separately for the DR and SR.

- 1. As an example, consider a company with the results of the following three contracts:

Table 12.1: Sample Allocation of Aggregate Reserve

Contract (i)	1	2	3	Total
Cash Surrender Value, C	28	40	52	120
Risk adjusted measure, R	38	52	50	
Aggregate Reserve				140
Allocation Basis for the excess of the Aggregate Reserve over the Cash Surrender Value $A_i = \text{Max}(R_i - C_i, 0)$	10	12	0	22

Allocation of the excess of the Aggregate Reserve over the Cash Surrender Value $Li = (Ai)/\Sigma Ai * [Aggregate Reserve - \Sigma Ci]$	9.09	10.91	0.00	20
Contract-level reserve $Ci + Li$	37.09	50.91	52.00	140.00

2. In this example, the Aggregate Reserve exceeds the aggregate Cash Surrender Value by 20. The 20 is allocated proportionally across the three contracts based on the allocation basis of the larger of (i) zero; and (ii) a risk adjusted measure based on reserve principles. Therefore, contracts 1 and 2 receive 45% (9/22) and 55% (11/22), respectively, of the excess Aggregate Reserve. As Contract 3 presents no risk in excess of its cash surrender value, it does not receive an allocation of the excess Aggregate Reserve.

Option 2: Actuarial Present Value Approach

- B. The excess of the aggregate reserve over the aggregate cash surrender value is allocated to policies based on a calculation of the actuarial present value of projected liability cash flows in excess of the cash surrender value:
 1. Discount the liability cash flows at the NAER, pursuant to requirements in Section 4, for the scenario that produces the scenario reserve closest to, but not less than the ~~stochastic reserve~~ SR defined in Section 3.D.
 - a. Groups of contracts that elect the Deterministic Certification Option defined in Section 7.E shall use the NAER in the single scenario used to calculate the reserve to discount liability cash flows, as well as any cash flows that are scenario dependent.
 2. If the actuarial present value is less than the cash surrender value, then the excess actuarial present value to be used for allocating the excess aggregate reserve over the cash value shall be floored at zero.
 - a. If all contracts have an excess actuarial present value that is floored at zero, then use the cash surrender value to allocate any excess aggregate reserve over the aggregate cash surrender value.
 3. For projecting future liability cash flows, assume the same liability assumptions that were used to calculate the ~~stochastic reserve~~ SR defined in Section 3.D.
 4. As a hypothetical example, consider a company with the results of the following five contracts:

Commented [X656]: This method depends on the NAER, so would not work for companies that use direct iteration.

Commented [X657]: This could give an unstable allocation if there is an even mix of products with different risk profiles, so that the tail is populated with some scenarios where Product A does poorly and some where Product B does poorly. The single scenario will only reflect the riskiness of one of the products.

Commented [X658]: Not just the NAER, but the cashflows are also scenario dependent.

Commented [VM22659R658]: Edits to address this comment will be reflected in next exposure

Commented [CD660]: "Section 3.D"

Commented [VM22661R660]: Edits to address this comment will be reflected in next exposure

Table 12.1: Hypothetical Sample Allocation of Aggregate Reserve

Contract	Example Product Type	CSV* (1)	Scenario APV (2)	Excess (Floored) of the scenario APV over CSV* (3) = $\text{Max}\{(2)-(1), 0\}$	Aggregate Reserve CTE 70 (4)	Excess of Aggregate Reserve over Aggregate CSV* (5) = $\text{Max}\{[(4 \text{ Total}) - (1 \text{ Total}), 0]\}$	Allocated Excess Reserve (6) = (3) x $\{[(5 \text{ Total}) / (3 \text{ Total})]\}$	Total Contract Level Reserve (7) = (1) + (6)
Contract 1:	Indexed Annuity with no GLWB**	95.0	90.0	0.0			0.0	95.0
Contract 2:	Indexed Annuity with low benefit GLWB**	92.0	95.0	3.0			3.6	95.6
Contract 3:	Indexed Annuity with medium benefit GLWB**	90.0	100.0	10.0			12.0	102.0
Contract 4:	Indexed Annuity with high benefit GLWB**	88.0	105.0	17.0			20.4	108.4
Contract 5:	Fixed Life Contingent Payout Annuity	0.0	70.0	70.0			84.0	84.0
Total		365.0		100.0	485.0	120.0	120.0	485.0

*Cash Surrender Value
**Guaranteed Lifetime Withdrawal Benefit

Guidance Note: The actuarial present value (APV) in the section above is separate from the Guarantee Actuarial Present Value (GAPV) referred to in the additional standard projection amount calculation in VM-21. The GAPV is only applicable to guaranteed minimum benefits and uses prescribed liability assumptions. In contrast, the APV in this section applies to the entire contract, irrespective of whether guaranteed benefits are attached, and uses company prudent estimate liability assumptions.

Commented [CD662]: should be "Max{(2)-(1), 0}"

Commented [VM22663R662]: Edits to address this comment will be reflected in next exposure

Section ~~13~~14: Statutory Maximum Valuation Interest Rates for Income Annuity Formulaic Reserves

A. Purpose and Scope

1. These requirements define for single premium immediate annuity contracts and other similar contracts, certificates and contract features the statutory maximum valuation interest rate that complies with Model #820. These are the maximum interest rate assumption requirements to be used in the CARVM and for certain contracts, the CRVM. These requirements do not preclude the use of a lower valuation interest rate assumption by the company if such assumption produces statutory reserves at least as great as those calculated using the maximum rate defined herein.
2. The following categories of contracts, certificates and contract features, whether group or individual, including both life contingent and term certain only contracts, directly written or assumed through reinsurance, with the exception of benefits arising from variable annuities, ~~are covered in this section and all contracts not passing the SET covered by Sections 1 through 13 of VM-22, are covered Section 14 of VM-22:~~
 - a. Immediate annuity contracts issued after Dec. 31, 2017;
 - b. Deferred income annuity contracts issued after Dec. 31, 2017;
 - c. Structured settlements in payout or deferred status issued after Dec. 31, 2017;
 - d. Fixed payout annuities resulting from the exercise of settlement options or annuitizations of host contracts issued after Dec. 31, 2017;
 - e. Fixed payout annuities resulting from the exercise of settlement options or annuitizations of host contracts issued during 2017, for fixed payouts commencing after Dec. 31, 2018, or, at the option of the company, for fixed payouts commencing after Dec. 31, 2017;
 - f. Supplementary contracts, excluding contracts with no scheduled payments (such as retained asset accounts and settlements at interest), issued after Dec. 31, 2017;
 - g. Fixed income payment streams, attributable to contingent deferred annuities (CDAs) issued after Dec. 31, 2017, once the underlying contract funds are exhausted;
 - h. Fixed income payment streams attributable to guaranteed living benefits associated with deferred annuity contracts issued after Dec. 31, 2017, once the contract funds are exhausted; and
 - i. Certificates with premium determination dates after Dec. 31, 2017, emanating from non-variable group annuity contracts specified in Model #820, Section 5.C.2, purchased for the purpose of providing certificate holders benefits upon their retirement.

Guidance Note: For Section ~~13~~14.A.2.d, Section ~~13~~14.A.2.e, Section ~~13~~14.A.2.f and Section ~~13~~14.A.2.h above, there is no restriction on the type of contract that may give rise to the benefit.

3. Exemptions:
 - a. With the permission of the domiciliary commissioner, for the categories of annuity contracts, certificates and/or contract features in scope as outlined in Section ~~13~~14.A.2.d, Section ~~13~~14.A.2.e, Section ~~13~~14.A.2.f, Section ~~13~~14.A.2.g or Section ~~13~~14.A.2.h, the

Commented [X664]: Under A.2: need to exclude contracts being covered by the earlier sections of VM-22 not passing the exclusion tests and need a clearer reference instead of "covered in this section"

Commented [VM22665R664]: Edits to address this comment will be reflected in next exposure

company may use the same maximum valuation interest rate used to value the payment stream in accordance with the guidance applicable to the host contract. In order to obtain such permission, the company must demonstrate that its investment policy and practices are consistent with this approach.

4. The maximum valuation interest rates for the contracts, certificates and contract features within the scope of Section 13.14 of VM-22 supersede those described in Appendix VM-A and Appendix VM-C, but they do not otherwise change how those appendices are to be interpreted. In particular, *Actuarial Guideline IX-B—Clarification of Methods Under Standard Valuation Law for Individual Single Premium Immediate Annuities, Any Deferred Payments Associated Therewith, Some Deferred Annuities and Structured Settlements Contracts* (AG-9-B) (see VM-C) provides guidance on valuation interest rates and is, therefore, superseded by these requirements for contracts, certificates and contract features in scope. Likewise, any valuation interest rate references in *Actuarial Guideline IX-C—Use of Substandard Annuity Mortality Tables in Valuing Impaired Lives Under Individual Single Premium Immediate Annuities* (AG-9-C) (see VM-C) are also superseded by these requirements.

B. Definitions

1. The term “reference period” means the length of time used in assigning the Valuation Rate Bucket for the purpose of determining the statutory maximum valuation interest rate and is determined as follows:
 - a. For contracts, certificates or contract features with life contingencies and substantially similar payments, the reference period is the length of time, rounded to the nearest year, from the premium determination date to the earlier of: i) the date of the last non-life-contingent payment under the contract, certificate or contract feature; and ii) the date of the first life-contingent payment under the contract, certificate or contract feature, or
 - b. For contracts, certificates or contract features with no life-contingent payments and substantially similar payments, the reference period is the length of time, rounded to the nearest year, from the premium determination date to the date of the last non-life-contingent payment under the contract, certificate or contract feature, or
 - c. For contracts, certificates or contract features where the payments are not substantially similar, the actuary should apply prudent judgment and select the Valuation Rate Bucket with Macaulay duration that is a best fit to the Macaulay duration of the payments in question.

Guidance Note: Contracts with installment refunds or similar features should consider the length of the installment period calculated from the premium determination date as the non-life contingent period for the purpose of determining the reference period.

Guidance Note: The determination in Section 13.14.B.1.c above shall be made based on the materiality of the payments that are not substantially similar relative to the life-contingent payments.

2. The term “jumbo contract” means a contract with an initial consideration equal to or greater than \$250 million. Considerations for contracts issued by an insurer to the same contract holder within 90 days shall be combined for purposes of determining whether the contracts meet this threshold.

Guidance Note: If multiple contracts meet this criterion in aggregate, then each contract is a jumbo contract.

3. The term “non-jumbo contract” means a contract that does not meet the definition of a jumbo contract.
4. The term “premium determination date” means the date as of which the valuation interest rate for the contract, certificate or contract feature being valued is determined.
5. The term “initial age” means the age of the annuitant as of his or her age last birthday relative to the premium determination date. For joint life contracts, certificates or contract features, the “initial age” means the initial age of the younger annuitant. If a contract, certificate or contract feature for an annuitant is being valued on a standard mortality table as an impaired annuitant, “initial age” means the rated age. If a contract, certificate or contract feature is being valued on a substandard mortality basis, “initial age” means an equivalent rated age.
6. The term “Table X spreads” means the prescribed VM-22 Section ~~13~~¹⁴ current market benchmark spreads for the quarter prior to the premium determination date, as published on the Industry tab of the NAIC website. The process used to determine Table X spreads is the same as that specified in VM-20 Appendix 2.D for Table F, except that JP Morgan and Bank of America bond spreads are averaged over the quarter rather than the last business day of the month.
7. The term “expected default cost” means a vector of annual default costs by weighted average life. This is calculated as a weighted average of the VM-20 Table A prescribed annual default costs published on the Industry tab of the NAIC website in effect for the quarter prior to the premium determination date, using the prescribed portfolio credit quality distribution as weights.
8. The term “expected spread” means a vector of spreads by weighted average life. This is calculated as a weighted average of the Table X spreads, using the prescribed portfolio credit quality distribution as weights.
9. The term “prescribed portfolio credit quality distribution” means the following credit rating distribution:
 - a. 5% Treasuries
 - b. 15% Aa bonds (5% Aa1, 5% Aa2, 5% Aa3)
 - c. 40% A bonds (13.33% A1, 13.33% A2, 13.33% A3)*
 - d. 40% Baa bonds (13.33% Baa1, 13.33% Baa2, 13.33% Baa3)*

*40%/3 is used unrounded in the calculations.

C. Determination of the Statutory Maximum Valuation Interest Rate

1. Valuation Rate Buckets
 - a. For the purpose of determining the statutory maximum valuation interest rate, the contract, certificate or contract feature being valued must be assigned to one of four Valuation Rate Buckets labeled A through D.
 - b. If the contract, certificate or contract feature has no life contingencies, the Valuation Rate Bucket is assigned based on the length of the reference period (RP), as follows:

Table 3-1: Assignment to Valuation Rate Bucket by Reference Period Only

RP ≤ 5 Years	5Y < RP ≤ 10Y	10Y < RP ≤ 15Y	RP > 15Y
A	B	C	D

- c. If the contract, certificate or contract feature has life contingencies, the Valuation Rate Bucket is assigned based on the length of the RP and the initial age of the annuitant, as follows:

Table 3-2: Assignment to Valuation Rate Bucket by Reference Period and Initial Age

Initial Age	RP ≤ 5Y	5Y < RP ≤ 10Y	10Y < RP ≤ 15Y	RP > 15Y
90+	A	B	C	D
80–89	B	B	C	D
70–79	C	C	C	D
< 70	D	D	D	D

2. Premium Determination Dates

- a. The following table specifies the decision rules for setting the premium determination date for each of the contracts, certificates and contract features listed in Section 1:

Table 3-3: Premium Determination Dates

Section	Item Description	Premium determination date
A.2.a	Immediate annuity	Date consideration is determined and committed to by contract holder
A.2.b	Deferred income annuity	Date consideration is determined and committed to by contract holder
A.2.c	Structured settlements	Date consideration is determined and committed to by contract holder
A.2.d and A.2.e	Fixed payout annuities resulting from settlement options or annuitizations from host contracts	Date consideration for benefit is determined and committed to by contract holder
A.2.f	Supplementary contracts	Date of issue of supplementary contract
A.2.g	Fixed income payment streams from CDAs, AV becomes 0	Date on which AV becomes 0
A.2.h	Fixed income payment streams from guaranteed living benefits, AV becomes 0	Date on which AV becomes 0

A.2.i	Group annuity and related certificates	Date consideration is determined and committed to by contract holder
-------	--	--

Guidance Note: For the purposes of the items in the table above, the phrase “date consideration is determined and committed to by the contract holder” should be interpreted by the company in a manner that is consistent with its standard practices. For some products, that interpretation may be the issue date or the date the premium is paid.

b. Immaterial Change in Consideration

If the premium determination date is based on the consideration, and if the consideration changes by an immaterial amount (defined as a change in present value of less than 10% and less than \$1 million) subsequent to the original premium determination date, such as due to a data correction, then the original premium determination date shall be retained. In the case of a group annuity contract where a single premium is intended to cover multiple certificates, certificates added to the contract after the premium determination date that do not trigger the company’s right to reprice the contract shall be treated as if they were included in the contract as of the premium determination date.

3. Statutory Maximum Valuation Interest Rate

- a. For a given contract, certificate or contract feature, the statutory maximum valuation interest rate is determined based on its assigned Valuation Rate Bucket (Section 1314.C.1) and its Premium Determination Date (Section 1314.C.2) and whether the contract associated with it is a jumbo contract or a non-jumbo contract.
- b. Statutory maximum valuation interest rates for jumbo contracts are determined and published daily by the NAIC on the Industry tab of the NAIC website. For a given premium determination date, the statutory maximum valuation interest rate is the daily statutory maximum valuation interest rate published for that premium determination date.
- c. Statutory maximum valuation interest rates for non-jumbo contracts are determined and published quarterly by the NAIC on the Industry tab of the NAIC website by the third business day of the quarter. For a given premium determination date, the statutory maximum valuation interest rate is the quarterly statutory maximum valuation interest rate published for the quarter in which the premium determination date falls.
- d. Quarterly Valuation Rate:

For each Valuation Rate Bucket, the quarterly valuation rate is defined as follows:

$$I_q = R + S - D - E$$

Where:

- a. R is the reference rate for that Valuation Rate Bucket (defined in Section 1314.C.4);
- b. S is the spread rate for that Valuation Rate Bucket (defined in Section 1314.C.5);
- c. D is the default cost rate for that Valuation Rate Bucket (defined in Section 1314.C.6);

and

d. E is the spread deduction defined as 0.25%.

e. Daily Valuation Rate:

For each Valuation Rate Bucket, the daily valuation rate is defined as follows:

$$I_d = I_q + C_{d-1} - C_q$$

Where:

- a. I_q is the quarterly valuation rate for the calendar quarter preceding the business day immediately preceding the premium determination date;
- b. C_{d-1} is the daily corporate rate (defined in Section ~~13~~14.C.7) for the business day immediately preceding the premium determination date; and
- c. C_q is the average daily corporate rate (defined in Section ~~13~~14.C.8) corresponding to the same period used to develop I_q .

For jumbo contracts, the daily statutory maximum valuation interest rate is the daily valuation rate (I_d) rounded to the nearest one-hundredth of one percent (1/100 of 1%).

4. Reference Rate

Reference rates are updated quarterly as described below:

- a. The “quarterly Treasury rate” is the average of the daily Treasury rates for a given maturity over the calendar quarter prior to the premium determination date. The quarterly Treasury rate is downloaded from <https://fred.stlouisfed.org>, and is rounded to two decimal places.
- b. Download the quarterly Treasury rates for two-year, five-year, 10-year and 30-year U.S. Treasuries.
- c. The reference rate for each Valuation Rate Bucket is calculated as the weighted average of the quarterly Treasury rates using Table 1 weights (defined in Section ~~13~~14.C.9) effective for the calendar year in which the premium determination date falls.

5. Spread

The spreads for each Valuation Rate Bucket are updated quarterly as described below:

- a. Use the Table X spreads from the NAIC website for WALs two, five, 10 and 30 years only to calculate the expected spread.
- b. Calculate the spread for each Valuation Rate Bucket, which is a weighted average of the expected spreads for WALs two, five, 10 and 30 using Table 2 weights (defined in Section 3.I) effective for the calendar year in which the premium determination date falls.

6. Default costs for each Valuation Rate Bucket are updated annually as described below:

- a. Use the VM-20 prescribed annual default cost table (Table A) in effect for the quarter prior to the premium determination date for WAL two, WAL five and WAL 10 years only to calculate the expected default cost. Table A is updated and published annually on

the Industry tab of the NAIC website during the second calendar quarter and is used for premium determination dates starting in the third calendar quarter.

- b. Calculate the default cost for each Valuation Rate Bucket, which is a weighted average of the expected default costs for WAL two, WAL five and WAL 10, using Table 3 weights (defined in Section 4314.C.9) effective for the calendar year in which the premium determination date falls.

7. Daily Corporate Rate

Daily corporate rates for each valuation rate bucket are updated daily as described below:

- a. Each day, download the Bank of America Merrill Lynch U.S. corporate effective yields as of the previous business day’s close for each index series shown in the sample below from the St. Louis Federal Reserve website: <https://research.stlouisfed.org/fred2/categories/32348>. To access a specific series, search the St. Louis Federal Reserve website for the series name by inputting the name into the search box in the upper right corner, or input the following web address: [https://research.stlouisfed.org/fred2/series/\[replace with series name from the table below\]](https://research.stlouisfed.org/fred2/series/[replace with series name from the table below]).

Table 3-4: Index Series Names

Maturity	Series Name
1Y – 3Y	BAMLC1A0C13YEY
3Y – 5Y	BAMLC2A0C35YEY
5Y – 7Y	BAMLC3A0C57YEY
7Y – 10Y	BAMLC4A0C710YEY
10Y – 15Y	BAMLC7A0C1015YEY
15Y+	BAMLC8A0C15PYEY

- b. Calculate the daily corporate rate for each valuation rate bucket, which is a weighted average of the Bank of America Merrill Lynch U.S. corporate effective yields, using Table 4 weights (defined in Section 4314.C.9) effective for the calendar year in which the business date immediately preceding the premium determination date falls.

8. Average Daily Corporate Rate

Average daily corporate rates are updated quarterly as described below:

- a. Download the quarterly average Bank of America Merrill Lynch U.S. corporate effective yields for each index series shown in Section 3.G.1 from the St. Louis Federal Reserve website: <https://research.stlouisfed.org/fred2/categories/32348>. To access a specific series, search the St. Louis Federal Reserve website for the series name by inputting the name into the search box in the upper right corner, or input the following web address: [https://research.stlouisfed.org/fred2/series/\[replace with series name from Section 4314.C.7.a\]](https://research.stlouisfed.org/fred2/series/[replace with series name from Section 4314.C.7.a]).

- b. Calculate the average daily corporate rate for each valuation rate bucket, which is a weighted average of the quarterly average Bank of America Merrill Lynch U.S. corporate effective yields, using Table 4 weights (defined in Section 14.C.9) for the same calendar year as the weight tables (i.e. Tables 1, 2, and 3) used in calculating I_q in Section 14.C.3.e.

9. Weight Tables 1 through 4

The system for calculating the statutory maximum valuation interest rates relies on a set of four tables of weights that are based on duration and asset/liability cash-flow matching analysis for representative annuities within each valuation rate bucket. A given set of weight tables is applicable to the calculations for every day of the calendar year.

In the fourth quarter of each calendar year, the weights used within each valuation rate bucket for determining the applicable valuation interest rates for the following calendar year will be updated using the process described below. In each of the four tables of weights, the weights in a given row (valuation rate bucket) must add to exactly 100%.

Weight Table 1

The process for determining Table 1 weights is described below:

- a. Each valuation rate bucket has a set of representative annuity forms. These annuity forms are as follows:
 - i. Bucket A:
 - a) Single Life Annuity age 91 with 0 and five-year certain periods.
 - b) Five-year certain only.
 - ii. Bucket B:
 - a) Single Life Annuity age 80 and 85 with 0, five-year and 10-year certain periods.
 - b) 10-year certain only.
 - iii. Bucket C:
 - a) Single Life Annuity age 70 with 0 and 15-year certain periods.
 - b) Single Life Annuity age 75 with 0, 10-year and 15-year certain periods.
 - c) 15-year certain only.
 - iv. Bucket D:
 - a) Single Life Annuity age 55, 60 and 65 with 0 and 15-year certain periods.
 - b) 25-year certain only.
- b. Annual cash flows are projected assuming annuity payments are made at the end of each year. These cash flows are averaged for each valuation rate bucket across the annuity forms for that bucket using the statutory valuation mortality table in effect for the following calendar year for

individual annuities for males (ANB).

- c. The average daily rates in the third quarter for the two-year, five-year, 10-year and 30-year U.S. Treasuries are downloaded from <https://fred.stlouisfed.org> as input to calculate the present values in Step d.
- d. The average cash flows are summed into four time period groups: years 1–3, years 4–7, years 8–15 and years 16–30. (**Note:** The present value of cash flows beyond year 30 are discounted to the end of year 30 and included in the years 16–30 group. This present value is based on the lower of 3% and the 30-year Treasury rate input in Step c.)
- e. The present value of each summed cash-flow group in Step d is then calculated by using the Step 3 U.S. Treasury rates for the midpoint of that group (and using the linearly interpolated U.S. Treasury rate when necessary).
- f. The duration-weighted present value of the cash flows is determined by multiplying the present value of the cash-flow groups by the midpoint of the time period for each applicable group.
- g. Weightings for each cash-flow time period group within a valuation rate bucket are calculated by dividing the duration weighted present value of the cash flow by the sum of the duration weighted present value of cash flow for each valuation rate bucket.

Weight Tables 2 through 4

Weight Tables 2 through 4 are determined using the following process:

- i. Table 2 is identical to Table 1.
 - ii. Table 3 is based on the same set of underlying weights as Table 1, but the 10-year and 30-year columns are combined since VM-20 default rates are only published for maturities of up to 10 years.
 - iii. Table 4 is derived from Table 1 as follows:
 - a) Column 1 of Table 4 is identical to column 1 of Table 1.
 - b) Column 2 of Table 4 is 50% of column 2 of Table 1.
 - c) Column 3 of Table 4 is identical to column 2 of Table 4.
 - d) Column 4 of Table 4 is 50% of column 3 of Table 1.
 - e) Column 5 of Table 4 is identical to column 4 of Table 4.
 - f) Column 6 of Table 4 is identical to column 4 of Table 1.
10. Group Annuity Contracts

For a group annuity purchased under a retirement or deferred compensation plan (Section ~~13~~14.A.2.i), the following apply:

- a. The statutory maximum valuation interest rate shall be determined separately for each certificate, considering its premium determination date, the certificate holder's initial age, the reference period corresponding to its form of payout and whether the contract is a jumbo contract or a non-jumbo contract.

Guidance Note: Under some group annuity contracts, certificates may be purchased on different

dates.

- b. In the case of a certificate whose form of payout has not been elected by the beneficiary at its premium determination date, the statutory maximum valuation interest rate shall be based on the reference period corresponding to the normal form of payout as defined in the contract or as is evidenced by the underlying pension plan documents or census file. If the normal form of payout cannot be determined, the maximum valuation interest rate shall be based on the reference period corresponding to the annuity form available to the certificate holder that produces the most conservative rate.

Guidance Note: The statutory maximum valuation interest rate will not change when the form of payout is elected.

This page intentionally left blank

Valuation Manual Section II Reserve Requirements

Subsection 2: Annuity Products

- A. This subsection establishes reserve requirements for all contracts classified as annuity contracts as defined in SSAP No. 50 in the AP&P Manual.
- B. Minimum reserve requirements for variable annuity (VA) contracts and similar business, specified in VM-21, Requirements for Principle-Based Reserves for Variable Annuities, shall be those provided by VM-21. The minimum reserve requirements of VM-21 are considered PBR requirements for purposes of the *Valuation Manual*.
- C. Minimum reserve requirements for ~~non-variable~~ fixed annuity contracts issued prior to 1/1/2024 are those requirements as found in VM-A and VM-C as applicable, with the exception of the minimum requirements for the valuation interest rate for single premium immediate annuity contracts, and other similar contracts, issued after Dec. 31, 2017, including those fixed payout annuities emanating from host contracts issued on or after Jan. 1, 2017, and on or before Dec. 31, 2017. The maximum valuation interest rate requirements for those contracts and fixed payout annuities are defined in Section 14 of VM-22, Statutory Maximum Valuation Interest Rates for Income Annuity Formulaic Reserves.
- D. Minimum reserve requirements for ~~non-variable~~ fixed annuity contracts issued on 1/1/2024 and later are those requirements as found in Sections 1 through 13 of VM-22.

The requirements in this section are still considered a part of PBR requirements and therefore are applicable to VM-G.

The below principles may serve as key considerations for assessing whether VM 21 or VM 22 requirements apply:

- D. Minimum reserve requirements apply:
- E. ~~Index for index-linked or modified guaranteed annuity contracts or riders that satisfy both of the following conditions may be a key consideration for application of VM 22 requirements and are issued on 1/1/2024 and later are those requirements: as found in Sections 1 through 13 of VM-22.:~~
 - 1. Guarantees the principal amount of purchase payments, net of any partial withdrawals, and interest credited thereto, less any deduction (without regard to its timing) for sales, administrative or other expenses or charges.
 - 2.b. Credits a rate of interest under the contract prior to the application of any market value adjustments that is at least equal to the minimum rate required to be credited by the standard nonforfeiture law in the jurisdiction in which the contract is issued.

~~Guidance Note: Paragraph E.1.b is intended to apply prior to the application of any market value adjustments for modified guaranteed annuities where the underlying assets are held in a separate account. If meeting Paragraph E.1.b prior to the application of any market value adjustments and Paragraph E.1.a above, it may be appropriate to value such contracts under VM 22 requirements.~~

Minimum reserve requirements.

Commented [X666]: We believe a Fixed Annuity PBR Exemption should be incorporated into draft in a manner consistent with the Life PBR Exemption.

Commented [VM22667R666]: Waylon Peoples comment letter: Extend small company exemption in place for life PBR (VM-20) to VM-22.

Commented [VM22668R666]: The Subgroup voted in favor of a VM-22 PBR Exemption. The ACLI will follow-up with proposed criteria for determining the exemption.

Commented [CD669]: "non-variable annuity"?

Commented [VM22670R669]: Edits to address this comment will be reflected in next exposure

Commented [X671]: "Section 13 of VM-22" may need to be updated if it is decided to have separate chapters for VM-22 VIR and VM-22 PBR.

Commented [VM22672R671]: Edits to address this comment will be reflected in next exposure

Commented [CD673]: "non-variable annuity"?

Commented [VM22674R673]: Edits to address this comment will be reflected in next exposure

Commented [CD675]: Consider adding the sentence: "The minimum reserve requirements of VM-22 are considered PBR requirements for purposes of the Valuation Manual." This is so VM-G will apply to VM-22, which would be appropriate.

Commented [VM22676R675]: Edits to address this comment will be reflected in next exposure

Commented [X677]: "Index-linked" annuity is not defined – only RILA and FIA in VM-22, recommend to revise the language or add a definition to define "index linked".

Commented [X678]: Recommend adding this part to E.1.b and delete the Guidance Note.

Commented [VM22679R678]: Edits to address this comment will be reflected in next exposure

for index

F. ~~2. Index-linked or modified guaranteed annuity contracts or riders that do not satisfy either of the two conditions listed above criteria in Paragraph Section 2.E.1 and Section 2.E.2 above and E.1.ii may be a key consideration for application of VM-21 are issued on 1/1/2024 and later are those requirements as found in VM-21.~~

Commented [X680]: VM-21 specifically says “These requirements do not apply to contracts falling under the scope of VM-A-255: Modified Guaranteed Annuities; however, they do apply to contracts listed above that include one or more subaccounts containing features similar in nature to those contained in modified guaranteed annuities (MGAs) (e.g., market value adjustments).” Is this a contradiction?

Commented [X681]: Consistent with E above.

Commented [VM22682R681]: Edits to address this comment will be reflected in next exposure

Subsection 6: Riders and Supplemental Benefits

Guidance Note: Policies ~~Designs~~ of policies or contracts with riders and supplemental benefits which are created to simply disguise benefits subject to the Valuation Manual section describing the reserve methodology for the base product to which they are attached, or exploit a perceived loophole, must be reserved in a manner similar to more typical designs with similar riders.

Commented [X683]: Still need the word "designs" otherwise this is saying the whole policy/contract was only created to disguise benefits, which would never be true.

Commented [VM22684R683]: Edits to address this comment will be reflected in next exposure

A. If a rider or supplemental benefit is attached to a health insurance product, deposit-type contract, or credit life or disability product, it may be valued with the base contract unless it is required to be separated by regulation or other requirements.

B. For supplemental benefits on life insurance policies or annuity contracts, including Guaranteed Insurability, Accidental Death or Disability Benefits, Convertibility, ~~Nursing Home Benefits~~ or Disability Waiver of Premium Benefits, the supplemental benefit may be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, VM-A, and/or VM-C, as applicable.

Commented [X685]: This reference is another place where there would be a benefit distinguishing the PBR sections of VM-22 from the non-PBR sections.

Commented [VM22686R685]: Edits to address this comment will be reflected in next exposure

~~C. ULSG and other secondary guarantee riders on a life insurance policy shall be valued with the base policy and follow the reserve requirements for ULSG policies under VM-20, VM-A and/or VM-C, as applicable.~~

~~D.C. Anyany~~ guaranteed minimum benefits on life insurance policies or annuity contracts ~~not subject to Paragraph C above~~ including, but not limited to, Guaranteed Minimum Accumulation Benefits, Guaranteed Minimum Death Benefits, Guaranteed Minimum Income Benefits, Guaranteed Minimum Withdrawal Benefits, Guaranteed Lifetime Income Benefits, Guaranteed Lifetime Withdrawal Benefits, Guaranteed Payout Annuity Floors, Waiver of Surrender Charges, Return of Premium, Systematic Withdrawal Benefits under Required Minimum Distributions, and all similar guaranteed benefits shall be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, and VM-A and/or VM-C, as applicable.

Commented [X687]: These parallel requirements can be combined.

Commented [VM22688R687]: Edits to address this comment will be reflected in next exposure

~~E.D.~~ If a rider or supplemental benefit to a life insurance policy or annuity contract that is not addressed in Paragraphs B, C, or D above possesses any of the following attributes, the rider or supplemental benefit shall be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, and VM-A and/or VM-C, as applicable.

1. The rider or supplemental benefit does not have a separately identified premium or charge.
2. After issuance, the rider or supplemental benefit premium, charge, value or benefits are determined by referencing the base policy or contract features or performance.
3. After issuance, the base policy or contract value or benefits are determined by referencing the rider or supplemental benefit features or performance. The deduction of rider or benefit premium or charge from the contract value is not sufficient for a determination by reference.

~~F.E.~~ If a term life insurance rider on the named insured[s] on the base life insurance policy does not meet the conditions of Paragraph E above, and either (1) guarantees level or near level premiums until a specified duration followed by a material premium increase; or (2) for a rider for which level or near level premiums are expected for a period followed by a material premium increase, the rider is

separated from the base policy and follows the reserve requirements for term policies under VM20, VM-A and/or VM-C, as applicable.

G.F. For all other riders or supplemental benefits on life insurance policies or annuity contracts not addressed in Paragraphs B through F above, the riders or supplemental benefits may be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, VM-A and/or VM-C, as applicable. For a given rider, the election to include riders or supplemental benefits with the base policy or contract shall be determined at the policy form level, not on a policy-by-policy basis, and shall be treated consistently from year-to-year, unless otherwise approved by the domiciliary commissioner.

H.G. Any supplemental benefits and riders offered on life insurance policies or annuity contracts that would have a material impact on the reserve (for VM-20 and VM-22) or TAR (for VM-21) if elected later in the contract life, such as joint income benefits, nursing home benefits, or withdrawal provisions on annuity contracts, shall be considered when determining reserves (for VM-20 and VM-22) or reserves and TAR (for VM-21) using the following principles:

1. Policyholders with living benefits and annuitization in the same contract will generally use the more valuable of the two benefits.
2. When advantageous, policyholders will commence living benefit payouts if not started yet.

Commented [X689]: Simplifications are judged relative to reserves for VM-20/VM-21 and TAR for VM-21.

Commented [VM22690R689]: Edits to address this comment will be reflected in next exposure

Commented [X691]: This section states that “When advantageous, policyholders will commence living benefit payouts if not started yet.” This text seems to directly contradict VM-22 Section 6.H.2 which states “contract holder behavior should neither assume that all contract holders act with 100% efficiency in a financially rational manner nor assume that contract holders will always act irrationally”. We suggest revising 6.H.2 to align with the text of 10.D.8.

VM-01: Definitions for Terms in Requirements

- The term “Guaranteed Minimum Accumulation Benefit” (GMAB) means a guaranteed benefit providing, or resulting in the provision, that an amount payable on the contractually determined maturity date of the benefit will be increased and/or will be at least a minimum amount. Only such guarantees having the potential to produce a contractual total amount payable on benefit maturity that exceeds the account value, or in the case of an annuity providing income payments, an amount payable on benefit maturity other than continuation of any guaranteed income payments, are included in this definition.
- The term “guaranteed minimum death benefit” (GMDB) means a provision (or provisions) for a guaranteed benefit payable on the death of a contract holder, annuitant, participant or insured where the amount payable is either (i) a minimum amount; or (ii) exceeds the minimum amount and is:
 - Increased by an amount that may be either specified by or computed from other policy or contract values; and
 - Contains either
 - The potential to produce a contractual total amount payable on such death that exceeds the account value, or
 - In the case of an annuity providing income payments, guarantees payment upon such death of an amount payable on death in addition to the continuation of any guaranteed income payments.
- The term “guaranteed minimum income benefit” (GMIB) means an option under which the contractholder has the right to apply a specified minimum amount that could be greater than the amount that would otherwise be available in the absence of such benefit to provide periodic income using a specified purchase basis.

Commented [X692]: We believe a Fixed Annuity PBR Exemption should be incorporated into draft in a manner consistent with the Life PBR Exemption.

Commented [VM22693R692]: The Subgroup voted in favor of a VM-22 PBR Exemption. The ACLI will follow-up with proposed criteria for determining the exemption.

Page 6: [1] Commented [VM2248R47] VM-22 Subgroup 7/13/2022 4:11:00 PM

Subgroup agrees with removing

Page 6: [2] Commented [X49] TDI 11/9/2021 8:56:00 AM

Proposed revision is not appropriate. Item (a) is unnecessary, and items under (b) would be addressed via simplifications and thus are indirectly reflected. Recommend deleting the whole section 1.C.3 including item (a) and item (b).

Page 6: [3] Commented [VM2250R49] VM-22 Subgroup 7/13/2022 4:11:00 PM

Subgroup agrees with removing this section.

Page 6: [4] Commented [CD51] CA DOI 12/30/2021 3:10:00 PM

should this same change also be made to VM-21?

Page 6: [5] Commented [VM2252R51] VM-22 Subgroup 6/23/2022 9:01:00 AM

Edits to address this comment will be reflected in next exposure

Page 6: [6] Commented [X53] TDI 11/9/2021 8:59:00 AM

The revised language “sudden and significant levels of withdrawal and surrenders” replaces the original language “run on the bank” and is less clear. Does “significant” mean severe or extreme? Or just appreciably? Withdraws and surrenders certainly may vary by projected economic scenarios. Recommend using the original language “run on the bank” that had a clearer intent.

Page 6: [7] Commented [VM2254R53] VM-22 Subgroup 7/13/2022 4:11:00 PM

Subgroup in favor of retaining VM-21 language of “run on the bank”.

Page 6: [8] Commented [X55] TDI 11/9/2021 9:02:00 AM

We recommend deleting the wording “fundamentally”.

If a breakthrough is known to have fundamentally changed expected future mortality, but is not yet significantly reflected in historical experience, why is it not reflected? Do we know about this fundamental shift for years before it is reflected? This issue also applies to the VM-21 requirement.

Page 6: [9] Commented [VM2256R55] VM-22 Subgroup 6/23/2022 9:02:00 AM

Edits to address this comment will be reflected in next exposure

Page 6: [10] Commented [X57] ACLI

We recommend removing the bullet “Significant future reserve increases as an unfavorable scenario is realized” as this is extraneous.

Page 6: [11] Commented [VM2258R57] VM-22 Subgroup 7/13/2022 4:12:00 PM

Subgroup in favor retaining language to stay consistent with VM-21.

Page 6: [12] Commented [X59] ACLI

List could be expanded to included operational risk and litigation risk.

Page 6: [13] Commented [VM2260R59] VM-22 Subgroup 6/23/2022 9:03:00 AM

Edits to address this comment will be reflected in next exposure

Page 7: [14] Commented [X65] TDI 11/9/2021 9:04:00 AM

The term Buffer Annuity is not interchangeable to Registered Index-Linked Annuity (RILA) since Buffer Annuity is a subset of RILA. RILA can have different downside protections such as "Buffer" or "Floor". Recommend deleting Buffer Annuity or add descriptions for Buffer Annuity as a subtype in the RILA definition.

Page 7: [15] Commented [X67] ACLI

Suggest aligning the cut off to 13 months for alignment consistent with Actuarial Guideline IX, rather than the 1 year that currently is in the VM-22 draft.

Page 7: [16] Commented [X75] TDI 11/9/2021 9:07:00 AM

The definition of FIA describes the account value as typically with guaranteed principal. Since FIA always has the guaranteed principal, recommend deleting the wording "typically".

Page 9: [17] Commented [X97] ACLI

Is "typically" intended to be a requirement in the definition? That is, to qualify as PRT must the insurance company have the asset risk? Consistent with the comment on Longevity Reinsurance, it would be helpful to clarify where a longevity swap contract falls within these definitions. Notably, index-based longevity swaps should be out of scope as they do not meet definition of "annuity contract" in SSAP 50. It should also be made explicit that PRT contracts can include lump sum benefits, death benefits and cash balance benefits as well.

Page 9: [18] Commented [VM2298R97] VM-22 Subgroup 7/13/2022 4:13:00 PM

Academy will review this comment as part of revisiting the longevity reinsurance definition.

Page 9: [19] Commented [X99] ACLI

It is unclear to us why RILA is defined in VM-22 when it is being used to exclude the product from VM-22 requirements.

Page 9: [20] Commented [VM22100R99] VM-22 Subgroup 6/23/2022 9:12:00 AM

ACLI already following up on a proposal to address the scope and definitions, which will address this issue.

Page 9: [21] Commented [X103] ACLI

Suggest aligning the cut off to 13 months for alignment consistent with Actuarial Guideline IX, rather than the 1 year that currently is in the VM-22 draft.

Page 9: [22] Commented [X105] TDI 11/9/2021 9:06:00 AM

The wording "after (or from)" the issue date used in the DIA and SPIA definitions is confusing. Recommend keeping it simple as "from" the issue date.

Page 11: [23] Commented [VM22126R123] VM-22 Subgroup 6/23/2022 9:14:00 AM

The VM-22 Subgroup voted to adopted "Option 1" for Reserving Categories

Page 11: [24] Commented [VM22125R123] VM-22 Subgroup 3/2/2022 4:12:00 PM

See Equitable comment letter: supports full aggregation, but if choosing between the two exposed options for two reserving categories, prefers option 2.

Page 11: [25] Commented [VM22124R123] VM-22 Subgroup 3/2/2022 2:59:00 PM

See NY comment letter: supports option 1, with additional category for “other” for any other contract with supporting assets such that there is greater reinvestment and longevity risks, than disintermediation risk and other risks associated with policyholder behavior as of the valuation date.

Page 11: [26] Commented [X123] TDI 11/9/2021 9:23:00 AM

The reserving categories for VM-22 are not included in Scope. Recommend including the defined reserving categories in the section when outlining Scope.

Page 11: [27] Commented [X121] ACLI

We would support reworking this section to rely on principles, rather than definitions to determine what is in and out of scope. As product innovation continues, a simple list may not appropriately accommodate the applicability of this chapter. However, if such a list is included, then we believe it should align with the full list presented in Section 13.

Page 11: [28] Commented [VM22122R121] VM-22 Subgroup 6/23/2022 9:16:00 AM

ACLI will follow up with a proposed revision to the definitions and scope section

Page 11: [29] Commented [VM22128R127] VM-22 Subgroup 6/23/2022 9:16:00 AM

Edits to address this comment will be reflected in next exposure

Page 11: [30] Commented [CD127] CA DOI 12/30/2021 3:27:00 PM

suggest numbering the paragraphs within this section

Page 11: [31] Commented [CD129] CA DOI 12/30/2021 3:27:00 PM

suggest swapping the order of this section. That is, start with the "in scope" list, rather than the "out of scope" list.

Also, it seems like there should be specific mentions of GMDBs and GLBs, as there are in VM-21, since those guarantees can also be found on FIAs.

Page 11: [32] Commented [VM22130R129] VM-22 Subgroup 6/23/2022 9:16:00 AM

Edits to address this comment will be reflected in next exposure

Page 11: [33] Commented [X131] TDI 11/9/2021 9:12:00 AM

Since buffer annuities are a subset of RILA, recommend deleting buffer annuities.

Page 11: [34] Commented [VM22132R131] VM-22 Subgroup 6/23/2022 9:16:00 AM

Edits to address this comment will be reflected in next exposure

Page 11: [35] Commented [CD133] CA DOI 12/30/2021 3:28:00 PM

this is not defined in the Definition section. should it be?

Page 11: [36] Commented [VM22134R133] VM-22 Subgroup 6/23/2022 9:17:00 AM

Edits to address this comment will be reflected in next exposure

Page 11: [37] Commented [X135] TDI 11/9/2021 9:17:00 AM

This needs to be revised to be in line with VM-21 Section 2.A. Consider removing "such as" list and adding a cross-reference to VM-21 Section 2.A.

Page 11: [38] Commented [VM22136R135] VM-22 Subgroup 6/23/2022 9:16:00 AM

Edits to address this comment will be reflected in next exposure

Page 12: [49] Commented [X160] TDI 11/9/2021 9:33:00 AM

Need to clarify what is meant by “VM-22 PBR Requirements”. Add specific section references, or update proposal to have the PBR and non-PBR sections of this VM-22 draft in different chapters. After having reviewed, we think it would be much more clear to reconsider the use of "VM-23" for the PBR requirements to avoid ambiguity around scope/exclusions. The non-PBR sections also just don't seem to fit in this draft, and there is now ambiguity around whether other parts of VM-22 apply to them (scope, effective date, principles, etc.).

Page 12: [50] Commented [X163] TDI 11/9/2021 9:28:00 AM

Can a company wait until the end of the transition period to start PBR, but then apply PBR to the issues from during the transition period? This was unclear for VM-20, and still seems unclear here. Need to be explicit one way or the other.

Page 12: [51] Commented [VM22164R163] VM-22 Subgroup 6/23/2022 9:19:00 AM

Discussed with Subgroup and decided to keep the VM-22 language silent on this issue, similar to VM-20, leaving it to be determined on a case-by-case basis for each state.

Page 15: [52] Commented [X179] ACLI

The term "Deterministic Certification Option" may be confusing, as there is no "deterministic" reserve, unlike VM-20. We recommend consideration of an alternative term. In addition, we recommend changing the phrasing to "with the exception of groups of contracts for which a company elects the [Deterministic Certification Option], following the requirements of Section 7.E."

Page 15: [53] Commented [X180] TDI 11/9/2021 9:48:00 AM

Recommend replacing “the scenario reserve” with “the deterministic reserve”. Note that we also disagree with calling the deterministic reserve a stochastic reserve (later in draft), which adds a good deal of confusion.

Page 15: [54] Commented [CD181] CA DOI 12/30/2021 3:35:00 PM

suggest expanding header to "Stochastic Exclusion Test", for clarity

Page 15: [55] Commented [X182] ACLI

Seems to imply that only SPIAs would pass due to the linkage to Section 13. But the reference to interest rates should be broader, if even necessary. Suggest editing as:

"these groups of contracts may be valued using the methodology and statutory maximum valuation rate pursuant to applicable requirements in VM-A, and VM-C, and with the statutory maximum valuation rate for immediate annuities specified in Section 13."

Page 15: [56] Commented [VM22183R182] VM-22 Subgroup 6/23/2022 11:26:00 AM

Edits to address this comment will be reflected in next exposure

Page 15: [57] Commented [CD184] CA DOI 12/30/2021 3:36:00 PM

Suggest rewording to just say "the stochastic exclusion test". There is only 1 SET, with 3 ways of passing it. Therefore, the current wording is confusion because it suggests that there are multiple SETs.

Page 15: [58] Commented [VM22185R184] VM-22 Subgroup 6/23/2022 9:23:00 AM

Edits to address this comment will be reflected in next exposure

Edits to address this comment will be reflected in next exposure

Page 15: [60] Commented [X188] ACLI

We believe this guidance note is unnecessary as the intent of the section is clear, and the wording is possibly confusing.

Page 15: [61] Commented [X189] TDI 11/9/2021 9:57:00 AM

The statement in this section is not acceptable as discussed in the previous TX comment letter. This will have the effect of potentially masking blocks that need PBR.

Page 15: [62] Commented [VM22190R189] VM-22 Subgroup 6/23/2022 9:26:00 AM

Subgroup agreed that wording for exclusion test aggregation should be consistent with VM-20. Edits to address this comment will be reflected in next exposure

Page 15: [63] Commented [X191] ACLI

This section seems to indicate that the grouping of contracts in exclusion testing should be the same as the grouping of contracts for aggregation. This might cause fewer product types to be qualifying for exclusion if the test must be performed at a higher level of aggregation.

Page 15: [64] Commented [VM22192R191] VM-22 Subgroup 6/23/2022 9:27:00 AM

Subgroup voted to use wording consistent with VM-20, which prohibits aggregating contracts with significantly different risk profiles.

Page 15: [65] Commented [CD193] CA DOI 12/30/2021 3:42:00 PM

for clarity, change this reference to "Section 3.D"

Page 15: [66] Commented [VM22194R193] VM-22 Subgroup 6/23/2022 9:24:00 AM

Edits to address this comment will be reflected in next exposure

Page 15: [67] Commented [CD195] CA DOI 12/30/2021 3:41:00 PM

again, suggest rewording this to just say "the stochastic exclusion test"

Page 15: [68] Commented [VM22196R195] VM-22 Subgroup 6/23/2022 9:24:00 AM

Edits to address this comment will be reflected in next exposure

Page 15: [69] Commented [VM22198R197] VM-22 Subgroup 7/16/2022 9:55:00 PM

Subgroup agreed that wording for exclusion test aggregation should be consistent with VM-20. Edits to address this comment will be reflected in next exposure.

Page 15: [70] Commented [X199] ACLI

Either in this item or in Section 12 allocation to contracts not covered by PBR methodology in VM-22 needs to be addressed e.g., carve out because reserves calculated on seriatim formulaic basis.

Page 15: [71] Commented [VM22200R199] VM-22 Subgroup 6/23/2022 9:24:00 AM

Edits to address this comment will be reflected in next exposure

Page 15: [72] Commented [X201] ACLI

This sub-section seems more appropriate in Section 4 (or pulled out completely and consolidated within "I. Introduction" or "VM-01" and applied to all PBR methods).

Page 15: [73] Commented [VM22202R201] VM-22 Subgroup 7/16/2022 9:57:00 PM

The Subgroup decided to focus solely on VM-22 for now and hold off exploring on common principles and assumptions sections

Page 15: [74] Commented [CD203] CA DOI 12/30/2021 3:43:00 PM

VM-21 Section 3.H on simplifications, approximations, and modeling efficiency techniques is missing (including the Guidance Note). Would it make sense to add it?

Edits to address this comment will be reflected in next exposure

Page 15: [76] Commented [X206] TDI 11/9/2021 9:59:00 AM

Recommend to periodically review at least every three years.

Page 15: [77] Commented [CD207] CA DOI 12/30/2021 3:45:00 PM

Should this be "the company... shall", rather than the "qualified actuary... shall"? Not sure why this particular task falls on the QA, when "the company" generally has responsibility for PBR and, in the subsection directly before this one, the company is assigned the task of establishing prudent estimate assumptions.

Page 15: [78] Commented [VM22208R207] VM-22 Subgroup 6/23/2022 9:27:00 AM

Edits to address this comment will be reflected in next exposure

Page 15: [79] Commented [X209] ACLI

Suggest replacing "If the results of statistical testing or other testing" with "If the results of the review" to simplify language and avoid possible confusion.

Page 15: [80] Commented [VM22210R209] VM-22 Subgroup 6/23/2022 9:27:00 AM

Edits to address this comment will be reflected in next exposure

Page 15: [81] Commented [X211] TDI 11/9/2021 10:01:00 AM

Recommend replacing "the qualified actuary" with "the Company" consistent with general PBR requirements that the company set assumptions.

Page 15: [82] Commented [VM22212R211] VM-22 Subgroup 6/23/2022 9:27:00 AM

Edits to address this comment will be reflected in next exposure

Page 15: [83] Commented [CD213] CA DOI 12/30/2021 3:48:00 PM

should this be "the company"? See prior comment.

Page 34: [85] Commented [VM22373] VM-22 Subgroup 7/5/2022 4:21:00 PM

New language drafted by select Subgroup Members to provide certain conditions under which SPIA contracts could automatically pass the exclusion test

Page 34: [86] Commented [CD374] CA DOI 12/30/2021 4:11:00 PM

Suggest renaming this section header/name to "Requirements to Pass the SET". There is only 1 SET, but 3 ways to pass it (SERT, Demonstration or Certifications). The language gets confusing (here and elsewhere) when you start saying there are different "types" of SETs.

Page 35: [87] Commented [X378] ACLI

We recommend removing "pension risk transfer business" from products scoped out of SET certification method. It is unclear why this business would be treated differently from individually issued business for testing intended to capture interest rate risk.

Page 35: [88] Commented [VM22379R378] VM-22 Subgroup 3/2/2022 2:51:00 PM

Subgroup voted to keep PRT ineligible for the Certification Method

Page 35: [89] Commented [CD380] CA DOI 12/30/2021 4:12:00 PM

Page 35: [92] Commented [CD386] CA DOI 12/30/2021 4:14:00 PM

what is meant by "aggregate risk levels"? Aggregated across what? Need clarification on the intentions for adding this phrase, when it is not in VM-20. Otherwise, i would suggest deleting this.

Page 35: [93] Commented [VM22387R386] VM-22 Subgroup 6/23/2022 10:11:00 AM

Edits to address this comment will be reflected in next exposure

Page 35: [94] Commented [X388] TDI 11/18/2021 9:49:00 PM

This is not in VM-20 and would substantially change the exclusion. The intent is not to allow you to group a block that has material interest rate risk with a larger block that is insensitive to interest rate risks and thereby pass. If "aggregate" referred to potential compounding of interest rate, longevity, or asset risk then this could be redrafted to clearly call out a 4th category of risk due to a combination of the first three. However, I think this is already implicitly covered.

Page 35: [108] Commented [X407]	ACLI	

As written, the SERT assumes a single premium product given the change of the denominator to the scenario reserve. Alternative product designs (such as longevity swap) could result in unintended results. We recommend maintaining consistency with VM-20 and using a denominator of future benefits (annuity payments, DBs, etc., excluding premium considerations, expenses, etc.).

Page 35: [109] Commented [VM22408R407] VM-22 Subgroup 6/23/2022 10:12:00 AM

Consensus to use a denominator that only includes benefits and expenses, consistent with VM-20

Page 35: [110] Commented [X409] TDI 11/18/2021 9:53:00 PM

Using (a) in the denominator instead of VM-20's (c) which is a PV of benefits could make this ratio unstable when the scenario reserve (a) is very small. This is particularly applicable if the block being tested does not have CSV.

Page 35: [111] Commented [VM22410R409] VM-22 Subgroup 6/23/2022 10:13:00 AM

Consensus to use a denominator that only includes benefits and expenses, consistent with VM-20

Page 35: [112] Commented [X411] TDI 11/18/2021 9:59:00 PM

The variability should be assured to be immaterial based on the company's materiality standard.

Draft: 8/2/22

Valuation Manual (VM)-22 (A) Subgroup
Virtual Meeting
July 13, 2022

The VM-22 (A) Subgroup of the Life Actuarial (A) Task Force met July 13, 2022. The following Subgroup members participated: Ben Slutsker, Chair (MN); Ahmad Kamil, Elaine Lam, and Thomas Reedy (CA); Lei Rao-Knight (CT); Vincent Tsang (IL); Nicole Boyd (KS); William Leung (MO); Seong-min Eom (NJ); Bill Carmello and Amanda Fenwick (NY); Rachel Hemphill and Yujie Huang (TX); Tomasz Serbinowski (UT); and Craig Chupp (VA).

1. Reviewed the Updated VM-22 Subgroup Documents

Mr. Slutsker said the drafting discussion log (Attachment Twenty-A) has been updated to include the decisions from the Subgroup's June 29 meeting.

2. Reviewed Tier Three Comments in the Proposed VM-22 Framework

Mr. Slutsker reviewed the tier three comments on the proposed VM-22 framework (Attachment Twenty-B). He said the American Council of Life Insurers (ACLI) comment on principle #3 suggested deleting the sentence that begins "Generally assumptions are ..." because it does not provide guidance. He said he is inclined to retain the wording because it also appears in VM-21, Requirements for Principle-Based Reserves for Variable Annuities. The ACLI also suggested deleting the sentence beginning "Therefore the use of assumptions ..." in principle #5. Mr. Carmello and Ms. Hemphill recommended retaining the wording for principle #3; Ms. Hemphill and Mr. Reedy recommended retaining the wording in principle #5. The Subgroup agreed to retain both sets of wording.

The California Department of Insurance (DOI) recommended adding "and Risks not Reflected" to the title of Section 1.C to be consistent with VM-21 and to appropriately describe the content of the subsections under the title. The Subgroup agreed to the title change but chose to delete Section 1.C.3 because a portion is unnecessary, and the remainder is redundant. Mr. Chupp noted that a similar change to VM-21 should be considered.

The California DOI recommended removing references to "separate account fund performance" in Section 1.C.2.a and other places because non-variable annuities are not known to have separate accounts. Rhonda Ahrens (Thrivent) asked if modified guaranteed annuities are considered variable or non-variable products. She said she is not aware of any requirement that would prohibit a non-variable product from having a separate account fund. Ms. Lam said the comment was intended to align this section with other sections where references to separate account funds were deleted. Mr. Leung said that if index-linked variable annuities will be covered by VM-22, the references to separate account funds will have to be retained. Mr. Slutsker said that the reference to separate account funds will be retained, but a guidance note soliciting feedback on the matter will be added.

The Texas Department of Insurance (TDI) recommended changing the wording in Section 1.C.4.a to its original wording, "run on the bank," to be consistent with the wording in VM-21.

The ACLI commented that Section 1.C.4.b.iv is extraneous and should be deleted. The Subgroup said that without a clear reason why the language should be removed, the language will be retained to maintain consistency with VM-21.

The Subgroup agreed that the term "fixed annuity" should be replaced by the term "non-variable annuities" throughout the proposed VM-22 framework.

The Subgroup discussed whether registered indexed-linked annuities (RILAs) should be subject to the requirements of VM-22 or VM-21. There was not a clear preference among Subgroup members. The Academy said RILAs should be addressed in VM-21. Mr. Leung said it should be clarified that non-registered indexed-linked annuities, such as fixed indexed annuities, are addressed in the proposed VM-22 framework. The Subgroup agreed to use the term index-linked variable annuities (ILVAs), instead of RILAs, to be consistent with the name of the Index-Linked Variable Annuity (A) Subgroup.

Ms. Lam agreed to retract the California DOI comment asking to retain the definition of cash value because it is defined in VM-01, Definitions. She assented to the deletion of the definition of guaranteed minimum death benefit (GMDB) from the proposed VM-22 framework if the GMDB definition in VM-21 is moved to VM-01.

Having no further business, the VM-22 (A) Subgroup adjourned.

NAIC VM-22 Drafting Discussion Log

#	Topic	Description	Date	Tier	Outcome
1	VM-22 Scope and Definitions	Keep current definitions for what is in-scope or focus only on non-variable annuities out of scope	4/13/2022	1	Openness to use Section II of the Valuation Manual to determine scope rather than relying on definitions; ACLI to provide potential draft wording
2	Reserving categories and aggregation	Determine Option 1 or Option 2 from exposed reserve category definitions	4/13/2022	1	Preliminary vote to pursue Option 1
3	Small Company Exemption	Fixed Annuity PBR exemption, similar to life PBR exemption for smaller carriers?	4/13/2022	1	Voted to pursue a "Fixed Annuity PBR Exemption"; ACLI to propose a set of potential draft criteria for the exemption
4	Reinvestment Guardrail	Keep VM-20/VM-21 mix, Academy mix, TX mix, or other? Wait until field test for final decision?	4/27/2022	1	Wait until observing impact in field testing results before voting on a reinvestment mix guardrail
5	Principles & Risks Across VM Chapters	Build one section in the Valuation Manual for principles that apply to VM-20, VM-21, and VM-22	4/27/2022	2	Openness to interested party proposals for a common "principles" section, but will focus on working through other VM-22 decisions before exploring
6	General Assumptions Section	Add a section to the VM-22 draft on general considerations and requirements for assumption	4/27/2022	2	Will include a proposed general assumptions section ("Section 1.3") from Texas, to be consistent with a recent APF adoption on VM-21
7	Transition Period	Permit 1) early adoption and 2) retrospective adoption to the start of the 3-year transition period?	4/27/2022	2	Decided to not pursue early adoption; VM-22 will say silent on retrospective adoption to start of transition period, similar to VM-20
8	Minimum Error for Index Credit Hedges	What should be the minimum breakage expense (i.e., error) for modeling hedges supporting index credits?	5/11/2022	2	Will wait until seeing field testing results before minimum threshold
9	Longevity Reinsurance	How should longevity reinsurance be defined and treat negative reserves/recurring premiums?	5/11/2022	2	Academy presented on longevity reinsurance and will provide a refined definition; New Jersey proposal is exposed for reserving requirements
10	Categories for VM-31 Disclosures	What level of granularity should be required for disclosing PBR reserves for product groups in VM-31?	5/11/2022	2	Will wait until seeing field testing results before determining granularity of disclosures
11	Exclusion Test: SPIA contracts	Allow SPIAs to have the option of PBR vs. pre-PBR valuation without an exclusion test?	6/1/2022	2	Voted to allow SPIAs automatically pass exclusion testing, subject to criteria around optionality and a liability duration threshold (TBD)
12	Exclusion Test: PRT Certification Method	Allow PRT contracts to use the Certification Method for exclusion testing?	6/1/2022	2	Do not allow PRT to undergo the Certification Method
13	Exclusion Test: Grouping	Group between products with significantly different risk profiles?	6/1/2022	2	Do not allow grouping between products with significantly different risk profiles, consistent with VM-20 and TDI's proposal
14	Exclusion Test: Future Premiums	For the stochastic exclusion ratio test, determine whether to include future premiums	6/1/2022	2	Include future premiums in the numerator, but only benefits and expenses in the denominator, consistent with VM-20.
15	Exclusion Test: Deterministic Reserve	To pass the deterministic test, does the company need to pass or disclose 16 scenarios with baseline mortality?	6/1/2022	2	Require passing the ratio test for 16 economic scenarios under 100% of the anticipated experience mortality assumption
17	Import Reinsurance Wording from VM-20	Import VM-20 wording on incorporating contractual or additional characteristics for modeling reinsurance?	6/14/2022	2	Include proposed wording from VM-20
18	Fair Value Certification	Include fair value certification, similar to existing VM-21 requirement?	6/14/2022	2	Include fair value certification disclosure for non-index credit hedging programs
16	PRT Mortality	Permit PRT mortality with limited credibility to follow a third-party provider instead of an industry table?	6/14/2022	2	Voted in favor of using a prescribed table; do not permit a third party table upon limited credibility
19	Allocation Method	Determine Option 1 or Option 2? Wait until observing field test results before deciding?	6/29/2022	2	Wait until field test results and further research by ACLI on tax implications prior to revisiting

NAIC VM-22 Drafting Discussion Log

#	Topic	Description	Date	Tier	Outcome
20	Working Reserve	Use a working reserve concept to serve as a floor for contracts without cash surrender value?	6/29/2022	2	Academy will work on a working reserve concept for contracts without cash surrender value, though may be little impact due to reserving categories
21	Grouping for Fund Value Depletion	Appropriate reserving category for deferred annuities with GMWBs/GMIBs that have depleted fund value	6/29/2022	2	Decided to leave these contracts in the "Payout Reserving Category" for now, but will add a drafting note to solicit feedback an optional approach
22	RBC Guidance Note	Retain the guidance note in VM-21 that discusses the relationship between reserves and RBC?	TBD	3	ACLU will provide the full text for the Subgroup to consider
23	Principle 1	Should the edits to Principle 1 for VM-22 be incorporated into VM-21 as well?	TBD	3	For now, will plan to focus only on VM-22, as LATF can explore the other VM chapters upon the Subgroup's recommendation of the VM-22 draft to LATF
24	Principle 2	Does setting an SR to be reasonably conservative over a span of economic cycles contradict other principles?	TBD	3	ACLU will provide the full text for the Subgroup to consider
25	Aggregation Limits	Guidance note stating aggregation may not be possible for experience rated group and reinsurance treaties	TBD	3	Will include this text in the VM-22 draft
26	Principle 3	Delete "Generally, assumptions are to be based on the conservative end of the confidence interval"?	TBD	3	
27	Principle 5	Delete sentence about the principle to not reduce the reserve unless reducing the risk?	TBD	3	
28	Risks not reflected	Retain or remove the list of "Risks not reflected" in VM-22?	TBD	3	
29	Separate Account References	Recommendation to delete all references to "separate accounts" in VM-22	TBD	3	
30	Combination Risks	Proposal to delete "Risks modeled in the company's risk assessment processes that are related to the contracts"	TBD	3	
31	Immaterial Risks	Recommendation to delete sentence about not reflecting risks that do not materially affect the reserves	TBD	3	
32	Significant Future Reserve Increases	Strike this item from the list of risks not reflected?	TBD	3	
33	Fixed Annuity Definition	Need to define a "fixed annuity"?	TBD	3	
34	Longevity Swaps	Are these contracts included in the definition of PRT?	TBD	3	
35	CSV and GMDB definitions	Retain VM-21 definitions for "cash surrender value" and "guaranteed minimum death benefits"?	TBD	3	
36	Assumed reserve level for RBC	Question whether CTE70 was the assumed level for reserves upon determining RBC	TBD	3	
37	VM-23	Consider reinstating "VM-23" to avoid confusion around the where exemptions/exclusions point to vs. PRR?	TBD	3	
38	Pre-Reinsurance	Request to develop further guidance around pre-reinsurance	TBD	3	

NAIC VM-22 Drafting Discussion Log

#	Topic	Description	Date	Tier	Outcome
39	Deterministic Reserve	Use this term for the single scenario reserve calculated upon passing the deterministic exclusion test?	TBD	3	
40	Stochastic Exclusion Test	Change Section 3.E to "Stochastic Exclusion Test" header?	TBD	3	
41	Prudent Estimate Assumptions	Move Section 3.G to Section 4 of the document?	TBD	3	
42	Simplifications	Port over VM-21 Section 3.H on simplifications, approximations, and modeling efficiency techniques?	TBD	3	
43	Review experience every three years?	Make this a requirement for the qualified actuary?	TBD	3	
44	Simplification example for the SPA	Add an example of a simplification for the SPA upon development	TBD	3	
45	Stochastic Mortality	Consider including stochastic mortality in the stochastic reserve for longevity reinsurance?	TBD	3	
46	MVA Guidance Note	Is the market value adjustment guidance note from VM-21 still appropriate for VM-22?	TBD	3	
47	Hedging Reorganization	Move parts of Section 4.A.4 to Section 9, which covers hedging	TBD	3	
48	Future Hedging Programs	Align VM-22 draft to be consistent with APF 2020-12 adopted edits for VM-21?	TBD	3	
49	Index Credit Hedge Margin	Does this reflect both model risk and real-world error? How does stress testing justify the error?	TBD	3	
50	Margin on Hedging Paragraph	Remove this paragraph if included in another section, even upon edits from TDI/OPRR?	TBD	3	
51	Revenue Sharing	Is the section of revenue sharing applicable to non-variable products?	TBD	3	
52	Projection Period	Use consistent language with VM-20?	TBD	3	
53	PIMR	Include pre-tax IMR in VM-22?	TBD	3	
54	MVA on CSV Floor	Apply the market value adjustment factor to the cash surrender value reserve floor for applicable products?	TBD	3	
55	Consistency with Managed Business	Modify NAER requirement to have assets modeled in a manner consistent with how business is managed?	TBD	3	
56	Limits on NAER	Define a specific cap or floor for the NAER instead of saying it should not be "unreasonably high"?	TBD	3	
57	Reserve Floor	NY comment on using CARVM as a reserve floor	TBD	3	

NAIC VM-22 Drafting Discussion Log

#	Topic	Description	Date	Tier	Outcome
58	Longevity Reinsurance & SPA	Require the k-factor approach to address negative reserve issue for longevity reinsurance in SPA?	TBD	3	
59	Longevity Reinsurance & Exclusion Testing	Require the k-factor approach or something similar for longevity reinsurance in exclusion testing?	TBD	3	
60	Standard Projection Amount	Equitable comment on supporting SPA with company assumptions insignificant risk factors	TBD	3	
61	Exclusion Testing & SPA	Modify exclusion test to address the standard projection amount?	TBD	3	
62	Hedging eligibility for exclusion testing	Refine wording around the restriction for not allowing blocks with hedging programs to use exclusion testing? If using the NY7 for the Certification Method, add mortality stress scenarios?	TBD	3	
63	Mortality Stress Tests		TBD	3	
64	Mortality Shock	Include the mortality shock for the ratio test based on the company materiality standard if more restrictive?	TBD	3	
65	Baseline Mortality Test	Include the baseline mortality test in determining the exclusion test?	TBD	3	
66	Permutations	Include note on number of exclusion test permutations for clarity?	TBD	3	
67	Non-Proportional Reinsurance	Retain section on non-proportional reinsurance?	TBD	3	
68	SERT if Other Tests Fail	Prohibit passing the SERT if the demonstration test fails?	TBD	3	
69	Demonstration Test	Remove options in 1.a and 2.a?	TBD	3	
70	Deterministic Exclusion for SPA	Consider SPA for the deterministic exclusion test	TBD	3	
71	Deterministic Exclusion Scenario	Consider disintermediation risk for the SPA scenario?	TBD	3	
72	SPIA Guidance Note	Remove guidance note specifying that the deterministic exclusion test generally applies to SPIAs?	TBD	3	
73	Delta Hedging	Replace or remove example about delta hedging for VM-22?	TBD	3	
74	Policyholder Behavior Considerations	Suggestion to re-word as considerations instead of questions?	TBD	3	
75	Non-Elective Benefits	Remove guidance note to limit modeling non-elective benefits after CSV is depleted if reducing reserves?	TBD	3	
76	100% Policyholder Efficiency	Assuming 100% policyholder inefficiency contradicts VM Section II 6.H.2, so revise VM Section II?	TBD	3	

NAIC VM-22 Drafting Discussion Log

#	Topic	Description	Date	Tier	Outcome
77	NGE Board of Directors	Comment that only allowing NGE exclusion if approved by the Board does not necessarily seem reasonable	TBD	3	
78	Unsupported Judgement	Comment to remove the reference to using "unsupported actuarial judgement" from Section 11	TBD	3	
79	Mortality and Reinsurance	Does Section 11.A require evaluation of a plus vs. minus segment differently for pre- vs. post reinsurance? Does "little or no data" need to be in the header of Section 11.B.3?	TBD	3	
80	Little or No Data		TBD	3	
81	Improvement with Limited Experience	Consider not only credibility blending the base mortality assumption but also the improvement assumption	TBD	3	
82	Option 1 DR vs SR	Require separate allocation for DR vs. SR for allocation Option 1 (Section 13)?	TBD	3	
83	Option 2 for Direct Iteration Method	Option 2 is not designed to work for the Direct Iteration Method	TBD	3	
84	Option 2 Single Scenario	Could produce unstable allocation when products with different risk profiles are aggregated for PBR	TBD	3	
85	Index-linked annuity	This term is used in the proposed Section II, Subsection 2 draft, but is not defined	TBD	3	
86	Modified Guaranteed Annuities (MGAs)	VM-21 has language that exempts contracts falling under scope of MDL-255, does this contradict Section II edits?	TBD	3

Commented [X3]: Note that part of the 2022 VM updates was to replace all instances of "stochastic reserve" with "SR" other than the initial definition in VM-01.

Commented [VM224R3]: Edit to be reflected in next exposure

Section 1: Background

A. Purpose

Sections 1 through 13 of these requirements establish the minimum reserve valuation standard for non-variable annuity contracts as defined in Section 2.A and issued on or after 1/1/2024. Section 14 of these requirements establish the maximum valuation rate for payout annuities for contracts issued on or after 1/1/2018. For all contracts encompassed by the Scope, these requirements constitute the Commissioners Annuity Reserve Valuation Method (CARVM) and, for certain contracts and certificates, the Commissioners Reserve Valuation Method (CRVM).

Guidance Note: CRVM requirements apply to some group pension contracts.

Guidance Note:
Relationship to RBC Requirements
These requirements anticipate that the projections described herein are used for the determination of RBC for all of the contracts falling within the scope of these requirements. These requirements and the RBC requirements for the topics covered within Sections 4.A through 4.E are identical. However, while the projections described in these requirements are performed on a basis that ignores federal income tax, a company may elect to conduct the projections for calculating the RBC requirements by including projected federal income tax in the cash flows and reducing the discount interest rates used to reflect the effect of federal income tax as described in the RBC requirements. A company that has elected to calculate RBC requirements in this manner may not switch back to using a calculation that ignores the effect of federal income tax without approval from the domiciliary commissioner.

Commented [X5]: The proposal suggests VM-22 is not operative until 1/1/2024, which contradicts Section 13 and existing requirements. We would suggest rewording this to clarify that Section 13 is effective after 12/31/2017. Further, we would suggest consistency in labeling of dates (either all text or all numeric).

Commented [VM226R5]: Edits to address this comment will be reflected in next exposure

Commented [CD7]: might be clearer to refer to "Section 2.A" here

Commented [VM228R7]: No objections from the Subgroup to an approach that is broader and focuses on Section 2.A. ACU will follow-up with proposed revisions to the scope section

Commented [X9]: The statement only addresses "contracts". Recommend adding "and certificates". Need to do a holistic review if where "and certificates" may be needed.

Commented [VM2210R9]: Edits to address this comment will be reflected in next exposure

Commented [VM2212R11]: Will discuss after ACU proposes specific draft wording

B. Principles

The projection methodology used to calculate the stochastic reserve^{SR} is based on the following set of principles. These principles should be followed when interpreting and applying the methodology in these requirements and analyzing the resulting reserves.

Guidance Note: The principles should be considered in their entirety, and it is required that companies meet these principles with respect to those contracts that fall within the scope of these requirements and are in force as of the valuation date to which these requirements are applied.

Principle 1: The objective of the approach used to determine the stochastic reserve^{SR} is to quantify the amount of statutory reserves needed by the company to be able to meet contractual obligations in light of the risks to which the company is exposed with an element of conservatism consistent with statutory reporting objectives.

Principle 2: The calculation of the stochastic reserve^{SR} is based on the results derived from an analysis of asset and liability cash flows produced by the application of a stochastic cash-

Commented [X13]: We would support consistent application of principles across all chapters as currently VM-20 does not have a like set of principles. We believe this could involve a broader discussion of the assorted product requirements in the VM. As a shorter-term fix, we would recommend generalizing the principles where appropriate and moving these to "Section I-Introduction" or "VM-0" and equally applying to VM-21.

Commented [VM2214R13]: Discussed with Subgroup. Members are open and interested to a common principles chapter, but decided to hold off on developing for now.

Commented [CD15]: for consistency, will this edit be considered for VM-21 as well?

Commented [VM2216R15]: VM-22 Subgroup will initially focus on VM-22. Consistency with other VM chapters can be explored after development of initial Subgroup recommendation for VM-22.

flow model to equity return and interest rate scenarios. For each scenario, the greatest present value of accumulated deficiency is calculated. The analysis reflects prudent estimate assumptions for deterministic variables and is performed in aggregate (subject to limitations related to contractual provisions and reserving categories) to allow the natural offset of risks within a given scenario. The methodology uses a projected total cash flow analysis by including all projected income, benefit, and expense items related to the business in the model and sets the stochastic reserve SR at a degree of confidence using the CTE measure applied to the set of scenario specific greatest present values of accumulated deficiencies that is deemed to be reasonably conservative over the span of economic cycles.

Guidance Note: Examples where full aggregation between contracts may not be possible include experience rated group contracts and the operation of reinsurance treaties.

Principle 3: The implementation of a model involves decisions about the experience assumptions and the modeling techniques to be used in measuring the risks to which the company is exposed. Generally, assumptions are to be based on the conservative end of the confidence interval. The choice of a conservative estimate for each assumption may result in a distorted measure of the total risk. Conceptually, the choice of assumptions and the modeling decisions should be made so that the final result approximates what would be obtained for the stochastic reserve SR at the required CTE level if it were possible to calculate results over the joint distribution of all future outcomes. In applying this concept to the actual calculation of the stochastic reserve SR, the company should be guided by evolving practice and expanding knowledge base in the measurement and management of risk.

Guidance Note: The intent of Principle 3 is to describe the conceptual framework for setting assumptions. Section 10 provides the requirements and guidance for setting contract holder behavior assumptions and includes alternatives to this framework if the company is unable to fully apply this principle. More guidance and requirements for setting assumptions in general are provided in Section 12.

Principle 4: While a stochastic cash-flow model attempts to include all real-world risks relevant to the objective of the stochastic cash-flow model and relationships among the risks, it will still contain limitations because it is only a model. The calculation of the stochastic reserve SR is based on the results derived from the application of the stochastic cash-flow model to scenarios, while the actual statutory reserve needs of the company arise from the risks to which the company is (or will be) exposed in reality. Any disconnect between the model and reality should be reflected in setting prudent estimate assumptions to the extent not addressed by other means.

Principle 5: Neither a cash-flow scenario model ~~nor a method based on factors calibrated to the results of a cash-flow scenario model~~ can completely quantify a company’s exposure to risk. A model attempts to represent reality but will always remain an approximation thereto and, hence, uncertainty in future experience is an important consideration when determining the stochastic reserve SR. ~~Therefore, the use of assumptions, methods, models, risk management strategies (e.g., hedging), derivative instruments, structured investments or any other risk transfer arrangements (such as reinsurance) that serve solely to reduce the calculated stochastic reserve SR without also reducing risk on scenarios similar to those used~~

Commented [X17]: We support this principle but note that later sections appear to contradict this principle. For example, the statement “The analysis reflects prudent estimate assumptions for deterministic variables and is performed in aggregate (subject to limitations related to contractual provisions) to allow the natural offset of risks within a given scenario.” contradicts with the introduction of additional reserve categories and other limitations (such as model segment restrictions).

Commented [VM2218R17]: Discuss adding “and reserving categories” to the parenthetical statement to avoid contradiction.

Commented [X19]: Principle 2: Recommend reinstating Guidance Note in Principle 2 to be consistent with VM-21.

Commented [VM2220R19]: No objections from Subgroup members to reinstating this guidance note.

Commented [X21]: We suggest deleting the sentence “Generally, assumptions are...” since it does not provide guidance. We also suggest tightening the remainder of the text for clarity.

Commented [X22]: ~~Reinstating assumption guidance~~

Commented [VM2223R22]: Subgroup agreed with this comment. Edits to address this comment will be reflected in next exposure.

Commented [X24]: Principle 5 has the statement “nor a method based on factors calibrated to the results of a cash flow scenario model” which is intended for the Alternative Methodology in VM-21. The statement should be deleted from VM-22.

Commented [VM2225R24]: Edits to address this comment will be reflected in next exposure

Commented [X26]: We recommend deleting the third sentence (starting with “Therefore, the use of assumptions...”) because this lacks historical context and is covered by the final sentence.

in the actual cash-flow modeling are inconsistent with these principles. The use of assumptions and risk management strategies should be appropriate to the business and not merely constructed to exploit “foreknowledge” of the components of the required methodology.

C. Risks Reflected

1. The risks reflected in the calculation of reserves under these requirements arise from actual or potential events or activities that are both:
 - a. Directly related to the contracts falling under the scope of these requirements or their supporting assets; and
 - b. Capable of materially affecting the reserve.

2. Categories and examples of risks reflected in the reserve calculations include, but are not necessarily limited to:
 - a. Asset risks
 - i. Credit risks (e.g., default or rating downgrades).
 - ii. Commercial mortgage loan roll-over rates (roll-over of bullet loans).
 - iii. Uncertainty in the timing or duration of asset cash flows (e.g., shortening (prepayment risk) and lengthening (extension risk)).
 - iv. Performance of equities, real estate, and Schedule BA assets.
 - v. Call risk on callable assets.
 - vi. Separate account fund performance.
 - vii. Risk associated with hedge instrument (includes basis, gap, price, parameter estimation risks, and variation in assumptions).
 - viii. Currency risk.
 - b. Liability risks
 - i. Reinsurer default, impairment, or rating downgrade known to have occurred before or on the valuation date.
 - ii. Mortality/longevity, persistency/lapse, partial withdrawal, and premium payment risks.
 - iii. Utilization risk associated with guaranteed living benefits.
 - iv. Anticipated mortality trends based on observed patterns of mortality improvement or deterioration, where permitted.

Commented [X27]: Consistent with our comments at [redacted], we would support consistent application of risks [redacted] reflected across all chapters, rather than embedding the language in each chapter. Were this to be retained in VM-21, we would suggest maintaining consistency with VM-21 to avoid any confusion.

Commented [VM2228R27]: The Subgroup is open to a common chapter with all risks identified for different PBR frameworks, but decided to hold off on developing for now.

Commented [CD29]: VM-21 has "... and Risks Not Reflected" in this section header, which should be retained here since the section on risks not reflected is still in here.

Commented [CD30]: Can a non-variable annuity have a separate account fund? I am not aware of any such annuity, that is not a variable annuity. Furthermore, all references to separate accounts and fund performance were deleted from this draft. Thus, we should consider deleting this item from the list.

- v. Annuitization risks.
 - vi. Additional premium dump-ins ~~or deposits~~ (high interest rate guarantees in low interest rate environments).
 - vii. Applicable expense risks, including fluctuation ~~in~~ maintenance expenses directly attributable to the business, future commission expenses, and expense inflation/growth.
- c. Combination risks
- i. Risks modeled in the company’s risk assessment processes that are related to the contracts, as described above.
 - ii. Disintermediation risk (including such risk related to payment of surrender or partial withdrawal benefits).
 - iii. Risks associated with revenue-sharing income.
3. The risks not necessarily reflected in the calculation of reserves under these requirements are:
- a. Those not associated with the ~~policies or~~ contracts being valued, or their supporting assets.
 - b. Determined to not be capable of materially affecting the reserve.
4. Categories and examples of risks not reflected in the reserve calculations include, but are not necessarily limited to:
- a. Asset risks
 - i. Liquidity risks associated with a ~~sudden and significant levels of withdrawals and surrenders; “run on the bank.”~~
 - b. Liability risks
 - i. Reinsurer default, impairment or rating downgrade occurring after the valuation date.
 - ii. Catastrophic events (e.g., epidemics or terrorist events).
 - iii. Major breakthroughs in life extension technology that have not yet ~~fundamentally~~ altered recently observed mortality experience.
 - iv. Significant future reserve increases as an unfavorable scenario is realized.
 - c. General business risks
 - i. Deterioration of reputation.

Commented [CD31]: Is there a distinction between "dump-ins" and "deposits"? Why are both words needed? Also, if it's determined that both words are needed, should this same change be made in VM-21?

Commented [VM2232R31]: Edits to address this comment will be reflected in next exposure

Commented [X33]: Recommend change to "fluctuation in" maintenance expenses for clarity.

Commented [VM2234R33]: Edits to address this comment will be reflected in next exposure

Commented [CD35]: should this same change also be made to VM-21?

Commented [VM2236R35]: Potential VM-21 will be examined separately from this Subgroup at a later point

Commented [X37]: We recommend removing the bullet "Risks modeled in the company's risk assessment processes that are related to the contracts, as described above" as this is unclear and probably extraneous.

Commented [X38]: We recommend removing this section. With the specific RBC language removed, the section loses meaning: "a" is unnecessary and "b" is redundant with other sections of the VM which allow for materiality considerations (language in VM-20 is likely better for this purpose and should be used consistently).

Commented [CD39]: Suggest eliminated "policies or", since customarily, annuities are "contracts"

Commented [VM2240R39]: Edits to address this comment will be reflected in next exposure

Commented [CD41]: This is not in VM-21, and my suggestion would be to delete this

Commented [X42]: Proposed revision is not appropriate. Item (a) is unnecessary, and items under (b) would be addressed via simplifications and thus are indirectly ... [1]

Commented [CD43]: should this same change also be made to VM-21?

Commented [VM2244R43]: Edits to address this comment will be reflected in next exposure

Commented [X45]: The revised language "sudden and significant levels of withdrawal and surrenders" replac ... [2]

Commented [X46]: We recommend deleting the wording "fundamentally" ... [3]

Commented [VM2247R46]: Edits to address this comment will be reflected in next exposure

Commented [X48]: We recommend removing the bullet "Significant future reserve increases as an unfavorable ... [4]

Commented [X49]: List could be expanded to include operational risk and litigation risk.

Commented [VM2250R49]: Edits to address this comment will be reflected in next exposure

- ii. Future changes in anticipated experience (reparameterization in the case of stochastic processes), which would be triggered if and when adverse modeled outcomes were to actually occur.
- iii. Poor management performance.
- iv. The expense risks associated with fluctuating amounts of new business.
- v. Risks associated with future economic viability of the company.
- vi. Moral hazards.
- vii. Fraud and theft.
- viii. Operational.
- ix. Litigation.

D. Specific Definitions for VM-22

Buffer Annuity

Interchangeable term for Registered Index-Linked Annuity (RILA). See definition for Registered Index-Linked Annuity below.

- **Deferred Income Annuity (DIA)**
An annuity which guarantees a periodic payment for the life of the annuitant or a term certain and payments begin ~~one year~~ 13 months or later ~~after (or from)~~ the issue date if the contract holder survives to a predetermined future age.
- **Fixed Indexed Annuity (FIA)**
An annuity with an account value where the contract holder has the option for a portion or all of the account value to grow at a rate linked to an external index, ~~subject to certain limits,~~ typically with guaranteed principal.
- **Flexible Premium Deferred Annuity (FPDA)**
An annuity with an account value established with a premium amount but allows for additional deposits to be paid into the annuity over time, resulting in an increase to the account value. The contract also has a guaranteed interest rate during the accumulation phase and has guaranteed mortality and interest rates applicable at the time of conversion to the payout phase.
- **Funding Agreement**
A contract issued to an institutional investor (domestic and international non-qualified fixed income investors) that provides fixed or floating interest rate guarantees.
- **Guaranteed Investment Contract (GIC)**

Commented [X51]: It seems the definitions included in this section are largely only used for the purpose of establishing the Scope in Section 2. Since this is intended to be a principles-based methodology, recommend a strong definition of "Fixed Annuity" instead of specific products underneath this business. The first paragraph in A. Scope seems to provide this with specific references which are out of scope. If changing the scope section, we would suggest deleting the various product definitions if not used elsewhere; if these definitions are potentially applied beyond VM-22, we would suggest moving any necessary definitions to VM-01.

Commented [VM2252R51]: No objections from the Subgroup to an approach that is broader and focuses less on definitions. ACLI will follow-up with proposed revisions to the scope section

Commented [CD53]: The format of this Definitions section is inconsistent with other parts of the VM. In VM-01 and VM-21, each defined term is numbered, and is defined in this format (for example):
1. The term "buffer annuity" is interchangeable with the term "registered index-linked annuity (RILA)", as defined in Section 1.D.?

Commented [VM2254R53]: Edits to address this comment will be reflected in next exposure

Commented [X55]: The term Buffer Annuity is not interchangeable to Registered Index-Linked Annuity (RILA) since Buffer Annuity is a subset of RILA. RILA can have different downside protections such as "Buffer" or "F... [5]

Commented [VM2256R55]: Edits to address this comment will be reflected in next exposure

Commented [X57]: Suggest aligning the cut off to 13 months for alignment consistent with Actuarial Guideline IX, rather than the 1 year that currently is in the VM-22 c... [6]

Commented [VM2258R57]: Edits to address this comment will be reflected in next exposure

Commented [X59]: The wording "after (or from)" the issue date used in the DIA and SPIA definitions is confusing. Recommend keeping it simple as "from" the issue date.

Commented [VM2260R59]: Edits to address this comment will be reflected in next exposure

Commented [X61]: Is "typically" intended to be a requirement in the definition? That is, to qualify as FIA does there need to be guaranteed principle?

Commented [VM2262R61]: Edits to address this comment will be reflected in next exposure

Commented [CD63]: insert: "subject to certain limits,"

Commented [VM2264R63]: Edits to address this comment will be reflected in next exposure

Commented [X65]: The definition of FIA describes the account value as typically with guaranteed principal. ... [7]

Commented [VM2266R65]: Edits to address this comment will be reflected in next exposure

Insurance contract typically issued to a retirement plan (defined contribution) under which the insurer accepts a deposit (or series of deposits) from the purchaser and guarantees to pay a specified interest rate on the funds deposited during a specified period of time.

- **Index Credit Hedge Margin**

A margin capturing the risk of inefficiencies in the company’s hedging program supporting index credits. This includes basis risk, persistency risk, and the risk associated with modeling decisions and simplifications. It also includes any uncertainty of costs associated with managing the hedging program and changes due to investment and management decisions.

- **Index Credit**

Any interest credit, multiplier, factor, bonus, charge reduction, or other enhancement to contract/policy values that is linked to an index or indices. Amounts credited to the contract/policy resulting from a floor on an index account are included.

Commented [CD67]: should be "contract"

Commented [VM2268R67]: Edits to address this comment will be reflected in next exposure

Commented [CD69]: should be "contract"

Commented [VM2270R69]: Edits to address this comment will be reflected in next exposure

- **Index Crediting Strategy**

The strategy defined in a contract to determine index credits for a contract. ~~This refers to~~ For example, this may refer to underlying index, index parameters, date, timing, performance triggers, and other elements of the crediting method.

- **Index Parameter**

Cap, floor, participation rate, spreads, or other features describing how the contract utilizes the index.

Commented [X71]: We would suggest adding performance trigger to the list, along with other potential crediting methods; alternatively, the definition could specify that the crediting methods listed are examples only.

Commented [VM2272R71]: Edits to address this comment will be reflected in next exposure

- **Longevity Reinsurance**

An agreement, typically a reinsurance arrangement covering one or more group or individual annuity contracts, under which an insurance company assumes the longevity risk associated with periodic payments made to specified annuitants under one or more immediate or deferred payout annuity contracts. A common example is participants in one or more underlying retirement plans.

Commented [X73]: The definition states that "agreements which are not treated as reinsurance under Statement of Statutory Accounting Principles (SSAP) No. 61R are not included in this definition". Why is this the case and does this imply that longevity swaps are not within the scope of VM-22? Recommend adding to the out of scope list in "2.A Scope" if that is the case. Clarification would also be helpful on what guidance should be used for the agreements if out of scope for VM-22. Further, we would suggest removing "typically" from the definition.

Commented [VM2274R73]: Academy will follow-up with proposed revisions to the definition of Longevity Reinsurance.

- Typically, the reinsurer pays a portion of the actual benefits due to the underlying annuitants (or, in some cases, a pre-agreed amount per annuitant), while the ceding insurance company retains the assets supporting the reinsured annuity payments and pays periodic, ongoing premiums to the reinsurer over the expected lifetime of benefits paid to the specified annuitants. Such agreements may contain net settlement provisions such that only one party makes ongoing cash payments in a particular period. Under these agreements, longevity risk may be transferred on either a permanent basis or for a prespecified period of time, and these agreements may or may not permit early termination.

Commented [VM2275]: New Jersey comment letter: due to future premiums, longevity reinsurance may generate negative reserves, which can be used to eliminate or reduce other immediate annuity reserves. Suggest using net premium methodology, solving for a k-factor at issue to solve for $PV(\text{premiums}) = PV(\text{benefits})$.

- Agreements which are not treated as reinsurance under Statement of Statutory Accounting Principles (SSAP) No. 61R are not included in this definition. In particular, contracts under which payments are made based on the aggregate mortality experience of

Commented [VM2276R75]: VM-22 Subgroup has exposed a proposal from NJ to address this issue.

a population of lives which are not covered by an underlying group or individual annuity contract (e.g., mortality index-based longevity swaps) are not included in this definition.

- **Market Value Adjustment (MVA) Annuity**

An annuity with an account value where withdrawals and full surrenders are subject to adjustments based on interest rates or index returns at the time of withdrawal/surrender. There could be ceilings and floors on the amount of the market-value adjustment.

- **Modified Guaranteed Annuity (MGA)**

A type of market-value adjusted annuity contract where the underlying assets are most commonly held in an insurance company separate account and the value of which are guaranteed if held for specified periods of time. The contract contains nonforfeiture values and death benefits that are based upon a market-value adjustment formula if held for shorter periods.

- **Multiple-Year Guaranteed Annuity (MYGA)**

A type of fixed annuity that provides a pre-determined and contractually guaranteed interest rate for specified periods of time, after which there is typically an annual reset or renewal of a multiple year guarantee period.

- **Pension Risk Transfer (PRT) Annuity**

An annuity, typically a group contract or reinsurance agreement, issued by an insurance company providing periodic payments to annuitants receiving immediate or deferred benefits from one or more retirement plans. Typically, the insurance company holds the assets supporting the benefits, which may be held in the general or separate account, and retains not only longevity risk but also asset risks (e.g., credit risk and reinvestment risk).

- **Registered Index-Linked Annuity (RILA)**

An annuity with an account value where the contract holder has the option for a portion or all of the account value to grow at a rate linked to an external index, similar to a Fixed Indexed Annuity, but with downside risk exposure that may not guarantee full principal repayment. These contracts may include a cap on upside returns, and may also include a floor on downside returns which may be below zero percent.

- **Single Premium Immediate Annuity (SPIA)**

An annuity purchased with a single premium amount which guarantees a periodic payment for the life of the annuitant or a term certain and payments begin within 13 months ~~one year after (or from)~~ the ~~issued~~ issue date.

- **Single Premium Deferred Annuity (SPDA)**

An annuity with an account value established with a single premium amount that grows with a guaranteed interest rate during the accumulation phase and has guaranteed mortality and interest rates applicable at the time of conversion to the payout phase. May also include cases where the premium is accepted for a limited amount of time early in the contract life, such as only in the first duration.

Commented [X77]: We recommend editing the definition as follows "A type of market-value adjusted annuity contract where the underlying assets are most commonly held in an insurance company separate account..."

Commented [VM2278R77]: Edits to address this comment will be reflected in next exposure

Commented [X79]: To clarify definition of MGA, recommend adding "death benefits".

Commented [VM2280R79]: Edits to address this comment will be reflected in next exposure

Commented [CD81]: should this be "Multi-Year" instead of "Multiple Year"? The former is the more commonly used term for MYGA

Commented [VM2282R81]: Edits to address this comment will be reflected in next exposure

Commented [CD83]: "fixed annuity" is not defined. Is it better to change all instances of "fixed annuity" to "non-variable annuity" to be consistent with the terminology introduced in Section 1.A (and to be aligned with the actual VM-22 chapter name)? An alternative could be to add a definition for "fixed annuity", with the definition of it being a "non-variable annuity"

Commented [CD84]: ok to keep this as "multiple year"

Commented [VM2285R84]: Edits to address this comment will be reflected in next exposure

Commented [X86]: Is "typically" intended to be a requirement in the definition? That is, to qualify as PRT must the insurance company have the asset risk? Consistent with the comment on Longevity Reinsurance, it would be helpful to clarify where a longevity swap contract falls within these definitions. Notably, index-based longevity swaps should be out of scope as they do not meet definition of "annuity contract" in SSAP 50. It should also be made explicit that PRT contracts can include lump sum benefits, death benefits and cash balance benefits as well.

Commented [X87]: It is unclear to us why RILA is defined in VM-22 when it is being used to exclude the product... [8]

Commented [VM2288R87]: ACLI already following up on a proposal to address the scope and definitions, w... [9]

Commented [X89]: If need to address Buffer Annuity (not sure this is needed), can add here as a subset of RILA.

Commented [VM2290R89]: Edits to remove "Buffer Annuity" will be reflected in next exposure

Commented [X91]: Suggest aligning the cut off to 13 months for alignment consistent with Actuarial Guide... [10]

Commented [VM2292R91]: Edits to address this comment will be reflected in next exposure

Commented [X93]: The wording "after (or from)" the issue date used in the DIA and SPIA definitions is co... [11]

Commented [VM2294R93]: Edits to address this comment will be reflected in next exposure

• **Stable Value Contract**

A contract that provides limited investment guarantees, typically preserving principal while crediting steady, positive returns and protecting against losses or declines in yield. Underlying asset portfolios typically consist of fixed income securities, which may sit in the insurer’s general account, a separate account, or in a third-party trust. These contracts often support defined contribution or defined benefit retirement plan liabilities.

• **Structured Settlement Contract (SSC)**

A contract that provides periodic benefits and is purchased with a single premium amount stemming from various types of claims pertaining to court settlements or out-of-court settlements from tort actions arising from accidents, medical malpractice, and other causes. ~~Adverse mortality is typically expected for these contracts.~~

Commented [X95]: Suggest striking sentence “Adverse mortality is typically expected for these contracts.” from definition. Additionally, it is possible that there may be non-standard settlements.

Commented [VM2296R95]: Edits to address this comment will be reflected in next exposure

• **Synthetic Guaranteed Investment Contract (Synthetic GIC)**

Contract that simulates the performance of a traditional GIC through a wrapper, swap, or other financial instruments, with the main difference being that the assets are owned by the ~~contract policyholder~~ or plan trust.

Commented [CD97]: suggest spelling out GIC first, followed by the acronym

Commented [VM2298R97]: Edits to address this comment will be reflected in next exposure

Commented [CD99]: should be “contract holder”

• **Term Certain Payout Annuity**

A contract issued, which offers guaranteed periodic payments for a specified period of time, not contingent upon mortality or morbidity of the annuitant.

Commented [VM22100R99]: Edits to address this comment will be reflected in next exposure

• **Two-Tiered Annuity**

A deferred annuity with two tiers of account values. One, with a higher accumulation interest rate, is only available for annuitization or death. The other typically contains a lower accumulation interest rate, and is only available upon surrender.

~~The term “cash surrender value” means, for the purposes of these requirements, the amount available to the contract holder upon surrender of the contract. Generally, it is equal to the account value less any applicable surrender charges, where the surrender charge reflects the availability of any free partial surrender options. However, for contracts where all or a portion of the amount available to the contract holder upon surrender is subject to a market value adjustment, the cash surrender value shall reflect the market value adjustment consistent with the required treatment of the underlying assets. That is, the cash surrender value shall reflect any market value adjustments where the underlying assets are reported at market value, but it shall not reflect any market value adjustments where the underlying assets are reported at book value.~~

Commented [CD101]: this definition still applies, should we keep it?

~~The term “guaranteed minimum death benefit” (GMDB) means a provision (or provisions) for a guaranteed benefit payable on the death of a contract holder, annuitant, participant or insured where the amount payable is either (i) a minimum amount; or (ii) exceeds the minimum amount and is:~~

Commented [CD102]: this definition still applies, should we keep it?

~~— is increased by an amount that may be either specified by or computed from other policy or contract values; and~~

~~has the potential to produce a contractual total amount payable on such death that exceeds the account value, or~~

~~in the case of an annuity providing income payments, guarantees payment upon such death of an amount payable on death in addition to the continuation of any guaranteed income payments.~~

E. Materiality

The company shall establish a standard containing the criteria for determining whether an assumption, risk factor, or other element of the principle-based valuation has a material impact on the size of the reserve. This standard shall be applied when identifying material risks.]

Section 2: Scope and Effective Date

A. Scope

Subject to the requirements of this Sections 1 to 13 of VM-22 are annuity contracts, certificates and contract features, whether group or individual, including both life contingent and term-certain-only, directly written or assumed through reinsurance issued on or after 1/1/2024, with the exception of contracts or benefits listed below.]

Products out of scope include:

1. ~~Contracts or benefits that are subject to VM 21 (such as variable annuities, RILAs, buffer annuities, and structured annuities)~~
2. ~~GICs~~
3. ~~Synthetic GICs~~
4. ~~Stable Value Contracts~~
5. ~~Funding Agreements~~

Products in scope of VM-22 include ~~non-variable~~ fixed annuities which consist of, but are not limited to, the following ~~the~~ list:

- **Account Value Based Annuities**
 1. Deferred Annuities (SPDA & FPDA)
 2. Multi-Year Guarantee Annuities (MYGA)
 3. Fixed Indexed Annuities (FIA)
 4. Market Value Adjustments (MVA)
 5. Two-tiered Annuities
 6. Guarantees/Benefits/Riders on ~~Non-Variable~~ Fixed Annuity Contracts
- **Payout Annuities**
 1. Single Premium Immediate Annuities (SPIA)
 2. Deferred Income Annuities (DIA)
 3. Term Certain Payout Annuities~~es~~
 4. Pension Risk Transfer Annuities (PRT)
 5. Structured Settlement Contracts (SSC)
 6. Longevity Reinsurance

2. GICs
3. Synthetic GICs
4. Stable Value Contracts
5. Funding Agreements

~~The company may elect to exclude one or more groups of contracts from the stochastic reserve calculation in certain situations, pursuant to the exclusion test requirements defined in Section 3.E of VM-22.~~

B. Effective Date & Transition

Effective Date

These requirements apply for valuation dates on or after January 1, 2024.

Transition

A company may elect to establish minimum reserves pursuant to applicable requirements in VM-A and VM-C for business otherwise subject to VM-22 PBR requirements and issued during the first three years following the effective date of VM-22 PBR. If a company during the three-year transition period elects to apply VM-22 PBR to a block of such business, then a company must continue to apply the requirements of VM-22 PBR for future issues of this business. Irrespective of the transition date, a company shall apply VM-22 PBR requirements to applicable blocks of business on a prospective basis starting at least three years after the effective date.

Commented [X137]: We suggest moving or deleting the sentence "The company may elect to exclude one or more groups of contracts from the stochastic reserve calculation in certain situations, pursuant to the exclusion test requirements defined in Section 3.E of VM-22." from this section as it does not seem fitting here.

Commented [VM22138R137]: Edits to address this comment will be reflected in next exposure

Commented [CD139]: self-referencing "VM-22" is not necessary

Commented [VM22140R139]: Edits to address this comment will be reflected in next exposure

Commented [X141]: Does this belong in Scope? Do these still follow the other VM-22 requirements (if the old VM-22 interest rate determinations are left in the same chapter as the VM-22 PBR requirements)?

It is normal to then list what requirements such excluded contracts would follow. However, the statement here is more problematic because you can be excluded from the SR but still subject to VM-22.

Commented [VM22142R141]: Edits to address this comment will be reflected in next exposure

Commented [CD143]: again, suggest numbering the paragraphs within this section

Commented [VM22144R143]: Edits to address this comment will be reflected in next exposure

Commented [X145]: We still have a question about whether RBC factors are still at an appropriate level, if principles-based capital is not developed. Were they set assuming that this reserve was at a CTE(70) level in the first place, or were they dependent on the prior framework?

Commented [X146]: Need to clarify what is meant by "VM-22 PBR Requirements". Add specific section references, or update proposal to have the PBR and non-PBR sections of this VM-22 draft in different chapters ... [38]

Commented [X147]: To be more clear, recommend adding "transition period" to "the three years".

Commented [VM22148R147]: Edits to address this comment will be reflected in next exposure

Commented [X149]: Can a company wait until the end of the transition period to start PBR, but then apply PBR to all issues from during the transition period? This was ... [39]

Commented [VM22150R149]: Discussed with Subgroup and decided to keep the VM-22 language silent on th ... [40]

Commented [CD151]: Will we (or should we) allow for any early adopters (like we did for VM-21)? It would seem reasonable to us to consider accommodating early adopters.

Commented [VM22152R151]: Discussed with Subgroup and decided to not have early adoption before the start of the three year transition period.

Section 3: Reserve Methodology

A. Aggregate Reserve

The aggregate reserve for contracts falling within the scope of these requirements shall equal the ~~stochastic reserve~~SR (following the requirements of Section 4) ~~plus the additional standard projection amount (following the requirements of Section 6) plus the DR for those contracts satisfying the Deterministic Certification Option,~~ less any applicable PIMR for all contracts not valued under applicable requirements in VM-A and VM-C, plus the reserve for any contracts valued under applicable requirements in VM-A and VM-C.

Guidance Note: Contracts valued under applicable requirements in VM-A and VM-C are ones that pass the exclusion test and elect to not model PBR ~~stochastic reserves~~SRs, per the requirements in Section 3.E.

B. Impact of Reinsurance ~~Ceded~~

All components in the aggregate reserve shall be determined post-reinsurance ceded, that is net of any reinsurance cash flows arising from treaties that meet the statutory requirements that allow the treaty to be accounted for as reinsurance. A pre-reinsurance ceded reserve also needs to be determined by ignoring all reinsurance cash flows (costs and benefits) in the reserve calculation.

~~C. To Be Determined~~The Additional Standard Projection Amount

D. The Stochastic Reserve

~~The stochastic reserve~~

The additional standard projection amount is determined by applying one of the two standard projection methods defined in Section 6. The same method must be used for all contracts within a group of contracts that are aggregated together to determine the reserve. The company shall elect which method they will use to determine the additional standard projection amount. The company may not change that election for a future valuation without the approval of the domiciliary commissioner.

D. The SR

1. The SR shall be determined based on asset and liability projections for the contracts falling within the scope of these requirements, excluding those contracts valued using the methodology pursuant to applicable requirements in VM-A and VM-C, over a broad range of stochastically generated projection scenarios described in Section 8 and using prudent estimate assumptions as required in Section 3.GF herein.
2. The ~~stochastic reserve~~SR amount for any group of contracts shall be determined as CTE70 of the scenario reserves following the requirements of Section 4, with the exception of groups of contracts for which a company elects the Deterministic Certification Option in Section 7.E, which shall be determined as the ~~scenario reserve~~DR following the requirements of Section 4.
3. The reserve may be determined in aggregate across various groups of contracts within each Reserving Category as a single model segment when determining the ~~stochastic reserve~~ if the business and risks are not managed separately or are part of the same integrated risk management program. Aggregation is permitted if a resulting group of contracts (or model segment) follows the listed principles:SR. However, groups of contracts within different Reserving Categories may

Commented [X153]: Reinstate and modify later as needed - SPA being developed in separate workflow.

Commented [VM22154R153]: To address SPA later in the VM-22 development process.

Commented [X155]: One of the most confused parts of the draft was referring to a DR as the SR for certain contracts. Need to handle and refer to separately.

Commented [VM22156R155]: Edits to address this comment will be reflected in next exposure

Commented [X157]: Guidance is needed on how a pre-reinsurance reserve is to be determined.

Commented [X158]: Reinstate and modify later as needed - SPA being developed in separate workflow.

Commented [VM22159R158]: Edits to address this comment will be reflected in next exposure

Commented [CD160]: Should this be Section 3.G?

Commented [VM22161R160]: Edits to address this comment will be reflected in next exposure

Commented [X162]: Recommend replacing “the scenario reserve” with “the deterministic reserve”. Note that we also disagree with calling the deterministic reserve a stochastic reserve (later in draft), which adds a good deal of confusion.

not be aggregated together in determining the SR. For the purposes of VM-22, Reserving Categories are classified as the following:

- a. The “Payout Annuity Reserving Category” includes the following categories of contracts, certificates and contract features, whether group or individual, including both life contingent and term certain only contracts, directly written or assumed through reinsurance, with the exception of benefits provided by variable annuities:
 - i. Immediate annuity contracts;
 - ii. Deferred income annuity contracts;
 - iii. Structured settlements in payout or deferred status;
 - iv. Fixed income payment streams resulting from the exercise of settlement options or annuitizations of host contracts issued;
 - v. Supplementary contracts, excluding contracts with no scheduled payments (such as retained asset accounts and settlements at interest);
 - vi. Fixed income payment streams attributable to guaranteed living benefits associated with deferred annuity contracts, once the contract funds are exhausted;
 - vii. Certificates, emanating from non- variable group annuity contracts specified in Model #820, Section 5.C.2, purchased for the purpose of providing certificate holders fixed income payment streams upon their retirement; and
 - viii. Pension Risk Transfer Annuities; and
 - ix. Longevity Reinsurance.
- b. The “Accumulation Reserving Category” are all annuities within scope of VM-22 under Section II of the NAIC Valuation Manual that are not in the “Payout Reserving Category”.

Drafting Note: Additional feedback is welcome for whether to permit optionality for categorizing guaranteed living benefit contracts with depleted fund value as either in the payout or accumulation reserving category.

Commented [VM22163]: Include in deferred annuities with depleted fund value in payout reserving Category or accumulation reserving category.

Commented [VM22164R163]: The Subgroup has elected to leave these contracts in the payout annuity reserving category, but is adding to a drafting note to welcome feedback.

Using prudent actuarial judgement, consider the following elements when aggregating groups of contracts: whether groups of contracts are part of the same portfolio (or different portfolios that interact), same integrated risk management system, administered/managed together

4. Do not aggregate groups of contracts for which the company elects to use the Deterministic Certification Option in Section 7.E with any groups of contracts that do not use such option.

54.7 To the extent that these limits on the aggregation results results in more than one model segment, the stochastic reserve SR shall equal the sum of the stochastic reserve SR amounts computed for each model segment and scenario reserve DR amounts computed for each model segment for which the company elects to use the Deterministic Certification Option in Section 7.E.

E. Exclusion Test

1. To the extent that certain groups of contracts pass one of the defined stochastic exclusion tests in Section 7.B, these groups of contracts may be valued using the methodology and statutory maximum valuation rate pursuant to applicable requirements in VM-A and VM-C, with the statutory maximum valuation rate for immediate annuities specified in and Section 13.

a. For dividend-paying contracts, a dividend liability shall be established upon following requirements in VM-A and VM-C, as described above, for the base contract.

Guidance Note: The intention of contracts that pass the stochastic exclusion test is to provide the option to value contracts under VM-A and VM-C. This may apply to pre-PBR CARVM requirements in accordance with Actuarial Guideline XXXIII (AG33) methodology with type A, B, C rates for SPIAs issued before 2018; AG33 methodology with pre-PBR VM-22 rates for SPIAs issued on/after 2018; Actuarial Guideline XXXV (AG35) pre-PBR methodology for Fixed Indexed Annuities; and AG33 methodology (with interest rate updates for modernization initiatives on new contracts) for non-SPIAs.

2. The approach for grouping contracts company may not group together contract types with significantly different risk profiles when performing the exclusion tests should follow the same principles that underlie the aggregation approach for model segments discussed for Stochastic Reserves in Section D above test.

F. Allocation of the Aggregate Reserve to Contracts

The aggregate reserve shall be allocated to the contracts falling within the scope of these requirements using the method outlined in Section 4.213, with the exception of contract following Section 3.E which are to be calculated on a seriatim basis.

G. Prudent Estimate Assumptions

1. With respect to the Stochastic Reserve SR in Section 3.D, the company shall establish the prudent estimate assumption for each risk factor in compliance with the requirements in Section 12 of Model #820 and must periodically at least every 3 years review and update the assumptions as appropriate in accordance with these requirements.

2. The qualified actuary, to whom responsibility for this group of contracts is assigned, shall annually review relevant emerging experience for the purpose of assessing the appropriateness of the anticipated experience assumption. If the results of statistical testing or other testing the review indicate that previously anticipated experience for a given factor is inadequate, then the qualified actuary Company shall set a new, adequate, anticipated experience assumption for the factor.

Commented [X165]: The term "Deterministic Certification Option" may be confusing, as there is no "deterministic" reserve, unlike VM-20. We recommend consideration of an alternative term. In addition, we recommend changing the phrasing to "with the exception of groups of contracts for which a company elects the [Deterministic Certification Option], following the requirements of Section 7.E."

- 3. To determine the prudent estimate assumptions, the stochastic reserve SR shall also follow the requirements in Sections 4 and general assumptions including Section 9 for asset assumptions, Section 10 for contract/policy holder behavior assumptions, and Section 11 for mortality assumptions, and Section 12 for general guidance and expense assumptions.

Commented [CD199]: should this be "contract holder"?

Commented [VM22200R199]: Edits to address this comment will be reflected in next exposure

Commented [X201]: Need a new section for the general assumptions, including specifics for the expense assumptions. APF currently exposed for VM-21. We should be consistent with any edits.

Commented [VM22202R201]: Edits to address this comment will be reflected in next exposure

H. Approximations, Simplifications, and Modeling Efficiency Techniques

A company may use simplifications, approximations, and modeling efficiency techniques to calculate the SR and/or the additional standard projection amount required by this section if the company can demonstrate that the use of such techniques does not understate the reserve by a material amount, and the expected value of the reserve calculated using simplifications, approximations, and modeling efficiency techniques is not less than the expected value of the reserve calculated that does not use them.

Guidance Note:

Examples of modeling efficiency techniques include, but are not limited to:

1. Choosing a reduced set of scenarios from a larger set consistent with prescribed models and parameters.
2. Generating a smaller liability or asset model to represent the full seriatim model using grouping compression techniques or other similar simplifications.

There are multiple ways of providing the demonstration required by Section 3.H. The complexity of the demonstration depends upon the simplifications, approximations or modeling efficiency techniques used. Examples include, but are not limited to:

1. Rounding at a transactional level in a direction that is clearly and consistently conservative or is clearly and consistently unbiased with an obviously immaterial impact on the result (e.g., rounding to the nearest dollar) would satisfy 3.H without needing a demonstration. However, rounding to too few significant digits relative to the quantity being rounded, even in an unbiased way, may be material and in that event, the company may need to provide a demonstration that the rounding would not produce a material understatement of the reserve.
2. A brute force demonstration involves calculating the minimum reserve both with and without the simplification, approximation or modeling efficiency technique, and making a direct comparison between the resulting reserve. Regardless of the specific simplification, approximation or modeling efficiency technique used, brute force demonstrations always satisfy the requirements of Section 3.H.
3. Choosing a reduced set of scenarios from a larger set consistent with prescribed models and parameters and providing a detailed demonstration of why it did not understate the reserve by a material amount and the expected value of the reserve would not be less than the expected value of the reserve that would otherwise be calculated. This demonstration may be a theoretical, statistical or mathematical argument establishing, to the satisfaction of the insurance commissioner, general bounds on the potential deviation in the reserve estimate rather than a brute force demonstration.
4. Justify the use of randomly sampling withdrawal ages for each contract instead of

following the exact prescribed WDCM method by demonstrating that the random sampling method is materially equivalent to the exact prescribed approach, and the simplification does not materially reduce the Additional Standard Projection Amount and the final reported reserve. In particular, the company should demonstrate that the statistical variability of the results based on the random sampling approach is immaterial by testing different random sets, e.g., if randomly selecting a withdrawal age for each contract, the probability distribution of the withdrawal age should be stable and not vary significantly when using different random number sets.

Commented [X203]: Specific example should be tailored based on the SPA developed.

Commented [X204]: Added consistent with VM-21 Section 3.H, which was added to the 2022 VM.

Commented [VM22205R204]: Edits to address this comment will be reflected in next exposure

Section 4: Determination of Stochastic Reserve SR

A. Projection of Accumulated Deficiencies

1. General Description of Projection

The projection of accumulated deficiencies shall be made ignoring federal income tax in both cash flows and discount rates, and it shall reflect the dynamics of the expected cash flows for the entire group of contracts, reflecting all product features, including any guarantees provided under the contracts using prudent estimate liability assumptions defined in Sections 10 and 11 and asset assumptions defined in Sections 4 and 9.D. The company shall project cash flows including the following:

a. ~~Revenues~~ Gross premium received by the company including gross premiums received from the ~~policyholder~~ policyholder contract holder (including any due premiums as of the projected start date).

Guidance Note: If due premiums are modeled, the final reported reserve needs to be adjusted by adding the due premium asset.

b. Other revenues, including contractual fees and charges, and revenue-sharing income received by the company (net of applicable expenses).

c. All material benefits projected to be paid to contract policyholders including, but not limited to, death claims, surrender benefits and withdrawal benefits—reflecting the impact of all guarantees and adjusted to take into account amounts projected to be charged to account values on general account business. Any guarantees, in addition to market value adjustments assessed on projected withdrawals or surrenders, shall be taken into account.

Guidance Note: Amounts charged to account values on general account business are not revenue; examples include rider charges and expense charges.

a.d. Non-Guaranteed Elements (NGE) cash flows as described in Section 10.II.

b.e. Insurance company expenses (including overhead and investment maintenance expense), commissions, contractual fees and charges, and revenue sharing income received by the company (net of applicable expenses) other acquisition expenses associated with business inforce as of the valuation date.

e.f. Net Cash flows associated with any reinsurance.

d.g. Cash flows from hedging instruments as described in Section 4.A.4.

Commented [NJ206]: Consider including stochastic mortality in the SR for longevity reinsurance

Commented [CD207]: Should this refer to Section 4 and Section 9?

Commented [VM22208R207]: Edits to address this comment will be reflected in next exposure

Commented [CD209]: "contract holder"?

Commented [VM22210R209]: Edits to address this comment will be reflected in next exposure

Commented [X211]: If due premium as of the projected start date is included in the modeling, the final reported reserve should be adjusted by adding the due premium, otherwise there would be a double counting of the due premium asset. This needs to be clarified - see guidance note added below.
Recommend specifying the revenue in this bullet to be gross premium since there are other revenue items that are discussed in other bullets.

Commented [VM22212R211]: Edits to address this comment will be reflected in next exposure

Commented [CD213]: "contract holders"

Commented [VM22214R213]: Edits to address this comment will be reflected in next exposure

Commented [X215]: The purpose of this guidance note is not clear as these charges would be reflected in the cash flows.

Commented [VM22216R215]: Edits to address this comment will be reflected in next exposure

Commented [CD217]: should this be Section 10.I?

Commented [VM22218R217]: Edits to address this comment will be reflected in next exposure

Commented [X219]: Changed investment expense to be maintenance expense so that it does not repeat what is included in bullet h.

Commented [VM22220R219]: Edits to address this comment will be reflected in next exposure

Commented [X221]: Added acquisition expenses.

Commented [VM22222R221]: Edits to address this comment will be reflected in next exposure

Commented [X223]: Take out the revenues that covers the investment expenses and added a separate bullet under bullet "a" for other revenues.

Commented [VM22224R223]: Edits to address this comment will be reflected in next exposure

Commented [CD225]: Both net and gross cash flows have to be considered, so I don't agree with the addition of "Net" here

Commented [VM22226R225]: Edits to address this comment will be reflected in next exposure

e-h. Cash receipts or disbursements associated with invested assets (other than policy loans) as described in Section 4.D.4, including investment income, realized capital gains and losses, principal repayments, asset default costs, investment expenses, asset prepayments, and asset sales.

f.i. If modeled explicitly, cash flows related to policy loans as described in Section 10.I.2, including interest income, new loan payments and principal repayments.

Guidance Note: Future net policy loan cash flows include: policy loan interest paid in cash plus repayments of policy loan principal, including repayments occurring at death or surrender (note that the future benefits in Section 4.A.1.b are before consideration of policy loans), less additional policy loan principal (but excluding policy loan interest that is added to the policy loan principal balance).

Guidance Note: Section 4.A.1 requires market value adjustments (MVAs) on liability cash flows to be reflected because in a cash flow model, assets are assumed to be liquidated at market value to cover the cash outflow of the cash surrender; therefore, inclusion of the market value adjustment aligns the asset and liability cash flows. This may differ from the treatment of MVAs in the definition of cash surrender value (Section 1.D), which defines the statutory reserve floor for which the values must be aligned with the annual statement value of the assets.

Commented [X227]: Guidance Note regarding the market value adjustment seems still applies and should not be deleted. We reinstated the guidance note.

2. Grouping of Index Crediting Strategies

Index crediting strategies for fixed indexed annuities may be grouped for modeling using an approach that recognizes the investment guidelines and objectives of each index crediting strategy. In assigning each index crediting strategy to a grouping for projection purposes, the fundamental characteristics of the index crediting strategy shall be reflected, and the parameters shall have the appropriate relationship to the stochastically generated projection scenarios described in Section 8. The grouping shall reflect characteristics of the efficient frontier (i.e., returns generally cannot be increased without assuming additional risk).

Commented [X228]: Suggest editing the first sentence to note scope is FIAs and to avoid confusion regarding the term "investment guideline" as follows: "Index crediting strategies for fixed indexed annuities may be grouped for modeling using an approach that recognizes the investment guidelines and objectives of each index crediting strategy."

Commented [VM2229R228]: Edits to address this comment will be reflected in next exposure

Index accounts sharing similar index crediting strategies may also be grouped for modeling to an appropriately crafted proxy strategy normally expressed as a linear combination of recognized market indices, sub-indices or funds, in order to develop the investment return paths and associated interest crediting. Each index crediting strategy's specific risk characteristics, associated index parameters, and relationship to the stochastically generated scenarios in Section 8 should be considered before grouping or assigning to a proxy strategy. Grouping and/or development of a proxy strategy may not be done in a manner that intentionally understates the resulting reserve.

3. Model Cells

Projections may be performed for each contract in force on the date of valuation or by assigning contracts into representative cells of model plans using all characteristics and criteria having a material impact on the size of the reserve. Assigning contracts to model cells may not be done in a manner that intentionally understates the resulting reserve.

4. Modeling of Hedges

a. For a company that does not have a future hedging program tied directly to supporting the contracts falling under the scope of VM-22 stochastic reserve SR requirements:

- i. The company shall not consider the cash flows from any future hedge purchases or any rebalancing of existing hedge assets in its modeling.
- ii. Existing hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the starting assets. The hedge assets may then be considered in one of two ways:
 - a) Include the asset cash flows from any contractual payments and maturity values in the projection model; or
 - b) No hedge positions in which case the hedge positions held on the valuation date are replaced with cash and/or other general account assets in an amount equal to the aggregate market value of these hedge positions.

Guidance Note: If the hedge positions held on the valuation date are replaced with cash, then as with any other cash, such amounts may then be invested following the company's investment strategy.

A company may switch from method a) to method b) at any time, but it may only change from b) to a) with the approval of the domiciliary commissioner.

b. For a company that has a future hedging program tied directly to supporting the contracts falling under the scope of VM-22 stochastic reserve SR requirements:

- i. For a hedging program with hedge payoffs that offset interest credits associated with indexed interest strategies (indexed interest credits):
 - a) In modeling cash flows, the company shall include the cash flows from future hedge purchases or any rebalancing of existing hedge assets that are intended solely to offset interest credits to policyholders/contract holders.
 - b) Existing hedging instruments that are currently held by the company for this purpose offsetting the indexed credits in support of the contracts falling under the scope of these requirements shall be included in the starting assets. Existing hedging instruments that are currently held by the company not for any other purpose offsetting the indexed credits should be modeled consistently with the requirements of Section 4.A.4.a.ii.
 - c) An Index Credit Hedge Margin for these hedge instruments shall be reflected by reducing index interest credit hedge payoffs by a margin multiple that shall be justified by sufficient and credible

Commented [X230]: Given that Section 9 covers hedging, we would suggest considering moving parts of Section 4.A.4 to that section.

Commented [X231]: VM-22 took out the CDHS requirement and replaced it with "future hedging program". Future hedging should not materially reduce reserves or TAR if it is not well documented. The hedging DG is currently working on this for VM-20/VM-21. We will work with VM-22 subgroup to edit VM-22 accordingly.

Commented [X232]: Suggest rewording "Future hedging program" to "hedging program with future transactions" to avoid ambiguity.

Commented [CD233]: The word "future" to describe the "hedging program" here is confusing. What about current hedging programs with expected future hedge purchases? Why not just say "hedging program"? Also, I wanted to note that removing the concept of CDHS creates inconsistency with both VM-20 and VM-21. Why not retain it?

Commented [CD234]: same comment as above, about the word "future" being confusing

Commented [CD235]: "contract holders"

Commented [VM22236R235]: Edits to address this comment will be reflected in next exposure

Commented [X237]: "Any other purpose" in the last sentence seems overly broad and should be narrowed.

Commented [VM22238R237]: Edits to address this comment will be reflected in next exposure

Commented [X239]: Specify "for this purpose" as "for offsetting the indexed credits", specify "for any other purposes" as "not for offsetting the indexed credits".

Commented [VM22240R239]: Edits to address this comment will be reflected in next exposure

Commented [X241]: We believe the company should determine the appropriate margin based on their demonstration of effectiveness. Any guardrails on these undetermined values should be minimal, including as low as possible, subject to the appropriate demonstration of effectiveness. Further, we believe that documentation of effective product management should be contemplated in addition to historical effectiveness.

Commented [VM22242R241]: Subgroup agreed to revisit this discussion after field testing.

Commented [CD243]: clarify verbiage by saying "hedge instruments" or "derivative instruments"

Commented [VM22244R243]: Edits to address this comment will be reflected in next exposure

company experience and be no less than [X%] multiplicatively of the interest credited. In the absence of sufficient and credible company experience, a margin of [Y%] shall be assumed. There is no cap on the index credit hedge margin if company experience indicates actual error is greater than [Y%]. It is permissible to substitute stress-testing for sufficient and credible experience if such stress-testing comprehensively considers a robust range of future market conditions.

- ii. For a company that hedges any contractual obligation or risks other than indexed interest credits, the detailed requirements for the modeling of hedges are defined in Section 9. The following requirements do not supersede the detailed requirements.
 - a) The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the projections used in the determination of the stochastic reserve SR.
 - b) The projections shall take into account the appropriate costs and benefits of hedge positions expected to be held in the future. Because models do not always accurately portray the results of hedge programs, the company shall, through back-testing and other means, assess the accuracy of the hedge modeling. The company shall determine a stochastic reserve SR as the weighted average of two CTE values; first, a CTE70 (“best efforts”) representing the company’s projection of all of the hedge cash flows, including future hedge purchases, and a second CTE70 (“adjusted”) which shall use only hedge assets held by the company on the valuation date and only future hedge purchases associated with indexed interest credited. These are discussed in greater detail in Section 9.
 - c) Consistent with Section 4.A.4.b.i., if the company has an indexed credit hedging program, the index credit hedge margin for instruments associated with indexed interest credited shall be reflected by reducing hedge payoffs by a margin multiple as defined in Section 4.A.4.b.i.c); in both the “best efforts” run and the “adjusted” run.
 - d) The use of products not falling under the scope of these VM-22 PBR Section 1 through 13 requirements (e.g., variable annuities) (e.g., equity indexed annuities) as a hedge shall not be recognized in the determination of accumulated deficiencies.

Commented [X245]: It is not clear how the stress testing can be used to support the index credit hedge margin. It is a test of the modeled strategy not actual performance and does not reflect any model error. We suggest that both back testing and stress testing be required and elaborated further:
Clearly specify method and metrics used for the back testing with focus on all available recent relevant history, not limited to 12 months
Recommend defined stress periods for stress testing, e.g., 2008 financial crisis, 2020 COVID impaired market conditions.

Commented [X246R245]: We will repeat the comment from our first letter: "Regarding hedge breakage expense assumptions, are both sources of error reflected here - error in the hedging itself, and error in the ability to accurately model it? Should we be separately considering the two limitations to make sure they are both clear: 1) the real-world hedging error and 2) the modeling error in reflecting the future hedging? Current error factor discussions seem muddled."

Commented [X247]: Again, need to coordinate with Hedging DG.

Commented [X248]: Margins are discussed in a different section, so recommend deleting.

Commented [X249]: Edits were made to provide context and clarification for the requirements.

Commented [VM22250R249]: Edits to address this comment will be reflected in next exposure

Commented [X251]: Clarify that “these requirements” should be specified as “VM-22 PBR requirements”. Again, we suggest reconsidering the use of “VM-23”, though.

Commented [VM22252R251]: Edits to address this comment will be reflected in next exposure

Commented [CD253]: It might be helpful to keep the parenthetical statement, with “variable annuities” as the example

Commented [VM22254R253]: Edits to address this comment will be reflected in next exposure

Guidance Note: Section 4.A.4.b.i is intended to address common situations for products with index crediting strategies where the company only hedges index credits or clearly separates index credit hedging from other hedging. In this case the hedge positions are considered similarly to other

fixed income assets supporting the contracts, and a margin is reflected rather than modeling using a CTE70 adjusted run with no future hedge purchases. If a company has a more comprehensive hedge strategy combining index credits, guaranteed benefit, and other risks (e.g., full fair value or economic hedging), an appropriate and documented bifurcation method should be used in the application of sections 4.A.4.b.i and 4.A.4.b.ii above for the hedge modeling and justification. Such bifurcation methods may quantify the specific risk exposure attributable to index credit liabilities versus other liabilities such as guaranteed living benefits, and apply such for the basis for allocation.

Guidance Note: The requirements of Section 4.A.4 govern the determination of reserves for annuity contracts and do not supersede any statutes, laws or regulations of any state or jurisdiction related to the use of derivative instruments for hedging purposes and should not be used in determining whether a company is permitted to use such instruments in any state or jurisdiction.

5. Revenue Sharing

If applicable, projections of accumulated deficiencies may include income from projected future revenue sharing, net of applicable projected expenses (net revenue-sharing income) if each of the following requirements are met:

Commented [X255]: Unclear why Revenue Sharing is considered for non-variable products, can probably delete.

6. Length of Projections

Projections of accumulated deficiencies shall be run for as many future years as needed so that no materially greater reserve value would result from longer projection periods. Obligations remain at the end of the projection periods. Company can choose to run a shorter projection period but not shorter than 20 years and include the present value of the terminal benefits and expenses in the accumulated deficiency calculation.

Commented [X256]: Clarify that for revenue sharing, the entire subsection of VM-21 Section 4.A.5 applies.

Commented [VM22257R256]: Edits to address this comment will be reflected in next exposure

Commented [CD258]: The "requirements are met" list is only in Section 4.A.5.a. Was the intent also to define the amount of net revenue-sharing income allowed in the projections? If so, will need to add verbiage to reference VM-21 Section 4.A.5.a through 4.A.5.f.

7. Interest Maintenance Reserve (IMR)

The IMR shall be handled consistently with the treatment in the company's cash flow testing, and the amounts should be adjusted to a pre-tax basis.

Commented [VM22259R258]: Edits to address this comment will be reflected in next exposure

Commented [X260]: We recommend that the projection period requirement be in line with that of VM-20. Instead of meeting the immateriality requirement, calculate the present value of the terminal benefits and expenses and include it in the accumulated deficiency calculation.

B. Determination of Scenario Reserve

1. For a given scenario, the scenario reserve shall be determined using one of two methods described below:

Commented [VM22261]: See Bill Wilton's comment letter, expressing opposition to inclusion of pre-tax IMR.

a) The starting asset amount plus the greatest present value, as of the projection start date, of the projected accumulated deficiencies; or

Commented [CD262]: should we consider these changes to VM-21 as well, for consistency?

Commented [VM22263R262]: Edits to address this comment will be reflected in next exposure

Guidance Note: The greatest present value of accumulated deficiencies can be negative.

b) The direct iteration method, where the scenario reserve is determined by solving for the amount of starting assets which, when projected along with all contract cash flows, result in the defeasement of all projected future benefits and expenses at the end of the projection horizon with no positive accumulated deficiencies at the end of any projection year during the projection period.

Commented [X264]: Section does not specify what the "greatest present value" means for contracts without cash surrender value.

Commented [VM22265R264]: Academy will work on developing a "working reserve" concept for products without cash surrender value, though the issue may be minimized given that payout annuities cannot be aggregated with accumulation annuities.

The scenario reserve for any given scenario shall not be less than the cash surrender value with market value adjustment in aggregate on the valuation date for the group of contracts modeled in the projection.

Commented [X266]: For products that do not have a cash surrender value, it is recommended that VM-22 use a "working reserve" concept, similar to VM-21 Section 3.1.1.2, to ensure that the reserve is not less than the cash surrender value requirement. Otherwise, there will be an issue aggregating reserves with and without CS.

2. Discount Rates

In determining the scenario reserve, unless using the direct iteration method pursuant to Section 4.B.1.b, the accumulated deficiencies shall be discounted at the NAER on additional assets, as defined in Section 4.B.3.

Commented [VM22267R266]: Academy will work on developing a "working reserve" concept for products without cash surrender value, though the issue may be minimized given that payout annuities cannot be aggregated with accumulation annuities.

3. Determination of NAER on Additional Invested Asset Portfolio

a. The additional invested asset portfolio for a scenario is a portfolio of general account assets as of the valuation date, outside of the starting asset portfolio, that is required in that projection scenario so that the projection would not have a positive accumulated deficiency at the end of any projection year. This portfolio may include only (i) General Account assets available to the company on the valuation date that do not constitute part of the starting asset portfolio; and (ii) cash assets.

Commented [X268]: For products with market value adjustment, needs to be floored at cash surrender value with MVA.

Commented [X269]: We believe that assets held in the separate account with performance not impacting policyholder benefits should be modeled consistent with how the business is managed.

Guidance Note:

Additional invested assets should be selected in a manner such that if the starting asset portfolio were revised to include the additional invested assets, the projection would not be expected to experience any positive accumulated deficiencies at the end of any projection year.

It is assumed that the accumulated deficiencies for this scenario projection are known.

- b. To determine the NAER on additional invested assets for a given scenario:
 - i. Project the additional invested asset portfolio as of the valuation date to the end of the projection period,
 - a) Investing any cash in the portfolio and reinvesting all investment proceeds using the company's investment policy.
 - b) Excluding any liability cash flows.
 - c) Incorporating the appropriate returns, defaults and investment expenses for the given scenario.
 - ii. If the value of the projected additional invested asset portfolio does not equal or exceed the accumulated deficiencies at the end of each projection year for the scenario, increase the size of the initial additional invested asset portfolio as of the valuation date, and repeat the preceding step.
 - iii. Determine a vector of annual earned rates that replicates the growth in the additional invested asset portfolio from the valuation date to the end of the

projection period for the scenario. This vector will be the NAER for the given scenario.

- iv. If the depletion of assets within the projection results in an unreasonably high negative NAER upon borrowing, the NAER may be set to the assumed cost of borrowing associated with each projected time period, in accordance with Section 4.D.3.c, as a safe harbor.

Guidance Note: There are multiple ways to select the additional invested asset portfolio at the valuation date. Similarly, there are multiple ways to determine the earned rate vector. The company shall be consistent in its choice of methods, from one valuation to the next.

Commented [X270]: The wording “unreasonably high” is not clear or appropriate. Recommend this requirement be revised as part of a holistic fix to address extreme outliers in NAER both on the low and high side to handle anomalies for all of VM-20, VM-21, and VM-22. Some upper/lower cutoffs could be used that depend on scenario returns.

Commented [CD271]: “unreasonably high” is not well defined. Also, do we need to consider guardrails in the case of “unreasonably high” positive NAERs, not just negative NAERs?

C. Projection Scenarios

1. Number of Scenarios

The number of scenarios for which the scenario reserve shall be computed shall be the responsibility of the company, and it shall be considered to be sufficient if any resulting understatement in the ~~stochastic reserve~~ SR, as compared with that resulting from running additional scenarios, is not material.

2. Economic Scenario Generation

Treasury Department interest rate curves, as well as investment return paths for index funds, equities, and fixed income assets shall be determined on a stochastic basis using the methodology described in Section 8. If the company uses a proprietary generator to develop scenarios, the company shall demonstrate that the resulting scenarios meet the requirements described in Section 8.

D. Projection of Assets

1. Starting Asset Amount

a. For the projections of accumulated deficiencies, the value of assets at the start of the projection shall be set equal to the approximate value of statutory reserves at the start of the projection plus the allocated amount of PIMR attributable to the assets selected. Assets shall be valued consistently with their annual statement values. The amount of such asset values shall equal the sum of the following items, all as of the start of the projection:

- i. Any hedge instruments held in support of the contracts being valued; and
- ii. An amount of assets held in the general account equal to the approximate value of statutory reserves as of the start of the projections less the amount in (i).

b. If the amount of initial general account assets is negative, the model should reflect a projected interest expense. General account assets chosen for use as described

above shall be selected on a consistent basis from one reserve valuation hereunder to the next.

2. Valuation of Projected Assets

For purposes of determining the projected accumulated deficiencies, the value of projected assets shall be determined in a manner consistent with their value at the start of the projection. For assets assumed to be purchased during a projection, the value shall be determined in a manner consistent with the value of assets at the start of the projection that have similar investment characteristics. However, for derivative instruments that are used in hedging and are not assumed to be sold during a particular projection interval, the company may account for them at an amortized cost in an appropriate manner elected by the company.

Guidance Note: Accounting for hedge assets should recognize any methodology prescribed by a company’s state of domicile.

3. General Account Assets

- a. General account assets shall be projected, net of projected defaults, using assumed investment returns consistent with their book value and expected to be realized in future periods as of the date of valuation. Initial assets that mature during the projection and positive cash flows projected for future periods shall be invested in a manner that is representative of and consistent with the company’s investment policy, subject to the following requirements:
 - i. The final maturities and cash flow structures of assets purchased in the model, such as the patterns of gross investment income and principal repayments or a fixed or floating rate interest basis, shall be determined by the company as part of the model representation;
 - ii. The combination of price and structure for fixed income investments and derivative instruments associated with fixed income investments shall appropriately reflect the projected Treasury Department curve along the relevant scenario and the requirements for gross asset spread assumptions stated below;
 - iii. For purchases of public non-callable corporate bonds, follow the requirements defined in VM-20 Sections 7.E, 7.F and 9.F. The prescribed spreads reflect current market conditions as of the model start date and grade to long-term conditions based on historical data at the start of projection year four;
 - iv. For transactions of derivative instruments associated with fixed income investments, reflect the prescribed assumptions in VM-20 Section 9.F for interest rate swap spreads;
 - v. For purchases of other fixed income investments, if included in ~~the model~~modeled company investment strategy, set assumed gross asset spreads over U.S. Treasuries in a manner that is consistent with, and results

Commented [X272]: This change was adopted for VM-20 and VM-21 for the 2022 VM.

Commented [VM22273R272]: Edits to address this comment will be reflected in next exposure

in reasonable relationships to, the prescribed spreads for public non-callable corporate bonds and interest rate swaps.

- b. Notwithstanding the above requirements, the modeled aggregate reserve shall be the higher of that produced by the modeled company investment strategy and any non-prescribed asset spreads shall be adjusted as necessary so that the aggregate reserve is not less than that which would be obtained produced by substituting an alternative investment strategy in which all the fixed income reinvestment assets are have the same weighted average life (WAL) as the reinvestment assets in the modeled company investment strategy and are all public non-callable corporate bonds with gross asset spreads, asset default costs, and investment expenses by projection year that are consistent with a credit quality blend of:

- i. ~~5%~~ Treasury
- ii. ~~15%~~ 20% PBR credit rating 3 (Aa2/AA)
- iii. ~~40%~~ 80% PBR credit rating 6 (A2/A)
- iv. 40% PBR credit rating 9 (Baa/BBB)

- c. Any disinvestment shall be modeled in a manner that is consistent with the company’s investment policy and that reflects the company’s cost of borrowing where applicable, provided that the assumed cost of borrowing is not lower than the rate at which positive cash flows are reinvested in the same time period, taking into account duration, ratings, and other attributes of the borrowing mechanism. Gross asset spreads used in computing market values of assets sold in the model shall be consistent with, but not necessarily the same as, the gross asset spreads in Section 4.D.4.a.iii and Section 4.D.4.a.iv, recognizing that initial assets that mature during the projection may have different characteristics than modeled reinvestment assets.

Guidance Note: This limitation is being referred to Life Actuarial (A) Task Force for review. The simple language above “provided that the assumed cost of borrowing is not lower than the rate at which positive cash flows are reinvested in the same time period” is not intended to impose a literal requirement. It is intended to reflect a general concept to prevent excessively optimistic borrowing assumptions. It is recognized that borrowing parameters and rules can be complicated, such that modeling limitations may not allow for literal compliance, in every time step, as long as the reserve is not materially affected. However, if the company is unable to fully apply this restriction, prudence dictates that a company shall not allow borrowing assumptions to materially reduce the reserve.

4. Cash Flows from Invested Assets

- a. Cash flows from general account fixed income assets, including starting and reinvestment assets, shall be reflected in the projection as follows:

Commented [CD274]: should this be "stochastic reserve", since this is within Section 4: Determination of Stochastic Reserve

Commented [VM22275R274]: Edits to address this comment will be reflected in next exposure

Commented [X276]: This change was adopted for VM-20 and VM-21 for the 2022 VM.

Commented [VM22277R276]: Edits to address this comment will be reflected in next exposure

Commented [CD278]: Suggest making this plural ("Treasures") to be consistent with Section 13.B.9

Commented [VM22279R278]: Edits to address this comment will be reflected in next exposure

Commented [X280]: The proposed reinvestment mix comes from a different assumption context in current VM-22, i.e., it is designed to calculate the maximum allowed valuation interest rates, while the reinvestment mix for VM-22 PBR draft is to put a guardrail around the fixed income reinvestment assets. A guardrail is not intended to identify outliers and should not be tied to an average. The biggest concern is with the higher allocation percentage in BBB assets. The valuation manual should build an appropriate level of conservatism in the valuation standards instead of reflecting industry trends. By moving from VM-20 and VM-21 required mix of 50%/50% AA/A to the proposed mix, the gross spreads increased by 20-30 bps for almost all WAL. We do not object to using a lower credit quality guardrail to get rid of any excessive conservatism. We recommend considering and comparing with other alternative allocations, something between the current and the proposed, e.g., 20% AA and 80% A. This will help regulators make informed decisions. In any case, we should be consistent with VM-20 and VM-21. If a change is made, it needs to be for all three.

Commented [VM22281R280]: Varying opinions among the Subgroup. Voted to revisit and determine the guardrail after the field test.

Commented [CD282]: These references should be Section 4.D.3.a.iii and 4.D.3.a.v

Commented [VM22283R282]: Edits to address this comment will be reflected in next exposure

- i. Model gross investment income and principal repayments in accordance with the contractual provisions of each asset and in a manner consistent with each scenario.
 - ii. Reflect asset default costs as prescribed in VM-20 Section 9.F and anticipated investment expenses through deductions to the gross investment income.
 - iii. Model the proceeds arising from modeled asset sales and determine the portion representing any realized capital gains and losses.
 - iv. Reflect any uncertainty in the timing and amounts of asset cash flows related to the paths of interest rates, equity returns or other economic values directly in the projection of asset cash flows. Asset defaults are not subject to this requirement, since asset default assumptions must be determined by the prescribed method in VM-20 Sections 7.E, 7.F and 9.F as noted in 4.a.ii above.
- b. Cash flows from general account index funds and general account equity assets—i.e., non-fixed income assets having substantial volatility of returns, such as common stocks and real estate—including starting and reinvestment assets, shall be reflected in the projection as follows:
- i. Determine the grouping for asset categories and the allocation of specific assets to each category in a manner that is consistent with that used for index crediting strategies, as discussed in Section 4.A.2.
 - ii. Project the gross investment return including realized and unrealized capital gains in a manner that is consistent with the stochastically generated scenarios.
 - iii. Model the timing of an asset sale in a manner that is consistent with the investment policy of the company for that type of asset. Reflect expenses through a deduction to the gross investment return using prudent estimate assumptions.
- c. Cash flows for each projection interval for policy loan assets shall follow the requirements in Section 10.H.
- E. Projection of Annuitization Benefits
- 1. Assumed Annuitization Purchase Rates
 - a. For payouts specified at issue (such as single premium immediate annuities, deferred income annuities, and certain structured settlements), such purchase/payout rates shall reflect the payout rate specified in the contract.
 - b. For purposes of projecting future elective annuitization benefits (including annuitizations stemming from the election of a GMIB) and withdrawal amounts from GMWBs, the projected annuitization purchase rates shall be determined

Commented [X284]: Correct an inaccurate VM section reference. The prescribed asset default spreads assumption should be referred to VM-20 Section 9.F. VM-20 Section 7.E and 7.F are requirements for reinvestment assets, disinvestment and cash flows for invested assets. In 7.F, VM-20 just refers to 9.F for defaults.

Commented [VM22285R284]: Edits to address this comment will be reflected in next exposure

Commented [X286]: Request clarification around the meaning of "general account index funds".

Commented [VM22287R286]: Edits to address this comment will be reflected in next exposure

Commented [CD288]: should this reference Section 10.H?

Commented [VM22289R288]: Edits to address this comment will be reflected in next exposure

Commented [CD290]: is there a difference between "purchase rates" and "payout rates"? Both terms are used, so that makes the language unclear. If they are the same, suggest sticking with "purchase rates".

Commented [VM22291R290]: Edits to address this comment will be reflected in next exposure

Commented [X292]: Suggest deleting "In contrast, for payouts specified at issue, the payout rates modeled should be consistent with those specified in the contract." as it appears to be covered by E.1.a.

Commented [VM22293R292]: Edits to address this comment will be reflected in next exposure

Commented [X294]: Reinstate the parenthetical content "(including annuitizations stemming from the election of a GMIB)" since there are GMIB riders attached to fixed annuity products.

Commented [VM22295R294]: Edits to address this comment will be reflected in next exposure

assuming that market interest rates available at the time of election are the interest rates used to project general account assets, as determined in Section 4.D.4. ~~In contrast, for payouts specified at issue, the payout rates modeled should be consistent with those specified in the contract.~~

Commented [X296]: Delete sentence since it repeats 4.E.1.a.

Commented [VM22297R296]: Edits to address this comment will be reflected in next exposure

2. Projected Election of GMIBs, GMWBs and Other Annuitization Options

a. For contracts projected to elect future annuitization options (including annuitizations stemming from the election of a GMIB) or for projections of GMWB benefits once the account value has been depleted, the projections ~~may~~ shall assume the contract will stay in force, the projected periodic payments are paid, and the associated maintenance expenses are incurred.

Commented [X298]: Suggest deleting "may" as there appears to be only option.

Commented [VM22299R298]: Edits to address this comment will be reflected in next exposure

F. Frequency of Projection and Time Horizon

1. Use of an annual cash-flow frequency ("timestep") is generally acceptable for benefits/features that are not sensitive to projection frequency. The lack of sensitivity to projection frequency should be validated by testing wherein the company should determine that the use of a more frequent—i.e., shorter—time step does not materially increase reserves. A more frequent time increment should always be used when the product features are sensitive to projection period frequency.

Commented [X300]: Projection Period is already covered in 4.A.6. Should not be in two places with different guidance.

Commented [VM22301R300]: Edits to address this comment will be reflected in next exposure

Care must be taken in simulating fee income and expenses when using an annual time step. ~~For example, recognizing fee income at the end of each period after market movements, but prior to persistency decrements, would normally be an inappropriate assumption.~~ It is also important that the frequency of the investment return model be linked appropriately to the projection horizon in the liability model. In particular, the horizon should be sufficiently long so as to capture the vast majority of costs (on a present value basis) from the scenarios.

Commented [X302]: Reinstate the deleted example of "For example, recognizing fee income at the end of each period after market movements, but prior to persistency decrements, would normally be an inappropriate assumption."

Commented [VM22303R302]: Edits to address this comment will be reflected in next exposure

Guidance Note: As a general guide, the forecast horizon should not be less than 20 years.

G. Compliance with ASOPs

When determining a stochastic reserve ~~SR~~, the analysis shall conform to the ASOPs as promulgated from time to time by the ASB.

Under these requirements, an actuary will make various determinations, verifications and certifications. The company shall provide the actuary with the necessary information sufficient to permit the actuary to fulfill the responsibilities set forth in these requirements and responsibilities arising from each applicable ASOP.

Section 5: Reinsurance Ceded and Assumed

A. Treatment of Reinsurance Ceded in the Aggregate Reserve

1. Aggregate Reserve Pre- and Post-Reinsurance Ceded

As noted in Section 3.B, the aggregate reserve is determined both pre-reinsurance ceded and post-reinsurance ceded—i.e., the stochastic reserve additional standard projection amount, the SR, DR, and/or the reserve amount valued using requirements in VM-A and VM-C, as applicable—on both bases. Sections 5.A.2 and 5.A.3 discuss adjustments to inputs necessary to determine these components on both a post-reinsurance ceded and a pre-reinsurance ceded basis. Note that due allowance for reasonable approximations may be used where appropriate.

2.
2. Stochastic Reserve

Reflection of Reinsurance Cash Flows in the DR or SR

- a. In order to determine the aggregate reserve post-reinsurance ceded, accumulated deficiencies, scenario reserves, and the resulting stochastic reserve SR and DR shall be determined reflecting the effects of reinsurance treaties that meet the statutory requirements that would allow the treaty to be accounted for as reinsurance within statutory accounting. This involves including, where appropriate, all projected reinsurance premiums or other costs and all reinsurance recoveries, where the reinsurance cash flows reflect all the provisions in the reinsurance agreement, using prudent estimate assumptions.

i. In this section, reinsurance includes retrocession, and assuming company includes retrocessionaire.

ii. All significant terms and provisions within reinsurance treaties shall be reflected. In addition, it shall be assumed that each party is knowledgeable about the treaty provisions and will exercise them to their advantage.

Guidance Note: Renegotiation of the treaty upon the expiration of an experience refund provision or at any other time shall not be assumed if such would be beneficial to the company and not beneficial to the counterparty. This is applicable to both the ceding party and assuming party within a reinsurance arrangement.

iii. If the company has knowledge that a counterparty is financially impaired, the company shall establish a margin for the risk of default by the counterparty. In the absence of knowledge that the counterparty is financially impaired, the company is not required to establish a margin for the risk of default by the counterparty.

iv. A company shall include the cash flows from a reinsurance agreement or amendment in calculating the stochastic aggregate reserve if such qualifies for credit in compliance with Appendix A-791 of the Accounting Practices and Procedures Manual. If a reinsurance agreement or amendment does not qualify for credit for reinsurance but treating the reinsurance agreement or amendment as if it did so qualify would result in a reduction to the company's surplus, then the company shall increase the minimum aggregate reserve by the absolute value of such reductions in surplus.

Commented [X304]: The wording and titling may need to be tightened due to clarify which items apply to assumed and ceded reinsurance in the text.

Commented [VM22305R304]: Edits to address this comment will be reflected in next exposure

Commented [X306]: Delete and just have title be "Reinsurance". Should structure be more like VM-20?

Commented [X307R306]: I, II (and III –VM-21 needs edits)

Commented [VM22308R306]: Edits to address this comment will be reflected in next exposure

Commented [CD309]: "and Assumed" is added here, but there is still only a subsection 5.A that addresses reinsurance ceded (at least in the section header).

Commented [VM22310R309]: Edits to address this comment will be reflected in next exposure

Commented [CD311]: need to add "and Assumed" here?

Commented [VM22312R311]: Edits to address this comment will be reflected in next exposure

Commented [X313]: reinstate

Commented [VM22314R313]: Edits to address this comment will be reflected in next exposure

Commented [X315]: Can take out vague approximation references, since now have a general allowance for appropriate approximations.

Commented [VM22316R315]: Edits to address this comment will be reflected in next exposure

Commented [X317]: Consistent with VM-20

Commented [VM22318R317]: Edits to address this comment will be reflected in next exposure

Commented [X319]: VM-20 Section 8.A.1 makes sense here as well.

Commented [VM22320R319]: Edits to address this comment will be reflected in next exposure

Commented [CD321]: should this be "stochastic reserve"?

Commented [VM22322R321]: Edits to address this comment will be reflected in next exposure

Commented [X323]: VM-22 draft so far uses aggregate, not minimum.

Commented [VM22324R323]: Edits to address this comment will be reflected in next exposure

- b. In order to determine the ~~stochastic reserve~~ SR and DR on a pre-reinsurance ceded basis, accumulated deficiencies, scenario reserves, and the resulting ~~stochastic reserve~~ SR and DR shall be determined ignoring the effects of reinsurance ceded within the projections. Different approaches may be used to determine the starting assets on the ceded portion of the contracts, dependent upon the characteristics of a given treaty:
 - i. For a standard coinsurance treaty, where the assets supporting the ceded liabilities were transferred to the assuming reinsurer, one acceptable approach involves a projection based on using starting assets on the ceded portion of the policies that are similar to those supporting the retained portion of the ceded policies or supporting similar types of policies. Scaling up each asset supporting the retained portion of the contract is also an acceptable method.

Guidance Note: For standard pro rata insurance treaties ~~(does that do not include experience refunds)~~, where allocated expenses are similar to the renewal expense allowance, reflecting the quota share applied to the present value of future reinsurance cash flows pertaining to the reinsured block of business may be considered as a possible approach to determine the ceded reserves.

Commented [X325]: Correct phrasing.

Commented [VM22326R325]: Edits to address this comment will be reflected in next exposure

- ii. Alternatively, a treaty may contain an identifiable portfolio of assets associated with the ceded liabilities. This could be the case for several forms of reinsurance: funds withheld coinsurance; modified coinsurance; coinsurance with a trust. To the extent these assets would be available to the cedant, an acceptable approach could involve modeling this portfolio of assets. To the extent that these assets were insufficient to defease the ceded liabilities, the modeling would partially default to the approach discussed for a standard coinsurance treaty. To the extent these assets exceeded what might be needed to defease the ceded liabilities (perhaps an over collateralization requirement in a trust), the inclusion of such assets shall be limited.

Guidance Note: Section 3.5.2 in ASOP No. 52, *Principle-Based Reserves for Life Products under the NAIC Valuation Manual*, provides possible methods for constructing a hypothetical pre-reinsurance asset portfolio, if necessary, for purposes of the pre-reinsurance reserve calculation.

- c. An assuming company shall use assumptions to project cash flows to and from ceding companies that reflect the assuming company’s experience for the business segment to which the reinsured policies belong and reflect the terms of the reinsurance agreement.
- d. The company shall assume that the counterparties to a reinsurance agreement are knowledgeable about the contingencies involved in the agreement and likely to exercise the terms of the agreement to their respective advantage, taking into account the context of the agreement in the entire economic relationship between the parties. In setting assumptions for the NGE in reinsurance cash flows, the company shall include, but not be limited to, the following:
 - i. The usual and customary practices associated with such agreements.
 - ii. Past practices by the parties concerning the changing of terms, in an economic environment similar to that projected.
 - iii. Any limits placed upon either party’s ability to exercise contractual options in the reinsurance agreement.
 - iv. The ability of the direct-writing company to modify the terms of its policies in response to changes in reinsurance terms.
 - v. Actions that might be taken by a party if the counterparty is in financial difficulty.

Commented [X327]: VM-20 Section 8.C.7 seems particularly applicable. We encourage others to also review VM-20 Section 8 for other sections that should also apply. VM-20 Section 8 is much more developed than VM-21 Section 5 with many more considerations for assumption setting, and we would suggest the VM-22 subgroup consider rewriting starting with VM-20 instead of VM-21.

Commented [VM22328R327]: Subgroup agreed with reflecting this language in the VM-22 draft

3. Reserve Determined Upon Passing the Exclusion Test

If a company passes the stochastic exclusion test and elects to use a methodology pursuant to applicable Sections VM-A and VM-C, as allowed in Section 3.E, it is important to note that the methodology produces reserves on a pre-reinsurance ceded basis. Therefore, the reserve must be adjusted for any reinsurance ceded accordingly. In addition, reserves valued under applicable Sections in VM-A and VM-C, unadjusted for reinsurance, shall be applied to the contracts falling under the scope of these requirements to determine the aggregate reserve prior to reinsurance.

It should be noted that the pre-reinsurance-~~ceded~~ and post-reinsurance-~~ceded~~ reserves may result in different outcomes for the exclusion test. In particular, it is possible that the pre-reinsurance-~~ceded~~ reserves would pass the relevant exclusion test (and allow the use of VM-A and VM-C) while the post-reinsurance-~~ceded~~ reserves might not, or vice versa.

4. Additional Standard Projection Amount

Where reinsurance is ceded, the additional standard projection amount shall be calculated as described in Section 6 to reflect the reinsurance costs and reinsurance recoveries under the reinsurance treaties. The additional standard projection amount shall also be calculated pre-reinsurance ceded using the methods described in Section 6 but ignoring the effects of the reinsurance ceded.

Commented [X329]: Both referring to reinsurance ceded. Should be clarified.

Commented [VM22330R329]: Edits to address this comment will be reflected in next exposure

Commented [X331]: ~~ceded~~

Commented [VM22332R331]: Edits to address this comment will be reflected in next exposure

Commented [X333]: ~~ceded~~

Commented [VM22334R333]: Edits to address this comment will be reflected in next exposure

Commented [X335]: Opposite could also be true.

Commented [VM22336R335]: Edits to address this comment will be reflected in next exposure

Commented [X337]: The current VM-21 language here looks to work for VM-22 without needing to know the specific assumptions, etc., for the SPA.

Commented [VM22338R337]: Edits to address this comment will be reflected in next exposure

Section 6: Standard Projection Amount To Be Determined

Commented [VM22339]: NY Comment Letter: Current CARVM standards should be a minimum floor for VM-22 policies, and only the stochastic reserve should permit grouping whereas the minimum floor should be seriatim.

Commented [X340]: SPA Section placement here still makes sense, but SPA under development.

Commented [VM22341R340]: Edit to update the title of this section will be reflected in next exposure

Commented [VM22342]: Refer to equitable comment letter, which expresses support for the standard projection amount as a binding floor, with the suggestion to rely on company-specific assumptions for insignificant assumptions that are difficult to develop.

Commented [X343]: SPA Section placement here still makes sense, but SPA under development.

Commented [VM22344]: Refer to equitable comment letter, which expresses support for the standard projection amount as a binding floor, with the suggestion to rely on company-specific assumptions for insignificant assumptions that are difficult to develop.

Commented [NJ345]: Once this is written, the language from 4.A.1.a for longevity reinsurance could be added here as well, i.e. the standard projection would use net premiums based on the k factor approach, using the standard projection prescribed assumptions. Floor on std projection is at the contract level

~~Section 6: To Be Determined~~

Section 7: Exclusion Testing

A. Stochastic Exclusion Test Requirement Overview

1. The company may elect to exclude one or more groups of contracts from the stochastic reserve SR calculation if the stochastic exclusion test (SET) is satisfied for that each of the group of contracts. The company has the option to calculate or not calculate the SET.
 - a. If the company does not elect to calculate the SET for one or more groups of contracts, or the company calculates the SET and fails the test for such groups of contracts, the reserve methodology described in Section 4 shall be used for calculating the aggregate reserve for those groups of contracts.
 - b. If the company elects to calculate the SET for one or more groups of contracts, and passes the test for such groups of contracts, then for each group of contracts that passes the SET, the company shall choose whether or not to use the reserve methodology described in Section 4 for those groups that group of contracts. If the reserve methodology described in Section 4 is not used for one or more groups of contracts, then the company shall use the reserve methodology pursuant to applicable requirements in VM-A and VM-C to calculate the aggregate reserve for those groups of contracts.
 - c. A company may not exclude a group of contracts from the stochastic reserve SR requirements if there are one or more future hedging programs associated with supporting the contracts, with the exception of hedging programs solely supporting index credits as described in Section 9.A.1.
 - d. A company may elect to automatically exclude one or more groups of policies from the stochastic reserve calculation without passing the stochastic exclusion test (SET) if all of the following are met for all contracts in the group or groups:
 - i. All of the contracts are either:
 - Single Premium Immediate Annuities,
 - Term Certain Payout Annuities, or
 - Structured Settlement Contracts;
 - ii. None of the contracts are pension risk transfer annuities (PRT) or are covered under a longevity reinsurance agreement;
 - iii. Future payout benefits are either level or stay within 5% of the initial payout benefit amount over time;
 - iv. There is either no or an immaterial level of policyholder options permitted within the contracts; and
 - v. The average [Macauley duration] of the liabilities of the contracts as measured from the issue date (or premium determination date) is less than [X].

B. Requirement to Pass the Types of Stochastic Exclusion Tests

Groups of contracts pass the SET if one of the following is met:

1850 M Street NW Suite 300 Washington, DC 20036 Telephone 202 223 8196 Facsimile 202 872 1948 www.actuary.org

Commented [X346]: Need to modify exclusion testing section to reflect SPA.

Commented [NJ347]: Longevity reinsurance likely to be scoped out of the stochastic reserve unless the stochastic reserve includes consideration of stochastic mortality. If it stays as stochastic interest only, then it probably does make sense that it would meet the exclusion testing. For exclusion testing, the k factor approach should continue to apply, and it should not be combined with other blocks of business

Commented [X348]: Inconsistent groups vs. group references.

Commented [VM22349R348]: Edits to address this comment will be reflected in next exposure

Commented [CD350]: should this be "stochastic reserve", since Section 4 is about determining the stochastic reserve.

Commented [VM22351R350]: Follow Section 4 method of stochastic reserve for Section 3 aggregate reserve if not using the SET

Commented [X352]: Decision is independent for each group the SET is performed on.

Commented [VM22353R352]: Edits to address this comment will be reflected in next exposure

Commented [CD354]: suggest deleting this highlighted part of the sentence

Commented [VM22355R354]: Edits to address this comment will be reflected in next exposure

Commented [CD356]: see earlier comment about the phrase "future hedge program" being confusing.

Commented [X357]: Is "associated with the contracts" the same as the earlier use of "supporting the contracts"? Should the same verbiage be used here? If there is asset hedging for the assets supporting the contracts, it should be included. Need to define "solely supporting" index credits, and also have criteria on the effectiveness/error and documentation of any such hedging that is allowed for excluded business.

Commented [VM22358]: Subgroup voted to permit PRTs below a certain duration to automatically pass the exclusion test, assuming there is limited optionality level/near-level payments, and not PRT or longevity reinsurance. The Academy has agreed to develop a proposed duration threshold

Commented [VM22359]: New language drafted by select Subgroup Members to provide certain conditio... [71]

Commented [CD360]: Suggest renaming this section header/name to "Requirements to Pass the SET". There is only 1 SET, but 3 ways to pass it (SERT, Demonstratio... [72]

Commented [VM22361R360]: Edits to address this comment will be reflected in next exposure

1. Stochastic Exclusion Ratio Test (SERT)—Annually ~~within 12 months before the valuation date~~ ~~within 12 months before the valuation date~~ the company demonstrates that the groups of contracts pass the SERT defined in Section 7.C.
2. Stochastic Exclusion Demonstration Test—In the first year and at least once every three calendar years thereafter, the company provides a demonstration in the PBR Actuarial Report as specified in Section 7.D.
3. ~~SET~~ Certification Method—For groups of contracts that do not have guaranteed living benefits, ~~future hedging programs, or pension risk transfer business~~, in the first year and at least every third calendar year thereafter, the company provides a certification by a qualified actuary that the group of contracts is not subject to material ~~aggregate risk levels across interest rate risk, mortality and/or longevity risk, or asset return volatility risk~~ (i.e., the risk on non-fixed-income investments having substantial volatility of returns, such as common stocks and real estate investments). ~~The company shall provide the certification and documentation supporting the certification to the commissioner upon request.~~

Guidance Note: The qualified actuary should develop documentation to support the actuarial certification that presents his or her analysis clearly and in detail sufficient for another actuary to understand the analysis and reasons for the actuary’s conclusion that the group of contracts is not subject to material interest rate risk, mortality and/or longevity risk, or asset return volatility risk. Examples of methods a qualified actuary could use to support the actuarial certification include, but are not limited to:

- a) A demonstration that, ~~using requirements under VM-A and VM-C~~ for the group of contracts, reserves calculated ~~using requirements under VM-A and VM-C~~ are at least as great as the assets required to support the group of contracts ~~and certificates~~ using the company’s cash-flow testing model under each of the ~~1648~~ scenarios identified in ~~this section~~ Section 7.C.1 or alternatively each of the New York seven ~~scenarios~~ economic scenarios, ~~under each of the three mortality adjustment factors identified in Section 7.C.1.~~
- b) A demonstration that the group of contracts passed the SERT within 36 months prior to the valuation date and the company has not had a material change in ~~its~~ interest rate risk, mortality and/or longevity risk, or asset return volatility risk.
- c) A qualitative risk assessment of the group of contracts that concludes that the group of contracts does not have ~~material~~ interest rate risk, mortality and/or longevity risk, or asset return volatility. Such assessment would include an analysis of product guarantees, the company’s non-guaranteed elements (NGEs) policy, assets backing the group of contracts, ~~the company’s longevity risk, and the company’s investment strategy.~~

C. Stochastic Exclusion Ratio Test

1. ~~In order to exclude a group of contracts from the stochastic reserve~~SR requirements under the stochastic exclusion ratio test (SERT), a company shall demonstrate that the ratio of $(b-a)/a$ is less than ~~the greater of [x]% where~~ the greater of [x]% where and the percentage change that would trigger the company’s materiality standard, ~~where:~~

- Commented [X397]: The variability should be assu...

- a. a = the adjusted scenario reserve described in Paragraph 7.C.2.a below using economic scenario 9, and 100% as the adjustment factor for mortality, the baseline economic scenario, as described in Appendix 1.E of VM-20.
- b. b = the largest adjusted scenario reserve described in Paragraph 7.C.2.b-a below under any of the other 1516 economic scenarios described in Appendix 1.E of VM-20 under both [95]%, 100%, and [105]% of anticipated experience mortality excluding margins. Because mortality variability may differ by company, if the magnitude of the company’s margin for mortality exceeds 5%, then the company shall use the baseline mortality and the mortality augmented by plus and minus the company’s margin for this exercise.

Guidance Note: Note that the numerator should be the largest adjusted scenario reserve for scenarios other than the baseline economic scenario, minus the adjusted scenario reserve for the baseline economic scenario, and 100% as the adjustment factor for mortality. This is not necessarily the same as the biggest difference from the adjusted scenario reserve for the baseline economic scenario and 100% as the adjustment factor for mortality, or the absolute value of the biggest difference from the adjusted scenario reserve for the baseline economic scenario and 100% as the adjustment factor for mortality, both of which could lead to an incorrect test result. There are 47 (=16x3-1) combined economic and mortality scenarios that should be compared for the determination of b.

2. In calculating the ratio in subsection (Section 7.C.1) above:

- a. The company shall calculate an adjusted scenario reserve for the group of contracts for each of each of the 16 scenarios economic scenarios using the three levels of mortality adjustment factors that is equal to either (i) or (ii) below:
 - i. The scenario reserve defined in Section 4, but with the following differences:
 - a) Using anticipated experience assumptions with no margins, with the exception of mortality factors described in Paragraph Section 7.C.1.b of this section.
 - b) Using the interest rates and equity return assumptions specific to each scenario.
 - c) Using NAER and discount rates defined in Section 4 specific to each scenario to discount the cash flows.
 - d) Shall reflect future mortality improvement in line with anticipated experience assumptions.
 - e) Shall not reflect correlation between longevity and economic risks.
 - ii. The gross premium reserve developed from the cash flows from the company’s asset adequacy analysis models, using the experience assumptions of the company’s cash-flow analysis, but with the following differences:
 - a) Using the interest rates and equity return assumptions specific to each scenario.

- Commented [X398]: Correcting reference
- Commented [VM22399R398]: Edits to address this comment will be reflected in next exposure
- Commented [CD400]: better to keep the reference to the full Section (i.e., Section 7.C.2.a.i)
- Commented [VM22401R400]: Edits to address this comment will be reflected in next exposure
- Commented [X402]: Correcting reference
- Commented [VM22403R402]: Edits to address this comment will be reflected in next exposure
- Commented [CD404]: better to keep the reference to the full Section (i.e., Section 7.C.2.b)
- Commented [VM22405R404]: Edits to address this comment will be reflected in next exposure
- Commented [X406]: Need to modify in case largest result is just from the mortality stress on the same scenario.
- Commented [VM22407R406]: Edits to address this comment will be reflected in next exposure
- Commented [X408]: Need to modify in case largest result is just from the economic stress on the same mortality level.
- Commented [X409]: Need to ensure we have captured a prudent level of mortality variation for any given company in this test.
- Commented [X410]: Updating to reflect mortality/economic scenario combinations.
- Commented [X411]: For clarity
- Commented [X412]: Be consistent with standard VM references
- Commented [VM22413R412]: Edits to address this comment will be reflected in next exposure
- Commented [CD414]: better to keep the reference to the full Section (i.e., Section 7.C.1)
- Commented [VM22415R414]: Edits to address this comment will be reflected in next exposure
- Commented [CD416]: why delete this? seems like it wouldn't hurt to keep this language, for additional clarity
- Commented [VM22417R416]: Edits to address this comment will be reflected in next exposure
- Commented [X418]: Be consistent with standard VM references
- Commented [VM22419R418]: Edits to address this comment will be reflected in next exposure
- Commented [CD420]: better to reference the full Section (i.e., Section 7.C.1.b)
- Commented [VM22421R420]: Edits to address this comment will be reflected in next exposure

- b) Using the mortality scalars described in ~~Paragraph~~ Section 7.C.1.b of this section.
 - c) Using the methodology to determine NAER and discount rates defined in Section 4 specific to each scenario to discount the cash flows, but using the company’s cash-flow testing assumptions for default costs and reinvestment earnings.
- Commented [X422]:** Be consistent with standard VM references
- Commented [VM22423R422]:** Edits to address this comment will be reflected in next exposure
- Commented [CD424]:** better to reference the full Section
- Commented [VM22425R424]:** Edits to address this comment will be reflected in next exposure
- b. The company shall use the most current ~~46~~ available baseline economic scenario and the 15 other economic scenarios published by the NAIC. The methodology for creating these scenarios can be found in Appendix 1 of VM-20.
 - c. The company shall use assumptions within each scenario that are dynamically adjusted as appropriate for consistency with each tested scenario.
 - d. ~~The company may not group together contract types with significantly different risk profiles for purposes of calculating this ratio.~~
 - e. ~~If the company has reinsurance arrangements that are pro rata coinsurance and do not materially impact the interest rate risk, longevity risk, or asset return volatility in the contract, then the company may elect to not conduct the stochastic exclusion ratio test under only a pre-reinsurance ceded single basis upon determining the either pre-reinsurance ceded basis upon determining the pre or post-reinsurance reserve ceded aggregate reserve.~~
- Commented [X426]:** No reason for change/inconsistency with other chapters - reject edit.
- Commented [VM22427R426]:** Edits to address this comment will be reflected in next exposure
- Commented [X428]:** Clarification is needed around reference to “significantly different risk profiles”.
- 3. If the ratio calculated in this section is less than [x]% pre-non-proportional reinsurance, but is greater than [x]% post-non-proportional reinsurance, the group of contracts will still pass the SERT if the company can demonstrate that the sensitivity of the adjusted scenario reserve to economic scenarios is comparable pre- and post-non-proportional reinsurance.
- a. An example of an acceptable demonstration:
 - i. For convenience in notation • SERT = the ratio (b–a)/a defined in Section 7.C.1 above
 - a) The pre-non-proportional reinsurance results are “gross of non-proportional,” with a subscript “gn,” so denoted SERT_{gn}
 - b) The post-non-proportional results are “net of non-proportional,” with subscript “nn,” so denoted SERT_{nn}
 - ii. If a block of business being tested is subject to one or more non-proportional reinsurance cessions as well as other forms of reinsurance, such as pro rata coinsurance, take “gross of non-proportional” to mean net of all prorata reinsurance but ignoring the non-proportional contract(s), and “net of non-proportional” to mean net of *all* reinsurance contracts. That is, treat non-proportional reinsurance as the last reinsurance in, and compute certain values below with and without that last component.
- Commented [CD429]:** to be more specific, say “stochastic exclusion ratio test”
- Commented [VM22430R429]:** Edits to address this comment will be reflected in next exposure
- Commented [X431]:** Original did not make sense. Also, the point is that you just need one basis, either pre-reinsurance or post-reinsurance.
- Commented [VM22432R431]:** Edits to address this comment will be reflected in next exposure
- Commented [X433]:** We request clarification or definition of the term “non-proportional reinsurance”.
- Commented [X434]:** Does this make sense for VM-20 as well?
- Commented [VM22435R434]:** Subgroup to only focus on VM-22 for now

iii. So, if $SERT_{gn} \leq [x]_{t+1}^{\%}$ but $SERT_{nn} > [x]_{t+1}^{\%}$, then compute the largest percent increase in reserve (LPIR) = $(b-a)/a$, both “gross of non-proportional” and “net of non-proportional.”

$$LPIR_{gn} = (b_{gy} - a_{gy}) / b_{gn} - a_{gn} / a_{gn}$$

$$LPIR_{nn} = (b_{ny} - a_{ny}) / b_{nn} - a_{nn} / a_{nn}$$

Note that the scenario underlying b_{gn} could be different from the scenario underlying b_{nn} .

If $SERT_{gn} \times LPIR_{nn} / LPIR_{gn} < [x]_{t+1}^{\%}$, then the block of contracts passes the SERT.

- b. Another more qualitative approach is to calculate the adjusted scenario reserves for the 1648 combined economic and mortality scenarios both gross and net of reinsurance to demonstrate that there is a similar pattern of sensitivity by scenario.
- 4. The SERT may not be used for a group of contracts if, using the current year’s data, (i) the stochastic exclusion demonstration test defined in Section 7.D had already been attempted using the method in this section of Section 7.D.2.a or Section 7.D.2.b and did not pass; or (ii) the qualified actuary had actively undertaken to perform the certification method in this section and concluded that such certification could not legitimately be made.

D. Stochastic Exclusion Demonstration Test

- 1. In order to exclude a group of contracts from the stochastic reserve SR requirements using the methodology in this section Stochastic Exclusion Demonstration Test, the company must provide a demonstration in the PBR Actuarial Report in the first year and at least once every three calendar years thereafter that complies with the following:
 - a. The demonstration shall provide a reasonable assurance that if the stochastic reserve SR was calculated on a stand-alone basis for the group of contracts subject to the stochastic reserve SR exclusion, the resulting stochastic reserve for those groups of contracts would not be higher than the statutory reserve determined pursuant to the applicable requirements in VM-A and VM-C. The demonstration shall take into account whether changing conditions over the current and two subsequent calendar years would be likely to change the conclusion to exclude the group of contracts from the stochastic reserve SR requirements.
 - b. If, as of the end of any calendar year, the company determines the aggregate statutory reserve determined pursuant to the applicable requirements in VM-A and VM-C for the group of contracts no longer adequately provides for all material risks, the exclusion shall be discontinued, and the company fails the SERT SET for those contracts.
 - c. The demonstration may be based on analysis from a date that precedes the valuation date for the initial year to which it applies if the demonstration includes an

Commented [X436]: We believe subscript “gy” should be “gn”.

Commented [VM22437R436]: Edits to address this comment will be reflected in next exposure

Commented [X438]: % missing

Commented [VM22439R438]: Edits to address this comment will be reflected in next exposure

Commented [X440]: Note that LPIR is just the SERT using the VM-22 formulation (b-a)/a.

Commented [VM22441R440]: Edits to address this comment will be reflected in next exposure

Commented [X442]: The first and last terms on the left side of this equation cancel out, so it just ends up with needing to pass the SERT on the net basis again. This worked when (c) was the denominator, but now with (a) in the denominator this adjustment is meaningless. Take out the whole example, or revise the SERT to use benefits in the denominator again. Or some new formulation for SERT.

Commented [VM22443R442]: Updated denominator, addressing this issue

Commented [X444]: In VM-20, it is only prohibited for the clearly sufficiently robust attempts of the demonstration method where failing shows the SR would be greater. The other two options could have been incomplete demonstrations and not necessarily imply the SR would be dominant.

Commented [X445]: Clearer language

Commented [VM22446R445]: Edits to address this comment will be reflected in next exposure

Commented [X447]: Does this statement imply a floor reserve of VM-A and VM-C? VM-20 does require the NPR as the floor of the reserve but as written, VM-22 does not require a floor reserve. Recommend removing 1.a. Same statement with the 2.a statement demonstration. This requirement does not apply to the other permitted tests, which seemed counterintuitive.

Commented [CD448]: should this, instead, refer to the statutory reserve determined pursuant to the applicable requirements in VM-A and VM-C?

Commented [VM22449R448]: Edits to address this comment will be reflected in next exposure

Commented [X450]: Typo is also in VM-20

Commented [VM22451R450]: Will follow-up upon addressing VM-30 disclosure requirements

explanation of why the use of such a date will not produce a material change in the outcome, as compared to results based on an analysis as of the valuation date.

- d. The demonstration shall provide an effective evaluation of the residual risk exposure remaining after risk mitigation techniques, such as derivative programs and reinsurance.
2. The company may use one of the following or another method acceptable to the insurance commissioner to demonstrate compliance with ~~subsection~~Section 7.D.1 above:
- a. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the ~~stochastic reserve~~SR calculated on a stand-alone basis.
 - b. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the scenario reserve that results from each of a sufficient number of adverse deterministic scenarios.
 - c. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the ~~stochastic reserve~~SR calculated on a stand-alone basis, but using a representative sample of contracts in the ~~stochastic reserve~~SR calculations.
 - d. Demonstrate that any risk characteristics that would otherwise cause the ~~stochastic reserve~~SR calculated on a stand-alone basis to exceed the statutory reserve calculated in accordance with VM-A and VM-C, are not present or have been substantially eliminated through actions such as hedging, investment strategy, reinsurance or passing the risk on to the ~~contract~~policyholder by contract provision.

Commented [CD452]: should say "Section"

Commented [VM22453R452]: Edits to address this comment will be reflected in next exposure

E. Deterministic Certification Option

- 1. The company ~~has the option to may~~ determine the ~~stochastic reserve~~SR for a group of contracts using a single deterministic economic scenario, subject to the following conditions.
 - a. The company certifies that economic conditions do not materially influence anticipated contract holder behavior for the group of ~~policies, contracts and certificates~~. Examples of contract holder options that are materially influenced by economic conditions include surrender benefits, recurring premium payments, and guaranteed living benefits.
 - b. The company certifies that the group of ~~policies, contracts and certificates~~ is not supported by a reinvestment strategy that contains ~~future hedge purchases~~.
 - c. ~~The company must perform and disclose results from the stochastic exclusion ratio test following the requirements in Section 7.C, thereby disclosing and the scenario reserve volatility across various company must pass the SERT when considering only the 16 economic scenarios, paired with the 100% mortality scenario.~~

Commented [CD454]: "contract holder"

Commented [VM22455R454]: Edits to address this comment will be reflected in next exposure

Commented [X456]: Need SPA for DR as well as SR

Commented [CD457]: suggest saying "may" instead of "has the option to"

Commented [VM22458R457]: Edits to address this comment will be reflected in next exposure

Commented [CD459]: "contracts"

Commented [VM22460R459]: Edits to address this comment will be reflected in next exposure

Commented [X461]: Clarify if this was the intent to exclude contracts supported by index hedging.

Commented [X462]: this is needed to assure the SR is not needed. Otherwise this section is incomplete and does not support using a DR

Commented [VM22463R462]: Subgroup agrees with including the 100% mortality scenario.

- d. The company must disclose a description of contracts and associated features in the certification.

Drafting Note: Consider revisiting Paragraph E.1.c to possibly either require i) falling below a preset threshold for the exclusion ratio test under a single longevity/mortality scenario; or ii) to pass the exclusion test if longevity is not included as part of the ratio test.

Commented [X464]: Agree with drafting note. Edit

Commented [VM22465R464]: Subgroup agrees with including the 100% mortality scenario.

- 2. The stochastic reserve SR for the group of contracts under the Deterministic Certification Option is determined as follows:

- a. Cash flows are projected in compliance with the applicable requirements in Section 4, Section 5, Section 10, and Section 11 of VM-22 over a single economic scenario (scenario 12 found in Appendix 1 of VM-20).
- b. The stochastic reserve SR equals the scenario reserve following the requirements for Section 4.

Guidance Note: The Deterministic Certification Option is intended to provide a non-stochastic option for Single Premium Immediate Annuities (SPIAs) and similar payout annuity products that contain limited or no optionality in the asset and liability cash flow projections.

Commented [X466]: It may not be appropriate to use scenario 12 to calculate the scenario reserve for SPIA. See this article <https://www.soa.org/sections/financial-reporting/financial-reporting-newsletter/2021/july/fr-2021-07-su/>

“in an increasing interest rate environment for business where policyholder behavior is sensitive to prevailing interest rates, life insurers may face an increase in disintermediation risk (i.e., the risk of having to sell assets, potentially at a loss, to fund policyholder surrender benefits) For example, rising interest rates, particularly sudden jumps (e.g., New York 7 pop-up scenario with an immediate interest rate increase of 3 percent), may lead to higher actual and projected policyholder surrenders as policyholders seek out higher yielding investment opportunities. These increasing cash demands may require fixed income assets to be sold at depressed prices, and resultant projected losses (or lower gains) may result in reserve insufficiencies, necessitating the need for AAT reserves.”

Commented [X467]: Recommend deleting guidance note, as it doesn't provide full or clear scope of what may be excluded, so could be misread to either guarantee option for certain products or exclude the option for other products.

Section 8: To Be Determined (Scenario Generation for VM-21)

Section 9) Modeling Hedges under a ~~Future~~ Non-Index Credit Hedging Strategy

A. Initial Considerations

- 1. This section applies to modeling of hedges other than situations where the company (a) only hedges index credits. ~~If the company, or (b) clearly separates index credit hedging from other hedging, then only the section only pertains to the other hedging if the index hedging follows.~~ In those situations, the modeling of hedges supporting index credits can be simplified including applying an index credit hedge margin, following the requirements in Section 4.A.4.b.i.
- 2. The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the calculation of the ~~stochastic reserve~~SR, determined in accordance with Section 3.D and Section 4.D.
- 3. The company shall take into account the costs and benefits of hedge positions expected to be held by the company in the future along each scenario. ~~Company management is responsible for developing, documenting, executing and evaluating the investment strategy for future hedge purchases. Prior to reflection in projections, the strategy for future hedge purposes shall be the actual practice of the company for a period of time not less than [6] months, including the hedging strategy, used to implement the investment policy~~
- 4. For this purpose, the investment assets refer to all the assets, including derivatives supporting covered products and guarantees. This also is referred to as the investment portfolio. The investment strategy is the set of all asset holdings at all points in time in all scenarios. The hedging portfolio, which also is referred to as the hedging assets, is a subset of the investment assets. The hedging strategy is the hedging asset holdings at all points in time in all scenarios. There is no attempt to distinguish what is the hedging portfolio and what is the investment portfolio in this section. Nor is the distinction between investment strategy and hedging strategy formally made here. Where necessary to give effect to the intent of this section, the requirements applicable to the hedging portfolio or the hedging strategy are to apply to the overall investment portfolio and investment strategy.
- 5. This particularly applies to restrictions on the reasonableness or acceptability of the models that make up the stochastic cash-flow model used to perform the projections, since these restrictions are inherently restrictions on the joint modeling of the hedging and non-hedging portfolio. To give effect to these requirements, they must apply to the overall investment strategy and investment portfolio.

B. Modeling Approaches

- 1. The analysis of the impact of the hedging strategy on cash flows is typically performed using either one of two types of methods as described below. Although a hedging strategy normally would be expected to reduce risk provisions, the nature of the hedging strategy and the costs to implement the strategy may result in an increase in the amount of the ~~stochastic reserve~~SR otherwise calculated.
- 2. The fundamental characteristic of the first type of method, referred to as the “explicit method,” is that hedging positions and their resulting cash flows are included in the stochastic cash-flow model used to determine the scenario reserve, as discussed in Section 3.D, for each scenario.

Commented [X468]: Section 4.A.4 (Modeling of Hedges) has some relationship with this section, we request clarification around the applicability of these two areas of hedge guidance.

Commented [VM22469R468]: Edits to address this comment will be reflected in next exposure

Commented [CD470]: see previous comments about use of the word "future" to describe "hedging strategy"

Commented [X471]: We seek clarification of this text: if a company only hedges indices or separates index crediting from other hedges, does this apply, or does it only apply to any other hedging?

Commented [VM22472R471]: Edits to address this comment will be reflected in next exposure

Commented [X473]: The sentence "Prior to reflection in projections, the strategy for future hedge purposes shall be the actual practice of the company for a period of time not less than [6] months." seems to suggest you would do something other than the actual hedging strategy after [6] months. In this case, what are you assuming for modeling? We suggest clarification of this sentence.

Commented [VM22474R473]: Edits to address this comment will be reflected in next exposure

Commented [CD475]: is this a typo? should this be "purchases"?

Commented [VM22476R475]: Edits to address this comment will be reflected in next exposure

Commented [X477]: This 6 month exclusion creates unintended optionality for inclusion/exclusion based on whether a hedge strategy is considered "new". Instead, this should be addressed through the Error factor for new programs being temporarily larger.

Commented [VM22478R477]: Edits to address this comment will be reflected in next exposure

Commented [X479]: Reinstate the original sentence which puts the reflection of hedging into the greater context of reflecting the company's investment policy.

Commented [VM22480R479]: Edits to address this comment will be reflected in next exposure

Commented [X481]: Agree that the uncertainty associated with new strategies should be handled via the E factor, not through blanket exclusion.

Commented [VM22482R481]: Edits to address this comment will be reflected in next exposure

3. The fundamental characteristic of the second type of method, referred to as the “implicit method,” is that the effectiveness of the current hedging strategy on future cash flows is evaluated, in part or in whole, outside of the stochastic cash-flow model. There are multiple ways that this type of modeling can be implemented. In this case, the reduction to the ~~stochastic reserve~~SR otherwise calculated should be commensurate with the degree of effectiveness of the hedging strategy in reducing accumulated deficiencies otherwise calculated.
4. Regardless of the methodology used by the company, the ultimate effect of the current hedging strategy (including currently held hedge positions) on the ~~stochastic reserve~~SR needs to recognize all risks, associated costs, imperfections in the hedges and hedging mismatch tolerances associated with the hedging strategy. The risks include, but are not limited to: basis, gap, price, parameter estimation and variation in assumptions (mortality, persistency, withdrawal, annuitization, etc.). Costs include, but are not limited to: transaction, margin (opportunity costs associated with margin requirements) and administration. In addition, the reduction to the ~~stochastic reserve~~SR attributable to the hedging strategy may need to be limited due to the uncertainty associated with the company’s ability to implement the hedging strategy in a timely and effective manner. The level of operational uncertainty varies indirectly with the amount of time that the new or revised strategy has been in effect or ~~mode~~ tested.

Guidance Note: No hedging strategy is perfect. A given hedging strategy may eliminate or reduce some but not all risks, transform some risks into others, introduce new risks, or have other imperfections. For example, a delta-only hedging strategy does not adequately hedge the risks measured by the “Greeks” other than delta.

5. A safe harbor approach is permitted for those companies whose modeled hedge assets comprise only linear instruments not sensitive to implied volatility. For companies with option-based hedge strategies, electing this approach would require representing the option-based portion of the strategy as a delta-rho two-Greek hedge program. The normally modeled option portfolio would be replaced with a set of linear instruments that have the same first-order Greeks as the original option portfolio.

Commented [X483]: Is delta-only hedging common in VM-22 hedging? Could the example be replaced with something more relevant to VM-22 hedging?

C. Calculation of ~~Stochastic Reserve~~SR (Reported)

1. The company shall calculate CTE70 (best efforts)—the results obtained when the CTE70 is based on incorporating the modeling of hedges (including both currently held and future hedge positions) into the stochastic cash-flow model on a best efforts basis, including all of the factors and assumptions needed to model the hedges (e.g., stochastic implied volatility). The determination of CTE70 (best efforts) may utilize either explicit or implicit modeling techniques.
2. The company shall calculate a CTE70 (adjusted) by recalculating the CTE70 assuming the company has no ~~future hedging purchases~~ strategy, except those to hedge interest credits and hedge assets held by the company on the valuation date, therefore following the requirements of Section 4.A.4.a and 4.A.4.b.i.
3. Because most models will include at least some approximations or idealistic assumptions, CTE70 (best efforts) may overstate the impact of the hedging strategy. To compensate for potential overstatement of the impact of the hedging strategy, the value for the ~~stochastic reserve~~SR is given by:

Commented [X484]: The Hedging DG is currently working on language and we will want to be consistent across VM-20, VM-21, and VM-22.

Commented [CD485]: perhaps better to say “no future hedge purchases...”

Commented [VM22486R485]: Edits to address this comment will be reflected in next exposure

$$\text{Stochastic reserveSR} = \text{CTE70 (best efforts)} + E \times \max[0, \text{CTE70 (adjusted)} - \text{CTE70 (best efforts)}]$$

4. The company shall specify a value for E (the “error factor”) in the range from 5% to 100% to reflect the company’s view of the potential error resulting from the level of sophistication of the stochastic cash-flow model and its ability to properly reflect the parameters of the hedging strategy (i.e., the Greeks being covered by the strategy), as well as the associated costs, risks and benefits. The greater the ability of the stochastic model to capture all risks and uncertainties, the lower the value of E . The value of E may be as low as 5% only if the model used to determine the CTE70 (best efforts) effectively reflects all of the parameters used in the hedging strategy. If certain economic risks are not hedged, yet the model does not generate scenarios that sufficiently capture those risks, E must be in the higher end of the range, reflecting the greater likelihood of error. Likewise, simplistic hedge cash-flow models shall assume a higher likelihood of error.
5. The company shall conduct a formal back-test, based on an analysis of at least the most recent available relevant period of data (but no less than 12 months), to assess how well the model is able to replicate the hedging strategy in a way that supports the determination of the value used for E .
6. Such a back-test shall involve one of the following analyses:
 - a. For companies that model hedge cash flows directly (“explicit method”), replace the stochastic scenarios used in calculating the CTE70 (best efforts) with a single scenario that represents the market path that actually manifested over the selected back-testing period and compare the projected hedge asset gains and losses against the actual hedge asset gains and losses – both realized and unrealized – observed over the same time period. For this calculation, the model assumptions may be replaced with parameters that reflect actual experience during the back-testing period. In order to isolate the comparison between the modeled hedge results and actual hedge results for this calculation, the projected liabilities should accurately reflect the actual liabilities throughout the back-testing period; therefore, adjustments that facilitate this accuracy (e.g. reflecting actual experience instead of model assumptions, including new business, etc.) are permissible.

To support the choice of a low value of E , the company should ascertain that the projected hedge asset gains and losses are within close range of 100% (e.g., 80–125%) of the actual hedge asset gains and losses. The company may also support the choice of a low value of E by achieving a high R-squared (e.g., 0.80 or higher) when using a regression analysis technique.
 - b. For companies that model hedge cash flows implicitly by quantifying the cost and benefit of hedging using the fair value of the hedged item (an “implicit method” or “cost of reinsurance method”), calculate the delta, rho and vega coverage ratios in each month over the selected back-testing period in the following manner:
 - i. Determine the hedge asset gains and losses—both realized and unrealized—incurred over the month attributable to equity, interest rate, and implied volatility movements.
 - ii. Determine the change in the fair value of the hedged item over the month attributable to equity, interest rate, and implied volatility movements. The hedged item should be defined in a manner that reflects the proportion of risks hedged (e.g., if a company elects to hedge 50% of a contract’s market risks, it should quantify the fair value of the hedged item as 50% of the fair value of the contract).

Commented [X487]: We have been getting weak E factor support, with minimum backtesting due to the current phrasing.

Commented [X488R487]: Recommend adding stress testing language similar to Section 4.A.4.b.i.c) but with edits based on TDI’s comments/suggestions to Section 4.A.4.b.i.c).

Commented [VM22489R487]: Edits to address this comment will be reflected in next exposure

Commented [X490]: Recommend adding reporting requirement to VM-31 to disclose if company has switched between explicit method and implicit method, discuss rationale of the change and the change impact.

Commented [VM22491R490]: Edits to address this comment will be reflected in next exposure

- iii. Calculate the delta coverage ratio as the ratio between (i) and (ii) attributable to equity movements.
 - iv. Calculate the rho coverage ratio as the ratio between (i) and (ii) attributable to interest rate movements.
 - v. Calculate the vega coverage ratio as the ratio between (i) and (ii) attributable to implied volatility movements.
 - vi. To support the company's choice of a low value of E, the company should be able to demonstrate that the delta and rho coverage ratios are both within close range of 100 % (e.g., 80–125%) consistently across the back-testing period.
 - vii. In addition, the company should be able to demonstrate that the vega coverage ratio is within close range of 100 % in order to use the prevailing implied volatility levels as of the valuation date in quantifying the fair value of the hedged item for the purpose of calculating CTE70 (best efforts). Otherwise, the company shall quantify the fair value of the hedged item for the purpose of calculating CTE70 (best efforts) in a manner consistent with the realized volatility of the scenarios captured in the CTE (best efforts).
- c. Companies that do not model hedge cash flows explicitly, but that also do not use the implicit method as outlined in Section 9.C.6.b above, shall conduct the formal back-test in a manner that allows the company to clearly illustrate the appropriateness of the selected method for reflecting the cost and benefit of hedging, as well as the value used for E.
7. A company that does not have 12 months of experience to date shall set E to a value that reflects the amount of experience available, and the degree and nature of any change to the hedge program. For a material change in strategy, with ~~no less than 6 months of history~~, E should be ~~at least 1.0-50~~. However, E may be lower than ~~1.0-50~~ if ~~some~~ at least 6 months of reliable experience is available and/or if the change in strategy is a minor refinement rather than a substantial material change in strategy.

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily large (e.g., $\geq 50\%$) for substantial changes in hedge methodology (e.g., moving from a fair-value based strategy to a stop-loss strategy) where the company has not been able to provide a meaningful simulation of hedge performance based on the new strategy.
- A temporary moderate increase (e.g., 15–30%) in error factor should be used for substantial modifications to hedge programs or modeling where meaningful simulation has not been created (e.g., adding second-order hedging, such as gamma or rate convexity).
- No increase in the error factor may be used for incremental modifications to the hedge strategy (e.g., adding death benefits to a program that previously covered only living benefits, or moving from swaps to Treasury Department futures).

Commented [X492]: 6 month restriction should be handled in the error factor. Other language for clarity. Edited guidance note below to be consistent with this.

Commented [VM22493R492]: Edits to create consistency with recently adopted APF 2020-12 will be considered for the next exposure

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily large (e.g., $\geq 50\%$) for substantial changes in hedge methodology (e.g., moving from a fair value based strategy to a stop-loss strategy) where the company has not been able to provide a meaningful simulation of hedge performance based on the new strategy.
- A temporary moderate increase (e.g., 15–30%) in error factor should be used for substantial modifications to hedge programs or modeling where meaningful simulation has not been created (e.g., adding second-order hedging, such as gamma or rate convexity).
- No increase in the error factor may be used for incremental modifications to the hedge strategy (e.g., adding death benefits to a program that previously covered only living benefits, or moving from swaps to Treasury Department futures).

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily 100% for material changes in hedge methodology (e.g., moving from a fair-value based strategy to a stop-loss strategy).
- An increase in the error factor may not always be needed for minor refinements to the hedge strategy (e.g., moving from swaps to Treasury futures).

8. The company shall set the value of E reflecting the extent to which the future hedging program is clearly defined. To support a value of E below 1.0, there should be very robust documentation outlining the future hedging program. To the extent that documentation outlining the future hedging program is incomplete, the value of E shall be increased. Any increases required to the value of E to reflect that documentation is not available to support that the future hedging program is clearly defined shall be in addition to increases to the value of E to reflect a lack of historical experience or to reflect the back-testing results.

E. Additional Considerations for CTE70 (best efforts)

If the company is following a CDHS, the fair value of the portfolio of contracts falling within the scope of these requirements shall be computed and compared to the CTE70 (best efforts) and CTE70 (adjusted). If the CTE70 (best efforts) is below both the fair value and CTE70 (adjusted), the company should be prepared to explain why that result is reasonable.

For the purposes of this analysis, the SR and fair value calculations shall be done without requiring the scenario reserve for any given scenario to be equal to or in excess of the cash surrender value in aggregate for the group of contracts modeled in the projection.

D. Specific Considerations and Requirements

1. As part of the process of choosing a methodology and assumptions for estimating the future effectiveness of the current hedging strategy (including currently held hedge positions) for purposes of reducing the stochastic reserve SR, the company should review actual historical hedging effectiveness. The company shall evaluate the appropriateness of the assumptions

Commented [X494]: Work is being done by the hedging DG. This is a placeholder. Need to reflect how clearly defined and well documented the hedge program is, to be able to rely on the backtesting provided. To the extent that hedge programs are not clearly defined, E should be increased to reflect that the backtesting cannot be relied on as an indicator of future effectiveness.

Commented [X495]: Generate this disclosure from within a rough responsibility check for regulatory review/information on the modeled hedge and add an prompt further discussion.

Commented [VM22496R495]: Subgroup voted in favor of retaining the fair value disclosure wording here, which is only subject to non-index credit hedges at this point

Commented [CD497]: Not sure why this section is being deleted. Perhaps references to CDHS could be deleted, but otherwise this section still seems applicable.

Commented [VM22498R497]: Subgroup voted in favor of retaining the fair value disclosure wording here, which is only subject to non-index credit hedges at this point

on future trading, transaction costs, other elements of the model, the strategy, the mix of business and other items that are likely to result in materially adverse results. This includes an analysis of model assumptions that, when combined with the reliance on the hedging strategy, are likely to result in adverse results relative to those modeled. The parameters and assumptions shall be adjusted (based on testing contingent on the strategy used and other assumptions) to levels that fully reflect the risk based on historical ranges and foreseeable future ranges of the assumptions and parameters. If this is not possible by parameter adjustment, the model shall be modified to reflect them at either anticipated experience or adverse estimates of the parameters.

2. A discontinuous hedging strategy is a hedging strategy where the relationships between the sensitivities to equity markets and interest rates (commonly referred to as the Greeks) associated with the guaranteed contract holder options embedded in the variable fixed indexed annuities and other in-scope products and these same sensitivities associated with the hedging assets are subject to material discontinuities. This includes, but is not limited to, a hedging strategy where material hedging assets will be obtained when the fixed indexed annuity and other in-scope products account balances reach a predetermined level in relationship to the guarantees. Any hedging strategy, including a delta hedging strategy, can be a discontinuous hedging strategy if implementation of the strategy permits material discontinuities between the sensitivities to equity markets and interest rates associated with the guaranteed contract holder options embedded in the variable fixed indexed annuities and other in-scope products and these same sensitivities associated with the hedging assets. There may be scenarios that are particularly costly to discontinuous hedging strategies, especially where those result in large discontinuous changes in sensitivities (Greeks) associated with the hedging assets. Where discontinuous hedging strategies contribute materially to a reduction in the stochastic reserveSR, the company must evaluate the interaction of future trigger definitions and the discontinuous hedging strategy, in addition to the items mentioned in the previous paragraph. This includes an analysis of model assumptions that, when combined with the reliance on the discontinuous hedging strategy, may result in adverse results relative to those modeled.
3. A strategy that has a strong dependence on acquiring hedging assets at specific times that depend on specific values of an index or other market indicators may not be implemented as precisely as planned.
4. The combination of elements of the stochastic cash-flow model—including the initial actual market asset prices, prices for trading at future dates, transaction costs and other assumptions—should be analyzed by the company as to whether the stochastic cash-flow model permits hedging strategies that make money in some scenarios without losing a reasonable amount in some other scenarios. This includes, but is not limited to:
 - a. Hedging strategies with no initial investment that never lose money in any scenario and in some scenarios make money.
 - b. Hedging strategies that, with a given amount of initial money, never make less than accumulation at the one-period risk-free rates in any scenario but make more than this in one or more scenarios.
5. If the stochastic cash-flow model allows for such situations, the company should be satisfied that the results do not materially rely directly or indirectly on the use of such strategies. If the results do materially rely directly or indirectly on the use of such strategies, the strategies may not be used to reduce the stochastic reserveSR otherwise calculated.

Commented [X499]: Suggest replacing "indexed" with "fixed" since this would apply to all fixed annuities.

Commented [VM22500R499]: Edits to address this comment will be reflected in next exposure

Commented [X501]: Editorial change of "variable fixed indexed annuity" to be "fixed indexed annuity and other in-scope products".

Commented [VM22502R501]: Edits to address this comment will be reflected in next exposure

Commented [X503]: Recommend deleting "including a delta hedging strategy" as it is already covered by "any hedging strategy" and it is not clear if delta hedging strategy is the most common strategy in VM-22 hedging to be used as a general example.

Commented [VM22504R503]: Edits to address this comment will be reflected in next exposure

6. In addition to the above, the method used to determine prices of financial instruments for trading in scenarios should be compared to actual initial market prices. In addition to comparisons to initial market prices, there should be testing of the pricing models that are used to determine subsequent prices when scenarios involve trading financial instruments. This testing should consider historical relationships. For example, if a method is used where recent volatility in the scenario is one of the determinants of prices for trading in that scenario, then that model should approximate actual historic prices in similar circumstances in history.

Section 10: Guidance and Requirements for Setting Contract Holder Behavior Prudent Estimate Assumptions

A. General

Contract holder behavior assumptions encompass actions such as lapses, withdrawals, transfers, recurring deposits, benefit utilization, option election, etc. Contract holder behavior is difficult to predict accurately, and variance in behavior assumptions can significantly affect the ~~results~~ reserves level. In the absence of relevant and fully credible empirical data, the company should set behavior assumptions as guided by Principle 3 in Section 1.B and Section 12.

In setting behavior assumptions, the company should examine, but not be limited by, the following considerations:

1. Behavior can vary by product, market, distribution channel, index performance, interest credited (current and guaranteed rates), time/product duration, etc.
2. Options embedded in the product may affect behavior.
3. Utilization of options may be elective or non-elective in nature. Living benefits often are elective, and death benefit options are generally non-elective.
4. Elective contract holder options may be more driven by economic conditions than non-elective options.
5. As the value of a product option increases, there is an increased likelihood that contract holders will behave in a manner that maximizes their financial interest (e.g., lower lapses, higher benefit utilization, etc.).
6. Behavior formulas may have both rational and irrational components (irrational behavior is defined as situations where some contract holders may not always act in their best financial interest). The rational component should be dynamic, but the concept of rationality need not be interpreted in strict financial terms and might change over time in response to observed trends in contract holder behavior based on increased or decreased financial efficiency in exercising their contractual options.
7. Options that are ancillary to the primary product features may or may not be significant drivers of behavior. Whether an option is ancillary to the primary product features depends on many things, such as:
 - a. For what purpose was the product purchased?
 - b. Is the option elective or non-elective?
 - c. Is the value of the option well-known?
8. External influences may affect behavior.

Commented [X505]: Editorial clarification

Commented [VM22506R505]: Edits to address this comment will be reflected in next exposure

Commented [X507]: Need general assumption setting section, see APF 2021-11.

Commented [VM22508R507]: Edits to address this comment will be reflected in next exposure

Commented [X509]: We would suggest rewording this section to be considerations rather than posed as questions.

Commented [X510]: Editorial clarification

Commented [VM22511R510]: Edits to address this comment will be reflected in next exposure

Commented [X512]: Recommend adding some examples here if this is included.

Commented [VM22513R512]: Edits to address this comment will be reflected in next exposure

B. Aggregate vs. Individual Margins

1. Prudent estimate assumptions are developed by applying a margin for uncertainty to the anticipated experience assumption. The issue of whether the level of the margin applied to the anticipated experience assumption is determined in aggregate or independently for each and every behavior assumption is discussed in Principle 3 in Section 1.B.

2. Although this principle discusses the concept of determining the level of margins in aggregate, it notes that the application of this concept shall be guided by evolving practice and expanding knowledge. From a practical standpoint, it may not always be possible to completely apply this concept to determine the level of margins in aggregate for all behavior assumptions.
3. Therefore, the company shall determine prudent estimate assumptions independently for each behavior (e.g., mortality, lapses and benefit utilization), using the requirements and guidance in this section and throughout these requirements, unless the company can demonstrate that an appropriate method was used to determine the level of margin in aggregate for two or more material behavior assumptions, if relevant to the risks in the product, and thus the approach will not understate the reserve.

C. Sensitivity Testing

The impact of behavior can vary by product, time period, etc. For any assumption that is not prescribed or stochastically modeled, the company qualified actuary to whom responsibility for this group of contracts is assigned shall use sensitivity testing to ensure that the assumption is set at the conservative end of the plausible range. The company shall sensitivity test:

- Surrenders.
- Partial withdrawals.
- Benefit utilization.
- Account transfers.
- Future deposits.
- Other behavior assumptions if relevant to the risks in the product.

Sensitivity testing of assumptions is required and shall be more complex than, for example, base lapse assumption plus or minus X% across all contracts. A more appropriate sensitivity test in this example might be to devise parameters in a dynamic lapse formula to reflect more out-of-the-money contracts lapsing and/or more holders of in-the-money contracts persisting and eventually using the guarantee. The company should apply more caution in setting assumptions for behaviors where testing suggests that stochastic modeling results are sensitive to small changes in such assumptions. For such sensitive behaviors, the company shall use higher margins when the underlying experience is less than fully relevant and credible.

The company shall examine the results of sensitivity testing to understand the materiality of prudent estimate assumptions on the modeled reserve. The company shall update the sensitivity tests periodically as appropriate, considering the materiality of the results of the tests. The company may update the tests less frequently (but no less than every 3 years) when the tests show less sensitivity of the modeled reserve to changes in the assumptions being tested or the experience is not changing rapidly. Providing there is no material impact on the results of the sensitivity testing, the company may perform sensitivity testing:

1. Using samples of the contracts in force rather than performing the entire valuation for each alternative assumption set.

Commented [X514]: Clarification

Commented [VM22515R514]: Edits to address this comment will be reflected in next exposure

Commented [X516]: Suggest updating bullet to "Other material behavior assumptions if relevant to the risks in the product."

Commented [VM22517R516]: Edits to address this comment will be reflected in next exposure

Commented [X518]: Sensitivity testing is covered by the submitted APF 2021-11 for VM-21, and we should be consistent. VM-21 is currently lacking on sensitivity testing.

Commented [VM22519R518]: Make edits to be consistent with VM-21 APFs prior to adoption of VM-22

Commented [VM22520R518]: Edits to address this comment will be reflected in next exposure

Commented [CD521]: why assign this specifically to the QA rather than leaving it as the responsibility of "the company", like we do elsewhere in the requirements?

Commented [VM22522R521]: Edits to address this comment will be reflected in next exposure

Commented [X523]: include for completion

Commented [VM22524R523]: Edits to address this comment will be reflected in next exposure

Commented [X525]: Consistent with APF 2021-11.

Commented [VM22526R525]: Edits to address this comment will be reflected in next exposure

- 2. Using data from prior periods.

D. Specific Considerations and Requirements

- 1. Within materiality considerations, the company should consider all relevant forms of contract holder behavior and persistency, including, but not limited to, the following:
 - a. Mortality (additional guidance and requirements regarding mortality is contained in Section 11).
 - b. Surrenders.
 - c. Partial withdrawals (systematic and elective).
 - d. Account transfers (switching/exchanges).
 - e. Resets/ratchets of the guaranteed amounts (automatic and elective).
 - f. Future deposits.
 - g. Income start date for the benefit utilization.
 - h. Commutation of benefit (from periodic payment to lump sum) or vice versa.
- 2. It may be acceptable to ignore certain items that might otherwise be explicitly modeled in an ideal world, particularly if the inclusion of such items reduces the calculated provisions.

For example:

- a. The impact of account transfers (intra-contract index “switching”) might be ignored, unless required under the terms of the contract (e.g., automatic ~~asset~~ re-allocation/rebalancing,) or if the contract provisions incentivize the contract holders to transfer between accounts.
- b. Future deposits might be excluded from the model, unless required by the terms of the contracts under consideration and then only in such cases where future premiums can reasonably be anticipated (e.g., with respect to timing and amount).
- c. For some non-elective benefits (nursing home benefits for example), a zero incidence rate after the surrender charge has ended, or the cash value has depleted, may be acceptable since use of a non-zero rate could reduce the modeled reserve.

~~Guidance Note: For some non elective benefits (nursing home benefits for example), unless relevant company experience exists to the contrary, the use of incidence rates greater than zero after the surrender charge has ended, or the cash value was depleted might be inappropriate may not be prudent since it would reduce the modeled reserve.~~

- 3. However, the company should exercise caution in assuming that current behavior will be indefinitely maintained. For example, it might be appropriate to test the impact of a shifting asset mix and/or consider future deposits to the extent they can reasonably be anticipated and increase the calculated amounts.

Commented [X527]: Clarification

Commented [VM22528R527]: Edits to address this comment will be reflected in next exposure

Commented [X529]: Clarification

Commented [VM22530R529]: Edits to address this comment will be reflected in next exposure

Commented [CD531]: delete this word

Commented [VM22532R531]: Edits to address this comment will be reflected in next exposure

Commented [X533]: Reviewing, this guidance note does not exist in the 2019, 2020, 2021, or 2022 versions of VM-21. Where is this from? Should this be added to VM-21?

4. Normally, the underlying model assumptions would differ according to the attributes of the contract being valued. This would typically mean that contract holder behavior and persistency may be expected to vary according to such characteristics as (this is not an exhaustive list):
 - a. Gender.
 - b. Attained age.
 - c. Issue age.
 - d. Contract duration.
 - e. Time to maturity.
 - f. Tax status.
 - g. Account value.
 - h. Interest credited (current and guaranteed).
 - i. Available indices.
 - j. Guaranteed benefit amounts.
 - k. Surrender charges, transaction fees or other contract charges.
 - l. Distribution channel.
5. Unless there is clear evidence to the contrary, behavior assumptions should be no less conservative than past experience. Margins for contract holder behavior assumptions shall assume, without relevant and credible experience or clear evidence to the contrary, that contract holders' efficiency will increase over time.
6. In determining contract holder behavior assumptions, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience), whether or not the segment is directly written by the company. If data from a similar business segment are used, the assumption shall be adjusted to reflect differences between the two segments. Margins shall reflect the data uncertainty associated with using data from a similar but not identical business segment.
7. Where relevant and fully credible empirical data do not exist for a given contract holder behavior assumption, the company shall set the contract holder behavior assumption to reflect the increased uncertainty such that the contract holder behavior assumption is shifted towards the conservative end of the plausible range of expected experience that serves to increase the stochastic reserve. SR. If there are no relevant data, the company shall set the contract holder behavior assumption to reflect the increased uncertainty such that the contract holder behavior assumption is at the conservative end of the range. Such adjustments shall be consistent with the definition of prudent estimate, with the principles described in Section 1.B, and with the guidance and requirements in this section.
8. Ideally, contract holder behavior would be modeled dynamically according to the simulated economic environment and/or other conditions. It is important to note, however, that contract holder behavior should neither assume that all contract holders act with 100%

Commented [X534]: This also applies to VM-21, as there are fixed accounts. Is there any reason not to be consistent?

Commented [VM22535R534]: Only to focus on VM-22 for now

Commented [X536]: This is not a synonym (perhaps transfer fees is a subset of transaction fees) - why would transaction fees apply for VM-21, but only transfer fees for VM-22?

Commented [VM22537R536]: Edits to address this comment will be reflected in next exposure

Commented [X538]: This section states that "contract holder behavior should neither assume that all contract holders act with 100% efficiency in a financially rational manner nor assume that contract holders will always act irrationally." This text seems to directly contradict Section II. Reserve Requirements 6.H.2 which states "When advantageous, policyholders will commence living benefit payouts if not started yet.". We suggest revising 6.H.2 to align with the text of 10.D.8.

efficiency in a financially rational manner nor assume that contract holders will always act irrationally. These extreme assumptions may be used for modeling efficiency if the result is more conservative.

E. Dynamic Assumptions

1. Consistent with the concept of prudent estimate assumptions described earlier, the liability model should incorporate margins for uncertainty for all risk factors that are not ~~dynamic (i.e., the non-scenario tested assumptions) and are assumed not to vary according to the financial interest of the contract holder~~ stochastically modeled.
2. ~~The company should exercise care in using static assumptions when it would be more natural and reasonable~~ appropriate to use a dynamic model or other scenario-dependent formulation for behavior. ~~With due regard to considerations of materiality and practicality~~ allowance for appropriate simplifications, approximations and modeling efficiency techniques, the use of dynamic models is encouraged, but not mandatory. ~~Static assumptions~~ Risk factors that are not scenario tested but could reasonably be expected to vary according to a stochastic process, or future states of the world (especially in response to economic drivers), may require higher margins and/or signal a need for higher margins for certain other assumptions.
3. Risk factors that are modeled dynamically should encompass the plausible range of behavior consistent with the economic scenarios and other variables in the model, including the non-scenario tested assumptions. The company shall test the sensitivity of results to understand the materiality of making alternate assumptions and follow the guidance discussed above on setting assumptions for sensitive behaviors.

Commented [X539]: Recommend replacing “dynamic” with “stochastic.” Risk factors with dynamic assumptions still need margins (although for an assumption that was part fixed and part dynamic, only one piece may have the margin but still the risk factor would have a margin).

Commented [VM22540R539]: Edits to address this comment will be reflected in next exposure

Commented [X541]: Suggest replacing “Risk factors that are not scenario tested but” with “Static assumptions that” to improve clarity in the wording.

Commented [VM22542R541]: Edits to address this comment will be reflected in next exposure

Commented [X543]: Get rid of some of the vague adjectives and be consistent with VM framework for simplifications.

Commented [VM22544R543]: Edits to address this comment will be reflected in next exposure

F. Consistency with the CTE Level

1. All behaviors (i.e., dynamic, formulaic and non-scenario tested) should be consistent with the scenarios used in the CTE calculations (generally, the top 30% of the loss distribution). To maintain such consistency, it is not necessary to iterate (i.e., successive runs of the model) in order to determine exactly which scenario results are included in the CTE measure. Rather, in light of the products being valued, the company should be mindful of the general characteristics of those scenarios likely to represent the tail of the loss distribution and consequently use prudent estimate assumptions for behavior that are reasonable and appropriate in such scenarios. For ~~non-variable~~ fixed annuities, these “valuation” scenarios would typically display one or more of the following attributes:
 - a. ~~Declining-, increasing~~ and/or volatile index values, where applicable.
 - b. Price gaps and/or liquidity constraints.
 - c. ~~Rapidly changing~~ Volatile interest rates ~~or~~ persistently low interest rates.
 - d. ~~Volatile credit spreads.~~
2. The behavior assumptions should be logical and consistent both individually and in aggregate, especially in the scenarios that govern the results. In other words, the company should not set behavior assumptions in isolation, but give due consideration to other elements of the model. The interdependence of assumptions (particularly those governing customer behaviors) makes this task difficult and by definition requires professional judgment, but it is important that the model risk factors and assumptions:

Commented [CD545]: “non-variable”?

Commented [VM22546R545]: Edits to address this comment will be reflected in next exposure

Commented [X547]: Editorial clarification to cover scenarios for all products/guarantees in scope

Commented [VM22548R547]: Edits to address this comment will be reflected in next exposure

Commented [X549]: Editorial for consistency with (a) above

Commented [VM22550R549]: Edits to address this comment will be reflected in next exposure

Commented [X551]: Suggesting deleting as we are not aware of dynamic credit spreads typically being modeled.

Commented [VM22552R551]: Edits to address this comment will be reflected in next exposure

- a. Remain logically and internally consistent across the scenarios tested.
 - b. Represent plausible outcomes.
 - c. Lead to appropriate, but not excessive, asset requirements.
4. The company should remember that the continuum of “plausibility” should not be confined or constrained to the outcomes and events exhibited by historic experience.
 5. Companies should attempt to track experience for all assumptions that materially affect their risk profiles by collecting and maintaining the data required to conduct credible and meaningful studies of contract holder behavior.

G. Additional Considerations and Requirements for Assumptions Applicable to Guaranteed Living Benefits

Experience for contracts without guaranteed living benefits may be of limited use in setting a lapse assumption for contracts with in-the-money or at-the-money guaranteed living benefits. Such experience may only be used if it is appropriate (e.g., lapse experience on contracts without a living benefit may have relevance to the early durations of contracts with living benefits) and relevant to the business.

H. Policy Loans

If policy loans are applicable for the block of business, the company shall determine cash flows for each projection interval for policy loan assets by modeling existing loan balances either explicitly or by substituting assets that are a proxy for policy loans (e.g., bonds, cash, etc.) subject to the following:

1. If the company substitutes assets that are a proxy for policy loans, the company must demonstrate that such substitution:
 - a. Produces reserves that are no less than those that would be produced by modeling existing loan balances explicitly.
 - b. Complies with the contract holder behavior requirements stated in Section 10.A to Section 10.G above in this section.
2. If the company models policy loans explicitly, the company shall:
 - a. Treat policy loan activity as an aspect of contract holder behavior and subject to the requirements above in this section.
 - b. Assign loan balances either to exactly match each policy's contract's utilization or to reflect average utilization over a model segment or sub-segments, if the results are materially similar.
 - c. Model policy loan interest in a manner consistent with policy contract provisions and with the scenario. Include interest paid in cash as a positive policy loan cash flow in that projection interval, but do not include interest added to the loan balance as a policy loan cash flow. (The increased balance will require increased repayment cash flows in future projection intervals.)

Commented [CD553]: Okay to keep the term "Policy Loans"

Commented [VM22554R553]: Edits to address this comment will be reflected in next exposure

Commented [X555]: Clarify reference to be more specific

Commented [VM22556R555]: Edits to address this comment will be reflected in next exposure

Commented [X557]: Editorial - VM-22 should consistently use contracts

Commented [VM22558R557]: Edits to address this comment will be reflected in next exposure

Commented [CD559]: "contract's"

Commented [VM22560R559]: Edits to address this comment will be reflected in next exposure

Commented [X561]: We have concern that reflecting average utilization may have material impact on benefit projections. Recommend adding "if the results are materially similar". This change is also applied to VM-20 and added to VM-21.

Commented [VM22562R561]: Edits to address this comment will be reflected in next exposure

Commented [X563]: Editorial - VM-22 should consistently use contracts

Commented [VM22564R563]: Edits to address this comment will be reflected in next exposure

Commented [CD565]: "contract"

Commented [VM22566R565]: Edits to address this comment will be reflected in next exposure

- d. Model policy loan principal repayments, including those that occur automatically upon death or surrender. Include policy loan principal repayments as a positive policy loan cash flow, per Section 4.A.1.h.
- e. Model ~~additional~~ policy loan principal. Include additional policy loan principal as a negative policy loan cash flow, per Section 4.A.1.h (but do not include interest added to the loan balance as a negative policy loan cash flow).
- f. Model any investment expenses allocated to policy loans and include them either with negative policy loan cash flows or insurance expense cash flows.

I. Non-Guaranteed Elements

Consistent with the definition in VM-01, Non-Guaranteed Elements (NGEs) are elements within a contract that affect ~~policy contract~~ costs or values and are not guaranteed or not determined at issue. NGEs consist of elements affecting contract holder costs or values that are both established and subject to change at the discretion of the insurer.

Examples of NGEs specific to ~~non-variable~~ fixed annuities include but are not limited to the following: ~~fixed~~ the credited rates on fixed accounts, index parameters (caps, spreads, participation rates, etc.), rider fees, rider benefit features being subject to change (rollup rates, rollup period, etc.), account value charges, and dividends under participating policies or contracts.

- 1. Except as noted below in Section ~~10.H.5~~ 10.H.5, the company shall include NGE in the models to project future cash flows beyond the time the company has authorized their payment or crediting.
- 2. The projected NGE shall reflect factors that include, but are not limited to, the following (not all of these factors will necessarily be present in all situations):
 - a. The nature of contractual guarantees.
 - b. The company’s past NGE practices and established NGE policies.
 - c. The timing of any change in NGE relative to the date of recognition of a change in experience.
 - d. The benefits and risks to the company of continuing to authorize NGE.
- 3. Projected NGE shall be established based on projected experience consistent with how actual NGE are determined.
- 4. Projected levels of NGE in the cash-flow model must be consistent with the experience assumptions used in each scenario. Contract holder behavior assumptions in the model must be consistent with the NGE assumed in the model.
- 5. The company may exclude any portion of an NGE that:
 - a. Is not based on some aspect of the ~~policy’s or~~ contract’s experience.
 - b. Is authorized by the board of directors and documented in the board minutes, where the documentation includes the amount of the NGE that arises from other sources.

However, if the board has guaranteed a portion of the NGE into the future, the company must model that amount. In other words, the company cannot exclude

Commented [CD567]: The wording of "additional" is unclear. Does this mean maintaining a certain level of policy loan utilization throughout the projection (i.e., adding principal as repayments are made), or actually increasing policy loan utilization (i.e., adding more principal) over time? The former would seem more appropriate than the latter.

Commented [VM22568R567]: Edits to address this comment will be reflected in next exposure

Commented [X569]: Clarification

Commented [VM22570R569]: Edits to address this comment will be reflected in next exposure

Commented [CD571]: suggest: "contract holder"

Commented [VM22572R571]: Edits to address this comment will be reflected in next exposure

Commented [X573]: Editorial - VM-22 should consistently use contracts

Commented [VM22574R573]: Edits to address this comment will be reflected in next exposure

Commented [CD575]: suggest: "are not"

Commented [VM22576R575]: Edits to address this comment will be reflected in next exposure

Commented [CD577]: suggest: "non-variable annuities"

Commented [VM22578R577]: Edits to address this comment will be reflected in next exposure

Commented [CD583]: delete "policy's or"

Commented [VM22584R583]: Edits to address this comment will be reflected in next exposure

Commented [X585]: Why does being authorized mean it can be excluded? This seems backwards. Does this mean it has already transpired?

from its model any NGE that the board has guaranteed for future years, even if it could have otherwise excluded them, based on this subsection.

- 6. The liability for contract holder dividends declared but not yet paid that has been established according to statutory accounting principles as of the valuation date is reported separately from the statutory reserve. The contract holder dividends that give rise to this dividend liability as of the valuation date may or may not be included in the cash-flow model at the company’s option.
 - a. If the contract holder dividends that give rise to the dividend liability are not included in the cash-flow model, then no adjustment is needed to the resulting ~~aggregate stochastic reserve~~SR.
 - b. If the contract holder dividends that give rise to the dividend liability are included in the cash-flow model, then the resulting ~~aggregate stochastic reserve~~SR should be reduced by the amount of the dividend liability.
- 7. All projected cash flows associated with NGEs shall reflect margins for adverse deviations and estimation error in prudent estimate assumptions.

Commented [CD586]: delete "aggregate"

Commented [VM22587R586]: Edits to address this comment will be reflected in next exposure

Commented [CD588]: delete "aggregate"

Commented [VM22589R588]: Edits to address this comment will be reflected in next exposure

Section 11: Guidance and Requirements for Setting Prudent Estimate Mortality Assumptions

A. Overview

1. Intent

The guidance and requirements in this section apply to setting prudent estimate mortality assumptions when determining the ~~stochastic reserve SR~~. The intent is for prudent estimate mortality assumptions to be based on facts, circumstances and appropriate actuarial practice, with only a limited role for unsupported actuarial judgment. ~~(Where more than one approach to appropriate actuarial practice exists, the company should select the practice that the company deems most appropriate under the circumstances.)~~

Commented [X590]: Specific requirements will require further discussion, particularly what if any industry experience is identified for the SPA. Ideally, updated and appropriate assumptions should be used for better alignment and to avoid any false positives flagged as an outlier by the SPA.

Commented [VM22591R590]: Will address SPA separately

2. Description

Prudent estimate mortality assumptions shall be determined by first developing expected mortality curves based on either available experience or published tables. Where necessary, margins shall be applied to the experience to reflect data uncertainty. The expected mortality curves shall then be adjusted based on the credibility of the experience used to determine the expected mortality curve. Section 11.B addresses guidance and requirements for determining expected mortality curves, and Section 11.C addresses guidance and requirements for adjusting the expected mortality curves to determine prudent estimate mortality.

Commented [X592]: Recommend removing reference to actuarial judgment being "unsupported" from VM-21 and VM-22 because actuarial judgment should always be supportable - it is "judgment" not an arbitrary decision.

Finally, the credibility-adjusted tables shall be adjusted for mortality improvement (where such adjustment is permitted or required) using the guidance and requirements in Section 11.D.

3. Business Segments

For purposes of setting prudent estimate mortality assumptions, the products falling under the scope of these requirements shall be grouped into business segments with different mortality assumptions. The grouping, at a minimum, should differentiate between payout annuities or deferred annuity contracts that contain GLBs, and deferred annuity contracts with no guaranteed benefits or only GMDBs. Where appropriate, the grouping should also differentiate between segments which are known or expected to contain contract holders with sociodemographic, geographic, or health factors reasonably expected to impact the mortality assumptions for the segment (e.g., annuitants drawn from different countries, geographic areas, industry groups, or impaired lives on individually underwritten contracts such as structured settlements). The grouping should also generally follow the pricing, marketing, management and/or reinsurance programs of the company.

Guidance Note: This paragraph contemplates situations where it may be appropriate to differentiate mortality assumptions by segment or even by contract due to varying sociodemographic, geographic, or health factors. Particularly, though not exclusively, in the context of group payout annuity contracts, companies may have credible, contract-specific mortality experience data or relevant pooled data from annuitants drawn from similar industries or geographies that may be used to sub-divide inforce blocks into business segments for purposes of setting prudent estimate mortality assumptions.

For example, a company may sell group PRT contracts both to union plans in the U.S. and to private single-employer plans in another country. While both are "PRT contracts," it would be appropriate to differentiate them for mortality assumption purposes, similar to

how payout annuities vs. deferred annuities are distinguished.

Guidance Note: Distinct mortality or liability assumptions among different contracts within a group of contracts does not in itself preclude the group of contracts from being aggregated for the purposes of the broader stochastic reserve calculation.

4. Margin for Data Uncertainty

The expected mortality curves that are determined in Section 11.B may need to include a margin for data uncertainty. The margin could be in the form of an increase or a decrease in mortality, depending on the business segment under consideration. The margin shall be applied in a direction (i.e., increase or decrease in mortality) that results in a higher reserve. A sensitivity test may be needed to determine the appropriate direction of the provision for uncertainty to mortality. The test could be a prior year mortality sensitivity analysis of the business segment or an examination of current representative cells of the segment.

For purposes of this section, if mortality must be increased (decreased) to provide for uncertainty, the business segment is referred to as a ~~plus (minus)~~ mortality (longevity) segment.

It may be necessary, because of a change in the mortality risk profile of the segment, to reclassify a business segment from a ~~mortality (longevity) plus (minus)~~ segment to a ~~longevity (mortality) minus (plus)~~ segment to the extent compliance with this section requires such a reclassification. For example, a segment could require reclassification depending on whether it is gross or net of reinsurance.

Commented [X593]: Recommend deleting this guidance note since it is unnecessary - there is no such restriction for any of VM-20, VM-21 or VM-22. It would be an absurd level of granular distinction, such that it is not clear you could actually perform the projection, given that assumptions vary by attained age, etc.

Commented [VM22594R593]: Edits to address this comment will be reflected in next exposure

Commented [X595]: Terming the segments "mortality (longevity) segments" would be easier to understand than "plus (minus) segments".

Commented [VM22596R595]: Edits to address this comment will be reflected in next exposure

B. Determination of Expected Mortality Curves

1. Experience Data

In determining expected mortality curves, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience). See Section 11.B.2. for additional considerations. Finally, if there is no data, the company shall use the applicable table, as required in Section 11.B.3.

Commented [X597]: It is unclear how to interpretate the statement and how to review it for both VM-21 and VM-22. If a company reinsures GMWB riders, then does it mean that on a net basis the segment would no longer be considered as minus? So, there would be distinct designations for the pre and post reinsurance runs? Recommend discussing the statement and adding additional language or a guidance note to make it clear.

Commented [X598]: Delete period, it is a typo

Commented [VM22599R598]: Edits to address this comment will be reflected in next exposure

2. Data Other Than Direct Experience

Adjustments shall be applied to the data to reflect differences between the business segments, and margins shall be applied to the adjusted expected mortality curves to reflect the data uncertainty associated with using data from a similar but not identical business segment.

To the extent the mortality of a business segment is reinsured, any mortality charges that are consistent with the company's own pricing and applicable to a substantial portion of the mortality risk also may be a reasonable starting point for the determination of the company's expected mortality curves.

3. No Data Requirements

Commented [X600]: Does this need to be edited to be consistent with "little or no" data?

- i. When little or no experience or information is available on a business segment, the company shall use expected mortality curves that would produce expected deaths no less than:

[2021 SOA Deferred Annuity Mortality Table] with [Projection Scale G2] for individual deferred annuities that do not contain guaranteed living benefits

$$q_x^{20XX+n} = q_x^{20XX}(1 - G2_x)^n$$

- ii. When little or no experience or information is available on a business segment, the company shall use expected mortality curves that would produce expected deaths no greater than:

- a. [The appropriate percentage (F_x) from Table 11.1 applied to the 2012 IAM Basic Mortality Table] with [Projection Scale G2] for individual payout annuity contracts and deferred annuity contracts with guaranteed living benefits

$$q_x^{2012+n} = q_x^{2012}(1 - G2_x)^n * F_x$$

- b. [1983 Table "a"] for structured settlements or other contracts with impaired mortality
- c. [1994 GAR Table] with [Projection Scale AA] for group annuities

$$q_x^{1994+n} = q_x^{1994}(1 - AA_x)^n$$

Table 11.1

Attained Age (x)	F_x
<=65	80.0%
66	81.5%
67	83.0%
68	84.5%
69	86.0%
70	87.5%
71	89.0%
72	90.5%
73	92.0%
74	93.5%
75	95.0%
76	96.5%
77	98.0%
78	99.5%
79	101.0%
80	102.5%
81	104.0%

Commented [X601]: Section 11.B.3.i only has one item "a". There is no need to specifically have a single item "a". Recommend delete the notation "a" and have "Section 11.B.3.i" only.

Commented [VM22602R601]: Will be updated upon SPA assumption development

Commented [X603]: For PRT an assumption based on a third-party data provider would be better than the industry table to get contract specific mortality assumptions. Is this permitted? The guidance note in A.3 seems to get at this, but it's not clear in B.3 ii c whether this is allowed. This is an important distinction as PRT population can vary from those populations the tables are based upon.

Commented [VM22604R603]: Subgroup voted to only allow a prescribed table (to be determined upon SPA development) and not permit the use of third-party data provider upon a limited credibility

Commented [X605]: The 1983 Table "a" and 1994 GAR are used for structured settlements and group annuities, respectively. These tables seem to be out of date. If Standard Projected Amount work develops more granular and up to date tables, should these tables be updated to use consistent tables?

Commented [VM22606R605]: Will be updated upon SPA assumption development

Commented [X607]: The percentage factors (F_x) are over 100% from attained age 79 to age 104. Is it appropriate to set the factors above 100% for the older ages with no credibility?

Commented [VM22608R607]: Will be updated upon SPA assumption development

Commented [CD609]: does the F_x factor need any consideration for FIAs with GLBs?

Commented [VM22610R609]: Will be updated upon SPA assumption development

82	105.5%	
83	107.0%	
84	108.5%	
85	110.0%	
86	110.0%	
87	110.0%	
88	110.0%	
89	110.0%	
90	110.0%	
91	110.0%	
92	110.0%	
93	110.0%	
94	110.0%	
95	110.0%	
96	109.0%	
97	108.0%	
98	107.0%	
99	106.0%	
100	105.0%	
101	104.0%	
102	103.0%	
103	102.0%	
104	101.0%	
>=105	100.0%	

iii. For a business segment with non-U.S. insureds, when little or no experience or information is available on a business segment, an established industry or national mortality table and mortality improvement scale may be used, with approval from the domiciliary commissioner.

4. Additional Considerations Involving Data

The following considerations shall apply to mortality data specific to the business segment for which assumptions are being determined (i.e., direct data discussed in Section 11.B.1 or other than direct data discussed in Section 11.B.2).

a. Underreporting of Deaths

Mortality data shall be examined for possible underreporting of deaths. Adjustments shall be made to the data if there is any evidence of underreporting. Alternatively, exposure by lives or amounts on contracts for which death benefits were in the money may be used to determine expected mortality curves. Underreporting on such exposures should be minimal; however, this reduced subset of data will have less credibility.

b. Experience by Contract Duration

Experience of a plus segment shall be examined to determine if mortality by contract duration increases materially due to selection at issue. In the absence of information, the company shall assume that expected mortality will increase by

Commented [X611]: The phrase "When little or no experience or information is available on a business segment" is not included, unlike in (i) and (ii) of the same sub-section. It appears to be the intent that this is the only situation in which this would apply, but it would be helpful to make this explicit.

Commented [VM22612R611]: Edits to address this comment will be reflected in next exposure

Commented [X613]: Reference to the MI scale missing for international business

Commented [VM22614R613]: Edits to address this comment will be reflected in next exposure

contract duration for an appropriate select period. As an alternative, if the company determines that mortality is affected by selection, the company could apply margins to the expected mortality in such a way that the actual mortality modeled does not depend on contract duration.

c. Modification and Relevance of Data

Even for a large company, the quantity of life exposures and deaths are such that a significant amount of smoothing may be required to determine expected mortality curves from mortality experience. Expected mortality curves, when applied to the recent historic exposures (e.g., three to seven years), should not result in an estimate of aggregate number of deaths less (greater) than the actual number deaths during the exposure period for plus (minus) segments.

In determining expected mortality curves (and the credibility of the underlying data), older data may no longer be relevant. The “age” of the experience data used to determine expected mortality curves should be documented.

d. Other Considerations

In determining expected mortality curves, consideration should be given to factors that include, but are not limited to, trends in mortality experience, trends in exposure, volatility in year-to-year A/E mortality ratios, mortality by lives relative to mortality by amounts, changes in the mix of business and product features that could lead to mortality selection.

C. Adjustment for Credibility to Determine Prudent Estimate Mortality

1. Adjustment for Credibility

The expected mortality curves determined in Section 11.B shall be adjusted based on the credibility of the experience used to determine the curves in order to arrive at prudent estimate mortality. The adjustment for credibility shall result in blending the expected mortality curves including margins for uncertainty with the mortality assumption assumptions described in Section 11.B.3. The approach used to adjust the curves shall suitably account for credibility.

Guidance Note: For example, when credibility is zero, an appropriate approach should result in a mortality assumption consistent with 100% of the industry mortality assumption described in Section 11.B.3 ~~table~~ used in the blending.

2. Adjustment of ~~Statutory Valuation~~ Industry Mortality for Improvement

For purposes of the adjustment for credibility, the ~~industry~~ mortality table for a plus segment may be and the ~~industry~~ mortality table for a minus segment must be adjusted for mortality improvement. Such adjustment shall reflect the mortality improvement scale described in Section 11.B.3 from the effective date of the respective ~~industry~~ mortality table to the experience weighted average date underlying the data used to develop the expected mortality curves.

3. Credibility Procedure

The credibility procedure used shall:

- a. Produce results that are reasonable.

Commented [X615]: Both plan and industry data should be weighted for business such as PRT. This text says ~~blend with prescribed tables, but that might not make sense unless additional experience data was unavailable~~

Commented [VM22616R615]: Subgroup voted to only allow a prescribed table (to be determined upon SPA development) and not permit the use of third-party data provider upon a limited credibility

Commented [X617]: Clarification

Commented [VM22618R617]: Edits to address this comment will be reflected in next exposure

Commented [X619]: Editoria

Commented [VM22620R619]: Edits to address this comment will be reflected in next exposure

Commented [X621]: The “statutory valuation” is struck but in the guidance note. Recommend replacing “statutory valuation” with either “reference of Section 11.B.3” or “industry”. Otherwise, it is a vague reference since we have both a company mortality table and an industry mortality table.

Commented [VM22622R621]: Edits to address this comment will be reflected in next exposure

Commented [CD623]: need to reference “the mortality assumption described in Section 11.B.3” here? Otherwise, the sentence is unclear.

Commented [VM22624R623]: Edits to address this comment will be reflected in next exposure

Commented [X625]: Mortality improvement should be consistent with the underlying tables used, so we would suggest this being based on available experience subject to appropriate guardrails.

Commented [X626]: “Statutory Valuation” was stricken from all the body, but left in this title. Consider replacing with “industry”.

Commented [VM22627R626]: Edits to address this comment will be reflected in next exposure

Commented [CD628]: for consistency, need to delete this reference to “Statutory Valuation”

Commented [VM22629R628]: Edits to address this comment will be reflected in next exposure

- b. Not tend to bias the results in any material way.
 - c. Be practical to implement.
 - d. Give consideration to the need to balance responsiveness and stability.
 - e. Take into account not only the level of aggregate claims but the shape of the mortality curve.
 - f. Contain criteria for full credibility and partial credibility that have a sound statistical basis and be appropriately applied.
4. Further Adjustment of the Credibility-Adjusted Table for Mortality Improvement

The credibility-adjusted table used for plus segments may be and the credibility adjusted table used for minus segments must be adjusted for mortality improvement using the applicable mortality improvement scale described in Section 11.B.3 from the experience weighted average date underlying the company experience used in the credibility process to the valuation date.

Any adjustment for mortality improvement beyond the valuation date is discussed in Section 11.D.

D. Future Mortality Improvement

The mortality assumption resulting from the requirements of Section 11.C shall be adjusted for mortality improvements beyond the valuation date if such an adjustment would serve to increase the resulting ~~stochastic reserve~~SR. If such an adjustment would reduce the ~~stochastic reserve~~SR, such assumptions are permitted, but not required. In either case, the assumption must be based on current relevant data with a margin for uncertainty (increasing assumed rates of improvement if that results in a higher reserve or reducing them otherwise).

Section 12: Other Guidance and Requirements for Assumptions

A. Overview

This section provides guidance and requirements in general for setting prudent estimate assumptions when determining either the SR or DR. It also provides specific guidance and requirements for expense assumptions.

B. General Assumption Requirements

1. The company shall use prudent estimate assumptions for risk factors that are not stochastically modeled by applying margins to the anticipated experience assumptions if such risk factors have been categorized as material risks by following Section 1.B Principle 3 and requirements in Section 12.C.
 2. The company shall establish the prudent estimate assumptions for risk factors in compliance with the requirements in Section 12 of Model #820 and must periodically review and update the assumptions as appropriate in accordance with these requirements.
 3. The company shall model the following risk factors stochastically unless the company elects the stochastic modeling exclusion defined in Section 7:
 - a. Interest rate movements (i.e., Treasury interest rate curves).
 - b. Equity performance (e.g., Standard & Poor’s 500 index [S&P 500] returns and returns of other equity investments).
 4. If the company elects to stochastically model risk factors in addition to the economic scenarios, the requirements in this section for determining prudent estimate assumptions for these risk factors do not apply.
- Guidance Note:** It is expected that companies will not stochastically model risk factors other than the economic scenarios, such as contract holder behavior or mortality, until VM-22 has more specific guidance and requirements available. Companies shall discuss with domiciliary regulators if they wish to stochastically model other risk factors.
5. The company shall use its own experience, if relevant and credible, to establish an anticipated experience assumption for any risk factor. To the extent that company experience is not available or credible, the company may use industry experience or other data to establish the anticipated experience assumption, making modifications as needed to reflect the circumstances of the company.
 - a. For risk factors (such as mortality) to which statistical credibility theory may be appropriately applied, the company shall establish anticipated experience assumptions for the risk factor by combining relevant company experience with industry experience data, tables or other applicable data in a manner that is consistent with credibility theory and accepted actuarial practice.

Commented [X630]: We believe discussion of allocation of aggregate reserves should be analyzed as part of the field study.

Commented [VM22631R630]: The VM-22 Subgroup has no objections to waiting until after the field study to determine the allocation approach.

Commented [X632]: Need to add a Section 12 for general guidance on prudent assumption setting and on expenses. For VM-21, APF 2021-11 is currently exposed. Should be consistent with that APF, after any tweaks are made. <https://content.naic.org/sites/default/files/inline-images/APF%202021-11%20VM21%20Assumptions%2010012021.pdf>

Commented [VM22633R632]: Subgroup agreed on adding this as a new Section 12

- b. For risk factors (such as utilization of guaranteed living benefits) that do not lend themselves to the use of statistical credibility theory, and for risk factors (such as some of the lapse assumptions) to which statistical credibility theory can be appropriately applied but cannot currently be applied due to lack of industry data, the company shall establish anticipated experience assumptions in a manner that is consistent with accepted actuarial practice and that reflects any available relevant company experience, any available relevant industry experience, or any other experience data that are available and relevant. Such techniques include:
- i. Adopting standard assumptions published by professional, industry or regulatory organizations to the extent they reflect any available relevant company experience or reasonable expectations.
 - ii. Applying factors to relevant industry experience tables or other relevant data to reflect any available relevant company experience and differences in expected experience from that underlying the base tables or data due to differences between the risk characteristics of the company experience and the risk characteristics of the experience underlying the base tables or data.
 - iii. Blending any available relevant company experience with any available relevant industry experience and/or other applicable data using weightings established in a manner that is consistent with accepted actuarial practice and that reflects the risk characteristics of the underlying contracts and/or company practices.
- c. For risk factors that have limited or no experience or other applicable data to draw upon, the assumptions shall be established using sound actuarial judgment and the most relevant data available, if such data exists.
- d. For any assumption that is set in accordance with the requirements of Section 12.B.5.c, the qualified actuary to whom responsibility for this group of contracts is assigned shall use sensitivity testing and disclose the analysis performed to ensure that the assumption is set at the conservative end of the plausible range.
- e. The qualified actuary, to whom responsibility for this group of contracts is assigned, shall annually review relevant emerging experience for the purpose of assessing the appropriateness of the anticipated experience assumption. If the results of statistical or other testing indicate that previously anticipated experience for a given factor is inadequate, then the qualified actuary shall set a new, adequate, anticipated experience assumption for the factor.
6. The company shall sensitivity test risk factors that are not stochastically modeled and examine the impact on the stochastic reserve. The company shall update the sensitivity tests periodically as appropriate. The company may update the tests less frequently, but no less than every 3 years, when the tests show less sensitivity of the stochastic reserve to changes in the assumptions being tested or the experience is not changing rapidly. Providing there is no material impact on the results of the sensitivity testing, the company

may perform sensitivity testing:

- a. Using samples of the contracts in force rather than performing the entire valuation for each alternative assumption set.
- b. Using data from prior periods.

Guidance Note: Sensitivity testing every risk factor on an annual basis is not required. For some risk factors, it may be reasonable, in lieu of sensitivity testing, to employ statistical measures for margins, such as adding one or more standard deviations to the anticipated experience assumption.

- 7. The company shall vary the prudent estimate assumptions from scenario to scenario within the stochastic reserve calculation in an appropriate manner to reflect the scenario-dependent risks.

C. Assumption Margins

The company shall include margins to provide for adverse deviations and estimation error in the prudent estimate assumption for each risk factor that is not stochastically modeled or prescribed, subject to the following:

- 1. The level of margin applied to the anticipated experience assumptions may be determined in aggregate or independently as discussed in Section 1.B Principle 3. It is not permissible to set a margin less toward the conservative end of the spectrum to recognize, in whole or in part, implicit or prescribed margins that are present, or are believed to be present, in other risk factors.

Risks that are stochastically modeled (e.g., interest rates, equity returns) or have prescribed margins or guardrails (e.g., assets, revenue sharing) shall be considered material risks. Other risks generally considered to be material include, but are not limited to, mortality, contract holder behavior, maintenance and overhead expenses, inflation and implied volatility. In some cases, the list of material risks may also include acquisition expenses, partial withdrawals, policy loans, annuitizations, account transfers and deposits, and/or option elections that contain an element of anti-selection.

- 2. The greater the uncertainty in the anticipated experience assumption, the larger the required margin, with the margin added or subtracted as needed to produce a larger Sr or DR than would otherwise result. For example, the company shall use a larger margin when:

- a. The experience data have less relevance or lower credibility.
- b. The experience data are of lower quality, such as incomplete, internally inconsistent or not current.
- c. There is doubt about the reliability of the anticipated experience assumption, such as, but not limited to, recent changes in circumstances or changes in company policies.
- d. There are constraints in the modeling that limit an effective reflection of the risk factor.

Commented [X634]: Edit for VM-22 vs. VM-21?

Commented [VM22635R634]: Will include this language in the next exposure and will solicit any comments

3. In complying with the sensitivity testing requirements in Section 12.B.6 above, greater analysis and more detailed justification are needed to determine the level of uncertainty when establishing margins for risk factors that produce greater sensitivity on the stochastic reserve.
4. A margin is permitted but not required for assumptions that do not represent material risks.
5. A margin should reflect the magnitude of fluctuations in historical experience of the company for the risk factor, as appropriate.
6. The company shall apply the method used to determine the margin consistently on each valuation date but is permitted to change the method from the prior year if the rationale for the change and the impact on the stochastic reserve is disclosed.

D. Expense Assumptions

1. General Prudent Estimate Expense Assumption Requirements

In determining prudent estimate expense assumptions, the company:

- a. May spread certain information technology development costs and other capital expenditures over a reasonable number of years in accordance with accepted statutory accounting principles as defined in the Statements of Statutory Accounting Principles.

Guidance Note: Care should be taken with regard to the potential interaction with the inflation assumption below.

- b. Shall assume that the company is a going concern.
- c. Shall choose an appropriate expense basis that properly aligns the actual expense to the assumption. If values are not significant, they may be aggregated into a different base assumption.

Guidance Note: For example, death benefit expenses should be modeled with an expense assumption that is per death incurred.

- d. Shall reflect the impact of inflation.
- e. Shall not assume future expense improvements.
- f. Shall not include assumptions for federal income taxes (and expenses paid to provide fraternal benefits in lieu of federal income taxes) and foreign income taxes.
- g. Shall use assumptions that are consistent with other related assumptions.
- h. Shall use fully allocated expenses.

Guidance Note: Expense assumptions should reflect the direct costs associated with the block of contracts being modeled, as well as indirect costs and overhead costs that have been allocated to the modeled contracts.

- i. Shall allocate expenses using an allocation method that is consistent across

company lines of business. Such allocation must be determined in a manner that is within the range of actuarial practice and methodology and consistent with applicable ASOPs. Allocations may not be done for the purpose of decreasing the stochastic reserve.

- j. Shall reflect expense efficiencies that are derived and realized from the combination of blocks of business due to a business acquisition or merger in the expense assumption only when any future costs associated with achieving the efficiencies are also recognized.

Guidance Note: For example, the combining of two similar blocks of business on the same administrative system may yield some expense savings on a per unit basis, but any future cost of the system conversion should also be considered in the final assumption. If all costs for the conversion are in the past, then there would be no future expenses to reflect in the valuation.

- k. Shall reflect the direct costs associated with the contracts being modeled, as well as an appropriate portion of indirect costs and overhead (i.e., expense assumptions representing fully allocated expenses should be used), including expenses categorized in the annual statement as “taxes, licenses and fees” (Exhibit 3 of the annual statement) in the expense assumption.

- l. Shall include acquisition expenses associated with business in force as of the valuation date and significant non-recurring expenses expected to be incurred after the valuation date in the expense assumption.

- m. For contracts sold under a new policy form or due to entry into a new product line, the company shall use expense factors that are consistent with the expense factors used to determine anticipated experience assumptions for contracts from an existing block of mature contracts taking into account:

i. Any differences in the expected long-term expense levels between the block of new contacts and the block of mature contracts.

ii. That all expenses must be fully allocated as required under Section 12.D.1.h above.

2. Margins for Prudent Estimate Expense Assumptions

The company shall determine margins for expense assumptions following Section 12.C.

Section 13: Allocation of Aggregate Reserves to the Contract Level

Section 3.F states that the aggregate reserve shall be allocated to the contracts falling within the scope of these requirements. That allocation should be done for both the pre- and post-reinsurance ceded reserves. Contracts that have passed the stochastic exclusion test as defined in Section 7.B will not be included in the allocation of the aggregate reserve. For the purpose of this section, if a contract does not have a cash surrender value, then the cash surrender value is assumed to be zero.

Contracts for which the Deterministic Certification Option is elected in Section 7.E are intended to use the methodology described in this section to allocate aggregate reserves in excess of the cash surrender value to individual contracts.

The contract-level reserve for each contract shall be the sum of the following:

- A. The contract’s cash surrender value.

Drafting Note: The American Academy of Actuaries Annuity Reserves and Capital Work Group is including two potential options for allocating the excess portion of the aggregate reserve over cash surrender value: (1) Use the same approach as VM-21 (2) Allocate based on an actuarial present value calculation.

The Work Group did not reach a consensus between these two approaches, so wording for both is included in the text below. The Work Group recommends field testing both approaches and considering the results in determining future decisions.

Option 1: VM-21 Approach

- B. An allocated portion of the excess of the aggregate reserve over the aggregate cash surrender value shall be allocated to each contract based on a measure of the risk of that product relative to its cash surrender value in the context of the company’s in force contracts (assuming zero cash value for contracts that do not contain such). The allocation shall be made separately for DR and SR. The measure of risk should consider the impact of risk mitigation programs, including hedge programs and reinsurance, that would affect the risk of the product. The specific method of assessing that risk and how it contributes to the company’s aggregate reserve shall be defined by the company. The method should provide for an equitable allocation based on risk analysis.

Commented [X636]: This method only makes sense if done separately for the DR and SR.

- 1. As an example, consider a company with the results of the following three contracts:

Table 12.1: Sample Allocation of Aggregate Reserve

Contract (i)	1	2	3	Total
Cash Surrender Value, C	28	40	52	120
Risk adjusted measure, R	38	52	50	
Aggregate Reserve				140
Allocation Basis for the excess of the Aggregate Reserve over the Cash Surrender Value $A_i = \text{Max}(R_i - C_i, 0)$	10	12	0	22

Allocation of the excess of the Aggregate Reserve over the Cash Surrender Value $Li = (Ai)/\Sigma Ai * [Aggregate Reserve - \Sigma Ci]$	9.09	10.91	0.00	20
Contract-level reserve $Ci + Li$	37.09	50.91	52.00	140.00

2. In this example, the Aggregate Reserve exceeds the aggregate Cash Surrender Value by 20. The 20 is allocated proportionally across the three contracts based on the allocation basis of the larger of (i) zero; and (ii) a risk adjusted measure based on reserve principles. Therefore, contracts 1 and 2 receive 45% (9/22) and 55% (11/22), respectively, of the excess Aggregate Reserve. As Contract 3 presents no risk in excess of its cash surrender value, it does not receive an allocation of the excess Aggregate Reserve.

Option 2: Actuarial Present Value Approach

- B. The excess of the aggregate reserve over the aggregate cash surrender value is allocated to policies based on a calculation of the actuarial present value of projected liability cash flows in excess of the cash surrender value:
 1. Discount the liability cash flows at the NAER, pursuant to requirements in Section 4, for the scenario that produces the scenario reserve closest to, but not less than the ~~stochastic reserve~~ SR defined in Section 3.D.
 - a. Groups of contracts that elect the Deterministic Certification Option defined in Section 7.E shall use the NAER in the single scenario used to calculate the reserve to discount liability cash flows, as well as any cash flows that are scenario dependent.
 2. If the actuarial present value is less than the cash surrender value, then the excess actuarial present value to be used for allocating the excess aggregate reserve over the cash value shall be floored at zero.
 - a. If all contracts have an excess actuarial present value that is floored at zero, then use the cash surrender value to allocate any excess aggregate reserve over the aggregate cash surrender value.
 3. For projecting future liability cash flows, assume the same liability assumptions that were used to calculate the ~~stochastic reserve~~ SR defined in Section 3.D.
 4. As a hypothetical example, consider a company with the results of the following five contracts:

Commented [X637]: This method depends on the NAER, so would not work for companies that use direct iteration.

Commented [X638]: This could give an unstable allocation if there is an even mix of products with different risk profiles, so that the tail is populated with some scenarios where Product A does poorly and some where Product B does poorly. The single scenario will only reflect the riskiness of one of the products.

Commented [X639]: Not just the NAER, but the cashflows are also scenario dependent.

Commented [VM22640R639]: Edits to address this comment will be reflected in next exposure

Commented [CD641]: "Section 3.D"

Commented [VM22642R641]: Edits to address this comment will be reflected in next exposure

Table 12.1: Hypothetical Sample Allocation of Aggregate Reserve

Contract	Example Product Type	CSV* (1)	Scenario APV (2)	Excess (Floored) of the scenario APV over CSV* (3) = $\text{Max}\{(2)-(1), 0\}$	Aggregate Reserve CTE 70 (4)	Excess of Aggregate Reserve over Aggregate CSV* (5) = $\text{Max}\{[(4 \text{ Total}) - (1 \text{ Total}), 0\}$	Allocated Excess Reserve (6) = (3) x $\frac{[(5 \text{ Total})]}{[(3 \text{ Total})]}$	Total Contract Level Reserve (7) = (1) + (6)
Contract 1:	Indexed Annuity with no GLWB**	95.0	90.0	0.0			0.0	95.0
Contract 2:	Indexed Annuity with low benefit GLWB**	92.0	95.0	3.0			3.6	95.6
Contract 3:	Indexed Annuity with medium benefit GLWB**	90.0	100.0	10.0			12.0	102.0
Contract 4:	Indexed Annuity with high benefit GLWB**	88.0	105.0	17.0			20.4	108.4
Contract 5:	Fixed Life Contingent Payout Annuity	0.0	70.0	70.0			84.0	84.0
Total		365.0		100.0	485.0	120.0	120.0	485.0

*Cash Surrender Value
**Guaranteed Lifetime Withdrawal Benefit

Guidance Note: The actuarial present value (APV) in the section above is separate from the Guarantee Actuarial Present Value (GAPV) referred to in the additional standard projection amount calculation in VM-21. The GAPV is only applicable to guaranteed minimum benefits and uses prescribed liability assumptions. In contrast, the APV in this section applies to the entire contract, irrespective of whether guaranteed benefits are attached, and uses company prudent estimate liability assumptions.

Commented [CD643]: should be "Max{(2)-(1), 0}"
Commented [VM22644R643]: Edits to address this comment will be reflected in next exposure

Section ~~13~~14: Statutory Maximum Valuation Interest Rates for Income Annuity Formulaic Reserves

A. Purpose and Scope

1. These requirements define for single premium immediate annuity contracts and other similar contracts, certificates and contract features the statutory maximum valuation interest rate that complies with Model #820. These are the maximum interest rate assumption requirements to be used in the CARVM and for certain contracts, the CRVM. These requirements do not preclude the use of a lower valuation interest rate assumption by the company if such assumption produces statutory reserves at least as great as those calculated using the maximum rate defined herein.
2. The following categories of contracts, certificates and contract features, whether group or individual, including both life contingent and term certain only contracts, directly written or assumed through reinsurance, with the exception of benefits arising from variable annuities, ~~are covered in this section and all contracts not passing the SET covered by Sections 1 through 13 of VM-22, are covered Section 14 of VM-22:~~
 - a. Immediate annuity contracts issued after Dec. 31, 2017;
 - b. Deferred income annuity contracts issued after Dec. 31, 2017;
 - c. Structured settlements in payout or deferred status issued after Dec. 31, 2017;
 - d. Fixed payout annuities resulting from the exercise of settlement options or annuitizations of host contracts issued after Dec. 31, 2017;
 - e. Fixed payout annuities resulting from the exercise of settlement options or annuitizations of host contracts issued during 2017, for fixed payouts commencing after Dec. 31, 2018, or, at the option of the company, for fixed payouts commencing after Dec. 31, 2017;
 - f. Supplementary contracts, excluding contracts with no scheduled payments (such as retained asset accounts and settlements at interest), issued after Dec. 31, 2017;
 - g. Fixed income payment streams, attributable to contingent deferred annuities (CDAs) issued after Dec. 31, 2017, once the underlying contract funds are exhausted;
 - h. Fixed income payment streams attributable to guaranteed living benefits associated with deferred annuity contracts issued after Dec. 31, 2017, once the contract funds are exhausted; and
 - i. Certificates with premium determination dates after Dec. 31, 2017, emanating from non-variable group annuity contracts specified in Model #820, Section 5.C.2, purchased for the purpose of providing certificate holders benefits upon their retirement.

Commented [X645]: Under A.2: need to exclude contracts being covered by the earlier sections of VM-22 not passing the exclusion tests and need a clearer reference instead of "covered in this section"

Commented [VM22646R645]: Edits to address this comment will be reflected in next exposure

Guidance Note: For Section ~~13~~14.A.2.d, Section ~~13~~14.A.2.e, Section ~~13~~14.A.2.f and Section ~~13~~14.A.2.h above, there is no restriction on the type of contract that may give rise to the benefit.

3. Exemptions:
 - a. With the permission of the domiciliary commissioner, for the categories of annuity contracts, certificates and/or contract features in scope as outlined in Section ~~13~~14.A.2.d, Section ~~13~~14.A.2.e, Section ~~13~~14.A.2.f, Section ~~13~~14.A.2.g or Section ~~13~~14.A.2.h, the

company may use the same maximum valuation interest rate used to value the payment stream in accordance with the guidance applicable to the host contract. In order to obtain such permission, the company must demonstrate that its investment policy and practices are consistent with this approach.

4. The maximum valuation interest rates for the contracts, certificates and contract features within the scope of Section ~~13~~14 of VM-22 supersede those described in Appendix VM-A and Appendix VM-C, but they do not otherwise change how those appendices are to be interpreted. In particular, *Actuarial Guideline IX-B—Clarification of Methods Under Standard Valuation Law for Individual Single Premium Immediate Annuities, Any Deferred Payments Associated Therewith, Some Deferred Annuities and Structured Settlements Contracts* (AG-9-B) (see VM-C) provides guidance on valuation interest rates and is, therefore, superseded by these requirements for contracts, certificates and contract features in scope. Likewise, any valuation interest rate references in *Actuarial Guideline IX-C—Use of Substandard Annuity Mortality Tables in Valuing Impaired Lives Under Individual Single Premium Immediate Annuities* (AG-9-C) (see VM-C) are also superseded by these requirements.

B. Definitions

1. The term “reference period” means the length of time used in assigning the Valuation Rate Bucket for the purpose of determining the statutory maximum valuation interest rate and is determined as follows:
 - a. For contracts, certificates or contract features with life contingencies and substantially similar payments, the reference period is the length of time, rounded to the nearest year, from the premium determination date to the earlier of: i) the date of the last non-life-contingent payment under the contract, certificate or contract feature; and ii) the date of the first life-contingent payment under the contract, certificate or contract feature, or
 - b. For contracts, certificates or contract features with no life-contingent payments and substantially similar payments, the reference period is the length of time, rounded to the nearest year, from the premium determination date to the date of the last non-life-contingent payment under the contract, certificate or contract feature, or
 - c. For contracts, certificates or contract features where the payments are not substantially similar, the actuary should apply prudent judgment and select the Valuation Rate Bucket with Macaulay duration that is a best fit to the Macaulay duration of the payments in question.

Guidance Note: Contracts with installment refunds or similar features should consider the length of the installment period calculated from the premium determination date as the non-life contingent period for the purpose of determining the reference period.

Guidance Note: The determination in Section ~~13~~14.B.1.c above shall be made based on the materiality of the payments that are not substantially similar relative to the life-contingent payments.

2. The term “jumbo contract” means a contract with an initial consideration equal to or greater than \$250 million. Considerations for contracts issued by an insurer to the same contract holder within 90 days shall be combined for purposes of determining whether the contracts meet this threshold.

Guidance Note: If multiple contracts meet this criterion in aggregate, then each contract is a jumbo contract.

3. The term “non-jumbo contract” means a contract that does not meet the definition of a jumbo contract.
4. The term “premium determination date” means the date as of which the valuation interest rate for the contract, certificate or contract feature being valued is determined.
5. The term “initial age” means the age of the annuitant as of his or her age last birthday relative to the premium determination date. For joint life contracts, certificates or contract features, the “initial age” means the initial age of the younger annuitant. If a contract, certificate or contract feature for an annuitant is being valued on a standard mortality table as an impaired annuitant, “initial age” means the rated age. If a contract, certificate or contract feature is being valued on a substandard mortality basis, “initial age” means an equivalent rated age.
6. The term “Table X spreads” means the prescribed VM-22 Section ~~13~~¹⁴ current market benchmark spreads for the quarter prior to the premium determination date, as published on the Industry tab of the NAIC website. The process used to determine Table X spreads is the same as that specified in VM-20 Appendix 2.D for Table F, except that JP Morgan and Bank of America bond spreads are averaged over the quarter rather than the last business day of the month.
7. The term “expected default cost” means a vector of annual default costs by weighted average life. This is calculated as a weighted average of the VM-20 Table A prescribed annual default costs published on the Industry tab of the NAIC website in effect for the quarter prior to the premium determination date, using the prescribed portfolio credit quality distribution as weights.
8. The term “expected spread” means a vector of spreads by weighted average life. This is calculated as a weighted average of the Table X spreads, using the prescribed portfolio credit quality distribution as weights.
9. The term “prescribed portfolio credit quality distribution” means the following credit rating distribution:
 - a. 5% Treasuries
 - b. 15% Aa bonds (5% Aa1, 5% Aa2, 5% Aa3)
 - c. 40% A bonds (13.33% A1, 13.33% A2, 13.33% A3)*
 - d. 40% Baa bonds (13.33% Baa1, 13.33% Baa2, 13.33% Baa3)*

*40%/3 is used unrounded in the calculations.

C. Determination of the Statutory Maximum Valuation Interest Rate

1. Valuation Rate Buckets

- a. For the purpose of determining the statutory maximum valuation interest rate, the contract, certificate or contract feature being valued must be assigned to one of four Valuation Rate Buckets labeled A through D.
- b. If the contract, certificate or contract feature has no life contingencies, the Valuation Rate Bucket is assigned based on the length of the reference period (RP), as follows:

Table 3-1: Assignment to Valuation Rate Bucket by Reference Period Only

RP ≤ 5 Years	5Y < RP ≤ 10Y	10Y < RP ≤ 15Y	RP > 15Y
A	B	C	D

- c. If the contract, certificate or contract feature has life contingencies, the Valuation Rate Bucket is assigned based on the length of the RP and the initial age of the annuitant, as follows:

Table 3-2: Assignment to Valuation Rate Bucket by Reference Period and Initial Age

Initial Age	RP ≤ 5Y	5Y < RP ≤ 10Y	10Y < RP ≤ 15Y	RP > 15Y
90+	A	B	C	D
80–89	B	B	C	D
70–79	C	C	C	D
< 70	D	D	D	D

2. Premium Determination Dates

- a. The following table specifies the decision rules for setting the premium determination date for each of the contracts, certificates and contract features listed in Section 1:

Table 3-3: Premium Determination Dates

Section	Item Description	Premium determination date
A.2.a	Immediate annuity	Date consideration is determined and committed to by contract holder
A.2.b	Deferred income annuity	Date consideration is determined and committed to by contract holder
A.2.c	Structured settlements	Date consideration is determined and committed to by contract holder
A.2.d and A.2.e	Fixed payout annuities resulting from settlement options or annuitizations from host contracts	Date consideration for benefit is determined and committed to by contract holder
A.2.f	Supplementary contracts	Date of issue of supplementary contract
A.2.g	Fixed income payment streams from CDAs, AV becomes 0	Date on which AV becomes 0
A.2.h	Fixed income payment streams from guaranteed living benefits, AV becomes 0	Date on which AV becomes 0

A.2.i	Group annuity and related certificates	Date consideration is determined and committed to by contract holder
-------	--	--

Guidance Note: For the purposes of the items in the table above, the phrase “date consideration is determined and committed to by the contract holder” should be interpreted by the company in a manner that is consistent with its standard practices. For some products, that interpretation may be the issue date or the date the premium is paid.

b. Immaterial Change in Consideration

If the premium determination date is based on the consideration, and if the consideration changes by an immaterial amount (defined as a change in present value of less than 10% and less than \$1 million) subsequent to the original premium determination date, such as due to a data correction, then the original premium determination date shall be retained. In the case of a group annuity contract where a single premium is intended to cover multiple certificates, certificates added to the contract after the premium determination date that do not trigger the company’s right to reprice the contract shall be treated as if they were included in the contract as of the premium determination date.

3. Statutory Maximum Valuation Interest Rate

- a. For a given contract, certificate or contract feature, the statutory maximum valuation interest rate is determined based on its assigned Valuation Rate Bucket (Section 4314.C.1) and its Premium Determination Date (Section 4314.C.2) and whether the contract associated with it is a jumbo contract or a non-jumbo contract.
- b. Statutory maximum valuation interest rates for jumbo contracts are determined and published daily by the NAIC on the Industry tab of the NAIC website. For a given premium determination date, the statutory maximum valuation interest rate is the daily statutory maximum valuation interest rate published for that premium determination date.
- c. Statutory maximum valuation interest rates for non-jumbo contracts are determined and published quarterly by the NAIC on the Industry tab of the NAIC website by the third business day of the quarter. For a given premium determination date, the statutory maximum valuation interest rate is the quarterly statutory maximum valuation interest rate published for the quarter in which the premium determination date falls.
- d. Quarterly Valuation Rate:

For each Valuation Rate Bucket, the quarterly valuation rate is defined as follows:

$$I_q = R + S - D - E$$

Where:

- a. R is the reference rate for that Valuation Rate Bucket (defined in Section 4314.C.4);
- b. S is the spread rate for that Valuation Rate Bucket (defined in Section 4314.C.5);
- c. D is the default cost rate for that Valuation Rate Bucket (defined in Section 4314.C.6);

and

d. E is the spread deduction defined as 0.25%.

e. Daily Valuation Rate:

For each Valuation Rate Bucket, the daily valuation rate is defined as follows:

$$I_d = I_q + C_{d-1} - C_q$$

Where:

- a. I_q is the quarterly valuation rate for the calendar quarter preceding the business day immediately preceding the premium determination date;
- b. C_{d-1} is the daily corporate rate (defined in Section 1314.C.7) for the business day immediately preceding the premium determination date; and
- c. C_q is the average daily corporate rate (defined in Section 1314.C.8) corresponding to the same period used to develop I_q .

For jumbo contracts, the daily statutory maximum valuation interest rate is the daily valuation rate (I_d) rounded to the nearest one-hundredth of one percent (1/100 of 1%).

4. Reference Rate

Reference rates are updated quarterly as described below:

- a. The “quarterly Treasury rate” is the average of the daily Treasury rates for a given maturity over the calendar quarter prior to the premium determination date. The quarterly Treasury rate is downloaded from <https://fred.stlouisfed.org>, and is rounded to two decimal places.
- b. Download the quarterly Treasury rates for two-year, five-year, 10-year and 30-year U.S. Treasuries.
- c. The reference rate for each Valuation Rate Bucket is calculated as the weighted average of the quarterly Treasury rates using Table 1 weights (defined in Section 1314.C.9) effective for the calendar year in which the premium determination date falls.

5. Spread

The spreads for each Valuation Rate Bucket are updated quarterly as described below:

- a. Use the Table X spreads from the NAIC website for WALs two, five, 10 and 30 years only to calculate the expected spread.
- b. Calculate the spread for each Valuation Rate Bucket, which is a weighted average of the expected spreads for WALs two, five, 10 and 30 using Table 2 weights (defined in Section 3.I) effective for the calendar year in which the premium determination date falls.

6. Default costs for each Valuation Rate Bucket are updated annually as described below:

- a. Use the VM-20 prescribed annual default cost table (Table A) in effect for the quarter prior to the premium determination date for WAL two, WAL five and WAL 10 years only to calculate the expected default cost. Table A is updated and published annually on

the Industry tab of the NAIC website during the second calendar quarter and is used for premium determination dates starting in the third calendar quarter.

- b. Calculate the default cost for each Valuation Rate Bucket, which is a weighted average of the expected default costs for WAL two, WAL five and WAL 10, using Table 3 weights (defined in Section 4314.C.9) effective for the calendar year in which the premium determination date falls.

7. Daily Corporate Rate

Daily corporate rates for each valuation rate bucket are updated daily as described below:

- a. Each day, download the Bank of America Merrill Lynch U.S. corporate effective yields as of the previous business day’s close for each index series shown in the sample below from the St. Louis Federal Reserve website: <https://research.stlouisfed.org/fred2/categories/32348>. To access a specific series, search the St. Louis Federal Reserve website for the series name by inputting the name into the search box in the upper right corner, or input the following web address: [https://research.stlouisfed.org/fred2/series/\[replace with series name from the table below\]](https://research.stlouisfed.org/fred2/series/[replace with series name from the table below]).

Table 3-4: Index Series Names

Maturity	Series Name
1Y – 3Y	BAMLC1A0C13YEY
3Y – 5Y	BAMLC2A0C35YEY
5Y – 7Y	BAMLC3A0C57YEY
7Y – 10Y	BAMLC4A0C710YEY
10Y – 15Y	BAMLC7A0C1015YEY
15Y+	BAMLC8A0C15PYEY

- b. Calculate the daily corporate rate for each valuation rate bucket, which is a weighted average of the Bank of America Merrill Lynch U.S. corporate effective yields, using Table 4 weights (defined in Section 4314.C.9) effective for the calendar year in which the business date immediately preceding the premium determination date falls.

8. Average Daily Corporate Rate

Average daily corporate rates are updated quarterly as described below:

- a. Download the quarterly average Bank of America Merrill Lynch U.S. corporate effective yields for each index series shown in Section 3.G.1 from the St. Louis Federal Reserve website: <https://research.stlouisfed.org/fred2/categories/32348>. To access a specific series, search the St. Louis Federal Reserve website for the series name by inputting the name into the search box in the upper right corner, or input the following web address: [https://research.stlouisfed.org/fred2/series/\[replace with series name from Section 4314.C.7.a\]](https://research.stlouisfed.org/fred2/series/[replace with series name from Section 4314.C.7.a]).

- b. Calculate the average daily corporate rate for each valuation rate bucket, which is a weighted average of the quarterly average Bank of America Merrill Lynch U.S. corporate effective yields, using Table 4 weights (defined in Section 14.C.9) for the same calendar year as the weight tables (i.e. Tables 1, 2, and 3) used in calculating I_q in Section 14.C.3.e.

9. Weight Tables 1 through 4

The system for calculating the statutory maximum valuation interest rates relies on a set of four tables of weights that are based on duration and asset/liability cash-flow matching analysis for representative annuities within each valuation rate bucket. A given set of weight tables is applicable to the calculations for every day of the calendar year.

In the fourth quarter of each calendar year, the weights used within each valuation rate bucket for determining the applicable valuation interest rates for the following calendar year will be updated using the process described below. In each of the four tables of weights, the weights in a given row (valuation rate bucket) must add to exactly 100%.

Weight Table 1

The process for determining Table 1 weights is described below:

- a. Each valuation rate bucket has a set of representative annuity forms. These annuity forms are as follows:
- i. Bucket A:
 - a) Single Life Annuity age 91 with 0 and five-year certain periods.
 - b) Five-year certain only.
 - ii. Bucket B:
 - a) Single Life Annuity age 80 and 85 with 0, five-year and 10-year certain periods.
 - b) 10-year certain only.
 - iii. Bucket C:
 - a) Single Life Annuity age 70 with 0 and 15-year certain periods.
 - b) Single Life Annuity age 75 with 0, 10-year and 15-year certain periods.
 - c) 15-year certain only.
 - iv. Bucket D:
 - a) Single Life Annuity age 55, 60 and 65 with 0 and 15-year certain periods.
 - b) 25-year certain only.
- b. Annual cash flows are projected assuming annuity payments are made at the end of each year. These cash flows are averaged for each valuation rate bucket across the annuity forms for that bucket using the statutory valuation mortality table in effect for the following calendar year for

individual annuities for males (ANB).

- c. The average daily rates in the third quarter for the two-year, five-year, 10-year and 30-year U.S. Treasuries are downloaded from <https://fred.stlouisfed.org> as input to calculate the present values in Step d.
- d. The average cash flows are summed into four time period groups: years 1–3, years 4–7, years 8–15 and years 16–30. (**Note:** The present value of cash flows beyond year 30 are discounted to the end of year 30 and included in the years 16–30 group. This present value is based on the lower of 3% and the 30-year Treasury rate input in Step c.)
- e. The present value of each summed cash-flow group in Step d is then calculated by using the Step 3 U.S. Treasury rates for the midpoint of that group (and using the linearly interpolated U.S. Treasury rate when necessary).
- f. The duration-weighted present value of the cash flows is determined by multiplying the present value of the cash-flow groups by the midpoint of the time period for each applicable group.
- g. Weightings for each cash-flow time period group within a valuation rate bucket are calculated by dividing the duration weighted present value of the cash flow by the sum of the duration weighted present value of cash flow for each valuation rate bucket.

Weight Tables 2 through 4

Weight Tables 2 through 4 are determined using the following process:

- i. Table 2 is identical to Table 1.
 - ii. Table 3 is based on the same set of underlying weights as Table 1, but the 10-year and 30-year columns are combined since VM-20 default rates are only published for maturities of up to 10 years.
 - iii. Table 4 is derived from Table 1 as follows:
 - a) Column 1 of Table 4 is identical to column 1 of Table 1.
 - b) Column 2 of Table 4 is 50% of column 2 of Table 1.
 - c) Column 3 of Table 4 is identical to column 2 of Table 4.
 - d) Column 4 of Table 4 is 50% of column 3 of Table 1.
 - e) Column 5 of Table 4 is identical to column 4 of Table 4.
 - f) Column 6 of Table 4 is identical to column 4 of Table 1.
10. Group Annuity Contracts

For a group annuity purchased under a retirement or deferred compensation plan (Section ~~13~~14.A.2.i), the following apply:

- a. The statutory maximum valuation interest rate shall be determined separately for each certificate, considering its premium determination date, the certificate holder's initial age, the reference period corresponding to its form of payout and whether the contract is a jumbo contract or a non-jumbo contract.

Guidance Note: Under some group annuity contracts, certificates may be purchased on different

dates.

- b. In the case of a certificate whose form of payout has not been elected by the beneficiary at its premium determination date, the statutory maximum valuation interest rate shall be based on the reference period corresponding to the normal form of payout as defined in the contract or as is evidenced by the underlying pension plan documents or census file. If the normal form of payout cannot be determined, the maximum valuation interest rate shall be based on the reference period corresponding to the annuity form available to the certificate holder that produces the most conservative rate.

Guidance Note: The statutory maximum valuation interest rate will not change when the form of payout is elected.

This page intentionally left blank

Valuation Manual Section II, Reserve Requirements

Subsection 2: Annuity Products

- A. This subsection establishes reserve requirements for all contracts classified as annuity contracts as defined in SSAP No. 50 in the AP&P Manual.
- B. Minimum reserve requirements for variable annuity (VA) contracts and similar business, specified in VM-21, Requirements for Principle-Based Reserves for Variable Annuities, shall be those provided by VM-21. The minimum reserve requirements of VM-21 are considered PBR requirements for purposes of the *Valuation Manual*.
- C. Minimum reserve requirements for ~~non-variable~~ fixed annuity contracts issued prior to 1/1/2024 are those requirements as found in VM-A and VM-C as applicable, with the exception of the minimum requirements for the valuation interest rate for single premium immediate annuity contracts, and other similar contracts, issued after Dec. 31, 2017, including those fixed payout annuities emanating from host contracts issued on or after Jan. 1, 2017, and on or before Dec. 31, 2017. The maximum valuation interest rate requirements for those contracts and fixed payout annuities are defined in Section 14 of VM-22, Statutory Maximum Valuation Interest Rates for Income Annuity Formulaic Reserves.
- D. Minimum reserve requirements for ~~non-variable~~ fixed annuity contracts issued on 1/1/2024 and later are those requirements as found in Sections 1 through 13 of VM-22.

The requirements in this section are still considered a part of PBR requirements and therefore are applicable to VM-G.

The below principles may serve as key considerations for assessing whether VM 21 or VM 22 requirements apply:

D. Minimum reserve requirements apply:

E. ~~Index for index-linked or modified guaranteed annuity contracts or riders that satisfy both of the following conditions may be a key consideration for application of VM 22 requirements and are issued on 1/1/2024 and later are those requirements: as found in Sections 1 through 13 of VM-22.:~~

- 1. Guarantees the principal amount of purchase payments, net of any partial withdrawals, and interest credited thereto, less any deduction (without regard to its timing) for sales, administrative or other expenses or charges.
- 2.b. Credits a rate of interest under the contract prior to the application of any market value adjustments that is at least equal to the minimum rate required to be credited by the standard nonforfeiture law in the jurisdiction in which the contract is issued.

~~Guidance Note: Paragraph E.1.b is intended to apply prior to the application of any market value adjustments for modified guaranteed annuities where the underlying assets are held in a separate account. If meeting Paragraph E.1.b prior to the application of any market value adjustments and Paragraph E.1.a above, it may be appropriate to value such contracts under VM 22 requirements.~~

Minimum reserve requirements.

Commented [X647]: We believe a Fixed Annuity PBR Exemption should be incorporated into draft in a manner consistent with the Life PBR Exemption.

Commented [VM22648R647]: Waylon Peoples comment letter: Extend small company exemption in place for life PBR (VM-20) to VM-22.

Commented [VM22649R647]: The Subgroup voted in favor of a VM-22 PBR Exemption. The ACLI will follow-up with proposed criteria for determining the exemption.

Commented [CD650]: "non-variable annuity"?

Commented [VM22651R650]: Edits to address this comment will be reflected in next exposure

Commented [X652]: "Section 13 of VM-22" may need to be updated if it is decided to have separate chapters for VM-22 VIR and VM-22 PBR.

Commented [VM22653R652]: Edits to address this comment will be reflected in next exposure

Commented [CD654]: "non-variable annuity"?

Commented [VM22655R654]: Edits to address this comment will be reflected in next exposure

Commented [CD656]: Consider adding the sentence: "The minimum reserve requirements of VM-22 are considered PBR requirements for purposes of the Valuation Manual." This is so VM-G will apply to VM-22, which would be appropriate.

Commented [VM22657R656]: Edits to address this comment will be reflected in next exposure

Commented [X658]: "Index-linked" annuity is not defined – only RILA and FIA in VM-22, recommend to revise the language or add a definition to define "index linked".

Commented [X659]: Recommend adding this part to E.1.b and delete the Guidance Note.

Commented [VM22660R659]: Edits to address this comment will be reflected in next exposure

for index

F. ~~2. Index-linked or modified guaranteed annuity contracts or riders that do not satisfy either of the two conditions listed above criteria in Paragraph Section 2.E.1 and Section 2.E.2 above and E.1.ii may be a key consideration for application of VM-21 are issued on 1/1/2024 and later are those requirements as found in VM-21.~~

Commented [X661]: VM-21 specifically says “These requirements do not apply to contracts falling under the scope of VM-A-255: Modified Guaranteed Annuities; however, they do apply to contracts listed above that include one or more subaccounts containing features similar in nature to those contained in modified guaranteed annuities (MGAs) (e.g., market value adjustments).” Is this a contradiction?

Commented [X662]: Consistent with E above.

Commented [VM22663R662]: Edits to address this comment will be reflected in next exposure

Subsection 6: Riders and Supplemental Benefits

Guidance Note: Policies ~~Designs~~ of policies or contracts with riders and supplemental benefits which are created to simply disguise benefits subject to the Valuation Manual section describing the reserve methodology for the base product to which they are attached, or exploit a perceived loophole, must be reserved in a manner similar to more typical designs with similar riders.

Commented [X664]: Still need the word "designs" otherwise this is saying the whole policy/contract was only created to disguise benefits, which would never be true.

Commented [VM22665R664]: Edits to address this comment will be reflected in next exposure

A. If a rider or supplemental benefit is attached to a health insurance product, deposit-type contract, or credit life or disability product, it may be valued with the base contract unless it is required to be separated by regulation or other requirements.

B. For supplemental benefits on life insurance policies or annuity contracts, including Guaranteed Insurability, Accidental Death or Disability Benefits, Convertibility, ~~Nursing Home Benefits~~ or Disability Waiver of Premium Benefits, the supplemental benefit may be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, VM-A, and/or VM-C, as applicable.

Commented [X666]: This reference is another place where there would be a benefit distinguishing the PBR sections of VM-22 from the non-PBR sections.

Commented [VM22667R666]: Edits to address this comment will be reflected in next exposure

~~C. ULSG and other secondary guarantee riders on a life insurance policy shall be valued with the base policy and follow the reserve requirements for ULSG policies under VM-20, VM-A and/or VM-C, as applicable.~~

~~D.C. Anyany~~ guaranteed minimum benefits on life insurance policies or annuity contracts ~~not subject to Paragraph C above~~ including, but not limited to, Guaranteed Minimum Accumulation Benefits, Guaranteed Minimum Death Benefits, Guaranteed Minimum Income Benefits, Guaranteed Minimum Withdrawal Benefits, Guaranteed Lifetime Income Benefits, Guaranteed Lifetime Withdrawal Benefits, Guaranteed Payout Annuity Floors, Waiver of Surrender Charges, Return of Premium, Systematic Withdrawal Benefits under Required Minimum Distributions, and all similar guaranteed benefits shall be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, and VM-A and/or VM-C, as applicable.

Commented [X668]: These parallel requirements can be combined.

Commented [VM22669R668]: Edits to address this comment will be reflected in next exposure

~~E.D.~~ If a rider or supplemental benefit to a life insurance policy or annuity contract that is not addressed in Paragraphs B, C, or D above possesses any of the following attributes, the rider or supplemental benefit shall be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, and VM-A and/or VM-C, as applicable.

1. The rider or supplemental benefit does not have a separately identified premium or charge.
2. After issuance, the rider or supplemental benefit premium, charge, value or benefits are determined by referencing the base policy or contract features or performance.
3. After issuance, the base policy or contract value or benefits are determined by referencing the rider or supplemental benefit features or performance. The deduction of rider or benefit premium or charge from the contract value is not sufficient for a determination by reference.

~~F.E.~~ If a term life insurance rider on the named insured[s] on the base life insurance policy does not meet the conditions of Paragraph E above, and either (1) guarantees level or near level premiums until a specified duration followed by a material premium increase; or (2) for a rider for which level or near level premiums are expected for a period followed by a material premium increase, the rider is

separated from the base policy and follows the reserve requirements for term policies under VM20, VM-A and/or VM-C, as applicable.

G.F. For all other riders or supplemental benefits on life insurance policies or annuity contracts not addressed in Paragraphs B through F above, the riders or supplemental benefits may be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, VM-A and/or VM-C, as applicable. For a given rider, the election to include riders or supplemental benefits with the base policy or contract shall be determined at the policy form level, not on a policy-by-policy basis, and shall be treated consistently from year-to-year, unless otherwise approved by the domiciliary commissioner.

H.G. Any supplemental benefits and riders offered on life insurance policies or annuity contracts that would have a material impact on the reserve (for VM-20 and VM-22) or TAR (for VM-21) if elected later in the contract life, such as joint income benefits, nursing home benefits, or withdrawal provisions on annuity contracts, shall be considered when determining reserves (for VM-20 and VM-22) or reserves and TAR (for VM-21) using the following principles:

1. Policyholders with living benefits and annuitization in the same contract will generally use the more valuable of the two benefits.
2. When advantageous, policyholders will commence living benefit payouts if not started yet.

Commented [X670]: Simplifications are judged relative to reserves for VM-20/VM-21 and TAR for VM-21.

Commented [VM22671R670]: Edits to address this comment will be reflected in next exposure

Commented [X672]: This section states that “When advantageous, policyholders will commence living benefit payouts if not started yet.” This text seems to directly contradict VM-22 Section 6.H.2 which states “contract holder behavior should neither assume that all contract holders act with 100% efficiency in a financially rational manner nor assume that contract holders will always act irrationally”. We suggest revising 6.H.2 to align with the text of 10.D.8.

Page 6: [1] Commented [X42] TDI 11/9/2021 8:56:00 AM

Proposed revision is not appropriate. Item (a) is unnecessary, and items under (b) would be addressed via simplifications and thus are indirectly reflected. Recommend deleting the whole section 1.C.3 including item (a) and item (b).

Page 6: [2] Commented [X45] TDI 11/9/2021 8:59:00 AM

The revised language “sudden and significant levels of withdrawal and surrenders” replaces the original language “run on the bank” and is less clear. Does “significant” mean severe or extreme? Or just appreciably? Withdrawals and surrenders certainly may vary by projected economic scenarios. Recommend using the original language “run on the bank” that had a clearer intent.

Page 6: [3] Commented [X46] TDI 11/9/2021 9:02:00 AM

We recommend deleting the wording “fundamentally”.

If a breakthrough is known to have fundamentally changed expected future mortality, but is not yet significantly reflected in historical experience, why is it not reflected? Do we know about this fundamental shift for years before it is reflected? This issue also applies to the VM-21 requirement.

Page 6: [4] Commented [X48] ACLI

We recommend removing the bullet “Significant future reserve increases as an unfavorable scenario is realized” as this is extraneous.

Page 7: [5] Commented [X55] TDI 11/9/2021 9:04:00 AM

The term Buffer Annuity is not interchangeable to Registered Index-Linked Annuity (RILA) since Buffer Annuity is a subset of RILA. RILA can have different downside protections such as “Buffer” or “Floor”. Recommend deleting Buffer Annuity or add descriptions for Buffer Annuity as a subtype in the RILA definition.

Page 7: [6] Commented [X57] ACLI

Suggest aligning the cut off to 13 months for alignment consistent with Actuarial Guideline IX, rather than the 1 year that currently is in the VM-22 draft.

Page 7: [7] Commented [X65] TDI 11/9/2021 9:07:00 AM

The definition of FIA describes the account value as typically with guaranteed principal. Since FIA always has the guaranteed principal, recommend deleting the wording “typically”.

Page 9: [8] Commented [X87] ACLI

It is unclear to us why RILA is defined in VM-22 when it is being used to exclude the product from VM-22 requirements.

Page 9: [9] Commented [VM2288R87] VM-22 Subgroup 6/23/2022 9:12:00 AM

ACLI already following up on a proposal to address the scope and definitions, which will address this issue.

Page 9: [10] Commented [X91] ACLI

Suggest aligning the cut off to 13 months for alignment consistent with Actuarial Guideline IX, rather than the 1 year that currently is in the VM-22 draft.

Page 9: [11] Commented [X93] TDI 11/9/2021 9:06:00 AM

The wording “after (or from)” the issue date used in the DIA and SPIA definitions is confusing. Recommend keeping it simple as “from” the issue date.

Page 11: [12] Commented [VM22112R109] VM-22 Subgroup 6/23/2022 9:14:00 AM

The VM-22 Subgroup voted to adopted “Option 1” for Reserving Categories

Page 11: [13] Commented [VM22111R109] VM-22 Subgroup 3/2/2022 4:12:00 PM

See Equitable comment letter: supports full aggregation, but if choosing between the two exposed options for two reserving categories, prefers option 2.

Page 11: [14] Commented [VM22110R109] VM-22 Subgroup 3/2/2022 2:59:00 PM

See NY comment letter: supports option 1, with additional category for “other” for any other contract with supporting assets such that there is greater reinvestment and longevity risks, than disintermediation risk and other risks associated with policyholder behavior as of the valuation date.

Page 11: [15] Commented [X109] TDI 11/9/2021 9:23:00 AM

The reserving categories for VM-22 are not included in Scope. Recommend including the defined reserving categories in the section when outlining Scope.

Page 11: [16] Commented [X107] ACLI

We would support reworking this section to rely on principles, rather than definitions to determine what is in and out of scope. As product innovation continues, a simple list may not appropriately accommodate the applicability of this chapter. However, if such a list is included, then we believe it should align with the full list presented in Section 13.

Page 11: [17] Commented [VM22108R107] VM-22 Subgroup 6/23/2022 9:16:00 AM

ACLI will follow up with a proposed revision to the definitions and scope section

Page 11: [18] Commented [VM22114R113] VM-22 Subgroup 6/23/2022 9:16:00 AM

Edits to address this comment will be reflected in next exposure

Page 11: [19] Commented [CD113] CA DOI 12/30/2021 3:27:00 PM

suggest numbering the paragraphs within this section

Page 11: [20] Commented [CD115] CA DOI 12/30/2021 3:27:00 PM

suggest swapping the order of this section. That is, start with the "in scope" list, rather than the "out of scope" list.

Also, it seems like there should be specific mentions of GMDBs and GLBs, as there are in VM-21, since those guarantees can also be found on FIAs.

Page 11: [21] Commented [VM22116R115] VM-22 Subgroup 6/23/2022 9:16:00 AM

Edits to address this comment will be reflected in next exposure

Page 11: [22] Commented [X117] TDI 11/9/2021 9:12:00 AM

Since buffer annuities are a subset of RILA, recommend deleting buffer annuities.

Page 11: [23] Commented [VM22118R117] VM-22 Subgroup 6/23/2022 9:16:00 AM

Edits to address this comment will be reflected in next exposure

Page 11: [24] Commented [CD119] CA DOI 12/30/2021 3:28:00 PM

this is not defined in the Definition section. should it be?

Page 11: [25] Commented [VM22120R119] VM-22 Subgroup 6/23/2022 9:17:00 AM

Edits to address this comment will be reflected in next exposure

Page 11: [26] Commented [X121] TDI 11/9/2021 9:17:00 AM

This needs to be revised to be in line with VM-21 Section 2.A. Consider removing "such as" list and adding a cross-reference to VM-21 Section 2.A.

Page 11: [27] Commented [VM22122R121] VM-22 Subgroup 6/23/2022 9:16:00 AM

Edits to address this comment will be reflected in next exposure

Page 11: [28] Commented [CD123] CA DOI 12/30/2021 3:28:00 PM

should this be "non-variable annuities" since that is term used in Section 1.A?

Page 11: [29] Commented [VM22124R123] VM-22 Subgroup 6/23/2022 9:17:00 AM

Edits to address this comment will be reflected in next exposure

Edits to address this comment will be reflected in next exposure

Page 11: [34] Commented [CD133] CA DOI 12/30/2021 3:31:00 PM

should this be "Non-Variable Annuity"? Otherwise, should "Fixed Annuity" be defined in the Definitions section?

Page 11: [35] Commented [VM22134R133] VM-22 Subgroup 6/23/2022 9:18:00 AM

Edits to address this comment will be reflected in next exposure

Page 11: [36] Commented [CD135] CA DOI 12/30/2021 3:31:00 PM

for consistency, make plural; i.e., change to "ies"

Page 11: [37] Commented [VM22136R135] VM-22 Subgroup 6/23/2022 9:18:00 AM

Edits to address this comment will be reflected in next exposure

Page 12: [38] Commented [X146] TDI 11/9/2021 9:33:00 AM

Need to clarify what is meant by "VM-22 PBR Requirements". Add specific section references, or update proposal to have the PBR and non-PBR sections of this VM-22 draft in different chapters. After having reviewed, we think it would be much more clear to reconsider the use of "VM-23" for the PBR requirements to avoid ambiguity around scope/exclusions. The non-PBR sections also just don't seem to fit in this draft, and there is now ambiguity around whether other parts of VM-22 apply to them (scope, effective date, principles, etc.).

Page 12: [39] Commented [X149] TDI 11/9/2021 9:28:00 AM

Can a company wait until the end of the transition period to start PBR, but then apply PBR to the issues from during the transition period? This was unclear for VM-20, and still seems unclear here. Need to be explicit one way or the other.

Page 12: [40] Commented [VM22150R149] VM-22 Subgroup 6/23/2022 9:19:00 AM

Discussed with Subgroup and decided to keep the VM-22 language silent on this issue, similar to VM-20, leaving it to be determined on a case-by-case basis for each state.

Page 15: [41] Commented [X166] TDI 11/9/2021 9:48:00 AM

Recommend replacing "the scenario reserve" with "the deterministic reserve". Note that we also disagree with calling the deterministic reserve a stochastic reserve (later in draft), which adds a good deal of confusion.

Page 15: [42] Commented [CD167] CA DOI 12/30/2021 3:35:00 PM

suggest expanding header to "Stochastic Exclusion Test", for clarity

Page 15: [43] Commented [X168] ACLI

Seems to imply that only SPIAs would pass due to the linkage to Section 13. But the reference to interest rates should be broader, if even necessary. Suggest editing as:

"these groups of contracts may be valued using the methodology and statutory maximum valuation rate pursuant to applicable requirements in VM-A, and VM-C, and with the statutory maximum valuation rate for immediate annuities specified in Section 13."

Edits to address this comment will be reflected in next exposure

Page 15: [45] Commented [CD170] CA DOI 12/30/2021 3:36:00 PM

Suggest rewording to just say "the stochastic exclusion test". There is only 1 SET, with 3 ways of passing it. Therefore, the current wording is confusion because it suggests that there are multiple SETs.

Page 15: [48] Commented [X174] ACLI

We believe this guidance note is unnecessary as the intent of the section is clear, and the wording is possibly confusing.

Page 15: [49] Commented [X175] TDI 11/9/2021 9:57:00 AM

The statement in this section is not acceptable as discussed in the previous TX comment letter. This will have the effect of potentially masking blocks that need PBR.

Page 15: [50] Commented [VM22176R175] VM-22 Subgroup 6/23/2022 9:26:00 AM

Subgroup agreed that wording for exclusion test aggregation should be consistent with VM-20. Edits to address this comment will be reflected in next exposure

Page 15: [51] Commented [X177] ACLI

This section seems to indicate that the grouping of contracts in exclusion testing should be the same as the grouping of contracts for aggregation. This might cause fewer product types to be qualifying for exclusion if the test must be performed at a higher level of aggregation.

Page 15: [52] Commented [VM22178R177] VM-22 Subgroup 6/23/2022 9:27:00 AM

Subgroup voted to use wording consistent with VM-20, which prohibits aggregating contracts with significantly different risk profiles.

Page 15: [53] Commented [CD179] CA DOI 12/30/2021 3:42:00 PM

for clarity, change this reference to "Section 3.D"

Page 15: [54] Commented [VM22180R179] VM-22 Subgroup 6/23/2022 9:24:00 AM

Edits to address this comment will be reflected in next exposure

Page 15: [55] Commented [CD181] CA DOI 12/30/2021 3:41:00 PM

again, suggest rewording this to just say "the stochastic exclusion test"

Page 15: [56] Commented [VM22182R181] VM-22 Subgroup 6/23/2022 9:24:00 AM

Edits to address this comment will be reflected in next exposure

Page 15: [57] Commented [X184] ACLI

Either in this item or in Section 12 allocation to contracts not covered by PBR methodology in VM-22 needs to be addressed e.g., carve out because reserves calculated on seriatim formulaic basis.

Page 15: [58] Commented [VM22185R184] VM-22 Subgroup 6/23/2022 9:24:00 AM

Edits to address this comment will be reflected in next exposure

Page 15: [59] Commented [X186] ACLI

This sub-section seems more appropriate in Section 4 (or pulled out completely and consolidated within "I. Introduction" or "VM-01" and applied to all PBR methods).

Page 15: [60] Commented [CD187] CA DOI 12/30/2021 3:43:00 PM

VM-21 Section 3.H on simplifications, approximations, and modeling efficiency techniques is missing (including the Guidance Note). Would it make sense to add it?

Page 15: [62] Commented [X190] TDI 11/9/2021 9:59:00 AM

Recommend to periodically review at least every three years.

Page 15: [63] Commented [CD191] CA DOI 12/30/2021 3:45:00 PM

Should this be "the company... shall", rather than the "qualified actuary... shall"? Not sure why this particular task falls on the QA, when "the company" generally has responsibility for PBR and, in the subsection directly before this one, the company is assigned the task of establishing prudent estimate assumptions.

New language drafted by select Subgroup Members to provide certain conditions under which SPIA contracts could automatically pass the exclusion test

Page 34: [72] Commented [CD360] CA DOI 12/30/2021 4:11:00 PM

Suggest renaming this section header/name to "Requirements to Pass the SET". There is only 1 SET, but 3 ways to pass it (SERT, Demonstration or Certifications). The language gets confusing (here and elsewhere) when you start saying there are different "types" of SETs.

Page 35: [73] Commented [X364] ACLI

We recommend removing "pension risk transfer business" from products scoped out of SET certification method. It is unclear why this business would be treated differently from individually issued business for testing intended to capture interest rate risk.

Page 35: [74] Commented [VM22365R364] VM-22 Subgroup 3/2/2022 2:51:00 PM

Subgroup voted to keep PRT ineligible for the Certification Method

what is meant by "aggregate risk levels"? Aggregated across what? Need clarification on the intentions for adding this phrase, when it is not in VM-20. Otherwise, i would suggest deleting this.

Page 35: [79] Commented [VM22373R372] VM-22 Subgroup 6/23/2022 10:11:00 AM

Edits to address this comment will be reflected in next exposure

Page 35: [80] Commented [X374] TDI 11/18/2021 9:49:00 PM

This is not in VM-20 and would substantially change the exclusion. The intent is not to allow you to group a block that has material interest rate risk with a larger block that is insensitive to interest rate risks and thereby pass. If "aggregate" referred to potential compounding of interest rate, longevity, or asset risk then this could be redrafted to clearly call out a 4th category of risk due to a combination of the first three. However, I think this is already implicitly covered.

Edits to address this comment will be reflected in next exposure

Page 35: [94] Commented [X393] ACLI

As written, the SERT assumes a single premium product given the change of the denominator to the scenario reserve. Alternative product designs (such as longevity swap) could result in unintended results. We recommend maintaining consistency with VM-20 and using a denominator of future benefits (annuity payments, DBs, etc., excluding premium considerations, expenses, etc.).

Page 35: [95] Commented [VM22394R393] VM-22 Subgroup 6/23/2022 10:12:00 AM

Consensus to use a denominator that only includes benefits and expenses, consistent with VM-20

Page 35: [96] Commented [X395] TDI 11/18/2021 9:53:00 PM

Using (a) in the denominator instead of VM-20's (c) which is a PV of benefits could make this ratio unstable when the scenario reserve (a) is very small. This is particularly applicable if the block being tested does not have CSV.

Page 35: [97] Commented [VM22396R395] VM-22 Subgroup 6/23/2022 10:13:00 AM

Consensus to use a denominator that only includes benefits and expenses, consistent with VM-20

Page 35: [98] Commented [X397] TDI 11/18/2021 9:59:00 PM

The variability should be assured to be immaterial based on the company's materiality standard.

Draft: 8/2/22

Valuation Manual (VM)-22 (A) Subgroup
Virtual Meeting
June 29, 2022

The VM-22 (A) Subgroup of the Life Actuarial (A) Task Force met June 29, 2022. The following Subgroup members participated: Ben Slutsker, Chair (MN); Ahmad Kamil, Elaine Lam, and Thomas Reedy (CA); Lei Rao-Knight (CT); Mike Yanacheak (IA); Nicole Boyd (KS); William Leung (MO); Seong-min Eom (NJ); Bill Carmello and Amanda Fenwick (NY); Mike Boerner and Yujie Huang (TX); and Craig Chupp (VA).

1. Reviewed the Updated VM-22 Subgroup Documents

Mr. Slutsker said the drafting discussion log (Attachment Twenty-One-A) has been updated to include the tier three comments. He presented an updated version of the proposed VM-22 framework (Attachment Twenty-One-B), which reflects the tier one and tier two comments that have been addressed.

2. Discussed the Allocation of Excess Reserves

Mr. Slutsker said that two options have been proposed for the allocation of the excess of reserves over cash values. He said the first option allocates the excess in the same manner as VM-21, Requirements for Principle-Based Reserves for Variable Annuities, which uses the measure of the risk of the product relative to its cash surrender value. He said the second option uses the excess of the present value of the projected liability cash flows to allocate the excess reserves. Brian Bayerle (American Council of Life Insurers—ACLI) said the ACLI wants to ensure that the method chosen is consistent with other requirements. He said they are testing the options and will share the outcome of the testing once it is completed. He said they are particularly concerned with non-life contingent contracts. Chris Conrad (American Academy of Actuaries—Academy) said both options will be considered as part of the VM-22 field test. Mr. Slutsker said the allocation method decision will be deferred until after the field test.

3. Discussed Working Reserve for Contracts with no Cash Surrender Value

Mr. Slutsker said there is a question of whether to set a working reserve floor for contracts that have no cash surrender value. Al Zlogar (Academy) said it is unlikely that a model segment would combine contracts with cash surrender values and contracts with no cash surrender values because of the aggregation rules, which require the separation of the payout and accumulation categories. He said the Academy will work on a definition for a working reserve or working cash surrender value.

4. Discussed Reserve Categorization Upon Depletion of Fund Value

Mr. Slutsker asked how the proposed VM-22 framework should categorize accumulation contracts after their fund values have been depleted. Mr. Zlogar said that the Academy prefers a principle-based approach, which allows the company management of the investments supporting the liabilities to determine the categorization of the contract for reserving purposes. He said that in most cases, the assets are transferred to the payout reserving category. He noted that generally accepted accounting principles (GAAP) require that the reserves move from market risk benefit reserves to liability for future policy benefit reserves. He said one would expect the asset categorization to follow the categorization of the GAAP reserves. Mr. Slutsker asked how companies with no single premium immediate annuities or deferred income annuities would address their deferred annuities when the funds are depleted and the contract begins paying out guaranteed living benefits. John Miller (Academy) said the working reserve concept could come into play in that situation. Mr. Slutsker asked if forcing the contracts with

depleted fund values into the payout reserving category would alleviate the need to address the working reserve issue. Mr. Zlogar said that it is unclear whether that will be the case. Mr. Slutsker said that for the initial exposure, the contracts with depleted funds will be required to move to the payout reserving category. He said comments can be submitted at that time. Cindy Barnard (Pacific Life) said that treatment is inconsistent with VM-21. Mr. Slutsker said a drafting note will be added to solicit feedback on the consistency with VM-21.

5. Review Tier Three Comments in the VM-22 draft

Mr. Bayerle said that in Section I of the proposed VM-22 framework, the guidance note that references C-3 Phase II should be retained to acknowledge that a link to risk-based capital (RBC) will continue to exist. He said the appropriate wording can be added later. Mr. Slutsker suggested working offline with Mr. Bayerle to develop proposed wording.

Mr. Slutsker said the California Department of Insurance (DOI) commented that the VM-22 principles should align with VM-21. He said when the VM-22 framework proposal is completed, a document that outlines the differences from VM-21 will be produced. He said differences can be discussed at that time.

Mr. Bayerle said principle #2 is contradicted in later sections of the proposed VM-22 framework. He suggested revising the principle to reflect recent changes. Mr. Slutsker said the issue can be addressed when considering the language for the RBC guidance note.

Mr. Slutsker said that the TDI suggested reinstating the guidance note that gives examples where full aggregation may not be possible under principle #2. There were no objections to reinstating the guidance note.

Having no further business, the VM-22 (A) Subgroup adjourned.

[https://Support Staff Hub/Member Meetings/2022 NAIC Meetings/Spring National Meeting/Committee Meetings/LIFE INS and ANNUITIES \(A\) COMMITTEE/Life Actuarial \(A\) TF/Summer LATF Calls/VM-22 Subgroup/06 29/6_29 VM-22 Minutes.docx](https://Support Staff Hub/Member Meetings/2022 NAIC Meetings/Spring National Meeting/Committee Meetings/LIFE INS and ANNUITIES (A) COMMITTEE/Life Actuarial (A) TF/Summer LATF Calls/VM-22 Subgroup/06 29/6_29 VM-22 Minutes.docx)

NAIC VM-22 Drafting Discussion Log

#	Topic	Description	Date	Tier	Outcome
1	VM-22 Scope and Definitions	Keep current definitions for what is in-scope or focus only on non-variable annuities out of scope	4/13/2022	1	Openness to use Section II of the Valuation Manual to determine scope rather than relying on definitions; ACLI to provide potential draft wording
2	Reserving categories and aggregation	Determine Option 1 or Option 2 from exposed reserve category definitions	4/13/2022	1	Preliminary vote to pursue Option 1
3	Small Company Exemption	Fixed Annuity PBR exemption, similar to life PBR exemption for smaller carriers?	4/13/2022	1	Voted to pursue a "Fixed Annuity PBR Exemption"; ACLI to propose a set of potential draft criteria for the exemption
4	Reinvestment Guardrail	Keep VM-20/VM-21 mix, Academy mix, TX mix, or other? Wait until field test for final decision?	4/27/2022	1	Wait until observing impact in field testing results before voting on a reinvestment mix guardrail
5	Principles & Risks Across VM Chapters	Build one section in the Valuation Manual for principles that apply to VM-20, VM-21, and VM-22	4/27/2022	2	Openness to interested party proposals for a common "principles" section, but will focus on working through other VM-22 decisions before exploring
6	General Assumptions Section	Add a section to the VM-22 draft on general considerations and requirements for assumption	4/27/2022	2	Will include a proposed general assumptions section ("Section 13") from Texas, to be consistent with a recent APF adoption on VM-21
7	Transition Period	Permit 1) early adoption and 2) retrospective adoption to the start of the 3-year transition period?	4/27/2022	2	Decided to not pursue early adoption; VM-22 will say silent on retrospective adoption to start of transition period, similar to VM-20
8	Minimum Error for Index Credit Hedges	What should be the minimum breakage expense (i.e., error) for modeling hedges supporting index credits?	5/11/2022	2	Will wait until seeing field testing results before minimum threshold
9	Longevity Reinsurance	How should longevity reinsurance be defined and treat negative reserves/recurring premiums?	5/11/2022	2	Academy presented on longevity reinsurance and will provide a refined definition; New Jersey proposal is exposed for reserving requirements
10	Categories for VM-31 Disclosures	What level of granularity should be required for disclosing PBR reserves for product groups in VM-31?	5/11/2022	2	Will wait until seeing field testing results before determining granularity of disclosures
11	Exclusion Test: SPIA contracts	Allow SPIAs to have the option of PBR vs. pre-PBR valuation without an exclusion test?	6/1/2022	2	Voted to allow SPIAs automatically pass exclusion testing, subject to criteria around optionality and a liability duration threshold (TBD)
12	Exclusion Test: PRT Certification Method	Allow PRT contracts to use the Certification Method for exclusion testing?	6/1/2022	2	Do not allow PRT to undergo the Certification Method
13	Exclusion Test: Grouping	Group between products with significantly different risk profiles?	6/1/2022	2	Do not allow grouping between products with significantly different risk profiles, consistent with VM-20 and TDI's proposal
14	Exclusion Test: Future Premiums	For the stochastic exclusion ratio test, determine whether to include future premiums	6/1/2022	2	Include future premiums in the numerator, but only benefits and expenses in the denominator, consistent with VM-20.
15	Exclusion Test: Deterministic Reserve	To pass the deterministic test, does the company need to pass or disclose 16 scenarios with baseline mortality?	6/1/2022	2	Require passing the ratio test for 16 economic scenarios under 100% of the anticipated experience mortality assumption
17	Import Reinsurance Wording from VM-20	Import VM-20 wording on incorporating contractual or additional characteristics for modeling reinsurance?	6/14/2022	2	Include proposed wording from VM-20
18	Fair Value Certification	Include fair value certification, similar to existing VM-21 requirement?	6/14/2022	2	Include fair value certification disclosure for non-index credit hedging programs
16	PRT Mortality	Permit PRT mortality with limited credibility to follow a third-party provider instead of an industry table?	6/14/2022	2	Voted in favor of using a prescribed table; do not permit a third party table upon limited credibility
19	Allocation Method	Determine Option 1 or Option 2? Wait until observing field test results before deciding?	6/29/2022	2	

NAIC VM-22 Drafting Discussion Log

#	Topic	Description	Date	Tier	Outcome
20	Working Reserve	Use a working reserve concept to serve as a floor for contracts without cash surrender value?	6/29/2022	2	
21	Grouping for Fund Value Depletion	Appropriate reserving category for deferred annuities with GMMBs/GMIBs that have depleted fund value	6/29/2022	2	
22	RBC Guidance Note	Retain the guidance note in VM-21 that discusses the relationship between reserves and RBC?	TBD	3	
23	Principle 1	Should the edits to Principle 1 for VM-22 be incorporated into VM-21 as well?	TBD	3	
24	Principle 2	Does setting an SR to be reasonably conservative over a span of economic cycles contradict other principles?	TBD	3	
25	Aggregation Limits	Guidance note stating aggregation may not be possible for experience rated group and reinsurance treaties	TBD	3	
26	Principle 3	Delete "Generally, assumptions are to be based on the conservative end of the confidence interval"?	TBD	3	
27	Principle 5	Delete sentence about the principle to not reduce the reserve unless reducing the risk?	TBD	3	
28	Risks not reflected	Retain or remove the list of "risks not reflected" in VM-22?	TBD	3	
29	Separate Account References	Recommendation to delete all references to "separate accounts" in VM-22	TBD	3	
30	Combination Risks	Proposal to delete "Risks modeled in the company's risk assessment processes that are related to the contracts"	TBD	3	
31	Immaterial Risks	Recommendation to delete sentence about not reflecting risks that do not materially affect the reserves	TBD	3	
32	Significant Future Reserve Increases	Strike this item from the list of risks not reflected?	TBD	3	
33	Fixed Annuity Definition	Need to define a "fixed annuity"?	TBD	3	
34	Longevity Swaps	Are these contracts included in the definition of PRT?	TBD	3	
35	CSV and GMDB definitions	Retain VM-21 definitions for "cash surrender value" and "guaranteed minimum death benefits"?	TBD	3	
36	Assumed reserve level for RBC	Question whether CTE/O was the assumed level for reserves upon determining RBC	TBD	3	
37	VM-23	Consider reinstating "VM-23" to avoid confusion around the where exemptions/exclusions point to vs. PRR?	TBD	3	
38	Pre-Reinsurance	Request to develop further guidance around pre-reinsurance	TBD	3	

NAIC VM-22 Drafting Discussion Log

#	Topic	Description	Date	Tier	Outcome
39	Deterministic Reserve	Use this term for the single scenario reserve calculated upon passing the deterministic exclusion test?	TBD	3	
40	Stochastic Exclusion Test	Change Section 3.E to "Stochastic Exclusion Test" header?	TBD	3	
41	Prudent Estimate Assumptions	Move Section 3.G to Section 4 of the document?	TBD	3	
42	Simplifications	Port over VM-21 Section 3.H on simplifications, approximations, and modeling efficiency techniques?	TBD	3	
43	Review experience every three years?	Make this a requirement for the qualified actuary?	TBD	3	
44	Simplification example for the SPA	Add an example of a simplification for the SPA upon development	TBD	3	
45	Stochastic Mortality	Consider including stochastic mortality in the stochastic reserve for longevity reinsurance?	TBD	3	
46	NVA Guidance Note	Is the market value adjustment guidance note from VM-21 still appropriate for VM-22?	TBD	3	
47	Hedging Reorganization	Move parts of Section 4.A.4 to Section 9, which covers hedging	TBD	3	
48	Future Hedging Programs	Align VM-22 draft to be consistent with APF 2020-12 adopted edits for VM-21?	TBD	3	
49	Index Credit Hedge Margin	Does this reflect both model risk and real-world error? How does stress testing justify the error?	TBD	3	
50	Margin on Hedging Paragraph	Remove this paragraph if included in another section, even upon edits from TDJ/OPBR?	TBD	3	
51	Revenue Sharing	Is the section of revenue sharing applicable to non-variable products?	TBD	3	
52	Projection Period	Use consistent language with VM-20?	TBD	3	
53	PIMR	Include pre-tax IMR in VM-22?	TBD	3	
54	NVA on CSV Floor	Apply the market value adjustment factor to the cash surrender value reserve floor for applicable products?	TBD	3	
55	Consistency with Managed Business	Modify NAER requirement to have assets modeled in a manner consistent with how business is managed?	TBD	3	
56	Limits on NAER	Define a specific cap or floor for the NAER instead of saying it should not be "unreasonably high"?	TBD	3	
57	Reserve Floor	NY comment on using CARVM as a reserve floor	TBD	3	

NAIC VM-22 Drafting Discussion Log

#	Topic	Description	Date	Tier	Outcome
58	Longevity Reinsurance & SPA	Require the k-factor approach to address negative reserve issue for longevity reinsurance in SPA?	TBD	3	
59	Longevity Reinsurance & Exclusion Testing	Require the k-factor approach or something similar for longevity reinsurance in exclusion testing?	TBD	3	
60	Standard Projection Amount	Equitable comment on supporting SPA with company assumptions insignificant risk factors	TBD	3	
61	Exclusion Testing & SPA	Modify exclusion test to address the standard projection amount?	TBD	3	
62	Hedging eligibility for exclusion testing	Refine wording around the restriction for not allowing blocks with hedging programs to use exclusion testing? If using the NV7 for the Certification Method, add mortality stress scenarios?	TBD	3	
63	Mortality Stress Tests		TBD	3	
64	Mortality Shock	Include the mortality shock for the ratio test based on the company materiality standard if more restrictive?	TBD	3	
65	Baseline Mortality Test	Include the baseline mortality test in determining the exclusion test?	TBD	3	
66	Permutations	Include note on number of exclusion test permutations for clarity?	TBD	3	
67	Non-Proportional Reinsurance	Retain section on non-proportional reinsurance?	TBD	3	
68	SERT if Other Tests Fail	Prohibit passing the SERT if the demonstration test fails?	TBD	3	
69	Demonstration Test	Remove options in 1.a and 2.a?	TBD	3	
70	Deterministic Exclusion for SPA	Consider SPA for the deterministic exclusion test	TBD	3	
71	Deterministic Exclusion Scenario	Consider disintermediation risk for the SPA scenario?	TBD	3	
72	SPIA Guidance Note	Remove guidance note specifying that the deterministic exclusion test generally applies to SPIAs?	TBD	3	
73	Delta Hedging	Replace or remove example about delta hedging for VM-22?	TBD	3	
74	Policyholder Behavior Considerations	Suggestion to re-word as considerations instead of questions?	TBD	3	
75	Non-Elective Benefits	Remove guidance note to limit modeling non-elective benefits after CSV is depleted if reducing reserves?	TBD	3	
76	100% Policyholder Efficiency	Assuming 100% policyholder inefficiency contradicts VM Section II 6.H.2, so revise VM Section II?	TBD	3	

NAIC VM-22 Drafting Discussion Log

#	Topic	Description	Date	Tier	Outcome
77	NGE Board of Directors	Comment that only allowing NGE exclusion if approved by the Board does not necessarily seem reasonable	TBD	3	
78	Unsupported judgement	Comment to remove the reference to using "unsupported actuarial judgement" from Section 11	TBD	3	
79	Mortality and Reinsurance	Does Section 11.A require evaluation of a plus vs. minus segment differently for pre- vs. post reinsurance? Does "little or no data" need to be in the header of Section 11.B.3?	TBD	3	
80	Little or No Data		TBD	3	
81	Improvement with Limited Experience	Consider not only credibility blending the base mortality assumption but also the improvement assumption	TBD	3	
82	Option 1 DR vs SR	Require separate allocation for DR vs. SR for allocation Option 1 (Section 13)?	TBD	3	
83	Option 2 for Direct Iteration Method	Option 2 is not designed to work for the Direct Iteration Method	TBD	3	
84	Option 2 Single Scenario	Could produce unstable allocation when products with different risk profiles are aggregated for PBR	TBD	3	
85	Index-linked annuity	This term is used in the proposed Section II, Subsection 2 draft, but is not defined	TBD	3	
86	Modified Guaranteed Annuities (MGAs)	VM-21 has language that exempts contracts falling under scope of MDL-255, does this contradict Section II edits?	TBD	3

Commented [X3]: Note that part of the 2022 VM updates was to replace all instances of "stochastic reserve" with "SR" other than the initial definition in VM-01.

Commented [VM224R3]: Edit to be reflected in next exposure

Section 1: Background

A. Purpose

Sections 1 through 13 of these requirements establish the minimum reserve valuation standard for non-variable annuity contracts as defined in Section 2.A and issued on or after 1/1/2024. Section 14 of these requirements establish the maximum valuation rate for payout annuities for contracts issued on or after 1/1/2018. For all contracts encompassed by the Scope, these requirements constitute the Commissioners Annuity Reserve Valuation Method (CARVM) and, for certain contracts and certificates, the Commissioners Reserve Valuation Method (CRVM).

Guidance Note: CRVM requirements apply to some group pension contracts.

B. Principles

The projection methodology used to calculate the stochastic reserve_{SR} is based on the following set of principles. These principles should be followed when interpreting and applying the methodology in these requirements and analyzing the resulting reserves.

Guidance Note: The principles should be considered in their entirety, and it is required that companies meet these principles with respect to those contracts that fall within the scope of these requirements and are in force as of the valuation date to which these requirements are applied.

Principle 1: The objective of the approach used to determine the stochastic reserve_{SR} is to quantify the amount of statutory reserves needed by the company to be able to meet contractual obligations in light of the risks to which the company is exposed with an element of conservatism consistent with statutory reporting objectives.

Principle 2: The calculation of the stochastic reserve_{SR} is based on the results derived from an analysis of asset and liability cash flows produced by the application of a stochastic cash-flow model to equity return and interest rate scenarios. For each scenario, the greatest present value of accumulated deficiency is calculated. The analysis reflects prudent estimate assumptions for deterministic variables and is performed in aggregate (subject to limitations related to contractual provisions) to allow the natural offset of risks within a given scenario. The methodology uses a projected total cash flow analysis by including all projected income, benefit, and expense items related to the business in the model and sets the stochastic reserve_{SR} at a degree of confidence using the CTE measure applied to the set of scenario specific greatest present values of accumulated deficiencies that is deemed to be reasonably conservative over the span of economic cycles.

Guidance Note: Examples where full aggregation between contracts may not be possible include experience rated group contracts and the operation of reinsurance treaties.

Principle 3: The implementation of a model involves decisions about the experience assumptions and the modeling techniques to be used in measuring the risks to which the

Commented [X5]: The proposal suggests VM-22 is not operative until 1/1/2024, which contradicts Section 13 and existing requirements. We would suggest rewording this to clarify that Section 13 is effective after 12/31/2017. Further, we would suggest consistency in labeling of dates (either all text or all numeric).

Commented [VM226R5]: Edits to address this comment will be reflected in next exposure

Commented [CD7]: might be clearer to refer to "Section 2.A" here

Commented [VM228R7]: No objections from the Subgroup to an approach that is broader and focuses on Section 2.A. ACLI will follow-up with proposed revisions to the scope section

Commented [X9]: The statement only addresses "contracts". Recommend adding "and certificates". Need to do a holistic review if where "and certificates" may be needed.

Commented [VM2210R9]: Edits to address this comment will be reflected in next exposure

Commented [X11]: (Relationship to RBC Requirements): The VM-21 guidance note was not included in VM-22; however, we believe it would be appropriate to retain and reword to say, "products that calculate a stochastic reserve", since the relationship to RBC would likely be maintained.

Commented [X12]: We would support consistent application of principles across all chapters as currently VM-20 does not have a like set of principles. We believe this could involve a broader discussion of the assorted product requirements in the VM. As a shorter term fix, we would recommend generalizing the principles where appropriate and moving these to "Section 1: Introduction" or "VM-0" and equally applying to VM-2.

Commented [VM2213R12]: Discussed with Subgroup. Members are open and interested to a common principles chapter, but decided to hold off on developing for now.

Commented [CD14]: for consistency, will this edit be considered for VM-21 as well?

Commented [X15]: We support this principle but note that later sections appear to contradict this principle. For example, the statement "The analysis reflects prudent estimate assumptions for deterministic variables and is performed in aggregate (subject to limitations related to contractual provisions) to allow the natural offset of risks within a given scenario." contradicts with the introduction of additional reserve categories and other limitations (such as model segment restrictions).

Commented [X16]: Principle 2: Recommend reinstating Guidance Note in Principle 2 to be consistent with VM-21.

company is exposed. Generally, assumptions are to be based on the conservative end of the confidence interval. The choice of a conservative estimate for each assumption may result in a distorted measure of the total risk. Conceptually, the choice of assumptions and the modeling decisions should be made so that the final result approximates what would be obtained for the stochastic reserve_{SR} at the required CTE level if it were possible to calculate results over the joint distribution of all future outcomes. In applying this concept to the actual calculation of the stochastic reserve_{SR}, the company should be guided by evolving practice and expanding knowledge base in the measurement and management of risk.

Guidance Note: The intent of Principle 3 is to describe the conceptual framework for setting assumptions. Section 10 provides the requirements and guidance for setting contract holder behavior assumptions and includes alternatives to this framework if the company is unable to fully apply this principle. More guidance and requirements for setting assumptions in general are provided in Section 12.

Principle 4: While a stochastic cash-flow model attempts to include all real-world risks relevant to the objective of the stochastic cash-flow model and relationships among the risks, it will still contain limitations because it is only a model. The calculation of the stochastic reserve_{SR} is based on the results derived from the application of the stochastic cash-flow model to scenarios, while the actual statutory reserve needs of the company arise from the risks to which the company is (or will be) exposed in reality. Any disconnect between the model and reality should be reflected in setting prudent estimate assumptions to the extent not addressed by other means.

Principle 5: Neither a cash-flow scenario model ~~nor a method based on factors calibrated to the results of a cash-flow scenario model~~ can completely quantify a company’s exposure to risk. A model attempts to represent reality but will always remain an approximation thereto and, hence, uncertainty in future experience is an important consideration when determining the stochastic reserve_{SR}. ~~Therefore, the use of assumptions, methods, models, risk management strategies (e.g., hedging), derivative instruments, structured investments or any other risk transfer arrangements (such as reinsurance) that serve solely to reduce the calculated stochastic reserve_{SR} without also reducing risk on scenarios similar to those used in the actual cash-flow modeling are inconsistent with these principles. The use of assumptions and risk management strategies should be appropriate to the business and not merely constructed to exploit “foreknowledge” of the components of the required methodology.~~

C. Risks Reflected

1. The risks reflected in the calculation of reserves under these requirements arise from actual or potential events or activities that are both:
 - a. Directly related to the contracts falling under the scope of these requirements or their supporting assets; and
 - b. Capable of materially affecting the reserve.

Commented [X17]: We suggest deleting the sentence “Generally, assumptions are...” since it does not provide guidance. We also suggest tightening the remainder of the text for clarity.

Commented [X18]: ~~More general assumption guidance is provided in Section 12.~~

Commented [VM2219R18]: Subgroup agreed with this comment. Edits to address this comment will be reflected in next exposure.

Commented [X20]: Principle 5 has the statement “~~nor a method based on factors calibrated to the results of a cash-flow scenario model~~” which is intended for the Alternative Methodology in VM-21. The statement should be deleted from VM-22.

Commented [VM2221R20]: Edits to address this comment will be reflected in next exposure

Commented [X22]: We recommend deleting the third sentence (starting with “Therefore, the use of assumptions...”) because this lacks historical context and is covered by the final sentence.

Commented [X23]: ~~Consistent with our comments on VM-21, we suggest consistent application of risks reflected across all chapters, rather than embedding the language in each chapter. Were this to be retained in VM-22, we would suggest maintaining consistency with VM-21 to avoid any confusion.~~

Commented [VM2224R23]: The Subgroup is open to a common chapter with all risks identified for different PBR frameworks, but decided to hold off on developing for now.

Commented [CD25]: VM-21 has “... and Risks Not Reflected” in this section header, which should be retained here since the section on risks not reflected is still in here.

2. Categories and examples of risks reflected in the reserve calculations include, but are not necessarily limited to:

a. Asset risks

- i. Credit risks (e.g., default or rating downgrades).
- ii. Commercial mortgage loan roll-over rates (roll-over of bullet loans).
- iii. Uncertainty in the timing or duration of asset cash flows (e.g., shortening (prepayment risk) and lengthening (extension risk)).
- iv. Performance of equities, real estate, and Schedule BA assets.
- v. Call risk on callable assets.
- vi. Separate account fund performance.
- vii. Risk associated with hedge instrument (includes basis, gap, price, parameter estimation risks, and variation in assumptions).
- viii. Currency risk.

Commented [CD26]: Can a non-variable annuity have a separate account fund? I am not aware of any such annuity, that is not a variable annuity. Furthermore, all references to separate accounts and fund performance were deleted from this draft. Thus, we should consider deleting this item from the list.

b. Liability risks

- i. Reinsurer default, impairment, or rating downgrade known to have occurred before or on the valuation date.
- ii. Mortality/longevity, persistency/lapse, partial withdrawal, and premium payment risks.
- iii. Utilization risk associated with guaranteed living benefits.
- iv. Anticipated mortality trends based on observed patterns of mortality improvement or deterioration, where permitted.
- v. Annuitization risks.
- vi. Additional premium dump-ins or deposits (high interest rate guarantees in low interest rate environments).
- vii. Applicable expense risks, including fluctuation in maintenance expenses directly attributable to the business, future commission expenses, and expense inflation/growth.

Commented [CD27]: Is there a distinction between "dump-ins" and "deposits"? Why are both words needed? Also, if it's determined that both words are needed, should this same change be made in VM-21?

Commented [VM2228R27]: Edits to address this comment will be reflected in next exposure

Commented [X29]: Recommend change to "fluctuation in" maintenance expenses for clarity.

Commented [VM2230R29]: Edits to address this comment will be reflected in next exposure

Commented [CD31]: should this same change also be made to VM-21?

Commented [VM2232R31]: Potential VM-21 will be examined separately from this Subgroup at a later point

c. Combination risks

- i. Risks modeled in the company's risk assessment processes that are related to the contracts, as described above.
- ii. Disintermediation risk (including such risk related to payment of surrender or partial withdrawal benefits).

Commented [X33]: We recommend removing the bullet "Risks modeled in the company's risk assessment processes that are related to the contracts, as described above" as this is unclear and probably extraneous.

- iii. Risks associated with revenue-sharing income.
- 3. The risks not necessarily reflected in the calculation of reserves under these requirements are:
 - a. Those not associated with the policies or contracts being valued, or their supporting assets.
 - b. Determined to not be capable of materially affecting the reserve.
- 4. Categories and examples of risks not reflected in the reserve calculations include, but are not necessarily limited to:
 - a. Asset risks
 - i. Liquidity risks associated with a sudden and significant levels of withdrawals and surrenders; "run on the bank."
 - b. Liability risks
 - i. Reinsurer default, impairment or rating downgrade occurring after the valuation date.
 - ii. Catastrophic events (e.g., epidemics or terrorist events).
 - iii. Major breakthroughs in life extension technology that have not yet fundamentally altered recently observed mortality experience.
 - iv. Significant future reserve increases as an unfavorable scenario is realized.
 - c. General business risks
 - i. Deterioration of reputation.
 - ii. Future changes in anticipated experience (reparameterization in the case of stochastic processes), which would be triggered if and when adverse modeled outcomes were to actually occur.
 - iii. Poor management performance.
 - iv. The expense risks associated with fluctuating amounts of new business.
 - v. Risks associated with future economic viability of the company.
 - vi. Moral hazards.
 - vii. Fraud and theft.
 - viii. Operational.
 - ix. Litigation.

Commented [X34]: We recommend removing this section. With the specific RBC language removed, the section loses meaning: "a" is unnecessary and "b" is redundant with other sections of the VM which allow for materiality considerations (language in VM-20 is likely better for this purpose and should be used consistently).

Commented [CD35]: Suggest eliminated "policies or" since customarily, annuities are "contracts"

Commented [VM2236R35]: Edits to address this comment will be reflected in next exposure

Commented [CD37]: This is not in VM-21, and my suggestion would be to delete this

Commented [X38]: Proposed revision is not appropriate. Item (a) is unnecessary, and items under (b) would be addressed via simplifications and thus are indirectly reflected. Recommend deleting the whole section 1.C.3 including item (a) and item (b).

Commented [CD39]: should this same change also be made to VM-21?

Commented [VM2240R39]: Edits to address this comment will be reflected in next exposure

Commented [X41]: The revised language "sudden and significant levels of withdrawal and surrenders" replaces the original language "run on the bank" and is less clear. Does "significant" mean severe or extreme? Or just appreciably? Withdraws and surrenders certainly may vary by projected economic scenarios. Recommend using the original language "run on the bank" that had a clearer intent.

Commented [X42]: We recommend deleting the wording "fundamentally". If a breakthrough is known to have fundamentally changed expected future mortality, but is not yet significantly reflected in historical experience, why is it not reflected? Do we know about this fundamental shift for years before it is reflected? This issue also applies to the VM-21 requirement.

Commented [VM2243R42]: Edits to address this comment will be reflected in next exposure

Commented [X44]: We recommend removing the bullet "Significant future reserve increases as an unfavorable scenario is realized" as this is extraneous.

Commented [X45]: List could be expanded to included operational risk and litigation risk.

Commented [VM2246R45]: Edits to address this comment will be reflected in next exposure

D. Specific Definitions for VM-22

Buffer Annuity

Interchangeable term for Registered Index-Linked Annuity (RILA). See definition for Registered Index-Linked Annuity below.

- **Deferred Income Annuity (DIA)**

An annuity which guarantees a periodic payment for the life of the annuitant or a term certain and payments begin one year, 13 months or later after (or from) the issue date if the contract holder survives to a predetermined future age.

- **Fixed Indexed Annuity (FIA)**

An annuity with an account value where the contract holder has the option for a portion or all of the account value to grow at a rate linked to a n external index, subject to certain limits, typically with guaranteed principal.

- **Flexible Premium Deferred Annuity (FPDA)**

An annuity with an account value established with a premium amount but allows for additional deposits to be paid into the annuity over time, resulting in an increase to the account value. The contract also has a guaranteed interest rate during the accumulation phase and has guaranteed mortality and interest rates applicable at the time of conversion to the payout phase.

- **Funding Agreement**

A contract issued to an institutional investor (domestic and international non-qualified fixed income investors) that provides fixed or floating interest rate guarantees.

- **Guaranteed Investment Contract (GIC)**

Insurance contract typically issued to a retirement plan (defined contribution) under which the insurer accepts a deposit (or series of deposits) from the purchaser and guarantees to pay a specified interest rate on the funds deposited during a specified period of time.

- **Index Credit Hedge Margin**

A margin capturing the risk of inefficiencies in the company's hedging program supporting index credits. This includes basis risk, persistency risk, and the risk associated with modeling decisions and simplifications. It also includes any uncertainty of costs associated with managing the hedging program and changes due to investment and management decisions.

- **Index Credit**

Any interest credit, multiplier, factor, bonus, charge reduction, or other enhancement to contract policy values that is linked to an index or indices. Amounts credited to the contract policy resulting from a floor on an index account are included.

Commented [X47]: It seems the definitions included in this section are largely only used for the purpose of establishing the Scope in Section 2. Since this is intended to be a principles-based methodology, recommend a strong definition of "Fixed Annuity" instead of specific products underneath this business. The first paragraph in A. Scope seems to provide this with specific references which are out of scope. If changing the scope section, we would suggest deleting the various product definitions if not used elsewhere; if these definitions are potentially applied beyond VM-22, we would suggest moving any necessary definitions to VM-01.

Commented [VM2248R47]: No objections from the Subgroup to an approach that is broader and focuses less on definitions. ACLI will follow-up with proposed revisions to the scope section

Commented [CD49]: The format of this Definitions section is inconsistent with other parts of the VM. In ... [1]

Commented [CD63]: should be "contract"

Commented [VM2264R63]: Edits to address this comment will be reflected in next exposure

Commented [CD65]: should be "contract"

Commented [VM2266R65]: Edits to address this comment will be reflected in next exposure

- **Index Crediting Strategy**

The strategy defined in a contract to determine index credits for a contract. ~~This refers to~~For example, this may refer to underlying index, index parameters, date, timing, performance triggers, and other elements of the crediting method.

- **Index Parameter**

Cap, floor, participation rate, spreads, or other features describing how the contract utilizes the index.

- **Longevity Reinsurance**

An agreement, typically a reinsurance arrangement covering one or more group or individual annuity contracts, under which an insurance company assumes the longevity risk associated with periodic payments made to specified annuitants under one or more immediate or deferred payout annuity contracts. A common example is participants in one or more underlying retirement plans.

- Typically, the reinsurer pays a portion of the actual benefits due to the underlying annuitants (or, in some cases, a pre-agreed amount per annuitant), while the ceding insurance company retains the assets supporting the reinsured annuity payments and pays periodic, ongoing premiums to the reinsurer over the expected lifetime of benefits paid to the specified annuitants. Such agreements may contain net settlement provisions such that only one party makes ongoing cash payments in a particular period. Under these agreements, longevity risk may be transferred on either a permanent basis or for a prespecified period of time, and these agreements may or may not permit early termination.

- Agreements which are not treated as reinsurance under Statement of Statutory Accounting Principles (SSAP) No. 61R are not included in this definition. In particular, contracts under which payments are made based on the aggregate mortality experience of a population of lives which are not covered by an underlying group or individual annuity contract (e.g., mortality index-based longevity swaps) are not included in this definition.

- **Market Value Adjustment (MVA) Annuity**

An annuity with an account value where withdrawals and full surrenders are subject to adjustments based on interest rates or index returns at the time of withdrawal/surrender. There could be ceilings and floors on the amount of the market-value adjustment.

- **Modified Guaranteed Annuity (MGA)**

A type of market-value adjusted annuity contract where the underlying assets are most commonly held in an insurance company separate account and the value of which are guaranteed if held for specified periods of time. The contract contains nonforfeiture values and death benefits that are based upon a market-value adjustment formula if held for shorter periods.

Commented [X67]: We would suggest adding performance trigger to the list, along with other potential crediting methods; alternatively, the definition could specify that the crediting methods listed are examples only.

Commented [VM2268R67]: Edits to address this comment will be reflected in next exposure

Commented [X69]: The definition states that "Agreements which are not treated as reinsurance under Statement of Statutory Accounting Principles (SSAP) No. 61R are not included in this definition". Why is this the case and does this imply that longevity swaps are not within the scope of VM-22? Recommend adding to the out of scope list in "2.A. Scope" if that is the case. Clarification would also be helpful on what guidance should be used for these agreements if out of scope for VM-22. Further, we would suggest removing "typically" from the definition.

Commented [VM2270R69]: Academy will follow-up with proposed revisions to the definition of Longevity Reinsurance.

Commented [VM2271]: New Jersey comment letter: due to future premiums, longevity reinsurance may generate negative reserves, which can be used to eliminate or reduce other immediate annuity reserves. Suggest using net premium methodology, solving for a k-factor at issue to solve for $PV(\text{premiums}) = PV(\text{benefits})$.

Commented [VM2272R71]: VM-22 Subgroup has exposed a proposal from NJ to address this issue.

Commented [X73]: We recommend editing the definition as follows "A type of market-value adjusted annuity contract where the underlying assets are most commonly held in an insurance company separate account..."

Commented [VM2274R73]: Edits to address this comment will be reflected in next exposure

Commented [X75]: To clarify definition of MGA, recommend adding "death benefits".

Commented [VM2276R75]: Edits to address this comment will be reflected in next exposure

- Multiple-Year Guaranteed Annuity (MYGA)**
A type of fixed annuity that provides a pre-determined and contractually guaranteed interest rate for specified periods of time, after which there is typically an annual reset or renewal of a multiple year guarantee period.
- Pension Risk Transfer (PRT) Annuity**
An annuity, typically a group contract or reinsurance agreement, issued by an insurance company providing periodic payments to annuitants receiving immediate or deferred benefits from one or more retirement plans. Typically, the insurance company holds the assets supporting the benefits, which may be held in the general or separate account, and retains not only longevity risk but also asset risks (e.g., credit risk and reinvestment risk).
- Registered Index-Linked Annuity (RILA)**
An annuity with an account value where the contract holder has the option for a portion or all of the account value to grow at a rate linked to an external index, similar to a Fixed Indexed Annuity, but with downside risk exposure that may not guarantee full principal repayment. These contracts may include a cap on upside returns, and may also include a floor on downside returns which may be below zero percent.
- Single Premium Immediate Annuity (SPIA)**
An annuity purchased with a single premium amount which guarantees a periodic payment for the life of the annuitant or a term certain and payments begin within 13 months one year after (or from) the issue date issue date.
- Single Premium Deferred Annuity (SPDA)**
An annuity with an account value established with a single premium amount that grows with a guaranteed interest rate during the accumulation phase and has guaranteed mortality and interest rates applicable at the time of conversion to the payout phase. May also include cases where the premium is accepted for a limited amount of time early in the contract life, such as only in the first duration.
- Stable Value Contract**
A contract that provides limited investment guarantees, typically preserving principal while crediting steady, positive returns and protecting against losses or declines in yield. Underlying asset portfolios typically consist of fixed income securities, which may sit in the insurer's general account, a separate account, or in a third-party trust. These contracts often support defined contribution or defined benefit retirement plan liabilities.
- Structured Settlement Contract (SSC)**
A contract that provides periodic benefits and is purchased with a single premium amount stemming from various types of claims pertaining to court settlements or out-of-court settlements from tort actions arising from accidents, medical malpractice, and other causes. Adverse mortality is typically expected for these contracts.
- Synthetic Guaranteed Investment Contract (Synthetic GIC)**

- Commented [CD77]:** should this be "Multi-Year" instead of "Multiple Year"? The former is the more commonly used term for MYGA
- Commented [VM2278R77]:** Edits to address this comment will be reflected in next exposure
- Commented [CD79]:** "fixed annuity" is not defined. Is it better to change all instances of "fixed annuity" to "non-variable annuity" to be consistent with the terminology introduced in Section 1.A (and to be aligned with the actual VM-22 chapter name)? An alternative could be to add a definition for "fixed annuity", with the definition of it being a "non-variable annuity"
- Commented [CD80]:** ok to keep this as "multiple year"
- Commented [VM2281R80]:** Edits to address this comment will be reflected in next exposure
- Commented [X82]:** Is "typically" intended to be a requirement in the definition? That is, to qualify as PRT must the insurance company have the asset risk? Consistent with the comment on Longevity Reinsurance, it would be helpful to clarify where a longevity swap contract falls within these definitions. Notably, index-based longevity swaps should be out of scope as they do not meet definition of "annuity contract" in SSAP 50. It should also be made explicit that PRT contracts can include lump sum benefits, death benefits and cash balance benefits as well.
- Commented [X83]:** It is unclear to us why RILA is defined in VM-22 when it is being used to exclude the product from VM-22 requirements.
- Commented [VM2284R83]:** ACLI already following up on a proposal to address the scope and definitions, which will address this issue.
- Commented [X85]:** If need to address Buffer Annuity (not sure this is needed), can add here as a subset of RILA.
- Commented [VM2286R85]:** Edits to remove "Buffer Annuity" will be reflected in next exposure

- Commented [VM2292R91]:** Edits to address this comment will be reflected in next exposure
- Commented [CD93]:** suggest spelling out GIC first, followed by the acronym
- Commented [VM2294R93]:** Edits to address this comment will be reflected in next exposure

Contract that simulates the performance of a traditional GIC through a wrapper, swap, or other financial instruments, with the main difference being that the assets are owned by the contract policyholder or plan trust.

Commented [CD95]: should be "contract holder"

- **Term Certain Payout Annuity**

A contract issued, which offers guaranteed periodic payments for a specified period of time, not contingent upon mortality or morbidity of the annuitant.

Commented [VM2296R95]: Edits to address this comment will be reflected in next exposure

- **Two-Tiered Annuity**

A deferred annuity with two tiers of account values. One, with a higher accumulation interest rate, is only available for annuitization or death. The other typically contains a lower accumulation interest rate, and is only available upon surrender.

The term "cash surrender value" means, for the purposes of these requirements, the amount available to the contract holder upon surrender of the contract. Generally, it is equal to the account value less any applicable surrender charges, where the surrender charge reflects the availability of any free partial surrender options. However, for contracts where all or a portion of the amount available to the contract holder upon surrender is subject to a market value adjustment, the cash surrender value shall reflect the market value adjustment consistent with the required treatment of the underlying assets. That is, the cash surrender value shall reflect any market value adjustments where the underlying assets are reported at market value, but it shall not reflect any market value adjustments where the underlying assets are reported at book value.

Commented [CD97]: this definition still applies, should we keep it?

The term "guaranteed minimum death benefit" (GMDB) means a provision (or provisions) for a guaranteed benefit payable on the death of a contract holder, annuitant, participant or insured where the amount payable is either (i) a minimum amount; or (ii) exceeds the minimum amount and is:

Commented [CD98]: this definition still applies, should we keep it?

- is increased by an amount that may be either specified by or computed from other policy or contract values; and

- has the potential to produce a contractual total amount payable on such death that exceeds the account value; or

- in the case of an annuity providing income payments, guarantees payment upon such death of an amount payable on death in addition to the continuation of any guaranteed income payments.

E. Materiality

The company shall establish a standard containing the criteria for determining whether an assumption, risk factor, or other element of the principle-based valuation has a material impact on the size of the reserve. This standard shall be applied when identifying material risks.

Commented [X99]: Add consistent with VM-21 Section 1.E, which was added to the 2022 VM.

Commented [VM22100R99]: Edits to address this comment will be reflected in next exposure

Commented [X101]: Consistent with our comment in Section 1, the language around effective date should be clear this only applies to new PBR methodology, and rates in Section 13 have a different effective date.

Commented [VM22102R101]: Edits to address this comment will be reflected in next exposure

Section 2: Scope and Effective Date

A. Scope

Subject to the requirements of this Sections 1 to 13 of VM-22 are annuity contracts, certificates and contract features, whether group or individual, including both life contingent and term-certain-only, directly written or assumed through reinsurance issued on or after 1/1/2024, with the exception of contracts or benefits listed below.

Products out of scope include:

1. Contracts or benefits that are subject to VM 21 (such as variable annuities, RILAs, buffer annuities, and structured annuities)
2. GICs
3. Synthetic GICs
4. Stable Value Contracts
5. Funding Agreements

Products in scope of VM-22 include non-variable fixed annuities which consist of, but are not limited to, the following the list:

▪ Account Value Based Annuities

1. Deferred Annuities (SPDA & FPDA)
2. Multi-Year Guarantee Annuities (MYGA)
3. Fixed Indexed Annuities (FIA)
4. Market Value Adjustments (MVA)
5. Two-tiered Annuities
6. Guarantees/Benefits/Riders on Non-Variable Fixed Annuity Contracts

▪ Payout Annuities

1. Single Premium Immediate Annuities (SPIA)
2. Deferred Income Annuities (DIA)
3. Term Certain Payout Annuities
4. Pension Risk Transfer Annuities (PRT)
5. Structured Settlement Contracts (SSC)
6. Longevity Reinsurance

Products out of scope include:

1. Contracts or benefits that are subject to VM-21 (such as variable annuities and RILAs)
2. GICs
3. Synthetic GICs
4. Stable Value Contracts
5. Funding Agreements

The company may elect to exclude one or more groups of contracts from the stochastic reserve SR calculation in certain situations, pursuant to the exclusion test requirements defined in Section 3.E of VM 22.

B. Effective Date & Transition

Effective Date

These requirements apply for valuation dates on or after January 1, 2024.

Transition

A company may elect to establish minimum reserves pursuant to applicable requirements in VM-A and VM-C for business otherwise subject to VM-22 PBR requirements and issued during the first three years following the effective date of VM-22 PBR. If a company during the three-year transition period elects to apply VM-22 PBR to a block of such business, then a company must continue to apply the requirements of VM-22 PBR for future issues of this business. Irrespective of the transition date, a company shall apply VM-22 PBR requirements to applicable blocks of business on a prospective basis starting at least three years after the effective date.

Commented [X142]: Need to clarify what is meant by "VM-22 PBR Requirements". Add specific section references, or update proposal to have the PBR and non-PBR sections of this VM-22 draft in different chapters. After having reviewed, we think it would be much more clear to reconsider the use of "VM-23" for the PBR requirements to avoid ambiguity around scope/exclusions. The non-PBR sections also just don't seem to fit in this draft, and there is now ambiguity around whether other parts of VM-22 apply to them (scope, effective date, principles, etc.).

Commented [X143]: To be more clear, recommend adding "transition period" to "the three years".

Commented [VM22144R143]: Edits to address this comment will be reflected in next exposure

Commented [X145]: Can a company wait until the end of the transition period to start PBR, but then apply PBR to the issues from during the transition period? This was unclear for VM-20, and still seems unclear here. Need to be explicit one way or the other.

Commented [VM22146R145]: Discussed with Subgroup and decided to keep the VM-22 language silent on this issue, similar to VM-20, leaving it to be determined on a case-by-case basis for each state.

Commented [CD147]: Will we (or should we) allow for any early adopters (like we did for VM-21)? It would seem reasonable to us to consider accommodating early adopters.

Commented [VM22148R147]: Discussed with Subgroup and decided to not have early adoption before the start of the three year transition period.

Section 3: Reserve Methodology

A. Aggregate Reserve

The aggregate reserve for contracts falling within the scope of these requirements shall equal the ~~stochastic reserve~~SR (following the requirements of Section 4) ~~plus the additional standard projection amount (following the requirements of Section 6) plus the DR for those contracts satisfying the Deterministic Certification Option,~~ less any applicable PIMR for all contracts not valued under applicable requirements in VM-A and VM-C, plus the reserve for any contracts valued under applicable requirements in VM-A and VM-C.

Guidance Note: Contracts valued under applicable requirements in VM-A and VM-C are ones that pass the exclusion test and elect to not model PBR ~~stochastic reserves~~SRs, per the requirements in Section 3.E.

B. Impact of Reinsurance ~~Ceded~~

All components in the aggregate reserve shall be determined post-reinsurance ceded, that is net of any reinsurance cash flows arising from treaties that meet the statutory requirements that allow the treaty to be accounted for as reinsurance. A pre-reinsurance ceded reserve also needs to be determined by ignoring all reinsurance cash flows (costs and benefits) in the reserve calculation.

~~C. To Be Determined~~The Additional Standard Projection Amount

D. The Stochastic Reserve

~~The stochastic reserve~~

The additional standard projection amount is determined by applying one of the two standard projection methods defined in Section 6. The same method must be used for all contracts within a group of contracts that are aggregated together to determine the reserve. The company shall elect which method they will use to determine the additional standard projection amount. The company may not change that election for a future valuation without the approval of the domiciliary commissioner.

D. The SR

1. The SR shall be determined based on asset and liability projections for the contracts falling within the scope of these requirements, excluding those contracts valued using the methodology pursuant to applicable requirements in VM-A and VM-C, over a broad range of stochastically generated projection scenarios described in Section 8 and using prudent estimate assumptions as required in Section 3.GF herein.
2. The ~~stochastic reserve~~SR amount for any group of contracts shall be determined as CTE70 of the scenario reserves following the requirements of Section 4, with the exception of groups of contracts for which a company elects the Deterministic Certification Option in Section 7.E, which shall be determined as the ~~scenario reserve~~DR following the requirements of Section 4.
3. The reserve may be determined in aggregate across various groups of contracts within each Reserving Category as a single model segment when determining the ~~stochastic reserve~~ if the business and risks are not managed separately or are part of the same integrated risk management program. Aggregation is permitted if a resulting group of contracts (or model segment) follows the listed principles:SR. However, groups of contracts within different Reserving Categories may

Commented [X149]: Reinstate and modify later as needed - SPA being developed in separate workflow.

Commented [VM22150R149]: To address SPA later in the VM-22 development process.

Commented [X151]: One of the most confused parts of the draft was referring to a DR as the SR for certain contracts. Need to handle and refer to separately.

Commented [VM22152R151]: Edits to address this comment will be reflected in next exposure

Commented [X153]: Guidance is needed on how a pre-reinsurance reserve is to be determined.

Commented [X154]: Reinstate and modify later as needed - SPA being developed in separate workflow.

Commented [VM22155R154]: Edits to address this comment will be reflected in next exposure

Commented [CD156]: Should this be Section 3.G?

Commented [VM22157R156]: Edits to address this comment will be reflected in next exposure

Commented [X158]: Recommend replacing “the scenario reserve” with “the deterministic reserve”. Note that we also disagree with calling the deterministic reserve a stochastic reserve (later in draft), which adds a good deal of confusion.

not be aggregated together in determining the SR. For the purposes of VM-22, Reserving Categories are classified as the following:

a. The “Payout Annuity Reserving Category” includes the following categories of contracts, certificates and contract features, whether group or individual, including both life contingent and term certain only contracts, directly written or assumed through reinsurance, with the exception of benefits provided by variable annuities:

- i. Immediate annuity contracts;
- ii. Deferred income annuity contracts;
- iii. Structured settlements in payout or deferred status;
- iv. Fixed income payment streams resulting from the exercise of settlement options or annuitizations of host contracts issued;
- v. Supplementary contracts, excluding contracts with no scheduled payments (such as retained asset accounts and settlements at interest);
- vi. Fixed income payment streams attributable to guaranteed living benefits associated with deferred annuity contracts, once the contract funds are exhausted;
- vii. Certificates, emanating from non- variable group annuity contracts specified in Model #820, Section 5.C.2, purchased for the purpose of providing certificate holders fixed income payment streams upon their retirement; and
- viii. Pension Risk Transfer Annuities; and
- ix. Longevity Reinsurance.

Commented [VM22159]: Include in deferred annuities with depleted fund value in payout reserving category or accumulation reserving category?

b. The “Accumulation Reserving Category” are all annuities within scope of VM-22 under Section II of the NAIC Valuation Manual that are not in the “Payout Reserving Category”.

Using prudent actuarial judgement, consider the following elements when aggregating groups of contracts: whether groups of contracts are part of the same portfolio (or different portfolios that interact), same integrated risk management system, administered/managed together

4. Do not aggregate groups of contracts for which the company elects to use the Deterministic Certification Option in Section 7.E with any groups of contracts that do not use such option.

54. To the extent that these limits on the aggregation results results in more than one model segment, the stochastic reserveSR shall equal the sum of the stochastic reserveSR amounts

Commented [X160]: The term "Deterministic Certification Option" may be confusing, as there is no "deterministic" reserve, unlike VM-20. We recommend consideration of an alternative term. In addition, we recommend changing the phrasing to "with the exception of groups of contracts for which a company elects the [Deterministic Certification Option], following the requirements of Section 7.E."

computed for each model segment and scenario reserve DR amounts computed for each model segment for which the company elects to use the Deterministic Certification Option in Section 7.E.

Commented [X161]: Recommend replacing “the scenario reserve” with “the deterministic reserve”. Note that we also disagree with calling the deterministic reserve a ... [45]

E. Exclusion Test

1. To the extent that certain groups of contracts pass ~~one of the defined~~ the stochastic exclusion tests in Section 7.B, these groups of contracts may be valued using the methodology and statutory maximum valuation rate pursuant to applicable requirements in VM-A and VM-C, with the statutory maximum valuation rate for immediate annuities specified in and Section 13.
 - a. For dividend-paying contracts, a dividend liability shall be established upon following requirements in VM-A and VM-C, as described above, for the base contract.

G. Prudent Estimate Assumptions

1. With respect to the Stochastic Reserve SR in Section 3.DC, the company shall establish the prudent estimate assumption for each risk factor in compliance with the requirements in Section 12 of Model #820 and must periodically at least every 3 years review and update the assumptions as appropriate in accordance with these requirements.
2. The qualified actuary, to whom responsibility for this group of contracts is assigned, shall annually review relevant emerging experience for the purpose of assessing the appropriateness of the anticipated experience assumption. If the results of statistical testing or other testing the review indicate that previously anticipated experience for a given factor is inadequate, then the qualified actuary Company shall set a new, adequate, anticipated experience assumption for the factor.
3. To determine the prudent estimate assumptions, the stochastic reserve SR shall also follow the requirements in Sections 4 and general assumptions including Section 9 for asset assumptions, Section 10 for contract policy holder behavior assumptions, and Section 11 for mortality assumptions, and Section 12 for general guidance and expense assumptions.

H. Approximations, Simplifications, and Modeling Efficiency Techniques

A company may use simplifications, approximations, and modeling efficiency techniques to calculate the SR and/or the additional standard projection amount required by this section if the company can demonstrate that the use of such techniques does not understate the reserve by a material amount, and the expected value of the reserve calculated using simplifications, approximations, and modeling efficiency techniques is not less than the expected value of the reserve calculated that does not use them.

Guidance Note:

Examples of modeling efficiency techniques include, but are not limited to:

1. Choosing a reduced set of scenarios from a larger set consistent with prescribed models and parameters.
2. Generating a smaller liability or asset model to represent the full seriatim model using grouping compression techniques or other similar simplifications.

There are multiple ways of providing the demonstration required by Section 3.H. The complexity of the demonstration depends upon the simplifications, approximations or modeling efficiency techniques used. Examples include, but are not limited to:

1. Rounding at a transactional level in a direction that is clearly and consistently conservative or is clearly and consistently unbiased with an obviously immaterial impact on the result (e.g., rounding to the nearest dollar) would satisfy 3.H without needing a demonstration. However, rounding to too few significant digits relative to the quantity being rounded, even in an unbiased way, may be material and in that event, the company may need to provide a demonstration that the rounding would not produce a material understatement of the reserve.
2. A brute force demonstration involves calculating the minimum reserve both with and without the simplification, approximation or modeling efficiency technique, and making a direct comparison between the resulting reserve. Regardless of the specific simplification, approximation or modeling efficiency technique used, brute force demonstrations always satisfy the requirements of Section 3.H.
3. Choosing a reduced set of scenarios from a larger set consistent with prescribed models and parameters and providing a detailed demonstration of why it did not understate the reserve by a material amount and the expected value of the reserve would not be less than the expected value of the reserve that would otherwise be calculated. This demonstration may be a theoretical, statistical or mathematical argument establishing, to the satisfaction of the insurance commissioner, general bounds on the potential deviation in the reserve estimate rather than a brute force demonstration.
4. Justify the use of randomly sampling withdrawal ages for each contract instead of following the exact prescribed WDCM method by demonstrating that the random sampling method is materially equivalent to the exact prescribed approach, and the simplification does not materially reduce the Additional Standard Projection Amount and the final reported reserve. In particular, the company should demonstrate that the statistical variability of the results based on the random sampling approach is immaterial by testing different random sets, e.g., if randomly selecting a withdrawal age for each contract, the probability distribution of the withdrawal age should be stable and not vary

significantly when using different random number sets.

Commented [X198]: Specific example should be tailored based on the SPA developed.

Commented [X199]: Added consistent with VM-21 Section 3.H, which was added to the 2022 VM.

Commented [VM22200R199]: Edits to address this comment will be reflected in next exposure

Section 4: Determination of Stochastic Reserve SR

A. Projection of Accumulated Deficiencies

1. General Description of Projection

The projection of accumulated deficiencies shall be made ignoring federal income tax in both cash flows and discount rates, and it shall reflect the dynamics of the expected cash flows for the entire group of contracts, reflecting all product features, including any guarantees provided under the contracts using prudent estimate liability assumptions defined in Sections 10 and 11 and asset assumptions defined in Sections 4 and 9.D. The company shall project cash flows including the following:

- a. ~~Revenues~~ Gross premium received by the company including gross premiums received from the ~~policyholder~~ policyholder contract holder (including any due premiums as of the projected start date).

Guidance Note: If due premiums are modeled, the final reported reserve needs to be adjusted by adding the due premium asset.

- b. Other revenues, including contractual fees and charges, and revenue-sharing income received by the company (net of applicable expenses).
- c. All material benefits projected to be paid to contract policyholders including, but not limited to, death claims, surrender benefits and withdrawal benefits—reflecting the impact of all guarantees and adjusted to take into account amounts projected to be charged to account values on general account business. Any guarantees, in addition to market value adjustments assessed on projected withdrawals or surrenders, shall be taken into account.

Guidance Note: Amounts charged to account values on general account business are not revenue; examples include rider charges and expense charges.

- a.d. Non-Guaranteed Elements (NGE) cash flows as described in Section 10.II.
- b.e. Insurance company expenses (including overhead and investment maintenance expense), commissions, contractual fees and charges, and revenue sharing income received by the company (net of applicable expenses) other acquisition expenses associated with business inforce as of the valuation date.
- e.f. Net Cash flows associated with any reinsurance.
- d.g. Cash flows from hedging instruments as described in Section 4.A.4.

Commented [NJ201]: Consider including stochastic mortality in the SR for longevity reinsurance

Commented [CD202]: Should this refer to Section 4 and Section 9?

Commented [VM22203R202]: Edits to address this comment will be reflected in next exposure

Commented [CD204]: "contract holder"?

Commented [VM22205R204]: Edits to address this comment will be reflected in next exposure

Commented [X206]: If due premium as of the projected start date is included in the modeling, the final reported reserve should be adjusted by adding the due premium, otherwise there would be a double counting of the due premium asset. This needs to be clarified - see guidance note added below.
Recommend specifying the revenue in this bullet to be gross premium since there are other revenue items that are discussed in other bullets.

Commented [VM22207R206]: Edits to address this comment will be reflected in next exposure

Commented [CD208]: "contract holders"

Commented [VM22209R208]: Edits to address this comment will be reflected in next exposure

Commented [X210]: The purpose of this guidance note is not clear as these charges would be reflected in the cash flows.

Commented [VM22211R210]: Edits to address this comment will be reflected in next exposure

Commented [CD212]: should this be Section 10.I?

Commented [VM22213R212]: Edits to address this comment will be reflected in next exposure

Commented [X214]: Changed investment expense to be maintenance expense so that it does not repeat what is included in bullet h.

Commented [VM22215R214]: Edits to address this comment will be reflected in next exposure

Commented [X216]: Added acquisition expenses.

Commented [VM22217R216]: Edits to address this comment will be reflected in next exposure

Commented [X218]: Take out the revenues that covers the investment expenses and added a separate bullet under bullet "a" for other revenues.

Commented [VM22219R218]: Edits to address this comment will be reflected in next exposure

Commented [CD220]: Both net and gross cash flows have to be considered, so I don't agree with the addition of "Net" here

Commented [VM22221R220]: Edits to address this comment will be reflected in next exposure

e.h. Cash receipts or disbursements associated with invested assets (other than policy loans) as described in Section 4.D.4, including investment income, realized capital gains and losses, principal repayments, asset default costs, investment expenses, asset prepayments, and asset sales.

f.i. If modeled explicitly, cash flows related to policy loans as described in Section 10.I.2, including interest income, new loan payments and principal repayments.

Guidance Note: Future net policy loan cash flows include: policy loan interest paid in cash plus repayments of policy loan principal, including repayments occurring at death or surrender (note that the future benefits in Section 4.A.1.b are before consideration of policy loans), less additional policy loan principal (but excluding policy loan interest that is added to the policy loan principal balance).

Guidance Note: Section 4.A.1 requires market value adjustments (MVAs) on liability cash flows to be reflected because in a cash flow model, assets are assumed to be liquidated at market value to cover the cash outflow of the cash surrender; therefore, inclusion of the market value adjustment aligns the asset and liability cash flows. This may differ from the treatment of MVAs in the definition of cash surrender value (Section 1.D), which defines the statutory reserve floor for which the values must be aligned with the annual statement value of the assets.

Commented [X222]: Guidance Note regarding the market value adjustment seems still applies and should not be deleted. We reinstated the guidance note.

2. Grouping of Index Crediting Strategies

Index crediting strategies for fixed indexed annuities may be grouped for modeling using an approach that recognizes the investment guidelines and objectives of each index crediting strategy. In assigning each index crediting strategy to a grouping for projection purposes, the fundamental characteristics of the index crediting strategy shall be reflected, and the parameters shall have the appropriate relationship to the stochastically generated projection scenarios described in Section 8. The grouping shall reflect characteristics of the efficient frontier (i.e., returns generally cannot be increased without assuming additional risk).

Commented [X223]: Suggest editing the first sentence to note scope is FIAs and to avoid confusion regarding the term "investment guideline" as follows: "Index crediting strategies for fixed indexed annuities may be grouped for modeling using an approach that recognizes the investment guidelines and objectives of each index crediting strategy."

Commented [VM2224R223]: Edits to address this comment will be reflected in next exposure

Index accounts sharing similar index crediting strategies may also be grouped for modeling to an appropriately crafted proxy strategy normally expressed as a linear combination of recognized market indices, sub-indices or funds, in order to develop the investment return paths and associated interest crediting. Each index crediting strategy's specific risk characteristics, associated index parameters, and relationship to the stochastically generated scenarios in Section 8 should be considered before grouping or assigning to a proxy strategy. Grouping and/or development of a proxy strategy may not be done in a manner that intentionally understates the resulting reserve.

3. Model Cells

Projections may be performed for each contract in force on the date of valuation or by assigning contracts into representative cells of model plans using all characteristics and criteria having a material impact on the size of the reserve. Assigning contracts to model cells may not be done in a manner that intentionally understates the resulting reserve.

4. Modeling of Hedges

a. For a company that does not have a future hedging program tied directly to supporting the contracts falling under the scope of VM-22 stochastic reserve SR requirements:

- i. The company shall not consider the cash flows from any future hedge purchases or any rebalancing of existing hedge assets in its modeling.
- ii. Existing hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the starting assets. The hedge assets may then be considered in one of two ways:
 - a) Include the asset cash flows from any contractual payments and maturity values in the projection model; or
 - b) No hedge positions in which case the hedge positions held on the valuation date are replaced with cash and/or other general account assets in an amount equal to the aggregate market value of these hedge positions.

Guidance Note: If the hedge positions held on the valuation date are replaced with cash, then as with any other cash, such amounts may then be invested following the company's investment strategy.

A company may switch from method a) to method b) at any time, but it may only change from b) to a) with the approval of the domiciliary commissioner.

b. For a company that has a future hedging program tied directly to supporting the contracts falling under the scope of VM-22 stochastic reserve SR requirements:

- i. For a hedging program with hedge payoffs that offset interest credits associated with indexed interest strategies (indexed interest credits):
 - a) In modeling cash flows, the company shall include the cash flows from future hedge purchases or any rebalancing of existing hedge assets that are intended solely to offset interest credits to policyholders/contract holders.
 - b) Existing hedging instruments that are currently held by the company for this purpose offsetting the indexed credits in support of the contracts falling under the scope of these requirements shall be included in the starting assets. Existing hedging instruments that are currently held by the company not for any other purpose offsetting the indexed credits should be modeled consistently with the requirements of Section 4.A.4.a.ii.
 - c) An Index Credit Hedge Margin for these hedge instruments shall be reflected by reducing index interest credit hedge payoffs by a margin multiple that shall be justified by sufficient and credible

Commented [X225]: Given that Section 9 covers hedging, we would suggest considering moving parts of Section 4.A.4 to that section.

Commented [X226]: VM-22 took out the CDHS requirement and replaced it with "future hedging program". Future hedging should not materially reduce reserves or TAR if it is not well documented. The hedging DG is currently working on this for VM-20/VM-21. We will work with VM-22 subgroup to edit VM-22 accordingly.

Commented [X227]: Suggest rewording "Future hedging program" to "hedging program with future transactions" to avoid ambiguity.

Commented [CD228]: The word "future" to describe the "hedging program" here is confusing. What about current hedging programs with expected future hedge purchases? Why not just say "hedging program"? Also, I wanted to note that removing the concept of CDHS creates inconsistency with both VM-20 and VM-21. Why not retain it?

Commented [CD229]: same comment as above, about the word "future" being confusing

Commented [CD230]: "contract holders"

Commented [VM22231R230]: Edits to address this comment will be reflected in next exposure

Commented [X232]: "Any other purpose" in the last sentence seems overly broad and should be narrowed.

Commented [VM22233R232]: Edits to address this comment will be reflected in next exposure

Commented [X234]: Specify "for this purpose" as "for offsetting the indexed credits", specify "for any other purposes" as "not for offsetting the indexed credits".

Commented [VM22235R234]: Edits to address this comment will be reflected in next exposure

Commented [X236]: We believe the company should determine the appropriate margin based on their demonstration of effectiveness. Any guardrails on these undetermined values should be minimal, including as low as possible, subject to the appropriate demonstration of effectiveness. Further, we believe that documentation of effective product management should be contemplated in addition to historical effectiveness.

Commented [VM22237R236]: Subgroup agreed to revisit this discussion after field testing.

Commented [CD238]: clarify verbiage by saying "hedge instruments" or "derivative instruments"

Commented [VM22239R238]: Edits to address this comment will be reflected in next exposure

company experience and be no less than [X%] multiplicatively of the interest credited. In the absence of sufficient and credible company experience, a margin of [Y%] shall be assumed. There is no cap on the index credit hedge margin if company experience indicates actual error is greater than [Y%]. It is permissible to substitute stress-testing for sufficient and credible experience if such stress-testing comprehensively considers a robust range of future market conditions.

- ii. For a company that hedges any contractual obligation or risks other than indexed interest credits, the detailed requirements for the modeling of hedges are defined in Section 9. The following requirements do not supersede the detailed requirements.
 - a) The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the projections used in the determination of the stochastic reserve SR.
 - b) The projections shall take into account the appropriate costs and benefits of hedge positions expected to be held in the future. Because models do not always accurately portray the results of hedge programs, the company shall, through back-testing and other means, assess the accuracy of the hedge modeling. The company shall determine a stochastic reserve SR as the weighted average of two CTE values; first, a CTE70 (“best efforts”) representing the company’s projection of all of the hedge cash flows, including future hedge purchases, and a second CTE70 (“adjusted”) which shall use only hedge assets held by the company on the valuation date and only future hedge purchases associated with indexed interest credited. These are discussed in greater detail in Section 9.
 - c) Consistent with Section 4.A.4.b.i., if the company has an indexed credit hedging program, the index credit hedge margin for instruments associated with indexed interest credited shall be reflected by reducing hedge payoffs by a margin multiple as defined in Section 4.A.4.b.i.c); in both the “best efforts” run and the “adjusted” run.
 - d) The use of products not falling under the scope of these VM-22 PBR Section 1 through 13 requirements (e.g., variable annuities) (e.g., equity indexed annuities) as a hedge shall not be recognized in the determination of accumulated deficiencies.

Commented [X240]: It is not clear how the stress testing can be used to support the index credit hedge margin. It is a test of the modeled strategy not actual performance and does not reflect any model error. We suggest that both back testing and stress testing be required and elaborated further:
Clearly specify method and metrics used for the back testing with focus on all available recent relevant history, not limited to 12 months
Recommend defined stress periods for stress testing, e.g., 2008 financial crisis, 2020 COVID impaired market conditions.

Commented [X241R240]: We will repeat the comment from our first letter: "Regarding hedge breakage expense assumptions, are both sources of error reflected here - error in the hedging itself, and error in the ability to accurately model it? Should we be separately considering the two limitations to make sure they are both clear: 1) the real-world hedging error and 2) the modeling error in reflecting the future hedging? Current error factor discussions seem muddled."

Commented [X242]: Again, need to coordinate with Hedging DG.

Commented [X243]: Margins are discussed in a different section, so recommend deleting.

Commented [X244]: Edits were made to provide context and clarification for the requirements.

Commented [VM22245R244]: Edits to address this comment will be reflected in next exposure

Commented [X246]: Clarify that “these requirements” should be specified as “VM-22 PBR requirements”. Again, we suggest reconsidering the use of “VM-23”, though.

Commented [VM22247R246]: Edits to address this comment will be reflected in next exposure

Commented [CD248]: It might be helpful to keep the parenthetical statement, with “variable annuities” as the example

Commented [VM22249R248]: Edits to address this comment will be reflected in next exposure

Guidance Note: Section 4.A.4.b.i is intended to address common situations for products with index crediting strategies where the company only hedges index credits or clearly separates index credit hedging from other hedging. In this case the hedge positions are considered similarly to other

fixed income assets supporting the contracts, and a margin is reflected rather than modeling using a CTE70 adjusted run with no future hedge purchases. If a company has a more comprehensive hedge strategy combining index credits, guaranteed benefit, and other risks (e.g., full fair value or economic hedging), an appropriate and documented bifurcation method should be used in the application of sections 4.A.4.b.i and 4.A.4.b.ii above for the hedge modeling and justification. Such bifurcation methods may quantify the specific risk exposure attributable to index credit liabilities versus other liabilities such as guaranteed living benefits, and apply such for the basis for allocation.

Guidance Note: The requirements of Section 4.A.4 govern the determination of reserves for annuity contracts and do not supersede any statutes, laws or regulations of any state or jurisdiction related to the use of derivative instruments for hedging purposes and should not be used in determining whether a company is permitted to use such instruments in any state or jurisdiction.

5. Revenue Sharing

If applicable, projections of accumulated deficiencies may include income from projected future revenue sharing, net of applicable projected expenses (net revenue-sharing income) if each of the following requirements are met:

Commented [X250]: Unclear why Revenue Sharing is considered for non-variable products, can probably delete.

6. Length of Projections

Projections of accumulated deficiencies shall be run for as many future years as needed so that no materially greater reserve value would result from longer projection periods. Obligations remain at the end of the projection periods. Company can choose to run a shorter projection period but not shorter than 20 years and include the present value of the terminal benefits and expenses in the accumulated deficiency calculation.

Commented [X251]: Clarify that for revenue sharing, the entire subsection of VM-21 Section 4.A.5 applies.

Commented [VM22252R251]: Edits to address this comment will be reflected in next exposure

Commented [CD253]: The "requirements are met" list is only in Section 4.A.5.a. Was the intent also to define the amount of net revenue-sharing income allowed in the projections? If so, will need to add verbiage to reference VM-21 Section 4.A.5.a through 4.A.5.f.

Commented [VM22254R253]: Edits to address this comment will be reflected in next exposure

7. Interest Maintenance Reserve (IMR)

The IMR shall be handled consistently with the treatment in the company's cash flow testing, and the amounts should be adjusted to a pre-tax basis.

Commented [X255]: We recommend that the projection period requirement be in line with that of VM-20. Instead of meeting the immateriality requirement, calculate the present value of the terminal benefits and expenses and include it in the accumulated deficiency calculation.

B. Determination of Scenario Reserve

1. For a given scenario, the scenario reserve shall be determined using one of two methods described below:

Commented [VM22256]: See Bill Wilton's comment letter, expressing opposition to inclusion of pre-tax IMR.

a) The starting asset amount plus the greatest present value, as of the projection start date, of the projected accumulated deficiencies; or

Commented [CD257]: should we consider these changes to VM-21 as well, for consistency?

Commented [VM22258R257]: Edits to address this comment will be reflected in next exposure

Guidance Note: The greatest present value of accumulated deficiencies can be negative.

Commented [X259]: Section does not specify what the reserve floor shall be (if any) for contracts without cash surrender value.

b) The direct iteration method, where the scenario reserve is determined by solving for the amount of starting assets which, when projected along with all contract cash flows, result in the defeasement of all projected future benefits and expenses at the end of the projection horizon with no positive accumulated deficiencies at the end of any projection year during the projection period.

The scenario reserve for any given scenario shall not be less than the cash surrender value with market value adjustment in aggregate on the valuation date for the group of contracts modeled in the projection.

Commented [X260]: For products that do not have a cash surrender value, it is recommended that VM-22 use a “working reserve” concept, similar to VM-21 Section 3.G requirement. Otherwise, there will be an issue aggregating those with and without CSV.

2. Discount Rates

In determining the scenario reserve, unless using the direct iteration method pursuant to Section 4.B.1.b, the accumulated deficiencies shall be discounted at the NAER on additional assets, as defined in Section 4.B.3.

Commented [X261]: For products with market value adjustment, needs to be floored at cash surrender value with MVA.

3. Determination of NAER on Additional Invested Asset Portfolio

a. The additional invested asset portfolio for a scenario is a portfolio of general account assets as of the valuation date, outside of the starting asset portfolio, that is required in that projection scenario so that the projection would not have a positive accumulated deficiency at the end of any projection year. This portfolio may include only (i) General Account assets available to the company on the valuation date that do not constitute part of the starting asset portfolio; and (ii) cash assets.

Commented [X262]: We believe that assets held in the separate account with performance not impacting policyholder benefits should be modeled consistent with how the business is managed.

Guidance Note:

Additional invested assets should be selected in a manner such that if the starting asset portfolio were revised to include the additional invested assets, the projection would not be expected to experience any positive accumulated deficiencies at the end of any projection year.

It is assumed that the accumulated deficiencies for this scenario projection are known.

- b. To determine the NAER on additional invested assets for a given scenario:
 - i. Project the additional invested asset portfolio as of the valuation date to the end of the projection period,
 - a) Investing any cash in the portfolio and reinvesting all investment proceeds using the company’s investment policy.
 - b) Excluding any liability cash flows.
 - c) Incorporating the appropriate returns, defaults and investment expenses for the given scenario.
 - ii. If the value of the projected additional invested asset portfolio does not equal or exceed the accumulated deficiencies at the end of each projection year for the scenario, increase the size of the initial additional invested asset portfolio as of the valuation date, and repeat the preceding step.
 - iii. Determine a vector of annual earned rates that replicates the growth in the additional invested asset portfolio from the valuation date to the end of the

projection period for the scenario. This vector will be the NAER for the given scenario.

- iv. If the depletion of assets within the projection results in an unreasonably high negative NAER upon borrowing, the NAER may be set to the assumed cost of borrowing associated with each projected time period, in accordance with Section 4.D.3.c, as a safe harbor.

Guidance Note: There are multiple ways to select the additional invested asset portfolio at the valuation date. Similarly, there are multiple ways to determine the earned rate vector. The company shall be consistent in its choice of methods, from one valuation to the next.

Commented [X263]: The wording “unreasonably high” is not clear or appropriate. Recommend this requirement be revised as part of a holistic fix to address extreme outliers in NAER both on the low and high side to handle anomalies for all of VM-20, VM-21, and VM-22. Some upper/lower cutoffs could be used that depend on scenario returns.

Commented [CD264]: “unreasonably high” is not well defined. Also, do we need to consider guardrails in the case of “unreasonably high” positive NAERs, not just negative NAERs?

C. Projection Scenarios

1. Number of Scenarios

The number of scenarios for which the scenario reserve shall be computed shall be the responsibility of the company, and it shall be considered to be sufficient if any resulting understatement in the ~~stochastic reserve~~ SR, as compared with that resulting from running additional scenarios, is not material.

2. Economic Scenario Generation

Treasury Department interest rate curves, as well as investment return paths for index funds, equities, and fixed income assets shall be determined on a stochastic basis using the methodology described in Section 8. If the company uses a proprietary generator to develop scenarios, the company shall demonstrate that the resulting scenarios meet the requirements described in Section 8.

D. Projection of Assets

1. Starting Asset Amount

- a. For the projections of accumulated deficiencies, the value of assets at the start of the projection shall be set equal to the approximate value of statutory reserves at the start of the projection plus the allocated amount of PIMR attributable to the assets selected. Assets shall be valued consistently with their annual statement values. The amount of such asset values shall equal the sum of the following items, all as of the start of the projection:
 - i. Any hedge instruments held in support of the contracts being valued; and
 - ii. An amount of assets held in the general account equal to the approximate value of statutory reserves as of the start of the projections less the amount in (i).
- b. If the amount of initial general account assets is negative, the model should reflect a projected interest expense. General account assets chosen for use as described

above shall be selected on a consistent basis from one reserve valuation hereunder to the next.

2. Valuation of Projected Assets

For purposes of determining the projected accumulated deficiencies, the value of projected assets shall be determined in a manner consistent with their value at the start of the projection. For assets assumed to be purchased during a projection, the value shall be determined in a manner consistent with the value of assets at the start of the projection that have similar investment characteristics. However, for derivative instruments that are used in hedging and are not assumed to be sold during a particular projection interval, the company may account for them at an amortized cost in an appropriate manner elected by the company.

Guidance Note: Accounting for hedge assets should recognize any methodology prescribed by a company’s state of domicile.

3. General Account Assets

- a. General account assets shall be projected, net of projected defaults, using assumed investment returns consistent with their book value and expected to be realized in future periods as of the date of valuation. Initial assets that mature during the projection and positive cash flows projected for future periods shall be invested in a manner that is representative of and consistent with the company’s investment policy, subject to the following requirements:
 - i. The final maturities and cash flow structures of assets purchased in the model, such as the patterns of gross investment income and principal repayments or a fixed or floating rate interest basis, shall be determined by the company as part of the model representation;
 - ii. The combination of price and structure for fixed income investments and derivative instruments associated with fixed income investments shall appropriately reflect the projected Treasury Department curve along the relevant scenario and the requirements for gross asset spread assumptions stated below;
 - iii. For purchases of public non-callable corporate bonds, follow the requirements defined in VM-20 Sections 7.E, 7.F and 9.F. The prescribed spreads reflect current market conditions as of the model start date and grade to long-term conditions based on historical data at the start of projection year four;
 - iv. For transactions of derivative instruments associated with fixed income investments, reflect the prescribed assumptions in VM-20 Section 9.F for interest rate swap spreads;
 - v. For purchases of other fixed income investments, if included in ~~the model~~modeled company investment strategy, set assumed gross asset spreads over U.S. Treasuries in a manner that is consistent with, and results

Commented [X265]: This change was adopted for VM-20 and VM-21 for the 2022 VM.

Commented [VM22266R265]: Edits to address this comment will be reflected in next exposure

in reasonable relationships to, the prescribed spreads for public non-callable corporate bonds and interest rate swaps.

- b. Notwithstanding the above requirements, the modeled aggregate reserve shall be the higher of that produced by the modeled company investment strategy and any non-prescribed asset spreads shall be adjusted as necessary so that the aggregate reserve is not less than that which would be obtained produced by substituting an alternative investment strategy in which all the fixed income reinvestment assets ~~are~~ have the same weighted average life (WAL) as the reinvestment assets in the modeled company investment strategy and are all public non-callable corporate bonds with gross asset spreads, asset default costs, and investment expenses by projection year that are consistent with a credit quality blend of:

- i. ~~5%~~ Treasury
- ii. ~~15%~~ 20% PBR credit rating 3 (Aa2/AA)
- iii. ~~80%~~ 40% PBR credit rating 6 (A2/A)
- iv. ~~40%~~ 40% PBR credit rating 9 (Baa/BBB)

- c. Any disinvestment shall be modeled in a manner that is consistent with the company's investment policy and that reflects the company's cost of borrowing where applicable, provided that the assumed cost of borrowing is not lower than the rate at which positive cash flows are reinvested in the same time period, taking into account duration, ratings, and other attributes of the borrowing mechanism. Gross asset spreads used in computing market values of assets sold in the model shall be consistent with, but not necessarily the same as, the gross asset spreads in Section 4.D.4.a.iii and Section 4.D.4.a.iv, recognizing that initial assets that mature during the projection may have different characteristics than modeled reinvestment assets.

Guidance Note: This limitation is being referred to Life Actuarial (A) Task Force for review. The simple language above "provided that the assumed cost of borrowing is not lower than the rate at which positive cash flows are reinvested in the same time period" is not intended to impose a literal requirement. It is intended to reflect a general concept to prevent excessively optimistic borrowing assumptions. It is recognized that borrowing parameters and rules can be complicated, such that modeling limitations may not allow for literal compliance, in every time step, as long as the reserve is not materially affected. However, if the company is unable to fully apply this restriction, prudence dictates that a company shall not allow borrowing assumptions to materially reduce the reserve.

4. Cash Flows from Invested Assets

- a. Cash flows from general account fixed income assets, including starting and reinvestment assets, shall be reflected in the projection as follows:

Commented [CD267]: should this be "stochastic reserve", since this is within Section 4: Determination of Stochastic Reserve

Commented [VM22268R267]: Edits to address this comment will be reflected in next exposure

Commented [X269]: This change was adopted for VM-20 and VM-21 for the 2022 VM.

Commented [VM22270R269]: Edits to address this comment will be reflected in next exposure

Commented [CD271]: Suggest making this plural ("Treasures") to be consistent with Section 13.B.9

Commented [VM22272R271]: Edits to address this comment will be reflected in next exposure

Commented [X273]: The proposed reinvestment mix comes from a different assumption context in current VM-22, i.e., it is designed to calculate the maximum allowed valuation interest rates, while the reinvestment mix for VM-22 PBR draft is to put a guardrail around the fixed income reinvestment assets. A guardrail is not intended to identify outliers and should not be tied to an average. The biggest concern is with the higher allocation percentage in BBB assets. The valuation manual should build an appropriate level of conservatism in the valuation standards instead of reflecting industry trends. By moving from VM-20 and VM-21 required mix of 50%/50% AA/A to the proposed mix, the gross spreads increased by 20-30 bps for almost all WAL. We do not object to using a lower credit quality guardrail to get rid of any excessive conservatism. We recommend considering and comparing with other alternative allocations, something between the current and the proposed, e.g., 20% AA and 80% A. This will help regulators make informed decisions. In any case, we should be consistent with VM-20 and VM-21. If a change is made, it needs to be for all three.

Commented [VM22274R273]: Varying opinions among the Subgroup. Voted to revisit and determine the guardrail after the field test.

Commented [CD275]: These references should be Section 4.D.3.a.iii and 4.D.3.a.v

Commented [VM22276R275]: Edits to address this comment will be reflected in next exposure

- i. Model gross investment income and principal repayments in accordance with the contractual provisions of each asset and in a manner consistent with each scenario.
- ii. Reflect asset default costs as prescribed in VM-20 Section 9.F and anticipated investment expenses through deductions to the gross investment income.
- iii. Model the proceeds arising from modeled asset sales and determine the portion representing any realized capital gains and losses.
- iv. Reflect any uncertainty in the timing and amounts of asset cash flows related to the paths of interest rates, equity returns or other economic values directly in the projection of asset cash flows. Asset defaults are not subject to this requirement, since asset default assumptions must be determined by the prescribed method in VM-20 Sections 7.E, 7.F and 9.F as noted in 4.a.ii above.

b. Cash flows from general account index funds and general account equity assets—i.e., non-fixed income assets having substantial volatility of returns, such as common stocks and real estate—including starting and reinvestment assets, shall be reflected in the projection as follows:

- i. Determine the grouping for asset categories and the allocation of specific assets to each category in a manner that is consistent with that used for index crediting strategies, as discussed in Section 4.A.2.
- ii. Project the gross investment return including realized and unrealized capital gains in a manner that is consistent with the stochastically generated scenarios.
- iii. Model the timing of an asset sale in a manner that is consistent with the investment policy of the company for that type of asset. Reflect expenses through a deduction to the gross investment return using prudent estimate assumptions.

c. Cash flows for each projection interval for policy loan assets shall follow the requirements in Section 10.H.

E. Projection of Annuitization Benefits

1. Assumed Annuitization Purchase Rates

- a. For payouts specified at issue (such as single premium immediate annuities, deferred income annuities, and certain structured settlements), such purchase/payout rates shall reflect the payout rate specified in the contract.
- b. For purposes of projecting future elective annuitization benefits (including annuitizations stemming from the election of a GMIB) and withdrawal amounts from GMWBs, the projected annuitization purchase rates shall be determined

Commented [X277]: Correct an inaccurate VM section reference. The prescribed asset default spreads assumption should be referred to VM-20 Section 9.F. VM-20 Section 7.E and 7.F are requirements for reinvestment assets, disinvestment and cash flows for invested assets. In 7.F, VM-20 just refers to 9.F for defaults.

Commented [VM22278R277]: Edits to address this comment will be reflected in next exposure

Commented [X279]: Request clarification around the meaning of "general account index funds".

Commented [VM22280R279]: Edits to address this comment will be reflected in next exposure

Commented [CD281]: should this reference Section 10.H?

Commented [VM22282R281]: Edits to address this comment will be reflected in next exposure

Commented [CD283]: Is there a difference between "purchase rates" and "payout rates"? Both terms are used, so that makes the language unclear. If they are the same, suggest sticking with "purchase rates".

Commented [VM22284R283]: Edits to address this comment will be reflected in next exposure

Commented [X285]: Suggest deleting "In contrast, for payouts specified at issue, the payout rates modeled should be consistent with those specified in the contract." as it appears to be covered by E.1.a.

Commented [VM22286R285]: Edits to address this comment will be reflected in next exposure

Commented [X287]: Reinstate the parenthetical content "(including annuitizations stemming from the election of a GMIB)" since there are GMIB riders attached to fixed annuity products.

Commented [VM22288R287]: Edits to address this comment will be reflected in next exposure

assuming that market interest rates available at the time of election are the interest rates used to project general account assets, as determined in Section 4.D.4. ~~In contrast, for payouts specified at issue, the payout rates modeled should be consistent with those specified in the contract.~~

Commented [X289]: Delete sentence since it repeats 4.E.1.a.

Commented [VM22290R289]: Edits to address this comment will be reflected in next exposure

2. Projected Election of GMIBs, GMWBs and Other Annuitization Options

- a. For contracts projected to elect future annuitization options (including annuitizations stemming from the election of a GMIB) or for projections of GMWB benefits once the account value has been depleted, the projections ~~may~~ shall assume the contract will stay in force, the projected periodic payments are paid, and the associated maintenance expenses are incurred.

Commented [X291]: Suggest deleting "may" as there appears to be only option.

Commented [VM22292R291]: Edits to address this comment will be reflected in next exposure

F. Frequency of Projection and Time Horizon

- 1. Use of an annual cash-flow frequency ("timestep") is generally acceptable for benefits/features that are not sensitive to projection frequency. The lack of sensitivity to projection frequency should be validated by testing wherein the company should determine that the use of a more frequent—i.e., shorter—time step does not materially increase reserves. A more frequent time increment should always be used when the product features are sensitive to projection period frequency.

Commented [X293]: Projection Period is already covered in 4.A.6. Should not be in two places with different guidance.

Commented [VM22294R293]: Edits to address this comment will be reflected in next exposure

Care must be taken in simulating fee income and expenses when using an annual time step. ~~For example, recognizing fee income at the end of each period after market movements, but prior to persistency decrements, would normally be an inappropriate assumption.~~ It is also important that the frequency of the investment return model be linked appropriately to the projection horizon in the liability model. In particular, the horizon should be sufficiently long so as to capture the vast majority of costs (on a present value basis) from the scenarios.

Commented [X295]: Reinstate the deleted example of "For example, recognizing fee income at the end of each period after market movements, but prior to persistency decrements, would normally be an inappropriate assumption."

Commented [VM22296R295]: Edits to address this comment will be reflected in next exposure

Guidance Note: As a general guide, the forecast horizon should not be less than 20 years.

G. Compliance with ASOPs

When determining a stochastic reserve SR, the analysis shall conform to the ASOPs as promulgated from time to time by the ASB.

Under these requirements, an actuary will make various determinations, verifications and certifications. The company shall provide the actuary with the necessary information sufficient to permit the actuary to fulfill the responsibilities set forth in these requirements and responsibilities arising from each applicable ASOP.

Section 5: Reinsurance Ceded and Assumed

A. Treatment of Reinsurance Ceded in the Aggregate Reserve

1. Aggregate Reserve Pre- and Post-Reinsurance Ceded

As noted in Section 3.B, the aggregate reserve is determined both pre-reinsurance ceded and post-reinsurance ceded—i.e., the stochastic reserve additional standard projection amount, the SR, DR, and/or the reserve amount valued using requirements in VM-A and VM-C, as applicable—on both bases. Sections 5.A.2 and 5.A.3 discuss adjustments to inputs necessary to determine these components on both a post-reinsurance ceded and a pre-reinsurance ceded basis. Note that due allowance for reasonable approximations may be used where appropriate.

2. Stochastic Reserve

Reflection of Reinsurance Cash Flows in the DR or SR

- a. In order to determine the aggregate reserve post-reinsurance ceded, accumulated deficiencies, scenario reserves, and the resulting stochastic reserve SR and DR shall be determined reflecting the effects of reinsurance treaties that meet the statutory requirements that would allow the treaty to be accounted for as reinsurance within statutory accounting. This involves including, where appropriate, all projected reinsurance premiums or other costs and all reinsurance recoveries, where the reinsurance cash flows reflect all the provisions in the reinsurance agreement, using prudent estimate assumptions.

i. In this section, reinsurance includes retrocession, and assuming company includes retrocessionaire.

ii. All significant terms and provisions within reinsurance treaties shall be reflected. In addition, it shall be assumed that each party is knowledgeable about the treaty provisions and will exercise them to their advantage.

Guidance Note: Renegotiation of the treaty upon the expiration of an experience refund provision or at any other time shall not be assumed if such would be beneficial to the company and not beneficial to the counterparty. This is applicable to both the ceding party and assuming party within a reinsurance arrangement.

iii. If the company has knowledge that a counterparty is financially impaired, the company shall establish a margin for the risk of default by the counterparty. In the absence of knowledge that the counterparty is financially impaired, the company is not required to establish a margin for the risk of default by the counterparty.

iv. A company shall include the cash flows from a reinsurance agreement or amendment in calculating the stochastic aggregate reserve if such qualifies for credit in compliance with Appendix A-791 of the Accounting Practices and Procedures Manual. If a reinsurance agreement or amendment does not qualify for credit for reinsurance but treating the reinsurance agreement or amendment as if it did so qualify would result in a reduction to the company's surplus, then the company shall increase the minimum aggregate reserve by the absolute value of such reductions in surplus.

Commented [X297]: The wording and titling may need to be tightened due to clarify which items apply to assumed and ceded reinsurance in the text.

Commented [VM22298R297]: Edits to address this comment will be reflected in next exposure

Commented [X299]: Delete and just have title be "Reinsurance". Should structure be more like VM-20?

Commented [X300R299]: I, II (and III –VM-21 needs edits)

Commented [VM22301R299]: Edits to address this comment will be reflected in next exposure

Commented [CD302]: "and Assumed" is added here, but there is still only a subsection 5.A that addresses reinsurance ceded (at least in the section header).

Commented [VM22303R302]: Edits to address this comment will be reflected in next exposure

Commented [CD304]: need to add "and Assumed" here?

Commented [VM22305R304]: Edits to address this comment will be reflected in next exposure

Commented [X306]: reinstate

Commented [VM22307R306]: Edits to address this comment will be reflected in next exposure

Commented [X308]: Can take out vague approximation references, since now have a general allowance for appropriate approximations.

Commented [VM22309R308]: Edits to address this comment will be reflected in next exposure

Commented [X310]: Consistent with VM-20

Commented [VM22311R310]: Edits to address this comment will be reflected in next exposure

Commented [X312]: VM-20 Section 8.A.1 makes sense here as well.

Commented [VM22313R312]: Edits to address this comment will be reflected in next exposure

Commented [CD314]: should this be "stochastic reserve"?

Commented [VM22315R314]: Edits to address this comment will be reflected in next exposure

Commented [X316]: VM-22 draft so far uses aggregate, not minimum.

Commented [VM22317R316]: Edits to address this comment will be reflected in next exposure

- b. In order to determine the ~~stochastic reserve~~ SR and DR on a pre-reinsurance ceded basis, accumulated deficiencies, scenario reserves, and the resulting ~~stochastic reserve~~ SR and DR shall be determined ignoring the effects of reinsurance ceded within the projections. Different approaches may be used to determine the starting assets on the ceded portion of the contracts, dependent upon the characteristics of a given treaty:
- i. For a standard coinsurance treaty, where the assets supporting the ceded liabilities were transferred to the assuming reinsurer, one acceptable approach involves a projection based on using starting assets on the ceded portion of the policies that are similar to those supporting the retained portion of the ceded policies or supporting similar types of policies. Scaling up each asset supporting the retained portion of the contract is also an acceptable method.

Guidance Note: For standard pro rata insurance treaties ~~(does that do not include experience refunds)~~, where allocated expenses are similar to the renewal expense allowance, reflecting the quota share applied to the present value of future reinsurance cash flows pertaining to the reinsured block of business may be considered as a possible approach to determine the ceded reserves.

Commented [X318]: Correct phrasing.

Commented [VM22319R318]: Edits to address this comment will be reflected in next exposure

- ii. Alternatively, a treaty may contain an identifiable portfolio of assets associated with the ceded liabilities. This could be the case for several forms of reinsurance: funds withheld coinsurance; modified coinsurance; coinsurance with a trust. To the extent these assets would be available to the cedant, an acceptable approach could involve modeling this portfolio of assets. To the extent that these assets were insufficient to defease the ceded liabilities, the modeling would partially default to the approach discussed for a standard coinsurance treaty. To the extent these assets exceeded what might be needed to defease the ceded liabilities (perhaps an over collateralization requirement in a trust), the inclusion of such assets shall be limited.

Guidance Note: Section 3.5.2 in ASOP No. 52, *Principle-Based Reserves for Life Products under the NAIC Valuation Manual*, provides possible methods for constructing a hypothetical pre-reinsurance asset portfolio, if necessary, for purposes of the pre-reinsurance reserve calculation.

- c. An assuming company shall use assumptions to project cash flows to and from ceding companies that reflect the assuming company’s experience for the business segment to which the reinsured policies belong and reflect the terms of the reinsurance agreement.
- d. The company shall assume that the counterparties to a reinsurance agreement are knowledgeable about the contingencies involved in the agreement and likely to exercise the terms of the agreement to their respective advantage, taking into account the context of the agreement in the entire economic relationship between the parties. In setting assumptions for the NGE in reinsurance cash flows, the company shall include, but not be limited to, the following:
 - i. The usual and customary practices associated with such agreements.
 - ii. Past practices by the parties concerning the changing of terms, in an economic environment similar to that projected.
 - iii. Any limits placed upon either party’s ability to exercise contractual options in the reinsurance agreement.
 - iv. The ability of the direct-writing company to modify the terms of its policies in response to changes in reinsurance terms.
 - v. Actions that might be taken by a party if the counterparty is in financial difficulty.

Commented [X320]: VM-20 Section 8.C.7 seems particularly applicable. We encourage others to also review VM-20 Section 8 for other sections that should also apply. VM-20 Section 8 is much more developed than VM-21 Section 5 with many more considerations for assumption setting, and we would suggest the VM-22 subgroup consider rewriting starting with VM-20 instead of VM-21.

Commented [VM22321R320]: Subgroup agreed with reflecting this language in the VM-22 draft

3. Reserve Determined Upon Passing the Exclusion Test

If a company passes the stochastic exclusion test and elects to use a methodology pursuant to applicable Sections VM-A and VM-C, as allowed in Section 3.E, it is important to note that the methodology produces reserves on a pre-reinsurance ceded basis. Therefore, the reserve must be adjusted for any reinsurance ceded accordingly. In addition, reserves valued under applicable Sections in VM-A and VM-C, unadjusted for reinsurance, shall be applied to the contracts falling under the scope of these requirements to determine the aggregate reserve prior to reinsurance.

It should be noted that the ~~pre-reinsurance-ceded~~ and ~~post-reinsurance-ceded~~ reserves may result in different outcomes for the exclusion test. In particular, it is possible that the ~~pre-reinsurance-ceded~~ reserves would pass the relevant exclusion test (and allow the use of VM-A and VM-C) while the ~~post-reinsurance-ceded~~ reserves might not, or vice versa.

4. Additional Standard Projection Amount

Where reinsurance is ceded, the additional standard projection amount shall be calculated as described in Section 6 to reflect the reinsurance costs and reinsurance recoveries under the reinsurance treaties. The additional standard projection amount shall also be calculated pre-reinsurance ceded using the methods described in Section 6 but ignoring the effects of the reinsurance ceded.

- Commented [X322]: Both referring to reinsurance ceded. Should be clarified.
- Commented [VM22323R322]: Edits to address this comment will be reflected in next exposure
- Commented [X324]: ~~ceded~~
- Commented [VM22325R324]: Edits to address this comment will be reflected in next exposure
- Commented [X326]: ~~ceded~~
- Commented [VM22327R326]: Edits to address this comment will be reflected in next exposure
- Commented [X328]: Opposite could also be true.
- Commented [VM22329R328]: Edits to address this comment will be reflected in next exposure
- Commented [X330]: The current VM-21 language here looks to work for VM-22 without needing to know the specific assumptions, etc., for the SPA.
- Commented [VM22331R330]: Edits to address this comment will be reflected in next exposure

Section 6: Standard Projection Amount To Be Determined

Commented [VM22332]: NY Comment Letter: Current CARVM standards should be a minimum floor for VM-22 policies, and only the stochastic reserve should permit grouping whereas the minimum floor should be seriatim.

Commented [X333]: SPA Section placement here still makes sense, but SPA under development.

Commented [VM22334R333]: Edit to update the title of this section will be reflected in next exposure

Commented [VM22335]: Refer to equitable comment letter, which expresses support for the standard projection amount as a binding floor, with the suggestion to rely on company-specific assumptions for insignificant assumptions that are difficult to develop.

Commented [X336]: SPA Section placement here still makes sense, but SPA under development.

Commented [VM22337]: Refer to equitable comment letter, which expresses support for the standard projection amount as a binding floor, with the suggestion to rely on company-specific assumptions for insignificant assumptions that are difficult to develop.

Commented [NJ338]: Once this is written, the language from 4.A.1.a for longevity reinsurance could be added here as well, i.e. the standard projection would use net premiums based on the k factor approach, using the standard projection prescribed assumptions. Floor on std projection is at the contract level

~~Section 6: To Be Determined~~

Section 7: Exclusion Testing

A. Stochastic Exclusion Test Requirement Overview

1. The company may elect to exclude one or more groups of contracts from the stochastic reserve SR calculation if the stochastic exclusion test (SET) is satisfied for that each of the group of contracts. The company has the option to calculate or not calculate the SET.
 - a. If the company does not elect to calculate the SET for one or more groups of contracts, or the company calculates the SET and fails the test for such groups of contracts, the reserve methodology described in Section 4 shall be used for calculating the aggregate reserve for those groups of contracts.
 - b. If the company elects to calculate the SET for one or more groups of contracts, and passes the test for such groups of contracts, then for each group of contracts that passes the SET, the company shall choose whether or not to use the reserve methodology described in Section 4 for those groups that group of contracts. If the reserve methodology described in Section 4 is not used for one or more groups of contracts, then the company shall use the reserve methodology pursuant to applicable requirements in VM-A and VM-C to calculate the aggregate reserve for those groups of contracts.
 - c. A company may not exclude a group of contracts from the stochastic reserve SR requirements if there are one or more future hedging programs associated with supporting the contracts, with the exception of hedging programs solely supporting index credits as described in Section 9.A.1.
 - d. A company may elect to automatically exclude one or more groups of policies from the stochastic reserve calculation without passing the stochastic exclusion test (SET) if all of the following are met for all contracts in the group or groups:
 - i. All of the contracts are either:
 - Single Premium Immediate Annuities,
 - Term Certain Payout Annuities, or
 - Structured Settlement Contracts;
 - ii. None of the contracts are pension risk transfer annuities (PRT) or are covered under a longevity reinsurance agreement;
 - iii. Future payout benefits are either level or stay within 5% of the initial payout benefit amount over time;
 - iv. There is either no or an immaterial level of policyholder options permitted within the contracts; and
 - v. The average [Macauley duration] of the liabilities of the contracts as measured from the issue date (or premium determination date) is less than [X].

B. Requirement to Pass the Types of Stochastic Exclusion Tests

Groups of contracts pass the SET if one of the following is met:

1850 M Street NW Suite 300 Washington, DC 20036 Telephone 202 223 8196 Facsimile 202 872 1948 www.actuary.org

Commented [X339]: Need to modify exclusion testing section to reflect SPA.

Commented [NJ340]: Longevity reinsurance likely to be scoped out of the stochastic reserve unless the stochastic reserve includes consideration of stochastic mortality. If it stays as stochastic interest only, then it probably does make sense that it would meet the exclusion testing. For exclusion testing, the k factor approach should continue to apply, and it should not be combined with other blocks of business

Commented [X341]: Inconsistent groups vs. group references.

Commented [VM22342R341]: Edits to address this comment will be reflected in next exposure

Commented [CD343]: should this be "stochastic reserve", since Section 4 is about determining the stochastic reserve.

Commented [VM22344R343]: Follow Section 4 method of stochastic reserve for Section 3 aggregate reserve if not using the SET

Commented [X345]: Decision is independent for each group the SET is performed on.

Commented [VM22346R345]: Edits to address this comment will be reflected in next exposure

Commented [CD347]: suggest deleting this highlighted part of the sentence

Commented [VM22348R347]: Edits to address this comment will be reflected in next exposure

Commented [CD349]: see earlier comment about the phrase "future hedge program" being confusing.

Commented [X350]: Is "associated with the contracts" the same as the earlier use of "supporting the contracts"? Should the same verbiage be used here? If there is asset hedging for the assets supporting the contracts, it should be included. Need to define "solely supporting" index credits, and also have criteria on the effectiveness/error and documentation of any such hedging that is allowed for excluded business.

Commented [VM22351]: Subgroup voted to permit SPAs below a certain duration to automatically pass the exclusion test, assuming there is limited optionality level/near-level payments, and not PRT or longevity reinsurance. The Academy has agreed to develop a proposed duration threshold

Commented [CD352]: Suggest renaming this section header/name to "Requirements to Pass the SET". There is only 1 SET, but 3 ways to pass it (SET, Demonstration or Certifications). The language gets confusing (here and elsewhere) when you start saying there are different "types" of SETs.

Commented [VM22353R352]: Edits to address this comment will be reflected in next exposure

1. Stochastic Exclusion Ratio Test (SERT)—Annually ~~within 12 months before the valuation date~~ ~~within 12 months before the valuation date~~ the company demonstrates that the groups of contracts pass the SERT defined in Section 7.C.
2. Stochastic Exclusion Demonstration Test—In the first year and at least once every three calendar years thereafter, the company provides a demonstration in the PBR Actuarial Report as specified in Section 7.D.
3. ~~SET~~ Certification Method—For groups of contracts that do not have guaranteed living benefits, ~~future hedging programs, or pension risk transfer business~~, in the first year and at least every third calendar year thereafter, the company provides a certification by a qualified actuary that the group of contracts is not subject to material ~~aggregate risk levels across interest rate risk, mortality and/or longevity risk, or asset return volatility risk~~ (i.e., the risk on non-fixed-income investments having substantial volatility of returns, such as common stocks and real estate investments). ~~The company shall provide the certification and documentation supporting the certification to the commissioner upon request.~~

Guidance Note: The qualified actuary should develop documentation to support the actuarial certification that presents his or her analysis clearly and in detail sufficient for another actuary to understand the analysis and reasons for the actuary’s conclusion that the group of contracts is not subject to material interest rate risk, mortality and/or longevity risk, or asset return volatility risk. Examples of methods a qualified actuary could use to support the actuarial certification include, but are not limited to:

- a) A demonstration that, ~~using requirements under VM-A and VM-C~~ for the group of contracts, reserves calculated ~~using requirements under VM-A and VM-C~~ are at least as great as the assets required to support the group of contracts ~~and certificates~~ using the company’s cash-flow testing model under each of the ~~1648~~ scenarios identified in ~~this section~~ Section 7.C.1 or alternatively each of the New York seven ~~scenarios~~ economic scenarios, ~~under each of the three mortality adjustment factors identified in Section 7.C.1.~~
- b) A demonstration that the group of contracts passed the SERT within 36 months prior to the valuation date and the company has not had a material change in its interest rate risk, mortality and/or longevity risk, or asset return volatility risk.
- c) A qualitative risk assessment of the group of contracts that concludes that the group of contracts does not have material interest rate risk, mortality and/or longevity risk, or asset return volatility. Such assessment would include an analysis of product guarantees, the company’s non-guaranteed elements (NGEs) policy, assets backing the group of contracts, the company’s longevity risk, and the company’s investment strategy.

C. Stochastic Exclusion Ratio Test

1. In order to ~~exclude a group of contracts from the stochastic reserve~~ SR requirements under the stochastic exclusion ratio test (SERT), a company shall demonstrate that the ratio of $(b-a)/a$ is less than the greater of [x]% where and the percentage change that would trigger the company’s materiality standard, where:

- Commented [VM22388R387]: Consensus to us ... [102]
- Commented [X389]: The variability should be as ... [103]

- a. a = the adjusted scenario reserve described in Paragraph 7.C.2.a below using economic scenario 9- and 100% as the adjustment factor for mortality, the baseline economic scenario, as described in Appendix 1.E of VM-20.
- b. b = the largest adjusted scenario reserve described in Paragraph 7.C.2.b-a below under any of the other 1516 economic scenarios described in Appendix 1.E of VM-20 under both [95]%, 100%, and [105]% of anticipated experience mortality excluding margins. Because mortality variability may differ by company, if the magnitude of the company's margin for mortality exceeds 5%, then the company shall use the baseline mortality and the mortality augmented by plus and minus the company's margin for this exercise.

Guidance Note: Note that the numerator should be the largest adjusted scenario reserve for scenarios other than the baseline economic scenario, minus the adjusted scenario reserve for the baseline economic scenario and 100% as the adjustment factor for mortality. This is not necessarily the same as the biggest difference from the adjusted scenario reserve for the baseline economic scenario and 100% as the adjustment factor for mortality, or the absolute value of the biggest difference from the adjusted scenario reserve for the baseline economic scenario and 100% as the adjustment factor for mortality, both of which could lead to an incorrect test result. There are 47 (=16x3-1) combined economic and mortality scenarios that should be compared for the determination of b.

2. In calculating the ratio in subsection (Section 7.C.1) above:

- a. The company shall calculate an adjusted scenario reserve for the group of contracts for each of each of the 16 scenarios economic scenarios using the three levels of mortality adjustment factors that is equal to either (i) or (ii) below:
 - i. The scenario reserve defined in Section 4, but with the following differences:
 - a) Using anticipated experience assumptions with no margins, with the exception of mortality factors described in Paragraph Section 7.C.1.b of this section.
 - b) Using the interest rates and equity return assumptions specific to each scenario.
 - c) Using NAER and discount rates defined in Section 4 specific to each scenario to discount the cash flows.
 - d) Shall reflect future mortality improvement in line with anticipated experience assumptions.
 - e) Shall not reflect correlation between longevity and economic risks.
 - ii. The gross premium reserve developed from the cash flows from the company's asset adequacy analysis models, using the experience assumptions of the company's cash-flow analysis, but with the following differences:
 - a) Using the interest rates and equity return assumptions specific to each scenario.

- Commented [X390]: Correcting reference
- Commented [VM22391R390]: Edits to address this comment will be reflected in next exposure
- Commented [CD392]: better to keep the reference to the full Section (i.e., Section 7.C.2.a.i)
- Commented [VM22393R392]: Edits to address this comment will be reflected in next exposure
- Commented [X394]: Correcting reference
- Commented [VM22395R394]: Edits to address this comment will be reflected in next exposure
- Commented [CD396]: better to keep the reference to the full Section (i.e., Section 7.C.2.b)
- Commented [VM22397R396]: Edits to address this comment will be reflected in next exposure
- Commented [X398]: Need to modify in case largest result is just from the mortality stress on the same scenario.
- Commented [VM22399R398]: Edits to address this comment will be reflected in next exposure
- Commented [X400]: Need to modify in case largest result is just from the economic stress on the same mortality level.
- Commented [X401]: Need to ensure we have captured a prudent level of mortality variation for any given company in this test.
- Commented [X402]: Updating to reflect mortality/economic scenario combinations.
- Commented [X403]: For clarity
- Commented [X404]: Be consistent with standard VM references
- Commented [VM22405R404]: Edits to address this comment will be reflected in next exposure
- Commented [CD406]: better to keep the reference to the full Section (i.e., Section 7.C.1)
- Commented [VM22407R406]: Edits to address this comment will be reflected in next exposure
- Commented [CD408]: why delete this? seems like it wouldn't hurt to keep this language, for additional clarity
- Commented [VM22409R408]: Edits to address this comment will be reflected in next exposure
- Commented [X410]: Be consistent with standard VM references
- Commented [VM22411R410]: Edits to address this comment will be reflected in next exposure
- Commented [CD412]: better to reference the full Section (i.e., Section 7.C.1.b)
- Commented [VM22413R412]: Edits to address this comment will be reflected in next exposure

- b) Using the mortality scalars described in ~~Paragraph~~ Section 7.C.1.b of this section.
 - c) Using the methodology to determine NAER and discount rates defined in Section 4 specific to each scenario to discount the cash flows, but using the company’s cash-flow testing assumptions for default costs and reinvestment earnings.
- Commented [X414]:** Be consistent with standard VM references
- Commented [VM22415R414]:** Edits to address this comment will be reflected in next exposure
- Commented [CD416]:** better to reference the full Section
- Commented [VM22417R416]:** Edits to address this comment will be reflected in next exposure
- b. The company shall use the most current ~~16~~ available baseline economic scenario and the 15 other economic scenarios published by the NAIC. The methodology for creating these scenarios can be found in Appendix 1 of VM-20.
 - c. The company shall use assumptions within each scenario that are dynamically adjusted as appropriate for consistency with each tested scenario.
 - d. The company may not group together contract types with significantly different risk profiles for purposes of calculating this ratio.
 - e. If the company has reinsurance arrangements that are pro rata coinsurance and do not materially impact the interest rate risk, longevity risk, or asset return volatility in the contract, then the company may elect to not conduct the stochastic exclusion ratio test ~~under only a pre-reinsurance ceded single basis upon determining the, either pre-reinsurance ceded basis upon determining the prior post-reinsurance reserve ceded aggregate reserve.~~
- Commented [X418]:** No reason for change/inconsistency with other chapters - reject edit.
- Commented [VM22419R418]:** Edits to address this comment will be reflected in next exposure
- Commented [X420]:** Clarification is needed around reference to “significantly different risk profiles”.
- 3. If the ratio calculated in this section is less than [x]% pre-non-proportional reinsurance, but is greater than [x]% post-non-proportional reinsurance, the group of contracts will still pass the SERT if the company can demonstrate that the sensitivity of the adjusted scenario reserve to economic scenarios is comparable pre- and post-non-proportional reinsurance.
- Commented [CD421]:** to be more specific, say “stochastic exclusion ratio test”
- Commented [VM22422R421]:** Edits to address this comment will be reflected in next exposure
- Commented [X423]:** Original did not make sense. Also, the point is that you just need one basis, either pre-reinsurance or post-reinsurance.
- Commented [VM22424R423]:** Edits to address this comment will be reflected in next exposure
- Commented [X425]:** We request clarification or definition of the term “non-proportional reinsurance”.
- a. An example of an acceptable demonstration:
 - i. For convenience in notation • SERT = the ratio (b–a)/a defined in Section 7.C.1 above
 - a) The pre-non-proportional reinsurance results are “gross of non-proportional,” with a subscript “gn,” so denoted SERT_{gn}
 - b) The post-non-proportional results are “net of non-proportional,” with subscript “nn,” so denoted SERT_{nn}
 - ii. If a block of business being tested is subject to one or more non-proportional reinsurance cessions as well as other forms of reinsurance, such as pro rata coinsurance, take “gross of non-proportional” to mean net of all prorata reinsurance but ignoring the non-proportional contract(s), and “net of non-proportional” to mean net of *all* reinsurance contracts. That is, treat non-proportional reinsurance as the last reinsurance in, and compute certain values below with and without that last component.
- Commented [X426]:** Does this make sense for VM-20 as well?
- Commented [VM22427R426]:** Subgroup to only focus on VM-22 for now

iii. So, if $SERT_{gn} \leq [x]_{t-1}^{\%}$ but $SERT_{nn} > [x]_{t-1}^{\%}$, then compute the largest percent increase in reserve (LPIR) = $(b-a)/a$, both “gross of non-proportional” and “net of non-proportional.”

$$LPIR_{gn} = (b_{gy} - a_{gy}) / b_{gn} - a_{gn} / a_{gn}$$

$$LPIR_{nn} = (b_{ny} - a_{ny}) / b_{nn} - a_{nn} / a_{nn}$$

Note that the scenario underlying b_{gn} could be different from the scenario underlying b_{nn} .

If $SERT_{gn} \times LPIR_{nn} / LPIR_{gn} < [x]_{t-1}^{\%}$, then the block of contracts passes the SERT.

- b. Another more qualitative approach is to calculate the adjusted scenario reserves for the 1648 combined economic and mortality scenarios both gross and net of reinsurance to demonstrate that there is a similar pattern of sensitivity by scenario.
- 4. The SERT may not be used for a group of contracts if, using the current year’s data, (i) the stochastic exclusion demonstration test defined in Section 7.D had already been attempted using the method in this section of Section 7.D.2.a or Section 7.D.2.b and did not pass; or (ii) the qualified actuary had actively undertaken to perform the certification method in this section and concluded that such certification could not legitimately be made.

D. Stochastic Exclusion Demonstration Test

- 1. In order to exclude a group of contracts from the stochastic reserve SR requirements using the methodology in this section, the company must provide a demonstration in the PBR Actuarial Report in the first year and at least once every three calendar years thereafter that complies with the following:

a. The demonstration shall provide a reasonable assurance that if the stochastic reserve SR was calculated on a stand-alone basis for the group of contracts subject to the stochastic reserve SR exclusion, the resulting stochastic reserve for those groups of contracts would not be higher than the statutory reserve determined pursuant to the applicable requirements in VM-A and VM-C. The demonstration shall take into account whether changing conditions over the current and two subsequent calendar years would be likely to change the conclusion to exclude the group of contracts from the stochastic reserve SR requirements.

b. If, as of the end of any calendar year, the company determines the aggregate statutory reserve determined pursuant to the applicable requirements in VM-A and VM-C for the group of contracts no longer adequately provides for all material risks, the exclusion shall be discontinued, and the company fails the SERT for those contracts.

c. The demonstration may be based on analysis from a date that precedes the valuation date for the initial year to which it applies if the demonstration includes an

Commented [X428]: We believe subscript “gy” should be “gn”.

Commented [VM22429R428]: Edits to address this comment will be reflected in next exposure

Commented [X430]: % missing

Commented [VM22431R430]: Edits to address this comment will be reflected in next exposure

Commented [X432]: Note that LPIR is just the SERT using the VM-22 formulation (b-a)/a.

Commented [VM22433R432]: Edits to address this comment will be reflected in next exposure

Commented [X434]: The first and last terms on the left side of this equation cancel out, so it just ends up with needing to pass the SERT on the net basis again. This worked when (c) was the denominator, but now with (a) in the denominator this adjustment is meaningless. Take out the whole example, or revise the SERT to use benefits in the denominator again. Or some new formulation for SERT.

Commented [VM22435R434]: Updated denominator, addressing this issue

Commented [X436]: In VM-20, it is only prohibited for the clearly sufficiently robust attempts of the demonstration method where failing shows the SR would be greater. The other two options could have been incomplete demonstrations and not necessarily imply the SR would be dominant.

Commented [X437]: Clearer language

Commented [VM22438R437]: Edits to address this comment will be reflected in next exposure

Commented [X439]: Does this statement imply a floor reserve of VM-A and VM-C? VM-20 does require the NPR as the floor of the reserve but as written, VM-22 does not require a floor reserve. Recommend removing 1.a. Same statement with the 2.a statement demonstration. This requirement does not apply to the other permitted tests, which seemed counterintuitive.

Commented [CD440]: should this, instead, refer to the statutory reserve determined pursuant to the applicable requirements in VM-A and VM-C?

Commented [VM22441R440]: Edits to address this comment will be reflected in next exposure

Commented [X442]: Typo is also in VM-20

Commented [VM22443R442]: Will follow-up upon addressing VM-30 disclosure requirements

explanation of why the use of such a date will not produce a material change in the outcome, as compared to results based on an analysis as of the valuation date.

- d. The demonstration shall provide an effective evaluation of the residual risk exposure remaining after risk mitigation techniques, such as derivative programs and reinsurance.
- 2. The company may use one of the following or another method acceptable to the insurance commissioner to demonstrate compliance with ~~subsection~~Section 7.D.1 above:
 - a. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the ~~stochastic reserve~~SR calculated on a stand-alone basis.
 - b. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the scenario reserve that results from each of a sufficient number of adverse deterministic scenarios.
 - c. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the ~~stochastic reserve~~SR calculated on a stand-alone basis, but using a representative sample of contracts in the ~~stochastic reserve~~SR calculations.
 - d. Demonstrate that any risk characteristics that would otherwise cause the ~~stochastic reserve~~SR calculated on a stand-alone basis to exceed the statutory reserve calculated in accordance with VM-A and VM-C, are not present or have been substantially eliminated through actions such as hedging, investment strategy, reinsurance or passing the risk on to the ~~contract~~policyholder by contract provision.

Commented [CD444]: should say "Section"

Commented [VM22445R444]: Edits to address this comment will be reflected in next exposure

E. Deterministic Certification Option

- 1. The company ~~has the option to may~~ determine the ~~stochastic reserve~~SR for a group of contracts using a single deterministic economic scenario, subject to the following conditions.
 - a. The company certifies that economic conditions do not materially influence anticipated contract holder behavior for the group of ~~policies, contracts and certificates~~. Examples of contract holder options that are materially influenced by economic conditions include surrender benefits, recurring premium payments, and guaranteed living benefits.
 - b. The company certifies that the group of ~~policies, contracts and certificates~~ is not supported by a reinvestment strategy that contains ~~future hedge purchases~~.
 - c. ~~The company must perform and disclose results from the stochastic exclusion ratio test following the requirements in Section 7.C, thereby disclosing and the scenario reserve volatility across various company must pass the SERT when considering only the 16 economic scenarios, paired with the 100% mortality scenario.~~

Commented [CD446]: "contract holder"

Commented [VM22447R446]: Edits to address this comment will be reflected in next exposure

Commented [X448]: Need SPA for DR as well as SR

Commented [CD449]: suggest saying "may" instead of "has the option to"

Commented [VM22450R449]: Edits to address this comment will be reflected in next exposure

Commented [CD451]: "contracts"

Commented [VM22452R451]: Edits to address this comment will be reflected in next exposure

Commented [X453]: Clarify if this was the intent to exclude contracts supported by index hedging.

Commented [X454]: this is needed to assure the SR is not needed. Otherwise this section is incomplete and does not support using a DR

Commented [VM22455R454]: Subgroup agrees with including the 100% mortality scenario.

- d. The company must disclose a description of contracts and associated features in the certification.

Drafting Note: Consider revisiting Paragraph E.1.c to possibly either require i) falling below a preset threshold for the exclusion ratio test under a single longevity/mortality scenario; or ii) to pass the exclusion test if longevity is not included as part of the ratio test.

Commented [X456]: Agree with drafting note. Ed

Commented [VM22457R456]: Subgroup agrees with including the 100% mortality scenario.

- 2. The stochastic reserve SR for the group of contracts under the Deterministic Certification Option is determined as follows:

- a. Cash flows are projected in compliance with the applicable requirements in Section 4, Section 5, Section 10, and Section 11 of VM-22 over a single economic scenario (scenario 12 found in Appendix 1 of VM-20).
- b. The stochastic reserve SR equals the scenario reserve following the requirements for Section 4.

Guidance Note: The Deterministic Certification Option is intended to provide a non-stochastic option for Single Premium Immediate Annuities (SPIAs) and similar payout annuity products that contain limited or no optionality in the asset and liability cash flow projections.

Commented [X458]: It may not be appropriate to use scenario 12 to calculate the scenario reserve for SPIA. See this article <https://www.soa.org/sections/financial-reporting/financial-reporting-newsletter/2021/july/fr-2021-07-su/>

“in an increasing interest rate environment for business where policyholder behavior is sensitive to prevailing interest rates, life insurers may face an increase in disintermediation risk (i.e., the risk of having to sell assets, potentially at a loss, to fund policyholder surrender benefits) For example, rising interest rates, particularly sudden jumps (e.g., New York 7 pop-up scenario with an immediate interest rate increase of 3 percent), may lead to higher actual and projected policyholder surrenders as policyholders seek out higher yielding investment opportunities. These increasing cash demands may require fixed income assets to be sold at depressed prices, and resultant projected losses (or lower gains) may result in reserve insufficiencies, necessitating the need for AAT reserves.”

Commented [X459]: Recommend deleting guidance note, as it doesn't provide full or clear scope of what may be excluded, so could be misread to either guarantee option for certain products or exclude the option for other products.

Section 8: To Be Determined (Scenario Generation for VM-21)

Section 9: Modeling Hedges under a Future Non-Index Credit Hedging Strategy

A. Initial Considerations

1. This section applies to modeling of hedges other than situations where the company (a) only hedges index credits. ~~If the company, or (b) clearly separates index credit hedging from other hedging, then only the section only pertains to the other hedging if the index hedging follows.~~ In those situations, the modeling of hedges supporting index credits can be simplified including applying an index credit hedge margin, following the requirements in Section 4.A.4.b.i.
2. The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the calculation of the ~~stochastic reserve~~SR, determined in accordance with Section 3.D and Section 4.D.
3. The company shall take into account the costs and benefits of hedge positions expected to be held by the company in the future along each scenario. Company management is responsible for developing, documenting, executing and evaluating the investment strategy for future hedge purchases. ~~Prior to reflection in projections, the strategy for future hedge purposes shall be the actual practice of the company for a period of time not less than [6] months,~~ including the hedging strategy, used to implement the investment policy.
4. For this purpose, the investment assets refer to all the assets, including derivatives supporting covered products and guarantees. This also is referred to as the investment portfolio. The investment strategy is the set of all asset holdings at all points in time in all scenarios. The hedging portfolio, which also is referred to as the hedging assets, is a subset of the investment assets. The hedging strategy is the hedging asset holdings at all points in time in all scenarios. There is no attempt to distinguish what is the hedging portfolio and what is the investment portfolio in this section. Nor is the distinction between investment strategy and hedging strategy formally made here. Where necessary to give effect to the intent of this section, the requirements applicable to the hedging portfolio or the hedging strategy are to apply to the overall investment portfolio and investment strategy.
5. This particularly applies to restrictions on the reasonableness or acceptability of the models that make up the stochastic cash-flow model used to perform the projections, since these restrictions are inherently restrictions on the joint modeling of the hedging and non-hedging portfolio. To give effect to these requirements, they must apply to the overall investment strategy and investment portfolio.

B. Modeling Approaches

1. The analysis of the impact of the hedging strategy on cash flows is typically performed using either one of two types of methods as described below. Although a hedging strategy normally would be expected to reduce risk provisions, the nature of the hedging strategy and the costs to implement the strategy may result in an increase in the amount of the ~~stochastic reserve~~SR otherwise calculated.
2. The fundamental characteristic of the first type of method, referred to as the “explicit method,” is that hedging positions and their resulting cash flows are included in the stochastic cash-flow model used to determine the scenario reserve, as discussed in Section 3.D, for each scenario.

Commented [X460]: Section 4.A.4 (Modeling of Hedges) has some relationship with this section, we request clarification around the applicability of these two areas of hedge guidance.

Commented [VM22461R460]: Edits to address this comment will be reflected in next exposure

Commented [CD462]: see previous comments about use of the word "future" to describe "hedging strategy"

Commented [X463]: We seek clarification of this text: if a company only hedges indices or separates index crediting from other hedges, does this apply, or does it only apply to any other hedging?

Commented [VM22464R463]: Edits to address this comment will be reflected in next exposure

Commented [X465]: The sentence "Prior to reflection in projections, the strategy for future hedge purposes shall be the actual practice of the company for a period of time not less than [6] months." seems to suggest you would do something other than the actual hedging strategy after [6] months. In this case, what are you assuming for modeling? We suggest clarification of this sentence.

Commented [VM22466R465]: Edits to address this comment will be reflected in next exposure

Commented [CD467]: is this a typo? should this be "purchases"?

Commented [VM22468R467]: Edits to address this comment will be reflected in next exposure

Commented [X469]: This 6 month exclusion creates unintended optionality for inclusion/exclusion based on whether a hedge strategy is considered "new". Instead, this should be addressed through the Error factor for new programs being temporarily larger.

Commented [VM22470R469]: Edits to address this comment will be reflected in next exposure

Commented [X471]: Reinstate the original sentence which puts the reflection of hedging into the greater context of reflecting the company's investment policy.

Commented [VM22472R471]: Edits to address this comment will be reflected in next exposure

Commented [X473]: Agree that the uncertainty associated with new strategies should be handled via the E factor, not through blanket exclusion.

Commented [VM22474R473]: Edits to address this comment will be reflected in next exposure

3. The fundamental characteristic of the second type of method, referred to as the “implicit method,” is that the effectiveness of the current hedging strategy on future cash flows is evaluated, in part or in whole, outside of the stochastic cash-flow model. There are multiple ways that this type of modeling can be implemented. In this case, the reduction to the ~~stochastic reserve~~SR otherwise calculated should be commensurate with the degree of effectiveness of the hedging strategy in reducing accumulated deficiencies otherwise calculated.
4. Regardless of the methodology used by the company, the ultimate effect of the current hedging strategy (including currently held hedge positions) on the ~~stochastic reserve~~SR needs to recognize all risks, associated costs, imperfections in the hedges and hedging mismatch tolerances associated with the hedging strategy. The risks include, but are not limited to: basis, gap, price, parameter estimation and variation in assumptions (mortality, persistency, withdrawal, annuitization, etc.). Costs include, but are not limited to: transaction, margin (opportunity costs associated with margin requirements) and administration. In addition, the reduction to the ~~stochastic reserve~~SR attributable to the hedging strategy may need to be limited due to the uncertainty associated with the company’s ability to implement the hedging strategy in a timely and effective manner. The level of operational uncertainty varies indirectly with the amount of time that the new or revised strategy has been in effect or ~~mode~~ tested.

Guidance Note: No hedging strategy is perfect. A given hedging strategy may eliminate or reduce some but not all risks, transform some risks into others, introduce new risks, or have other imperfections. For example, a delta-only hedging strategy does not adequately hedge the risks measured by the “Greeks” other than delta.

5. A safe harbor approach is permitted for those companies whose modeled hedge assets comprise only linear instruments not sensitive to implied volatility. For companies with option-based hedge strategies, electing this approach would require representing the option-based portion of the strategy as a delta-rho two-Greek hedge program. The normally modeled option portfolio would be replaced with a set of linear instruments that have the same first-order Greeks as the original option portfolio.

Commented [X475]: Is delta-only hedging common in VM-22 hedging? Could the example be replaced with something more relevant to VM-22 hedging?

C. Calculation of ~~Stochastic Reserve~~SR (Reported)

1. The company shall calculate CTE70 (best efforts)—the results obtained when the CTE70 is based on incorporating the modeling of hedges (including both currently held and future hedge positions) into the stochastic cash-flow model on a best efforts basis, including all of the factors and assumptions needed to model the hedges (e.g., stochastic implied volatility). The determination of CTE70 (best efforts) may utilize either explicit or implicit modeling techniques.
2. The company shall calculate a CTE70 (adjusted) by recalculating the CTE70 assuming the company has no ~~future hedging purchases~~ strategy, except those to hedge interest credits and hedge assets held by the company on the valuation date, therefore following the requirements of Section 4.A.4.a and 4.A.4.b.i.
3. Because most models will include at least some approximations or idealistic assumptions, CTE70 (best efforts) may overstate the impact of the hedging strategy. To compensate for potential overstatement of the impact of the hedging strategy, the value for the ~~stochastic reserve~~SR is given by:

Commented [X476]: The Hedging DG is currently working on language and we will want to be consistent across VM-20, VM-21, and VM-22.

Commented [CD477]: perhaps better to say “no future hedge purchases...”

Commented [VM22478R477]: Edits to address this comment will be reflected in next exposure

$$\text{Stochastic reserveSR} = \text{CTE70 (best efforts)} + E \times \max[0, \text{CTE70 (adjusted)} - \text{CTE70 (best efforts)}]$$

4. The company shall specify a value for *E* (the “error factor”) in the range from 5% to 100% to reflect the company’s view of the potential error resulting from the level of sophistication of the stochastic cash-flow model and its ability to properly reflect the parameters of the hedging strategy (i.e., the Greeks being covered by the strategy), as well as the associated costs, risks and benefits. The greater the ability of the stochastic model to capture all risks and uncertainties, the lower the value of *E*. The value of *E* may be as low as 5% only if the model used to determine the CTE70 (best efforts) effectively reflects all of the parameters used in the hedging strategy. If certain economic risks are not hedged, yet the model does not generate scenarios that sufficiently capture those risks, *E* must be in the higher end of the range, reflecting the greater likelihood of error. Likewise, simplistic hedge cash-flow models shall assume a higher likelihood of error.
5. The company shall conduct a formal back-test, based on an analysis of ~~at least the most recent~~ available relevant period of data (but no less than 12 months), to assess how well the model is able to replicate the hedging strategy in a way that supports the determination of the value used for *E*.
6. Such a back-test shall involve one of the following analyses:
 - a. For companies that model hedge cash flows directly (“explicit method”), replace the stochastic scenarios used in calculating the CTE70 (best efforts) with a single scenario that represents the market path that actually manifested over the selected back-testing period and compare the projected hedge asset gains and losses against the actual hedge asset gains and losses – both realized and unrealized – observed over the same time period. For this calculation, the model assumptions may be replaced with parameters that reflect actual experience during the back-testing period. In order to isolate the comparison between the modeled hedge results and actual hedge results for this calculation, the projected liabilities should accurately reflect the actual liabilities throughout the back-testing period; therefore, adjustments that facilitate this accuracy (e.g. reflecting actual experience instead of model assumptions, including new business, etc.) are permissible.

To support the choice of a low value of *E*, the company should ascertain that the projected hedge asset gains and losses are within close range of 100% (e.g., 80–125%) of the actual hedge asset gains and losses. The company may also support the choice of a low value of *E* by achieving a high R-squared (e.g., 0.80 or higher) when using a regression analysis technique.
 - b. For companies that model hedge cash flows implicitly by quantifying the cost and benefit of hedging using the fair value of the hedged item (an “implicit method” or “cost of reinsurance method”), calculate the delta, rho and vega coverage ratios in each month over the selected back-testing period in the following manner:
 - i. Determine the hedge asset gains and losses—both realized and unrealized—incurred over the month attributable to equity, interest rate, and implied volatility movements.
 - ii. Determine the change in the fair value of the hedged item over the month attributable to equity, interest rate, and implied volatility movements. The hedged item should be defined in a manner that reflects the proportion of risks hedged (e.g., if a company elects to hedge 50% of a contract’s market risks, it should quantify the fair value of the hedged item as 50% of the fair value of the contract).

Commented [X479]: We have been getting weak E factor support, with minimum backtesting due to the current phrasing.

Commented [X480R479]: Recommend adding stress testing language similar to Section 4.A.4.b.i.c) but with edits based on TDI’s comments/suggestions to Section 4.A.4.b.i.c).

Commented [VM22481R479]: Edits to address this comment will be reflected in next exposure

Commented [X482]: Recommend adding reporting requirement to VM-31 to disclose if company has switched between explicit method and implicit method, discuss rationale of the change and the change impact.

Commented [VM22483R482]: Edits to address this comment will be reflected in next exposure

- iii. Calculate the delta coverage ratio as the ratio between (i) and (ii) attributable to equity movements.
 - iv. Calculate the rho coverage ratio as the ratio between (i) and (ii) attributable to interest rate movements.
 - v. Calculate the vega coverage ratio as the ratio between (i) and (ii) attributable to implied volatility movements.
 - vi. To support the company's choice of a low value of E, the company should be able to demonstrate that the delta and rho coverage ratios are both within close range of 100 % (e.g., 80–125%) consistently across the back-testing period.
 - vii. In addition, the company should be able to demonstrate that the vega coverage ratio is within close range of 100 % in order to use the prevailing implied volatility levels as of the valuation date in quantifying the fair value of the hedged item for the purpose of calculating CTE70 (best efforts). Otherwise, the company shall quantify the fair value of the hedged item for the purpose of calculating CTE70 (best efforts) in a manner consistent with the realized volatility of the scenarios captured in the CTE (best efforts).
- c. Companies that do not model hedge cash flows explicitly, but that also do not use the implicit method as outlined in Section 9.C.6.b above, shall conduct the formal back-test in a manner that allows the company to clearly illustrate the appropriateness of the selected method for reflecting the cost and benefit of hedging, as well as the value used for E.
7. A company that does not have 12 months of experience to date shall set E to a value that reflects the amount of experience available, and the degree and nature of any change to the hedge program. For a material change in strategy, with ~~no less than 6 months of history~~, E should be ~~at least 1.0-50~~. However, E may be lower than ~~1.0-50~~ if ~~some~~ at least 6 months of reliable experience is available and/or if the change in strategy is a minor refinement rather than a substantial material change in strategy.

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily large (e.g., $\geq 50\%$) for substantial changes in hedge methodology (e.g., moving from a fair-value based strategy to a stop-loss strategy) where the company has not been able to provide a meaningful simulation of hedge performance based on the new strategy.
- A temporary moderate increase (e.g., 15–30%) in error factor should be used for substantial modifications to hedge programs or modeling where meaningful simulation has not been created (e.g., adding second-order hedging, such as gamma or rate convexity).
- No increase in the error factor may be used for incremental modifications to the hedge strategy (e.g., adding death benefits to a program that previously covered only living benefits, or moving from swaps to Treasury Department futures).

Commented [X484]: 6 month restriction should be handled in the error factor. Other language for clarity. Edited guidance note below to be consistent with this.

Commented [VM22485R484]: Edits to create consistency with recently adopted APF 2020-12 will be considered for the next exposure

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily large (e.g., $\geq 50\%$) for substantial changes in hedge methodology (e.g., moving from a fair value based strategy to a stop-loss strategy) where the company has not been able to provide a meaningful simulation of hedge performance based on the new strategy.
- A temporary moderate increase (e.g., 15–30%) in error factor should be used for substantial modifications to hedge programs or modeling where meaningful simulation has not been created (e.g., adding second-order hedging, such as gamma or rate convexity).
- No increase in the error factor may be used for incremental modifications to the hedge strategy (e.g., adding death benefits to a program that previously covered only living benefits, or moving from swaps to Treasury Department futures).

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily 100% for material changes in hedge methodology (e.g., moving from a fair-value based strategy to a stop-loss strategy).
- An increase in the error factor may not always be needed for minor refinements to the hedge strategy (e.g., moving from swaps to Treasury futures).

8. The company shall set the value of E reflecting the extent to which the future hedging program is clearly defined. To support a value of E below 1.0, there should be very robust documentation outlining the future hedging program. To the extent that documentation outlining the future hedging program is incomplete, the value of E shall be increased. Any increases required to the value of E to reflect that documentation is not available to support that the future hedging program is clearly defined shall be in addition to increases to the value of E to reflect a lack of historical experience or to reflect the back-testing results.

E. Additional Considerations for CTE70 (best efforts)

If the company is following a CDHS, the fair value of the portfolio of contracts falling within the scope of these requirements shall be computed and compared to the CTE70 (best efforts) and CTE70 (adjusted). If the CTE70 (best efforts) is below both the fair value and CTE70 (adjusted), the company should be prepared to explain why that result is reasonable.

For the purposes of this analysis, the SR and fair value calculations shall be done without requiring the scenario reserve for any given scenario to be equal to or in excess of the cash surrender value in aggregate for the group of contracts modeled in the projection.

D. Specific Considerations and Requirements

1. As part of the process of choosing a methodology and assumptions for estimating the future effectiveness of the current hedging strategy (including currently held hedge positions) for purposes of reducing the stochastic reserve SR, the company should review actual historical hedging effectiveness. The company shall evaluate the appropriateness of the assumptions

Commented [X486]: Work is being done by the hedging DG. This is a placeholder. Need to reflect how clearly defined and well documented the hedge program is, to be able to rely on the backtesting provided. To the extent that hedge programs are not clearly defined, E should be increased to reflect that the backtesting cannot be relied on as an indicator of future effectiveness.

Commented [X487]: [Redacted] create this disclosure from what is a rough responsibility check for regulatory review/information on the modeled hedge and add an [Redacted] prompt further discussion.

Commented [VM22488R487]: Subgroup voted in favor of retaining the fair value disclosure wording here, which is only subject to non-index credit hedges at this point

Commented [CD489]: [Redacted] not sure why this section is being deleted. Perhaps references to CDHS could be deleted, but otherwise this section still seems applicable.

Commented [VM22490R489]: Subgroup voted in favor of retaining the fair value disclosure wording here, which is only subject to non-index credit hedges at this point

on future trading, transaction costs, other elements of the model, the strategy, the mix of business and other items that are likely to result in materially adverse results. This includes an analysis of model assumptions that, when combined with the reliance on the hedging strategy, are likely to result in adverse results relative to those modeled. The parameters and assumptions shall be adjusted (based on testing contingent on the strategy used and other assumptions) to levels that fully reflect the risk based on historical ranges and foreseeable future ranges of the assumptions and parameters. If this is not possible by parameter adjustment, the model shall be modified to reflect them at either anticipated experience or adverse estimates of the parameters.

2. A discontinuous hedging strategy is a hedging strategy where the relationships between the sensitivities to equity markets and interest rates (commonly referred to as the Greeks) associated with the guaranteed contract holder options embedded in the variable fixed indexed annuities and other in-scope products and these same sensitivities associated with the hedging assets are subject to material discontinuities. This includes, but is not limited to, a hedging strategy where material hedging assets will be obtained when the fixed indexed annuity and other in-scope products account balances reach a predetermined level in relationship to the guarantees. Any hedging strategy, including a delta hedging strategy, can be a discontinuous hedging strategy if implementation of the strategy permits material discontinuities between the sensitivities to equity markets and interest rates associated with the guaranteed contract holder options embedded in the variable fixed indexed annuities and other in-scope products and these same sensitivities associated with the hedging assets. There may be scenarios that are particularly costly to discontinuous hedging strategies, especially where those result in large discontinuous changes in sensitivities (Greeks) associated with the hedging assets. Where discontinuous hedging strategies contribute materially to a reduction in the stochastic reserveSR, the company must evaluate the interaction of future trigger definitions and the discontinuous hedging strategy, in addition to the items mentioned in the previous paragraph. This includes an analysis of model assumptions that, when combined with the reliance on the discontinuous hedging strategy, may result in adverse results relative to those modeled.
3. A strategy that has a strong dependence on acquiring hedging assets at specific times that depend on specific values of an index or other market indicators may not be implemented as precisely as planned.
4. The combination of elements of the stochastic cash-flow model—including the initial actual market asset prices, prices for trading at future dates, transaction costs and other assumptions—should be analyzed by the company as to whether the stochastic cash-flow model permits hedging strategies that make money in some scenarios without losing a reasonable amount in some other scenarios. This includes, but is not limited to:
 - a. Hedging strategies with no initial investment that never lose money in any scenario and in some scenarios make money.
 - b. Hedging strategies that, with a given amount of initial money, never make less than accumulation at the one-period risk-free rates in any scenario but make more than this in one or more scenarios.
5. If the stochastic cash-flow model allows for such situations, the company should be satisfied that the results do not materially rely directly or indirectly on the use of such strategies. If the results do materially rely directly or indirectly on the use of such strategies, the strategies may not be used to reduce the stochastic reserveSR otherwise calculated.

Commented [X491]: Suggest replacing "indexed" with "fixed" since this would apply to all fixed annuities.

Commented [VM22492R491]: Edits to address this comment will be reflected in next exposure

Commented [X493]: Editorial change of "variable fixed indexed annuity" to be "fixed indexed annuity and other in-scope products".

Commented [VM22494R493]: Edits to address this comment will be reflected in next exposure

Commented [X495]: Recommend deleting "including a delta hedging strategy" as it is already covered by "any hedging strategy" and it is not clear if delta hedging strategy is the most common strategy in VM-22 hedging to be used as a general example.

Commented [VM22496R495]: Edits to address this comment will be reflected in next exposure

6. In addition to the above, the method used to determine prices of financial instruments for trading in scenarios should be compared to actual initial market prices. In addition to comparisons to initial market prices, there should be testing of the pricing models that are used to determine subsequent prices when scenarios involve trading financial instruments. This testing should consider historical relationships. For example, if a method is used where recent volatility in the scenario is one of the determinants of prices for trading in that scenario, then that model should approximate actual historic prices in similar circumstances in history.

Section 10: Guidance and Requirements for Setting Contract Holder Behavior Prudent Estimate Assumptions

A. General

Contract holder behavior assumptions encompass actions such as lapses, withdrawals, transfers, recurring deposits, benefit utilization, option election, etc. Contract holder behavior is difficult to predict accurately, and variance in behavior assumptions can significantly affect the ~~results~~ reserves level. In the absence of relevant and fully credible empirical data, the company should set behavior assumptions as guided by Principle 3 in Section 1.B and Section 12.

In setting behavior assumptions, the company should examine, but not be limited by, the following considerations:

1. Behavior can vary by product, market, distribution channel, index performance, interest credited (current and guaranteed rates), time/product duration, etc.
2. Options embedded in the product may affect behavior.
3. Utilization of options may be elective or non-elective in nature. Living benefits often are elective, and death benefit options are generally non-elective.
4. Elective contract holder options may be more driven by economic conditions than non-elective options.
5. As the value of a product option increases, there is an increased likelihood that contract holders will behave in a manner that maximizes their financial interest (e.g., lower lapses, higher benefit utilization, etc.).
6. Behavior formulas may have both rational and irrational components (irrational behavior is defined as situations where some contract holders may not always act in their best financial interest). The rational component should be dynamic, but the concept of rationality need not be interpreted in strict financial terms and might change over time in response to observed trends in contract holder behavior based on increased or decreased financial efficiency in exercising their contractual options.
7. Options that are ancillary to the primary product features may or may not be significant drivers of behavior. Whether an option is ancillary to the primary product features depends on many things, such as:
 - a. For what purpose was the product purchased?
 - b. Is the option elective or non-elective?
 - c. Is the value of the option well-known?
8. External influences may affect behavior.

Commented [X497]: Editorial clarification

Commented [VM22498R497]: Edits to address this comment will be reflected in next exposure

Commented [X499]: Need general assumption setting section, see APF 2021-11.

Commented [VM22500R499]: Edits to address this comment will be reflected in next exposure

Commented [X501]: We would suggest rewording this section to be considerations rather than posed as questions.

Commented [X502]: Editorial clarification

Commented [VM22503R502]: Edits to address this comment will be reflected in next exposure

Commented [X504]: Recommend adding some examples here if this is included.

Commented [VM22505R504]: Edits to address this comment will be reflected in next exposure

B. Aggregate vs. Individual Margins

1. Prudent estimate assumptions are developed by applying a margin for uncertainty to the anticipated experience assumption. The issue of whether the level of the margin applied to the anticipated experience assumption is determined in aggregate or independently for each and every behavior assumption is discussed in Principle 3 in Section 1.B.

2. Although this principle discusses the concept of determining the level of margins in aggregate, it notes that the application of this concept shall be guided by evolving practice and expanding knowledge. From a practical standpoint, it may not always be possible to completely apply this concept to determine the level of margins in aggregate for all behavior assumptions.
3. Therefore, the company shall determine prudent estimate assumptions independently for each behavior (e.g., mortality, lapses and benefit utilization), using the requirements and guidance in this section and throughout these requirements, unless the company can demonstrate that an appropriate method was used to determine the level of margin in aggregate for two or more material behavior assumptions, if relevant to the risks in the product, and thus the approach will not understate the reserve.

C. Sensitivity Testing

The impact of behavior can vary by product, time period, etc. For any assumption that is not prescribed or stochastically modeled, ~~the company qualified actuary to whom responsibility for this group of contracts is assigned~~ shall use sensitivity testing to ensure that the assumption is set at the conservative end of the plausible range. The company shall sensitivity test:

- Surrenders.
- Partial withdrawals.
- Benefit utilization.
- Account transfers.
- Future deposits.
- Other behavior assumptions if relevant to the risks in the product.

Sensitivity testing of assumptions is required and shall be more complex than, for example, base lapse assumption plus or minus X% across all contracts. A more appropriate sensitivity test in this example might be to devise parameters in a dynamic lapse formula to reflect more out-of-the-money contracts lapsing and/or more holders of in-the-money contracts persisting and eventually using the guarantee. The company should apply more caution in setting assumptions for behaviors where testing suggests that stochastic modeling results are sensitive to small changes in such assumptions. For such sensitive behaviors, the company shall use higher margins when the underlying experience is less than fully relevant and credible.

The company shall examine the results of sensitivity testing to understand the materiality of prudent estimate assumptions on the modeled reserve. The company shall update the sensitivity tests periodically as appropriate, considering the materiality of the results of the tests. The company may update the tests less frequently (but no less than every 3 years) when the tests show less sensitivity of the modeled reserve to changes in the assumptions being tested or the experience is not changing rapidly. Providing there is no material impact on the results of the sensitivity testing, the company may perform sensitivity testing:

1. Using samples of the contracts in force rather than performing the entire valuation for each alternative assumption set.

Commented [X506]: Clarification

Commented [VM22507R506]: Edits to address this comment will be reflected in next exposure

Commented [X508]: Suggest updating bullet to "Other material behavior assumptions if relevant to the risks in the product."

Commented [VM22509R508]: Edits to address this comment will be reflected in next exposure

Commented [X510]: Sensitivity testing is covered by the submitted APF 2021-11 for VM-21, and we should be consistent. VM-21 is currently lacking on sensitivity testing.

Commented [VM22511R510]: Make edits to be consistent with VM-21 APFs prior to adoption of VM-22

Commented [VM22512R510]: Edits to address this comment will be reflected in next exposure

Commented [CD513]: why assign this specifically to the QA rather than leaving it as the responsibility of "the company", like we do elsewhere in the requirements?

Commented [VM22514R513]: Edits to address this comment will be reflected in next exposure

Commented [X515]: include for completion

Commented [VM22516R515]: Edits to address this comment will be reflected in next exposure

Commented [X517]: Consistent with APF 2021-11.

Commented [VM22518R517]: Edits to address this comment will be reflected in next exposure

- 2. Using data from prior periods.

D. Specific Considerations and Requirements

- 1. Within materiality considerations, the company should consider all relevant forms of contract holder behavior and persistency, including, but not limited to, the following:
 - a. Mortality (additional guidance and requirements regarding mortality is contained in Section 11).
 - b. Surrenders.
 - c. Partial withdrawals (systematic and elective).
 - d. Account transfers (switching/exchanges).
 - e. Resets/ratchets of the guaranteed amounts (automatic and elective).
 - f. Future deposits.
 - g. Income start date for the benefit utilization.
 - h. Commutation of benefit (from periodic payment to lump sum) or vice versa.
- 2. It may be acceptable to ignore certain items that might otherwise be explicitly modeled in an ideal world, particularly if the inclusion of such items reduces the calculated provisions.

For example:

- a. The impact of account transfers (intra-contract index “switching”) might be ignored, unless required under the terms of the contract (e.g., automatic ~~asset~~ re-allocation/rebalancing,) or if the contract provisions incentivize the contract holders to transfer between accounts.
- b. Future deposits might be excluded from the model, unless required by the terms of the contracts under consideration and then only in such cases where future premiums can reasonably be anticipated (e.g., with respect to timing and amount).
- c. For some non-elective benefits (nursing home benefits for example), a zero incidence rate after the surrender charge has ended, or the cash value has depleted, may be acceptable since use of a non-zero rate could reduce the modeled reserve.

~~Guidance Note: For some non elective benefits (nursing home benefits for example), unless relevant company experience exists to the contrary, the use of incidence rates greater than zero after the surrender charge has ended, or the cash value was depleted might be inappropriate may not be prudent since it would reduce the modeled reserve.~~

- 3. However, the company should exercise caution in assuming that current behavior will be indefinitely maintained. For example, it might be appropriate to test the impact of a shifting asset mix and/or consider future deposits to the extent they can reasonably be anticipated and increase the calculated amounts.

Commented [X519]: Clarification

Commented [VM22520R519]: Edits to address this comment will be reflected in next exposure

Commented [X521]: Clarification

Commented [VM22522R521]: Edits to address this comment will be reflected in next exposure

Commented [CD523]: delete this word

Commented [VM22524R523]: Edits to address this comment will be reflected in next exposure

Commented [X525]: Reviewing, this guidance note does not exist in the 2019, 2020, 2021, or 2022 versions of VM-21. Where is this from? Should this be added to VM-21?

4. Normally, the underlying model assumptions would differ according to the attributes of the contract being valued. This would typically mean that contract holder behavior and persistency may be expected to vary according to such characteristics as (this is not an exhaustive list):
 - a. Gender.
 - b. Attained age.
 - c. Issue age.
 - d. Contract duration.
 - e. Time to maturity.
 - f. Tax status.
 - g. Account value.
 - h. Interest credited (current and guaranteed).
 - i. Available indices.
 - j. Guaranteed benefit amounts.
 - k. Surrender charges, transaction fees or other contract charges.
 - l. Distribution channel.
5. Unless there is clear evidence to the contrary, behavior assumptions should be no less conservative than past experience. Margins for contract holder behavior assumptions shall assume, without relevant and credible experience or clear evidence to the contrary, that contract holders' efficiency will increase over time.
6. In determining contract holder behavior assumptions, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience), whether or not the segment is directly written by the company. If data from a similar business segment are used, the assumption shall be adjusted to reflect differences between the two segments. Margins shall reflect the data uncertainty associated with using data from a similar but not identical business segment.
7. Where relevant and fully credible empirical data do not exist for a given contract holder behavior assumption, the company shall set the contract holder behavior assumption to reflect the increased uncertainty such that the contract holder behavior assumption is shifted towards the conservative end of the plausible range of expected experience that serves to increase the stochastic reserve. SR. If there are no relevant data, the company shall set the contract holder behavior assumption to reflect the increased uncertainty such that the contract holder behavior assumption is at the conservative end of the range. Such adjustments shall be consistent with the definition of prudent estimate, with the principles described in Section 1.B, and with the guidance and requirements in this section.
8. Ideally, contract holder behavior would be modeled dynamically according to the simulated economic environment and/or other conditions. It is important to note, however, that contract holder behavior should neither assume that all contract holders act with 100%

Commented [X526]: This also applies to VM-21, as there are fixed accounts. Is there any reason not to be consistent?

Commented [VM22527R526]: Only to focus on VM-22 for now

Commented [X528]: This is not a synonym (perhaps transfer fees is a subset of transaction fees) - why would transaction fees apply for VM-21, but only transfer fees for VM-22?

Commented [VM22529R528]: Edits to address this comment will be reflected in next exposure

Commented [X530]: This section states that "contract holder behavior should neither assume that all contract holders act with 100% efficiency in a financially rational manner nor assume that contract holders will always act irrationally." This text seems to directly contradict Section II. Reserve Requirements 6.H.2 which states "When advantageous, policyholders will commence living benefit payouts if not started yet.". We suggest revising 6.H.2 to align with the text of 10.D.8.

efficiency in a financially rational manner nor assume that contract holders will always act irrationally. These extreme assumptions may be used for modeling efficiency if the result is more conservative.

E. Dynamic Assumptions

1. Consistent with the concept of prudent estimate assumptions described earlier, the liability model should incorporate margins for uncertainty for all risk factors that are not ~~dynamic (i.e., the non-scenario tested assumptions) and are assumed not to vary according to the financial interest of the contract holder~~ stochastically modeled.
2. ~~The company should exercise care in using static assumptions when it would be more natural and reasonable~~ appropriate to use a dynamic model or other scenario-dependent formulation for behavior. ~~With due regard to considerations of materiality and practicality~~ allowance for appropriate simplifications, approximations and modeling efficiency techniques, the use of dynamic models is encouraged, but not mandatory. ~~Static assumptions~~ Risk factors that are not scenario tested but could reasonably be expected to vary according to a stochastic process, or future states of the world (especially in response to economic drivers), may require higher margins and/or signal a need for higher margins for certain other assumptions.
3. Risk factors that are modeled dynamically should encompass the plausible range of behavior consistent with the economic scenarios and other variables in the model, including the non-scenario tested assumptions. The company shall test the sensitivity of results to understand the materiality of making alternate assumptions and follow the guidance discussed above on setting assumptions for sensitive behaviors.

Commented [X531]: Recommend replacing "dynamic" with "stochastic." Risk factors with dynamic assumptions still need margins (although for an assumption that was part fixed and part dynamic, only one piece may have the margin but still the risk factor would have a margin).

Commented [VM22532R531]: Edits to address this comment will be reflected in next exposure

Commented [X533]: Suggest replacing "Risk factors that are not scenario tested but" with "Static assumptions that" to improve clarity in the wording.

Commented [VM22534R533]: Edits to address this comment will be reflected in next exposure

Commented [X535]: Get rid of some of the vague adjectives and be consistent with VM framework for simplifications.

Commented [VM22536R535]: Edits to address this comment will be reflected in next exposure

F. Consistency with the CTE Level

1. All behaviors (i.e., dynamic, formulaic and non-scenario tested) should be consistent with the scenarios used in the CTE calculations (generally, the top 30% of the loss distribution). To maintain such consistency, it is not necessary to iterate (i.e., successive runs of the model) in order to determine exactly which scenario results are included in the CTE measure. Rather, in light of the products being valued, the company should be mindful of the general characteristics of those scenarios likely to represent the tail of the loss distribution and consequently use prudent estimate assumptions for behavior that are reasonable and appropriate in such scenarios. For ~~non-variable~~ fixed annuities, these "valuation" scenarios would typically display one or more of the following attributes:
 - a. ~~Declining-, increasing~~ and/or volatile index values, where applicable.
 - b. Price gaps and/or liquidity constraints.
 - c. ~~Rapidly changing~~ Volatile interest rates ~~or~~ persistently low interest rates.
 - d. ~~Volatile credit spreads.~~
2. The behavior assumptions should be logical and consistent both individually and in aggregate, especially in the scenarios that govern the results. In other words, the company should not set behavior assumptions in isolation, but give due consideration to other elements of the model. The interdependence of assumptions (particularly those governing customer behaviors) makes this task difficult and by definition requires professional judgment, but it is important that the model risk factors and assumptions:

Commented [CD537]: "non-variable"?

Commented [VM22538R537]: Edits to address this comment will be reflected in next exposure

Commented [X539]: Editorial clarification to cover scenarios for all products/guarantees in scope

Commented [VM22540R539]: Edits to address this comment will be reflected in next exposure

Commented [X541]: Editorial for consistency with (a) above

Commented [VM22542R541]: Edits to address this comment will be reflected in next exposure

Commented [X543]: Suggesting deleting as we are not aware of dynamic credit spreads typically being modeled.

Commented [VM22544R543]: Edits to address this comment will be reflected in next exposure

- a. Remain logically and internally consistent across the scenarios tested.
 - b. Represent plausible outcomes.
 - c. Lead to appropriate, but not excessive, asset requirements.
4. The company should remember that the continuum of “plausibility” should not be confined or constrained to the outcomes and events exhibited by historic experience.
 5. Companies should attempt to track experience for all assumptions that materially affect their risk profiles by collecting and maintaining the data required to conduct credible and meaningful studies of contract holder behavior.

G. Additional Considerations and Requirements for Assumptions Applicable to Guaranteed Living Benefits

Experience for contracts without guaranteed living benefits may be of limited use in setting a lapse assumption for contracts with in-the-money or at-the-money guaranteed living benefits. Such experience may only be used if it is appropriate (e.g., lapse experience on contracts without a living benefit may have relevance to the early durations of contracts with living benefits) and relevant to the business.

H. Policy Loans

If policy loans are applicable for the block of business, the company shall determine cash flows for each projection interval for policy loan assets by modeling existing loan balances either explicitly or by substituting assets that are a proxy for policy loans (e.g., bonds, cash, etc.) subject to the following:

1. If the company substitutes assets that are a proxy for policy loans, the company must demonstrate that such substitution:
 - a. Produces reserves that are no less than those that would be produced by modeling existing loan balances explicitly.
 - b. Complies with the contract holder behavior requirements stated in Section 10.A to Section 10.G above in this section.
2. If the company models policy loans explicitly, the company shall:
 - a. Treat policy loan activity as an aspect of contract holder behavior and subject to the requirements above in this section.
 - b. Assign loan balances either to exactly match each policy's contract's utilization or to reflect average utilization over a model segment or sub-segments, if the results are materially similar.
 - c. Model policy loan interest in a manner consistent with policy contract provisions and with the scenario. Include interest paid in cash as a positive policy loan cash flow in that projection interval, but do not include interest added to the loan balance as a policy loan cash flow. (The increased balance will require increased repayment cash flows in future projection intervals.)

Commented [CD545]: Okay to keep the term "Policy Loans"

Commented [VM22546R545]: Edits to address this comment will be reflected in next exposure

Commented [X547]: Clarify reference to be more specific

Commented [VM22548R547]: Edits to address this comment will be reflected in next exposure

Commented [X549]: Editorial - VM-22 should consistently use contracts

Commented [VM22550R549]: Edits to address this comment will be reflected in next exposure

Commented [CD551]: "contract's"

Commented [VM22552R551]: Edits to address this comment will be reflected in next exposure

Commented [X553]: We have concern that reflecting average utilization may have material impact on benefit projections. Recommend adding "if the results are materially similar". This change is also applied to VM-20 and added to VM-21.

Commented [VM22554R553]: Edits to address this comment will be reflected in next exposure

Commented [X555]: Editorial - VM-22 should consistently use contracts

Commented [VM22556R555]: Edits to address this comment will be reflected in next exposure

Commented [CD557]: "contract"

Commented [VM22558R557]: Edits to address this comment will be reflected in next exposure

- d. Model policy loan principal repayments, including those that occur automatically upon death or surrender. Include policy loan principal repayments as a positive policy loan cash flow, per Section 4.A.1.h.
- e. Model ~~additional~~ policy loan principal. Include additional policy loan principal as a negative policy loan cash flow, per Section 4.A.1.h (but do not include interest added to the loan balance as a negative policy loan cash flow).
- f. Model any investment expenses allocated to policy loans and include them either with negative policy loan cash flows or insurance expense cash flows.

I. Non-Guaranteed Elements

Consistent with the definition in VM-01, Non-Guaranteed Elements (NGEs) are elements within a contract that affect ~~policy contract~~ costs or values and are not guaranteed or not determined at issue. NGEs consist of elements affecting contract holder costs or values that are both established and subject to change at the discretion of the insurer.

Examples of NGEs specific to ~~non-variable~~ fixed annuities include but are not limited to the following: ~~fixed~~ the credited rates on fixed accounts, index parameters (caps, spreads, participation rates, etc.), rider fees, rider benefit features being subject to change (rollup rates, rollup period, etc.), account value charges, and dividends under participating policies or contracts.

- 1. Except as noted below in Section ~~10.H.5~~ 10.H.5, the company shall include NGE in the models to project future cash flows beyond the time the company has authorized their payment or crediting.
- 2. The projected NGE shall reflect factors that include, but are not limited to, the following (not all of these factors will necessarily be present in all situations):
 - a. The nature of contractual guarantees.
 - b. The company’s past NGE practices and established NGE policies.
 - c. The timing of any change in NGE relative to the date of recognition of a change in experience.
 - d. The benefits and risks to the company of continuing to authorize NGE.
- 3. Projected NGE shall be established based on projected experience consistent with how actual NGE are determined.
- 4. Projected levels of NGE in the cash-flow model must be consistent with the experience assumptions used in each scenario. Contract holder behavior assumptions in the model must be consistent with the NGE assumed in the model.
- 5. The company may exclude any portion of an NGE that:
 - a. Is not based on some aspect of the ~~policy’s or~~ contract’s experience.
 - b. Is authorized by the board of directors and documented in the board minutes, where the documentation includes the amount of the NGE that arises from other sources.

However, if the board has guaranteed a portion of the NGE into the future, the company must model that amount. In other words, the company cannot exclude

Commented [CD559]: The wording of "additional" is unclear. Does this mean maintaining a certain level of policy loan utilization throughout the projection (i.e., adding principal as repayments are made), or actually increasing policy loan utilization (i.e., adding more principal) over time? The former would seem more appropriate than the latter.

Commented [VM22560R559]: Edits to address this comment will be reflected in next exposure

Commented [X561]: Clarification

Commented [VM22562R561]: Edits to address this comment will be reflected in next exposure

Commented [CD563]: suggest: "contract holder"

Commented [VM22564R563]: Edits to address this comment will be reflected in next exposure

Commented [X565]: Editorial - VM-22 should consistently use contracts

Commented [VM22566R565]: Edits to address this comment will be reflected in next exposure

Commented [CD567]: suggest: "are not"

Commented [VM22568R567]: Edits to address this comment will be reflected in next exposure

Commented [VM22574R573]: Edits to address this comment will be reflected in next exposure

Commented [CD575]: delete "policy's or"

Commented [VM22576R575]: Edits to address this comment will be reflected in next exposure

Commented [X577]: Why does being authorized mean it can be excluded? This seems backwards. Does this mean it has already transpired?

from its model any NGE that the board has guaranteed for future years, even if it could have otherwise excluded them, based on this subsection.

- 6. The liability for contract holder dividends declared but not yet paid that has been established according to statutory accounting principles as of the valuation date is reported separately from the statutory reserve. The contract holder dividends that give rise to this dividend liability as of the valuation date may or may not be included in the cash-flow model at the company’s option.
 - a. If the contract holder dividends that give rise to the dividend liability are not included in the cash-flow model, then no adjustment is needed to the resulting ~~aggregate stochastic reserve~~SR.
 - b. If the contract holder dividends that give rise to the dividend liability are included in the cash-flow model, then the resulting ~~aggregate stochastic reserve~~SR should be reduced by the amount of the dividend liability.
- 7. All projected cash flows associated with NGEs shall reflect margins for adverse deviations and estimation error in prudent estimate assumptions.

Commented [CD578]: delete "aggregate"

Commented [VM22579R578]: Edits to address this comment will be reflected in next exposure

Commented [CD580]: delete "aggregate"

Commented [VM22581R580]: Edits to address this comment will be reflected in next exposure

Section 11: Guidance and Requirements for Setting Prudent Estimate Mortality Assumptions

A. Overview

1. Intent

The guidance and requirements in this section apply to setting prudent estimate mortality assumptions when determining the ~~stochastic reserve, SR~~. The intent is for prudent estimate mortality assumptions to be based on facts, circumstances and appropriate actuarial practice, with only a limited role for unsupported actuarial judgment. ~~(Where more than one approach to appropriate actuarial practice exists, the company should select the practice that the company deems most appropriate under the circumstances.)~~

Commented [X582]: Specific requirements will require further discussion, particularly what if any industry experience is identified for the SPA. Ideally, updated and appropriate assumptions should be used for better alignment and to avoid any false positives flagged as an outlier by the SPA.

Commented [VM22583R582]: Will address SPA separately

2. Description

Prudent estimate mortality assumptions shall be determined by first developing expected mortality curves based on either available experience or published tables. Where necessary, margins shall be applied to the experience to reflect data uncertainty. The expected mortality curves shall then be adjusted based on the credibility of the experience used to determine the expected mortality curve. Section 11.B addresses guidance and requirements for determining expected mortality curves, and Section 11.C addresses guidance and requirements for adjusting the expected mortality curves to determine prudent estimate mortality.

Commented [X584]: Recommend removing reference to actuarial judgment being "unsupported" from VM-21 and VM-22 because actuarial judgment should always be supportable - it is "judgment" not an arbitrary decision.

Finally, the credibility-adjusted tables shall be adjusted for mortality improvement (where such adjustment is permitted or required) using the guidance and requirements in Section 11.D.

3. Business Segments

For purposes of setting prudent estimate mortality assumptions, the products falling under the scope of these requirements shall be grouped into business segments with different mortality assumptions. The grouping, at a minimum, should differentiate between payout annuities or deferred annuity contracts that contain GLBs, and deferred annuity contracts with no guaranteed benefits or only GMDBs. Where appropriate, the grouping should also differentiate between segments which are known or expected to contain contract holders with sociodemographic, geographic, or health factors reasonably expected to impact the mortality assumptions for the segment (e.g., annuitants drawn from different countries, geographic areas, industry groups, or impaired lives on individually underwritten contracts such as structured settlements). The grouping should also generally follow the pricing, marketing, management and/or reinsurance programs of the company.

Guidance Note: This paragraph contemplates situations where it may be appropriate to differentiate mortality assumptions by segment or even by contract due to varying sociodemographic, geographic, or health factors. Particularly, though not exclusively, in the context of group payout annuity contracts, companies may have credible, contract-specific mortality experience data or relevant pooled data from annuitants drawn from similar industries or geographies that may be used to sub-divide inforce blocks into business segments for purposes of setting prudent estimate mortality assumptions.

For example, a company may sell group PRT contracts both to union plans in the U.S. and to private single-employer plans in another country. While both are "PRT contracts," it would be appropriate to differentiate them for mortality assumption purposes, similar to

how payout annuities vs. deferred annuities are distinguished.

Guidance Note: Distinct mortality or liability assumptions among different contracts within a group of contracts does not in itself preclude the group of contracts from being aggregated for the purposes of the broader stochastic reserve calculation.

4. Margin for Data Uncertainty

The expected mortality curves that are determined in Section 11.B may need to include a margin for data uncertainty. The margin could be in the form of an increase or a decrease in mortality, depending on the business segment under consideration. The margin shall be applied in a direction (i.e., increase or decrease in mortality) that results in a higher reserve. A sensitivity test may be needed to determine the appropriate direction of the provision for uncertainty to mortality. The test could be a prior year mortality sensitivity analysis of the business segment or an examination of current representative cells of the segment.

For purposes of this section, if mortality must be increased (decreased) to provide for uncertainty, the business segment is referred to as a ~~plus (minus)~~ mortality (longevity) segment.

It may be necessary, because of a change in the mortality risk profile of the segment, to reclassify a business segment from a ~~mortality (longevity) plus (minus)~~ segment to a ~~longevity (mortality) minus (plus)~~ segment to the extent compliance with this section requires such a reclassification. For example, a segment could require reclassification depending on whether it is gross or net of reinsurance.

Commented [X585]: Recommend deleting this guidance note since it is unnecessary - there is no such restriction for any of VM-20, VM-21 or VM-22. It would be an absurd level of granular distinction, such that it is not clear you could actually perform the projection, given that assumptions vary by attained age, etc.

Commented [VM22586R585]: Edits to address this comment will be reflected in next exposure

Commented [X587]: Terming the segments "mortality (longevity) segments" would be easier to understand than "plus (minus) segments".

Commented [VM22588R587]: Edits to address this comment will be reflected in next exposure

B. Determination of Expected Mortality Curves

1. Experience Data

In determining expected mortality curves, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience). See Section 11.B.2. for additional considerations. Finally, if there is no data, the company shall use the applicable table, as required in Section 11.B.3.

Commented [X589]: It is unclear how to interpretate the statement and how to review it for both VM-21 and VM-22. If a company reinsures GMWB riders, then does it mean that on a net basis the segment would no longer be considered as minus? So, there would be distinct designations for the pre and post reinsurance runs? Recommend discussing the statement and adding additional language or a guidance note to make it clear.

2. Data Other Than Direct Experience

Adjustments shall be applied to the data to reflect differences between the business segments, and margins shall be applied to the adjusted expected mortality curves to reflect the data uncertainty associated with using data from a similar but not identical business segment.

To the extent the mortality of a business segment is reinsured, any mortality charges that are consistent with the company's own pricing and applicable to a substantial portion of the mortality risk also may be a reasonable starting point for the determination of the company's expected mortality curves.

Commented [X590]: Delete period, it is a typo

Commented [VM22591R590]: Edits to address this comment will be reflected in next exposure

3. No Data Requirements

Commented [X592]: Does this need to be edited to be consistent with "little or no" data?

- i. When little or no experience or information is available on a business segment, the company shall use expected mortality curves that would produce expected deaths no less than:

[2021 SOA Deferred Annuity Mortality Table] with [Projection Scale G2] for individual deferred annuities that do not contain guaranteed living benefits

$$q_x^{20XX+n} = q_x^{20XX}(1 - G2_x)^n$$

- ii. When little or no experience or information is available on a business segment, the company shall use expected mortality curves that would produce expected deaths no greater than:

- a. [The appropriate percentage (F_x) from Table 11.1 applied to the 2012 IAM Basic Mortality Table] with [Projection Scale G2] for individual payout annuity contracts and deferred annuity contracts with guaranteed living benefits

$$q_x^{2012+n} = q_x^{2012}(1 - G2_x)^n * F_x$$

- b. [1983 Table "a"] for structured settlements or other contracts with impaired mortality
- c. [1994 GAR Table] with [Projection Scale AA] for group annuities

$$q_x^{1994+n} = q_x^{1994}(1 - AA_x)^n$$

Table 11.1

Attained Age (x)	F_x
<=65	80.0%
66	81.5%
67	83.0%
68	84.5%
69	86.0%
70	87.5%
71	89.0%
72	90.5%
73	92.0%
74	93.5%

77	98.0%
78	99.5%
79	101.0%
80	102.5%
81	104.0%

Commented [X593]: Section 11.B.3.i only has one item "a". There is no need to specifically have a single item "a". Recommend delete the notation "a" and have "Section 11.B.3.i" only.

Commented [VM22594R593]: Will be updated upon SPA assumption development

Commented [X595]: For PRT an assumption based on a third-party data provider would be better than the industry table to get contract specific mortality assumptions. Is this permitted? The guidance note in A.3 seems to get at this, but it's not clear in B.3 ii c whether this is allowed. This is an important distinction as PRT population can vary from those populations the tables are based upon.

Commented [VM22596R595]: Subgroup voted to only allow a prescribed table (to be determined upon SPA development) and not permit the use of third-party data provider upon a limited credibility

Commented [X597]: The 1983 Table "a" and 1994 GAR are used for structured settlements and group annuities, respectively. These tables seem to be out of date. If Standard Projected Amount work develops more granular and up to date tables, should these tables be updated to use consistent tables?

Commented [VM22598R597]: Will be updated upon SPA assumption development

Commented [X599]: The percentage factors (F_x) are over 100% from attained age 79 to age 104. Is it appropriate to set the factors above 100% for the older ages with no credibility?

Commented [VM22600R599]: Will be updated upon SPA assumption development

Commented [CD601]: does the F_x factor need any consideration for FIAs with GLBs?

Commented [VM22602R601]: Will be updated upon SPA assumption development

82	105.5%

104	101.0%	
>=105	100.0%	

iii. For a business segment with non-U.S. insureds, when little or no experience or information is available on a business segment, an established industry or national mortality table and mortality improvement scale may be used, with approval from the domiciliary commissioner.

4. Additional Considerations Involving Data

The following considerations shall apply to mortality data specific to the business segment for which assumptions are being determined (i.e., direct data discussed in Section 11.B.1 or other than direct data discussed in Section 11.B.2).

a. Underreporting of Deaths

Mortality data shall be examined for possible underreporting of deaths. Adjustments shall be made to the data if there is any evidence of underreporting. Alternatively, exposure by lives or amounts on contracts for which death benefits were in the money may be used to determine expected mortality curves. Underreporting on such exposures should be minimal; however, this reduced subset of data will have less credibility.

b. Experience by Contract Duration

Experience of a plus segment shall be examined to determine if mortality by contract duration increases materially due to selection at issue. In the absence of information, the company shall assume that expected mortality will increase by

Commented [X603]: The phrase "When little or no experience or information is available on a business segment" is not included, unlike in (i) and (ii) of the same sub-section. It appears to be the intent that this is the only situation in which this would apply, but it would be helpful to make this explicit.

Commented [VM22604R603]: Edits to address this comment will be reflected in next exposure

Commented [X605]: Reference to the MI scale missing for international business

Commented [VM22606R605]: Edits to address this comment will be reflected in next exposure

contract duration for an appropriate select period. As an alternative, if the company determines that mortality is affected by selection, the company could apply margins to the expected mortality in such a way that the actual mortality modeled does not depend on contract duration.

c. Modification and Relevance of Data

Even for a large company, the quantity of life exposures and deaths are such that a significant amount of smoothing may be required to determine expected mortality curves from mortality experience. Expected mortality curves, when applied to the recent historic exposures (e.g., three to seven years), should not result in an estimate of aggregate number of deaths less (greater) than the actual number deaths during the exposure period for plus (minus) segments.

In determining expected mortality curves (and the credibility of the underlying data), older data may no longer be relevant. The “age” of the experience data used to determine expected mortality curves should be documented.

d. Other Considerations

In determining expected mortality curves, consideration should be given to factors that include, but are not limited to, trends in mortality experience, trends in exposure, volatility in year-to-year A/E mortality ratios, mortality by lives relative to mortality by amounts, changes in the mix of business and product features that could lead to mortality selection.

C. Adjustment for Credibility to Determine Prudent Estimate Mortality

1. Adjustment for Credibility

The expected mortality curves determined in Section 11.B shall be adjusted based on the credibility of the experience used to determine the curves in order to arrive at prudent estimate mortality. The adjustment for credibility shall result in blending the expected mortality curves including margins for uncertainty with the mortality assumption assumptions described in Section 11.B.3. The approach used to adjust the curves shall suitably account for credibility.

Guidance Note: For example, when credibility is zero, an appropriate approach should result in a mortality assumption consistent with 100% of the industry mortality assumption described in Section 11.B.3 ~~table~~ used in the blending.

2. Adjustment of ~~Statutory Valuation~~ Industry Mortality for Improvement

For purposes of the adjustment for credibility, the ~~industry~~ mortality table for a plus segment may be and the ~~industry~~ mortality table for a minus segment must be adjusted for mortality improvement. Such adjustment shall reflect the mortality improvement scale described in Section 11.B.3 from the effective date of the respective ~~industry~~ mortality table to the experience weighted average date underlying the data used to develop the expected mortality curves.

3. Credibility Procedure

The credibility procedure used shall:

- a. Produce results that are reasonable.

Commented [X607]: Both plan and industry data should be weighted for business such as PRT. This text says blend with prescribed tables, but that might not make sense unless additional experience data was unavailable.

Commented [VM22608R607]: Subgroup voted to only allow a prescribed table (to be determined upon SPA development) and not permit the use of third-party data provider upon a limited credibility

Commented [X609]: Clarification

Commented [VM22610R609]: Edits to address this comment will be reflected in next exposure

Commented [X611]: Editoria

Commented [VM22612R611]: Edits to address this comment will be reflected in next exposure

Commented [X613]: The “statutory valuation” is struck but in the guidance note. Recommend replacing “statutory valuation” with either “reference of Section 11.B.3” or “industry”. Otherwise, it is a vague reference since we have both a company mortality table and an industry mortality table.

Commented [VM22614R613]: Edits to address this comment will be reflected in next exposure

Commented [CD615]: need to reference “the mortality assumption described in Section 11.B.3” here? Otherwise, the sentence is unclear.

Commented [VM22616R615]: Edits to address this comment will be reflected in next exposure

Commented [X617]: Mortality improvement should be consistent with the underlying tables used, so we would suggest this being based on available experience subject to appropriate guardrails.

Commented [X618]: “Statutory Valuation” was stricken from all the body, but left in this title. Consider replacing with “industry”.

Commented [VM22619R618]: Edits to address this comment will be reflected in next exposure

Commented [CD620]: for consistency, need to delete this reference to “Statutory Valuation”

Commented [VM22621R620]: Edits to address this comment will be reflected in next exposure

- b. Not tend to bias the results in any material way.
 - c. Be practical to implement.
 - d. Give consideration to the need to balance responsiveness and stability.
 - e. Take into account not only the level of aggregate claims but the shape of the mortality curve.
 - f. Contain criteria for full credibility and partial credibility that have a sound statistical basis and be appropriately applied.
4. Further Adjustment of the Credibility-Adjusted Table for Mortality Improvement

The credibility-adjusted table used for plus segments may be and the credibility adjusted table used for minus segments must be adjusted for mortality improvement using the applicable mortality improvement scale described in Section 11.B.3 from the experience weighted average date underlying the company experience used in the credibility process to the valuation date.

Any adjustment for mortality improvement beyond the valuation date is discussed in Section 11.D.

D. Future Mortality Improvement

The mortality assumption resulting from the requirements of Section 11.C shall be adjusted for mortality improvements beyond the valuation date if such an adjustment would serve to increase the resulting ~~stochastic reserve~~SR. If such an adjustment would reduce the ~~stochastic reserve~~SR, such assumptions are permitted, but not required. In either case, the assumption must be based on current relevant data with a margin for uncertainty (increasing assumed rates of improvement if that results in a higher reserve or reducing them otherwise).

Section 12: Other Guidance and Requirements for AssumptionsA. Overview

This section provides guidance and requirements in general for setting prudent estimate assumptions when determining either the SR or DR. It also provides specific guidance and requirements for expense assumptions.

B. General Assumption Requirements

1. The company shall use prudent estimate assumptions for risk factors that are not stochastically modeled by applying margins to the anticipated experience assumptions if such risk factors have been categorized as material risks by following Section 1.B Principle 3 and requirements in Section 12.C.
2. The company shall establish the prudent estimate assumptions for risk factors in compliance with the requirements in Section 12 of Model #820 and must periodically review and update the assumptions as appropriate in accordance with these requirements.
3. The company shall model the following risk factors stochastically unless the company elects the stochastic modeling exclusion defined in Section 7:
 - a. Interest rate movements (i.e., Treasury interest rate curves).
 - b. Equity performance (e.g., Standard & Poor's 500 index [S&P 500] returns and returns of other equity investments).
4. If the company elects to stochastically model risk factors in addition to the economic scenarios, the requirements in this section for determining prudent estimate assumptions for these risk factors do not apply.

Guidance Note: It is expected that companies will not stochastically model risk factors other than the economic scenarios, such as contract holder behavior or mortality, until VM-22 has more specific guidance and requirements available. Companies shall discuss with domiciliary regulators if they wish to stochastically model other risk factors.

5. The company shall use its own experience, if relevant and credible, to establish an anticipated experience assumption for any risk factor. To the extent that company experience is not available or credible, the company may use industry experience or other data to establish the anticipated experience assumption, making modifications as needed to reflect the circumstances of the company.
 - a. For risk factors (such as mortality) to which statistical credibility theory may be appropriately applied, the company shall establish anticipated experience assumptions for the risk factor by combining relevant company experience with industry experience data, tables or other applicable data in a manner that is consistent with credibility theory and accepted actuarial practice.

Commented [X622]: We believe discussion of allocation of aggregate reserves should be analyzed as part of the field study.

Commented [X623]: Filed to add a Section 12 for general guidance on prudent assumption setting and on expenses. For VM-21, APF 2021-11 is currently exposed. Should be consistent with that APF, after any tweaks are made. <https://transact.naic.org/sites/default/files/inline-images/APF%2021-11%20to%20review%20assumptions%20and%20expenses.pdf>

Commented [VM22624R623]: Subgroup agreed on adding this as a new Section 12

- b. For risk factors (such as utilization of guaranteed living benefits) that do not lend themselves to the use of statistical credibility theory, and for risk factors (such as some of the lapse assumptions) to which statistical credibility theory can be appropriately applied but cannot currently be applied due to lack of industry data, the company shall establish anticipated experience assumptions in a manner that is consistent with accepted actuarial practice and that reflects any available relevant company experience, any available relevant industry experience, or any other experience data that are available and relevant. Such techniques include:
- i. Adopting standard assumptions published by professional, industry or regulatory organizations to the extent they reflect any available relevant company experience or reasonable expectations.
 - ii. Applying factors to relevant industry experience tables or other relevant data to reflect any available relevant company experience and differences in expected experience from that underlying the base tables or data due to differences between the risk characteristics of the company experience and the risk characteristics of the experience underlying the base tables or data.
 - iii. Blending any available relevant company experience with any available relevant industry experience and/or other applicable data using weightings established in a manner that is consistent with accepted actuarial practice and that reflects the risk characteristics of the underlying contracts and/or company practices.
- c. For risk factors that have limited or no experience or other applicable data to draw upon, the assumptions shall be established using sound actuarial judgment and the most relevant data available, if such data exists.
- d. For any assumption that is set in accordance with the requirements of Section 12.B.5.c, the qualified actuary to whom responsibility for this group of contracts is assigned shall use sensitivity testing and disclose the analysis performed to ensure that the assumption is set at the conservative end of the plausible range.
- e. The qualified actuary, to whom responsibility for this group of contracts is assigned, shall annually review relevant emerging experience for the purpose of assessing the appropriateness of the anticipated experience assumption. If the results of statistical or other testing indicate that previously anticipated experience for a given factor is inadequate, then the qualified actuary shall set a new, adequate, anticipated experience assumption for the factor.
6. The company shall sensitivity test risk factors that are not stochastically modeled and examine the impact on the stochastic reserve. The company shall update the sensitivity tests periodically as appropriate. The company may update the tests less frequently, but no less than every 3 years, when the tests show less sensitivity of the stochastic reserve to changes in the assumptions being tested or the experience is not changing rapidly. Providing there is no material impact on the results of the sensitivity testing, the company

may perform sensitivity testing:

- a. Using samples of the contracts in force rather than performing the entire valuation for each alternative assumption set.
- b. Using data from prior periods.

Guidance Note: Sensitivity testing every risk factor on an annual basis is not required. For some risk factors, it may be reasonable, in lieu of sensitivity testing, to employ statistical measures for margins, such as adding one or more standard deviations to the anticipated experience assumption.

- 7. The company shall vary the prudent estimate assumptions from scenario to scenario within the stochastic reserve calculation in an appropriate manner to reflect the scenario-dependent risks.

C. Assumption Margins

The company shall include margins to provide for adverse deviations and estimation error in the prudent estimate assumption for each risk factor that is not stochastically modeled or prescribed, subject to the following:

- 1. The level of margin applied to the anticipated experience assumptions may be determined in aggregate or independently as discussed in Section 1.B Principle 3. It is not permissible to set a margin less toward the conservative end of the spectrum to recognize, in whole or in part, implicit or prescribed margins that are present, or are believed to be present, in other risk factors.

Risks that are stochastically modeled (e.g., interest rates, equity returns) or have prescribed margins or guardrails (e.g., assets, revenue sharing) shall be considered material risks. Other risks generally considered to be material include, but are not limited to, mortality, contract holder behavior, maintenance and overhead expenses, inflation and implied volatility. In some cases, the list of material risks may also include acquisition expenses, partial withdrawals, policy loans, annuitizations, account transfers and deposits, and/or option elections that contain an element of anti-selection.

- 2. The greater the uncertainty in the anticipated experience assumption, the larger the required margin, with the margin added or subtracted as needed to produce a larger Sr or DR than would otherwise result. For example, the company shall use a larger margin when:

- a. The experience data have less relevance or lower credibility.
- b. The experience data are of lower quality, such as incomplete, internally inconsistent or not current.
- c. There is doubt about the reliability of the anticipated experience assumption, such as, but not limited to, recent changes in circumstances or changes in company policies.
- d. There are constraints in the modeling that limit an effective reflection of the risk factor.

Commented [X625]: Edit for VM-22 vs. VM-21?

Commented [VM22626R625]: Will include this language in the next exposure and will solicit any comments

3. In complying with the sensitivity testing requirements in Section 12.B.6 above, greater analysis and more detailed justification are needed to determine the level of uncertainty when establishing margins for risk factors that produce greater sensitivity on the stochastic reserve.
4. A margin is permitted but not required for assumptions that do not represent material risks.
5. A margin should reflect the magnitude of fluctuations in historical experience of the company for the risk factor, as appropriate.
6. The company shall apply the method used to determine the margin consistently on each valuation date but is permitted to change the method from the prior year if the rationale for the change and the impact on the stochastic reserve is disclosed.

D. Expense Assumptions

1. General Prudent Estimate Expense Assumption Requirements

In determining prudent estimate expense assumptions, the company:

- a. May spread certain information technology development costs and other capital expenditures over a reasonable number of years in accordance with accepted statutory accounting principles as defined in the Statements of Statutory Accounting Principles.

Guidance Note: Care should be taken with regard to the potential interaction with the inflation assumption below.

- b. Shall assume that the company is a going concern.
- c. Shall choose an appropriate expense basis that properly aligns the actual expense to the assumption. If values are not significant, they may be aggregated into a different base assumption.

Guidance Note: For example, death benefit expenses should be modeled with an expense assumption that is per death incurred.

- d. Shall reflect the impact of inflation.
- e. Shall not assume future expense improvements.
- f. Shall not include assumptions for federal income taxes (and expenses paid to provide fraternal benefits in lieu of federal income taxes) and foreign income taxes.
- g. Shall use assumptions that are consistent with other related assumptions.
- h. Shall use fully allocated expenses.

Guidance Note: Expense assumptions should reflect the direct costs associated with the block of contracts being modeled, as well as indirect costs and overhead costs that have been allocated to the modeled contracts.

- i. Shall allocate expenses using an allocation method that is consistent across

company lines of business. Such allocation must be determined in a manner that is within the range of actuarial practice and methodology and consistent with applicable ASOPs. Allocations may not be done for the purpose of decreasing the stochastic reserve.

- j. Shall reflect expense efficiencies that are derived and realized from the combination of blocks of business due to a business acquisition or merger in the expense assumption only when any future costs associated with achieving the efficiencies are also recognized.

Guidance Note: For example, the combining of two similar blocks of business on the same administrative system may yield some expense savings on a per unit basis, but any future cost of the system conversion should also be considered in the final assumption. If all costs for the conversion are in the past, then there would be no future expenses to reflect in the valuation.

- k. Shall reflect the direct costs associated with the contracts being modeled, as well as an appropriate portion of indirect costs and overhead (i.e., expense assumptions representing fully allocated expenses should be used), including expenses categorized in the annual statement as “taxes, licenses and fees” (Exhibit 3 of the annual statement) in the expense assumption.
- l. Shall include acquisition expenses associated with business in force as of the valuation date and significant non-recurring expenses expected to be incurred after the valuation date in the expense assumption.
- m. For contracts sold under a new policy form or due to entry into a new product line, the company shall use expense factors that are consistent with the expense factors used to determine anticipated experience assumptions for contracts from an existing block of mature contracts taking into account:
- i. Any differences in the expected long-term expense levels between the block of new contacts and the block of mature contracts.
 - ii. That all expenses must be fully allocated as required under Section 12.D.1.h above.

2. Margins for Prudent Estimate Expense Assumptions

The company shall determine margins for expense assumptions following Section 12.C.

Section 13: Allocation of Aggregate Reserves to the Contract Level

Section 3.F states that the aggregate reserve shall be allocated to the contracts falling within the scope of these requirements. That allocation should be done for both the pre- and post-reinsurance ceded reserves. Contracts that have passed the stochastic exclusion test as defined in Section 7.B will not be included in the allocation of the aggregate reserve. For the purpose of this section, if a contract does not have a cash surrender value, then the cash surrender value is assumed to be zero.

Contracts for which the Deterministic Certification Option is elected in Section 7.E are intended to use the methodology described in this section to allocate aggregate reserves in excess of the cash surrender value to individual contracts.

The contract-level reserve for each contract shall be the sum of the following:

- A. The contract’s cash surrender value.

Drafting Note: The American Academy of Actuaries Annuity Reserves and Capital Work Group is including two potential options for allocating the excess portion of the aggregate reserve over cash surrender value: (1) Use the same approach as VM-21 (2) Allocate based on an actuarial present value calculation.

The Work Group did not reach a consensus between these two approaches, so wording for both is included in the text below. The Work Group recommends field testing both approaches and considering the results in determining future decisions.

Option 1: VM-21 Approach

- B. An allocated portion of the excess of the aggregate reserve over the aggregate cash surrender value shall be allocated to each contract based on a measure of the risk of that product relative to its cash surrender value in the context of the company’s in force contracts (assuming zero cash value for contracts that do not contain such). The allocation shall be made separately for DR and SR. The measure of risk should consider the impact of risk mitigation programs, including hedge programs and reinsurance, that would affect the risk of the product. The specific method of assessing that risk and how it contributes to the company’s aggregate reserve shall be defined by the company. The method should provide for an equitable allocation based on risk analysis.

Commented [X627]: This method only makes sense if done separately for the DR and SR.

- 1. As an example, consider a company with the results of the following three contracts:

Table 12.1: Sample Allocation of Aggregate Reserve

Contract (i)	1	2	3	Total
Cash Surrender Value, C	28	40	52	120
Risk adjusted measure, R	38	52	50	
Aggregate Reserve				140
Allocation Basis for the excess of the Aggregate Reserve over the Cash Surrender Value $A_i = \text{Max}(R_i - C_i, 0)$	10	12	0	22

Allocation of the excess of the Aggregate Reserve over the Cash Surrender Value $Li = (Ai)/\sum Ai * [Aggregate Reserve - \sum Ci]$	9.09	10.91	0.00	20
Contract-level reserve $Ci + Li$	37.09	50.91	52.00	140.00

2. In this example, the Aggregate Reserve exceeds the aggregate Cash Surrender Value by 20. The 20 is allocated proportionally across the three contracts based on the allocation basis of the larger of (i) zero; and (ii) a risk adjusted measure based on reserve principles. Therefore, contracts 1 and 2 receive 45% (9/22) and 55% (11/22), respectively, of the excess Aggregate Reserve. As Contract 3 presents no risk in excess of its cash surrender value, it does not receive an allocation of the excess Aggregate Reserve.

Option 2: Actuarial Present Value Approach

- B. The excess of the aggregate reserve over the aggregate cash surrender value is allocated to policies based on a calculation of the actuarial present value of projected liability cash flows in excess of the cash surrender value:
 1. Discount the liability cash flows at the NAER, pursuant to requirements in Section 4, for the scenario that produces the scenario reserve closest to, but not less than the ~~stochastic reserve~~ SR defined in Section 3.D.
 - a. Groups of contracts that elect the Deterministic Certification Option defined in Section 7.E shall use the NAER in the single scenario used to calculate the reserve to discount liability cash flows, as well as any cash flows that are scenario dependent.
 2. If the actuarial present value is less than the cash surrender value, then the excess actuarial present value to be used for allocating the excess aggregate reserve over the cash value shall be floored at zero.
 - a. If all contracts have an excess actuarial present value that is floored at zero, then use the cash surrender value to allocate any excess aggregate reserve over the aggregate cash surrender value.
 3. For projecting future liability cash flows, assume the same liability assumptions that were used to calculate the ~~stochastic reserve~~ SR defined in Section 3.D.
 4. As a hypothetical example, consider a company with the results of the following five contracts:

Commented [X628]: This method depends on the NAER, so would not work for companies that use direct iteration.

Commented [X629]: This could give an unstable allocation if there is an even mix of products with different risk profiles, so that the tail is populated with some scenarios where Product A does poorly and some where Product B does poorly. The single scenario will only reflect the riskiness of one of the products.

Commented [X630]: Not just the NAER, but the cashflows are also scenario dependent.

Commented [VM22631R630]: Edits to address this comment will be reflected in next exposure

Commented [CD632]: "Section 3.D"

Commented [VM22633R632]: Edits to address this comment will be reflected in next exposure

Table 12.1: Hypothetical Sample Allocation of Aggregate Reserve

Contract	Example Product Type	CSV* (1)	Scenario APV (2)	Excess (Floored) of the scenario APV over CSV* (3) = $\text{Max}\{(2)-(1), 0\}$	Aggregate Reserve CTE 70 (4)	Excess of Aggregate Reserve over Aggregate CSV* (5) = $\text{Max}\{[(4 \text{ Total}) - (1 \text{ Total}), 0]\}$	Allocated Excess Reserve (6) = (3) x $\{[(5 \text{ Total}) / (3 \text{ Total})]\}$	Total Contract Level Reserve (7) = (1) + (6)
Contract 1:	Indexed Annuity with no GLWB**	95.0	90.0	0.0			0.0	95.0
Contract 2:	Indexed Annuity with low benefit GLWB**	92.0	95.0	3.0			3.6	95.6
Contract 3:	Indexed Annuity with medium benefit GLWB**	90.0	100.0	10.0			12.0	102.0
Contract 4:	Indexed Annuity with high benefit GLWB**	88.0	105.0	17.0			20.4	108.4
Contract 5:	Fixed Life Contingent Payout Annuity	0.0	70.0	70.0			84.0	84.0
Total		365.0		100.0	485.0	120.0	120.0	485.0

*Cash Surrender Value
**Guaranteed Lifetime Withdrawal Benefit

Guidance Note: The actuarial present value (APV) in the section above is separate from the Guarantee Actuarial Present Value (GAPV) referred to in the additional standard projection amount calculation in VM-21. The GAPV is only applicable to guaranteed minimum benefits and uses prescribed liability assumptions. In contrast, the APV in this section applies to the entire contract, irrespective of whether guaranteed benefits are attached, and uses company prudent estimate liability assumptions.

Commented [CD634]: should be "Max{(2)-(1), 0}"

Commented [VM22635R634]: Edits to address this comment will be reflected in next exposure

Section ~~13~~14: Statutory Maximum Valuation Interest Rates for Income Annuity Formulaic Reserves

A. Purpose and Scope

1. These requirements define for single premium immediate annuity contracts and other similar contracts, certificates and contract features the statutory maximum valuation interest rate that complies with Model #820. These are the maximum interest rate assumption requirements to be used in the CARVM and for certain contracts, the CRVM. These requirements do not preclude the use of a lower valuation interest rate assumption by the company if such assumption produces statutory reserves at least as great as those calculated using the maximum rate defined herein.
2. The following categories of contracts, certificates and contract features, whether group or individual, including both life contingent and term certain only contracts, directly written or assumed through reinsurance, with the exception of benefits arising from variable annuities, ~~are covered in this section and all contracts not passing the SET covered by Sections 1 through 13 of VM-22, are covered Section 14 of VM-22:~~
 - a. Immediate annuity contracts issued after Dec. 31, 2017;
 - b. Deferred income annuity contracts issued after Dec. 31, 2017;
 - c. Structured settlements in payout or deferred status issued after Dec. 31, 2017;
 - d. Fixed payout annuities resulting from the exercise of settlement options or annuitizations of host contracts issued after Dec. 31, 2017;
 - e. Fixed payout annuities resulting from the exercise of settlement options or annuitizations of host contracts issued during 2017, for fixed payouts commencing after Dec. 31, 2018, or, at the option of the company, for fixed payouts commencing after Dec. 31, 2017;
 - f. Supplementary contracts, excluding contracts with no scheduled payments (such as retained asset accounts and settlements at interest), issued after Dec. 31, 2017;
 - g. Fixed income payment streams, attributable to contingent deferred annuities (CDAs) issued after Dec. 31, 2017, once the underlying contract funds are exhausted;
 - h. Fixed income payment streams attributable to guaranteed living benefits associated with deferred annuity contracts issued after Dec. 31, 2017, once the contract funds are exhausted; and
 - i. Certificates with premium determination dates after Dec. 31, 2017, emanating from non-variable group annuity contracts specified in Model #820, Section 5.C.2, purchased for the purpose of providing certificate holders benefits upon their retirement.

Commented [X636]: Under A.2: need to exclude contracts being covered by the earlier sections of VM-22 not passing the exclusion tests and need a clearer reference instead of "covered in this section"

Commented [VM22637R636]: Edits to address this comment will be reflected in next exposure

Guidance Note: For Section ~~13~~14.A.2.d, Section ~~13~~14.A.2.e, Section ~~13~~14.A.2.f and Section ~~13~~14.A.2.h above, there is no restriction on the type of contract that may give rise to the benefit.

3. Exemptions:
 - a. With the permission of the domiciliary commissioner, for the categories of annuity contracts, certificates and/or contract features in scope as outlined in Section ~~13~~14.A.2.d, Section ~~13~~14.A.2.e, Section ~~13~~14.A.2.f, Section ~~13~~14.A.2.g or Section ~~13~~14.A.2.h, the

company may use the same maximum valuation interest rate used to value the payment stream in accordance with the guidance applicable to the host contract. In order to obtain such permission, the company must demonstrate that its investment policy and practices are consistent with this approach.

4. The maximum valuation interest rates for the contracts, certificates and contract features within the scope of Section 13.14 of VM-22 supersede those described in Appendix VM-A and Appendix VM-C, but they do not otherwise change how those appendices are to be interpreted. In particular, *Actuarial Guideline IX-B—Clarification of Methods Under Standard Valuation Law for Individual Single Premium Immediate Annuities, Any Deferred Payments Associated Therewith, Some Deferred Annuities and Structured Settlements Contracts* (AG-9-B) (see VM-C) provides guidance on valuation interest rates and is, therefore, superseded by these requirements for contracts, certificates and contract features in scope. Likewise, any valuation interest rate references in *Actuarial Guideline IX-C—Use of Substandard Annuity Mortality Tables in Valuing Impaired Lives Under Individual Single Premium Immediate Annuities* (AG-9-C) (see VM-C) are also superseded by these requirements.

B. Definitions

1. The term “reference period” means the length of time used in assigning the Valuation Rate Bucket for the purpose of determining the statutory maximum valuation interest rate and is determined as follows:
 - a. For contracts, certificates or contract features with life contingencies and substantially similar payments, the reference period is the length of time, rounded to the nearest year, from the premium determination date to the earlier of: i) the date of the last non-life-contingent payment under the contract, certificate or contract feature; and ii) the date of the first life-contingent payment under the contract, certificate or contract feature, or
 - b. For contracts, certificates or contract features with no life-contingent payments and substantially similar payments, the reference period is the length of time, rounded to the nearest year, from the premium determination date to the date of the last non-life-contingent payment under the contract, certificate or contract feature, or
 - c. For contracts, certificates or contract features where the payments are not substantially similar, the actuary should apply prudent judgment and select the Valuation Rate Bucket with Macaulay duration that is a best fit to the Macaulay duration of the payments in question.

Guidance Note: Contracts with installment refunds or similar features should consider the length of the installment period calculated from the premium determination date as the non-life contingent period for the purpose of determining the reference period.

Guidance Note: The determination in Section 13.14.B.1.c above shall be made based on the materiality of the payments that are not substantially similar relative to the life-contingent payments.

2. The term “jumbo contract” means a contract with an initial consideration equal to or greater than \$250 million. Considerations for contracts issued by an insurer to the same contract holder within 90 days shall be combined for purposes of determining whether the contracts meet this threshold.

Guidance Note: If multiple contracts meet this criterion in aggregate, then each contract is a jumbo contract.

3. The term “non-jumbo contract” means a contract that does not meet the definition of a jumbo contract.
4. The term “premium determination date” means the date as of which the valuation interest rate for the contract, certificate or contract feature being valued is determined.
5. The term “initial age” means the age of the annuitant as of his or her age last birthday relative to the premium determination date. For joint life contracts, certificates or contract features, the “initial age” means the initial age of the younger annuitant. If a contract, certificate or contract feature for an annuitant is being valued on a standard mortality table as an impaired annuitant, “initial age” means the rated age. If a contract, certificate or contract feature is being valued on a substandard mortality basis, “initial age” means an equivalent rated age.
6. The term “Table X spreads” means the prescribed VM-22 Section ~~13~~¹⁴ current market benchmark spreads for the quarter prior to the premium determination date, as published on the Industry tab of the NAIC website. The process used to determine Table X spreads is the same as that specified in VM-20 Appendix 2.D for Table F, except that JP Morgan and Bank of America bond spreads are averaged over the quarter rather than the last business day of the month.
7. The term “expected default cost” means a vector of annual default costs by weighted average life. This is calculated as a weighted average of the VM-20 Table A prescribed annual default costs published on the Industry tab of the NAIC website in effect for the quarter prior to the premium determination date, using the prescribed portfolio credit quality distribution as weights.
8. The term “expected spread” means a vector of spreads by weighted average life. This is calculated as a weighted average of the Table X spreads, using the prescribed portfolio credit quality distribution as weights.
9. The term “prescribed portfolio credit quality distribution” means the following credit rating distribution:
 - a. 5% Treasuries
 - b. 15% Aa bonds (5% Aa1, 5% Aa2, 5% Aa3)
 - c. 40% A bonds (13.33% A1, 13.33% A2, 13.33% A3)*
 - d. 40% Baa bonds (13.33% Baa1, 13.33% Baa2, 13.33% Baa3)*

*40%/3 is used unrounded in the calculations.

C. Determination of the Statutory Maximum Valuation Interest Rate

1. Valuation Rate Buckets
 - a. For the purpose of determining the statutory maximum valuation interest rate, the contract, certificate or contract feature being valued must be assigned to one of four Valuation Rate Buckets labeled A through D.
 - b. If the contract, certificate or contract feature has no life contingencies, the Valuation Rate Bucket is assigned based on the length of the reference period (RP), as follows:

Table 3-1: Assignment to Valuation Rate Bucket by Reference Period Only

RP ≤ 5 Years	5Y < RP ≤ 10Y	10Y < RP ≤ 15Y	RP > 15Y
A	B	C	D

- c. If the contract, certificate or contract feature has life contingencies, the Valuation Rate Bucket is assigned based on the length of the RP and the initial age of the annuitant, as follows:

Table 3-2: Assignment to Valuation Rate Bucket by Reference Period and Initial Age

Initial Age	RP ≤ 5Y	5Y < RP ≤ 10Y	10Y < RP ≤ 15Y	RP > 15Y
90+	A	B	C	D
80–89	B	B	C	D
70–79	C	C	C	D
< 70	D	D	D	D

2. Premium Determination Dates

- a. The following table specifies the decision rules for setting the premium determination date for each of the contracts, certificates and contract features listed in Section 1:

Table 3-3: Premium Determination Dates

Section	Item Description	Premium determination date
A.2.a	Immediate annuity	Date consideration is determined and committed to by contract holder
A.2.b	Deferred income annuity	Date consideration is determined and committed to by contract holder
A.2.c	Structured settlements	Date consideration is determined and committed to by contract holder
A.2.d and A.2.e	Fixed payout annuities resulting from settlement options or annuitizations from host contracts	Date consideration for benefit is determined and committed to by contract holder
A.2.f	Supplementary contracts	Date of issue of supplementary contract
A.2.g	Fixed income payment streams from CDAs, AV becomes 0	Date on which AV becomes 0
A.2.h	Fixed income payment streams from guaranteed living benefits, AV becomes 0	Date on which AV becomes 0

A.2.i	Group annuity and related certificates	Date consideration is determined and committed to by contract holder
-------	--	--

Guidance Note: For the purposes of the items in the table above, the phrase “date consideration is determined and committed to by the contract holder” should be interpreted by the company in a manner that is consistent with its standard practices. For some products, that interpretation may be the issue date or the date the premium is paid.

b. Immaterial Change in Consideration

If the premium determination date is based on the consideration, and if the consideration changes by an immaterial amount (defined as a change in present value of less than 10% and less than \$1 million) subsequent to the original premium determination date, such as due to a data correction, then the original premium determination date shall be retained. In the case of a group annuity contract where a single premium is intended to cover multiple certificates, certificates added to the contract after the premium determination date that do not trigger the company’s right to reprice the contract shall be treated as if they were included in the contract as of the premium determination date.

3. Statutory Maximum Valuation Interest Rate

- a. For a given contract, certificate or contract feature, the statutory maximum valuation interest rate is determined based on its assigned Valuation Rate Bucket (Section ~~13~~14.C.1) and its Premium Determination Date (Section ~~13~~14.C.2) and whether the contract associated with it is a jumbo contract or a non-jumbo contract.
- b. Statutory maximum valuation interest rates for jumbo contracts are determined and published daily by the NAIC on the Industry tab of the NAIC website. For a given premium determination date, the statutory maximum valuation interest rate is the daily statutory maximum valuation interest rate published for that premium determination date.
- c. Statutory maximum valuation interest rates for non-jumbo contracts are determined and published quarterly by the NAIC on the Industry tab of the NAIC website by the third business day of the quarter. For a given premium determination date, the statutory maximum valuation interest rate is the quarterly statutory maximum valuation interest rate published for the quarter in which the premium determination date falls.
- d. Quarterly Valuation Rate:

For each Valuation Rate Bucket, the quarterly valuation rate is defined as follows:

$$I_q = R + S - D - E$$

Where:

- a. R is the reference rate for that Valuation Rate Bucket (defined in Section ~~13~~14.C.4);
- b. S is the spread rate for that Valuation Rate Bucket (defined in Section ~~13~~14.C.5);
- c. D is the default cost rate for that Valuation Rate Bucket (defined in Section ~~13~~14.C.6);

and

d. E is the spread deduction defined as 0.25%.

e. Daily Valuation Rate:

For each Valuation Rate Bucket, the daily valuation rate is defined as follows:

$$I_d = I_q + C_{d-1} - C_q$$

Where:

- a. I_q is the quarterly valuation rate for the calendar quarter preceding the business day immediately preceding the premium determination date;
- b. C_{d-1} is the daily corporate rate (defined in Section ~~13~~14.C.7) for the business day immediately preceding the premium determination date; and
- c. C_q is the average daily corporate rate (defined in Section ~~13~~14.C.8) corresponding to the same period used to develop I_q .

For jumbo contracts, the daily statutory maximum valuation interest rate is the daily valuation rate (I_d) rounded to the nearest one-hundredth of one percent (1/100 of 1%).

4. Reference Rate

Reference rates are updated quarterly as described below:

- a. The “quarterly Treasury rate” is the average of the daily Treasury rates for a given maturity over the calendar quarter prior to the premium determination date. The quarterly Treasury rate is downloaded from <https://fred.stlouisfed.org>, and is rounded to two decimal places.
- b. Download the quarterly Treasury rates for two-year, five-year, 10-year and 30-year U.S. Treasuries.
- c. The reference rate for each Valuation Rate Bucket is calculated as the weighted average of the quarterly Treasury rates using Table 1 weights (defined in Section ~~13~~14.C.9) effective for the calendar year in which the premium determination date falls.

5. Spread

The spreads for each Valuation Rate Bucket are updated quarterly as described below:

- a. Use the Table X spreads from the NAIC website for WALs two, five, 10 and 30 years only to calculate the expected spread.
- b. Calculate the spread for each Valuation Rate Bucket, which is a weighted average of the expected spreads for WALs two, five, 10 and 30 using Table 2 weights (defined in Section 3.I) effective for the calendar year in which the premium determination date falls.

6. Default costs for each Valuation Rate Bucket are updated annually as described below:

- a. Use the VM-20 prescribed annual default cost table (Table A) in effect for the quarter prior to the premium determination date for WAL two, WAL five and WAL 10 years only to calculate the expected default cost. Table A is updated and published annually on

the Industry tab of the NAIC website during the second calendar quarter and is used for premium determination dates starting in the third calendar quarter.

- b. Calculate the default cost for each Valuation Rate Bucket, which is a weighted average of the expected default costs for WAL two, WAL five and WAL 10, using Table 3 weights (defined in Section 4314.C.9) effective for the calendar year in which the premium determination date falls.

7. Daily Corporate Rate

Daily corporate rates for each valuation rate bucket are updated daily as described below:

- a. Each day, download the Bank of America Merrill Lynch U.S. corporate effective yields as of the previous business day’s close for each index series shown in the sample below from the St. Louis Federal Reserve website: <https://research.stlouisfed.org/fred2/categories/32348>. To access a specific series, search the St. Louis Federal Reserve website for the series name by inputting the name into the search box in the upper right corner, or input the following web address: [https://research.stlouisfed.org/fred2/series/\[replace with series name from the table below\]](https://research.stlouisfed.org/fred2/series/[replace with series name from the table below]).

Table 3-4: Index Series Names

Maturity	Series Name
1Y – 3Y	BAMLC1A0C13YEY
3Y – 5Y	BAMLC2A0C35YEY
5Y – 7Y	BAMLC3A0C57YEY
7Y – 10Y	BAMLC4A0C710YEY
10Y – 15Y	BAMLC7A0C1015YEY
15Y+	BAMLC8A0C15PYEY

- b. Calculate the daily corporate rate for each valuation rate bucket, which is a weighted average of the Bank of America Merrill Lynch U.S. corporate effective yields, using Table 4 weights (defined in Section 4314.C.9) effective for the calendar year in which the business date immediately preceding the premium determination date falls.

8. Average Daily Corporate Rate

Average daily corporate rates are updated quarterly as described below:

- a. Download the quarterly average Bank of America Merrill Lynch U.S. corporate effective yields for each index series shown in Section 3.G.1 from the St. Louis Federal Reserve website: <https://research.stlouisfed.org/fred2/categories/32348>. To access a specific series, search the St. Louis Federal Reserve website for the series name by inputting the name into the search box in the upper right corner, or input the following web address: [https://research.stlouisfed.org/fred2/series/\[replace with series name from Section 4314.C.7.a\]](https://research.stlouisfed.org/fred2/series/[replace with series name from Section 4314.C.7.a]).

- b. Calculate the average daily corporate rate for each valuation rate bucket, which is a weighted average of the quarterly average Bank of America Merrill Lynch U.S. corporate effective yields, using Table 4 weights (defined in Section 14.C.9) for the same calendar year as the weight tables (i.e. Tables 1, 2, and 3) used in calculating I_q in Section 14.C.3.e.

9. Weight Tables 1 through 4

The system for calculating the statutory maximum valuation interest rates relies on a set of four tables of weights that are based on duration and asset/liability cash-flow matching analysis for representative annuities within each valuation rate bucket. A given set of weight tables is applicable to the calculations for every day of the calendar year.

In the fourth quarter of each calendar year, the weights used within each valuation rate bucket for determining the applicable valuation interest rates for the following calendar year will be updated using the process described below. In each of the four tables of weights, the weights in a given row (valuation rate bucket) must add to exactly 100%.

Weight Table 1

The process for determining Table 1 weights is described below:

- a. Each valuation rate bucket has a set of representative annuity forms. These annuity forms are as follows:
 - i. Bucket A:
 - a) Single Life Annuity age 91 with 0 and five-year certain periods.
 - b) Five-year certain only.
 - ii. Bucket B:
 - a) Single Life Annuity age 80 and 85 with 0, five-year and 10-year certain periods.
 - b) 10-year certain only.
 - iii. Bucket C:
 - a) Single Life Annuity age 70 with 0 and 15-year certain periods.
 - b) Single Life Annuity age 75 with 0, 10-year and 15-year certain periods.
 - c) 15-year certain only.
 - iv. Bucket D:
 - a) Single Life Annuity age 55, 60 and 65 with 0 and 15-year certain periods.
 - b) 25-year certain only.
- b. Annual cash flows are projected assuming annuity payments are made at the end of each year. These cash flows are averaged for each valuation rate bucket across the annuity forms for that bucket using the statutory valuation mortality table in effect for the following calendar year for

individual annuities for males (ANB).

- c. The average daily rates in the third quarter for the two-year, five-year, 10-year and 30-year U.S. Treasuries are downloaded from <https://fred.stlouisfed.org> as input to calculate the present values in Step d.
- d. The average cash flows are summed into four time period groups: years 1–3, years 4–7, years 8–15 and years 16–30. (**Note:** The present value of cash flows beyond year 30 are discounted to the end of year 30 and included in the years 16–30 group. This present value is based on the lower of 3% and the 30-year Treasury rate input in Step c.)
- e. The present value of each summed cash-flow group in Step d is then calculated by using the Step 3 U.S. Treasury rates for the midpoint of that group (and using the linearly interpolated U.S. Treasury rate when necessary).
- f. The duration-weighted present value of the cash flows is determined by multiplying the present value of the cash-flow groups by the midpoint of the time period for each applicable group.
- g. Weightings for each cash-flow time period group within a valuation rate bucket are calculated by dividing the duration weighted present value of the cash flow by the sum of the duration weighted present value of cash flow for each valuation rate bucket.

Weight Tables 2 through 4

Weight Tables 2 through 4 are determined using the following process:

- i. Table 2 is identical to Table 1.
 - ii. Table 3 is based on the same set of underlying weights as Table 1, but the 10-year and 30-year columns are combined since VM-20 default rates are only published for maturities of up to 10 years.
 - iii. Table 4 is derived from Table 1 as follows:
 - a) Column 1 of Table 4 is identical to column 1 of Table 1.
 - b) Column 2 of Table 4 is 50% of column 2 of Table 1.
 - c) Column 3 of Table 4 is identical to column 2 of Table 4.
 - d) Column 4 of Table 4 is 50% of column 3 of Table 1.
 - e) Column 5 of Table 4 is identical to column 4 of Table 4.
 - f) Column 6 of Table 4 is identical to column 4 of Table 1.
10. Group Annuity Contracts

For a group annuity purchased under a retirement or deferred compensation plan (Section ~~13~~14.A.2.i), the following apply:

- a. The statutory maximum valuation interest rate shall be determined separately for each certificate, considering its premium determination date, the certificate holder's initial age, the reference period corresponding to its form of payout and whether the contract is a jumbo contract or a non-jumbo contract.

Guidance Note: Under some group annuity contracts, certificates may be purchased on different

dates.

- b. In the case of a certificate whose form of payout has not been elected by the beneficiary at its premium determination date, the statutory maximum valuation interest rate shall be based on the reference period corresponding to the normal form of payout as defined in the contract or as is evidenced by the underlying pension plan documents or census file. If the normal form of payout cannot be determined, the maximum valuation interest rate shall be based on the reference period corresponding to the annuity form available to the certificate holder that produces the most conservative rate.

Guidance Note: The statutory maximum valuation interest rate will not change when the form of payout is elected.

This page intentionally left blank

Valuation Manual Section II Reserve Requirements

Subsection 2: Annuity Products

- A. This subsection establishes reserve requirements for all contracts classified as annuity contracts as defined in SSAP No. 50 in the AP&P Manual.
- B. Minimum reserve requirements for variable annuity (VA) contracts and similar business, specified in VM-21, Requirements for Principle-Based Reserves for Variable Annuities, shall be those provided by VM-21. The minimum reserve requirements of VM-21 are considered PBR requirements for purposes of the *Valuation Manual*.
- C. Minimum reserve requirements for ~~non-variable~~ fixed annuity contracts issued prior to 1/1/2024 are those requirements as found in VM-A and VM-C as applicable, with the exception of the minimum requirements for the valuation interest rate for single premium immediate annuity contracts, and other similar contracts, issued after Dec. 31, 2017, including those fixed payout annuities emanating from host contracts issued on or after Jan. 1, 2017, and on or before Dec. 31, 2017. The maximum valuation interest rate requirements for those contracts and fixed payout annuities are defined in Section 14 of VM-22, Statutory Maximum Valuation Interest Rates for Income Annuity Formulaic Reserves.
- D. Minimum reserve requirements for ~~non-variable~~ fixed annuity contracts issued on 1/1/2024 and later are those requirements as found in Sections 1 through 13 of VM-22.

The requirements in this section are still considered a part of PBR requirements and therefore are applicable to VM-G.

The below principles may serve as key considerations for assessing whether VM 21 or VM 22 requirements apply:

D. Minimum reserve requirements apply:

- E. ~~Index for index-linked or modified guaranteed annuity contracts or riders that satisfy both of the following conditions may be a key consideration for application of VM 22 requirements and are issued on 1/1/2024 and later are those requirements: as found in Sections 1 through 13 of VM-22.:~~
 - 1. Guarantees the principal amount of purchase payments, net of any partial withdrawals, and interest credited thereto, less any deduction (without regard to its timing) for sales, administrative or other expenses or charges.
 - 2.b. Credits a rate of interest under the contract prior to the application of any market value adjustments that is at least equal to the minimum rate required to be credited by the standard nonforfeiture law in the jurisdiction in which the contract is issued.

~~Guidance Note: Paragraph E.1.b is intended to apply prior to the application of any market value adjustments for modified guaranteed annuities where the underlying assets are held in a separate account. If meeting Paragraph E.1.b prior to the application of any market value adjustments and Paragraph E.1.a above, it may be appropriate to value such contracts under VM 22 requirements.~~

Minimum reserve requirements.

Commented [X638]: We believe a Fixed Annuity PBR Exemption should be incorporated into draft in a manner consistent with the Life PBR Exemption.

Commented [VM22639R638]: Waylon Peoples comment letter: Extend small company exemption in place for life PBR (VM-20) to VM-22.

Commented [VM22640R638]: The Subgroup voted in favor of a VM-22 PBR Exemption. The ACLI will follow-up with proposed criteria for determining the exemption.

Commented [CD641]: "non-variable annuity"?

Commented [VM22642R641]: Edits to address this comment will be reflected in next exposure

Commented [X643]: "Section 13 of VM-22" may need to be updated if it is decided to have separate chapters for VM-22 VIR and VM-22 PBR.

Commented [VM22644R643]: Edits to address this comment will be reflected in next exposure

Commented [CD645]: "non-variable annuity"?

Commented [VM22646R645]: Edits to address this comment will be reflected in next exposure

Commented [CD647]: Consider adding the sentence: "The minimum reserve requirements of VM-22 are considered PBR requirements for purposes of the Valuation Manual." This is so VM-G will apply to VM-22, which would be appropriate.

Commented [VM22648R647]: Edits to address this comment will be reflected in next exposure

Commented [X649]: "Index-linked" annuity is not defined – only RILA and FIA in VM-22, recommend to revise the language or add a definition to define "index linked".

Commented [X650]: Recommend adding this part to E.1.b and delete the Guidance Note.

Commented [VM22651R650]: Edits to address this comment will be reflected in next exposure

for index

F. ~~2. Index-linked or modified guaranteed annuity contracts or riders that do not satisfy either of the two conditions listed above criteria in Paragraph Section 2.E.1 and Section 2.E.2 above and E.1.ii may be a key consideration for application of VM-21 are issued on 1/1/2024 and later are those requirements as found in VM-21.~~

Commented [X652]: VM-21 specifically says “These requirements do not apply to contracts falling under the scope of VM-A-255: Modified Guaranteed Annuities; however, they do apply to contracts listed above that include one or more subaccounts containing features similar in nature to those contained in modified guaranteed annuities (MGAs) (e.g., market value adjustments).” Is this a contradiction?

Commented [X653]: Consistent with E above.

Commented [VM22654R653]: Edits to address this comment will be reflected in next exposure

Subsection 6: Riders and Supplemental Benefits

Guidance Note: Policies ~~Designs~~ of policies or contracts with riders and supplemental benefits which are created to simply disguise benefits subject to the Valuation Manual section describing the reserve methodology for the base product to which they are attached, or exploit a perceived loophole, must be reserved in a manner similar to more typical designs with similar riders.

Commented [X655]: Still need the word "designs" otherwise this is saying the whole policy/contract was only created to disguise benefits, which would never be true.

Commented [VM22658R655]: Edits to address this comment will be reflected in next exposure

A. If a rider or supplemental benefit is attached to a health insurance product, deposit-type contract, or credit life or disability product, it may be valued with the base contract unless it is required to be separated by regulation or other requirements.

B. For supplemental benefits on life insurance policies or annuity contracts, including Guaranteed Insurability, Accidental Death or Disability Benefits, Convertibility, ~~Nursing Home Benefits~~ or Disability Waiver of Premium Benefits, the supplemental benefit may be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, VM-A, and/or VM-C, as applicable.

Commented [X657]: This reference is another place where there would be a benefit distinguishing the PBR sections of VM-22 from the non-PBR sections.

Commented [VM22658R657]: Edits to address this comment will be reflected in next exposure

~~C. ULSG and other secondary guarantee riders on a life insurance policy shall be valued with the base policy and follow the reserve requirements for ULSG policies under VM-20, VM-A and/or VM-C, as applicable.~~

~~D.C. Anyany~~ guaranteed minimum benefits on life insurance policies or annuity contracts ~~not subject to Paragraph C above~~ including, but not limited to, Guaranteed Minimum Accumulation Benefits, Guaranteed Minimum Death Benefits, Guaranteed Minimum Income Benefits, Guaranteed Minimum Withdrawal Benefits, Guaranteed Lifetime Income Benefits, Guaranteed Lifetime Withdrawal Benefits, Guaranteed Payout Annuity Floors, Waiver of Surrender Charges, Return of Premium, Systematic Withdrawal Benefits under Required Minimum Distributions, and all similar guaranteed benefits shall be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, and VM-A and/or VM-C, as applicable.

Commented [X659]: These parallel requirements can be combined.

Commented [VM22660R659]: Edits to address this comment will be reflected in next exposure

~~E.D.~~ If a rider or supplemental benefit to a life insurance policy or annuity contract that is not addressed in Paragraphs B, C, or D above possesses any of the following attributes, the rider or supplemental benefit shall be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, and VM-A and/or VM-C, as applicable.

1. The rider or supplemental benefit does not have a separately identified premium or charge.
2. After issuance, the rider or supplemental benefit premium, charge, value or benefits are determined by referencing the base policy or contract features or performance.
3. After issuance, the base policy or contract value or benefits are determined by referencing the rider or supplemental benefit features or performance. The deduction of rider or benefit premium or charge from the contract value is not sufficient for a determination by reference.

~~F.E.~~ If a term life insurance rider on the named insured[s] on the base life insurance policy does not meet the conditions of Paragraph E above, and either (1) guarantees level or near level premiums until a specified duration followed by a material premium increase; or (2) for a rider for which level or near level premiums are expected for a period followed by a material premium increase, the rider is

separated from the base policy and follows the reserve requirements for term policies under VM20, VM-A and/or VM-C, as applicable.

G.F. For all other riders or supplemental benefits on life insurance policies or annuity contracts not addressed in Paragraphs B through F above, the riders or supplemental benefits may be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, VM-A and/or VM-C, as applicable. For a given rider, the election to include riders or supplemental benefits with the base policy or contract shall be determined at the policy form level, not on a policy-by-policy basis, and shall be treated consistently from year-to-year, unless otherwise approved by the domiciliary commissioner.

H.G. Any supplemental benefits and riders offered on life insurance policies or annuity contracts that would have a material impact on the reserve (for VM-20 and VM-22) or TAR (for VM-21) if elected later in the contract life, such as joint income benefits, nursing home benefits, or withdrawal provisions on annuity contracts, shall be considered when determining reserves (for VM-20 and VM-22) or reserves and TAR (for VM-21) using the following principles:

1. Policyholders with living benefits and annuitization in the same contract will generally use the more valuable of the two benefits.
2. When advantageous, policyholders will commence living benefit payouts if not started yet.

Commented [X661]: Simplifications are judged relative to reserves for VM-20/VM-21 and TAR for VM-21.

Commented [VM22662R661]: Edits to address this comment will be reflected in next exposure

Commented [X663]: This section states that “When advantageous, policyholders will commence living benefit payouts if not started yet.” This text seems to directly contradict VM-22 Section 6.H.2 which states “contract holder behavior should neither assume that all contract holders act with 100% efficiency in a financially rational manner nor assume that contract holders will always act irrationally”. We suggest revising 6.H.2 to align with the text of 10.D.8.

Page 7: [1] Commented [CD49] CA DOI 12/30/2021 3:11:00 PM

The format of this Definitions section is inconsistent with other parts of the VM. In VM-01 and VM-21, each defined term is numbered, and is defined in this format (for example):

1. The term "buffer annuity" is interchangeable with the term "registered index-linked annuity (RILA)", as defined in Section 1.D.?

Page 7: [2] Commented [X51] TDI 11/9/2021 9:04:00 AM

The term Buffer Annuity is not interchangeable to Registered Index-Linked Annuity (RILA) since Buffer Annuity is a subset of RILA. RILA can have different downside protections such as "Buffer" or "Floor". Recommend deleting Buffer Annuity or add descriptions for Buffer Annuity as a subtype in the RILA definition.

Page 7: [3] Commented [X53] ACLI

Suggest aligning the cut off to 13 months for alignment consistent with Actuarial Guideline IX, rather than the 1 year that currently is in the VM-22 draft.

Page 7: [4] Commented [X55] TDI 11/9/2021 9:05:00 AM

The wording "after (or from)" the issue date used in the DIA and SPIA definitions is confusing. Recommend keeping it simple as "from" the issue date.

Page 7: [5] Commented [X57] ACLI

Is "typically" intended to be a requirement in the definition? That is, to qualify as FIA does there need to be guaranteed principle?

Page 7: [6] Commented [X61] TDI 11/9/2021 9:07:00 AM

The definition of FIA describes the account value as typically with guaranteed principal. Since FIA always has the guaranteed principal, recommend deleting the wording "typically".

Page 9: [7] Commented [X87] ACLI

Suggest aligning the cut off to 13 months for alignment consistent with Actuarial Guideline IX, rather than the 1 year that currently is in the VM-22 draft.

Page 9: [8] Commented [X89] TDI 11/9/2021 9:06:00 AM

The wording "after (or from)" the issue date used in the DIA and SPIA definitions is confusing. Recommend keeping it simple as "from" the issue date.

Page 9: [9] Commented [X91] ACLI

Suggest striking sentence "Adverse mortality is typically expected for these contracts." from definition. Additionally, it is possible that there may be non-substandard settlements.

Page 11: [10] Commented [VM22108R105] VM-22 Subgroup 6/23/2022 9:14:00 AM

The VM-22 Subgroup voted to adopted "Option 1" for Reserving Categories

Page 11: [11] Commented [VM22107R105] VM-22 Subgroup 3/2/2022 4:12:00 PM

See Equitable comment letter: supports full aggregation, but if choosing between the two exposed options for two reserving categories, prefers option 2.

Page 11: [12] Commented [VM22106R105] VM-22 Subgroup 3/2/2022 2:59:00 PM

See NY comment letter: supports option 1, with additional category for “other” for any other contract with supporting assets such that there is greater reinvestment and longevity risks, than disintermediation risk and other risks associated with policyholder behavior as of the valuation date.

Page 11: [13] Commented [X105] TDI 11/9/2021 9:23:00 AM

The reserving categories for VM-22 are not included in Scope. Recommend including the defined reserving categories in the section when outlining Scope.

Page 11: [14] Commented [X103] ACLI

We would support reworking this section to rely on principles, rather than definitions to determine what is in and out of scope. As product innovation continues, a simple list may not appropriately accommodate the applicability of this chapter. However, if such a list is included, then we believe it should align with the full list presented in Section 13.

Page 11: [15] Commented [VM22104R103] VM-22 Subgroup 6/23/2022 9:16:00 AM

ACLI will follow up with a proposed revision to the definitions and scope section

Page 11: [16] Commented [VM22110R109] VM-22 Subgroup 6/23/2022 9:16:00 AM

Edits to address this comment will be reflected in next exposure

Page 11: [17] Commented [CD109] CA DOI 12/30/2021 3:27:00 PM

suggest numbering the paragraphs within this section

Page 11: [18] Commented [CD111] CA DOI 12/30/2021 3:27:00 PM

suggest swapping the order of this section. That is, start with the "in scope" list, rather than the "out of scope" list.

Also, it seems like there should be specific mentions of GMDBs and GLBs, as there are in VM-21, since those guarantees can also be found on FIAs.

Page 11: [19] Commented [VM22112R111] VM-22 Subgroup 6/23/2022 9:16:00 AM

Edits to address this comment will be reflected in next exposure

Page 11: [20] Commented [X113] TDI 11/9/2021 9:12:00 AM

Since buffer annuities are a subset of RILA, recommend deleting buffer annuities.

Page 11: [21] Commented [VM22114R113] VM-22 Subgroup 6/23/2022 9:16:00 AM

Edits to address this comment will be reflected in next exposure

Page 11: [22] Commented [CD115] CA DOI 12/30/2021 3:28:00 PM

this is not defined in the Definition section. should it be?

Page 11: [23] Commented [VM22116R115] VM-22 Subgroup 6/23/2022 9:17:00 AM

Edits to address this comment will be reflected in next exposure

Page 11: [24] Commented [X117] TDI 11/9/2021 9:17:00 AM

This needs to be revised to be in line with VM-21 Section 2.A. Consider removing "such as" list and adding a cross-reference to VM-21 Section 2.A.

Page 11: [25] Commented [VM22118R117] VM-22 Subgroup 6/23/2022 9:16:00 AM

Edits to address this comment will be reflected in next exposure

Page 11: [26] Commented [CD119] CA DOI 12/30/2021 3:28:00 PM

should this be "non-variable annuities" since that is term used in Section 1.A?

Page 11: [27] Commented [VM22120R119] VM-22 Subgroup 6/23/2022 9:17:00 AM

Edits to address this comment will be reflected in next exposure

Page 11: [36] Commented [X133] ACLI

We suggest moving or deleting the sentence “The company may elect to exclude one or more groups of contracts from the stochastic reserve calculation in certain situations, pursuant to the exclusion test requirements defined in Section 3.E of VM-22.” from this section as it does not seem fitting here.

Page 11: [37] Commented [VM22134R133] VM-22 Subgroup 6/23/2022 9:18:00 AM

Edits to address this comment will be reflected in next exposure

Page 11: [38] Commented [CD135] CA DOI 12/30/2021 3:32:00 PM

self-referencing "VM-22" is not necessary

Page 11: [39] Commented [VM22136R135] VM-22 Subgroup 6/23/2022 9:18:00 AM

Edits to address this comment will be reflected in next exposure

Page 11: [40] Commented [X137] TDI 11/9/2021 9:19:00 AM

Does this belong in Scope? Do these still follow the other VM-22 requirements (if the old VM-22 interest rate determinations are left in the same chapter as the VM-22 PBR requirements)?

It is normal to then list what requirements such excluded contracts would follow. However, the statement here is more problematic because you can be excluded from the SR but still subject to VM-22.

Page 11: [41] Commented [VM22138R137] VM-22 Subgroup 6/23/2022 9:18:00 AM

Edits to address this comment will be reflected in next exposure

Edits to address this comment will be reflected in next exposure

Page 11: [44] Commented [X141] TDI 11/9/2021 9:25:00 AM

We still have a question about whether RBC factors are still at an appropriate level, if principles-based capital is not developed. Were they set assuming that this reserve was at a CTE(70) level in the first place, or were they dependent on the prior framework?

Page 15: [45] Commented [X161] TDI 11/9/2021 9:48:00 AM

Recommend replacing “the scenario reserve” with “the deterministic reserve”. Note that we also disagree with calling the deterministic reserve a stochastic reserve (later in draft), which adds a good deal of confusion.

Page 15: [46] Commented [CD162] CA DOI 12/30/2021 3:35:00 PM

suggest expanding header to "Stochastic Exclusion Test", for clarity

Page 15: [47] Commented [X163] ACLI

Seems to imply that only SPIAs would pass due to the linkage to Section 13. But the reference to interest rates should be broader, if even necessary. Suggest editing as:

"these groups of contracts may be valued using the methodology and statutory maximum valuation rate pursuant to applicable requirements in VM-A, and VM-C, and with the statutory maximum valuation rate for immediate annuities specified in Section 13."

Page 15: [48] Commented [VM22164R163] VM-22 Subgroup 6/23/2022 11:26:00 AM

Edits to address this comment will be reflected in next exposure

Page 15: [49] Commented [CD165] CA DOI 12/30/2021 3:36:00 PM

Suggest rewording to just say "the stochastic exclusion test". There is only 1 SET, with 3 ways of passing it. Therefore, the current wording is confusion because it suggests that there are multiple SETs.

Page 15: [50] Commented [VM22166R165] VM-22 Subgroup 6/23/2022 9:23:00 AM

Edits to address this comment will be reflected in next exposure

Page 35: [85] Commented [X366] TDI 11/18/2021 9:49:00 PM

This is not in VM-20 and would substantially change the exclusion. The intent is not to allow you to group a block that has material interest rate risk with a larger block that is insensitive to interest rate risks and thereby pass. If "aggregate" referred to potential compounding of interest rate, longevity, or asset risk then this could be redrafted to clearly call out a 4th category of risk due to a combination of the first three. However, I think this is already implicitly covered.

Edits to address this comment will be reflected in next exposure

Page 35: [99] Commented [X385] ACLI

As written, the SERT assumes a single premium product given the change of the denominator to the scenario reserve. Alternative product designs (such as longevity swap) could result in unintended results. We recommend maintaining consistency with VM-20 and using a denominator of future benefits (annuity payments, DBs, etc., excluding premium considerations, expenses, etc.).

Page 35: [100] Commented [VM22386R385] VM-22 Subgroup 6/23/2022 10:12:00 AM

Consensus to use a denominator that only includes benefits and expenses, consistent with VM-20

Page 35: [101] Commented [X387] TDI 11/18/2021 9:53:00 PM

Using (a) in the denominator instead of VM-20's (c) which is a PV of benefits could make this ratio unstable when the scenario reserve (a) is very small. This is particularly applicable if the block being tested does not have CSV.

Page 35: [102] Commented [VM22388R387] VM-22 Subgroup 6/23/2022 10:13:00 AM

Consensus to use a denominator that only includes benefits and expenses, consistent with VM-20

Page 35: [103] Commented [X389] TDI 11/18/2021 9:59:00 PM

The variability should be assured to be immaterial based on the company's materiality standard.

Draft: 8/2/22

Valuation Manual (VM)-22 (A) Subgroup
Virtual Meeting
June 14, 2022

The VM-22 (A) Subgroup of the Life Actuarial (A) Task Force met June 14, 2022. The following Subgroup members participated: Ben Slutsker, Chair (MN); Ahmad Kamil, Elaine Lam, and Thomas Reedy (CA); Lei Rao-Knight (CT); Mike Yanacheak (IA); Nicole Boyd (KS); William Leung (MO); Seong-min Eom (NJ); Bill Carmello and Amanda Fenwick (NY); Mike Boerner and Yujie Huang (TX); and Craig Chupp (VA).

1. Exposed the Longevity Reinsurance Proposal

Ms. Eom shared the draft of the proposal for addressing longevity risk (Attachment Twenty-Two-A) in the proposed VM-22 framework as discussed during the Subgroup's June 1 meeting. She proposed that longevity reinsurance be excluded from the payout annuity reserving category and be listed as a separate reserving category. She said the proposal recommends using net premiums instead of gross premiums for the calculation of longevity reinsurance accumulated deficiencies. The proposal recommends reducing the gross premiums by a k-factor to determine the net premium. She expressed openness to suggestions on how the k-factor is determined or alternative calculations that do not use a k-factor.

Mr. Carmello made a motion, seconded by Mr. Boerner, to expose the longevity reinsurance proposal for a 60-day public comment period ending Aug. 14. The motion passed unanimously.

2. Discussed the Stochastic Exclusion Ratio Test

Mr. Slutsker said that during the Subgroup's June 1 meeting, the Academy agreed to review the proposal for using the VM-20, Requirements for Principle-Based Reserves for Life Products, approach for determining the numerator and denominator of the stochastic exclusion ratio test (SERT). Chris Conrad (American Academy of Actuaries—Academy) said the Academy has reviewed the proposal and agrees with the approach.

3. Discussed Tier Two Comments on the Proposed VM-22 Framework

Mr. Slutsker said the Texas Department of Insurance (TDI) proposes using the reinsurance language from VM-20 in Section 5 of the proposed VM-22 framework. Mr. Conrad said that while the Academy believes that the language is not necessary in a principle-based approach, it is comfortable with using the language in Section 5.

Mr. Slutsker said the TDI and the California Department of Insurance (DOI) proposes adding VM-21, Requirements for Principle-Based Reserves for Variable Annuities, language for fair value disclosures to the conditional tail expectations 70 (CTE-70) best efforts. Mr. Reedy said the language was added to be consistent with VM-21. Connie Tang (Prudential) said some clarifying notes may be needed because the methodology for some index credit products does not have "best efforts" versus "adjusted." Al Zlogar (Academy) said that if the hedging program is only for index crediting, the proposed language is not needed. Mr. Slutsker said the language is in a section addressing non-indexed hedging strategies supporting guarantees. He said comments on whether it should be extended to all hedges can be submitted during the exposure period.

Mr. Slutsker said the proposed VM-22 framework lists the 1994 group annuity reserving table (1994 GAR) as the table a company should use if it has little pension risk transfer (PRT) mortality experience. He said the ACLI asked

if the mortality assumption can be based on third-party data rather than an industry table. He said the question is also pertinent to the credibility section of the proposal. Ms. Eom asked how state insurance regulators might get comfortable with the data from a third party. Mr. Bayerle said the ACLI will give that some thought. Mr. Carmello said the Subgroup should require a prescribed table. The Subgroup voted not to allow the use of third-party data.

Having no further business, the VM-22 (A) Subgroup adjourned.

[https://Support Staff Hub/Member Meetings/2022 NAIC Meetings/Spring National Meeting/Committee Meetings/LIFE INS and ANNUITIES \(A\) COMMITTEE/Life Actuarial \(A\) TF/Summer LATF Calls/VM-22 Subgroup/06 14/6_14 VM-22 Minutes.docx](https://Support Staff Hub/Member Meetings/2022 NAIC Meetings/Spring National Meeting/Committee Meetings/LIFE INS and ANNUITIES (A) COMMITTEE/Life Actuarial (A) TF/Summer LATF Calls/VM-22 Subgroup/06 14/6_14 VM-22 Minutes.docx)

RESERVING CATEGORY DEFINITIONS

The Term “Payout Annuity Reserving Category” includes the following categories of contracts, certificates and contract features, whether group or individual, including both life contingent and term certain only contracts, directly written or assumed through reinsurance, with the exception of benefits provided by variable annuities. For the purposes of the “Payout Annuity Reserving Category”, Longevity Reinsurance shall be excluded from the following categories of contracts, certificates and contract features.

:

1. Immediate annuity contracts;
2. Deferred income annuity contracts;
3. Structured settlements in payout or deferred status;
4. Fixed income payment streams resulting from the exercise of settlement options or annuitizations of host contracts issued;
5. Supplementary contracts, excluding contracts with no scheduled payments (such as retained asset accounts and settlements at interest);
6. Fixed income payment streams attributable to guaranteed living benefits associated with deferred annuity contracts, once the contract funds are exhausted;
7. Certificates, emanating from non- variable group annuity contracts specified in Model #820, Section 5.C.2, purchased for the purpose of providing certificate holders fixed income payment streams upon their retirement; and
8. Pension Risk Transfer Annuities; ~~and~~
9. ~~Longevity Reinsurance.~~

The term “Longevity Reinsurance Reserving Category” refers to Longevity Reinsurance under the definition provided in [VM-01 or VM-22 Section 1.d of the Valuation Manual].

The term “Accumulation Reserving Category” are all annuities within scope of VM-22 under Section II of the NAIC Valuation Manual that are not in the “Payout Reserving Category” or “Longevity Reinsurance Reserving Category”.

Drafting Note: *Intent is to not permit aggregation between longevity reinsurance and other contracts for VM-22 PBR calculations.*

Section 4: Determination of SR

A. Projection of Accumulated Deficiencies

1. General Description of Projection

The projection of accumulated deficiencies shall be made ignoring federal income tax in both cash flows and discount rates, and it shall reflect the dynamics of the expected cash flows for the entire group of contracts, reflecting all product features, including any guarantees provided under the contracts using prudent estimate liability assumptions defined in Sections 10 and 11 and asset assumptions defined in Sections 4 and 9. The company shall project cash flows including the following:

- a. Gross premium received by the company from the contract holder (including any due premiums as of the projected start date). For purposes of Longevity Reinsurance, net premium shall be used in the projection and defined as the gross premium multiplied by a “K-factor,” where the K-factor is determined as:
 - i. The present value of the expected future benefits at contract inception using the prudent estimate assumptions determined at contract inception and an interest rate equal to the prescribed interest rate under VM-A and VM-C, divided by item ii immediately below.
 - ii. The present value of the expected future gross premiums at contract inception using the prudent estimate assumptions determined at contract inception and an interest rate equal to the prescribed interest rate under VM-A and VM-C.
 - iii. The resulting amount is capped at 1, in other words the application of the K-factor shall not result in the net premium exceeding the gross premium.

Commented [NJ1]: Another option for assumptions would be to calculate the k factor using assumptions prior to margins, which would lower the k factor. Another option for the interest rate would be to use the standard projection interest rate scenario

Guidance Note: If due premiums are modeled, the final reported reserve needs to be adjusted by adding the due premium asset.

- b. Other revenues, including contractual fees and charges, and revenue-sharing income received by the company (net of applicable expenses). For purposes of Longevity Reinsurance, it is not expected that any such other revenues will apply. To the extent there are other revenues, they should be included with item ii under a. immediately above so that the calculation of the K-factor includes all expected future revenues from the contract holder.
- a-c. All material benefits projected to be paid to contract holders—including, but not limited to, death claims, surrender benefits and withdrawal benefits—reflecting the impact of all guarantees and adjusted to take into account amounts projected to be charged to account values on general account business. Any guarantees, in addition to market value adjustments assessed on projected withdrawals or surrenders, shall be taken into account.

- b.d. Non-Guaranteed Elements (NGE) cash flows as described in Section 10.I.
- e.e. Insurance company expenses (including overhead and maintenance expense), commissions and other acquisition expenses associated with business inforce as of the valuation date.
- f.f. Cash flows associated with any reinsurance.
- e.g. Cash flows from hedging instruments as described in Section 4.A.4.
- f.h. Cash receipts or disbursements associated with invested assets (other than policy loans) as described in Section 4.D.4, including investment income, realized capital gains and losses, principal repayments, asset default costs, investment expenses, asset prepayments, and asset sales.

If modeled explicitly, cash flows related to policy loans as described in Section 10.I.2, including interest income, new loan payments and principal repayments.

Draft: 8/2/22

Valuation Manual (VM)-22 (A) Subgroup
Virtual Meeting
June 1, 2022

The VM-22 (A) Subgroup of the Life Actuarial (A) Task Force met June 1, 2022. The following Subgroup members participated: Ben Slutsker, Chair (MN); Ahmad Kamil, Elaine Lam, and Thomas Reedy (CA); Lei Rao-Knight (CT); Vincent Tsang (IL); Nicole Boyd (KS); William Leung (MO); Seong-min Eom (NJ); Bill Carmello and Amanda Fenwick (NY); Mike Boerner and Yujie Huang (TX); Tomasz Serbinowski (UT); and Craig Chupp (VA).

1. Discussed the VM-22 Draft Comment Tracker

Mr. Slutsker said a drafting discussion log (Attachment Twenty-Three-A) has been created to track Subgroup progress on comments received on the proposed VM-22 framework (Attachment Twenty-Three-B).

2. Discussed Tier Two Comments on the Proposed VM-22 Framework

Mr. Slutsker reviewed the list of VM-22 framework discussion topics (Attachment Twenty-Three-C). He said the American Council of Life Insurers (ACLI) questioned whether single premium immediate annuities (SPIAs) should be allowed the option to use the Commissioners Annuity Reserve Valuation Method (CARVM) without having to pass an exclusion test to avoid having to do principle-based reserving (PBR). Brian Bayerle said that in general, SPIAs will pass the exclusion test and do not carry any significant risk not captured by CARVM. Ms. Eom agreed with allowing the option to automatically exclude SPIAs but suggested that the exclusion would only apply to vanilla SPIAs. Mr. Chupp asked if the rates currently in VM-22, Statutory Maximum Valuation Interest Rates for Income Annuities, would be applicable. Mr. Bayerle confirmed that would be the case. Mr. Tsang agreed with using the pre-PBR methodology but said the exclusion should only apply prospectively. Mr. Carmello said that once the company selects the option, it should not be able to reverse it. He said he would prefer that instead of providing an option, the Subgroup should decide whether to exempt SPIAs from PBR. Mr. Bayerle said the ACLI would like SPIAs that pass the exclusion test to retain the option to do PBR. Chris Conrad (American Academy of Actuaries—Academy) said the Academy believes that SPIAs should be subjected to exclusion testing. He said SPIAs with terms greater than 20 years would potentially fail the exclusion test because they have greater reinvestment risk. He said the Academy intends to include SPIA exclusion testing in the VM-22 field study to determine if 20 years is the right cutoff. Mr. Chupp recommended basing the eligibility for exclusion testing on an average duration threshold instead of the length of the term. Subgroup members voted unanimously to allow SPIAs to automatically pass the exclusion test. The Subgroup then unanimously voted to limit the automatic pass to SPIAs with liability durations less than a certain threshold to be determined by the Subgroup. Mr. Slutsker said he will work with Mr. Chupp, Ms. Eom, and Mr. Carmello to determine if additional criteria are needed. Mr. Conrad agreed that the Academy would work to determine the appropriate durations for the threshold, as well as analyze how the automatic pass might affect the deterministic reserve.

Mr. Bayerle said the ACLI supports using the certification method for pension risk transfer (PRT) business. Ms. Eom said she is considering proposing additional language to reflect the influence of mortality on PRT contracts. Mr. Conrad said the Academy excluded PRT business from the certification method due to the potentially long durations of PRT business. Subgroup members voted to retain the language that prohibits PRT business to use the certification method.

Mr. Slutsker said the Texas Department of Insurance (TDI) suggested that the product grouping for exclusion testing should be similar to the grouping for PBR modeling. He said that the aggregation of blocks of business with

significantly different risk profiles would not be allowed. He said the ACLI favors allowing products to be grouped in alignment with the payout and accumulation categories determined for non-variable annuities. Mr. Bayerle said that aggregating on a higher level will force more products into stochastic modeling. Subgroup members agreed with the approach suggested by the TDI.

Mr. Slutsker said the TDI recommended having products pass, not merely disclose, the 16 scenarios from the exclusion ratio test to be eligible for the deterministic reserve. The Subgroup voted, with Mr. Chupp abstaining, to require that products pass the 16 scenarios to be eligible for the deterministic reserve.

Having no further business, the VM-22 (A) Subgroup adjourned.

NAIC VM-22 Drafting Discussion Log

#	Topic	Description	Date	Tier	Outcome
1	VM-22 Scope and Definitions	Keep current definitions for what is in-scope or focus only on non-variable annuities out of scope	4/13/2022	1	Openness to use Section II of the Valuation Manual to determine scope rather than relying on definitions; ACU to provide potential draft wording
2	Reserving categories and aggregation	Determine Option 1 or Option 2 from exposed reserve category definitions	4/13/2022	1	Preliminary vote to pursue Option 1
3	Small Company Exemption	Fixed Annuity PBR exemption, similar to life PBR exemption for smaller carriers?	4/13/2022	1	Voted to pursue a "Fixed Annuity PBR Exemption"; ACU to propose a set of potential draft criteria for the exemption
4	Reinvestment Guardrail	Keep VM-20/VM-21 mix, Academy mix, TX mix, or other? Wait until field test for final decision?	4/27/2022	1	Wait until observing impact in field testing results before voting on a reinvestment mix guardrail
5	Principles & Risks Across VM Chapters	Build one section in the Valuation Manual for principles that apply to VM-20, VM-21, and VM-22	4/27/2022	2	Openness to interested party proposals for a common "principles" section, but will focus on working through other VM-22 decisions before exploring
6	General Assumptions Section	Add a section to the VM-22 draft on general considerations and requirements for assumption	4/27/2022	2	Will include a proposed general assumptions section ("Section 13") from Texas to be consistent with a recent APF adoption on VM-21
7	Transition Period	Permit 1) early adoption and 2) retrospective adoption to the start of the 3-year transition period?	4/27/2022	2	Decided to not pursue early adoption; VM-22 will say silent on retrospective adoption to start of transition period, similar to VM-20
8	Minimum Error for Index Credit Hedges	What should be the minimum breakage expense (i.e., error) for modeling hedges supporting index credits?	5/11/2022	2	Will wait until seeing field testing results before minimum threshold
9	Longevity Reinsurance	How should longevity reinsurance be defined and treat negative reserves/recurring premiums?	5/11/2022	2	Academy presented on longevity reinsurance and will provide a refined definition; New Jersey will provide a proposal for reserving requirements
10	Categories for VM-31 Disclosures	What level of granularity should be required for disclosing PBR reserves for product groups in VM-31?	5/11/2022	2	Will wait until seeing field testing results before determining granularity of disclosures
11	Exclusion Test: SPIA contracts	Allow SPIAs to have the option of PBR vs. pre-PBR valuation without an exclusion test?	6/1/2022	2	
12	Exclusion Test: PRT Certification Method	Allow PRT contracts to use the Certification Method for exclusion testing?	6/1/2022	2	
13	Exclusion Test: Grouping	Group between products with significantly different risk profiles?	6/1/2022	2	
14	Exclusion Test: Future Premiums	For the stochastic exclusion ratio test, determine whether to include future premiums	6/1/2022	2	
15	Exclusion Test: Deterministic Reserve	To pass the deterministic test, does the company need to pass or disclose 16 scenarios with baseline mortality?	6/1/2022	2	
16	Working Reserve	Use a working reserve concept to serve as a floor for contracts without cash surrender value?	TBD	2	
17	PRT Mortality	Permit PRT mortality with limited credibility to follow a third-party provider instead of an industry table?	TBD	2	
18	Import Reinsure Wording from VM-20	Import VM-20 wording on incorporating contractual or additional characteristics for modeling reinsurance?	TBD	2	
19	Fair Value Certification	Include fair value certification, similar to existing VM-21 requirement?	TBD	2	

NAIC VM-22 Drafting Discussion Log

#	Topic	Description	Date	Tier	Outcome
20	Allocation Method	Determine Option 1 or Option 2? Wait until observing field test results before deciding?	TBD	2	
21	Grouping for Fund Value Depletion	Appropriate reserving category for deferred annuities with GMMBS/GMLBS that have depleted fund value	TBD	2

Valuation Manual Section II. Reserve Requirements8178

 Subsection 2: Annuity Products8178

 Subsection 6: Riders and Supplemental Benefits.....8379

Commented [X2]: Note that part of the 2022 VM updates was to replace all instances of "stochastic reserve" with "SR" other than the initial definition in VM-01.

Section 1: Background

A. Purpose

Sections 1 through 13 of these requirements establish the minimum reserve valuation standard for non-variable annuity contracts as defined in Section 2.A and issued on or after 1/1/2024. Section 14 of these requirements establish the maximum valuation rate for payout annuities for contracts issued on or after 1/1/2018. For all contracts encompassed by the Scope, these requirements constitute the Commissioners Annuity Reserve Valuation Method (CARVM) and, for certain contracts and certificates, the Commissioners Reserve Valuation Method (CRVM).

Guidance Note: CRVM requirements apply to some group pension contracts.

B. Principles

The projection methodology used to calculate the stochastic reserve_{SR} is based on the following set of principles. These principles should be followed when interpreting and applying the methodology in these requirements and analyzing the resulting reserves.

Guidance Note: The principles should be considered in their entirety, and it is required that companies meet these principles with respect to those contracts that fall within the scope of these requirements and are in force as of the valuation date to which these requirements are applied.

Principle 1: The objective of the approach used to determine the stochastic reserve_{SR} is to quantify the amount of statutory reserves needed by the company to be able to meet contractual obligations in light of the risks to which the company is exposed with an element of conservatism consistent with statutory reporting objectives.

Principle 2: The calculation of the stochastic reserve_{SR} is based on the results derived from an analysis of asset and liability cash flows produced by the application of a stochastic cash-flow model to equity return and interest rate scenarios. For each scenario, the greatest present value of accumulated deficiency is calculated. The analysis reflects prudent estimate assumptions for deterministic variables and is performed in aggregate (subject to limitations related to contractual provisions) to allow the natural offset of risks within a given scenario. The methodology uses a projected total cash flow analysis by including all projected income, benefit, and expense items related to the business in the model and sets the stochastic reserve_{SR} at a degree of confidence using the CTE measure applied to the set of scenario specific greatest present values of accumulated deficiencies that is deemed to be reasonably conservative over the span of economic cycles.

Guidance Note: Examples where full aggregation between contracts may not be possible include experience rated group contracts and the operation of reinsurance treaties.

Principle 3: The implementation of a model involves decisions about the experience assumptions and the modeling techniques to be used in measuring the risks to which the

Commented [X3]: The proposal suggests VM-22 is not operative until 1/1/2024, which contradicts Section 13 and existing requirements. We would suggest rewording this to clarify that Section 13 is effective after 12/31/2017. Further, we would suggest consistency in labeling of dates (either all text or all numeric).

Commented [CD4]: might be clearer to refer to "Section 2.A" here

Commented [X5]: The statement only addresses "contracts". Recommend adding "and certificates". Need to do a holistic review if where "and certificates" may be needed.

Commented [X6]: (Relationship to RBC Requirements): The VM-21 guidance note was not included in VM-22; however, we believe it would be appropriate to retain and reword to say, "products that calculate a stochastic reserve", since the relationship to RBC would likely be maintained.

Commented [X7]: We would support consistent application of principles across all chapters as currently VM-20 does not have a like-set of principles. We believe this could involve a broader discussion of the assorted product requirements in the VM. As a shorter-term fix, we would recommend generalizing the principles where appropriate and moving these to "Section 1. Introduction" or "VM-01" and equally applying to VM-20.

Commented [CD8]: for consistency, will this edit be considered for VM-21 as well?

Commented [X9]: We support this principle but note that later sections appear to contradict this principle. For example, the statement "The analysis reflects prudent estimate assumptions for deterministic variables and is performed in aggregate (subject to limitations related to contractual provisions) to allow the natural offset of risks within a given scenario." contradicts with the introduction of additional reserve categories and other limitations (such as model segment restrictions).

Commented [X10]: Principle 2: Recommend reinstating Guidance Note in Principle 2 to be consistent with VM-21.

company is exposed. Generally, assumptions are to be based on the conservative end of the confidence interval. The choice of a conservative estimate for each assumption may result in a distorted measure of the total risk. Conceptually, the choice of assumptions and the modeling decisions should be made so that the final result approximates what would be obtained for the ~~stochastic reserve~~SR at the required CTE level if it were possible to calculate results over the joint distribution of all future outcomes. In applying this concept to the actual calculation of the ~~stochastic reserve~~SR, the company should be guided by evolving practice and expanding knowledge base in the measurement and management of risk.

Guidance Note: The intent of Principle 3 is to describe the conceptual framework for setting assumptions. Section 10 provides the requirements and guidance for setting contract holder behavior assumptions and includes alternatives to this framework if the company is unable to fully apply this principle. More guidance and requirements for setting assumptions in general are provided in Section 12.

Commented [X11]: We suggest deleting the sentence "Generally, assumptions are..." since it does not provide guidance. We also suggest tightening the remainder of the text for clarity.

Commented [X12]: Need general assumption guidance section

Principle 4: While a stochastic cash-flow model attempts to include all real-world risks relevant to the objective of the stochastic cash-flow model and relationships among the risks, it will still contain limitations because it is only a model. The calculation of the ~~stochastic reserve~~SR is based on the results derived from the application of the stochastic cash-flow model to scenarios, while the actual statutory reserve needs of the company arise from the risks to which the company is (or will be) exposed in reality. Any disconnect between the model and reality should be reflected in setting prudent estimate assumptions to the extent not addressed by other means.

Principle 5: Neither a cash-flow scenario model ~~nor a method based on factors calibrated to the results of a cash-flow scenario model~~ can completely quantify a company's exposure to risk. A model attempts to represent reality but will always remain an approximation thereto and, hence, uncertainty in future experience is an important consideration when determining the ~~stochastic reserve~~SR. ~~Therefore, the use of assumptions, methods, models, risk management strategies (e.g., hedging), derivative instruments, structured investments or any other risk transfer arrangements (such as reinsurance) that serve solely to reduce the calculated stochastic reserve~~SR without also reducing risk on scenarios similar to those used in the actual cash-flow modeling are inconsistent with these principles. The use of assumptions and risk management strategies should be appropriate to the business and not merely constructed to exploit "foreknowledge" of the components of the required methodology.

Commented [X13]: Principle 5 has the statement "nor a method based on factors calibrated to the results of a cash flow scenario model" which is intended for the Alternative Methodology in VM-21. The statement should be deleted from VM-22.

Commented [X14]: We recommend deleting the third sentence (starting with "Therefore, the use of assumptions...") because this lacks historical context and is covered by the final sentence.

C. Risks Reflected

1. The risks reflected in the calculation of reserves under these requirements arise from actual or potential events or activities that are both:
 - a. Directly related to the contracts falling under the scope of these requirements or their supporting assets; and
 - b. Capable of materially affecting the reserve.

Commented [X15]: Consistent with our comments on 1.B, we would support consistent application of risks reflected across all chapters, rather than embedding the language in each chapter. Were this to be retained in VM-22, we would suggest maintaining consistency with VM-21 to avoid any confusion.

Commented [CD16]: VM-21 has "... and Risks Not Reflected" in this section header, which should be retained here since the section on risks not reflected is still in here.

2. Categories and examples of risks reflected in the reserve calculations include, but are not necessarily limited to:

a. Asset risks

- i. Credit risks (e.g., default or rating downgrades).
- ii. Commercial mortgage loan roll-over rates (roll-over of bullet loans).
- iii. Uncertainty in the timing or duration of asset cash flows (e.g., shortening (prepayment risk) and lengthening (extension risk)).
- iv. Performance of equities, real estate, and Schedule BA assets.
- v. Call risk on callable assets.
- vi. Separate account fund performance.
- vii. Risk associated with hedge instrument (includes basis, gap, price, parameter estimation risks, and variation in assumptions).
- viii. Currency risk.

Commented [CD17]: Can a non-variable annuity have a separate account fund? I am not aware of any such annuity, that is not a variable annuity. Furthermore, all references to separate accounts and fund performance were deleted from this draft. Thus, we should consider deleting this item from the list.

b. Liability risks

- i. Reinsurer default, impairment, or rating downgrade known to have occurred before or on the valuation date.
- ii. Mortality/longevity, persistency/lapse, partial withdrawal, and premium payment risks.
- iii. Utilization risk associated with guaranteed living benefits.
- iv. Anticipated mortality trends based on observed patterns of mortality improvement or deterioration, where permitted.
- v. Annuitization risks.
- vi. Additional premium dump-ins or deposits (high interest rate guarantees in low interest rate environments).
- vii. Applicable expense risks, including fluctuation in maintenance expenses directly attributable to the business, future commission expenses, and expense inflation/growth.

Commented [CD18]: Is there a distinction between "dump-ins" and "deposits"? Why are both words needed? Also, if it's determined that both words are needed, should this same change be made in VM-21?

Commented [X19]: Recommend change to "fluctuation in" maintenance expenses for clarity.

Commented [CD20]: should this same change also be made to VM-21?

c. Combination risks

- i. Risks modeled in the company's risk assessment processes that are related to the contracts, as described above.
- ii. Disintermediation risk (including such risk related to payment of surrender or partial withdrawal benefits).

Commented [X21]: We recommend removing the bullet "Risks modeled in the company's risk assessment processes that are related to the contracts, as described above" as this is unclear and probably extraneous.

- iii. Risks associated with revenue-sharing income.
- 3. The risks not necessarily reflected in the calculation of reserves under these requirements are:
 - a. Those not associated with the policies or contracts being valued, or their supporting assets.
 - b. Determined to not be capable of materially affecting the reserve.
- 4. Categories and examples of risks not reflected in the reserve calculations include, but are not necessarily limited to:
 - a. Asset risks
 - i. Liquidity risks associated with a sudden and significant levels of withdrawals and surrenders; "run on the bank."
 - b. Liability risks
 - i. Reinsurer default, impairment or rating downgrade occurring after the valuation date.
 - ii. Catastrophic events (e.g., epidemics or terrorist events).
 - iii. Major breakthroughs in life extension technology that have not yet fundamentally altered recently observed mortality experience.
 - iv. Significant future reserve increases as an unfavorable scenario is realized.
 - c. General business risks
 - i. Deterioration of reputation.
 - ii. Future changes in anticipated experience (reparameterization in the case of stochastic processes), which would be triggered if and when adverse modeled outcomes were to actually occur.
 - iii. Poor management performance.
 - iv. The expense risks associated with fluctuating amounts of new business.
 - v. Risks associated with future economic viability of the company.
 - vi. Moral hazards.
 - vii. Fraud and theft.
 - viii. Operational.
 - ix. Litigation.

Commented [X22]: We recommend removing this section. With the specific RBC language removed, the section loses meaning: "a" is unnecessary and "b" is redundant with other sections of the VM which allow for materiality considerations (language in VM-20 is likely better for this purpose and should be used consistently).

Commented [CD23]: Suggest eliminated "policies or", since customarily, annuities are "contracts"

Commented [CD24]: This is not in VM-21, and my suggestion would be to delete this

Commented [X25]: Proposed revision is not appropriate. Item (a) is unnecessary, and items under (b) would be addressed via simplifications and thus are indirectly reflected. Recommend deleting the whole section 1.C.3 including item (a) and item (b).

Commented [CD26]: should this same change also be made to VM-21?

Commented [X27]: The revised language "sudden and significant levels of withdrawal and surrenders" replaces the original language "run on the bank" and is less clear. Does "significant" mean severe or extreme? Or just appreciably? Withdraws and surrenders certainly may vary by projected economic scenarios. Recommend using the original language "run on the bank" that had a clearer intent.

Commented [X28]: We recommend deleting the wording "fundamentally". If a breakthrough is known to have fundamentally changed expected future mortality, but is not yet significantly reflected in historical experience, why is it not reflected? Do we know about this fundamental shift for years before it is reflected? This issue also applies to the VM-21 requirement.

Commented [X29]: We recommend removing the bullet "Significant future reserve increases as an unfavorable scenario is realized" as this is extraneous.

Commented [X30]: List could be expanded to include operational risk and litigation risk.

D. Specific Definitions for VM-22

Buffer Annuity

Interchangeable term for Registered Index-Linked Annuity (RILA). See definition for Registered Index-Linked Annuity below.

• **Deferred Income Annuity (DIA)**

An annuity which guarantees a periodic payment for the life of the annuitant or a term certain and payments begin one year, 13 months or later after (or from) the issue date if the contract holder survives to a predetermined future age.

• **Fixed Indexed Annuity (FIA)**

An annuity with an account value where the contract holder has the option for a portion or all of the account value to grow at a rate linked to an external index, subject to certain limits, typically with guaranteed principal.

• **Flexible Premium Deferred Annuity (FPDA)**

An annuity with an account value established with a premium amount but allows for additional deposits to be paid into the annuity over time, resulting in an increase to the account value. The contract also has a guaranteed interest rate during the accumulation phase and has guaranteed mortality and interest rates applicable at the time of conversion to the payout phase.

• **Funding Agreement**

A contract issued to an institutional investor (domestic and international non-qualified fixed income investors) that provides fixed or floating interest rate guarantees.

• **Guaranteed Investment Contract (GIC)**

Insurance contract typically issued to a retirement plan (defined contribution) under which the insurer accepts a deposit (or series of deposits) from the purchaser and guarantees to pay a specified interest rate on the funds deposited during a specified period of time.

• **Index Credit Hedge Margin**

A margin capturing the risk of inefficiencies in the company's hedging program supporting index credits. This includes basis risk, persistency risk, and the risk associated with modeling decisions and simplifications. It also includes any uncertainty of costs associated with managing the hedging program and changes due to investment and management decisions.

• **Index Credit**

Any interest credit, multiplier, factor, bonus, charge reduction, or other enhancement to contract policy values that is linked to an index or indices. Amounts credited to the contract policy resulting from a floor on an index account are included.

Commented [X31]: It seems the definitions included in this section are largely only used for the purpose of establishing the Scope in Section 2. Since this is intended to be a principles-based methodology, recommend a strong definition of "Fixed Annuity" instead of specific products underneath this business. The first paragraph in A. Scope seems to provide this with specific references which are out of scope. If changing the scope section, we would suggest deleting the various product definitions if not used elsewhere; if these definitions are potentially applied beyond VM-22, we would suggest moving any necessary definitions to VM-01.

Commented [CD32]: The format of this Definitions section is inconsistent with other parts of the VM. In VM-01 and VM-21, each defined term is numbered, and is defined in this format (for example):
1. The term "buffer annuity" is interchangeable with the term "registered index-linked annuity (RILA)", as defined in Section 1.D.?

Commented [X33]: The term Buffer Annuity is not interchangeable to Registered Index-Linked Annuity (RILA) since Buffer Annuity is a subset of RILA. RILA can have different downside protections such as "Buffer" or "Floor". Recommend deleting Buffer Annuity or add descriptions for Buffer Annuity as a subtype in the RILA definition.

Commented [X34]: Suggest aligning the cut off to 13 months for alignment consistent with Actuarial Guideline IX, rather than the 1 year that currently is in the VM-22 draft.

Commented [X35]: The wording "after (or from)" the issue date used in the DIA and SPIA definitions is confusing. Recommend keeping it simple as "from" the issue date.

Commented [X36]: Is "typically" intended to be a requirement in the definition? That is, to qualify as FIA does there need to be guaranteed principle?

Commented [CD37]: insert: "subject to certain limits,"

Commented [X38]: The definition of FIA describes the account value as typically with guaranteed principal. Since FIA always has the guaranteed principal, recommend deleting the wording "typically".

Commented [CD39]: should be "contract"

Commented [CD40]: should be "contract"

• **Index Crediting Strategy**

The strategy defined in a contract to determine index credits for a contract. ~~This refers to~~For example, this may refer to underlying index, index parameters, date, timing, performance triggers, and other elements of the crediting method.

• **Index Parameter**

Cap, floor, participation rate, spreads, or other features describing how the contract utilizes the index.

Commented [X41]: We would suggest adding performance trigger to the list, along with other potential crediting methods; alternatively, the definition could specify that the crediting methods listed are examples only.

• **Longevity Reinsurance**

An agreement, typically a reinsurance arrangement covering one or more group or individual annuity contracts, under which an insurance company assumes the longevity risk associated with periodic payments made to specified annuitants under one or more immediate or deferred payout annuity contracts. A common example is participants in one or more underlying retirement plans.

Commented [X42]: The definition states that "Agreements which are not treated as reinsurance under Statement of Statutory Accounting Principles (SSAP) No. 61R are not included in this definition". Why is this the case and does this imply that longevity swaps are not within the scope of VM-22? Recommend adding to the out of scope list in "2.A. Scope" if that is the case. Clarification would also be helpful on what guidance should be used for these agreements if out of scope for VM-22. Further, we would suggest removing "typically" from the definition.

Typically, the reinsurer pays a portion of the actual benefits due to the underlying annuitants (or, in some cases, a pre-agreed amount per annuitant), while the ceding insurance company retains the assets supporting the reinsured annuity payments and pays periodic, ongoing premiums to the reinsurer over the expected lifetime of benefits paid to the specified annuitants. Such agreements may contain net settlement provisions such that only one party makes ongoing cash payments in a particular period. Under these agreements, longevity risk may be transferred on either a permanent basis or for a prespecified period of time, and these agreements may or may not permit early termination.

Commented [VM2243R42]: Target resolving definition of longevity reinsurance prior to addressing NJ comment letter on using a potential net premium method

Agreements which are not treated as reinsurance under Statement of Statutory Accounting Principles (SSAP) No. 61R are not included in this definition. In particular, contracts under which payments are made based on the aggregate mortality experience of a population of lives which are not covered by an underlying group or individual annuity contract (e.g., mortality index-based longevity swaps) are not included in this definition.

Commented [VM2244]: New Jersey comment letter: due to future premiums, longevity reinsurance may generate negative reserves, which can be used to eliminate or reduce other immediate annuity reserves. Suggest using net premium methodology, solving for a k-factor at issue to solve for $PV(\text{premiums}) = PV(\text{benefits})$.

Commented [VM2245R44]: Target resolving definition of longevity reinsurance prior to addressing NJ comment.

• **Market Value Adjustment (MVA) Annuity**

An annuity with an account value where withdrawals and full surrenders are subject to adjustments based on interest rates or index returns at the time of withdrawal/surrender. There could be ceilings and floors on the amount of the market-value adjustment.

• **Modified Guaranteed Annuity (MGA)**

A type of market-value adjusted annuity contract where the underlying assets are most commonly held in an insurance company separate account and the value of which are guaranteed if held for specified periods of time. The contract contains nonforfeiture values and death benefits that are based upon a market-value adjustment formula if held for shorter periods.

Commented [X46]: We recommend editing the definition as follows "A type of market-value adjusted annuity contract where the underlying assets are most commonly held in an insurance company separate account..."

Commented [X47]: To clarify definition of MGA, recommend adding "death benefits".

- **Multiple-Year Guaranteed Annuity (MYGA)**
 A type of fixed annuity that provides a pre-determined and contractually guaranteed interest rate for specified periods of time, after which there is typically an annual reset or renewal of a multiple year guarantee period.
- **Pension Risk Transfer (PRT) Annuity**
 An annuity, typically a group contract or reinsurance agreement, issued by an insurance company providing periodic payments to annuitants receiving immediate or deferred benefits from one or more retirement plans. Typically, the insurance company holds the assets supporting the benefits, which may be held in the general or separate account, and retains not only longevity risk but also asset risks (e.g., credit risk and reinvestment risk).
- **Registered Index-Linked Annuity (RILA)**
 An annuity with an account value where the contract holder has the option for a portion or all of the account value to grow at a rate linked to an external index, similar to a Fixed Indexed Annuity, but with downside risk exposure that may not guarantee full principal repayment. These contracts may include a cap on upside returns, and may also include a floor on downside returns which may be below zero percent.
- **Single Premium Immediate Annuity (SPIA)**
 An annuity purchased with a single premium amount which guarantees a periodic payment for the life of the annuitant or a term certain and payments begin within 13 months one year after (or from) the issue date issue date.
- **Single Premium Deferred Annuity (SPDA)**
 An annuity with an account value established with a single premium amount that grows with a guaranteed interest rate during the accumulation phase and has guaranteed mortality and interest rates applicable at the time of conversion to the payout phase. May also include cases where the premium is accepted for a limited amount of time early in the contract life, such as only in the first duration.
- **Stable Value Contract**
 A contract that provides limited investment guarantees, typically preserving principal while crediting steady, positive returns and protecting against losses or declines in yield. Underlying asset portfolios typically consist of fixed income securities, which may sit in the insurer's general account, a separate account, or in a third-party trust. These contracts often support defined contribution or defined benefit retirement plan liabilities.
- **Structured Settlement Contract (SSC)**
 A contract that provides periodic benefits and is purchased with a single premium amount stemming from various types of claims pertaining to court settlements or out-of-court settlements from tort actions arising from accidents, medical malpractice, and other causes. Adverse mortality is typically expected for these contracts.
- **Synthetic Guaranteed Investment Contract (Synthetic GIC)**

Commented [CD48]: should this be "Multi-Year" instead of "Multiple Year"? The former is the more commonly used term for MYGA

Commented [CD49]: "fixed annuity" is not defined. Is it better to change all instances of "fixed annuity" to "non-variable annuity" to be consistent with the terminology introduced in Section 1.A (and to be aligned with the actual VM-22 chapter name)? An alternative could be to add a definition for "fixed annuity", with the definition of it being a "non-variable annuity"

Commented [CD50]: ok to keep this as "multiple year"

Commented [X51]: Is "typically" intended to be a requirement in the definition? That is, to qualify as PRT must the insurance company have the asset risk? Consistent with the comment on Longevity Reinsurance, it would be helpful to clarify where a longevity swap contract falls within these definitions. Notably, index-based longevity swaps should be out of scope as they do not meet definition of "annuity contract" in SSAP 50. It should also be made explicit that PRT contracts can include lump sum benefits, death benefits and cash balance benefits as well.

Commented [X52]: It is unclear to us why RILA is defined in VM-22 when it is being used to exclude the product from VM-22 requirements.

Commented [X53]: If need to address Buffer Annuity (not sure this is needed), can add here as a subset of RILA.

Commented [X54]: Suggest aligning the cut off to 13 months for alignment consistent with Actuarial Guideline IX, rather than the 1 year that currently is in the VM-22 draft.

Commented [X55]: The wording "after (or from)" the issue date used in the DIA and SPIA definitions is confusing. Recommend keeping it simple as "from" the issue date.

Commented [X56]: Suggest striking sentence "Adverse mortality is typically expected for these contracts." from definition. Additionally, it is possible that there may be non-standard settlements.

Commented [CD57]: suggest spelling out GIC first, followed by the acronym

Contract that simulates the performance of a traditional GIC through a wrapper, swap, or other financial instruments, with the main difference being that the assets are owned by the contract policyholder or plan trust.

Commented [CD58]: should be "contract holder"

- **Term Certain Payout Annuity**

A contract issued, which offers guaranteed periodic payments for a specified period of time, not contingent upon mortality or morbidity of the annuitant.

- **Two-Tiered Annuity**

A deferred annuity with two tiers of account values. One, with a higher accumulation interest rate, is only available for annuitization or death. The other typically contains a lower accumulation interest rate, and is only available upon surrender.

The term "cash surrender value" means, for the purposes of these requirements, the amount available to the contract holder upon surrender of the contract. Generally, it is equal to the account value less any applicable surrender charges, where the surrender charge reflects the availability of any free partial surrender options. However, for contracts where all or a portion of the amount available to the contract holder upon surrender is subject to a market value adjustment, the cash surrender value shall reflect the market value adjustment consistent with the required treatment of the underlying assets. That is, the cash surrender value shall reflect any market value adjustments where the underlying assets are reported at market value, but it shall not reflect any market value adjustments where the underlying assets are reported at book value.

Commented [CD59]: this definition still applies, should we keep it?

The term "guaranteed minimum death benefit" (GMDB) means a provision (or provisions) for a guaranteed benefit payable on the death of a contract holder, annuitant, participant or insured where the amount payable is either (i) a minimum amount; or (ii) exceeds the minimum amount and is:

Commented [CD60]: this definition still applies, should we keep it?

- is increased by an amount that may be either specified by or computed from other policy or contract values; and

- has the potential to produce a contractual total amount payable on such death that exceeds the account value; or

- in the case of an annuity providing income payments, guarantees payment upon such death of an amount payable on death in addition to the continuation of any guaranteed income payments.

E. Materiality

The company shall establish a standard containing the criteria for determining whether an assumption, risk factor, or other element of the principle-based valuation has a material impact on the size of the reserve. This standard shall be applied when identifying material risks.

Commented [X61]: Add consistent with VM-21 Section 1.E, which was added to the 2022 VM.

Commented [X62]: Consistent with our comment in Section 1, the language around effective date should be clear this only applies to new PBR methodology, and rates in Section 13 have a different effective date.

Section 2: Scope and Effective Date

A. Scope

Subject to the requirements of this Sections 1 to 13 of VM-22 are annuity contracts, certificates and contract features, whether group or individual, including both life contingent and term-certain-only, directly written or assumed through reinsurance issued on or after 1/1/2024, with the exception of contracts or benefits listed below.

Products out of scope include:

1. Contracts or benefits that are subject to VM-21 (such as variable annuities, RILAs, buffer annuities, and structured annuities)
2. GICs
3. Synthetic GICs
4. Stable Value Contracts
5. Funding Agreements

Products in scope of VM-22 include non-variable fixed annuities which consist of, but are not limited to, the following the list:

Account Value Based Annuities

1. Deferred Annuities (SPDA & FPDA)
2. Multi-Year Guarantee Annuities (MYGA)
3. Fixed Indexed Annuities (FIA)
4. Market Value Adjustments (MVA)
5. Two-tiered Annuities
6. Guarantees/Benefits/Riders on Non-Variable Fixed Annuity Contracts

Payout Annuities

1. Single Premium Immediate Annuities (SPIA)
2. Deferred Income Annuities (DIA)
3. Term Certain Payout Annuities
4. Pension Risk Transfer Annuities (PRT)
5. Structured Settlement Contracts (SSC)
6. Longevity Reinsurance

Products out of scope include:

1. Contracts or benefits that are subject to VM-21 (such as variable annuities and RILAs)
2. GICs
3. Synthetic GICs
4. Stable Value Contracts
5. Funding Agreements

The company may elect to exclude one or more groups of contracts from the stochastic reserveSR calculation in certain situations, pursuant to the exclusion test requirements defined in Section 3.E of VM-22.

B. Effective Date & Transition

Effective Date

These requirements apply for valuation dates on or after January 1, 2024.

Commented [X63]: We would support reworking this section to rely on principles, rather than definitions to determine what is in and out of scope. As product innovation continues, a simple list may not appropriately accommodate the applicability of this chapter. However, if such a list is included, then we believe it should align with the full list presented in Section 13.

Commented [X64]: The reserving categories for VM-22 are not included in Scope. Recommend including the defined reserving categories in the section when outlining Scope.

Commented [VM2265R64]: See NY comment letter; supports option 1, with additional category for "other" for any other contract with supporting assets such that there is greater reinvestment and longevity risks, than disintermediation risk and other risks associated with policyholder behavior as of the valuation date.

Commented [VM2266R64]: See Equitable comment letter; supports full aggregation, but if choosing between ... [1]

Commented [CD67]: suggest numbering the paragraphs within this section

Commented [CD68]: suggest swapping the order of this section. That is, start with the "in scope" list, rather than ... [2]

Commented [X69]: Since buffer annuities are a subset of RILA, recommend deleting buffer annuities.

Commented [CD70]: this is not defined in the Definition section. should it be?

Commented [X71]: This needs to be revised to be in line with VM-21 Section 2.A. Consider removing "such as" ... [3]

Commented [CD72]: should this be "non-variable annuities" since that is term used in Section 1.A?

Commented [X73]: Typo. Delete extra "the".

Commented [CD74]: grammar - delete "the"

Commented [CD75]: should have space instead of dash

Commented [CD76]: delete the "s" and add "Annuities"

Commented [CD77]: should this be "Non-Variable Annuity"? Otherwise, should "Fixed Annuity" be defined ... [4]

Commented [CD78]: for consistency, make plural; i.e., change to "ies"

Commented [X79]: We suggest moving or deleting the sentence "The company may elect to exclude one or more groups of contracts from the stochastic reserveSR calculation in certain situations, pursuant to the exclusion test requirements defined in Section 3.E of VM-22." ... [5]

Commented [CD80]: self-referencing "VM-22" is not necessary

Commented [X81]: Does this belong in Scope? Do these still follow the other VM-22 requirements (if the old VM-22 ... [6]

Commented [CD82]: again, suggest numbering the paragraphs within this section

Commented [X83]: We still have a question about whether RBC factors are still at an appropriate level, if ... [7]

Transition

A company may elect to establish minimum reserves pursuant to applicable requirements in VM-A and VM-C for business otherwise subject to VM-22 PBR requirements and issued during the first three years following the effective date of VM-22 PBR. If a company during the ~~three years~~ year transition period elects to apply VM-22 PBR to a block of such business, then a company must continue to apply the requirements of VM-22 PBR for future issues of this business. Irrespective of the transition date, a company shall apply VM-22 PBR requirements to applicable blocks of business on a prospective basis starting at least three years after the effective date.

Commented [X84]: Need to clarify what is meant by "VM-22 PBR Requirements". Add specific section references, or update proposal to have the PBR and non-PBR sections of this VM-22 draft in different chapters. After having reviewed, we think it would be much more clear to reconsider the use of "VM-23" for the PBR requirements to avoid ambiguity around scope/exclusions. The non-PBR sections also just don't seem to fit in this draft, and there is now ambiguity around whether other parts of VM-22 apply to them (scope, effective date, principles, etc.).

Commented [X85]: To be more clear, recommend adding "transition period" to "the three years".

Commented [X86]: Can a company wait until the end of the transition period to start PBR, but then apply PBR to the issues from during the transition period? This was unclear for VM-20, and still seems unclear here. Need to be explicit one way or the other.

Commented [CD87]: Will we (or should we) allow for any early adopters (like we did for VM-21)? It would seem reasonable to us to consider accommodating early adopters

Section 3: Reserve Methodology

A. Aggregate Reserve

The aggregate reserve for contracts falling within the scope of these requirements shall equal the ~~stochastic reserve~~SR (following the requirements of Section 4) ~~plus the additional standard projection amount (following the requirements of Section 6) plus the DR for those contracts satisfying the Deterministic Certification Option,~~ less any applicable PIMR for all contracts not valued under applicable requirements in VM-A and VM-C, plus the reserve for any contracts valued under applicable requirements in VM-A and VM-C.

Commented [X88]: Reinstated and modify later as needed - SPA being developed in separate workflow.

Commented [X89]: One of the most confused parts of the draft was referring to a DR as the SR for certain contracts. Need to handle and refer to separately.

Guidance Note: Contracts valued under applicable requirements in VM-A and VM-C are ones that pass the exclusion test and elect to not model PBR ~~stochastic reserves~~SRs, per the requirements in Section 3.E.

B. Impact of Reinsurance | ~~Ceded~~ |

All components in the aggregate reserve shall be determined post-reinsurance ceded, that is net of any reinsurance cash flows arising from treaties that meet the statutory requirements that allow the treaty to be accounted for as reinsurance. A pre-reinsurance ceded reserve also needs to be determined by ignoring all reinsurance cash flows (costs and benefits) in the reserve calculation.

Commented [X90]: Guidance is needed on how a pre-reinsurance reserve is to be determined.

~~C. To Be Determined~~The Additional Standard Projection Amount

D. The Stochastic Reserve

~~The stochastic reserve~~

The additional standard projection amount is determined by applying one of the two standard projection methods defined in Section 6. The same method must be used for all contracts within a group of contracts that are aggregated together to determine the reserve. The company shall elect which method they will use to determine the additional standard projection amount. The company may not change that election for a future valuation without the approval of the domiciliary commissioner.

Commented [X91]: Reinstated and modify later as needed - SPA being developed in separate workflow.

D. The SR

1. The SR shall be determined based on asset and liability projections for the contracts falling within the scope of these requirements, excluding those contracts valued using the methodology pursuant to applicable requirements in VM-A and VM-C, over a broad range of stochastically generated projection scenarios described in Section 8 and using prudent estimate assumptions as required in Section ~~3.GF~~ herein.
2. The ~~stochastic reserve~~SR amount for any group of contracts shall be determined as CTE70 of the scenario reserves following the requirements of Section 4, with the exception of groups of contracts for which a company elects the Deterministic Certification Option in Section 7.E, which shall be determined as the ~~scenario reserve~~DR following the requirements of Section 4.
3. The reserve may be determined in aggregate across various groups of contracts as a single model segment when determining the ~~stochastic reserve if the business and risks are not managed separately or are part of the same integrated risk management program. Aggregation is permitted if a resulting group of contracts (or model segment) follows the listed principles;~~SR

Commented [CD92]: Should this be Section 3.G?

Commented [X93]: Recommend replacing "the scenario reserve" with "the deterministic reserve". Note that we also disagree with calling the deterministic reserve a stochastic reserve (later in draft), which adds a good deal of confusion.

a. Aggregate in a manner that is consistent with the company's risk management strategy and reflects the likelihood of any change in risk offsets that could arise from shifts between product types, and

a.
b.

b. Using prudent actuarial judgement, consider the following elements when aggregating groups of contracts: whether groups of contracts are part of the same portfolio (or different portfolios that interact), same integrated risk management system, administered/managed together

4. Do not aggregate groups of contracts for which the company elects to use the Deterministic Certification Option in Section 7.E with any groups of contracts that do not use such option.

5.4. To the extent that these limits on the aggregation results results in more than one model segment, the stochastic reserve SR shall equal the sum of the stochastic reserve SR amounts computed for each model segment and scenario reserve DR amounts computed for each model segment for which the company elects to use the Deterministic Certification Option in Section 7.E.

E. Exclusion Test

1. To the extent that certain groups of contracts pass one of the defined the stochastic exclusion tests in Section 7.B, these groups of contracts may be valued using the methodology pursuant to applicable requirements in VM-A and VM-C, with the statutory maximum valuation rate for immediate annuities specified in Section 13.

a. For dividend-paying contracts, a dividend liability shall be established upon following requirements in VM-A and VM-C, as described above, for the base contract.

Guidance Note: The intention of contracts that pass the stochastic exclusion test is to provide the option to value contracts under VM-A and VM-C. This may apply to pre-PBR CARVM requirements in accordance with Actuarial Guideline XXXIII (AG33) methodology with type A, B, C rates for SPIAs issued before 2018; AG33 methodology with pre-PBR VM-22 rates for SPIAs issued on/after 2018; Actuarial Guideline XXXV (AG35) pre-PBR methodology for Fixed Indexed Annuities; and AG33 methodology (with interest rate updates for modernization initiatives on new contracts) for non-SPIAs.

2. The approach for grouping contracts company may not group together contract types with significantly different risk profiles when performing the exclusion tests should follow the same principles that underlie the aggregation approach for model segments discussed for Stochastic Reserves in Section D above test.

F. Allocation of the Aggregate Reserve to Contracts

The aggregate reserve shall be allocated to the contracts falling within the scope of these requirements using the method outlined in Section 4.2.1.3, with the exception of contract following Section 3.E which are to be calculated on a seriatim basis.

G. Prudent Estimate Assumptions:

1. With respect to the Stochastic Reserve SR in Section 3.D, the company shall establish the prudent estimate assumption for each risk factor in compliance with the requirements

Commented [X94]: As we have seen with VM-20, these types of extremely fuzzy requirements lead to full aggregation. If full aggregation is the intent, just explicitly allow it. We do recommend granular disclosures of the aggregation benefit for FIAs w/ GLBs, FIAs w/o GLBs, FDAs w/ GLBs, FDAs w/o GLBs, SPIAs, PRT, DIAs, and SSC.

Commented [VM2295R94]: In addition, consider NJ comment letter about longevity reinsurance, and how this fits into the above categories.

Commented [X96]: The term "Deterministic Certification Option" may be confusing, as there is no "deterministic" reserve, unlike VM-20. We recommend consideration of an alternative term. In addition, we recommend changing the phrasing to "with the exception of groups of contracts for which a company elects the [Deterministic Certification Option], following the requirements of Section 7.E."

Commented [X97]: Recommend replacing "the scenario reserve" with "the deterministic reserve". Note that we also disagree with calling the deterministic reserve a stochastic reserve (later in draft), which adds a good deal of confusion.

Commented [CD98]: suggest expanding header to "Stochastic Exclusion Test", for clarity

Commented [X99]: Seems to imply that only SPIAs would pass due to the linkage to Section 13. But the reference to interest rates should be broader, if even necessary. Suggest editing as:

"these groups of contracts may be valued using the methodology and statutory maximum valuation rate ... [8]"

Commented [CD100]: Suggest rewording to just say "the stochastic exclusion test". There is only 1 SET, with 3 ... [9]"

Commented [X101]: Typo. Delete for clarity.

Commented [X102]: We believe this guidance note is unnecessary as the intent of the section is clear, and ... [10]"

Commented [X103]: The statement in this section is not acceptable as discussed in the previous TX comment ... [11]"

Commented [X104]: This section seems to indicate that the grouping of contracts in exclusion testing should ... [12]"

Commented [CD105]: for clarity, change this reference to "Section 3.D"

Commented [CD106]: again, suggest rewording this to just say "the stochastic exclusion test"

Commented [X107]: Based on VM-20 language.

Commented [X108]: Either in this item or in Section 12 allocation to contracts not covered by PBR methodol ... [13]"

Commented [X109]: This sub-section seems more appropriate in Section 4 (or pulled out completely an ... [14]"

Commented [CD110]: VM-21 Section 3.H on simplifications, approximations, and modeling efficie ... [15]"

Commented [CD111]: should this be "Section 3.D"?

in Section 12 of Model #820 and must ~~periodically~~ at least every 3 years review and update the assumptions as appropriate in accordance with these requirements.

Commented [X112]: Recommend to periodically review at least every three years.

2. ~~The qualified actuary, to whom responsibility for this group of contracts is assigned, shall annually review relevant emerging experience for the purpose of assessing the appropriateness of the anticipated experience assumption. If the results of statistical testing or other testing the review indicate that previously anticipated experience for a given factor is inadequate, then the qualified actuary/Company shall set a new, adequate, anticipated experience assumption for the factor.~~

Commented [CD113]: Should this be "the company... shall", rather than the "qualified actuary... shall"? Not sure why this particular task falls on the QA, when "the company" generally has responsibility for PBR and, in the subsection directly before this one, the company is assigned the task of establishing prudent estimate assumptions.

3. To determine the prudent estimate assumptions, the ~~stochastic reserve~~SR shall also follow the requirements in Sections 4 and ~~general assumptions including Section 9 for asset assumptions, Section 10 for contract/policy holder behavior assumptions, and Section 11 for mortality assumptions, and Section 12 for general guidance and expense assumptions.~~

Commented [X114]: Suggest replacing "If the results of statistical testing or other testing" with "If the results of the review" to simplify language and avoid possible confusion.

Commented [X115]: Recommend replacing "the qualified actuary" with "the Company" consistent with general PBR requirements that the company set assumptions.

H. A company may use simplifications, approximations, and modeling efficiency techniques to calculate the SR and/or the additional standard projection amount required by this section if the company can demonstrate that the use of such techniques does not understate the reserve by a material amount, and the expected value of the reserve calculated using simplifications, approximations, and modeling efficiency techniques is not less than the expected value of the reserve calculated that does not use them.

Commented [CD116]: should this be "the company"? See prior comment.

Commented [CD117]: should this be "contract holder"?

Commented [X118]: Need a new section for the general assumptions, including specifics for the expense assumptions. APF currently exposed for VM-21. We should be consistent with any edits.

Guidance Note:

Examples of modeling efficiency techniques include, but are not limited to:

1. Choosing a reduced set of scenarios from a larger set consistent with prescribed models and parameters.
2. Generating a smaller liability or asset model to represent the full seriatim model using grouping compression techniques or other similar simplifications.

There are multiple ways of providing the demonstration required by Section 3.H. The complexity of the demonstration depends upon the simplifications, approximations or modeling efficiency techniques used. Examples include, but are not limited to:

1. Rounding at a transactional level in a direction that is clearly and consistently conservative or is clearly and consistently unbiased with an obviously immaterial impact on the result (e.g., rounding to the nearest dollar) would satisfy 3.H without needing a demonstration. However, rounding to too few significant digits relative to the quantity being rounded, even in an unbiased way, may be material and in that event, the company may need to provide a demonstration that the rounding would not produce a material understatement of the reserve.
2. A brute force demonstration involves calculating the minimum reserve both with and without the simplification, approximation or modeling efficiency technique, and making a direct comparison between the resulting reserve. Regardless of the specific simplification, approximation or modeling efficiency technique used, brute force demonstrations always satisfy the requirements of Section 3.H.

- 3. Choosing a reduced set of scenarios from a larger set consistent with prescribed models and parameters and providing a detailed demonstration of why it did not understate the reserve by a material amount and the expected value of the reserve would not be less than the expected value of the reserve that would otherwise be calculated. This demonstration may be a theoretical, statistical or mathematical argument establishing, to the satisfaction of the insurance commissioner, general bounds on the potential deviation in the reserve estimate rather than a brute force demonstration.
- 4. Justify the use of randomly sampling withdrawal ages for each contract instead of following the exact prescribed WDCM method by demonstrating that the random sampling method is materially equivalent to the exact prescribed approach, and the simplification does not materially reduce the Additional Standard Projection Amount and the final reported reserve. In particular, the company should demonstrate that the statistical variability of the results based on the random sampling approach is immaterial by testing different random sets, e.g., if randomly selecting a withdrawal age for each contract, the probability distribution of the withdrawal age should be stable and not vary significantly when using different random number sets.

Commented [X119]: Specific example should be tailored based on the SPA developed.

Commented [X120]: Added consistent with VM-21 Section 3.H, which was added to the 2022 VM.

Section 4: Determination of ~~Stochastic Reserve~~SR

A. Projection of Accumulated Deficiencies

1. General Description of Projection

The projection of accumulated deficiencies shall be made ignoring federal income tax in both cash flows and discount rates, and it shall reflect the dynamics of the expected cash flows for the entire group of contracts, reflecting all product features, including any guarantees provided under the contracts using prudent estimate liability assumptions defined in Sections 10 and 11 and asset assumptions defined in ~~Sections 4 and 9.D~~. The company shall project cash flows including the following:

Commented [CD121]: Should this refer to Section 4 and Section 9?

a. ~~Revenues~~Gross premium received by the company including gross premiums received from the ~~policyholder~~ policyholder/contract holder (including any due premiums as of the projected start date).

Commented [CD122]: "contract holder"?

Commented [X123]: If due premium as of the projected start date is included in the modeling, the final reported reserve should be adjusted by adding the due premium, otherwise there would be a double counting of the due premium asset. This needs to be clarified - see guidance note added below.
Recommend specifying the revenue in this bullet to be gross premium since there are other revenue items that are discussed in other bullets.

Guidance Note: If due premiums are modeled, the final reported reserve needs to be adjusted by adding the due premium asset.

b. Other revenues, including contractual fees and charges, and revenue-sharing income received by the company (net of applicable expenses).

c. All material benefits projected to be paid to ~~contract~~ policyholders including, but not limited to, death claims, surrender benefits and withdrawal benefits—reflecting the impact of all guarantees and adjusted to take into account amounts projected to be charged to account values on general account business. Any guarantees, in addition to market value adjustments assessed on projected withdrawals or surrenders, shall be taken into account.

Commented [CD124]: "contract holders"

~~Guidance Note: Amounts charged to account values on general account business are not revenue; examples include rider charges and expense charges.~~

Commented [X125]: The purpose of this guidance note is not clear as these charges would be reflected in the cash flows.

~~a.d.~~ Non-Guaranteed Elements (NGE) cash flows as described in Section 10.I.

Commented [CD126]: should this be Section 10.I?

~~b.e.~~ Insurance company expenses (including overhead and investment maintenance expense), commissions, contractual fees and charges, and revenue-sharing income received by the company (net of applicable expenses) other acquisition expenses associated with business in force as of the valuation date.

Commented [X127]: Changed investment expense to be maintenance expense so that it does not repeat what is included in bullet h.
Commented [X128]: Added acquisition expenses.

~~e.f.~~ ~~Net~~Cash flows associated with any reinsurance.

Commented [X129]: Take out the revenues that covers the investment expenses and added a separate bullet under bullet "a" for other revenues.

~~e.g.~~ Cash flows from hedging instruments as described in Section 4.A.4.

Commented [CD130]: Both net and gross cash flows have to be considered, so I don't agree with the addition of "Net" here

e.h. Cash receipts or disbursements associated with invested assets (other than policy loans) as described in Section 4.D.4, including investment income, realized capital

gains and losses, principal repayments, asset default costs, investment expenses, asset prepayments, and asset sales.

- fi. If modeled explicitly, cash flows related to policy loans as described in Section 10.I.2, including interest income, new loan payments and principal repayments.

Guidance Note: Future net policy loan cash flows include: policy loan interest paid in cash plus repayments of policy loan principal, including repayments occurring at death or surrender (note that the future benefits in Section 4.A.1.b are before consideration of policy loans), less additional policy loan principal (but excluding policy loan interest that is added to the policy loan principal balance).

Guidance Note: Section 4.A.1 requires market value adjustments (MVAs) on liability cash flows to be reflected because in a cash flow model, assets are assumed to be liquidated at market value to cover the cash outflow of the cash surrender; therefore, inclusion of the market value adjustment aligns the asset and liability cash flows. This may differ from the treatment of MVAs in the definition of cash surrender value (Section 1.D), which defines the statutory reserve floor for which the values must be aligned with the annual statement value of the assets.

Commented [X131]: Guidance Note regarding the market value adjustment seems still applies and should not be deleted. We reinstated the guidance note.

2. Grouping of Index Crediting Strategies

Index crediting strategies for fixed indexed annuities may be grouped for modeling using an approach that recognizes the investment guidelines and objectives of each index crediting strategy. In assigning each index crediting strategy to a grouping for projection purposes, the fundamental characteristics of the index crediting strategy shall be reflected, and the parameters shall have the appropriate relationship to the stochastically generated projection scenarios described in Section 8. The grouping shall reflect characteristics of the efficient frontier (i.e., returns generally cannot be increased without assuming additional risk).

Commented [X132]: Suggest editing the first sentence to note scope is FIAs and to avoid confusion regarding the term “investment guideline” as follows: “Index crediting strategies for fixed indexed annuities may be grouped for modeling using an approach that recognizes the investment guidelines and objectives of each index crediting strategy.”

Index accounts sharing similar index crediting strategies may also be grouped for modeling to an appropriately crafted proxy strategy normally expressed as a linear combination of recognized market indices, sub-indices or funds, in order to develop the investment return paths and associated interest crediting. Each index crediting strategy’s specific risk characteristics, associated index parameters, and relationship to the stochastically generated scenarios in Section 8 should be considered before grouping or assigning to a proxy strategy. Grouping and/or development of a proxy strategy may not be done in a manner that intentionally understates the resulting reserve.

3. Model Cells

Projections may be performed for each contract in force on the date of valuation or by assigning contracts into representative cells of model plans using all characteristics and criteria having a material impact on the size of the reserve. Assigning contracts to model cells may not be done in a manner that intentionally understates the resulting reserve.

Commented [X133]: Given that Section 9 covers hedging, we would suggest considering moving parts of Section 4.A.4 to that section.

Commented [X134]: VM-22 took out the CDHS requirement and replaced it with “future hedging program”. Future hedging should not materially reduce reserves or TAR if it is not well documented. The hedging DG is currently working on this for VM-20/VM-21. We will work with VM-22 subgroup to edit VM-22 accordingly.

4. Modeling of Hedges

- a. For a company that does not have a future hedging program ~~hed directly to supporting~~ the contracts falling under the scope of VM-22 ~~stochastic reserve~~ SR requirements:
 - i. The company shall not consider the cash flows from any future hedge purchases or any rebalancing of existing hedge assets in its modeling.
 - ii. Existing hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the starting assets. ~~The hedge assets may then be considered in one of two ways:~~
 - a) ~~Include the asset cash flows from any contractual payments and maturity values in the projection model; or~~
 - b) ~~No hedge positions in which case the hedge positions held on the valuation date are replaced with cash and/or other general account assets in an amount equal to the aggregate market value of these hedge positions.~~

Commented [X135]: Suggest rewording "Future hedging program" to "hedging program with future transactions" to avoid ambiguity.

Commented [CD136]: The word "future" to describe the "hedging program" here is confusing. What about current hedging programs with expected future hedge purchases? Why not just say "hedging program"? Also, I wanted to note that removing the concept of CDHS creates inconsistency with both VM-20 and VM-21. Why not retain it?

Guidance Note: ~~If the hedge positions held on the valuation date are replaced with cash, then as with any other cash, such amounts may then be invested following the company's investment strategy.~~

~~A company may switch from method a) to method b) at any time, but it may only change from b) to a) with the approval of the domiciliary commissioner.~~

- b. For a company that has a future hedging program ~~hed directly to supporting~~ the contracts falling under the scope of VM-22 ~~stochastic reserve~~ SR requirements:
 - i. For a hedging program with hedge payoffs that offset interest credits associated with indexed interest strategies (indexed interest credits):
 - a) In modeling cash flows, the company shall include the cash flows from future hedge purchases or any rebalancing of existing hedge assets that are intended solely to offset interest credits to ~~policyholders~~ contract holders.
 - b) Existing hedging instruments that are currently held by the company for ~~this purpose~~ offsetting the indexed credits in support of the contracts falling under the scope of these requirements shall be included in the starting assets. Existing hedging instruments that are currently held by the company ~~not for any other purpose~~ offsetting the indexed credits should be modeled consistently with the requirements of Section 4.A.4.a.ii.
 - c) An Index Credit Hedge Margin for these hedge instruments shall be reflected by reducing index interest credit hedge payoffs by a margin multiple that shall be justified by sufficient and credible company experience and be no less than [X%] multiplicatively of

Commented [CD137]: same comment as above, about the word "future" being confusing

Commented [CD138]: "contract holders"

Commented [X139]: "Any other purpose" in the last sentence seems overly broad and should be narrowed.

Commented [X140]: Specify "for this purpose" as "for offsetting the indexed credits", specify "for any other purposes" as "not for offsetting the indexed credits".

Commented [X141]: We believe the company should determine the appropriate margin based on their demonstration of effectiveness. Any guardrails on these undetermined values should be minimal, including as low as 0, subject to the appropriate demonstration of effectiveness. Further, we believe that documentation of effective product management should be contemplated in addition to historical effectiveness.

Commented [CD142]: clarify verbiage by saying "hedge instruments" or "derivative instruments"

the interest credited. In the absence of sufficient and credible company experience, a margin of [Y%] shall be assumed. There is no cap on the index credit hedge margin if company experience indicates actual error is greater than [Y%]. It is permissible to substitute stress-testing for sufficient and credible experience if such stress-testing comprehensively considers a robust range of future market conditions.

ii. For a company that hedges any contractual obligation or risks other than indexed interest credits, the detailed requirements for the modeling of hedges are defined in Section 9. The following requirements do not supersede the detailed requirements.

- a) The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the projections used in the determination of the ~~stochastic reserve~~ SR.
- b) The projections shall take into account the appropriate costs and benefits of hedge positions expected to be held in the future. Because models do not always accurately portray the results of hedge programs, the company shall, through back-testing and other means, assess the accuracy of the hedge modeling. The company shall determine a ~~stochastic reserve~~ SR as the weighted average of two CTE values; first, a CTE70 (“best efforts”) representing the company’s projection of all of the hedge cash flows, including future hedge purchases, and a second CTE70 (“adjusted”) which shall use only hedge assets held by the company on the valuation date and only future hedge purchases associated with indexed interest credited. These are discussed in greater detail in Section 9.
- c) ~~Consistent with Section 4.A.4.b.i., if the company has an indexed credit hedging program,~~ the index credit hedge margin for instruments associated with indexed interest credited shall be reflected by reducing hedge payoffs by a margin multiple as defined in Section 4.A.4.b.i.c) in both the “best efforts” run and the “adjusted” run.
- d) The use of products not falling under the scope of ~~these~~ VM-22 PBR Section 1 through 13 requirements (e.g., variable annuities) ~~(e.g., equity indexed annuities)~~ as a hedge shall not be recognized in the determination of accumulated deficiencies.

Commented [X143]: It is not clear how the stress testing can be used to support the index credit hedge margin. It is a test of the modeled strategy not actual performance and does not reflect any model error. We suggest that both back testing and stress testing be required and elaborated further:
 Clearly specify method and metrics used for the back testing with focus on all available recent relevant history, not limited to 12 months
 Recommend defined stress periods for stress testing, e.g., 2008 financial crisis, 2020 COVID impaired market conditions.

Commented [X144R143]: We will repeat the comment from our first letter: “Regarding hedge breakage expense assumptions, are both sources of error reflected here - error in the hedging itself, and error in the ability to accurately model it? Should we be separately considering the two limitations to make sure they are both clear: 1) the real-world hedging error and 2) the modeling error in reflecting the future hedging? Current error factor discussions seem muddled.”

Commented [X145]: Again, need to coordinate with Hedging DG.

Commented [X146]: Margins are discussed in a different section, so recommend deleting.

Commented [X147]: Edits were made to provide context and clarification for the requirements.

Commented [X148]: Clarify that “these requirements” should be specified as “VM-22 PBR requirements”. Again, we suggest reconsidering the use of “VM-23”, though.

Commented [CD149]: it might be helpful to keep the parenthetical statement, with “variable annuities” as the example

Guidance Note: Section 4.A.4.b.i is intended to address common situations for products with index crediting strategies where the company only hedges index credits or clearly separates index credit hedging from other hedging. In this case the hedge positions are considered similarly to other fixed income assets supporting the contracts, and a margin is reflected rather than modeling using

a CTE70 adjusted run with no future hedge purchases. If a company has a more comprehensive hedge strategy combining index credits, guaranteed benefit, and other risks (e.g., full fair value or economic hedging), an appropriate and documented bifurcation method should be used in the application of sections 4.A.4.b.i and 4.A.4.b.ii above for the hedge modeling and justification. Such bifurcation methods may quantify the specific risk exposure attributable to index credit liabilities versus other liabilities such as guaranteed living benefits, and apply such for the basis for allocation.

Guidance Note: The requirements of Section 4.A.4 govern the determination of reserves for annuity contracts and do not supersede any statutes, laws or regulations of any state or jurisdiction related to the use of derivative instruments for hedging purposes and should not be used in determining whether a company is permitted to use such instruments in any state or jurisdiction.

5. Revenue Sharing

If applicable, projections of accumulated deficiencies may include income from projected future revenue sharing, net of applicable projected expenses (net revenue-sharing income) if each of the following requirements set forth in VM-21 Sections 4.A.5.a through 4.A.5.f are met.

Commented [X150]: Unclear why Revenue Sharing is considered for non-variable products, can probably delete.

6. Length of Projections

Projections of accumulated deficiencies shall be run for as many future years as needed so that no materially greater reserve value would result from longer projection periods. Obligations remain at the end of the projection periods. Company can choose to run a shorter projection period but not shorter than 20 years and include the present value of the terminal benefits and expenses in the accumulated deficiency calculation.

Commented [X151]: Clarify that for revenue sharing, the entire subsection of VM-21 Section 4.A.5 applies.

Commented [CD152]: The "requirements are met" list is only in Section 4.A.5.a. Was the intent also to define the amount of net revenue-sharing income allowed in the projections? If so, will need to add verbiage to reference VM-21 Section 4.A.5.a through 4.A.5.f.

7. Interest Maintenance Reserve (IMR)

The IMR shall be handled consistently with the treatment in the company's cash flow testing, and the amounts should be adjusted to a pre-tax basis.

Commented [X153]: We recommend that the projection period requirement be in line with that of VM-20. Instead of meeting the immateriality requirement, calculate the present value of the terminal benefits and expenses and include it in the accumulated deficiency calculation.

Commented [VM22154]: See Bill Wilton's comment letter, expressing opposition to inclusion of pre-tax IMR.

B. Determination of Scenario Reserve

1. For a given scenario, the scenario reserve shall be determined using one of two methods described below:

Commented [CD155]: should we consider these changes to VM-21 as well, for consistency?

Commented [X156]: Section does not specify what the reserve floor shall be (if any) for contracts without cash surrender value.

a) The starting asset amount plus the greatest present value, as of the projection start date, of the projected accumulated deficiencies; or

Guidance Note: The greatest present value of accumulated deficiencies can be negative.

b) The direct iteration method, where the scenario reserve is determined by solving for the amount of starting assets which, when projected along with all contract cash flows, result in the defeasement of all projected future benefits and expenses at the end of the projection horizon with no positive accumulated deficiencies at the end of any projection year during the projection period.

The scenario reserve for any given scenario shall not be less than the cash surrender value with market value adjustment in aggregate on the valuation date for the group of contracts modeled in the projection.

Commented [X157]: For products that do not have a cash surrender value, it is recommended that VM-22 use a “working reserve” concept, similar to VM-21 Section 3.G requirement. Otherwise, there will be an issue aggregating those with and without CSV.

2. Discount Rates

In determining the scenario reserve, unless using the direct iteration method pursuant to Section 4.B.1.b, the accumulated deficiencies shall be discounted at the NAER on additional assets, as defined in Section 4.B.3.

Commented [X158]: For products with market value adjustment, needs to be floored at cash surrender value with MVA.

3. Determination of NAER on Additional Invested Asset Portfolio

a. The additional invested asset portfolio for a scenario is a portfolio of general account assets as of the valuation date, outside of the starting asset portfolio, that is required in that projection scenario so that the projection would not have a positive accumulated deficiency at the end of any projection year. This portfolio may include only (i) General Account assets available to the company on the valuation date that do not constitute part of the starting asset portfolio; and (ii) cash assets.

Commented [X159]: We believe that assets held in the separate account with performance not impacting policyholder benefits should be modeled consistent with how the business is managed.

Guidance Note:

Additional invested assets should be selected in a manner such that if the starting asset portfolio were revised to include the additional invested assets, the projection would not be expected to experience any positive accumulated deficiencies at the end of any projection year.

It is assumed that the accumulated deficiencies for this scenario projection are known.

- b. To determine the NAER on additional invested assets for a given scenario:
 - i. Project the additional invested asset portfolio as of the valuation date to the end of the projection period,
 - a) Investing any cash in the portfolio and reinvesting all investment proceeds using the company’s investment policy.
 - b) Excluding any liability cash flows.
 - c) Incorporating the appropriate returns, defaults and investment expenses for the given scenario.
 - ii. If the value of the projected additional invested asset portfolio does not equal or exceed the accumulated deficiencies at the end of each projection year for the scenario, increase the size of the initial additional invested asset portfolio as of the valuation date, and repeat the preceding step.
 - iii. Determine a vector of annual earned rates that replicates the growth in the additional invested asset portfolio from the valuation date to the end of the

projection period for the scenario. This vector will be the NAER for the given scenario.

- iv. If the depletion of assets within the projection results in an unreasonably high negative NAER upon borrowing, the NAER may be set to the assumed cost of borrowing associated with each projected time period, in accordance with Section 4.D.3.c, as a safe harbor.

Guidance Note: There are multiple ways to select the additional invested asset portfolio at the valuation date. Similarly, there are multiple ways to determine the earned rate vector. The company shall be consistent in its choice of methods, from one valuation to the next.

Commented [X160]: The wording “unreasonably high” is not clear or appropriate. Recommend this requirement be revised as part of a holistic fix to address extreme outliers in NAER both on the low and high side to handle anomalies for all of VM-20, VM-21, and VM-22. Some upper/lower cutoffs could be used that depend on scenario returns.

Commented [CD161]: “unreasonably high” is not well defined. Also, do we need to consider guardrails in the case of “unreasonably high” positive NAERs, not just negative NAERs?

C. Projection Scenarios

1. Number of Scenarios

The number of scenarios for which the scenario reserve shall be computed shall be the responsibility of the company, and it shall be considered to be sufficient if any resulting understatement in the ~~stochastic reserve~~ SR, as compared with that resulting from running additional scenarios, is not material.

2. Economic Scenario Generation

Treasury Department interest rate curves, as well as investment return paths for index funds, equities, and fixed income assets shall be determined on a stochastic basis using the methodology described in Section 8. If the company uses a proprietary generator to develop scenarios, the company shall demonstrate that the resulting scenarios meet the requirements described in Section 8.

D. Projection of Assets

1. Starting Asset Amount

- a. For the projections of accumulated deficiencies, the value of assets at the start of the projection shall be set equal to the approximate value of statutory reserves at the start of the projection plus the allocated amount of PIMR attributable to the assets selected. Assets shall be valued consistently with their annual statement values. The amount of such asset values shall equal the sum of the following items, all as of the start of the projection:
 - i. Any hedge instruments held in support of the contracts being valued; and
 - ii. An amount of assets held in the general account equal to the approximate value of statutory reserves as of the start of the projections less the amount in (i).
- b. If the amount of initial general account assets is negative, the model should reflect a projected interest expense. General account assets chosen for use as described

above shall be selected on a consistent basis from one reserve valuation hereunder to the next.

2. Valuation of Projected Assets

For purposes of determining the projected accumulated deficiencies, the value of projected assets shall be determined in a manner consistent with their value at the start of the projection. For assets assumed to be purchased during a projection, the value shall be determined in a manner consistent with the value of assets at the start of the projection that have similar investment characteristics. However, for derivative instruments that are used in hedging and are not assumed to be sold during a particular projection interval, the company may account for them at an amortized cost in an appropriate manner elected by the company.

Guidance Note: Accounting for hedge assets should recognize any methodology prescribed by a company's state of domicile.

3. General Account Assets

- a. General account assets shall be projected, net of projected defaults, using assumed investment returns consistent with their book value and expected to be realized in future periods as of the date of valuation. Initial assets that mature during the projection and positive cash flows projected for future periods shall be invested in a manner that is representative of and consistent with the company's investment policy, subject to the following requirements:
- i. The final maturities and cash flow structures of assets purchased in the model, such as the patterns of gross investment income and principal repayments or a fixed or floating rate interest basis, shall be determined by the company as part of the model representation;
 - ii. The combination of price and structure for fixed income investments and derivative instruments associated with fixed income investments shall appropriately reflect the projected Treasury Department curve along the relevant scenario and the requirements for gross asset spread assumptions stated below;
 - iii. For purchases of public non-callable corporate bonds, follow the requirements defined in VM-20 Sections 7.E, 7.F and 9.F. The prescribed spreads reflect current market conditions as of the model start date and grade to long-term conditions based on historical data at the start of projection year four;
 - iv. For transactions of derivative instruments associated with fixed income investments, reflect the prescribed assumptions in VM-20 Section 9.F for interest rate swap spreads;
 - v. For purchases of other fixed income investments, if included in ~~the model~~modeled company investment strategy, set assumed gross asset spreads over U.S. Treasuries in a manner that is consistent with, and results

Commented [X162]: This change was adopted for VM-20 and VM-21 for the 2022 VM.

in reasonable relationships to, the prescribed spreads for public non-callable corporate bonds and interest rate swaps.

- b. Notwithstanding the above requirements, the ~~modeled aggregate reserve shall be the higher of that produced by the modeled company investment strategy and any non-prescribed asset spreads shall be adjusted as necessary so that the aggregate reserve is not less than that which would be obtained produced~~ by substituting an alternative investment strategy in which all the fixed income reinvestment assets ~~are~~ have the same weighted average life (WAL) as the reinvestment assets in the modeled company investment strategy and are all public non-callable corporate bonds with gross asset spreads, asset default costs, and investment expenses by projection year that are consistent with a credit quality blend of:
 - i. ~~5% Treasury~~
 - ii. ~~15~~ 20% PBR credit rating 3 (Aa2/AA)
 - iii. ~~40~~ 80% PBR credit rating 6 (A2/A)
 - iv. ~~40~~ 40% PBR credit rating 9 (Baa/BBB)

Commented [CD163]: should this be "stochastic reserve", since this is within Section 4: Determination of Stochastic Reserve

Commented [X164]: This change was adopted for VM-20 and VM-21 for the 2022 VM.

Commented [CD165]: Suggest making this plural ("Treasuries") to be consistent with Section 13.B.9

Commented [X166]: The proposed reinvestment mix comes from a different assumption context in current VM-22, i.e., it is designed to calculate the maximum allowed valuation interest rates, while the reinvestment mix for VM-22 PBR draft is to put a guardrail around the fixed income reinvestment assets. A guardrail is not intended to identify outliers and should not be tied to an average. The biggest concern is with the higher allocation percentage in BBB assets. The valuation manual should build an appropriate level of conservatism in the valuation standards instead of reflecting industry trends. By moving from VM-20 and VM-21 required mix of 50%/50% AA/A to the proposed mix, the gross spreads increased by 20-30 bps for almost all WAL. We do not object to using a lower credit quality guardrail to get rid of any excessive conservatism. We recommend considering and comparing with other alternative allocations, something between the current and the proposed, e.g., 20% AA and 80% A. This will help regulators make informed decisions. In any case, we should be consistent with VM-20 and VM-21. If a change is made, it needs to be for all three.

Commented [CD167]: These references should be Section 4.D.3.a.iii and 4.D.3.a.v

- c. Any disinvestment shall be modeled in a manner that is consistent with the company's investment policy and that reflects the company's cost of borrowing where applicable, provided that the assumed cost of borrowing is not lower than the rate at which positive cash flows are reinvested in the same time period, taking into account duration, ratings, and other attributes of the borrowing mechanism. Gross asset spreads used in computing market values of assets sold in the model shall be consistent with, but not necessarily the same as, the gross asset spreads in Section 4.D.4.a.iii and Section 4.D.4.a.iv, recognizing that initial assets that mature during the projection may have different characteristics than modeled reinvestment assets.

Guidance Note: This limitation is being referred to Life Actuarial (A) Task Force for review. The simple language above "provided that the assumed cost of borrowing is not lower than the rate at which positive cash flows are reinvested in the same time period" is not intended to impose a literal requirement. It is intended to reflect a general concept to prevent excessively optimistic borrowing assumptions. It is recognized that borrowing parameters and rules can be complicated, such that modeling limitations may not allow for literal compliance, in every time step, as long as the reserve is not materially affected. However, if the company is unable to fully apply this restriction, prudence dictates that a company shall not allow borrowing assumptions to materially reduce the reserve.

4. Cash Flows from Invested Assets

- a. Cash flows from general account fixed income assets, including starting and reinvestment assets, shall be reflected in the projection as follows:

- i. Model gross investment income and principal repayments in accordance with the contractual provisions of each asset and in a manner consistent with each scenario.
- ii. Reflect asset default costs as prescribed in VM-20 Section 9.F and anticipated investment expenses through deductions to the gross investment income.
- iii. Model the proceeds arising from modeled asset sales and determine the portion representing any realized capital gains and losses.
- iv. Reflect any uncertainty in the timing and amounts of asset cash flows related to the paths of interest rates, equity returns or other economic values directly in the projection of asset cash flows. Asset defaults are not subject to this requirement, since asset default assumptions must be determined by the prescribed method in VM-20 Sections 7.E, 7.F and 9.F as noted in 4.a.ii above.

b. Cash flows from ~~general account index funds and general account equity assets—~~ i.e., non-fixed income assets having substantial volatility of returns, such as common stocks and real estate— including starting and reinvestment assets, shall be reflected in the projection as follows:

- i. Determine the grouping for asset categories and the allocation of specific assets to each category in a manner that is consistent with that used for index crediting strategies, as discussed in Section 4.A.2.
- ii. Project the gross investment return including realized and unrealized capital gains in a manner that is consistent with the stochastically generated scenarios.
- iii. Model the timing of an asset sale in a manner that is consistent with the investment policy of the company for that type of asset. Reflect expenses through a deduction to the gross investment return using prudent estimate assumptions.

c. Cash flows for each projection interval for policy loan assets shall follow the requirements in Section ~~10.H~~.

E. Projection of Annuitization Benefits

1. Assumed Annuitization Purchase Rates

- a. For payouts specified at issue (such as single premium immediate annuities, deferred income annuities, and certain structured settlements), such ~~purchase~~ ~~rates~~ shall reflect the payout rate specified in the contract.
- b. For purposes of projecting future elective annuitization benefits ~~(including annuitizations stemming from the election of a GMIB) and withdrawal amounts from GMWBs,~~ the projected annuitization purchase rates shall be determined

Commented [X168]: Correct an inaccurate VM section reference. The prescribed asset default spreads assumption should be referred to VM-20 Section 9.F. VM-20 Section 7.E and 7.F are requirements for reinvestment assets, disinvestment and cash flows for invested assets. In 7.F, VM-20 just refers to 9.F for defaults.

Commented [X169]: Request clarification around the meaning of "general account index funds".

Commented [CD170]: should this reference Section 10.H?

Commented [CD171]: is there a difference between "purchase rates" and "payout rates"? Both terms are used, so that makes the language unclear. If they are they same, suggest sticking with "purchase rates".

Commented [X172]: Suggest deleting "In contrast, for payouts specified at issue, the payout rates modeled should be consistent with those specified in the contract." as it appears to be covered by E.1.a.

Commented [X173]: Reinstate the parenthetical content "(including annuitizations stemming from the election of a GMIB)" since there are GMIB riders attached to fixed annuity products.

assuming that market interest rates available at the time of election are the interest rates used to project general account assets, as determined in Section 4.D.4. ~~In contrast, for payouts specified at issue, the payout rates modeled should be consistent with those specified in the contract.~~

Commented [X174]: Delete sentence since it repeats 4.E.1.a.

2. Projected Election of GMIBs, GMWBs and Other Annuitization Options

- a. For contracts projected to elect future annuitization options (including annuitizations stemming from the election of a GMIB) or for projections of GMWB benefits once the account value has been depleted, the projections ~~may~~ shall assume the contract will stay in force, the projected periodic payments are paid, and the associated maintenance expenses are incurred.

Commented [X175]: Suggest deleting “may” as there appears to be only option.

F. Frequency of Projection and Time Horizon

- 1. Use of an annual cash-flow frequency (“timestep”) is generally acceptable for benefits/features that are not sensitive to projection frequency. The lack of sensitivity to projection frequency should be validated by testing wherein the company should determine that the use of a more frequent—i.e., shorter—time step does not materially increase reserves. A more frequent time increment should always be used when the product features are sensitive to projection period frequency.

Commented [X176]: Projection Period is already covered in 4.A.6. Should not be in two places with different guidance.

Care must be taken in simulating fee income and expenses when using an annual time step. ~~For example, recognizing fee income at the end of each period after market movements, but prior to persistency decrements, would normally be an inappropriate assumption. It is also important that the frequency of the investment return model be linked appropriately to the projection horizon in the liability model. In particular, the horizon should be sufficiently long so as to capture the vast majority of costs (on a present value basis) from the scenarios.~~

Commented [X177]: Reinstate the deleted example of “For example, recognizing fee income at the end of each period after market movements, but prior to persistency decrements, would normally be an inappropriate assumption.”

Guidance Note: As a general guide, the forecast horizon should not be less than 20 years.

G. Compliance with ASOPs

When determining a stochastic reserve SR, the analysis shall conform to the ASOPs as promulgated from time to time by the ASB.

Under these requirements, an actuary will make various determinations, verifications and certifications. The company shall provide the actuary with the necessary information sufficient to permit the actuary to fulfill the responsibilities set forth in these requirements and responsibilities arising from each applicable ASOP.

Section 5: Reinsurance Ceded and Assumed

A. Treatment of Reinsurance Ceded in the Aggregate Reserve

1. Aggregate Reserve Pre- and Post-Reinsurance Ceded

As noted in Section 3.B, the aggregate reserve is determined both pre-reinsurance ceded and post-reinsurance ceded—i.e., the stochastic reserve additional standard projection amount, the SR, DR, and/or the reserve amount valued using requirements in VM-A and VM-C, as applicable—on both bases. Sections 5.A.2 and 5.A.3 discuss adjustments to inputs necessary to determine these components on both a post-reinsurance ceded and a pre-reinsurance ceded basis. Note that due allowance for reasonable approximations may be used where appropriate.

2.

2. Stochastic Reserve

Reflection of Reinsurance Cash Flows in the DR or SR

- a. In order to determine the aggregate reserve post-reinsurance ceded, accumulated deficiencies, scenario reserves, and the resulting stochastic reserve SR and DR shall be determined reflecting the effects of reinsurance treaties that meet the statutory requirements that would allow the treaty to be accounted for as reinsurance within statutory accounting. This involves including, where appropriate, all projected reinsurance premiums or other costs and all reinsurance recoveries, where the reinsurance cash flows reflect all the provisions in the reinsurance agreement, using prudent estimate assumptions.

i. In this section, reinsurance includes retrocession, and assuming company includes retrocessionaire.

ii. All significant terms and provisions within reinsurance treaties shall be reflected. In addition, it shall be assumed that each party is knowledgeable about the treaty provisions and will exercise them to their advantage.

Guidance Note: Renegotiation of the treaty upon the expiration of an experience refund provision or at any other time shall not be assumed if such would be beneficial to the company and not beneficial to the counterparty. This is applicable to both the ceding party and assuming party within a reinsurance arrangement.

iii. If the company has knowledge that a counterparty is financially impaired, the company shall establish a margin for the risk of default by the counterparty. In the absence of knowledge that the counterparty is financially impaired, the company is not required to establish a margin for the risk of default by the counterparty.

iv. A company shall include the cash flows from a reinsurance agreement or amendment in calculating the stochastic aggregate reserve if such qualifies for credit in compliance with Appendix A-791 of the Accounting Practices and Procedures Manual. If a reinsurance agreement or amendment does not qualify for credit for reinsurance but treating the reinsurance agreement or amendment as if it did so qualify would result in a reduction to the company's surplus, then the company shall increase the minimum aggregate reserve by the absolute value of such reductions in surplus.

Commented [X178]: The wording and titling may need to be tightened due to clarify which items apply to assumed and ceded reinsurance in the text.

Commented [X179]: Delete and just have title be "Reinsurance". Should structure be more like VM-20?

Commented [X180R179]: I, II (and III –VM-21 needs edits)

Commented [CD181]: "and Assumed" is added here, but there is still only a subsection 5.A that addresses reinsurance ceded (at least in the section header).

Commented [CD182]: need to add "and Assumed" here?

Commented [X183]: reinstate

Commented [X184]: Can take out vague approximation references, since now have a general allowance for appropriate approximations.

Commented [X185]: Consistent with VM-20

Commented [X186]: VM-20 Section 8.A.1 makes sense here as well.

Commented [CD187]: should this be "stochastic reserve"?

Commented [X188]: VM-22 draft so far uses aggregate, not minimum.

- b. In order to determine the ~~stochastic reserve~~ SR and DR on a pre-reinsurance ceded basis, accumulated deficiencies, scenario reserves, and the resulting ~~stochastic reserve~~ SR and DR shall be determined ignoring the effects of reinsurance ceded within the projections. Different approaches may be used to determine the starting assets on the ceded portion of the contracts, dependent upon the characteristics of a given treaty:
- i. For a standard coinsurance treaty, where the assets supporting the ceded liabilities were transferred to the assuming reinsurer, one acceptable approach involves a projection based on using starting assets on the ceded portion of the policies that are similar to those supporting the retained portion of the ceded policies or supporting similar types of policies. Scaling up each asset supporting the retained portion of the contract is also an acceptable method.

Guidance Note: For standard pro rata insurance treaties ~~(does that do not include experience refunds)~~, where allocated expenses are similar to the renewal expense allowance, reflecting the quota share applied to the present value of future reinsurance cash flows pertaining to the reinsured block of business may be considered as a possible approach to determine the ceded reserves.

Commented [X189]: Correct phrasing.

- ii. Alternatively, a treaty may contain an identifiable portfolio of assets associated with the ceded liabilities. This could be the case for several forms of reinsurance: funds withheld coinsurance; modified coinsurance; coinsurance with a trust. To the extent these assets would be available to the cedant, an acceptable approach could involve modeling this portfolio of assets. To the extent that these assets were insufficient to defease the ceded liabilities, the modeling would partially default to the approach discussed for a standard coinsurance treaty. To the extent these assets exceeded what might be needed to defease the ceded liabilities (perhaps an over collateralization requirement in a trust), the inclusion of such assets shall be limited.

Guidance Note: Section 3.5.2 in ASOP No. 52, *Principle-Based Reserves for Life Products under the NAIC Valuation Manual*, provides possible methods for constructing a hypothetical pre-reinsurance asset portfolio, if necessary, for purposes of the pre-reinsurance reserve calculation.

- c. An assuming company shall use assumptions to project cash flows to and from ceding companies that reflect the assuming company’s experience for the business segment to which the reinsured policies belong and reflect the terms of the reinsurance agreement.
- d. The company shall assume that the counterparties to a reinsurance agreement are knowledgeable about the contingencies involved in the agreement and likely to exercise the terms of the agreement to their respective advantage, taking into account the context of the agreement in the entire economic relationship between the parties. In setting assumptions for the NGE in reinsurance cash flows, the company shall include, but not be limited to, the following:
 - i. The usual and customary practices associated with such agreements.
 - ii. Past practices by the parties concerning the changing of terms, in an economic environment similar to that projected.
 - iii. Any limits placed upon either party’s ability to exercise contractual options in the reinsurance agreement.
 - iv. The ability of the direct-writing company to modify the terms of its policies in response to changes in reinsurance terms.
 - v. Actions that might be taken by a party if the counterparty is in financial difficulty.

Commented [X190]: VM-20 Section 8.C.7 seems particularly applicable. We encourage others to also review VM-20 Section 8 for other sections that should also apply. VM-20 Section 8 is much more developed than VM-21 Section 5 with many more considerations for assumption-setting, and we would suggest the VM-22 subgroup consider rewriting starting with VM-20 instead of VM-21.

3. Reserve Determined Upon Passing the Exclusion Test

If a company passes the stochastic exclusion test and elects to use a methodology pursuant to applicable Sections VM-A and VM-C, as allowed in Section 3.E, it is important to note that the methodology produces reserves on a pre-reinsurance ceded basis. Therefore, the reserve must be adjusted for any reinsurance ceded accordingly. In addition, reserves valued under applicable Sections in VM-A and VM-C, unadjusted for reinsurance, shall be applied to the contracts falling under the scope of these requirements to determine the aggregate reserve prior to reinsurance.

It should be noted that the ~~pre-reinsurance-ceded~~ and ~~post-reinsurance-ceded~~ reserves may result in different outcomes for the exclusion test. In particular, it is possible that the ~~pre-reinsurance-ceded~~ reserves would pass the relevant exclusion test (and allow the use of VM-A and VM-C) while the ~~post-reinsurance-ceded~~ reserves might not, or vice versa.

4. Additional Standard Projection Amount

Where reinsurance is ceded, the additional standard projection amount shall be calculated as described in Section 6 to reflect the reinsurance costs and reinsurance recoveries under the reinsurance treaties. The additional standard projection amount shall also be calculated pre-reinsurance ceded using the methods described in Section 6 but ignoring the effects of the reinsurance ceded.

Commented [X191]: Both referring to reinsurance ceded. Should be clarified.

Commented [X192]: ceded

Commented [X193]: ceded

Commented [X194]: Opposite could also be true.

Commented [X195]: The current VM-21 language here looks to work for VM-22 without needing to know the specific assumptions, etc., for the SPA.

Section 6: To Be Determined

Commented [VM22196]: NY Comment Letter: Current CARVM standards should be a minimum floor for VM-22 policies, and only the stochastic reserve should permit grouping whereas the minimum floor should be seriatim.

Commented [X197]: SPA Section placement here still makes sense, but SPA under development.

Commented [VM22198]: Refer to equitable comment letter, which expresses support for the standard projection amount as a binding floor, with the suggestion to rely on company-specific assumptions for insignificant assumptions that are difficult to develop.

~~Section 6: To Be Determined~~

Section 7: Exclusion Testing

A. Stochastic Exclusion Test Requirement Overview

1. The company may elect to exclude one or more groups of contracts from the stochastic reserve SR calculation if the stochastic exclusion test (SET) is satisfied for ~~that~~ each of the group of contracts. The company has the option to calculate or not calculate the SET.
 - a. If the company does not elect to calculate the SET for one or more groups of contracts, or the company calculates the SET and fails the test for such groups of contracts, the reserve methodology described in Section 4 shall be used for calculating the aggregate reserve for those groups of contracts.
 - b. If the company elects to calculate the SET for one or more groups of contracts, and passes the test for such groups of contracts, then for each group of contracts that passes the SET, the company shall choose whether or not to use the reserve methodology described in Section 4 for these groups that group of contracts. If the reserve methodology described in Section 4 is not used for one or more groups of contracts, then the company shall use the reserve methodology pursuant to applicable requirements in VM-A and VM-C to calculate the aggregate reserve for those groups of contracts.
 - c. A company may not exclude a group of contracts from the stochastic reserve SR requirements if there are one or more future hedging programs associated with supporting the contracts, with the exception of hedging programs solely supporting index credits as described in Section 9.A.1.

Commented [X199]: Need to modify exclusion testing section to reflect SPA.

Commented [X200]: Inconsistent groups vs. group references.

Commented [CD201]: should this be "stochastic reserve", since Section 4 is about determining the stochastic reserve.

Commented [VM22202R201]: Follow Section 4 method of stochastic reserve for Section 3 aggregate reserve if not using the SET

Commented [X203]: Decision is independent for each group the SET is performed on.

Commented [CD204]: suggest deleting this highlighted part of the sentence

Commented [CD205]: see earlier comment about the phrase "future hedge program" being confusing.

Commented [X206]: Is "associated with the contracts" the same as the earlier use of "supporting the contracts"? Should the same verbiage be used here? If there is asset hedging for the assets supporting the contracts, it should be included. Need to define "solely supporting" index credits, and also have criteria on the effectiveness/error and documentation of any such hedging that is allowed for excluded business.

B. Requirement to Pass the Types of Stochastic Exclusion Tests

Groups of contracts pass the SET if one of the following is met:

1. Stochastic Exclusion Ratio Test (SERT)—Annually within 12 months before the valuation date within 12 months before the valuation date the company demonstrates that the groups of contracts pass the SERT defined in Section 7.C.
2. Stochastic Exclusion Demonstration Test—In the first year and at least once every three calendar years thereafter, the company provides a demonstration in the PBR Actuarial Report as specified in Section 7.D.
3. SET Certification Method—For groups of contracts that do not have guaranteed living benefits, future hedging programs, or pension risk transfer business, in the first year and at least every third calendar year thereafter, the company provides a certification by a qualified actuary that the group of contracts is not subject to material aggregate risk levels across interest rate risk, mortality and/or longevity risk, or asset return volatility risk (i.e., the risk on non-fixed-income investments having substantial volatility of returns, such as common stocks and real estate investments). The company shall provide the certification and documentation supporting the certification to the commissioner upon request.

Commented [CD207]: Suggest renaming this section header/name to "Requirements to Pass the SET". There is only 1 SET, but 3 ways to pass it (SERT, Demonstration or Certifications). The language gets confusing (here and elsewhere) when you start saying there are different "types" of SETs.

Commented [CD208]: not sure why this part is deleted. Suggest adding it back in.

Commented [X209]: We recommend removing "pension risk transfer business" from products scoped out of SET certification method. It is unclear why this business ... [16]

Commented [VM22210R209]: Determine whether to address longevity reinsurance in this topic, in light of ... [17]

Commented [CD211]: See earlier comments about the use of "future"

Commented [X212]: Needs to be defined.

Commented [X213]: Needs a comma

Commented [CD214]: need comma after "business"

Commented [CD215]: what is meant by "aggregate risk levels"? Aggregated across what? Need clarification ... [18]

Commented [X216]: This is not in VM-20 and would substantially change the exclusion. The intent is not ... [19]

Commented [X217]: This is covered by VM-31

Commented [CD218]: note, there is no insertion of "aggregate risk levels across" here, like there was ab ... [20]

Guidance Note: The qualified actuary should develop documentation to support the actuarial certification that presents his or her analysis clearly and in detail sufficient for another actuary to understand the analysis and reasons for the actuary's conclusion that the group of contracts is not subject to material interest rate risk, mortality and/or longevity risk, or asset return volatility risk.

Examples of methods a qualified actuary could use to support the actuarial certification include, but are not limited to:

- a) A demonstration that, using requirements under VM-A and VM-C for the group of contracts, reserves calculated using requirements under VM-A and VM-C are at least as great as the assets required to support the group of contracts and certificates using the company's cash-flow testing model under each of the 1648 scenarios identified in this section Section 7.C.1 or alternatively each of the New York seven scenarios, economic scenarios, under each of the three mortality adjustment factors identified in Section 7.C.1.
- b) A demonstration that the group of contracts passed the SERT within 36 months prior to the valuation date and the company has not had a material change in its interest rate risk, mortality and/or longevity risk, or asset return volatility risk.
- c) A qualitative risk assessment of the group of contracts that concludes that the group of contracts does not have material interest rate risk, mortality and/or longevity risk, or asset return volatility. Such assessment would include an analysis of product guarantees, the company's non-guaranteed elements (NGEs) policy, assets backing the group of contracts, the company's longevity risk, and the company's investment strategy.

Commented [CD219]: This wording is a little clunky here. My suggestion: "A demonstration that, for the group of contracts, reserves calculated using requirements under VM-A and VM-C are at least as great..."

Commented [X220]: Replace all "contracts" with "contracts and certificates"

Commented [X221]: Need mortality stresses if using NY7

Commented [X222]: Need complete list of risks

Commented [CD223]: need to insert "longevity risk" here

Commented [X224]: Need complete list of risks

Commented [X225]: Need to add a review of the company's mortality and/or longevity risk.

Commented [X226]: As written, the SERT assumes a single premium product given the change of the denominator to the scenario reserve. Alternative product designs (such as longevity swap) could result in unintended results. We recommend maintaining consistency with VM-20 and using a denominator of future benefits (annuity payments, DBs, etc., excluding premium considerations, expenses, etc.).

Commented [X227]: Using (a) in the denominator instead of VM-20's (c) which is a PV of benefits could make this ratio unstable when the scenario reserve (a) is very small. This is particularly applicable if the block being tested does not have CSV.

Commented [X228]: The variability should be assured to be immaterial based on the company's materiality standard.

Commented [X229]: Correcting reference

Commented [CD230]: better to keep the reference to the full Section (i.e., Section 7.C.2.a.i)

Commented [X231]: Correcting reference

Commented [CD232]: better to keep the reference to the full Section (i.e., Section 7.C.2.b)

Commented [X233]: Need to modify in case largest result is just from the mortality stress on the same scenario.

Commented [X234]: Need to modify in case largest result is just from the economic stress on the same mortality level.

Commented [X235]: Need to ensure we have captured a prudent level of mortality variation for any given company in this test.

Commented [X236]: Updating to reflect mortality/economic scenario combinations.

C. Stochastic Exclusion Ratio Test

- 1. In order to exclude a group of contracts from the stochastic reserve SR requirements under the stochastic exclusion ratio test (SERT), a company shall demonstrate that the ratio of (b-a)/a is less than the greater of [x]% where x is the percentage change that would trigger the company's materiality standard, where:
 - a. a = the adjusted scenario reserve described in Paragraph 7.C.2.a below using economic scenario 9, and 100% as the adjustment factor for mortality, the baseline economic scenario, as described in Appendix 1.E of VM-20.
 - b. b = the largest adjusted scenario reserve described in Paragraph 7.C.2.b-a below under any of the other 1516 economic scenarios described in Appendix 1.E of VM-20 under both [95]%, 100%, and [105]% of anticipated experience mortality excluding margins. Because mortality variability may differ by company, if the magnitude of the company's margin for mortality exceeds 5%, then the company shall use the baseline mortality and the mortality augmented by plus and minus the company's margin for this exercise.

Guidance Note: Note that the numerator should be the largest adjusted scenario reserve for scenarios other than the baseline economic scenario, minus the adjusted scenario reserve for the baseline economic scenario, and 100% as the adjustment factor for mortality. This is not necessarily the same as the biggest difference from the adjusted scenario reserve for the baseline economic scenario and 100% as the adjustment factor for mortality, or the absolute value of the biggest difference from the adjusted scenario reserve for the baseline economic scenario and 100% as the adjustment factor for mortality, both of which could lead to an incorrect test result.

There are 47 (=16x3-1) combined economic and mortality scenarios that should be compared for the determination of b.

Commented [X237]: For clarity

2. In calculating the ratio in ~~subsection (Section 7.C.1)~~ above:

Commented [X238]: Be consistent with standard VM references

a. The company shall calculate an adjusted scenario reserve for the group of contracts for ~~each of each of the 16 scenarios~~ economic scenarios using the three levels of mortality adjustment factors that is equal to either (i) or (ii) below:

Commented [CD239]: better to keep the reference to the full Section (i.e., Section 7.C.1)

Commented [CD240]: why delete this? seems like it wouldn't hurt to keep this language, for additional clarity

i. The scenario reserve defined in Section 4, but with the following differences:

- a) Using anticipated experience assumptions with no margins, with the exception of mortality factors described in ~~Paragraph Section 7.C.1.b~~ of this section.
- b) Using the interest rates and equity return assumptions specific to each scenario.
- c) Using NAER and discount rates defined in Section 4 specific to each scenario to discount the cash flows.
- d) Shall reflect future mortality improvement in line with anticipated experience assumptions.
- e) Shall not reflect correlation between longevity and economic risks.

Commented [X241]: Be consistent with standard VM references

Commented [CD242]: better to reference the full Section (i.e., Section 7.C.1.b)

ii. The gross premium reserve developed from the cash flows from the company's asset adequacy analysis models, using the experience assumptions of the company's cash-flow analysis, but with the following differences:

- a) Using the interest rates and equity return assumptions specific to each scenario.
- b) Using the mortality scalars described in ~~Paragraph Section 7.C.1.b~~ of this section.
- c) Using the methodology to determine NAER and discount rates defined in Section 4 specific to each scenario to discount the cash flows, but using the company's cash-flow testing assumptions for default costs and reinvestment earnings.

Commented [X243]: Be consistent with standard VM references

Commented [CD244]: better to reference the full Section

b. ~~The company shall use the most current 16 available baseline economic scenario and the 15 other~~-economic scenarios published by the NAIC. The methodology for creating these scenarios can be found in Appendix 1 of VM-20.

Commented [X245]: No reason for change/inconsistency with other chapters - reject edit.

c. The company shall use assumptions within each scenario that are dynamically adjusted as appropriate for consistency with each tested scenario.

d. ~~The company may not group together contract types with significantly different risk profiles~~ for purposes of calculating this ratio.

Commented [X246]: Clarification is needed around reference to "significantly different risk profiles".

- e. If the company has reinsurance arrangements that are pro rata coinsurance and do not materially impact the interest rate risk, longevity risk, or asset return volatility in the contract, then the company may elect to not conduct the stochastic exclusion ratio test under only a pre-reinsurance-ceded single basis upon determining the, either pre-reinsurance-ceded basis upon determining the pre or post-reinsurance-reserve-ceded aggregate reserve.
3. If the ratio calculated in this section is less than [x] % pre-non-proportional reinsurance, but is greater than [x] % post-non-proportional reinsurance, the group of contracts will still pass the SERT if the company can demonstrate that the sensitivity of the adjusted scenario reserve to economic scenarios is comparable pre- and post-non-proportional reinsurance.

Commented [CD247]: to be more specific, say "stochastic exclusion ratio test"

Commented [X248]: Original did not make sense. Also, the point is that you just need one basis, either pre-reinsurance or post-reinsurance.

Commented [X249]: We request clarification or definition of the term "non-proportional reinsurance".

Commented [X250]: Does this make sense for VM-20 as well?

- a. An example of an acceptable demonstration:
- i. For convenience in notation • SERT = the ratio (b-a)/a defined in Section 7.C.1 above
- a) The pre-non-proportional reinsurance results are "gross of non-proportional," with a subscript "gn," so denoted SERT_{gn}
- b) The post-non-proportional results are "net of non-proportional," with subscript "nn," so denoted SERT_{nn}
- ii. If a block of business being tested is subject to one or more non-proportional reinsurance cessions as well as other forms of reinsurance, such as pro rata coinsurance, take "gross of non-proportional" to mean net of all prorata reinsurance but ignoring the non-proportional contract(s), and "net of non-proportional" to mean net of *all* reinsurance contracts. That is, treat non-proportional reinsurance as the last reinsurance in, and compute certain values below with and without that last component.

iii. So, if SERT_{gn} ≤ [x] % but SERT_{nn} > [x] %, then compute the largest percent increase in reserve (LPIR) = (b-a)/a, both "gross of non-proportional" and "net of non-proportional."

Commented [X251]: We believe subscript "gy" should be "gn".

Commented [X252]: % missing

$$LPIR_{gn} = (b_{gy} - a_{gy}) / a_{gn}$$

$$LPIR_{nn} = (b_{ny} - a_{ny}) / a_{nn}$$

Commented [X253]: Note that LPIR is just the SERT using the VM-22 formulation (b-a)/a.

Note that the scenario underlying b_{gn} could be different from the scenario underlying b_{nn}.

If SERT_{gn} × LPIR_{nn} / LPIR_{gn} < [x] %, then the block of contracts passes the SERT.

Commented [X254]: The first and last terms on the left side of this equation cancel out, so it just ends up with needing to pass the SERT on the net basis again. This worked when (c) was the denominator, but now with (a) in the denominator this adjustment is meaningless. Take out the whole example, or revise the SERT to use benefits in the denominator again. Or some new formulation for SERT.

- b. Another more qualitative approach is to calculate the adjusted scenario reserves for the ~~1648~~ combined economic and mortality scenarios both gross and net of reinsurance to demonstrate that there is a similar pattern of sensitivity by scenario.

4. The SERT may not be used for a group of contracts if, using the current year’s data, (i) the stochastic exclusion demonstration test defined in Section 7.D had already been attempted using the method in this section of Section 7.D.2.a or Section 7.D.2.b and did not pass; or (ii) the qualified actuary had actively undertaken to perform the certification method in this section and concluded that such certification could not legitimately be made.

Commented [X255]: In VM-20, it is only prohibited for the clearly sufficiently robust attempts of the demonstration method where failing shows the SR would be greater. The other two options could have been incomplete demonstrations and not necessarily imply the SR would be dominant.

D. Stochastic Exclusion Demonstration Test

1. In order to exclude a group of contracts from the stochastic reserve SR requirements using the methodology in this section Stochastic Exclusion Demonstration Test, the company must provide a demonstration in the PBR Actuarial Report in the first year and at least once every three calendar years thereafter that complies with the following:

Commented [X256]: Clearer language

- a. The demonstration shall provide a reasonable assurance that if the stochastic reserve SR was calculated on a stand-alone basis for the group of contracts subject to the stochastic reserve SR exclusion, the resulting stochastic reserve for those groups of contracts would not be higher than the statutory reserve determined pursuant to the applicable requirements in VM-A and VM-C. The demonstration shall take into account whether changing conditions over the current and two subsequent calendar years would be likely to change the conclusion to exclude the group of contracts from the stochastic reserve SR requirements.

Commented [X257]: Does this statement imply a floor reserve of VM-A and VM-C? VM-20 does require the NPR as the floor of the reserve but as written, VM-22 does not require a floor reserve. Recommend removing 1.a. Same statement with the 2.a statement demonstration. This requirement does not apply to the other permitted tests, which seemed counterintuitive.

- b. If, as of the end of any calendar year, the company determines the aggregate statutory reserve determined pursuant to the applicable requirements in VM-A and VM-C for the group of contracts no longer adequately provides for all material risks, the exclusion shall be discontinued, and the company fails the SERT SET for those contracts.

Commented [CD258]: should this, instead, refer to the "statutory reserve determined pursuant to the applicable requirements in VM-A and VM-C?"

Commented [X259]: Typo is also in VM-20

- c. The demonstration may be based on analysis from a date that precedes the valuation date for the initial year to which it applies if the demonstration includes an explanation of why the use of such a date will not produce a material change in the outcome, as compared to results based on an analysis as of the valuation date.
- d. The demonstration shall provide an effective evaluation of the residual risk exposure remaining after risk mitigation techniques, such as derivative programs and reinsurance.

2. The company may use one of the following or another method acceptable to the insurance commissioner to demonstrate compliance with subsection Section 7.D.1 above:

Commented [CD260]: should say "Section"

- a. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the stochastic reserve SR calculated on a stand-alone basis.
- b. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the scenario reserve that results from each of a sufficient number of adverse deterministic scenarios.

- c. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the ~~stochastic reserve~~SR calculated on a stand-alone basis, but using a representative sample of contracts in the ~~stochastic reserve~~SR calculations.
- d. Demonstrate that any risk characteristics that would otherwise cause the ~~stochastic reserve~~SR calculated on a stand-alone basis to exceed the statutory reserve calculated in accordance with VM-A and VM-C, are not present or have been substantially eliminated through actions such as hedging, investment strategy, reinsurance or passing the risk on to the ~~contract policyholder~~ by contract provision.

Commented [CD261]: "contract holder"

E. Deterministic Certification Option

Commented [X262]: Need SPA for DR as well as SR

- 1. The company ~~has the option to may~~ determine the ~~stochastic reserve~~SR for a group of contracts using a single deterministic economic scenario, subject to the following conditions.

Commented [CD263]: suggest saying "may" instead of "has the option to"

- a. The company certifies that economic conditions do not materially influence anticipated contract holder behavior for the group of ~~policies, contracts and certificates~~. Examples of contract holder options that are materially influenced by economic conditions include surrender benefits, recurring premium payments, and guaranteed living benefits.

Commented [CD264]: "contracts"

- b. The company certifies that the group of ~~policies, contracts and certificates~~ is not supported by a reinvestment strategy that contains ~~future hedge purchases~~.

Commented [X265]: Clarify if this was the intent to exclude contracts supported by index hedging.

- c. ~~The company must perform and disclose results from the stochastic exclusion ratio test following the requirements in Section 7.C, thereby disclosing and the scenario reserve volatility across various company must pass the SERT when considering only the 16 economic scenarios, paired with the 100% mortality scenario.~~

Commented [X266]: This is needed to assure the SR is not needed. Otherwise, this section is incomplete and does not support using a DR.

- d. The company must disclose a description of contracts and associated features in ~~the certification~~.

Commented [X267]: Agree with drafting note. Edits above.

Drafting Note: Consider revisiting Paragraph E.1.c to possibly either require i) falling below a preset threshold for the exclusion ratio test under a single longevity/mortality scenario; or ii) to pass the exclusion test if longevity is not included as part of the ratio test.

Commented [X268]: It may not be appropriate to use scenario 12 to calculate the scenario reserve for SPIA. See this article <https://www.soa.org/sections/financial-reporting/financial-reporting-newsletter/2021/july/fr-2021-07-su/>

- 2. The ~~stochastic reserve~~SR for the group of contracts under the Deterministic Certification Option is determined as follows:
 - a. Cash flows are projected in compliance with the applicable requirements in Section 4, Section 5, Section 10, and Section 11 of VM-22 over a single economic scenario (scenario 12 found in Appendix 1 of VM-20).
 - b. The ~~stochastic reserve~~SR equals the scenario reserve following the requirements for Section 4.

"in an increasing interest rate environment for business where policyholder behavior is sensitive to prevailing interest rates, life insurers may face an increase in disintermediation risk (i.e., the risk of having to sell assets, potentially at a loss, to fund policyholder surrender benefits) For example, rising interest rates, particularly sudden jumps (e.g., New York 7 pop-up scenario with an immediate interest rate increase of 3 percent), may lead to higher actual and projected policyholder surrenders as policyholders seek out higher yielding investment opportunities. These increasing cash demands may require fixed income assets to be sold at depressed prices, and resultant projected losses (or lower gains) may result in reserve insufficiencies, necessitating the need for AAT reserves."

Guidance Note: The Deterministic Certification Option is intended to provide a non-stochastic option for Single Premium Immediate Annuities (SPIAs) and similar payout annuity products that contain limited or no optionality in the asset and liability cash flow projections.

Commented [X269]: Recommend deleting guidance note, as it doesn't provide full or clear scope of what may be excluded, so could be misread to either guarantee option for certain products or exclude the option for other products.

Section 8: To Be Determined (Scenario Generation for VM-21)

Section 9: Modeling Hedges under a ~~Future~~ Non-Index Credit Hedging Strategy

A. Initial Considerations

1. This section applies to modeling of hedges other than situations where the company (a) only hedges index credits. ~~If the company, or (b) clearly separates index credit hedging from other hedging, then only the section only pertains to the other hedging if the index hedging follows.~~ In those situations, the modeling of hedges supporting index credits can be simplified including applying an index credit hedge margin, following the requirements in Section 4.A.4.b.i.
2. The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the calculation of the ~~stochastic reserve~~SR, determined in accordance with Section 3.D and Section 4.D.
3. The company shall take into account the costs and benefits of hedge positions expected to be held by the company in the future along each scenario. Company management is responsible for developing, documenting, executing and evaluating the investment strategy for future hedge purchases. ~~Prior to reflection in projections, the strategy for future hedge purposes shall be the actual practice of the company for a period of time not less than [6] months, including the hedging strategy, used to implement the investment policy.~~
4. For this purpose, the investment assets refer to all the assets, including derivatives supporting covered products and guarantees. This also is referred to as the investment portfolio. The investment strategy is the set of all asset holdings at all points in time in all scenarios. The hedging portfolio, which also is referred to as the hedging assets, is a subset of the investment assets. The hedging strategy is the hedging asset holdings at all points in time in all scenarios. There is no attempt to distinguish what is the hedging portfolio and what is the investment portfolio in this section. Nor is the distinction between investment strategy and hedging strategy formally made here. Where necessary to give effect to the intent of this section, the requirements applicable to the hedging portfolio or the hedging strategy are to apply to the overall investment portfolio and investment strategy.
5. This particularly applies to restrictions on the reasonableness or acceptability of the models that make up the stochastic cash-flow model used to perform the projections, since these restrictions are inherently restrictions on the joint modeling of the hedging and non-hedging portfolio. To give effect to these requirements, they must apply to the overall investment strategy and investment portfolio.

Commented [X270]: Section 4.A.4 (Modeling of Hedges) has some relationship with this section, we request clarification around the applicability of these two areas of hedge guidance.

Commented [CD271]: see previous comments about use of the word "future" to describe "hedging strategy"

Commented [X272]: We seek clarification of this text: if a company only hedges indices or separates index crediting from other hedges, does this apply, or does it only apply to any other hedging?

Commented [X273]: The sentence "Prior to reflection in projections, the strategy for future hedge purposes shall be the actual practice of the company for a period of time not less than [6] months." seems to suggest you would do something other than the actual hedging strategy after [6] months. In this case, what are you assuming for modeling? We suggest clarification of this sentence.

Commented [CD274]: is this a typo? should this be "purchases"?

Commented [X275]: This 6 month exclusion creates unintended optionality for inclusion/exclusion based on whether a hedge strategy is considered "new". Instead, this should be addressed through the Error factor for new programs being temporarily larger.

Commented [X276]: Reinstate the original sentence which puts the reflection of hedging into the greater context of reflecting the company's investment policy.

Commented [X277]: Agree that the uncertainty associated with new strategies should be handled via the E factor, not through blanket exclusion.

B. Modeling Approaches

1. The analysis of the impact of the hedging strategy on cash flows is typically performed using either one of two types of methods as described below. Although a hedging strategy normally would be expected to reduce risk provisions, the nature of the hedging strategy and the costs to implement the strategy may result in an increase in the amount of the ~~stochastic reserve~~SR otherwise calculated.
2. The fundamental characteristic of the first type of method, referred to as the "explicit method," is that hedging positions and their resulting cash flows are included in the stochastic cash-flow model used to determine the scenario reserve, as discussed in Section 3.D, for each scenario.

3. The fundamental characteristic of the second type of method, referred to as the “implicit method,” is that the effectiveness of the current hedging strategy on future cash flows is evaluated, in part or in whole, outside of the stochastic cash-flow model. There are multiple ways that this type of modeling can be implemented. In this case, the reduction to the ~~stochastic reserve~~SR otherwise calculated should be commensurate with the degree of effectiveness of the hedging strategy in reducing accumulated deficiencies otherwise calculated.
4. Regardless of the methodology used by the company, the ultimate effect of the current hedging strategy (including currently held hedge positions) on the ~~stochastic reserve~~SR needs to recognize all risks, associated costs, imperfections in the hedges and hedging mismatch tolerances associated with the hedging strategy. The risks include, but are not limited to: basis, gap, price, parameter estimation and variation in assumptions (mortality, persistency, withdrawal, annuitization, etc.). Costs include, but are not limited to: transaction, margin (opportunity costs associated with margin requirements) and administration. In addition, the reduction to the ~~stochastic reserve~~SR attributable to the hedging strategy may need to be limited due to the uncertainty associated with the company’s ability to implement the hedging strategy in a timely and effective manner. The level of operational uncertainty varies indirectly with the amount of time that the new or revised strategy has been in effect or ~~mode~~ tested.

Guidance Note: No hedging strategy is perfect. A given hedging strategy may eliminate or reduce some but not all risks, transform some risks into others, introduce new risks, or have other imperfections. For example, a delta-only hedging strategy does not adequately hedge the risks measured by the “Greeks” other than delta.

5. A safe harbor approach is permitted for those companies whose modeled hedge assets comprise only linear instruments not sensitive to implied volatility. For companies with option-based hedge strategies, electing this approach would require representing the option-based portion of the strategy as a delta-rho two-Greek hedge program. The normally modeled option portfolio would be replaced with a set of linear instruments that have the same first-order Greeks as the original option portfolio.

Commented [X278]: Is delta-only hedging common in VM-22 hedging? Could the example be replaced with something more relevant to VM-22 hedging?

C. Calculation of ~~Stochastic Reserve~~SR (Reported)

1. The company shall calculate CTE70 (best efforts)—the results obtained when the CTE70 is based on incorporating the modeling of hedges (including both currently held and future hedge positions) into the stochastic cash-flow model on a best efforts basis, including all of the factors and assumptions needed to model the hedges (e.g., stochastic implied volatility). The determination of CTE70 (best efforts) may utilize either explicit or implicit modeling techniques.
2. The company shall calculate a CTE70 (adjusted) by recalculating the CTE70 assuming the company has ~~no future hedging purchases strategy~~ except those to hedge interest credits and hedge assets held by the company on the valuation date, therefore following the requirements of Section 4.A.4.a and 4.A.4.b.i.
3. Because most models will include at least some approximations or idealistic assumptions, CTE70 (best efforts) may overstate the impact of the hedging strategy. To compensate for potential overstatement of the impact of the hedging strategy, the value for the ~~stochastic reserve~~SR is given by:

Commented [X279]: The Hedging DG is currently working on language and we will want to be consistent across VM-20, VM-21, and VM-22.

Commented [CD280]: perhaps better to say “no future hedge purchases...”

$$\text{Stochastic reserve SR} = \text{CTE70 (best efforts)} + E \times \max[0, \text{CTE70 (adjusted)} - \text{CTE70 (best efforts)}]$$

4. The company shall specify a value for *E* (the “error factor”) in the range from 5% to 100% to reflect the company’s view of the potential error resulting from the level of sophistication of the stochastic cash-flow model and its ability to properly reflect the parameters of the hedging strategy (i.e., the Greeks being covered by the strategy), as well as the associated costs, risks and benefits. The greater the ability of the stochastic model to capture all risks and uncertainties, the lower the value of *E*. The value of *E* may be as low as 5% only if the model used to determine the CTE70 (best efforts) effectively reflects all of the parameters used in the hedging strategy. If certain economic risks are not hedged, yet the model does not generate scenarios that sufficiently capture those risks, *E* must be in the higher end of the range, reflecting the greater likelihood of error. Likewise, simplistic hedge cash-flow models shall assume a higher likelihood of error.

5. The company shall conduct a formal back-test, based on an analysis of at least the most recent available relevant period of data (but no less than 12 months), to assess how well the model is able to replicate the hedging strategy in a way that supports the determination of the value used for *E*.

6. Such a back-test shall involve one of the following analyses:

a. For companies that model hedge cash flows directly (“explicit method”), replace the stochastic scenarios used in calculating the CTE70 (best efforts) with a single scenario that represents the market path that actually manifested over the selected back-testing period and compare the projected hedge asset gains and losses against the actual hedge asset gains and losses – both realized and unrealized – observed over the same time period. For this calculation, the model assumptions may be replaced with parameters that reflect actual experience during the back-testing period. In order to isolate the comparison between the modeled hedge results and actual hedge results for this calculation, the projected liabilities should accurately reflect the actual liabilities throughout the back-testing period; therefore, adjustments that facilitate this accuracy (e.g. reflecting actual experience instead of model assumptions, including new business, etc.) are permissible.

To support the choice of a low value of *E*, the company should ascertain that the projected hedge asset gains and losses are within close range of 100% (e.g., 80–125%) of the actual hedge asset gains and losses. The company may also support the choice of a low value of *E* by achieving a high R-squared (e.g., 0.80 or higher) when using a regression analysis technique.

b. For companies that model hedge cash flows implicitly by quantifying the cost and benefit of hedging using the fair value of the hedged item (an “implicit method” or “cost of reinsurance method”), calculate the delta, rho and vega coverage ratios in each month over the selected back-testing period in the following manner:

- i. Determine the hedge asset gains and losses—both realized and unrealized—incurred over the month attributable to equity, interest rate, and implied volatility movements.
- ii. Determine the change in the fair value of the hedged item over the month attributable to equity, interest rate, and implied volatility movements. The hedged item should be defined in a manner that reflects the proportion of risks hedged (e.g., if a company elects to hedge 50% of a contract’s market risks, it should quantify the fair value of the hedged item as 50% of the fair value of the contract).

Commented [X281]: We have been getting weak E factor support, with minimum backtesting due to the current phrasing.

Commented [X282R281]: Recommend adding stress testing language similar to [Section 4.A.4.b.i.c.](#) but with edits based on TD’s comments/suggestions to [Section 4.A.4.b.i.c.](#)

Commented [X283]: Recommend adding reporting requirement to VM-31 to disclose if company has switched between explicit method and implicit method, discuss rationale of the change and the change impact.

- iii. Calculate the delta coverage ratio as the ratio between (i) and (ii) attributable to equity movements.
 - iv. Calculate the rho coverage ratio as the ratio between (i) and (ii) attributable to interest rate movements.
 - v. Calculate the vega coverage ratio as the ratio between (i) and (ii) attributable to implied volatility movements.
 - vi. To support the company's choice of a low value of E, the company should be able to demonstrate that the delta and rho coverage ratios are both within close range of 100 % (e.g., 80–125%) consistently across the back-testing period.
 - vii. In addition, the company should be able to demonstrate that the vega coverage ratio is within close range of 100 % in order to use the prevailing implied volatility levels as of the valuation date in quantifying the fair value of the hedged item for the purpose of calculating CTE70 (best efforts). Otherwise, the company shall quantify the fair value of the hedged item for the purpose of calculating CTE70 (best efforts) in a manner consistent with the realized volatility of the scenarios captured in the CTE (best efforts).
- c. Companies that do not model hedge cash flows explicitly, but that also do not use the implicit method as outlined in Section 9.C.6.b above, shall conduct the formal back-test in a manner that allows the company to clearly illustrate the appropriateness of the selected method for reflecting the cost and benefit of hedging, as well as the value used for E.
7. A company that does not have 12 months of experience to date shall set E to a value that reflects the amount of experience available, and the degree and nature of any change to the hedge program. For a material change in strategy, with ~~no less than 6 months of history~~, E should be ~~at least 1.0-50~~. However, E may be lower than ~~1.0-50~~ if ~~some~~ at least 6 months of reliable experience is available and/or if the change in strategy is a minor refinement rather than a ~~substantial~~ material change in strategy.

Commented [X284]: 6 month restriction should be handled in the error factor. Other language for clarity. Edited guidance note below to be consistent with this.

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily large (e.g., $\geq 50\%$) for substantial changes in hedge methodology (e.g., moving from a fair-value based strategy to a stop-loss strategy) where the company has not been able to provide a meaningful simulation of hedge performance based on the new strategy.
- A temporary moderate increase (e.g., 15–30%) in error factor should be used for substantial modifications to hedge programs or modeling where meaningful simulation has not been created (e.g., adding second-order hedging, such as gamma or rate convexity).
- No increase in the error factor may be used for incremental modifications to the hedge strategy (e.g., adding death benefits to a program that previously covered only living benefits, or moving from swaps to Treasury Department futures).

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily large (e.g., $\geq 50\%$) for substantial changes in hedge methodology (e.g., moving from a fair value based strategy to a stop-loss strategy) where the company has not been able to provide a meaningful simulation of hedge performance based on the new strategy.
- A temporary moderate increase (e.g., 15–30%) in error factor should be used for substantial modifications to hedge programs or modeling where meaningful simulation has not been created (e.g., adding second-order hedging, such as gamma or rate convexity).
- No increase in the error factor may be used for incremental modifications to the hedge strategy (e.g., adding death benefits to a program that previously covered only living benefits, or moving from swaps to Treasury Department futures).

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily 100% for material changes in hedge methodology (e.g., moving from a fair-value based strategy to a stop-loss strategy).
- An increase in the error factor may not always be needed for minor refinements to the hedge strategy (e.g., moving from swaps to Treasury futures).

8. The company shall set the value of E reflecting the extent to which the future hedging program is clearly defined. To support a value of E below 1.0, there should be very robust documentation outlining the future hedging program. To the extent that documentation outlining the future hedging program is incomplete, the value of E shall be increased. Any increases required to the value of E to reflect that documentation is not available to support that the future hedging program is clearly defined shall be in addition to increases to the value of E to reflect a lack of historical experience or to reflect the back-testing results.

Commented [X285]: Work is being done by the hedging DG. This is a placeholder. Need to reflect how clearly defined and well documented the hedge program is, to be able to rely on the backtesting provided. To the extent that hedge programs are not clearly defined, E should be increased to reflect that the backtesting cannot be relied on as an indicator of future effectiveness.

E. Additional Considerations for CTE70 (best efforts)

If the company is following a CDHS, the fair value of the portfolio of contracts falling within the scope of these requirements shall be computed and compared to the CTE70 (best efforts) and CTE70 (adjusted). If the CTE70 (best efforts) is below both the fair value and CTE70 (adjusted), the company should be prepared to explain why that result is reasonable.

For the purposes of this analysis, the SR and fair value calculations shall be done without requiring the scenario reserve for any given scenario to be equal to or in excess of the cash surrender value in aggregate for the group of contracts modeled in the projection.

Commented [X286]: Reinstate this disclosure item, which is a rough reasonability check for regulator review/information on the modeled hedge benefit and can prompt further discussion.

D. Specific Considerations and Requirements

1. As part of the process of choosing a methodology and assumptions for estimating the future effectiveness of the current hedging strategy (including currently held hedge positions) for purposes of reducing the ~~stochastic reserve~~ SR, the company should review actual historical hedging effectiveness. The company shall evaluate the appropriateness of the assumptions

Commented [CD287]: not sure why this section is being deleted? Perhaps references to CDHS could be deleted, but otherwise this section still seems applicable.

on future trading, transaction costs, other elements of the model, the strategy, the mix of business and other items that are likely to result in materially adverse results. This includes an analysis of model assumptions that, when combined with the reliance on the hedging strategy, are likely to result in adverse results relative to those modeled. The parameters and assumptions shall be adjusted (based on testing contingent on the strategy used and other assumptions) to levels that fully reflect the risk based on historical ranges and foreseeable future ranges of the assumptions and parameters. If this is not possible by parameter adjustment, the model shall be modified to reflect them at either anticipated experience or adverse estimates of the parameters.

2. A discontinuous hedging strategy is a hedging strategy where the relationships between the sensitivities to equity markets and interest rates (commonly referred to as the Greeks) associated with the guaranteed contract holder options embedded in the variable fixed indexed annuities and other in-scope products and these same sensitivities associated with the hedging assets are subject to material discontinuities. This includes, but is not limited to, a hedging strategy where material hedging assets will be obtained when the fixed indexed annuity and other in-scope products account balances reach a predetermined level in relationship to the guarantees. Any hedging strategy, including a delta hedging strategy, can be a discontinuous hedging strategy if implementation of the strategy permits material discontinuities between the sensitivities to equity markets and interest rates associated with the guaranteed contract holder options embedded in the variable fixed indexed annuities and other in-scope products and these same sensitivities associated with the hedging assets. There may be scenarios that are particularly costly to discontinuous hedging strategies, especially where those result in large discontinuous changes in sensitivities (Greeks) associated with the hedging assets. Where discontinuous hedging strategies contribute materially to a reduction in the stochastic reserveSR, the company must evaluate the interaction of future trigger definitions and the discontinuous hedging strategy, in addition to the items mentioned in the previous paragraph. This includes an analysis of model assumptions that, when combined with the reliance on the discontinuous hedging strategy, may result in adverse results relative to those modeled.
3. A strategy that has a strong dependence on acquiring hedging assets at specific times that depend on specific values of an index or other market indicators may not be implemented as precisely as planned.
4. The combination of elements of the stochastic cash-flow model—including the initial actual market asset prices, prices for trading at future dates, transaction costs and other assumptions—should be analyzed by the company as to whether the stochastic cash-flow model permits hedging strategies that make money in some scenarios without losing a reasonable amount in some other scenarios. This includes, but is not limited to:
 - a. Hedging strategies with no initial investment that never lose money in any scenario and in some scenarios make money.
 - b. Hedging strategies that, with a given amount of initial money, never make less than accumulation at the one-period risk-free rates in any scenario but make more than this in one or more scenarios.
5. If the stochastic cash-flow model allows for such situations, the company should be satisfied that the results do not materially rely directly or indirectly on the use of such strategies. If the results do materially rely directly or indirectly on the use of such strategies, the strategies may not be used to reduce the stochastic reserveSR otherwise calculated.

Commented [X288]: Suggest replacing “indexed” with “fixed” since this would apply to all fixed annuities.

Commented [X289]: Editorial change of “variable fixed indexed annuity” to be “fixed indexed annuity and other in-scope products”.

Commented [X290]: Recommend deleting “including a delta hedging strategy” as it is already covered by “any hedging strategy” and it is not clear if delta hedging strategy is the most common strategy in VM-22 hedging to be used as a general example.

6. In addition to the above, the method used to determine prices of financial instruments for trading in scenarios should be compared to actual initial market prices. In addition to comparisons to initial market prices, there should be testing of the pricing models that are used to determine subsequent prices when scenarios involve trading financial instruments. This testing should consider historical relationships. For example, if a method is used where recent volatility in the scenario is one of the determinants of prices for trading in that scenario, then that model should approximate actual historic prices in similar circumstances in history.

Section 10: Guidance and Requirements for Setting Contract Holder Behavior Prudent Estimate Assumptions

A. General

Contract holder behavior assumptions encompass actions such as lapses, withdrawals, transfers, recurring deposits, benefit utilization, option election, etc. Contract holder behavior is difficult to predict accurately, and variance in behavior assumptions can significantly affect the results-reserves level. In the absence of relevant and fully credible empirical data, the company should set behavior assumptions as guided by Principle 3 in Section 1.B and Section 12.

Commented [X291]: Editorial clarification

Commented [X292]: Need general assumption setting section, see APF 2021-11.

In setting behavior assumptions, the company should examine, but not be limited by, the following considerations:

1. Behavior can vary by product, market, distribution channel, index performance, interest credited (current and guaranteed rates), time/product duration, etc.
2. Options embedded in the product may affect behavior.
3. Utilization of options may be elective or non-elective in nature. Living benefits often are elective, and death benefit options are generally non-elective.
4. Elective contract holder options may be more driven by economic conditions than non-elective options.
5. As the value of a product option increases, there is an increased likelihood that contract holders will behave in a manner that maximizes their financial interest (e.g., lower lapses, higher benefit utilization, etc.).
6. Behavior formulas may have both rational and irrational components (irrational behavior is defined as situations where some contract holders may not always act in their best financial interest). The rational component should be dynamic, but the concept of rationality need not be interpreted in strict financial terms and might change over time in response to observed trends in contract holder behavior based on increased or decreased financial efficiency in exercising their contractual options.
7. Options that are ancillary to the primary product features may or may not be significant drivers of behavior. Whether an option is ancillary to the primary product features depends on many things, such as:
 - a. For what purpose was the product purchased?
 - b. Is the option elective or non-elective?
 - c. Is the value of the option well-known?
8. External influences may affect behavior.

Commented [X293]: We would suggest rewording this section to be considerations rather than posed as questions.

Commented [X294]: Editorial clarification

Commented [X295]: Recommend adding some examples here if this is included.

B. Aggregate vs. Individual Margins

1. Prudent estimate assumptions are developed by applying a margin for uncertainty to the anticipated experience assumption. The issue of whether the level of the margin applied to the anticipated experience assumption is determined in aggregate or independently for each and every behavior assumption is discussed in Principle 3 in Section 1.B.

2. Although this principle discusses the concept of determining the level of margins in aggregate, it notes that the application of this concept shall be guided by evolving practice and expanding knowledge. From a practical standpoint, it may not always be possible to completely apply this concept to determine the level of margins in aggregate for all behavior assumptions.
3. Therefore, the company shall determine prudent estimate assumptions independently for each behavior (e.g., mortality, lapses and benefit utilization), using the requirements and guidance in this section and throughout these requirements, unless the company can demonstrate that an appropriate method was used to determine the level of margin in aggregate for two or more material behavior assumptions, if relevant to the risks in the product, and thus the approach will not understate the reserve.

Commented [X296]: Clarification

C. Sensitivity Testing

The impact of behavior can vary by product, time period, etc. For any assumption that is not prescribed or stochastically modeled, the company/qualified actuary to whom responsibility for this group of contracts is assigned shall use sensitivity testing to ensure that the assumption is set at the conservative end of the plausible range. The company shall sensitivity test:

Commented [X297]: Suggest updating bullet to "Other material behavior assumptions if relevant to the risks in the product."

Commented [X298]: Sensitivity testing is covered by the submitted APF 2021-11 for VM-21, and we should be consistent. VM-21 is currently lacking on sensitivity testing.

Commented [VM22299R298]: Make edits to be consistent with VM-21 APFs prior to adoption of VM-22

Commented [CD300]: why assign this specifically to the QA rather than leaving it as the responsibility of "the company", like we do elsewhere in the requirements?

- Surrenders.
- Partial withdrawals.
- Benefit utilization.
- Account transfers.
- Future deposits.

Commented [X301]: Include for completion

- Other behavior assumptions if relevant to the risks in the product.

Sensitivity testing of assumptions is required and shall be more complex than, for example, base lapse assumption plus or minus X% across all contracts. A more appropriate sensitivity test in this example might be to devise parameters in a dynamic lapse formula to reflect more out-of-the-money contracts lapsing and/or more holders of in-the-money contracts persisting and eventually using the guarantee. The company should apply more caution in setting assumptions for behaviors where testing suggests that stochastic modeling results are sensitive to small changes in such assumptions. For such sensitive behaviors, the company shall use higher margins when the underlying experience is less than fully relevant and credible.

The company shall examine the results of sensitivity testing to understand the materiality of prudent estimate assumptions on the modeled reserve. The company shall update the sensitivity tests periodically as appropriate, considering the materiality of the results of the tests. The company may update the tests less frequently (but no less than every 3 years) when the tests show less sensitivity of the modeled reserve to changes in the assumptions being tested or the experience is not changing rapidly. Providing there is no material impact on the results of the sensitivity testing, the company may perform sensitivity testing:

Commented [X302]: Consistent with APF 2021-11.

1. Using samples of the contracts in force rather than performing the entire valuation for each alternative assumption set.

- 2. Using data from prior periods.

D. Specific Considerations and Requirements

- 1. Within materiality considerations, the company should consider all relevant forms of contract holder behavior and persistency, including, but not limited to, the following:
 - a. Mortality (additional guidance and requirements regarding mortality is contained in Section 11).
 - b. Surrenders.
 - c. Partial withdrawals (systematic and elective).
 - d. Account transfers (switching/exchanges).
 - e. Resets/ratchets of the guaranteed amounts (automatic and elective).
 - f. Future deposits.
 - g. Income start date for the benefit utilization.
 - h. Commutation of benefit (from periodic payment to lump sum) or vice versa.
- 2. It may be acceptable to ignore certain items that might otherwise be explicitly modeled in an ideal world, particularly if the inclusion of such items reduces the calculated provisions.

Commented [X303]: Clarification

Commented [X304]: clarification

For example:

- a. The impact of account transfers (intra-contract index “switching”) might be ignored, unless required under the terms of the contract (e.g., automatic asset re-allocation/rebalancing,) or if the contract provisions incentivize the contract holders to transfer between accounts.
- b. Future deposits might be excluded from the model, unless required by the terms of the contracts under consideration and then only in such cases where future premiums can reasonably be anticipated (e.g., with respect to timing and amount).
- c. For some non-elective benefits (nursing home benefits for example), a zero incidence rate after the surrender charge has ended, or the cash value has depleted, may be acceptable since use of a non-zero rate could reduce the modeled reserve.

Commented [CD305]: delete this word

Commented [X306]: Reviewing, this guidance note does not exist in the 2019, 2020, 2021, or 2022 versions of VM-21. Where is this from? Should this be added to VM-21?

~~Guidance Note: For some non-elective benefits (nursing home benefits for example), unless relevant company experience exists to the contrary, the use of incidence rates greater than zero after the surrender charge has ended, or the cash value was depleted might be inappropriate may not be prudent since it would reduce the modeled reserve.~~

- 3. However, the company should exercise caution in assuming that current behavior will be indefinitely maintained. For example, it might be appropriate to test the impact of a shifting asset mix and/or consider future deposits to the extent they can reasonably be anticipated and increase the calculated amounts.

4. Normally, the underlying model assumptions would differ according to the attributes of the contract being valued. This would typically mean that contract holder behavior and persistency may be expected to vary according to such characteristics as (this is not an exhaustive list):
 - a. Gender.
 - b. Attained age.
 - c. Issue age.
 - d. Contract duration.
 - e. Time to maturity.
 - f. Tax status.
 - g. Account value.
 - h. Interest credited (current and guaranteed).
 - i. Available indices.
 - j. Guaranteed benefit amounts.
 - k. Surrender charges, ~~transaction~~ fees or other contract charges.
 - l. Distribution channel.

5. Unless there is clear evidence to the contrary, behavior assumptions should be no less conservative than past experience. Margins for contract holder behavior assumptions shall assume, without relevant and credible experience or clear evidence to the contrary, that contract holders' efficiency will increase over time.

6. In determining contract holder behavior assumptions, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience), whether or not the segment is directly written by the company. If data from a similar business segment are used, the assumption shall be adjusted to reflect differences between the two segments. Margins shall reflect the data uncertainty associated with using data from a similar but not identical business segment.

7. Where relevant and fully credible empirical data do not exist for a given contract holder behavior assumption, the company shall set the contract holder behavior assumption to reflect the increased uncertainty such that the contract holder behavior assumption is shifted towards the conservative end of the plausible range of expected experience that serves to increase the ~~stochastic reserve~~ SR. If there are no relevant data, the company shall set the contract holder behavior assumption to reflect the increased uncertainty such that the contract holder behavior assumption is at the conservative end of the range. Such adjustments shall be consistent with the definition of prudent estimate, with the principles described in Section 1.B, and with the guidance and requirements in this section.

8. Ideally, contract holder behavior would be modeled dynamically according to the simulated economic environment and/or other conditions. It is important to note, however, that contract holder behavior should neither assume that all contract holders act with 100%

Commented [X307]: This also applies to VM-21, as there are fixed accounts. Is there any reason not to be consistent?

Commented [X308]: This is not a synonym (perhaps transfer fees is a subset of transaction fees) - why would transaction fees apply for VM-21, but only transfer fees for VM-22?

Commented [X309]: This section states that "contract holder behavior should neither assume that all contract holders act with 100% efficiency in a financially rational manner nor assume that contract holders will always act irrationally." This text seems to directly contradict Section II. Reserve Requirements 6.H.2 which states "When advantageous, policyholders will commence living benefit payouts if not started yet.". We suggest revising 6.H.2 to align with the text of 10.D.8.

efficiency in a financially rational manner nor assume that contract holders will always act irrationally. These extreme assumptions may be used for modeling efficiency if the result is more conservative.

E. Dynamic Assumptions

1. Consistent with the concept of prudent estimate assumptions described earlier, the liability model should incorporate margins for uncertainty for all risk factors that are not dynamic (i.e., the non-scenario tested assumptions) and are assumed not to vary according to the financial interest of the contract holder stochastically modeled.
2. ~~The company should exercise care in using static assumptions when it would be more natural and reasonable~~ appropriate to use a dynamic model or other scenario-dependent formulation for behavior. With due regard to considerations of materiality and practicality ~~allowance for appropriate simplifications, approximations and modeling efficiency techniques~~, the use of dynamic models is encouraged, but not mandatory. Static assumptions ~~Risk factors that are not scenario tested but could reasonably be expected to vary according to a stochastic process, or future states of the world (especially in response to economic drivers), may require higher margins and/or signal a need for higher margins for certain other assumptions.~~
3. Risk factors that are modeled dynamically should encompass the plausible range of behavior consistent with the economic scenarios and other variables in the model, including the non-scenario tested assumptions. The company shall test the sensitivity of results to understand the materiality of making alternate assumptions and follow the guidance discussed above on setting assumptions for sensitive behaviors.

Commented [X310]: Recommend replacing “dynamic” with “stochastic.” Risk factors with dynamic assumptions still need margins (although for an assumption that was part fixed and part dynamic, only one piece may have the margin but still the risk factor would have a margin).

Commented [X311]: Suggest replacing “Risk factors that are not scenario tested but” with “Static assumptions that” to improve clarity in the wording.

Commented [X312]: Get rid of some of the vague adjectives and be consistent with VM framework for simplifications.

F. Consistency with the CTE Level

1. All behaviors (i.e., dynamic, formulaic and non-scenario tested) should be consistent with the scenarios used in the CTE calculations (generally, the top 30% of the loss distribution). To maintain such consistency, it is not necessary to iterate (i.e., successive runs of the model) in order to determine exactly which scenario results are included in the CTE measure. Rather, in light of the products being valued, the company should be mindful of the general characteristics of those scenarios likely to represent the tail of the loss distribution and consequently use prudent estimate assumptions for behavior that are reasonable and appropriate in such scenarios. For ~~non-variable~~ fixed annuities, these “valuation” scenarios would typically display one or more of the following attributes:
 - a. ~~Declining-, increasing~~ and/or volatile index values, where applicable.
 - b. Price gaps and/or liquidity constraints.
 - c. ~~Rapidly changing~~ Volatile interest rates or persistently low interest rates.
 - d. ~~Volatile credit spreads.~~
2. The behavior assumptions should be logical and consistent both individually and in aggregate, especially in the scenarios that govern the results. In other words, the company should not set behavior assumptions in isolation, but give due consideration to other elements of the model. The interdependence of assumptions (particularly those governing customer behaviors) makes this task difficult and by definition requires professional judgment, but it is important that the model risk factors and assumptions:

Commented [CD313]: “non-variable”?

Commented [X314]: Editorial clarification to cover scenarios for all products/guarantees in scope

Commented [X315]: Editorial for consistency with (a) above

Commented [X316]: Suggesting deleting as we are not aware of dynamic credit spreads typically being modeled.

- a. Remain logically and internally consistent across the scenarios tested.
 - b. Represent plausible outcomes.
 - c. Lead to appropriate, but not excessive, asset requirements.
4. The company should remember that the continuum of “plausibility” should not be confined or constrained to the outcomes and events exhibited by historic experience.
 5. Companies should attempt to track experience for all assumptions that materially affect their risk profiles by collecting and maintaining the data required to conduct credible and meaningful studies of contract holder behavior.

G. Additional Considerations and Requirements for Assumptions Applicable to Guaranteed Living Benefits

Experience for contracts without guaranteed living benefits may be of limited use in setting a lapse assumption for contracts with in-the-money or at-the-money guaranteed living benefits. Such experience may only be used if it is appropriate (e.g., lapse experience on contracts without a living benefit may have relevance to the early durations of contracts with living benefits) and relevant to the business.

H. Policy Loans

If policy loans are applicable for the block of business, the company shall determine cash flows for each projection interval for policy loan assets by modeling existing loan balances either explicitly or by substituting assets that are a proxy for policy loans (e.g., bonds, cash, etc.) subject to the following:

1. If the company substitutes assets that are a proxy for policy loans, the company must demonstrate that such substitution:
 - a. Produces reserves that are no less than those that would be produced by modeling existing loan balances explicitly.
 - b. Complies with the contract holder behavior requirements stated in Section 10.A to Section 10.G above in this section.
2. If the company models policy loans explicitly, the company shall:
 - a. Treat policy loan activity as an aspect of contract holder behavior and subject to the requirements above in this section.
 - b. Assign loan balances either to exactly match each policy's contract's utilization or to reflect average utilization over a model segment or sub-segments if the results are materially similar.
 - c. Model policy loan interest in a manner consistent with policy contract provisions and with the scenario. Include interest paid in cash as a positive policy loan cash flow in that projection interval, but do not include interest added to the loan balance as a policy loan cash flow. (The increased balance will require increased repayment cash flows in future projection intervals.)

Commented [CD317]: Okay to keep the term "Policy Loans"

Commented [X318]: Clarify reference to be more specific.

Commented [X319]: Editorial - VM-22 should consistently use contracts

Commented [CD320]: "contract's"

Commented [X321]: We have concern that reflecting average utilization may have material impact on benefit projections. Recommend adding "if the results are materially similar". This change is also applied to VM-20 and added to VM-21.

Commented [X322]: Editorial - VM-22 should consistently use contracts

Commented [CD323]: "contract"

- d. Model policy loan principal repayments, including those that occur automatically upon death or surrender. Include policy loan principal repayments as a positive policy loan cash flow, per Section 4.A.1.h.
- e. ~~Model additional~~ policy loan principal. Include additional policy loan principal as a negative policy loan cash flow, per Section 4.A.1.h (but do not include interest added to the loan balance as a negative policy loan cash flow).
- f. Model any investment expenses allocated to policy loans and include them either with ~~negative~~ policy loan cash flows or insurance expense cash flows.

Commented [CD324]: The wording of "additional" is unclear. Does this mean maintaining a certain level of policy loan utilization throughout the projection (i.e., adding principal as repayments are made), or actually increasing policy loan utilization (i.e., adding more principal) over time? The former would seem more appropriate than the latter.

Commented [X325]: Clarification

I. Non-Guaranteed Elements

Consistent with the definition in VM-01, Non-Guaranteed Elements (NGEs) are elements within a contract that affect ~~policy contract~~ costs or values and are not guaranteed or not determined at issue. NGEs consist of elements affecting contract holder costs or values that are both established and subject to change at the discretion of the insurer.

Examples of NGEs specific to ~~non-variable~~ ~~fixed~~ annuities include but are not limited to the following: ~~fixed~~ the credited rates on ~~fixed~~ accounts, index parameters (caps, spreads, participation rates, etc.), rider fees, rider benefit features being subject to change (rollup rates, rollup period, etc.), account value charges, and dividends under participating policies or contracts.

Commented [CD326]: suggest: "contract holder"

Commented [X327]: Editorial - VM-22 should consistently use contracts

Commented [CD328]: suggest: "are not"

Commented [CD329]: suggest: "non-variable annuities"

Commented [X330]: Clarity

- 1. Except as noted below in Section ~~10.H.5~~, the company shall include NGE in the models to project future cash flows beyond the time the company has authorized their payment or crediting.
- 2. The projected NGE shall reflect factors that include, but are not limited to, the following (not all of these factors will necessarily be present in all situations):
 - a. The nature of contractual guarantees.
 - b. The company's past NGE practices and established NGE policies.
 - c. The timing of any change in NGE relative to the date of recognition of a change in experience.
 - d. The benefits and risks to the company of continuing to authorize NGE.
- 3. Projected NGE shall be established based on projected experience consistent with how actual NGE are determined.
- 4. Projected levels of NGE in the cash-flow model must be consistent with the experience assumptions used in each scenario. Contract holder behavior assumptions in the model must be consistent with the NGE assumed in the model.
- 5. The company may exclude any portion of an NGE that:
 - a. Is not based on some aspect of the ~~policy's or~~ contract's experience.
 - b. Is authorized by the board of directors and documented in the board minutes, where the documentation includes the amount of the NGE that arises from other sources.

Commented [X331]: Correct section reference

Commented [CD332]: delete "policy's or"

However, if the board has guaranteed a portion of the NGE into the future, the company must model that amount. In other words, the company cannot exclude

Commented [X333]: Why does being authorized mean it can be excluded? This seems backwards. Does this mean it has already transpired?

from its model any NGE that the board has guaranteed for future years, even if it could have otherwise excluded them, based on this subsection.

6. The liability for contract holder dividends declared but not yet paid that has been established according to statutory accounting principles as of the valuation date is reported separately from the statutory reserve. The contract holder dividends that give rise to this dividend liability as of the valuation date may or may not be included in the cash-flow model at the company's option.
 - a. If the contract holder dividends that give rise to the dividend liability are not included in the cash-flow model, then no adjustment is needed to the resulting ~~aggregate stochastic reserve~~SR.
 - b. If the contract holder dividends that give rise to the dividend liability are included in the cash-flow model, then the resulting ~~aggregate stochastic reserve~~SR should be reduced by the amount of the dividend liability.
7. All projected cash flows associated with NGEs shall reflect margins for adverse deviations and estimation error in prudent estimate assumptions.

Commented [CD334]: delete "aggregate"

Commented [CD335]: delete "aggregate"

Section 11: Guidance and Requirements for Setting Prudent Estimate Mortality Assumptions

A. Overview

1. Intent

The guidance and requirements in this section apply to setting prudent estimate mortality assumptions when determining the ~~stochastic reserve, SR~~. The intent is for prudent estimate mortality assumptions to be based on facts, circumstances and appropriate actuarial practice, with only a limited role for unsupported actuarial judgment. ~~(Where more than one approach to appropriate actuarial practice exists, the company should select the practice that the company deems most appropriate under the circumstances.)~~

Commented [X336]: Specific requirements will require further discussion, particularly what if any industry experience is identified for the SPA. Ideally, updated and appropriate assumptions should be used for better alignment and to avoid any false positives flagged as an outlier by the SPA.

Commented [VM22337R336]: Will address SPA separately

2. Description

Prudent estimate mortality assumptions shall be determined by first developing expected mortality curves based on either available experience or published tables. Where necessary, margins shall be applied to the experience to reflect data uncertainty. The expected mortality curves shall then be adjusted based on the credibility of the experience used to determine the expected mortality curve. Section 11.B addresses guidance and requirements for determining expected mortality curves, and Section 11.C addresses guidance and requirements for adjusting the expected mortality curves to determine prudent estimate mortality.

Commented [X338]: Recommend removing reference to actuarial judgment being "unsupported" from VM-21 and VM-22 because actuarial judgment should always be supportable - it is "judgment" not an arbitrary decision.

Finally, the credibility-adjusted tables shall be adjusted for mortality improvement (where such adjustment is permitted or required) using the guidance and requirements in Section 11.D.

3. Business Segments

For purposes of setting prudent estimate mortality assumptions, the products falling under the scope of these requirements shall be grouped into business segments with different mortality assumptions. The grouping, at a minimum, should differentiate between payout annuities or deferred annuity contracts that contain GLBs, and deferred annuity contracts with no guaranteed benefits or only GMDBs. Where appropriate, the grouping should also differentiate between segments which are known or expected to contain contract holders with sociodemographic, geographic, or health factors reasonably expected to impact the mortality assumptions for the segment (e.g., annuitants drawn from different countries, geographic areas, industry groups, or impaired lives on individually underwritten contracts such as structured settlements). The grouping should also generally follow the pricing, marketing, management and/or reinsurance programs of the company.

Guidance Note: This paragraph contemplates situations where it may be appropriate to differentiate mortality assumptions by segment or even by contract due to varying sociodemographic, geographic, or health factors. Particularly, though not exclusively, in the context of group payout annuity contracts, companies may have credible, contract-specific mortality experience data or relevant pooled data from annuitants drawn from similar industries or geographies that may be used to sub-divide inforce blocks into business segments for purposes of setting prudent estimate mortality assumptions.

For example, a company may sell group PRT contracts both to union plans in the U.S. and to private single-employer plans in another country. While both are "PRT contracts," it would be appropriate to differentiate them for mortality assumption purposes, similar to

how payout annuities vs. deferred annuities are distinguished.

Guidance Note: Distinct mortality or liability assumptions among different contracts within a group of contracts does not in itself preclude the group of contracts from being aggregated for the purposes of the broader stochastic reserve calculation.

4. Margin for Data Uncertainty

The expected mortality curves that are determined in Section 11.B may need to include a margin for data uncertainty. The margin could be in the form of an increase or a decrease in mortality, depending on the business segment under consideration. The margin shall be applied in a direction (i.e., increase or decrease in mortality) that results in a higher reserve. A sensitivity test may be needed to determine the appropriate direction of the provision for uncertainty to mortality. The test could be a prior year mortality sensitivity analysis of the business segment or an examination of current representative cells of the segment.

For purposes of this section, if mortality must be increased (decreased) to provide for uncertainty, the business segment is referred to as a ~~plus (minus)~~ mortality (longevity) segment.

It may be necessary, because of a change in the mortality risk profile of the segment, to reclassify a business segment from a ~~mortality (longevity) plus (minus)~~ segment to a ~~longevity (mortality) minus (plus)~~ segment to the extent compliance with this section requires such a reclassification. For example, a segment could require reclassification depending on whether it is gross or net of reinsurance.

Commented [X339]: Recommend deleting this guidance note since it is unnecessary - there is no such restriction for any of VM-20, VM-21 or VM-22. It would be an absurd level of granular distinction, such that it is not clear you could actually perform the projection, given that assumptions vary by attained age, etc.

Commented [X340]: Terming the segments "mortality (longevity) segments" would be easier to understand than "plus (minus) segments".

B. Determination of Expected Mortality Curves

1. Experience Data

In determining expected mortality curves, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience). See Section 11.B.2 for additional considerations. Finally, if there is no data, the company shall use the applicable table, as required in Section 11.B.3.

Commented [X341]: It is unclear how to interpretate the statement and how to review it for both VM-21 and VM-22. If a company reinsures GMWB riders, then does it mean that on a net basis the segment would no longer be considered as minus? So, there would be distinct designations for the pre and post reinsurance runs? Recommend discussing the statement and adding additional language or a guidance note to make it clear.

Commented [X342]: Delete period, it is a typo

2. Data Other Than Direct Experience

Adjustments shall be applied to the data to reflect differences between the business segments, and margins shall be applied to the adjusted expected mortality curves to reflect the data uncertainty associated with using data from a similar but not identical business segment.

To the extent the mortality of a business segment is reinsured, any mortality charges that are consistent with the company's own pricing and applicable to a substantial portion of the mortality risk also may be a reasonable starting point for the determination of the company's expected mortality curves.

3. No Data Requirements

Commented [X343]: Does this need to be edited to be consistent with "little or no" data?

- i. When little or no experience or information is available on a business segment, the company shall use expected mortality curves that would produce expected deaths no less than:

[2021 SOA Deferred Annuity Mortality Table] with [Projection Scale G2] for individual deferred annuities that do not contain guaranteed living benefits

$$q_x^{20XX+n} = q_x^{20XX}(1 - G2_x)^n$$

- ii. When little or no experience or information is available on a business segment, the company shall use expected mortality curves that would produce expected deaths no greater than:

- a. [The appropriate percentage (F_x) from Table 11.1 applied to the 2012 IAM Basic Mortality Table] with [Projection Scale G2] for individual payout annuity contracts and deferred annuity contracts with guaranteed living benefits

$$q_x^{2012+n} = q_x^{2012}(1 - G2_x)^n * F_x$$

- b. [1983 Table "a"] for structured settlements or other contracts with impaired mortality
- c. [1994 GAR Table] with [Projection Scale AA] for group annuities

$$q_x^{1994+n} = q_x^{1994}(1 - AA_x)^n$$

Table 11.1

Attained Age (x)	F _x
<=65	80.0%
66	81.5%
67	83.0%
68	84.5%
69	86.0%
70	87.5%
71	89.0%
72	90.5%
73	92.0%
74	93.5%
75	95.0%
76	96.5%
77	98.0%
78	99.5%
79	101.0%
80	102.5%
81	104.0%

Commented [X344]: Section 11.B.3.i only has one item "a". There is no need to specifically have a single item "a". Recommend delete the notation "a" and have "Section 11.B.3.i" only.

Commented [VM22345R344]: Will be updated upon SPA assumption development

Commented [X346]: For PRT an assumption based on a third-party data provider would be better than the industry table to get contract specific mortality assumptions. Is this permitted? The guidance note in A.3 seems to get at this, but it's not clear in B.3.ii.c whether this is allowed. This is an important distinction as PRT population can vary from those populations the tables are based upon.

Commented [X347]: The 1983 Table "a" and 1994 GAR are used for structured settlements and group annuities, respectively. These tables seem to be out of date. If Standard Projected Amount work develops more granular and up to date tables, should these tables be updated to use consistent tables?

Commented [VM22348R347]: Will be updated upon SPA assumption development

Commented [X349]: The percentage factors (F_x) are over 100% from attained age 79 to age 104. Is it appropriate to set the factors above 100% for the older ages with no credibility?

Commented [VM22350R349]: Will be updated upon SPA assumption development

Commented [CD351]: does the F_x factor need any consideration for FIAs with GLBs?

Commented [VM22352R351]: Will be updated upon SPA assumption development

82	105.5%	
83	107.0%	
84	108.5%	
85	110.0%	
86	110.0%	
87	110.0%	
88	110.0%	
89	110.0%	
90	110.0%	
91	110.0%	
92	110.0%	
93	110.0%	
94	110.0%	
95	110.0%	
96	109.0%	
97	108.0%	
98	107.0%	
99	106.0%	
100	105.0%	
101	104.0%	
102	103.0%	
103	102.0%	
104	101.0%	
>=105	100.0%	

iii. For a business segment with non-U.S. insureds, when little or no experience or information is available on a business segment, an established industry or national mortality table and mortality improvement scale may be used, with approval from the domiciliary commissioner.

Commented [X353]: The phrase “When little or no experience or information is available on a business segment” is not included, unlike in (i) and (ii) of the same sub-section. It appears to be the intent that this is the only situation in which this would apply, but it would be helpful to make this explicit.

4. Additional Considerations Involving Data

The following considerations shall apply to mortality data specific to the business segment for which assumptions are being determined (i.e., direct data discussed in Section 11.B.1 or other than direct data discussed in Section 11.B.2).

Commented [X354]: Reference to the MI scale missing for international business

a. Underreporting of Deaths

Mortality data shall be examined for possible underreporting of deaths. Adjustments shall be made to the data if there is any evidence of underreporting. Alternatively, exposure by lives or amounts on contracts for which death benefits were in the money may be used to determine expected mortality curves. Underreporting on such exposures should be minimal; however, this reduced subset of data will have less credibility.

b. Experience by Contract Duration

Experience of a plus segment shall be examined to determine if mortality by contract duration increases materially due to selection at issue. In the absence of information, the company shall assume that expected mortality will increase by

contract duration for an appropriate select period. As an alternative, if the company determines that mortality is affected by selection, the company could apply margins to the expected mortality in such a way that the actual mortality modeled does not depend on contract duration.

c. Modification and Relevance of Data

Even for a large company, the quantity of life exposures and deaths are such that a significant amount of smoothing may be required to determine expected mortality curves from mortality experience. Expected mortality curves, when applied to the recent historic exposures (e.g., three to seven years), should not result in an estimate of aggregate number of deaths less (greater) than the actual number deaths during the exposure period for plus (minus) segments.

In determining expected mortality curves (and the credibility of the underlying data), older data may no longer be relevant. The “age” of the experience data used to determine expected mortality curves should be documented.

d. Other Considerations

In determining expected mortality curves, consideration should be given to factors that include, but are not limited to, trends in mortality experience, trends in exposure, volatility in year-to-year A/E mortality ratios, mortality by lives relative to mortality by amounts, changes in the mix of business and product features that could lead to mortality selection.

C. Adjustment for Credibility to Determine Prudent Estimate Mortality

1. Adjustment for Credibility

The expected mortality curves determined in Section 11.B shall be adjusted based on the credibility of the experience used to determine the curves in order to arrive at prudent estimate mortality. The adjustment for credibility shall result in blending the expected mortality curves including margins for uncertainty with the mortality assumption assumptions described in Section 11.B.3. The approach used to adjust the curves shall suitably account for credibility.

Guidance Note: For example, when credibility is zero, an appropriate approach should result in a mortality assumption consistent with 100% of the industry mortality assumption described in Section 11.B.3 table used in the blending.

2. Adjustment of Statutory Valuation Industry Mortality for Improvement

For purposes of the adjustment for credibility, the industry mortality table for a plus segment may be and the industry mortality table for a minus segment must be adjusted for mortality improvement. Such adjustment shall reflect the mortality improvement scale described in Section 11.B.3 from the effective date of the respective industry mortality table to the experience weighted average date underlying the data used to develop the expected mortality curves.

3. Credibility Procedure

The credibility procedure used shall:

- a. Produce results that are reasonable.

Commented [X355]: Both plan and industry data should get weighted for business such as PRT. This text says to blend with prescribed tables, but that might not make sense unless additional experience data was unavailable.

Commented [X356]: Clarification

Commented [X357]: Editorial

Commented [X358]: The “statutory valuation” is struck out in the guidance note. Recommend replacing “statutory valuation” with either “reference of Section 11.B.3” or “industry”. Otherwise, it is a vague reference since we have both a company mortality table and an industry mortality table.

Commented [CD359]: need to reference "the mortality assumption described in Section 11.B.3" here? Otherwise, the sentence is unclear.

Commented [X360]: Mortality improvement should be consistent with the underlying tables used, so we would suggest this being based on available experience subject to appropriate guardrails.

Commented [X361]: "Statutory Valuation" was stricken from all the body, but left in this title. Consider replacing with "industry".

Commented [CD362]: for consistency, need to delete this reference to "Statutory Valuation"

- b. Not tend to bias the results in any material way.
 - c. Be practical to implement.
 - d. Give consideration to the need to balance responsiveness and stability.
 - e. Take into account not only the level of aggregate claims but the shape of the mortality curve.
 - f. Contain criteria for full credibility and partial credibility that have a sound statistical basis and be appropriately applied.
4. Further Adjustment of the Credibility-Adjusted Table for Mortality Improvement

The credibility-adjusted table used for plus segments may be and the credibility adjusted table used for minus segments must be adjusted for mortality improvement using the applicable mortality improvement scale described in Section 11.B.3 from the experience weighted average date underlying the company experience used in the credibility process to the valuation date.

Any adjustment for mortality improvement beyond the valuation date is discussed in Section 11.D.

D. Future Mortality Improvement

The mortality assumption resulting from the requirements of Section 11.C shall be adjusted for mortality improvements beyond the valuation date if such an adjustment would serve to increase the resulting ~~stochastic reserve~~SR. If such an adjustment would reduce the ~~stochastic reserve~~SR, such assumptions are permitted, but not required. In either case, the assumption must be based on current relevant data with a margin for uncertainty (increasing assumed rates of improvement if that results in a higher reserve or reducing them otherwise).

Section 12: Other Guidance and Requirements for AssumptionsA. Overview

This section provides guidance and requirements in general for setting prudent estimate assumptions when determining either the SR or DR. It also provides specific guidance and requirements for expense assumptions.

B. General Assumption Requirements

1. The company shall use prudent estimate assumptions for risk factors that are not stochastically modeled by applying margins to the anticipated experience assumptions if such risk factors have been categorized as material risks by following Section 1.B Principle 3 and requirements in Section 12.C.
2. The company shall establish the prudent estimate assumptions for risk factors in compliance with the requirements in Section 12 of Model #820 and must periodically review and update the assumptions as appropriate in accordance with these requirements.
3. The company shall model the following risk factors stochastically unless the company elects the stochastic modeling exclusion defined in Section 7:
 - a. Interest rate movements (i.e., Treasury interest rate curves).
 - b. Equity performance (e.g., Standard & Poor's 500 index [S&P 500] returns and returns of other equity investments).
4. If the company elects to stochastically model risk factors in addition to the economic scenarios, the requirements in this section for determining prudent estimate assumptions for these risk factors do not apply.

Guidance Note: It is expected that companies will not stochastically model risk factors other than the economic scenarios, such as contract holder behavior or mortality, until VM-22 has more specific guidance and requirements available. Companies shall discuss with domiciliary regulators if they wish to stochastically model other risk factors.

5. The company shall use its own experience, if relevant and credible, to establish an anticipated experience assumption for any risk factor. To the extent that company experience is not available or credible, the company may use industry experience or other data to establish the anticipated experience assumption, making modifications as needed to reflect the circumstances of the company.
 - a. For risk factors (such as mortality) to which statistical credibility theory may be appropriately applied, the company shall establish anticipated experience assumptions for the risk factor by combining relevant company experience with industry experience data, tables or other applicable data in a manner that is consistent with credibility theory and accepted actuarial practice.

Commented [X363]: We believe discussion of allocation of aggregate reserves should be analyzed as part of the field study.

Commented [X364]: Need to add a Section 12 for general guidance on prudent assumption setting and on expenses. For VM-21, APF 2021-11 is currently exposed. Should be consistent with that APF, after any tweaks are made.
https://content.naic.org/sites/default/files/inline-files/APF%202021-11%20VM21%20assumptions_20211021-exposed.docx

- b. For risk factors (such as utilization of guaranteed living benefits) that do not lend themselves to the use of statistical credibility theory, and for risk factors (such as some of the lapse assumptions) to which statistical credibility theory can be appropriately applied but cannot currently be applied due to lack of industry data, the company shall establish anticipated experience assumptions in a manner that is consistent with accepted actuarial practice and that reflects any available relevant company experience, any available relevant industry experience, or any other experience data that are available and relevant. Such techniques include:
- i. Adopting standard assumptions published by professional, industry or regulatory organizations to the extent they reflect any available relevant company experience or reasonable expectations.
 - ii. Applying factors to relevant industry experience tables or other relevant data to reflect any available relevant company experience and differences in expected experience from that underlying the base tables or data due to differences between the risk characteristics of the company experience and the risk characteristics of the experience underlying the base tables or data.
 - iii. Blending any available relevant company experience with any available relevant industry experience and/or other applicable data using weightings established in a manner that is consistent with accepted actuarial practice and that reflects the risk characteristics of the underlying contracts and/or company practices.
- c. For risk factors that have limited or no experience or other applicable data to draw upon, the assumptions shall be established using sound actuarial judgment and the most relevant data available, if such data exists.
- d. For any assumption that is set in accordance with the requirements of Section 12.B.5.c, the qualified actuary to whom responsibility for this group of contracts is assigned shall use sensitivity testing and disclose the analysis performed to ensure that the assumption is set at the conservative end of the plausible range.
- e. The qualified actuary, to whom responsibility for this group of contracts is assigned, shall annually review relevant emerging experience for the purpose of assessing the appropriateness of the anticipated experience assumption. If the results of statistical or other testing indicate that previously anticipated experience for a given factor is inadequate, then the qualified actuary shall set a new, adequate, anticipated experience assumption for the factor.
6. The company shall sensitivity test risk factors that are not stochastically modeled and examine the impact on the stochastic reserve. The company shall update the sensitivity tests periodically as appropriate. The company may update the tests less frequently, but no less than every 3 years, when the tests show less sensitivity of the stochastic reserve to changes in the assumptions being tested or the experience is not changing rapidly. Providing there is no material impact on the results of the sensitivity testing, the company

may perform sensitivity testing:

- a. Using samples of the contracts in force rather than performing the entire valuation for each alternative assumption set.
- b. Using data from prior periods.

Guidance Note: Sensitivity testing every risk factor on an annual basis is not required. For some risk factors, it may be reasonable, in lieu of sensitivity testing, to employ statistical measures for margins, such as adding one or more standard deviations to the anticipated experience assumption.

- 7. The company shall vary the prudent estimate assumptions from scenario to scenario within the stochastic reserve calculation in an appropriate manner to reflect the scenario-dependent risks.

C. Assumption Margins

The company shall include margins to provide for adverse deviations and estimation error in the prudent estimate assumption for each risk factor that is not stochastically modeled or prescribed, subject to the following:

- 1. The level of margin applied to the anticipated experience assumptions may be determined in aggregate or independently as discussed in Section 1.B Principle 3. It is not permissible to set a margin less toward the conservative end of the spectrum to recognize, in whole or in part, implicit or prescribed margins that are present, or are believed to be present, in other risk factors.

Risks that are stochastically modeled (e.g., interest rates, equity returns) or have prescribed margins or guardrails (e.g., assets, revenue sharing) shall be considered material risks. Other risks generally considered to be material include, but are not limited to, mortality, contract holder behavior, maintenance and overhead expenses, inflation and implied volatility. In some cases, the list of material risks may also include acquisition expenses, partial withdrawals, policy loans, annuitizations, account transfers and deposits, and/or option elections that contain an element of anti-selection.

Commented [X365]: Edit for VM-22 vs. VM-21?

- 2. The greater the uncertainty in the anticipated experience assumption, the larger the required margin, with the margin added or subtracted as needed to produce a larger Sr or DR than would otherwise result. For example, the company shall use a larger margin when:
 - a. The experience data have less relevance or lower credibility.
 - b. The experience data are of lower quality, such as incomplete, internally inconsistent or not current.
 - c. There is doubt about the reliability of the anticipated experience assumption, such as, but not limited to, recent changes in circumstances or changes in company policies.
 - d. There are constraints in the modeling that limit an effective reflection of the risk factor.

3. In complying with the sensitivity testing requirements in Section 12.B.6 above, greater analysis and more detailed justification are needed to determine the level of uncertainty when establishing margins for risk factors that produce greater sensitivity on the stochastic reserve.
4. A margin is permitted but not required for assumptions that do not represent material risks.
5. A margin should reflect the magnitude of fluctuations in historical experience of the company for the risk factor, as appropriate.
6. The company shall apply the method used to determine the margin consistently on each valuation date but is permitted to change the method from the prior year if the rationale for the change and the impact on the stochastic reserve is disclosed.

D. Expense Assumptions

1. General Prudent Estimate Expense Assumption Requirements

In determining prudent estimate expense assumptions, the company:

- a. May spread certain information technology development costs and other capital expenditures over a reasonable number of years in accordance with accepted statutory accounting principles as defined in the Statements of Statutory Accounting Principles.

Guidance Note: Care should be taken with regard to the potential interaction with the inflation assumption below.

- b. Shall assume that the company is a going concern.
- c. Shall choose an appropriate expense basis that properly aligns the actual expense to the assumption. If values are not significant, they may be aggregated into a different base assumption.

Guidance Note: For example, death benefit expenses should be modeled with an expense assumption that is per death incurred.

- d. Shall reflect the impact of inflation.
- e. Shall not assume future expense improvements.
- f. Shall not include assumptions for federal income taxes (and expenses paid to provide fraternal benefits in lieu of federal income taxes) and foreign income taxes.
- g. Shall use assumptions that are consistent with other related assumptions.
- h. Shall use fully allocated expenses.

Guidance Note: Expense assumptions should reflect the direct costs associated with the block of contracts being modeled, as well as indirect costs and overhead costs that have been allocated to the modeled contracts.

- i. Shall allocate expenses using an allocation method that is consistent across

company lines of business. Such allocation must be determined in a manner that is within the range of actuarial practice and methodology and consistent with applicable ASOPs. Allocations may not be done for the purpose of decreasing the stochastic reserve.

- j. Shall reflect expense efficiencies that are derived and realized from the combination of blocks of business due to a business acquisition or merger in the expense assumption only when any future costs associated with achieving the efficiencies are also recognized.

Guidance Note: For example, the combining of two similar blocks of business on the same administrative system may yield some expense savings on a per unit basis, but any future cost of the system conversion should also be considered in the final assumption. If all costs for the conversion are in the past, then there would be no future expenses to reflect in the valuation.

- k. Shall reflect the direct costs associated with the contracts being modeled, as well as an appropriate portion of indirect costs and overhead (i.e., expense assumptions representing fully allocated expenses should be used), including expenses categorized in the annual statement as “taxes, licenses and fees” (Exhibit 3 of the annual statement) in the expense assumption.
- l. Shall include acquisition expenses associated with business in force as of the valuation date and significant non-recurring expenses expected to be incurred after the valuation date in the expense assumption.
- m. For contracts sold under a new policy form or due to entry into a new product line, the company shall use expense factors that are consistent with the expense factors used to determine anticipated experience assumptions for contracts from an existing block of mature contracts taking into account:
- i. Any differences in the expected long-term expense levels between the block of new contacts and the block of mature contracts.
 - ii. That all expenses must be fully allocated as required under Section 12.D.1.h above.

2. Margins for Prudent Estimate Expense Assumptions

The company shall determine margins for expense assumptions following Section 12.C.

Section 13: Allocation of Aggregate Reserves to the Contract Level

Section 3.F states that the aggregate reserve shall be allocated to the contracts falling within the scope of these requirements. That allocation should be done for both the pre- and post-reinsurance ceded reserves. Contracts that have passed the stochastic exclusion test as defined in Section 7.B will not be included in the allocation of the aggregate reserve. For the purpose of this section, if a contract does not have a cash surrender value, then the cash surrender value is assumed to be zero.

Contracts for which the Deterministic Certification Option is elected in Section 7.E are intended to use the methodology described in this section to allocate aggregate reserves in excess of the cash surrender value to individual contracts.

The contract-level reserve for each contract shall be the sum of the following:

- A. The contract’s cash surrender value.

Drafting Note: The American Academy of Actuaries Annuity Reserves and Capital Work Group is including two potential options for allocating the excess portion of the aggregate reserve over cash surrender value: (1) Use the same approach as VM-21 (2) Allocate based on an actuarial present value calculation.

The Work Group did not reach a consensus between these two approaches, so wording for both is included in the text below. The Work Group recommends field testing both approaches and considering the results in determining future decisions.

Option 1: VM-21 Approach

- B. An allocated portion of the excess of the aggregate reserve over the aggregate cash surrender value shall be allocated to each contract based on a measure of the risk of that product relative to its cash surrender value in the context of the company’s in force contracts (assuming zero cash value for contracts that do not contain such). The allocation shall be made separately for DR and SR. The measure of risk should consider the impact of risk mitigation programs, including hedge programs and reinsurance, that would affect the risk of the product. The specific method of assessing that risk and how it contributes to the company’s aggregate reserve shall be defined by the company. The method should provide for an equitable allocation based on risk analysis.

Commented [X366]: This method only makes sense if done separately for the DR and SR.

- 1. As an example, consider a company with the results of the following three contracts:

Table 12.1: Sample Allocation of Aggregate Reserve

Contract (i)	1	2	3	Total
Cash Surrender Value, C	28	40	52	120
Risk adjusted measure, R	38	52	50	
Aggregate Reserve				140
Allocation Basis for the excess of the Aggregate Reserve over the Cash Surrender Value $A_i = \text{Max}(R_i - C_i, 0)$	10	12	0	22

Allocation of the excess of the Aggregate Reserve over the Cash Surrender Value $Li = (Ai)/\sum Ai * [Aggregate Reserve - \sum Ci]$	9.09	10.91	0.00	20
Contract-level reserve $Ci + Li$	37.09	50.91	52.00	140.00

2. In this example, the Aggregate Reserve exceeds the aggregate Cash Surrender Value by 20. The 20 is allocated proportionally across the three contracts based on the allocation basis of the larger of (i) zero; and (ii) a risk adjusted measure based on reserve principles. Therefore, contracts 1 and 2 receive 45% (9/22) and 55% (11/22), respectively, of the excess Aggregate Reserve. As Contract 3 presents no risk in excess of its cash surrender value, it does not receive an allocation of the excess Aggregate Reserve.

Option 2: Actuarial Present Value Approach

- B. The excess of the aggregate reserve over the aggregate cash surrender value is allocated to policies based on a calculation of the actuarial present value of projected liability cash flows in excess of the cash surrender value:
 1. Discount the liability cash flows at the NAER, pursuant to requirements in Section 4, for the scenario that produces the scenario reserve closest to, but not less than the ~~stochastic reserve~~ SR defined in Section 3.D.
 - a. Groups of contracts that elect the Deterministic Certification Option defined in Section 7.E shall use the NAER in the single scenario used to calculate the reserve to discount liability cash flows, as well as any cash flows that are scenario dependent.
 2. If the actuarial present value is less than the cash surrender value, then the excess actuarial present value to be used for allocating the excess aggregate reserve over the cash value shall be floored at zero.
 - a. If all contracts have an excess actuarial present value that is floored at zero, then use the cash surrender value to allocate any excess aggregate reserve over the aggregate cash surrender value.
 3. For projecting future liability cash flows, assume the same liability assumptions that were used to calculate the ~~stochastic reserve~~ SR defined in Section 3.D.
 4. As a hypothetical example, consider a company with the results of the following five contracts:

Commented [X367]: This method depends on the NAER, so would not work for companies that use direct iteration.

Commented [X368]: This could give an unstable allocation if there is an even mix of products with different risk profiles, so that the tail is populated with some scenarios where Product A does poorly and some where Product B does poorly. The single scenario will only reflect the riskiness of one of the products.

Commented [X369]: Not just the NAER, but the cashflows are also scenario dependent.

Commented [CD370]: "Section 3.D"

Table 12.1: Hypothetical Sample Allocation of Aggregate Reserve

Contract	Example Product Type	CSV* (1)	Scenario APV (2)	Excess (Floored) of the scenario APV over CSV* (3) = $\text{Max}[(2)-(1), 0]$	Aggregate Reserve CTE 70 (4)	Excess of Aggregate Reserve over Aggregate CSV* (5) = $\text{Max}[(4 \text{ Total}) - (1 \text{ Total}), 0]$	Allocated Excess Reserve (6) = (3) x $[(5 \text{ Total}) / (3 \text{ Total})]$	Total Contract Level Reserve (7) = (1) + (6)
Contract 1:	Indexed Annuity with no GLWB**	95.0	90.0	0.0			0.0	95.0
Contract 2:	Indexed Annuity with low benefit GLWB**	92.0	95.0	3.0			3.6	95.6
Contract 3:	Indexed Annuity with medium benefit GLWB**	90.0	100.0	10.0			12.0	102.0
Contract 4:	Indexed Annuity with high benefit GLWB**	88.0	105.0	17.0			20.4	108.4
Contract 5:	Fixed Life Contingent Payout Annuity	0.0	70.0	70.0			84.0	84.0
Total		365.0		100.0	485.0	120.0	120.0	485.0

Commented [CD371]: should be "Max[(2)-(1), 0]"

*Cash Surrender Value
**Guaranteed Lifetime Withdrawal Benefit

Guidance Note: The actuarial present value (APV) in the section above is separate from the Guarantee Actuarial Present Value (GAPV) referred to in the additional standard projection amount calculation in VM-21. The GAPV is only applicable to guaranteed minimum benefits and uses prescribed liability assumptions. In contrast, the APV in this section applies to the entire contract, irrespective of whether guaranteed benefits are attached, and uses company prudent estimate liability assumptions.

Section ~~13~~14: Statutory Maximum Valuation Interest Rates for Income Annuity Formulaic Reserves

A. Purpose and Scope

1. These requirements define for single premium immediate annuity contracts and other similar contracts, certificates and contract features the statutory maximum valuation interest rate that complies with Model #820. These are the maximum interest rate assumption requirements to be used in the CARVM and for certain contracts, the CRVM. These requirements do not preclude the use of a lower valuation interest rate assumption by the company if such assumption produces statutory reserves at least as great as those calculated using the maximum rate defined herein.
2. The following categories of contracts, certificates and contract features, whether group or individual, including both life contingent and term certain only contracts, directly written or assumed through reinsurance, with the exception of benefits arising from variable annuities, ~~are covered in this section, and all contracts not passing the SET covered by Sections 1 through 13 of VM-22, are covered Section 14 of VM-22:~~
 - a. Immediate annuity contracts issued after Dec. 31, 2017;
 - b. Deferred income annuity contracts issued after Dec. 31, 2017;
 - c. Structured settlements in payout or deferred status issued after Dec. 31, 2017;
 - d. Fixed payout annuities resulting from the exercise of settlement options or annuitizations of host contracts issued after Dec. 31, 2017;
 - e. Fixed payout annuities resulting from the exercise of settlement options or annuitizations of host contracts issued during 2017, for fixed payouts commencing after Dec. 31, 2018, or, at the option of the company, for fixed payouts commencing after Dec. 31, 2017;
 - f. Supplementary contracts, excluding contracts with no scheduled payments (such as retained asset accounts and settlements at interest), issued after Dec. 31, 2017;
 - g. Fixed income payment streams, attributable to contingent deferred annuities (CDAs) issued after Dec. 31, 2017, once the underlying contract funds are exhausted;
 - h. Fixed income payment streams attributable to guaranteed living benefits associated with deferred annuity contracts issued after Dec. 31, 2017, once the contract funds are exhausted; and
 - i. Certificates with premium determination dates after Dec. 31, 2017, emanating from non-variable group annuity contracts specified in Model #820, Section 5.C.2, purchased for the purpose of providing certificate holders benefits upon their retirement.

Commented [X372]: Under A.2: need to exclude contracts being covered by the earlier sections of VM-22 not passing the exclusion tests and need a clearer reference instead of "covered in this section"

Guidance Note: For Section ~~13~~14.A.2.d, Section ~~13~~14.A.2.e, Section ~~13~~14.A.2.f and Section ~~13~~14.A.2.h above, there is no restriction on the type of contract that may give rise to the benefit.

3. Exemptions:
 - a. With the permission of the domiciliary commissioner, for the categories of annuity contracts, certificates and/or contract features in scope as outlined in Section ~~13~~14.A.2.d, Section ~~13~~14.A.2.e, Section ~~13~~14.A.2.f, Section ~~13~~14.A.2.g or Section ~~13~~14.A.2.h, the

company may use the same maximum valuation interest rate used to value the payment stream in accordance with the guidance applicable to the host contract. In order to obtain such permission, the company must demonstrate that its investment policy and practices are consistent with this approach.

4. The maximum valuation interest rates for the contracts, certificates and contract features within the scope of Section 13.14 of VM-22 supersede those described in Appendix VM-A and Appendix VM-C, but they do not otherwise change how those appendices are to be interpreted. In particular, *Actuarial Guideline IX-B—Clarification of Methods Under Standard Valuation Law for Individual Single Premium Immediate Annuities, Any Deferred Payments Associated Therewith, Some Deferred Annuities and Structured Settlements Contracts* (AG-9-B) (see VM-C) provides guidance on valuation interest rates and is, therefore, superseded by these requirements for contracts, certificates and contract features in scope. Likewise, any valuation interest rate references in *Actuarial Guideline IX-C—Use of Substandard Annuity Mortality Tables in Valuing Impaired Lives Under Individual Single Premium Immediate Annuities* (AG-9-C) (see VM-C) are also superseded by these requirements.

B. Definitions

1. The term “reference period” means the length of time used in assigning the Valuation Rate Bucket for the purpose of determining the statutory maximum valuation interest rate and is determined as follows:
 - a. For contracts, certificates or contract features with life contingencies and substantially similar payments, the reference period is the length of time, rounded to the nearest year, from the premium determination date to the earlier of: i) the date of the last non-life-contingent payment under the contract, certificate or contract feature; and ii) the date of the first life-contingent payment under the contract, certificate or contract feature, or
 - b. For contracts, certificates or contract features with no life-contingent payments and substantially similar payments, the reference period is the length of time, rounded to the nearest year, from the premium determination date to the date of the last non-life-contingent payment under the contract, certificate or contract feature, or
 - c. For contracts, certificates or contract features where the payments are not substantially similar, the actuary should apply prudent judgment and select the Valuation Rate Bucket with Macaulay duration that is a best fit to the Macaulay duration of the payments in question.

Guidance Note: Contracts with installment refunds or similar features should consider the length of the installment period calculated from the premium determination date as the non-life contingent period for the purpose of determining the reference period.

Guidance Note: The determination in Section 13.14.B.1.c above shall be made based on the materiality of the payments that are not substantially similar relative to the life-contingent payments.

2. The term “jumbo contract” means a contract with an initial consideration equal to or greater than \$250 million. Considerations for contracts issued by an insurer to the same contract holder within 90 days shall be combined for purposes of determining whether the contracts meet this threshold.

Guidance Note: If multiple contracts meet this criterion in aggregate, then each contract is a jumbo contract.

3. The term “non-jumbo contract” means a contract that does not meet the definition of a jumbo contract.
4. The term “premium determination date” means the date as of which the valuation interest rate for the contract, certificate or contract feature being valued is determined.
5. The term “initial age” means the age of the annuitant as of his or her age last birthday relative to the premium determination date. For joint life contracts, certificates or contract features, the “initial age” means the initial age of the younger annuitant. If a contract, certificate or contract feature for an annuitant is being valued on a standard mortality table as an impaired annuitant, “initial age” means the rated age. If a contract, certificate or contract feature is being valued on a substandard mortality basis, “initial age” means an equivalent rated age.
6. The term “Table X spreads” means the prescribed VM-22 Section ~~13~~14 current market benchmark spreads for the quarter prior to the premium determination date, as published on the Industry tab of the NAIC website. The process used to determine Table X spreads is the same as that specified in VM-20 Appendix 2.D for Table F, except that JP Morgan and Bank of America bond spreads are averaged over the quarter rather than the last business day of the month.
7. The term “expected default cost” means a vector of annual default costs by weighted average life. This is calculated as a weighted average of the VM-20 Table A prescribed annual default costs published on the Industry tab of the NAIC website in effect for the quarter prior to the premium determination date, using the prescribed portfolio credit quality distribution as weights.
8. The term “expected spread” means a vector of spreads by weighted average life. This is calculated as a weighted average of the Table X spreads, using the prescribed portfolio credit quality distribution as weights.
9. The term “prescribed portfolio credit quality distribution” means the following credit rating distribution:
 - a. 5% Treasuries
 - b. 15% Aa bonds (5% Aa1, 5% Aa2, 5% Aa3)
 - c. 40% A bonds (13.33% A1, 13.33% A2, 13.33% A3)*
 - d. 40% Baa bonds (13.33% Baa1, 13.33% Baa2, 13.33% Baa3)*

*40%/3 is used unrounded in the calculations.

C. Determination of the Statutory Maximum Valuation Interest Rate

1. Valuation Rate Buckets

- a. For the purpose of determining the statutory maximum valuation interest rate, the contract, certificate or contract feature being valued must be assigned to one of four Valuation Rate Buckets labeled A through D.
- b. If the contract, certificate or contract feature has no life contingencies, the Valuation Rate Bucket is assigned based on the length of the reference period (RP), as follows:

Table 3-1: Assignment to Valuation Rate Bucket by Reference Period Only

RP ≤ 5 Years	5Y < RP ≤ 10Y	10Y < RP ≤ 15Y	RP > 15Y
A	B	C	D

- c. If the contract, certificate or contract feature has life contingencies, the Valuation Rate Bucket is assigned based on the length of the RP and the initial age of the annuitant, as follows:

Table 3-2: Assignment to Valuation Rate Bucket by Reference Period and Initial Age

Initial Age	RP ≤ 5Y	5Y < RP ≤ 10Y	10Y < RP ≤ 15Y	RP > 15Y
90+	A	B	C	D
80–89	B	B	C	D
70–79	C	C	C	D
< 70	D	D	D	D

2. Premium Determination Dates

- a. The following table specifies the decision rules for setting the premium determination date for each of the contracts, certificates and contract features listed in Section 1:

Table 3-3: Premium Determination Dates

Section	Item Description	Premium determination date
A.2.a	Immediate annuity	Date consideration is determined and committed to by contract holder
A.2.b	Deferred income annuity	Date consideration is determined and committed to by contract holder
A.2.c	Structured settlements	Date consideration is determined and committed to by contract holder
A.2.d and A.2.e	Fixed payout annuities resulting from settlement options or annuitizations from host contracts	Date consideration for benefit is determined and committed to by contract holder
A.2.f	Supplementary contracts	Date of issue of supplementary contract
A.2.g	Fixed income payment streams from CDAs, AV becomes 0	Date on which AV becomes 0
A.2.h	Fixed income payment streams from guaranteed living benefits, AV becomes 0	Date on which AV becomes 0

A.2.i	Group annuity and related certificates	Date consideration is determined and committed to by contract holder
-------	--	--

Guidance Note: For the purposes of the items in the table above, the phrase “date consideration is determined and committed to by the contract holder” should be interpreted by the company in a manner that is consistent with its standard practices. For some products, that interpretation may be the issue date or the date the premium is paid.

b. Immaterial Change in Consideration

If the premium determination date is based on the consideration, and if the consideration changes by an immaterial amount (defined as a change in present value of less than 10% and less than \$1 million) subsequent to the original premium determination date, such as due to a data correction, then the original premium determination date shall be retained. In the case of a group annuity contract where a single premium is intended to cover multiple certificates, certificates added to the contract after the premium determination date that do not trigger the company’s right to reprice the contract shall be treated as if they were included in the contract as of the premium determination date.

3. Statutory Maximum Valuation Interest Rate

- a. For a given contract, certificate or contract feature, the statutory maximum valuation interest rate is determined based on its assigned Valuation Rate Bucket (Section 1314.C.1) and its Premium Determination Date (Section 1314.C.2) and whether the contract associated with it is a jumbo contract or a non-jumbo contract.
- b. Statutory maximum valuation interest rates for jumbo contracts are determined and published daily by the NAIC on the Industry tab of the NAIC website. For a given premium determination date, the statutory maximum valuation interest rate is the daily statutory maximum valuation interest rate published for that premium determination date.
- c. Statutory maximum valuation interest rates for non-jumbo contracts are determined and published quarterly by the NAIC on the Industry tab of the NAIC website by the third business day of the quarter. For a given premium determination date, the statutory maximum valuation interest rate is the quarterly statutory maximum valuation interest rate published for the quarter in which the premium determination date falls.
- d. Quarterly Valuation Rate:

For each Valuation Rate Bucket, the quarterly valuation rate is defined as follows:

$$I_q = R + S - D - E$$

Where:

- a. R is the reference rate for that Valuation Rate Bucket (defined in Section 1314.C.4);
- b. S is the spread rate for that Valuation Rate Bucket (defined in Section 1314.C.5);
- c. D is the default cost rate for that Valuation Rate Bucket (defined in Section 1314.C.6);

and

- d. E is the spread deduction defined as 0.25%.
- e. Daily Valuation Rate:

For each Valuation Rate Bucket, the daily valuation rate is defined as follows:

$$I_d = I_q + C_{d-1} - C_q$$

Where:

- I_q is the quarterly valuation rate for the calendar quarter preceding the business day immediately preceding the premium determination date;
- C_{d-1} is the daily corporate rate (defined in Section ~~13~~14.C.7) for the business day immediately preceding the premium determination date; and
- C_q is the average daily corporate rate (defined in Section ~~13~~14.C.8) corresponding to the same period used to develop I_q .

For jumbo contracts, the daily statutory maximum valuation interest rate is the daily valuation rate (I_d) rounded to the nearest one-hundredth of one percent (1/100 of 1%).

4. Reference Rate

Reference rates are updated quarterly as described below:

- The “quarterly Treasury rate” is the average of the daily Treasury rates for a given maturity over the calendar quarter prior to the premium determination date. The quarterly Treasury rate is downloaded from <https://fred.stlouisfed.org>, and is rounded to two decimal places.
- Download the quarterly Treasury rates for two-year, five-year, 10-year and 30-year U.S. Treasuries.
- The reference rate for each Valuation Rate Bucket is calculated as the weighted average of the quarterly Treasury rates using Table 1 weights (defined in Section ~~13~~14.C.9) effective for the calendar year in which the premium determination date falls.

5. Spread

The spreads for each Valuation Rate Bucket are updated quarterly as described below:

- Use the Table X spreads from the NAIC website for WALs two, five, 10 and 30 years only to calculate the expected spread.
- Calculate the spread for each Valuation Rate Bucket, which is a weighted average of the expected spreads for WALs two, five, 10 and 30 using Table 2 weights (defined in Section 3.I) effective for the calendar year in which the premium determination date falls.

6. Default costs for each Valuation Rate Bucket are updated annually as described below:

- Use the VM-20 prescribed annual default cost table (Table A) in effect for the quarter prior to the premium determination date for WAL two, WAL five and WAL 10 years only to calculate the expected default cost. Table A is updated and published annually on

the Industry tab of the NAIC website during the second calendar quarter and is used for premium determination dates starting in the third calendar quarter.

- b. Calculate the default cost for each Valuation Rate Bucket, which is a weighted average of the expected default costs for WAL two, WAL five and WAL 10, using Table 3 weights (defined in Section 4314.C.9) effective for the calendar year in which the premium determination date falls.

7. Daily Corporate Rate

Daily corporate rates for each valuation rate bucket are updated daily as described below:

- a. Each day, download the Bank of America Merrill Lynch U.S. corporate effective yields as of the previous business day’s close for each index series shown in the sample below from the St. Louis Federal Reserve website: <https://research.stlouisfed.org/fred2/categories/32348>. To access a specific series, search the St. Louis Federal Reserve website for the series name by inputting the name into the search box in the upper right corner, or input the following web address: [https://research.stlouisfed.org/fred2/series/\[replace with series name from the table below\]](https://research.stlouisfed.org/fred2/series/[replace with series name from the table below]).

Table 3-4: Index Series Names

Maturity	Series Name
1Y – 3Y	BAMLC1A0C13YEY
3Y – 5Y	BAMLC2A0C35YEY
5Y – 7Y	BAMLC3A0C57YEY
7Y – 10Y	BAMLC4A0C710YEY
10Y – 15Y	BAMLC7A0C1015YEY
15Y+	BAMLC8A0C15PYEY

- b. Calculate the daily corporate rate for each valuation rate bucket, which is a weighted average of the Bank of America Merrill Lynch U.S. corporate effective yields, using Table 4 weights (defined in Section 4314.C.9) effective for the calendar year in which the business date immediately preceding the premium determination date falls.

8. Average Daily Corporate Rate

Average daily corporate rates are updated quarterly as described below:

- a. Download the quarterly average Bank of America Merrill Lynch U.S. corporate effective yields for each index series shown in Section 3.G.1 from the St. Louis Federal Reserve website: <https://research.stlouisfed.org/fred2/categories/32348>. To access a specific series, search the St. Louis Federal Reserve website for the series name by inputting the name into the search box in the upper right corner, or input the following web address: [https://research.stlouisfed.org/fred2/series/\[replace with series name from Section 4314.C.7.a\]](https://research.stlouisfed.org/fred2/series/[replace with series name from Section 4314.C.7.a]).

- b. Calculate the average daily corporate rate for each valuation rate bucket, which is a weighted average of the quarterly average Bank of America Merrill Lynch U.S. corporate effective yields, using Table 4 weights (defined in Section 14.C.9) for the same calendar year as the weight tables (i.e. Tables 1, 2, and 3) used in calculating I_q in Section 14.C.3.e.

9. Weight Tables 1 through 4

The system for calculating the statutory maximum valuation interest rates relies on a set of four tables of weights that are based on duration and asset/liability cash-flow matching analysis for representative annuities within each valuation rate bucket. A given set of weight tables is applicable to the calculations for every day of the calendar year.

In the fourth quarter of each calendar year, the weights used within each valuation rate bucket for determining the applicable valuation interest rates for the following calendar year will be updated using the process described below. In each of the four tables of weights, the weights in a given row (valuation rate bucket) must add to exactly 100%.

Weight Table 1

The process for determining Table 1 weights is described below:

- a. Each valuation rate bucket has a set of representative annuity forms. These annuity forms are as follows:
- i. Bucket A:
 - a) Single Life Annuity age 91 with 0 and five-year certain periods.
 - b) Five-year certain only.
 - ii. Bucket B:
 - a) Single Life Annuity age 80 and 85 with 0, five-year and 10-year certain periods.
 - b) 10-year certain only.
 - iii. Bucket C:
 - a) Single Life Annuity age 70 with 0 and 15-year certain periods.
 - b) Single Life Annuity age 75 with 0, 10-year and 15-year certain periods.
 - c) 15-year certain only.
 - iv. Bucket D:
 - a) Single Life Annuity age 55, 60 and 65 with 0 and 15-year certain periods.
 - b) 25-year certain only.
- b. Annual cash flows are projected assuming annuity payments are made at the end of each year. These cash flows are averaged for each valuation rate bucket across the annuity forms for that bucket using the statutory valuation mortality table in effect for the following calendar year for

individual annuities for males (ANB).

- c. The average daily rates in the third quarter for the two-year, five-year, 10-year and 30-year U.S. Treasuries are downloaded from <https://fred.stlouisfed.org> as input to calculate the present values in Step d.
- d. The average cash flows are summed into four time period groups: years 1–3, years 4–7, years 8–15 and years 16–30. (**Note:** The present value of cash flows beyond year 30 are discounted to the end of year 30 and included in the years 16–30 group. This present value is based on the lower of 3% and the 30-year Treasury rate input in Step c.)
- e. The present value of each summed cash-flow group in Step d is then calculated by using the Step 3 U.S. Treasury rates for the midpoint of that group (and using the linearly interpolated U.S. Treasury rate when necessary).
- f. The duration-weighted present value of the cash flows is determined by multiplying the present value of the cash-flow groups by the midpoint of the time period for each applicable group.
- g. Weightings for each cash-flow time period group within a valuation rate bucket are calculated by dividing the duration weighted present value of the cash flow by the sum of the duration weighted present value of cash flow for each valuation rate bucket.

Weight Tables 2 through 4

Weight Tables 2 through 4 are determined using the following process:

- i. Table 2 is identical to Table 1.
 - ii. Table 3 is based on the same set of underlying weights as Table 1, but the 10-year and 30-year columns are combined since VM-20 default rates are only published for maturities of up to 10 years.
 - iii. Table 4 is derived from Table 1 as follows:
 - a) Column 1 of Table 4 is identical to column 1 of Table 1.
 - b) Column 2 of Table 4 is 50% of column 2 of Table 1.
 - c) Column 3 of Table 4 is identical to column 2 of Table 4.
 - d) Column 4 of Table 4 is 50% of column 3 of Table 1.
 - e) Column 5 of Table 4 is identical to column 4 of Table 4.
 - f) Column 6 of Table 4 is identical to column 4 of Table 1.
10. Group Annuity Contracts

For a group annuity purchased under a retirement or deferred compensation plan (Section ~~13~~14.A.2.i), the following apply:

- a. The statutory maximum valuation interest rate shall be determined separately for each certificate, considering its premium determination date, the certificate holder's initial age, the reference period corresponding to its form of payout and whether the contract is a jumbo contract or a non-jumbo contract.

Guidance Note: Under some group annuity contracts, certificates may be purchased on different

dates.

- b. In the case of a certificate whose form of payout has not been elected by the beneficiary at its premium determination date, the statutory maximum valuation interest rate shall be based on the reference period corresponding to the normal form of payout as defined in the contract or as is evidenced by the underlying pension plan documents or census file. If the normal form of payout cannot be determined, the maximum valuation interest rate shall be based on the reference period corresponding to the annuity form available to the certificate holder that produces the most conservative rate.

Guidance Note: The statutory maximum valuation interest rate will not change when the form of payout is elected.

This page intentionally left blank

Valuation Manual Section II, Reserve Requirements

Subsection 2: Annuity Products

- A. This subsection establishes reserve requirements for all contracts classified as annuity contracts as defined in SSAP No. 50 in the AP&P Manual.
- B. Minimum reserve requirements for variable annuity (VA) contracts and similar business, specified in VM-21, Requirements for Principle-Based Reserves for Variable Annuities, shall be those provided by VM-21. The minimum reserve requirements of VM-21 are considered PBR requirements for purposes of the *Valuation Manual*.
- C. Minimum reserve requirements for ~~non-variable~~ fixed annuity contracts issued prior to 1/1/2024 are those requirements as found in VM-A and VM-C as applicable, with the exception of the minimum requirements for the valuation interest rate for single premium immediate annuity contracts, and other similar contracts, issued after Dec. 31, 2017, including those fixed payout annuities emanating from host contracts issued on or after Jan. 1, 2017, and on or before Dec. 31, 2017. The maximum valuation interest rate requirements for those contracts and fixed payout annuities are defined in ~~Section 13.14 of VM-22, Statutory Maximum Valuation Interest Rates for Income Annuity Formulaic Reserves.~~
- D. Minimum reserve requirements for ~~non-variable~~ fixed annuity contracts issued on 1/1/2024 and later are those requirements as found in Sections 1 through ~~12~~ 13 of VM-22.

Commented [X373]: We believe a Fixed Annuity PBR Exemption should be incorporated into draft in a manner consistent with the Life PBR Exemption.

Commented [VM22374R373]: Waylon Peoples comment letter: Extend small company exemption in place for life PBR (VM-20) to VM-22.

Commented [CD375]: "non-variable annuity"?

Commented [X376]: "Section 13 of VM-22" may need to be updated if it is decided to have separate chapters for VM-22 VIR and VM-22 PBR.

Commented [CD377]: "non-variable annuity"?

Commented [CD378]: Consider adding the sentence: "The minimum reserve requirements of VM-22 are considered PBR requirements for purposes of the Valuation Manual." This is so VM-G will apply to VM-22, which would be appropriate.

The requirements in this section are still considered a part of PBR requirements and therefore are applicable to VM-G.

The below principles may serve as key considerations for assessing whether VM 21 or VM 22 requirements apply:

D. Minimum reserve requirements apply:

- E. ~~Index for index-linked or modified guaranteed annuity contracts or riders that satisfy both of the following conditions may be a key consideration for application of VM 22 requirements and are issued on 1/1/2024 and later are those requirements; as found in Sections 1 through 13 of VM-22.:~~

Commented [X379]: "Index-linked" annuity is not defined – only RILA and FIA in VM-22, recommend to revise the language or add a definition to define "index linked".

- 1. Guarantees the principal amount of purchase payments, net of any partial withdrawals, and interest credited thereto, less any deduction (without regard to its timing) for sales, administrative or other expenses or charges.
- 2.b. Credits a rate of interest under the contract prior to the application of any market value adjustments that is at least equal to the minimum rate required to be credited by the standard nonforfeiture law in the jurisdiction in which the contract is issued.

~~Guidance Note: Paragraph E.1.b is intended to apply prior to the application of any market value adjustments for modified guaranteed annuities where the underlying assets are held in a separate account. If meeting Paragraph E.1.b prior to the application of any market value adjustments and Paragraph E.1.a above, it may be appropriate to value such contracts under VM 22 requirements.~~

Minimum reserve requirements.

Commented [X380]: Recommend adding this part to E.1.b and delete the Guidance Note.

for index

F. ~~2. Index-linked or modified guaranteed annuity contracts or riders that do not satisfy either of the two conditions listed above criteria in Paragraph Section 2.E.1 and Section 2.E.2 above and E.1.ii may be a key consideration for application of VM-21 are issued on 1/1/2024 and later are those requirements as found in VM-21.~~

Commented [X381]: VM-21 specifically says “These requirements do not apply to contracts falling under the scope of VM-A-255: Modified Guaranteed Annuities; however, they do apply to contracts listed above that include one or more subaccounts containing features similar in nature to those contained in modified guaranteed annuities (MGAs) (e.g., market value adjustments).” Is this a contradiction?

Commented [X382]: Consistent with E above.

Subsection 6: Riders and Supplemental Benefits

Guidance Note: Policies ~~Designs~~ of policies or contracts with riders and supplemental benefits which are created to simply disguise benefits subject to the Valuation Manual section describing the reserve methodology for the base product to which they are attached, or exploit a perceived loophole, must be reserved in a manner similar to more typical designs with similar riders.

Commented [X383]: Still need the word “designs” otherwise this is saying the whole policy/contract was only created to disguise benefits, which would never be true.

A. If a rider or supplemental benefit is attached to a health insurance product, deposit-type contract, or credit life or disability product, it may be valued with the base contract unless it is required to be separated by regulation or other requirements.

B. For supplemental benefits on life insurance policies or annuity contracts, including Guaranteed Insurability, Accidental Death or Disability Benefits, Convertibility, ~~Nursing Home Benefits~~ or Disability Waiver of Premium Benefits, the supplemental benefit may be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, VM-A, and/or VM-C, as applicable.

Commented [X384]: This reference is another place where there would be a benefit distinguishing the PBR sections of VM-22 from the non-PBR sections.

~~C. ULSG and other secondary guarantee riders on a life insurance policy shall be valued with the base policy and follow the reserve requirements for ULSG policies under VM-20, VM-A and/or VM-C, as applicable.~~

~~D.C. Any~~ any guaranteed minimum benefits on life insurance policies or annuity contracts ~~not subject to Paragraph C above~~ including, but not limited to, Guaranteed Minimum Accumulation Benefits, Guaranteed Minimum Death Benefits, Guaranteed Minimum Income Benefits, Guaranteed Minimum Withdrawal Benefits, Guaranteed Lifetime Income Benefits, Guaranteed Lifetime Withdrawal Benefits, Guaranteed Payout Annuity Floors, Waiver of Surrender Charges, Return of Premium, Systematic Withdrawal Benefits under Required Minimum Distributions, and all similar guaranteed benefits shall be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, and VM-A and/or VM-C, as applicable.

Commented [X385]: These parallel requirements can be combined.

~~E.D.~~ E.D. If a rider or supplemental benefit to a life insurance policy or annuity contract that is not addressed in Paragraphs B, C, or D above possesses any of the following attributes, the rider or supplemental benefit shall be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, and VM-A and/or VM-C, as applicable.

1. The rider or supplemental benefit does not have a separately identified premium or charge.
2. After issuance, the rider or supplemental benefit premium, charge, value or benefits are determined by referencing the base policy or contract features or performance.
3. After issuance, the base policy or contract value or benefits are determined by referencing the rider or supplemental benefit features or performance. The deduction of rider or benefit premium or charge from the contract value is not sufficient for a determination by reference.

~~F.E.~~ F.E. If a term life insurance rider on the named insured[s] on the base life insurance policy does not meet the conditions of Paragraph E above, and either (1) guarantees level or near level premiums until a specified duration followed by a material premium increase; or (2) for a rider for which level or near level premiums are expected for a period followed by a material premium increase, the rider is

separated from the base policy and follows the reserve requirements for term policies under VM20, VM-A and/or VM-C, as applicable.

~~G.F.~~ For all other riders or supplemental benefits on life insurance policies or annuity contracts not addressed in Paragraphs B through F above, the riders or supplemental benefits may be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, VM-A and/or VM-C, as applicable. For a given rider, the election to include riders or supplemental benefits with the base policy or contract shall be determined at the policy form level, not on a policy-by-policy basis, and shall be treated consistently from year-to-year, unless otherwise approved by the domiciliary commissioner.

~~H.G.~~ Any supplemental benefits and riders offered on life insurance policies or annuity contracts that would have a material impact on the reserve (for VM-20 and VM-22) or TAR (for VM-21) if elected later in the contract life, such as joint income benefits, nursing home benefits, or withdrawal provisions on annuity contracts, shall be considered when determining reserves (for VM-20 and VM-22) or reserves and TAR (for VM-21) using the following principles:

1. Policyholders with living benefits and annuitization in the same contract will generally use the more valuable of the two benefits.
2. ~~When advantageous, policyholders will commence living benefit payouts if not started yet.~~

Commented [X386]: Simplifications are judged relative to reserves for VM-20/VM-21 and TAR for VM-21.

Commented [X387]: This section states that “When advantageous, policyholders will commence living benefit payouts if not started yet.” This text seems to directly contradict VM-22 Section 6.H.2 which states “contract holder behavior should neither assume that all contract holders act with 100% efficiency in a financially rational manner nor assume that contract holders will always act irrationally”. We suggest revising 6.H.2 to align with the text of 10.D.8.

Page 11: [1] Commented [VM2266R64] VM-22 Subgroup 3/2/2022 4:12:00 PM

See Equitable comment letter: supports full aggregation, but if choosing between the two exposed options for two reserving categories, prefers option 2.

Page 11: [2] Commented [CD68] CA DOI 12/30/2021 3:27:00 PM

suggest swapping the order of this section. That is, start with the "in scope" list, rather than the "out of scope" list.

Also, it seems like there should be specific mentions of GMDBs and GLBs, as there are in VM-21, since those guarantees can also be found on FIAs.

Page 11: [3] Commented [X71] TDI 11/9/2021 9:17:00 AM

This needs to be revised to be in line with VM-21 Section 2.A. Consider removing "such as" list and adding a cross-reference to VM-21 Section 2.A.

Page 11: [4] Commented [CD77] CA DOI 12/30/2021 3:31:00 PM

should this be "Non-Variable Annuity"? Otherwise, should "Fixed Annuity" be defined in the Definitions section?

Page 11: [5] Commented [X79] ACLI

We suggest moving or deleting the sentence "The company may elect to exclude one or more groups of contracts from the stochastic reserve calculation in certain situations, pursuant to the exclusion test requirements defined in Section 3.E of VM-22." from this section as it does not seem fitting here.

Page 11: [6] Commented [X81] TDI 11/9/2021 9:19:00 AM

Does this belong in Scope? Do these still follow the other VM-22 requirements (if the old VM-22 interest rate determinations are left in the same chapter as the VM-22 PBR requirements)?

It is normal to then list what requirements such excluded contracts would follow. However, the statement here is more problematic because you can be excluded from the SR but still subject to VM-22.

Page 11: [7] Commented [X83] TDI 11/9/2021 9:25:00 AM

We still have a question about whether RBC factors are still at an appropriate level, if principles-based capital is not developed. Were they set assuming that this reserve was at a CTE(70) level in the first place, or were they dependent on the prior framework?

Page 14: [8] Commented [X99] ACLI

Seems to imply that only SPIAs would pass due to the linkage to Section 13. But the reference to interest rates should be broader, if even necessary. Suggest editing as:

"these groups of contracts may be valued using the methodology and statutory maximum valuation rate pursuant to applicable requirements in VM-A, and VM-C, and with the statutory maximum valuation rate for immediate annuities specified in Section 13."

Page 14: [9] Commented [CD100] CA DOI 12/30/2021 3:36:00 PM

Suggest rewording to just say "the stochastic exclusion test". There is only 1 SET, with 3 ways of passing it. Therefore, the current wording is confusion because it suggests that there are multiple SETs.

Page 14: [10] Commented [X102] ACLI

We believe this guidance note is unnecessary as the intent of the section is clear, and the wording is possibly confusing.

Page 14: [11] Commented [X103] TDI 11/9/2021 9:57:00 AM

The statement in this section is not acceptable as discussed in the previous TX comment letter. This will have the effect of potentially masking blocks that need PBR.

Page 14: [12] Commented [X104] ACLI

This section seems to indicate that the grouping of contracts in exclusion testing should be the same as the grouping of contracts for aggregation. This might cause fewer product types to be qualifying for exclusion if the test must be performed at a higher level of aggregation.

Page 14: [13] Commented [X108] ACLI

Either in this item or in Section 12 allocation to contracts not covered by PBR methodology in VM-22 needs to be addressed e.g., carve out because reserves calculated on seriatim formulaic basis.

Page 14: [14] Commented [X109] ACLI

This sub-section seems more appropriate in Section 4 (or pulled out completely and consolidated within "I. Introduction" or "VM-01" and applied to all PBR methods).

Page 14: [15] Commented [CD110] CA DOI 12/30/2021 3:43:00 PM

VM-21 Section 3.H on simplifications, approximations, and modeling efficiency techniques is missing (including the Guidance Note). Would it make sense to add it?

Page 33: [16] Commented [X209] ACLI

We recommend removing "pension risk transfer business" from products scoped out of SET certification method. It is unclear why this business would be treated differently from individually issued business for testing intended to capture interest rate risk.

Page 33: [17] Commented [VM22210R209] VM-22 Subgroup 3/2/2022 2:51:00 PM

Determine whether to address longevity reinsurance in this topic, in light of NJ comment letter.

Page 33: [18] Commented [CD215] CA DOI 12/30/2021 4:14:00 PM

what is meant by "aggregate risk levels"? Aggregated across what? Need clarification on the intentions for adding this phrase, when it is not in VM-20. Otherwise, i would suggest deleting this.

Page 33: [19] Commented [X216] TDI 11/18/2021 9:49:00 PM

This is not in VM-20 and would substantially change the exclusion. The intent is not to allow you to group a block that has material interest rate risk with a larger block that is insensitive to interest rate risks and thereby pass. If

"aggregate" referred to potential compounding of interest rate, longevity, or asset risk then this could be redrafted to clearly call out a 4th category of risk due to a combination of the first three. However, I think this is already implicitly covered.

Page 33: [20] Commented [CD218] CA DOI 12/30/2021 4:15:00 PM

note, there is no insertion of "aggregate risk levels across" here, like there was above. (to be clear, i don't support adding it.)

VM-22 Subgroup Discussion Topics*June 1, 2022*Remaining Tier 2 Comments

- Allow SPIAs to be optional without exclusion test? (page 14)
 - ACLI comments
- Allow PRT to undergo certification method (rather than being ineligible) (page 33)
 - ACLI comments
- Exclusion Test Grouping (page 14)
 - Group with risks with significantly different profiles?

- Reserving category for deferred annuities with depleted fund value
 - Payout or accumulation reserving category?

Draft: 8/2/22

Valuation Manual (VM)-22 (A) Subgroup
Virtual Meeting
May 11, 2022

The VM-22 (A) Subgroup of the Life Actuarial (A) Task Force met May 11, 2022. The following Subgroup members participated: Ben Slutsker, Chair (MN); Ahmad Kamil, Elaine Lam, and Thomas Reedy (CA); Lei Rao-Knight (CT); Vincent Tsang (IL); Nicole Boyd (KS); William Leung (MO); Seong-min Eom (NJ); Bill Carmello and Amanda Fenwick (NY); Yujie Huang (TX); Tomasz Serbinowski (UT); and Craig Chupp (VA).

1. Discussed Tier Two Comments on the Proposed VM-22 Framework

Mr. Slutsker reviewed the list of discussion topics (Attachment Twenty-Four-A). Mr. Tsang said the proposed VM-22 framework should be consistent with VM-21, Requirements for Principle-Based Reserves for Variable Annuities. He said VM-21 has a 5% minimum error on the hedging program breakage expense, so VM-22 should also set 5% as its minimum error even though the hedging for the fixed annuity is not as complex as the hedging for the variable annuity. He said that due to the availability of policyholder options, a minimum error equal to zero is almost impossible to justify. He said he would consider a minimum error other than 5% if the industry can present the supporting data. Brian Bayerle (American Council of Life Insurers—ACLI) said the VM-22 minimum error is applicable only to static hedges. He said the ACLI could provide an example of static hedges on vanilla payout annuities for which a zero minimum error is appropriate. He suggested separating static hedges from dynamic hedges to maintain alignment with VM-21. John Miller (American Academy of Actuaries—Academy) said the Academy supports the bifurcation of static and dynamic hedges. He said the Academy believes that the minimum error for static hedges should be close to zero. He suggested adding the minimum error to the issues considered during the VM-22 field test. The Subgroup agreed to have back testing of the minimum error over multiple years of issues with assorted product designs either provided by industry prior to the field test or included as part of the field test.

Brent Dooley (Academy) gave an overview of the Academy longevity reinsurance presentation (Attachment Twenty-Four-B). He noted that much of the longevity reinsurance business covers annuitants who live in other countries. He said the product is primarily purchased by pension plans attempting to reduce longevity risk exposure and insurance companies writing pension risk transfer (PRT) annuities. He explained that of the five categories of longevity reinsurance listed in the presentation, only indexed based longevity swaps are excluded from the scope of the proposed VM-22 framework. Mark Hutchinson (Academy) said longevity reinsurance does not fit neatly into the current statutory accounting and valuation guidance. However, he suggested that longevity reinsurance be considered to fall under the exclusion of “certain non-proportional reinsurance” as stated in the *Life and Health Reinsurance Agreements Model Regulation* (#791). Mr. Slutsker noted that there are aspects of the Academy presentation that should be shared with the Life Risk-Based Capital (E) Working Group and the Statutory Accounting Principles (E) Working Group. Mr. Bayerle said that the ACLI comment letter (Attachment Twenty-Four-C) asked why the definition of longevity reinsurance in the draft VM-22 framework excludes agreements that *Statement of Statutory Accounting Principles (SSAP) No. 61R—Life, Deposit-Type and Accident and Health Insurance* indicates should not be treated as reinsurance. Mr. Dooley said that longevity reinsurance was intentionally excluded. He said a note could be added to the draft to clarify the reasoning.

Ms. Eom said the New Jersey Department of Banking and Insurance (NJ DOBI) comment letter (Attachment Twenty-Four-D) was written with longevity reinsurance considered as a stand-alone product that is to be treated differently from traditional ceded or assumed reinsurance. She proposed a limitation that would prohibit a standard projection amount (SPA) reserve for an individual contract from being negative. She said that the

stochastic reserve (SR) for a product line would be allowed to have a negative reserve for an individual line of business, but the negative reserve would not be allowed to offset reserves for other lines of business when determining the aggregate VM-22 reserve. She agreed to draft language supporting the proposal. She noted that principle #2 of the proposed VM-22 framework already prohibits aggregation of different product lines.

Mr. Slutsker said the Texas Department of Insurance (TDI) commented that the VM-31, PBR Actuarial Report Requirements for Business Subject to a Principle-Based Valuation, disclosures should be made more granular, to separately cover fixed indexed annuities (FIAs), fixed deferred annuities (FDAs), single premium immediate annuities (SPIAs), deferred income annuities (DIAs), PRT, guaranteed living benefits (GLBs), and non-GLBs. Ms. Eom said longevity reinsurance should also be included. She said that if longevity reinsurance is included with PRT, a note to that effect should be included in VM-22. Mr. Chupp said that he would prefer to have the VM-22 level of granularity match the granularity required for VM-20, Requirements for Principle-Based Reserves for Life Products. He noted that with a higher level of granularity, there is a risk that new products may not fit into an existing category. Mr. Carmello and several other Subgroup members said that it is important to get as much product information as possible.

Having no further business, the VM-22 (A) Subgroup adjourned.

Valuation Manual (VM)-22 (A) Subgroup

Background on Longevity Reinsurance and Longevity Swaps

- **Goals for today's discussion**
 - Provide an overview of the major product designs in the market today.
 - Discuss the key features and similarities/differences among the designs
 - Provide input regarding which types of longevity reinsurance/swaps should be in-scope for VM-22 principle-based reserving (PBR) and discuss statutory considerations unique to these products
- **Who buys longevity reinsurance / swaps?**
 - Pension plans who want to reduce exposure to longevity risk; access reinsurance market through captives or insurance intermediaries
 - Insurance carriers who write pension risk transfer (PRT) group annuities or individual payout annuities looking to manage risk and/or optimize capital
 - Public announcements of transactions are the primary source of market data, with tens of billions of disclosed each year, denominated in a variety of currencies
 - Markets with large, publicly-disclosed transactions include the U.S., U.K., Netherlands, and Canada
- **Wide variety of product designs exist in the market, and nomenclature is not standardized**
 - Most contracts are bespoke, and underwriting is typically facultative
 - Many executed transactions and terms are not publicly disclosed

Longevity Reinsurance and Swaps

Category	Covers Named Annuitants vs. Index	Term of coverage	Single vs. Recurring Payments	Risks Transferred	Degree of Basis Risk	Moneyness at Issue	Potential U.S. STAT Classification
Classical Longevity Reinsurance	Named annuitants	Tied to life of block	Recurring premium and benefits, typically net settled	Longevity risk only	Limited (some structuring is common)	At the money	Proportional reinsurance
Temporary Longevity Reinsurance (a.k.a. "Cancellable Swap")	Named annuitants	Fixed horizon less than life of block (typically several years)	Recurring premium and benefits, typically net settled	Longevity risk only	Limited (some structuring is common)	At the money	Unclear; Conceptually similar to yearly renewable term (YRT), but longer term
Funded Reinsurance	Named annuitants	Tied to life of block	Single premium; recurring benefit payments	Longevity and asset risks	None (i.e., reinsurer makes actual benefit payments) to limited (some structuring)	At the money	Proportional reinsurance
Tail Longevity Coverage	Named annuitants	Tied to life of block, but attaches at fixed horizon	Risk fee payable in initial years; may never pay any benefits	Longevity risk only	Limited (some structuring is common)	Deeply out-of-the-money	Non-proportional reinsurance
Index-Based Longevity Swap	Population / Index	Fixed horizon less than life of block	Typically net settled; may be single or recurring settlement	Longevity risk only	Can be significant	Any	Derivative; Suggest including as asset in asset adequacy testing (AAT) / PBR calcs

Proposed In-scope VM-22

Other Statutory Accounting and Valuation Considerations

- **Longevity Reinsurance doesn't fit neatly into existing statutory accounting and valuation guidance**
 - Not specifically contemplated by Statement of Statutory Accounting Principles (SSAP) 50, SSAP 61R, or model laws (MDL) 791/Appendix A-791
 - Agreements may be either temporary or permanent and may be either proportional or non-proportional
 - In some cases, only a single risk is reinsured from the underlying direct contract, which contains multiple risks
- **How should ceding companies calculate reinsurance credit? Should assuming companies use the commissioners' reserve valuation method (CRVM) or the commissioners' annuity reserve valuation method (CARVM)?**
- **MDL 791 requires transfer of ALL defined risks (i.e. Credit, Reinvestment, Mortality) for Immediate Annuities to receive statutory credit for reinsurance**
 - Scope excludes only YRT, assumption reinsurance, and "certain nonproportional reinsurance such as stop-loss or catastrophe reinsurance"
 - MDL 791 original intent: "improper...to enter into reinsurance agreements for the principal purpose of producing significant surplus aid for the ceding insurer, typically on a temporary basis, while not transferring all of the significant risks inherent in the business being reinsured"
 - Unclear under VM-30/AAT whether to allow projection of proportional reinsurance without meeting statutory risk transfer requirements
- **For assuming companies, how should the "fee leg" of these transactions be treated?**
 - Guaranteed future fees are available to fund unfavorable future longevity experience.
 - How should VM-22 requirements coordinate with RBC C-2 requirements to properly reflect the net retained longevity risk?
- **How does one treat the "tail mortality risk" to which some of these designs are sensitive? Should stochastic mortality modeling be required?**
 - For Non-Proportional Reinsurance, SSAP 61R paragraph 38 says to review "present value of expected recoveries using realistic assumptions".

Appendix

5

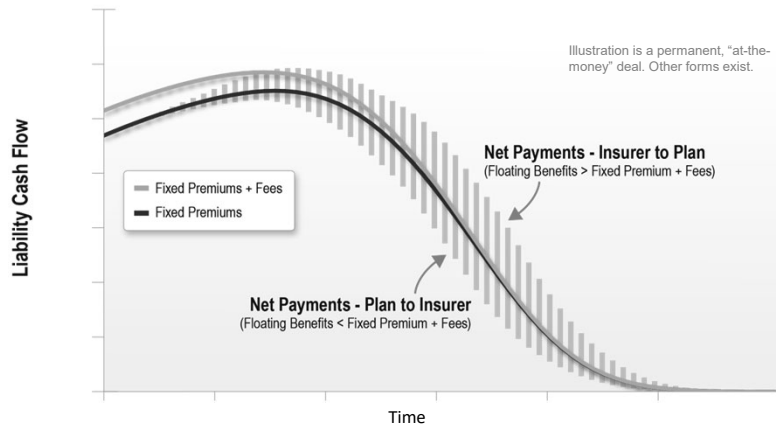

Designing a Classical Longevity Reinsurance agreement starts by projecting out the future expected benefit payments, similar to a pension risk transfer deal

6

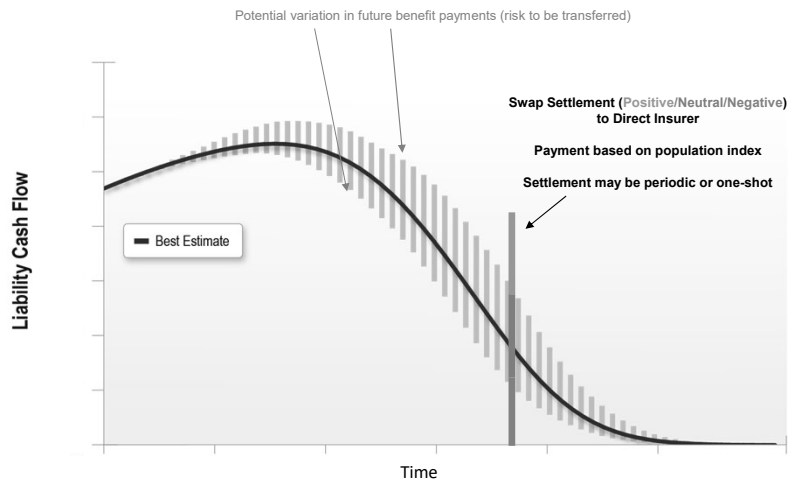

Classical Longevity Reinsurance decomposes the projected benefit payments into the underlying longevity and asset risks, with the goal of transferring only the longevity risks

7

Instead of being directly tied to a pool of annuitants, indexed-based longevity swaps are designed to transfer longevity risk in a more simplified manner, with a greater degree of basis risk

Mr. Bruce Sartain
Chair, NAIC Valuation Manual (VM)-22 (A) Subgroup (Subgroup)

Re: ACLI Comments on ARCWG VM-22 Framework Draft Proposal

Dear Mr. Sartain:

The American Council of Life Insurers (ACLI) appreciates the opportunity to provide comments on the American Academy of Actuaries (the Academy) Annuity Reserves and Capital Work Group) VM-22 Framework Exposure.

ACLI appreciates all the hard work of the Subgroup and ARCWG in development of this draft. We believe the framework is an excellent first step towards principles-based requirements for fixed annuities. We look forward to working with the Subgroup and ARCWG in further development of the framework, and on notable areas that were not addressed in this first exposure.

ACLI supports the continued development of principles-based reserving. We believe that this development is the natural progression of measurement of underlying risks in company portfolios. PBR enables better measurement of complex guarantees and other risks and reflects the underlying experience of the block, while maintaining appropriate flexibility consistent with the complexity of the risks being measured,

Our comments are broken into two sections: priority areas for requested comment and comments on individual sections of the VM-22. You will also find our comments in the accompanying Word document.

VM-22 Exposure Comments and Priorities Comments:

- **Standard Projection Amount (SPA):** If any reserve method includes a SPA, the ACLI supports making the SPA a nonbinding disclosure item across the applicable VM chapters. We appreciate the use of the SPA to help identify outlier assumptions; however, we note that having one-size-fits-all prescribed assumptions is extremely challenging due to the variety of designs in the market. Further, a binding floor introduces non-economic considerations to the reserve that do not align with management of the portfolio. Consistent with our feedback regarding the variable annuity framework, we are concerned

American Council of Life Insurers | 101 Constitution Ave, NW, Suite 700 | Washington, DC 20001-2133

The American Council of Life Insurers (ACLI) is the leading trade association driving public policy and advocacy on behalf of the life insurance industry. 90 million American families rely on the life insurance industry for financial protection and retirement security. ACLI's member companies are dedicated to protecting consumers' financial wellbeing through life insurance, annuities, retirement plans, long-term care insurance, disability income insurance, reinsurance, and dental, vision and other supplemental benefits. ACLI's 280 member companies represent 94 percent of industry assets in the United States.

acli.com

about the possibility of this approach producing false positives and false negatives regarding outliers.

- **Reserving Categories:** We believe aggregation should be consistent with management of liabilities and assets throughout the lifecycle of the portfolio and VM-22 should allow for companies to designate aggregation of blocks consistent with their operational and investment management. Multiple categories and other aggregation limits could create disconnects with the actual management and asset portfolio of the company. Further, a greater level of aggregation encourages well-diversified portfolios and sound-risk management.

Were multiple reserve categories to be defined, we would support a principles-based categorization to accommodate innovation in the market. Further, we suggest an “at issue” approach to better align with management of the block and to avoid any disconnects in the level of the reserve were a block to switch between categories. Additionally, certain additional disclosures may not be applicable under this approach, such as those related to investment strategy when the company is not modeling it; we would suggest limiting the disclosures and reporting to items actually used in the calculation. For Option 1, we suggest deleting item #6 to be consistent with VM-21 or at least need to exclude payment streams from VAs which are scoped into VM-21.

- **Model Segments (Section 3.E):** Consistent with our comments on reserving categories, we believe the model segments should appropriately align with the internal management framework of companies to appropriately reflect inherent offsets in risks, which is in the spirit of a principle-based framework. We do not believe restrictive requirements around segments serves to solve any known problems, as two disjoint scenarios cannot occur at the same time within a company’s portfolio. We suggest consistency of this text with the existing VM-20 Section 7.A.1.b.
- **Allocation (Section 12):** We believe discussion of allocation of aggregate reserves should be analyzed as part of the field study.
- **VM-21 vs. VM-22 Distinction (VM Section II edits):** Consistent with the exposed framework, we support the continued inclusion of RILA and RILA-like products within VM-21. We are appreciative of the key considerations outlined in Valuation Manual Section II. Reserve Requirements Subsection 2.E and support further clarification of the intent of this text for greater clarity on the applicable guidance.
- **Exclusion Test:** ACLI is supportive of the exclusion test, however, we believe there are areas that could be clarified. We think there could be greater clarity regarding how exactly the exclusion test should be executed. For the Deterministic Certification Option, we request the text to be clarified regarding what business can use this option due to potential confusion in the current text; it would be clearer if the Guidance Note after 7.E.2 were moved to the beginning of Section 7.E to clarify what type of business falls into this category.

We do not believe in the necessity of including longevity risk within the scope of the exclusion test since we are not attempting to model longevity/mortality stochastically. We recommend striking longevity risk related components of this section throughout, including in 7.B and 7.C.1, and deleting the Drafting Note after 7.E.1.d.

Please find additional comments below in Section 7.

Specific feedback on sections:

- Section 1
 - A (Purpose): The proposal suggests VM-22 is not operative until 1/1/2024, which contradicts Section 13 and existing requirements. We would suggest rewording this to clarify that Section 13 is effective after 12/31/2017. Further, we would suggest consistency in labeling of dates (either all text or all numeric).
 - A (Relationship to RBC Requirements): The VM-21 guidance note was not included in VM-22; however, we believe it would be appropriate to retain and reword to say, “products that calculate a stochastic reserve”, since the relationship to RBC would likely be maintained.
 - B (Principles): We would support consistent application of principles across all chapters as currently VM-20 does not have a like-set of principles. We believe this could involve a broader discussion of the assorted product requirements in the VM. As a shorter-term fix, we would recommend generalizing the principles where appropriate and moving these to "Section I. Introduction" or "VM-01" and equally applying to VM-20.
 - B (Principle 2): We support this principle but note that later sections appear to contradict this principle. For example, the statement “The analysis reflects prudent estimate assumptions for deterministic variables and is performed in aggregate (subject to limitations related to contractual provisions) to allow the natural offset of risks within a given scenario.” contradicts with the introduction of additional reserve categories and other limitations (such as model segment restrictions).
 - B (Principle 3): We suggest deleting the sentence "Generally, assumptions are..." since it does not provide guidance. We also suggest tightening the remainder of the text for clarity.
 - B (Principle 5): We recommend deleting the third sentence (starting with “Therefore, the use of assumptions...”) because this lacks historical context and is covered by the final sentence.
 - C (Risks Reflected): Consistent with our comments on 1.B, we would support consistent application of risks reflected across all chapters, rather than embedding the language in each chapter. Were this to be retained in VM-22, we would suggest maintaining consistency with VM-21 to avoid any confusion.
 - C.2.c.i: We recommend removing the bullet “Risks modeled in the company’s risk assessment processes that are related to the contracts, as described above” as this is unclear and probably extraneous.
 - C.3: We recommend removing this section. With the specific RBC language removed, the section loses meaning: "a" is unnecessary and "b" is redundant with

other sections of the VM which allow for materiality considerations (language in VM-20 is likely better for this purpose and should be used consistently).

- C.4.b.iv: We recommend removing the bullet “Significant future reserve increases as an unfavorable scenario is realized” as this is extraneous.
- C.4.c (General business risks): List could be expanded to include operational risk and litigation risk.
- D (Specific definitions for VM-22): It seems the definitions included in this section are largely only used for the purpose of establishing the Scope in Section 2. Since this is intended to be a principles-based methodology, recommend a strong definition of “Fixed Annuity” instead of specific products underneath this business. The first paragraph in A. Scope seems to provide this with specific references which are out of scope. If changing the scope section, we would suggest deleting the various product definitions if not used elsewhere; if these definitions are potentially applied beyond VM-22, we would suggest moving any necessary definitions to VM-01.
- D (Deferred Income Annuity (DIA) definition/Single Premium Immediate Annuity (SPIA) definition): Suggest aligning the cut off to 13 months for alignment consistent with Actuarial Guideline IX, rather than the 1 year that currently is in the VM-22 draft.
- D (Fixed Indexed Annuity (FIA) definition): Is “typically” intended to be a requirement in the definition? That is, to qualify as FIA does there need to be guaranteed principle?
- D (Index Parameter definition): We would suggest adding performance trigger to the list, along with other potential crediting methods; alternatively, the definition could specify that the crediting methods listed are examples only.
- D (Longevity Reinsurance definition): The definition states that “Agreements which are not treated as reinsurance under Statement of Statutory Accounting Principles (SSAP) No. 61R are not included in this definition”. Why is this the case and does this imply that longevity swaps are not within the scope of VM-22? Recommend adding to the out-of-scope list in “2.A. Scope” if that is the case. Clarification would also be helpful on what guidance should be used for these agreements if out of scope for VM-22. Further, we would suggest removing “typically” from the definition.
- D (Modified Guaranteed Annuity): We recommend editing the definition as follows “A type of market-value adjusted annuity contract where the underlying assets are most commonly held in an insurance company separate account...”
- D (Pension Risk Transfer (PRT) Annuity definition): Is “typically” intended to be a requirement in the definition? That is, to qualify as PRT must the insurance company have the asset risk? Consistent with the comment on Longevity Reinsurance, it would be helpful to clarify where a longevity swap contract falls within these definitions. Notably, index-based longevity swaps should be out of scope as they do not meet definition of “annuity contract” in SSAP 50. It should also be made explicit that PRT contracts can include lump sum benefits, death benefits and cash balance benefits as well.
- D (Registered Index-Linked Annuity (RILA)): It is unclear to us why RILA is defined in VM-22 when it is being used to exclude the product from VM-22 requirements.

- D (Structured Settlement Contracts (SSC)): Suggest striking sentence “Adverse mortality is typically expected for these contracts.” from definition. Additionally, it is possible that there may be non-substandard settlements.
- Section 2
 - Consistent with our comment in Section 1, the language around effective date should be clear this only applies to new PBR methodology, and rates in Section 13 have a different effective date.
 - We would support reworking this section to rely on principles, rather than definitions to determine what is in and out of scope. As product innovation continues, a simple list may not appropriately accommodate the applicability of this chapter. However, if such a list is included, then we believe it should align with the full list presented in Section 13.
 - We suggest moving or deleting the sentence “The company may elect to exclude one or more groups of contracts from the stochastic reserve calculation in certain situations, pursuant to the exclusion test requirements defined in Section 3.E of VM-22.” from this section as it does not seem fitting here.
- Section 3
 - B: Guidance is needed on how a pre-reinsurance reserve is to be determined.
 - D: The term "Deterministic Certification Option" may be confusing, as there is no "deterministic" reserve, unlike VM-20. We recommend consideration of an alternative term. In addition, we recommend changing the phrasing to "with the exception of groups of contracts for which a company elects the [Deterministic Certification Option], following the requirements of Section 7.E."
 - E.1: Seems to imply that only SPIAs would pass due to the linkage to Section 13. But the reference to interest rates should be broader, if even necessary. Suggest editing as:
 - "these groups of contracts may be valued using the methodology and statutory maximum valuation rate pursuant to applicable requirements in VM-A, and VM-C, and with the statutory maximum valuation rate for immediate annuities specified in Section 13."
 - E.2: This section seems to indicate that the grouping of contracts in exclusion testing should be the same as the grouping of contracts for aggregation. This might cause fewer product types to be qualifying for exclusion if the test must be performed at a higher level of aggregation.
 - E (Guidance note beginning “The intention of contracts that pass the stochastic exclusion test...”): We believe this guidance note is unnecessary as the intent of the section is clear, and the wording is possibly confusing.
 - F (Allocation) Either in this item or in Section 12 allocation to contracts not covered by PBR methodology in VM-22 needs to be addressed e.g., carve out because reserves calculated on seriatim formulaic basis.
 - G (Prudent Estimate Assumptions): This sub-section seems more appropriate in Section 4 (or pulled out completely and consolidated within "I. Introduction" or "VM-01" and applied to all PBR methods).

- G.2: Suggest replacing “If the results of statistical testing or other testing” with “If the results of the review” to simplify language and avoid possible confusion.
- Section 4
 - A.1.b (Guidance Note): The purpose of this guidance note is not clear as these charges would be reflected in the cash flows.
 - A.2: Suggest editing the first sentence to note scope is FIAs and to avoid confusion regarding the term “investment guideline” as follows: “Index crediting strategies for fixed indexed annuities may be grouped for modeling using an approach that recognizes the ~~investment guidelines~~ and objectives of each index crediting strategy.”
 - Given that Section 9 covers hedging, we would suggest considering moving parts of Section 4.A.4 to that section.
 - A.4: Suggest rewording “Future hedging program” to “hedging program with future transactions” to avoid ambiguity.
 - A.4.b.ii.b): “Any other purpose” in the last sentence seems overly broad and should be narrowed.
 - A.4.b.ii.c): Margins are discussed in a different section, so recommend deleting.
 - A.4.b.i.c): We believe the company should determine the appropriate margin based on their demonstration of effectiveness. Any guardrails on these undetermined values should be minimal, including as low as 0, subject to the appropriate demonstration of effectiveness. Further, we believe that documentation of effective product management should be contemplated in addition to historical effectiveness.
 - A.5: Unclear why Revenue Sharing is considered for non-variable products, can probably delete.
 - B.1: Section does not specify what the reserve floor shall be (if any) for contracts without cash surrender value.
 - B.3.a We believe that assets held in the separate account with performance not impacting policyholder benefits should be modeled consistent with how the business is managed.
 - D.4.b: Request clarification around the meaning of “general account index funds.”
 - E.1.b. Suggest deleting “In contrast, for payouts specified at issue, the payout rates modeled should be consistent with those specified in the contract.” as it appears to be covered by E.1.a.
 - E.2: Suggest deleting “may” as there appears to be only option.
- Section 5: The wording and titling may need to be tightened due to clarify which items apply to assumed and ceded reinsurance in the text.
- Section 7
 - B.3: We recommend removing “pension risk transfer business” from products scoped out of SET certification method. It is unclear why this business would be treated differently from individually issued business for testing intended to capture interest rate risk.

- C.1: As written, the SERT assumes a single premium product given the change of the denominator to the scenario reserve. Alternative product designs (such as longevity swap) could result in unintended results. We recommend maintaining consistency with VM-20 and using a denominator of future benefits (annuity payments, DBs, etc., excluding premium considerations, expenses, etc.).
 - C.2.d: Clarification is needed around reference to “significantly different risk profiles.”
 - C.3: We request clarification or definition of the term “non-proportional reinsurance.”
 - C.3.a.iii: We believe subscript “gy” should be “gn.”
 - D.1.a: Does this statement imply a floor reserve of VM-A and VM-C? VM-20 does require the NPR as the floor of the reserve but as written, VM-22 does not require a floor reserve. Recommend removing 1.a. Same statement with the 2.a statement demonstration. This requirement does not apply to the other permitted tests, which seemed counterintuitive.
- Section 9
 - Section 4.A.4 (Modeling of Hedges) has some relationship with this section, we request clarification around the applicability of these two areas of hedge guidance.
 - A.1: We seek clarification of this text: if a company only hedges indices or separates index crediting from other hedges, does this apply, or does it only apply to any other hedging?
 - A.3: The sentence “Prior to reflection in projections, the strategy for future hedge purposes shall be the actual practice of the company for a period of time not less than [6] months.” seems to suggest you would do something other than the actual hedging strategy after [6] months. In this case, what are you assuming for modeling? We suggest clarification of this sentence.
 - D.2: Suggest replacing “indexed” with “fixed” since this would apply to all fixed annuities.
 - Section 10
 - A.7: We would suggest rewording this section to be considerations rather than posed as questions.
 - D.8: This section states that “contract holder behavior should neither assume that all contract holders act with 100% efficiency in a financially rational manner nor assume that contract holders will always act irrationally.” This text seems to directly contradict Section II. Reserve Requirements 6.H.2 which states “When advantageous, policyholders will commence living benefit payouts if not started yet.” We suggest revising 6.H.2 to align with the text of 10.D.8.
 - C (Sensitivity Testing): Suggest updating bullet to “Other material behavior assumptions if relevant to the risks in the product.”
 - E.2: Suggest replacing “Risk factors that are not scenario tested but” with “Static assumptions that” to improve clarity in the wording.
 - F.1.d (Volatile credit spreads): Suggesting deleting as we are not aware of dynamic credit spreads typically being modeled.

- Section 11
 - Specific requirements will require further discussion, particularly what if any industry experience is identified for the SPA. Ideally, updated, and appropriate assumptions should be used for better alignment and to avoid any false positives flagged as an outlier by the SPA.
 - A.4: Terming the segments “mortality (longevity) segments” would be easier to understand than “plus (minus) segments.”
 - B.3.ii.c: For PRT an assumption based on a third-party data provider would be better than the industry table to get contract specific mortality assumptions. Is this permitted? The guidance note in A.3 seems to get at this, but it is not clear in B.3.ii.c whether this is allowed. This is an important distinction as PRT population can vary from those populations the tables are based upon.
 - B.3.iiiThe phrase “When little or no experience or information is available on a business segment” is not included, unlike in (i) and (ii) of the same sub-section. It appears to be the intent that this is the only situation in which this would apply, but it would be helpful to make this explicit.
 - C.1: Both plan and industry data should get weighted for business such as PRT. This text says to blend with prescribed tables, but that might not make sense unless additional experience data was unavailable.
 - C.2: Mortality improvement should be consistent with the underlying tables used, so we would suggest this being based on available experience subject to appropriate guardrails.
- Section 12: We believe discussion of allocation of aggregate reserves should be analyzed as part of the field study.
- Section II. Reserve Requirements
 - We believe a Fixed Annuity PBR Exemption should be incorporated into draft in a manner consistent with the Life PBR Exemption.
 - 6.H.2: This section states that “When advantageous, policyholders will commence living benefit payouts if not started yet.” This text seems to directly contradict VM-22 Section 6.H.2 which states “contract holder behavior should neither assume that all contract holders act with 100% efficiency in a financially rational manner nor assume that contract holders will always act irrationally”. We suggest revising 6.H.2 to align with the text of 10.D.8.

We appreciate the consideration of our comments and look forward to discussing at a future meeting.

Sincerely,

cc: Reggie Mazyck, NAIC

Mr. Ben Slutsker
Chair, VM-22 Subgroup
National Association of Insurance Commissioners

Dear Mr. Slutsker,

The New Jersey Department of Banking and Insurance (NJ DOBI) appreciates the opportunity to provide input to the VM-22 Subgroup regarding the currently exposed draft framework for VM-22. The purpose of this letter is to provide input related to the aggregation approach outlined in VM-22. Specifically, our comments relate to current Section 3.D.3.

We understand that there is current work underway regarding the appropriate approach for aggregation under VM-22, and the current language of subparagraph 3 states “The reserve may be determined in aggregate across various groups of contracts as a single model segment when determining the SR.” While we understand that under a principle-based framework there may be a desire to allow “credit” in the reserves for diversification across individual products or individual policies, we have some concern that full aggregation of all business in the scope of VM-22 may produce inappropriately low reserves. In some instances, products subject to VM-22 may involve future premium or fee revenue that exceeds future benefits, resulting in a negative reserve. If VM-22 indicates that all business may be aggregated, this could imply that certain blocks of business will have reserves that implicitly rely on the future premiums or fees associated with other blocks of business.

As an example, consider a company that has two blocks of business: traditional Single Premium Immediate Annuities (SPIAs) and Longevity Reinsurance (both of which are defined in VM-22). The reserves for the SPIAs would be based on the present value of future benefits and expenses, and a positive reserve would result under a principle-based calculation. For Longevity Reinsurance (which has periodic premium payments throughout the contract life), a principle-based calculation would likely produce a negative reserve, at least in early durations, since the present value of future premiums would exceed the present value of future benefits and expenses (assuming the product was appropriately priced). Under an aggregation approach across all lines of business, the positive SPIA reserves would be reduced by the Longevity Reinsurance negative reserve.

Under current statutory reserving approaches, negative reserves are avoided via the use of net premium approaches. For example, for annual premium whole life insurance, reserves are calculated using net premiums rather than gross premiums to avoid a negative reserve at issue. This net premium reserve approach was maintained as a floor in VM-20.

We strongly recommend a similar approach for Longevity Reinsurance and other products within VM-22 that may generate negative reserves. Rather than including all future premiums in the principle-based reserve calculation under VM-22, reserves should be calculated and floored using only the net premiums that are solved for at issues such that the starting reserve is no less than \$0. This would serve to ensure that a negative reserve is not held on any product group, and then offset with positive reserves for other product groups.

If there is general agreement regarding such a modification, we would be happy to work with the VM-22 subgroup to draft specific language outlining this approach for inclusion in VM-22.

Draft: 5/12/22

Valuation Manual (VM)-22 (A) Subgroup
Virtual Meeting
April 27, 2022

The VM-22 (A) Subgroup of the Life Actuarial (A) Task Force met April 27, 2022. The following Subgroup members participated: Ben Slutsker, Chair (MN); Ahmad Kamil, Elaine Lam, and Thomas Reedy (CA); Lei Rao-Knight (CT); Vincent Tsang (IL); Nicole Boyd (KS); William Leung (MO); Seong-min Eom (NJ); Bill Carmello and Amanda Fenwick (NY); Yujie Huang (TX); Tomasz Serbinowski (UT); and Craig Chupp (VA).

1. Discussed Tier One Comments on the Proposed VM-22 Framework

Chris Conrad (American Academy of Actuaries—Academy) said the Academy comment letter (Attachment Twenty-Five-A) references a spreadsheet (Attachment Twenty-Five-B) that compares VM-22, Statutory Maximum Valuation Interest Rates for Income Annuities, net spreads to net spreads from VM-20, Requirements for Principle-Based Reserves for Life Products, and VM-21, Requirements for Principle-Based Reserves for Variable Annuities, in a high spread environment (3/31/2020) and a low spread environment (3/31/2021). He said the comparison shows that the yields are not dramatically different. He said the takeaway is that there is a lot of conservatism in the baseline defaults that have been subtracted to get the net spreads. He noted that the VM-22 credit quality distribution adds conservatism by not considering private placements, commercial mortgages, structured securities, and below-investment-grade bonds in the rate determination. He said the Academy recommends using the VM-22 credit quality distribution as the investment guardrail. Mr. Carmello said he favors the VM-20 approach and does not support using the VM-22 credit quality distribution. Ms. Eom said she would like to wait to see field test results showing how reserve calculations using the VM-22 credit quality are affected by the current economic environment. Several Subgroup members concurred with Ms. Eom. Mr. Tsang said the Subgroup should determine the credit quality distribution prior to initiating the field test. Brian Bayerle (American Council of Life Insurers—ACLI) said the ACLI favors a credit quality distribution that better reflects companies' existing portfolios.

Mr. Slutsker reviewed the comments submitted by the Texas Department of Insurance (TDI), the California Office of Principle-Based Reserving (OPBR), and the ACLI on the proposed VM-22 revisions document (Attachment Twenty-Five-C). He said the TDI is recommending that the credit quality distribution be set consistently for VM-20, VM-21, and VM-22 at 20% AA-rated bonds and 80% A-rated bonds. Steve Tizzoni (Equitable) said the Equitable comment letter (Attachment Twenty-Five-D) supports the current VM-22 credit quality distribution, which he believes is representative of an A or A- credit quality. He agreed that the approach proposed by the TDI would also be reasonable. Mr. Bayerle asked whether Subgroup members prefer having the same credit quality distribution for VM-20, VM-21, and VM-22 or continuing with separate credit quality distributions for each chapter. Ms. Lam said the California OPBR prefers having separate distributions for each chapter. Mr. Carmello said an argument could be made for having separate credit quality distributions for each product. Mr. Leung expressed the desire to have credit quality distributions differ by product reserving category. Mr. Bayerle said that separating by individual product or product reserving category would increase the complexity for companies. Mr. Leung asked if the Academy might be able to perform model office runs to generate the results for the different credit quality distributions. Mr. Conrad said the Academy, the ACLI, and the NAIC are jointly working to engage a consultant to lead the field test. He said the consultant's task will include model office development. He added that it will be a while before any work results from that effort. Mr. Slutsker asked if it might be possible to use the Academy's existing VM-21 model office to do preliminary testing. Mr. Conrad agreed to check. Mr. Slutsker noted that the majority of Subgroup members favor waiting until field test results are available before deciding on the credit quality distribution approach.

2. Discussed Tier Two Comments on Proposed VM-22 Framework

Mr. Bayerle said the ACLI believes that *Valuation Manual* chapters should share a consistent set of principles. He suggested that there should be a separate chapter in which core principles reside. Several Subgroup members agreed that there should be consistency across chapters. Mr. Boerner said the ACLI could develop a proposal for consistency across the chapters and submit it to the Life Actuarial (A) Task Force. He then said the Subgroup should be allowed to complete its work on the VM-22 proposal before attempting the consolidation of principles into a single chapter.

Mr. Slutsker discussed the TDI recommendation to add a general assumptions section to VM-22 to match similar sections in VM-20 and VM-21. Subgroup members agreed to adding a general assumptions section.

Mr. Slutsker said a TDI comment questioned whether a company should be allowed to retrospectively apply the proposed VM-22 requirements back to the beginning of the transition period. Mr. Leung said he is aware that some companies retrospectively applied VM-20 during its transition period. Ms. Lam said that VM-20 is silent on the question of retrospective application. She said that the California OPBR would want the company to get the approval of its domiciliary commissioner before retrospective application is allowed. The Subgroup agreed that the VM-22 proposal will be silent on retrospective application, with the expectation that any such request must receive domiciliary commissioner approval.

Ms. Lam said that the California OPBR wishes to reconsider its comment requesting early adoption of the proposed requirement. She said the comment considered that VM-21 allowed early adoption but given the Subgroup determination that the application of the proposed VM-22 requirements will be prospective only, early adoption is no longer warranted.

Mr. Slutsker said an ACLI comment asked about the determination of the minimum error on the new index credit hedging program breakage expense. Mr. Bayerle said the minimum error should be tied to the demonstration of the effectiveness of the hedge instrument, with a range as low as zero. Mr. Slutsker said one option is to include the issue in the field test. Mr. Tsang asked if the ACLI could provide data to support the zero minimum error level. Mr. Bayerle said the ACLI will work with companies to provide the support.

Mr. Bayerle said the ACLI proposes the optionality for some products to be exempted from the requirements of the proposed VM-22 requirements without having to pass an exclusion test. He identified the single premium immediate annuity as a product that should qualify for such an exemption.

Having no further business, the VM-22 (A) Subgroup adjourned.

AMERICAN ACADEMY of ACTUARIES

Objective. Independent. Effective.™

February 9, 2022

Ben Slutsker, Chair
Valuation Manual (VM)-22 (A) Subgroup
National Association of Insurance Commissioners (NAIC)

Dear Mr. Slutsker,

The American Academy of Actuaries¹ Annuity Reserves and Capital Work Group (ARCWG) has recommended a reinvestment credit quality assumption consistent with the current VM-22 mix. The work group is recommending the VM-22 mix rather than the VM-20/VM-21 reinvestment mix because the VM-22 credit quality distribution is more representative of the actual investment practices of companies. Summarized below are the two different credit quality distributions:

- VM-20/VM-21: 50% AA, 50% A
- VM-22: 5% Treasury, 15% AA, 40% A, 40% BBB (Note: weights are spread out over the three rating notches for non-Treasuries)

The work group thought it might be useful in regulator deliberations to provide an analysis of the difference in the credit spreads net of conditional tail expectation 70 (CTE70) default costs between the VM-20/VM-21 and VM-22 reinvestment mix credit quality assumptions. To this end, the work group created the accompanying spreadsheet showing the credit spreads net of CTE70 defaults for the two reinvestment assumptions for securities with weighted average lives (WALs) of two years, five years, 10 years, and 30 years. The analysis was performed at two points in time: March 31, 2020 (spreads were above the long-term average) and March 31, 2021 (spreads were below the long-term average). Recall that the work group has recommended consistency in methodology with VM-20 and VM-21, so the net spreads grade to the long-term assumptions by year four in both cases. Table A is a summary of the difference between net spreads of the VM-22 mix less net spreads of the VM-20/VM-21 mix:

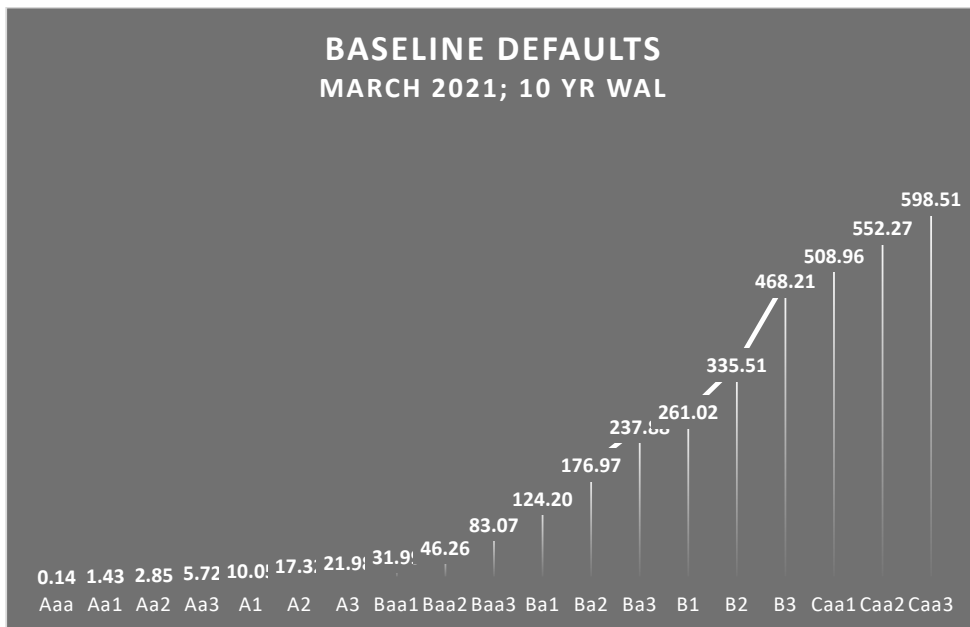

¹ The American Academy of Actuaries is a 19,500-member professional association whose mission is to serve the public and the U.S. actuarial profession. For more than 50 years, the Academy has assisted public policymakers on all levels by providing leadership, objective expertise, and actuarial advice on risk and financial security issues. The Academy also sets qualification, practice, and professionalism standards for actuaries in the United States.

Table A

Net Spread Differences for Reinvested Assets by Projection Year									
3/1/2021 ("Low" Spread Environment)					3/1/2020 ("High" Spread Environment)				
(VM-22) - (VM-20/VM-21 Spreads)					(VM-22) - (VM-20/VM-21 Spreads)				
Net of CTE70 Defaults in bps					Net of CTE70 Defaults in bps				
Projection	Year				Projection	Year			
	2Y	5Y	10Y	30Y		2Y	5Y	10Y	30Y
1	21.8	16.3	11.8	6.7	1	36.5	47.3	41.1	34.2
2	21.3	16.9	12.7	8.3	2	30.6	37.1	31.7	26.3
3	20.9	17.6	13.6	10.0	3	24.7	26.9	22.2	18.3
4+	20.5	18.3	14.5	11.6	4+	18.8	16.7	12.8	10.4

Also note that the CTE70 default costs rise exponentially as credit quality decreases, significantly blunting the increase in net spreads (as Table A shows). This relationship is displayed in Table B for a 10-year WAL security.

Table B

That being said, fixed annuities rely on yields in the general account to a greater degree than many other products—e.g., variable annuities—meaning a small change in net spread can have a material impact on the reserve. Taking this into account, and due to the VM-22 distribution better reflecting actual industry investment practices of companies, the work group is recommending a reinvestment credit quality assumption consistent with the current VM-22 mix. We also note that this mix still has significant elements of conservatism, as it omits consideration of private placements, commercial mortgages, structured securities, and below-investment-grade bonds.

Please let us know if you have any follow-up inquiries in response to this analysis. Again, we appreciate the opportunity to present the fixed annuity framework and all of the efforts made by the NAIC VM-22 Subgroup to focus on this topic.

Sincerely,

Chris Conrad
 Chairperson, Annuity Reserves and Capital Work Group
 American Academy of Actuaries

CC: Reggie Mazyck, NAIC

VM-22 PBR: Requirements for Principle-Based Reserves for Non-Variable Annuities

Drafting Overview: This document is the ARCWG-proposed draft Valuation Manual wording for VM-22 PBR for non-variable annuities. The edits reflected in this draft are made in association with the recommendations in the Annuity Reserves Work Group-proposed VM-22 presentation, exposed by the VM-22 Subgroup in October 2020. Each section shows editorial mark-ups compared to existing VM-20 or VM-21 wording, which is included as a draft note at the beginning of each section (with the only exceptions being Sections 1 and 2 that do not contain mark-ups to existing Valuation Manual wording).

Valuation Manual Section II. Reserve Requirements68

 Subsection 2: Annuity Products68

 Subsection 6: Riders and Supplemental Benefits69

Section 1: Background

A. Purpose

These requirements establish the minimum reserve valuation standard for non-variable annuity contracts as defined in Section 2.A and issued on or after 1/1/2024. For all contracts encompassed by the Scope, these requirements constitute the Commissioners Annuity Reserve Valuation Method (CARVM) and, for certain contracts, the Commissioners Reserve Valuation Method (CRVM).

Guidance Note: CRVM requirements apply to some group pension contracts.

Commented [A1]: The proposal suggests VM-22 is not operative until 1/1/2024, which contradicts Section 13 and existing requirements. We would suggest rewording this to clarify that Section 13 is effective after 12/31/2017. Further, we would suggest consistency in labeling of dates (either all text or all numeric).

B. Principles

The projection methodology used to calculate the stochastic reserve is based on the following set of principles. These principles should be followed when interpreting and applying the methodology in these requirements and analyzing the resulting reserves.

Guidance Note: The principles should be considered in their entirety, and it is required that companies meet these principles with respect to those contracts that fall within the scope of these requirements and are in force as of the valuation date to which these requirements are applied.

Commented [A2]: (Relationship to RBC Requirements): The VM-21 guidance note was not included in VM-22; however, we believe it would be appropriate to retain and reword to say, “products that calculate a stochastic reserve”, since the relationship to RBC would likely be maintained.

Commented [A3]: We would support consistent application of principles across all chapters as currently VM-20 does not have a like-set of principles. We believe this could involve a broader discussion of the assorted product requirements in the VM. As a shorter-term fix, we would recommend generalizing the principles where appropriate and moving these to “Section I. Introduction” or “VM-01” and equally applying to VM-20.

Principle 1: The objective of the approach used to determine the stochastic reserve is to quantify the amount of statutory reserves needed by the company to be able to meet contractual obligations in light of the risks to which the company is exposed with an element of conservatism consistent with statutory reporting objectives.

Principle 2: The calculation of the stochastic reserve is based on the results derived from an analysis of asset and liability cash flows produced by the application of a stochastic cash-flow model to equity return and interest rate scenarios. For each scenario, the greatest present value of accumulated deficiency is calculated. The analysis reflects prudent estimate assumptions for deterministic variables and is performed in aggregate (subject to limitations related to contractual provisions) to allow the natural offset of risks within a given scenario. The methodology uses a projected total cash flow analysis by including all projected income, benefit, and expense items related to the business in the model and sets the stochastic reserve at a degree of confidence using the CTE measure applied to the set of scenario specific greatest present values of accumulated deficiencies that is deemed to be reasonably conservative over the span of economic cycles.

Commented [A4]: We support this principle but note that later sections appear to contradict this principle. For example, the statement “The analysis reflects prudent estimate assumptions for deterministic variables and is performed in aggregate (subject to limitations related to contractual provisions) to allow the natural offset of risks within a given scenario.” contradicts with the introduction of additional reserve categories and other limitations (such as model segment restrictions).

Principle 3: The implementation of a model involves decisions about the experience assumptions and the modeling techniques to be used in measuring the risks to which the company is exposed. Generally, assumptions are to be based on the conservative end of the confidence interval. The choice of a conservative estimate for each assumption may result in a distorted measure of the total risk. Conceptually, the choice of assumptions and the modeling decisions should be made so that the final result approximates what would be obtained for the

stochastic reserve at the required CTE level if it were possible to calculate results over the joint distribution of all future outcomes. In applying this concept to the actual calculation of the stochastic reserve, the company should be guided by evolving practice and expanding knowledge base in the measurement and management of risk.

Guidance Note: The intent of Principle 3 is to describe the conceptual framework for setting assumptions. Section 10 provides the requirements and guidance for setting contract holder behavior assumptions and includes alternatives to this framework if the company is unable to fully apply this principle.

Commented [A5]: We suggest deleting the sentence "Generally, assumptions are..." since it does not provide guidance. We also suggest tightening the remainder of the text for clarity.

Principle 4: While a stochastic cash-flow model attempts to include all real-world risks relevant to the objective of the stochastic cash-flow model and relationships among the risks, it will still contain limitations because it is only a model. The calculation of the stochastic reserve is based on the results derived from the application of the stochastic cash-flow model to scenarios, while the actual statutory reserve needs of the company arise from the risks to which the company is (or will be) exposed in reality. Any disconnect between the model and reality should be reflected in setting prudent estimate assumptions to the extent not addressed by other means.

Principle 5: Neither a cash-flow scenario model nor a method based on factors calibrated to the results of a cash-flow scenario model can completely quantify a company’s exposure to risk. A model attempts to represent reality but will always remain an approximation thereto and, hence, uncertainty in future experience is an important consideration when determining the stochastic reserve. ~~Therefore, the use of assumptions, methods, models, risk management strategies (e.g., hedging), derivative instruments, structured investments or any other risk transfer arrangements (such as reinsurance) that serve solely to reduce the calculated stochastic reserve without also reducing risk on scenarios similar to those used in the actual cash-flow modeling are inconsistent with these principles. The use of assumptions and risk management strategies should be appropriate to the business and not merely constructed to exploit “foreknowledge” of the components of the required methodology.~~

Commented [A6]: We recommend deleting the third sentence (starting with “Therefore, the use of assumptions...”) because this lacks historical context and is covered by the final sentence.

C. Risks Reflected

1. The risks reflected in the calculation of reserves under these requirements arise from actual or potential events or activities that are both:
 - a. Directly related to the contracts falling under the scope of these requirements or their supporting assets; and
 - b. Capable of materially affecting the reserve.
2. Categories and examples of risks reflected in the reserve calculations include, but are not necessarily limited to:
 - a. Asset risks
 - i. Credit risks (e.g., default or rating downgrades).

Commented [A7]: Consistent with our comments on 1.B, we would support consistent application of risks reflected across all chapters, rather than embedding the language in each chapter. Were this to be retained in VM-22, we would suggest maintaining consistency with VM-21 to avoid any confusion.

- ii. Commercial mortgage loan roll-over rates (roll-over of bullet loans).
 - iii. Uncertainty in the timing or duration of asset cash flows (e.g., shortening (prepayment risk) and lengthening (extension risk)).
 - iv. Performance of equities, real estate, and Schedule BA assets.
 - v. Call risk on callable assets.
 - vi. Separate account fund performance.
 - vii. Risk associated with hedge instrument (includes basis, gap, price, parameter estimation risks, and variation in assumptions).
 - viii. Currency risk.
- b. Liability risks
- i. Reinsurer default, impairment, or rating downgrade known to have occurred before or on the valuation date.
 - ii. Mortality/longevity, persistency/lapse, partial withdrawal, and premium payment risks.
 - iii. Utilization risk associated with guaranteed living benefits.
 - iv. Anticipated mortality trends based on observed patterns of mortality improvement or deterioration, where permitted.
 - v. Annuitization risks.
 - vi. Additional premium dump-ins or deposits (high interest rate guarantees in low interest rate environments).
 - vii. Applicable expense risks, including fluctuation maintenance expenses directly attributable to the business, future commission expenses, and expense inflation/growth.
- c. Combination risks
- i. Risks modeled in the company's risk assessment processes that are related to the contracts, as described above.
 - ii. Disintermediation risk (including such risk related to payment of surrender or partial withdrawal benefits).
 - iii. Risks associated with revenue-sharing income.

Commented [A8]: We recommend removing the bullet "Risks modeled in the company's risk assessment processes that are related to the contracts, as described above" as this is unclear and probably extraneous.

3. The risks not necessarily reflected in the calculation of reserves under these requirements are:

Commented [A9]: We recommend removing this section. With the specific RBC language removed, the section loses meaning: "a" is unnecessary and "b" is redundant with other sections of the VM which allow for materiality considerations (language in VM-20 is likely better for this purpose and should be used consistently).

- a. Those not associated with the policies or contracts being valued, or their supporting assets.
 - b. Determined to not be capable of materially affecting the reserve.
4. Categories and examples of risks not reflected in the reserve calculations include, but are not necessarily limited to:
- a. Asset risks
 - i. Liquidity risks associated with sudden and significant levels of withdrawals and surrenders.
 - b. Liability risks
 - i. Reinsurer default, impairment or rating downgrade occurring after the valuation date.
 - ii. Catastrophic events (e.g., epidemics or terrorist events).
 - iii. Major breakthroughs in life extension technology that have not yet fundamentally altered recently observed mortality experience.
 - iv. Significant future reserve increases as an unfavorable scenario is realized.
 - c. General business risks
 - i. Deterioration of reputation.
 - ii. Future changes in anticipated experience (reparameterization in the case of stochastic processes), which would be triggered if and when adverse modeled outcomes were to actually occur.
 - iii. Poor management performance.
 - iv. The expense risks associated with fluctuating amounts of new business.
 - v. Risks associated with future economic viability of the company.
 - vi. Moral hazards.
 - vii. Fraud and theft.

Commented [A10]: We recommend removing the bullet "Significant future reserve increases as an unfavorable scenario is realized" as this is extraneous.

Commented [A11]: List could be expanded to included operational risk and litigation risk.

Commented [A12]: It seems the definitions included in this section are largely only used for the purpose of establishing the Scope in Section 2. Since this is intended to be a principles-based methodology, recommend a strong definition of "Fixed Annuity" instead of specific products underneath this business. The first paragraph in A. Scope seems to provide this with specific references which are out of scope. If changing the scope section, we would suggest deleting the various product definitions if not used elsewhere; if these definitions are potentially applied beyond VM-22, we would suggest moving any necessary definitions to VM-01.

Commented [A13]: Suggest aligning the cut off to 13 months for alignment consistent with Actuarial Guideline IX, rather than the 1 year that currently is in the VM-22 draft.

D. Specific Definitions for VM-22

Buffer Annuity

Interchangeable term for Registered Index-Linked Annuity (RILA). See definition for Registered Index-Linked Annuity below.

Deferred Income Annuity (DIA)

An annuity which guarantees a periodic payment for the life of the annuitant or a term certain and payments begin one year or later after (or from) the issue date if the contract holder survives to a predetermined future age.

Fixed Indexed Annuity (FIA)

An annuity with an account value where the contract holder has the option for a portion or all of the account value to grow at a rate linked to an external index, typically with guaranteed principal.

Commented [A14]: Is “typically” intended to be a requirement in the definition? That is, to qualify as FIA does there need to be guaranteed principle?

Flexible Premium Deferred Annuity (FPDA)

An annuity with an account value established with a premium amount but allows for additional deposits to be paid into the annuity over time, resulting in an increase to the account value. The contract also has a guaranteed interest rate during the accumulation phase and has guaranteed mortality and interest rates applicable at the time of conversion to the payout phase.

Funding Agreement

A contract issued to an institutional investor (domestic and international non-qualified fixed income investors) that provides fixed or floating interest rate guarantees.

Guaranteed Investment Contract (GIC)

Insurance contract typically issued to a retirement plan (defined contribution) under which the insurer accepts a deposit (or series of deposits) from the purchaser and guarantees to pay a specified interest rate on the funds deposited during a specified period of time.

Index Credit Hedge Margin

A margin capturing the risk of inefficiencies in the company’s hedging program supporting index credits. This includes basis risk, persistency risk, and the risk associated with modeling decisions and simplifications. It also includes any uncertainty of costs associated with managing the hedging program and changes due to investment and management decisions.

Index Credit

Any interest credit, multiplier, factor, bonus, charge reduction, or other enhancement to policy values that is linked to an index or indices. Amounts credited to the policy resulting from a floor on an index account are included.

Index Crediting Strategy

The strategy defined in a contract to determine index credits for a contract. This refers to underlying index, index parameters, date, timing, and other elements of the crediting method.

Commented [A15]: We would suggest adding performance trigger to the list, along with other potential crediting methods; alternatively, the definition could specify that the crediting methods listed are examples only.

Index Parameter

Cap, floor, participation rate, spreads, or other features describing how the contract utilizes the index.

Commented [A16]: The definition states that “Agreements which are not treated as reinsurance under Statement of Statutory Accounting Principles (SSAP) No. 61R are not included in this definition”. Why is this the case and does this imply that longevity swaps are not within the scope of VM-22? Recommend adding to the out of scope list in “2.A. Scope” if that is the case. Clarification would also be helpful on what guidance should be used for these agreements if out of scope for VM-22. Further, we would suggest removing “typically” from the definition.

Longevity Reinsurance

An agreement, typically a reinsurance arrangement covering one or more group or individual annuity contracts, under which an insurance company assumes the longevity risk associated with

periodic payments made to specified annuitants under one or more immediate or deferred payout annuity contracts. A common example is participants in one or more underlying retirement plans.

Typically, the reinsurer pays a portion of the actual benefits due to the underlying annuitants (or, in some cases, a pre-agreed amount per annuitant), while the ceding insurance company retains the assets supporting the reinsured annuity payments and pays periodic, ongoing premiums to the reinsurer over the expected lifetime of benefits paid to the specified annuitants. Such agreements may contain net settlement provisions such that only one party makes ongoing cash payments in a particular period. Under these agreements, longevity risk may be transferred on either a permanent basis or for a prespecified period of time, and these agreements may or may not permit early termination.

Agreements which are not treated as reinsurance under Statement of Statutory Accounting Principles (SSAP) No. 61R are not included in this definition. In particular, contracts under which payments are made based on the aggregate mortality experience of a population of lives which are not covered by an underlying group or individual annuity contract (e.g., mortality index-based longevity swaps) are not included in this definition.

Market Value Adjustment (MVA) Annuity

An annuity with an account value where withdrawals and full surrenders are subject to adjustments based on interest rates or index returns at the time of withdrawal/surrender. There could be ceilings and floors on the amount of the market-value adjustment.

Modified Guaranteed Annuity (MGA)

A type of market-value adjusted annuity contract where the underlying assets are held in an insurance company separate account and the value of which are guaranteed if held for specified periods of time. The contract contains nonforfeiture values that are based upon a market-value adjustment formula if held for shorter periods.

Commented [A17]: We recommend editing the definition as follows “A type of market-value adjusted annuity contract where the underlying assets are most commonly held in an insurance company separate account...”

Multiple Year Guaranteed Annuity (MYGA)

A type of fixed annuity that provides a pre-determined and contractually guaranteed interest rate for specified periods of time, after which there is typically an annual reset or renewal of a multiple year guarantee period.

Pension Risk Transfer (PRT) Annuity

An annuity, typically a group contract or reinsurance agreement, issued by an insurance company providing periodic payments to annuitants receiving immediate or deferred benefits from one or more retirement plans. Typically, the insurance company holds the assets supporting the benefits, which may be held in the general or separate account, and retains not only longevity risk but also asset risks (e.g., credit risk and reinvestment risk).

Commented [A18]: Is “typically” intended to be a requirement in the definition? That is, to qualify as PRT must the insurance company have the asset risk? Consistent with the comment on Longevity Reinsurance, it would be helpful to clarify where a longevity swap contract falls within these definitions. Notably, index-based longevity swaps should be out of scope as they do not meet definition of “annuity contract” in SSAP 50. It should also be made explicit that PRT contracts can include lump sum benefits, death benefits and cash balance benefits as well.

Registered Index-Linked Annuity (RILA)

An annuity with an account value where the contract holder has the option for a portion or all of the account value to grow at a rate linked to an external index, similar to a Fixed Indexed Annuity, but with downside risk exposure that may not guarantee full principal repayment. These contracts may include a cap on upside returns, and may also include a floor on downside returns which may be below zero percent.

Commented [A19]: It is unclear to us why RILA is defined in VM-22 when it is being used to exclude the product from VM-22 requirements.

Single Premium Immediate Annuity (SPIA)

An annuity purchased with a single premium amount which guarantees a periodic payment for the life of the annuitant or a term certain and payments begin within one year after (or from) the issue date.

Commented [A20]: Suggest aligning the cut off to 13 months for alignment consistent with Actuarial Guideline IX, rather than the 1 year that currently is in the VM-22 draft.

Single Premium Deferred Annuity (SPDA)

An annuity with an account value established with a single premium amount that grows with a guaranteed interest rate during the accumulation phase and has guaranteed mortality and interest rates applicable at the time of conversion to the payout phase. May also include cases where the premium is accepted for a limited amount of time early in the contract life, such as only in the first duration.

Stable Value Contract

A contract that provides limited investment guarantees, typically preserving principal while crediting steady, positive returns and protecting against losses or declines in yield. Underlying asset portfolios typically consist of fixed income securities, which may sit in the insurer's general account, a separate account, or in a third-party trust. These contracts often support defined contribution or defined benefit retirement plan liabilities.

Structured Settlement Contract (SSC)

A contract that provides periodic benefits and is purchased with a single premium amount stemming from various types of claims pertaining to court settlements or out-of-court settlements from tort actions arising from accidents, medical malpractice, and other causes. Adverse mortality is typically expected for these contracts.

Commented [A21]: Suggest striking sentence "Adverse mortality is typically expected for these contracts." from definition. Additionally, it is possible that there may be non-standard settlements.

Synthetic GIC

Contract that simulates the performance of a traditional GIC through a wrapper, swap, or other financial instruments, with the main difference being that the assets are owned by the policyholder or plan trust.

Term Certain Payout Annuity

A contract issued, which offers guaranteed periodic payments for a specified period of time, not contingent upon mortality or morbidity of the annuitant.

Two-Tiered Annuity

A deferred annuity with two tiers of account values. One, with a higher accumulation interest rate, is only available for annuitization or death. The other typically contains a lower accumulation interest rate, and is only available upon surrender.

Section 2: Scope and Effective Date

A. Scope

Subject to the requirements of this VM-22 are annuity contracts, certificates and contract features, whether group or individual, including both life contingent and term-certain-only, directly written or assumed through reinsurance issued on or after 1/1/2024, with the exception of contracts or benefits listed below.

Products out of scope include:

- Contracts or benefits that are subject to VM-21 (such as variable annuities, RILAs, buffer annuities, and structured annuities)
- GICs
- Synthetic GICs
- Stable Value Contracts
- Funding Agreements

Products in scope of VM-22 include fixed annuities which consist of, but are not limited to, the following the list:

- **Account Value Based Annuities**
 - Deferred Annuities (SPDA & FPDA)
 - Multi-Year Guarantee Annuities (MYGA)
 - Fixed Indexed Annuities (FIA)
 - Market-Value Adjustments (MVA)
 - Two-tiered Annuities
 - Guarantees/Benefits/Riders on Fixed Annuity Contracts
- **Payout Annuities**
 - Single Premium Immediate Annuities (SPIA)
 - Deferred Income Annuities (DIA)
 - Term Certain Payout Annuity
 - Pension Risk Transfer Annuities (PRT)
 - Structured Settlement Contracts (SSC)
 - Longevity Reinsurance

The company may elect to exclude one or more groups of contracts from the stochastic reserve calculation in certain situations, pursuant to the exclusion test requirements defined in Section 3.E of VM-22.

B. Effective Date & Transition

Effective Date

These requirements apply for valuation dates on or after January 1, 2024.

Transition

A company may elect to establish minimum reserves pursuant to applicable requirements in VM-A and VM-C for business otherwise subject to VM-22 PBR requirements and issued during the

Commented [A22]: Consistent with our comment in Section 1, the language around effective date should be clear this only applies to new PBR methodology, and rates in Section 13 have a different effective date.

Commented [A23]: We would support reworking this section to rely on principles, rather than definitions to determine what is in and out of scope. As product innovation continues, a simple list may not appropriately accommodate the applicability of this chapter. However, if such a list is included, then we believe it should align with the full list presented in Section 13.

Commented [A24]: We suggest moving or deleting the sentence "The company may elect to exclude one or more groups of contracts from the stochastic reserve calculation in certain situations, pursuant to the exclusion test requirements defined in Section 3.E of VM-22." from this section as it does not seem fitting here.

first three years following the effective date of VM-22 PBR. If a company during the three years elects to apply VM-22 PBR to a block of such business, then a company must continue to apply the requirements of VM-22 PBR for future issues of this business. Irrespective of the transition date, a company shall apply VM-22 PBR requirements to applicable blocks of business on a prospective basis starting at least three years after the effective date.

Section 3: Reserve Methodology

A. Aggregate Reserve

The aggregate reserve for contracts falling within the scope of these requirements shall equal the stochastic reserve (following the requirements of Section 4) less any applicable PIMR for all contracts not valued under applicable requirements in VM-A and VM-C, plus the reserve for any contracts valued under applicable requirements in VM-A and VM-C.

Guidance Note: Contracts valued under applicable requirements in VM-A and VM-C are ones that pass the exclusion test and elect to not model PBR stochastic reserves, per the requirements in Section 3.E.

B. Impact of Reinsurance Ceded

All components in the aggregate reserve shall be determined post-reinsurance ceded, that is net of any reinsurance cash flows arising from treaties that meet the statutory requirements that allow the treaty to be accounted for as reinsurance. A pre-reinsurance ceded reserve also needs to be determined by ignoring all reinsurance cash flows (costs and benefits) in the reserve calculation.

Commented [A25]: Guidance is needed on how a pre-reinsurance reserve is to be determined.

C. To Be Determined

D. The Stochastic Reserve

1. The stochastic reserve shall be determined based on asset and liability projections for the contracts falling within the scope of these requirements, excluding those contracts valued using the methodology pursuant to applicable requirements in VM-A and VM-C, over a broad range of stochastically generated projection scenarios described in Section 8 and using prudent estimate assumptions as required in Section 3.F herein.
2. The stochastic reserve amount for any group of contracts shall be determined as CTE70 of the scenario reserves following the requirements of Section 4, with the exception of groups of contracts for which a company elects the Deterministic Certification Option in Section 7.E, which shall be determined as the scenario reserve following the requirements of Section 4.
3. The reserve may be determined in aggregate across various groups of contracts as a single model segment when determining the stochastic reserve if the business and risks are not managed separately or are part of the same integrated risk management program. Aggregation is permitted if a resulting group of contracts (or model segment) follows the listed principles:
 - a. Aggregate in a manner that is consistent with the company’s risk management strategy and reflects the likelihood of any change in risk offsets that could arise from shifts between product types, and
 - b. Using prudent actuarial judgement, consider the following elements when aggregating groups of contracts: whether groups of contracts are part of the same portfolio (or different portfolios that interact), same integrated risk management system, administered/managed together
4. Do not aggregate groups of contracts for which the company elects to use the Deterministic Certification Option in Section 7.E with any groups of contracts that do not use such option.

Commented [A26]: The term "Deterministic Certification Option" may be confusing, as there is no "deterministic" reserve, unlike VM-20. We recommend consideration of an alternative term. In addition, we recommend changing the phrasing to "with the exception of groups of contracts for which a company elects the [Deterministic Certification Option], following the requirements of Section 7.E."

5. To the extent that these limits on aggregation result in more than one model segment, the stochastic reserve shall equal the sum of the stochastic reserve amounts computed for each model segment and scenario reserve amounts computed for each model segment for which the company elects to use the Deterministic Certification Option in Section 7.E.

E. Exclusion Test

1. To the extent that certain groups of contracts pass one of the defined stochastic exclusion tests in Section 7.B, these groups of contracts may be valued using the methodology pursuant to applicable requirements in VM-A and VM-C, with the statutory maximum valuation rate for immediate annuities specified in Section 13.
 - a. For dividend-paying contracts, a dividend liability shall be established upon following requirements in VM-A and VM-C, as described above, for the base contract.

Guidance Note: The intention of contracts that pass the stochastic exclusion test is to provide the option to value contracts under VM-A and VM-C. This may apply to pre-PBR CARVM requirements in accordance with Actuarial Guideline XXXIII (AG33) methodology with type A, B, C rates for SPIAs issued before 2018; AG33 methodology with pre-PBR VM-22 rates for SPIAs issued on/after 2018; Actuarial Guideline XXXV (AG35) pre-PBR methodology for Fixed Indexed Annuities; and AG33 methodology (with interest rate updates for modernization initiatives on new contracts) for non-SPIAs.

Commented [A27]: Seems to imply that only SPIAs would pass due to the linkage to Section 13. But the reference to interest rates should be broader, if even necessary. Suggest editing as:

"these groups of contracts may be valued using the methodology and statutory maximum valuation rate pursuant to applicable requirements in VM-A, and VM-C, and with the statutory maximum valuation rate for immediate annuities specified in Section 13."

Commented [A28]: We believe this guidance note is unnecessary as the intent of the section is clear, and the wording is possibly confusing.

2. The approach for grouping contracts when performing the exclusion tests should follow the same principles that underlie the aggregation approach for model segments discussed for Stochastic Reserves in Section D above.

Commented [A29]: This section seems to indicate that the grouping of contracts in exclusion testing should be the same as the grouping of contracts for aggregation. This might cause fewer product types to be qualifying for exclusion if the test must be performed at a higher level of aggregation.

F. Allocation of the Aggregate Reserve to Contracts

The aggregate reserve shall be allocated to the contracts falling within the scope of these requirements using the method outlined in Section 12.

Commented [A30]: Either in this item or in Section 12 allocation to contracts not covered by PBR methodology in VM-22 needs to be addressed e.g., carve out because reserves calculated on seriatim formulaic basis.

G. Prudent Estimate Assumptions:

1. With respect to the Stochastic Reserve in Section 3.C, the company shall establish the prudent estimate assumption for each risk factor in compliance with the requirements in Section 12 of Model #820 and must periodically review and update the assumptions as appropriate in accordance with these requirements.
2. The qualified actuary, to whom responsibility for this group of contracts is assigned, shall annually review relevant emerging experience for the purpose of assessing the appropriateness of the anticipated experience assumption. If the results of statistical testing or other testing indicate that previously anticipated experience for a given factor is inadequate, then the qualified actuary shall set a new, adequate, anticipated experience assumption for the factor.
3. To determine the prudent estimate assumptions, the stochastic reserve shall also follow the requirements in Sections 4 and 9 for asset assumptions, Section 10 for policyholder behavior assumptions, and Section 11 for mortality assumptions.

Commented [A31]: This sub-section seems more appropriate in Section 4 (or pulled out completely and consolidated within "I. Introduction" or "VM-01" and applied to all PBR methods).

Commented [A32]: Suggest replacing "If the results of statistical testing or other testing" with "If the results of the review" to simplify language and avoid possible confusion.

Section 4: Determination of Stochastic Reserve

A. Projection of Accumulated Deficiencies

1. General Description of Projection

The projection of accumulated deficiencies shall be made ignoring federal income tax in both cash flows and discount rates, and it shall reflect the dynamics of the expected cash flows for the entire group of contracts, reflecting all product features, including any guarantees provided under the contracts using prudent estimate liability assumptions defined in Sections 10 and 11 and asset assumptions defined in Section 4.D. The company shall project cash flows including the following:

- a. Revenues received by the company including gross premiums received from the policyholder (including any due premiums as of the projected start date).
- b. All material benefits projected to be paid to policyholders—including, but not limited to, death claims, surrender benefits and withdrawal benefits—reflecting the impact of all guarantees and adjusted to take into account amounts projected to be charged to account values on general account business. Any guarantees, in addition to market value adjustments assessed on projected withdrawals or surrenders, shall be taken into account.

Guidance Note: Amounts charged to account values on general account business are not revenue; examples include rider charges and expense charges.

Commented [A33]: The purpose of this guidance note is not clear as these charges would be reflected in the cash flows.

- c. Non-Guaranteed Elements (NGE) cash flows as described in Section 10.J.
- d. Insurance company expenses (including overhead and investment expense), commissions, contractual fees and charges, and revenue-sharing income received by the company (net of applicable expenses).
- e. Net cash flows associated with any reinsurance.
- f. Cash flows from hedging instruments as described in Section 4.A.4.
- g. Cash receipts or disbursements associated with invested assets (other than policy loans) as described in Section 4.D.4, including investment income, realized capital gains and losses, principal repayments, asset default costs, investment expenses, asset prepayments, and asset sales.
- h. If modeled explicitly, cash flows related to policy loans as described in Section 10.I.2, including interest income, new loan payments and principal repayments.

Guidance Note: Future net policy loan cash flows include: policy loan interest paid in cash plus repayments of policy loan principal, including repayments occurring at death or surrender (note that the future benefits in Section 4.A.1.b are before consideration of policy

loans), less additional policy loan principal (but excluding policy loan interest that is added to the policy loan principal balance).

2. Grouping of Index Crediting Strategies

Index crediting strategies may be grouped for modeling using an approach that recognizes the investment guidelines and objectives of each index crediting strategy. In assigning each index crediting strategy to a grouping for projection purposes, the fundamental characteristics of the index crediting strategy shall be reflected, and the parameters shall have the appropriate relationship to the stochastically generated projection scenarios described in Section 8. The grouping shall reflect characteristics of the efficient frontier (i.e., returns generally cannot be increased without assuming additional risk).

Commented [A34]: Suggest editing the first sentence to note scope is FIAs and to avoid confusion regarding the term “investment guideline” as follows: “Index crediting strategies for fixed indexed annuities may be grouped for modeling using an approach that recognizes the investment guidelines and objectives of each index crediting strategy.”

Index accounts sharing similar index crediting strategies may also be grouped for modeling to an appropriately crafted proxy strategy normally expressed as a linear combination of recognized market indices, sub-indices or funds, in order to develop the investment return paths and associated interest crediting. Each index crediting strategy’s specific risk characteristics, associated index parameters, and relationship to the stochastically generated scenarios in Section 8 should be considered before grouping or assigning to a proxy strategy. Grouping and/or development of a proxy strategy may not be done in a manner that intentionally understates the resulting reserve.

3. Model Cells

Projections may be performed for each contract in force on the date of valuation or by assigning contracts into representative cells of model plans using all characteristics and criteria having a material impact on the size of the reserve. Assigning contracts to model cells may not be done in a manner that intentionally understates the resulting reserve.

4. Modeling of Hedges

a. For a company that does not have a future hedging program tied directly to the contracts falling under the scope of VM-22 stochastic reserve requirements:

Commented [A35]: Given that Section 9 covers hedging, we would suggest considering moving parts of Section 4.A.4 to that section.

- i. The company shall not consider the cash flows from any future hedge purchases or any rebalancing of existing hedge assets in its modeling.
- ii. Existing hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the starting assets. The hedge assets may then be considered in one of two ways:
 - a) Include the asset cash flows from any contractual payments and maturity values in the projection model; or
 - b) No hedge positions—in which case the hedge positions held on the valuation date are replaced with cash and/or other general account assets in an amount equal to the aggregate market value of these hedge positions.

Commented [A36]: Suggest rewording “Future hedging program” to “hedging program with future transactions” to avoid ambiguity.

Guidance Note: If the hedge positions held on the valuation date are replaced with cash, then as with any other cash, such amounts may then be invested following the company’s investment strategy.

A company may switch from method a) to method b) at any time, but it may only change from b) to a) with the approval of the domiciliary commissioner.

- b. For a company that has a future hedging program tied directly to the contracts falling under the scope of VM-22 stochastic reserve requirements:
 - i. For a hedging program with hedge payoffs that offset interest credits associated with indexed interest strategies (indexed interest credits):
 - a) In modeling cash flows, the company shall include the cash flows from future hedge purchases or any rebalancing of existing hedge assets that are intended solely to offset interest credits to policyholders
 - b) Existing hedging instruments that are currently held by the company for this purpose in support of the contracts falling under the scope of these requirements shall be included in the starting assets. Existing hedging instruments that are currently held by the company for any other purpose should be modeled consistently with the requirements of Section 4.A.4.a.ii.
 - c) An Index Credit Hedge Margin for these instruments shall be reflected by reducing index interest credit hedge payoffs by a margin multiple that shall be justified by sufficient and credible company experience and be no less than [X%] multiplicatively of the interest credited. In the absence of sufficient and credible company experience, a margin of [Y%] shall be assumed. There is no cap on the index credit hedge margin if company experience indicates actual error is greater than [Y%]. It is permissible to substitute stress-testing for sufficient and credible experience if such stress-testing comprehensively considers a robust range of future market conditions.
 - ii. For a company that hedges any contractual obligation or risks other than indexed interest credits, the detailed requirements for the modeling of hedges are defined in Section 9. The following requirements do not supersede the detailed requirements.
 - a) The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the projections used in the determination of the stochastic reserve.
 - b) The projections shall take into account the appropriate costs and benefits of hedge positions expected to be held in the future.

Commented [A37]: “Any other purpose” in the last sentence seems overly broad and should be narrowed.

Commented [A38]: We believe the company should determine the appropriate margin based on their demonstration of effectiveness. Any guardrails on these undetermined values should be minimal, including as low as 0, subject to the appropriate demonstration of effectiveness. Further, we believe that documentation of effective product management should be contemplated in addition to historical effectiveness.

Because models do not always accurately portray the results of hedge programs, the company shall, through back-testing and other means, assess the accuracy of the hedge modeling. The company shall determine a stochastic reserve as the weighted average of two CTE values; first, a CTE70 (“best efforts”) representing the company’s projection of all of the hedge cash flows, including future hedge purchases, and a second CTE70 (“adjusted”) which shall use only hedge assets held by the company on the valuation date and only future hedge purchases associated with indexed interest credited. These are discussed in greater detail in Section 9.

- c) Consistent with Section 4.A.4.b.i., the index credit hedge margin for instruments associated with indexed interest credited shall be reflected by reducing hedge payoffs by a margin multiple as defined in Section 4.A.4.b.i.c).
- d) The use of products not falling under the scope of these requirements as a hedge shall not be recognized in the determination of accumulated deficiencies.

Commented [A39]: Margins are discussed in a different section, so recommend deleting.

Guidance Note: Section 4.A.4.b.i is intended to address common situations for products with index crediting strategies where the company only hedges index credits or clearly separates index credit hedging from other hedging. In this case the hedge positions are considered similarly to other fixed income assets supporting the contracts, and a margin is reflected rather than modeling using a CTE70 adjusted run with no future hedge purchases. If a company has a more comprehensive hedge strategy combining index credits, guaranteed benefit, and other risks (e.g., full fair value or economic hedging), an appropriate and documented bifurcation method should be used in the application of sections 4.A.4.b.i and 4.A.4.b.ii above for the hedge modeling and justification. Such bifurcation methods may quantify the specific risk exposure attributable to index credit liabilities versus other liabilities such as guaranteed living benefits, and apply such for the basis for allocation.

Guidance Note: The requirements of Section 4.A.4 govern the determination of reserves for annuity contracts and do not supersede any statutes, laws or regulations of any state or jurisdiction related to the use of derivative instruments for hedging purposes and should not be used in determining whether a company is permitted to use such instruments in any state or jurisdiction.

5. Revenue Sharing

If applicable, projections of accumulated deficiencies may include income from projected future revenue sharing, net of applicable projected expenses (net revenue-sharing income) if each of the requirements set forth in VM 21 Section 4.A.5 are met.

Commented [A40]: Unclear why Revenue Sharing is considered for non-variable products, can probably delete.

6. Length of Projections

Projections of accumulated deficiencies shall be run for as many future years as needed so that no materially greater reserve value would result from longer projection periods.

7. Interest Maintenance Reserve (IMR)

The IMR shall be handled consistently with the treatment in the company’s cash flow testing, and the amounts should be adjusted to a pre-tax basis.

B. Determination of Scenario Reserve

1. For a given scenario, the scenario reserve shall be determined using one of two methods described below:

Commented [A41]: Section does not specify what the reserve floor shall be (if any) for contracts without cash surrender value.

a) The starting asset amount plus the greatest present value, as of the projection start date, of the projected accumulated deficiencies; or

Guidance Note: The greatest present value of accumulated deficiencies can be negative.

b) The direct iteration method, where the scenario reserve is determined by solving for the amount of starting assets which, when projected along with all contract cash flows, result in the defeasement of all projected future benefits and expenses at the end of the projection horizon with no positive accumulated deficiencies at the end of any projection year during the projection period.

The scenario reserve for any given scenario shall not be less than the cash surrender value in aggregate on the valuation date for the group of contracts modeled in the projection.

2. Discount Rates

In determining the scenario reserve, unless using the direct iteration method pursuant to Section 4.B.1.b, the accumulated deficiencies shall be discounted at the NAER on additional assets, as defined in Section 4.B.3.

3. Determination of NAER on Additional Invested Asset Portfolio

a. The additional invested asset portfolio for a scenario is a portfolio of general account assets as of the valuation date, outside of the starting asset portfolio, that is required in that projection scenario so that the projection would not have a positive accumulated deficiency at the end of any projection year. This portfolio may include only (i) General Account assets available to the company on the valuation date that do not constitute part of the starting asset portfolio; and (ii) cash assets.

Commented [A42]: We believe that assets held in the separate account with performance not impacting policyholder benefits should be modeled consistent with how the business is managed.

Guidance Note:
 Additional invested assets should be selected in a manner such that if the starting asset portfolio were revised to include the additional invested assets, the projection would not be expected to experience any positive accumulated deficiencies at the end of any projection year.
 It is assumed that the accumulated deficiencies for this scenario projection are known.

b. To determine the NAER on additional invested assets for a given scenario:

- i. Project the additional invested asset portfolio as of the valuation date to the end of the projection period,
 - a) Investing any cash in the portfolio and reinvesting all investment proceeds using the company’s investment policy.
 - b) Excluding any liability cash flows.
 - c) Incorporating the appropriate returns, defaults and investment expenses for the given scenario.
- ii. If the value of the projected additional invested asset portfolio does not equal or exceed the accumulated deficiencies at the end of each projection year for the scenario, increase the size of the initial additional invested asset portfolio as of the valuation date, and repeat the preceding step.
- iii. Determine a vector of annual earned rates that replicates the growth in the additional invested asset portfolio from the valuation date to the end of the projection period for the scenario. This vector will be the NAER for the given scenario.
- iv. If the depletion of assets within the projection results in an unreasonably high negative NAER upon borrowing, the NAER may be set to the assumed cost of borrowing associated with each projected time period, in accordance with Section 4.D.3.c, as a safe harbor.

Guidance Note: There are multiple ways to select the additional invested asset portfolio at the valuation date. Similarly, there are multiple ways to determine the earned rate vector. The company shall be consistent in its choice of methods, from one valuation to the next.

C. Projection Scenarios

1. Number of Scenarios

The number of scenarios for which the scenario reserve shall be computed shall be the responsibility of the company, and it shall be considered to be sufficient if any resulting understatement in the stochastic reserve, as compared with that resulting from running additional scenarios, is not material.

2. Economic Scenario Generation

Treasury Department interest rate curves, as well as investment return paths for index funds, equities, and fixed income assets shall be determined on a stochastic basis using the methodology described in Section 8. If the company uses a proprietary generator to develop scenarios, the company shall demonstrate that the resulting scenarios meet the requirements described in Section 8.

D. Projection of Assets

1. Starting Asset Amount

- a. For the projections of accumulated deficiencies, the value of assets at the start of the projection shall be set equal to the approximate value of statutory reserves at the start of the projection plus the allocated amount of PIMR attributable to the assets selected. Assets shall be valued consistently with their annual statement values. The amount of such asset values shall equal the sum of the following items, all as of the start of the projection:
 - i. Any hedge instruments held in support of the contracts being valued; and
 - ii. An amount of assets held in the general account equal to the approximate value of statutory reserves as of the start of the projections less the amount in (i).
- b. If the amount of initial general account assets is negative, the model should reflect a projected interest expense. General account assets chosen for use as described above shall be selected on a consistent basis from one reserve valuation hereunder to the next.

2. Valuation of Projected Assets

For purposes of determining the projected accumulated deficiencies, the value of projected assets shall be determined in a manner consistent with their value at the start of the projection. For assets assumed to be purchased during a projection, the value shall be determined in a manner consistent with the value of assets at the start of the projection that have similar investment characteristics. However, for derivative instruments that are used in hedging and are not assumed to be sold during a particular projection interval, the company may account for them at an amortized cost in an appropriate manner elected by the company.

Guidance Note: Accounting for hedge assets should recognize any methodology prescribed by a company's state of domicile.

3. General Account Assets

- a. General account assets shall be projected, net of projected defaults, using assumed investment returns consistent with their book value and expected to be realized in future periods as of the date of valuation. Initial assets that mature during the projection and positive cash flows projected for future periods shall be invested in a manner that is representative of and consistent with the company's investment policy, subject to the following requirements:
 - i. The final maturities and cash flow structures of assets purchased in the model, such as the patterns of gross investment income and principal repayments or a fixed or floating rate interest basis, shall be determined by the company as part of the model representation;

- ii. The combination of price and structure for fixed income investments and derivative instruments associated with fixed income investments shall appropriately reflect the projected Treasury Department curve along the relevant scenario and the requirements for gross asset spread assumptions stated below;
 - iii. For purchases of public non-callable corporate bonds, follow the requirements defined in VM-20 Sections 7.E, 7.F and 9.F. The prescribed spreads reflect current market conditions as of the model start date and grade to long-term conditions based on historical data at the start of projection year four;
 - iv. For transactions of derivative instruments associated with fixed income investments, reflect the prescribed assumptions in VM-20 Section 9.F for interest rate swap spreads;
 - v. For purchases of other fixed income investments, if included in the model investment strategy, set assumed gross asset spreads over U.S. Treasuries in a manner that is consistent with, and results in reasonable relationships to, the prescribed spreads for public non-callable corporate bonds and interest rate swaps.
- b. Notwithstanding the above requirements, the model investment strategy and any non-prescribed asset spreads shall be adjusted as necessary so that the aggregate reserve is not less than that which would be obtained by substituting an alternative investment strategy in which all fixed income reinvestment assets are public non-callable corporate bonds with gross asset spreads, asset default costs, and investment expenses by projection year that are consistent with a credit quality blend of:
- i. 5% Treasury
 - ii. 15% PBR credit rating 3 (Aa2/AA)
 - iii. 40% PBR credit rating 6 (A2/A)
 - iv. 40% PBR credit rating 9 (Baa/BBB)
- c. Any disinvestment shall be modeled in a manner that is consistent with the company's investment policy and that reflects the company's cost of borrowing where applicable, provided that the assumed cost of borrowing is not lower than the rate at which positive cash flows are reinvested in the same time period, taking into account duration, ratings, and other attributes of the borrowing mechanism. Gross asset spreads used in computing market values of assets sold in the model shall be consistent with, but not necessarily the same as, the gross asset spreads in Section 4.D.4.a.ii and Section 4.D.4.a.iv, recognizing that initial assets that mature during the projection may have different characteristics than modeled reinvestment assets.

Guidance Note: This limitation is being referred to Life Actuarial (A) Task Force for review. The simple language above “provided that the assumed cost of borrowing is not lower than the rate at which positive cash flows are reinvested in the same time period” is not intended to impose a literal requirement. It is intended to reflect a general concept to prevent excessively optimistic borrowing assumptions. It is recognized that borrowing parameters and rules can be complicated, such that modeling limitations may not allow for literal compliance, in every time step, as long as the reserve is not materially affected. However, if the company is unable to fully apply this restriction, prudence dictates that a company shall not allow borrowing assumptions to materially reduce the reserve.

4. Cash Flows from Invested Assets

- a. Cash flows from general account fixed income assets, including starting and reinvestment assets, shall be reflected in the projection as follows:
 - i. Model gross investment income and principal repayments in accordance with the contractual provisions of each asset and in a manner consistent with each scenario.
 - ii. Reflect asset default costs as prescribed in VM-20 Section 9.F and anticipated investment expenses through deductions to the gross investment income.
 - iii. Model the proceeds arising from modeled asset sales and determine the portion representing any realized capital gains and losses.
 - iv. Reflect any uncertainty in the timing and amounts of asset cash flows related to the paths of interest rates, equity returns or other economic values directly in the projection of asset cash flows. Asset defaults are not subject to this requirement, since asset default assumptions must be determined by the prescribed method in VM-20 Sections 7.E, 7.F and 9.F.
- b. Cash flows from general account index funds and equity assets—i.e., non-fixed income assets having substantial volatility of returns, such as common stocks and real estate— including starting and reinvestment assets, shall be reflected in the projection as follows:
 - i. Determine the grouping for asset categories and the allocation of specific assets to each category in a manner that is consistent with that used for index crediting strategies, as discussed in Section 4.A.2.
 - ii. Project the gross investment return including realized and unrealized capital gains in a manner that is consistent with the stochastically generated scenarios.
 - iii. Model the timing of an asset sale in a manner that is consistent with the investment policy of the company for that type of asset. Reflect expenses through a deduction to the gross investment return using prudent estimate assumptions.

Commented [A43]: Request clarification around the meaning of “general account index funds”.

- c. Cash flows for each projection interval for policy loan assets shall follow the requirements in Section 10.I.

E. Projection of Annuitization Benefits

1. Assumed Annuitization Purchase Rates

- a. For payouts specified at issue (such as single premium immediate annuities, deferred income annuities, and certain structured settlements), such payout rates shall reflect the payout rate specified in the contract.
- b. For purposes of projecting future elective annuitization benefits and withdrawal amounts from GMWBs, the projected annuitization purchase rates shall be determined assuming that market interest rates available at the time of election are the interest rates used to project general account assets, as determined in Section 4.D.4. In contrast, for payouts specified at issue, the payout rates modeled should be consistent with those specified in the contract.

Commented [A44]: Suggest deleting “In contrast, for payouts specified at issue, the payout rates modeled should be consistent with those specified in the contract.” as it appears to be covered by E.1.a.

2. Projected Election of GMIBs, GMWBs and Other Annuitization Options

For contracts projected to elect future annuitization options (including annuitizations stemming from the election of a GMIB) or for projections of GMWB benefits once the account value has been depleted, the projections may assume the contract will stay in force, the projected periodic payments are paid, and the associated maintenance expenses are incurred.

Commented [A45]: Suggest deleting “may” as there appears to be only option.

F. Frequency of Projection and Time Horizon

- 1. Use of an annual cash-flow frequency (“timestep”) is generally acceptable for benefits/features that are not sensitive to projection frequency. The lack of sensitivity to projection frequency should be validated by testing wherein the company should determine that the use of a more frequent—i.e., shorter—time step does not materially increase reserves. A more frequent time increment should always be used when the product features are sensitive to projection period frequency.
- 2. Care must be taken in simulating fee income and expenses when using an annual time step. It is also important that the frequency of the investment return model be linked appropriately to the projection horizon in the liability model. In particular, the horizon should be sufficiently long so as to capture the vast majority of costs (on a present value basis) from the scenarios.

Guidance Note: As a general guide, the forecast horizon should not be less than 20 years.

G. Compliance with ASOPs

When determining a stochastic reserve, the analysis shall conform to the ASOPs as promulgated from time to time by the ASB.

Under these requirements, an actuary will make various determinations, verifications and certifications. The company shall provide the actuary with the necessary information sufficient to permit the actuary to fulfill the responsibilities set forth in these requirements and responsibilities arising from each applicable ASOP.

Section 5: Reinsurance Ceded and Assumed

Commented [A46]: The wording and titling may need to be tightened due to clarify which items apply to assumed and ceded reinsurance in the text.

A. Treatment of Reinsurance Ceded in the Aggregate Reserve

1. Aggregate Reserve Pre- and Post-Reinsurance Ceded

As noted in Section 3.B, the aggregate reserve is determined both pre-reinsurance ceded and post-reinsurance ceded. Therefore, it is necessary to determine the components needed to determine the aggregate reserve—i.e., the stochastic reserve and/or the reserve amount valued using requirements in VM-A and VM-C, as applicable—on both bases. Sections 5.A.2 and 5.A.3 discuss adjustments to inputs necessary to determine these components on both a post-reinsurance ceded and a pre-reinsurance ceded basis. Note that due allowance for reasonable approximations may be used where appropriate.

2. Stochastic Reserve

- a. In order to determine the aggregate reserve post-reinsurance ceded, accumulated deficiencies, scenario reserves, and the resulting stochastic reserve shall be determined reflecting the effects of reinsurance treaties that meet the statutory requirements that would allow the treaty to be accounted for as reinsurance within statutory accounting. This involves including, where appropriate, all projected reinsurance premiums or other costs and all reinsurance recoveries, where the reinsurance cash flows reflect all the provisions in the reinsurance agreement, using prudent estimate assumptions.
 - i. All significant terms and provisions within reinsurance treaties shall be reflected. In addition, it shall be assumed that each party is knowledgeable about the treaty provisions and will exercise them to their advantage.

Guidance Note: Renegotiation of the treaty upon the expiration of an experience refund provision or at any other time shall not be assumed if such would be beneficial to the company and not beneficial to the counterparty. This is applicable to both the ceding party and assuming party within a reinsurance arrangement.

- ii. If the company has knowledge that a counterparty is financially impaired, the company shall establish a margin for the risk of default by the counterparty. In the absence of knowledge that the counterparty is financially impaired, the company is not required to establish a margin for the risk of default by the counterparty.
 - iii. A company shall include the cash flows from a reinsurance agreement or amendment in calculating the aggregate reserve if such qualifies for credit in compliance with Appendix A-791 of the Accounting Practices and Procedures Manual. If a reinsurance agreement or amendment does not qualify for credit for reinsurance but treating the reinsurance agreement or amendment as if it did so qualify would result in a reduction to the company's surplus, then the company shall increase the minimum reserve by the absolute value of such reductions in surplus.
- b. In order to determine the stochastic reserve on a pre-reinsurance ceded basis, accumulated deficiencies, scenario reserves, and the resulting stochastic reserve shall be determined ignoring the effects of reinsurance ceded within the projections. Different approaches may be used to determine the starting assets on the ceded portion of the contracts, dependent upon the characteristics of a given treaty:
 - i. For a standard coinsurance treaty, where the assets supporting the ceded liabilities were transferred to the assuming reinsurer, one acceptable approach involves a projection

based on using starting assets on the ceded portion of the policies that are similar to those supporting the retained portion of the ceded policies or supporting similar types of policies. Scaling up each asset supporting the retained portion of the contract is also an acceptable method.

Guidance Note: For standard pro rata insurance treaties (does not include experience refunds), where allocated expenses are similar to the renewal expense allowance, reflecting the quota share applied to the present value of future reinsurance cash flows pertaining to the reinsured block of business may be considered as a possible approach to determine the ceded reserves.

- ii. Alternatively, a treaty may contain an identifiable portfolio of assets associated with the ceded liabilities. This could be the case for several forms of reinsurance: funds withheld coinsurance; modified coinsurance; coinsurance with a trust. To the extent these assets would be available to the cedant, an acceptable approach could involve modeling this portfolio of assets. To the extent that these assets were insufficient to defease the ceded liabilities, the modeling would partially default to the approach discussed for a standard coinsurance treaty. To the extent these assets exceeded what might be needed to defease the ceded liabilities (perhaps an over collateralization requirement in a trust), the inclusion of such assets shall be limited.

Guidance Note: Section 3.5.2 in ASOP No. 52, *Principle-Based Reserves for Life Products under the NAIC Valuation Manual*, provides possible methods for constructing a hypothetical pre-reinsurance asset portfolio, if necessary, for purposes of the pre-reinsurance reserve calculation.

- c. An assuming company shall use assumptions to project cash flows to and from ceding companies that reflect the assuming company's experience for the business segment to which the reinsured policies belong and reflect the terms of the reinsurance agreement.

3. Reserve Determined Upon Passing the Exclusion Test

If a company passes the stochastic exclusion test and elects to use a methodology pursuant to applicable Sections VM-A and VM-C, as allowed in Section 3.E, it is important to note that the methodology produces reserves on a pre-reinsurance ceded basis. Therefore, the reserve must be adjusted for any reinsurance ceded accordingly. In addition, reserves valued under applicable Sections in VM-A and VM-C, unadjusted for reinsurance, shall be applied to the contracts falling under the scope of these requirements to determine the aggregate reserve prior to reinsurance.

It should be noted that the pre-reinsurance and post-reinsurance reserves may result in different outcomes for the exclusion test. In particular, it is possible that the pre-reinsurance reserves would pass the relevant exclusion test (and allow the use of VM-A and VM-C) while the post-reinsurance reserves might not.

4. To Be Determined

Section 6: To Be Determined

Section 7: Exclusion Testing

A. Stochastic Exclusion Test Requirement Overview

1. The company may elect to exclude one or more groups of contracts from the stochastic reserve calculation if the stochastic exclusion test (SET) is satisfied for that group of contracts. The company has the option to calculate or not calculate the SET.
 - a. If the company does not elect to calculate the SET for one or more groups of contracts, or the company calculates the SET and fails the test for such groups of contracts, the reserve methodology described in Section 4 shall be used for calculating the aggregate reserve for those groups of contracts.
 - b. If the company elects to calculate the SET for one or more groups of contracts, and passes the test for such groups of contracts, then the company shall choose whether or not to use the reserve methodology described in Section 4 for those groups of contracts. If the reserve methodology described in Section 4 is not used for one or more groups of contracts, then the company shall use the reserve methodology pursuant to applicable requirements in VM-A and VM-C to calculate the aggregate reserve for those groups of contracts.
 - c. A company may not exclude a group of contracts from the stochastic reserve requirements if there are one or more future hedging programs associated with the contracts, with the exception of hedging programs solely supporting index credits as described in Section 9.A.1.

B. Types of Stochastic Exclusion Tests

Groups of contracts pass the SET if one of the following is met:

1. Stochastic Exclusion Ratio Test (SERT)—Annually the company demonstrates that the groups of contracts pass the SERT defined in Section 7.C.
2. Stochastic Exclusion Demonstration Test—In the first year and at least once every three calendar years thereafter, the company provides a demonstration in the PBR Actuarial Report as specified in Section 7.D.
3. ~~SET Certification Method—For groups of contracts that do not have guaranteed living benefits, future hedging programs, or pension risk transfer business in the first year and at least every third calendar year thereafter, the company provides a certification by a qualified actuary that the group of contracts is not subject to material aggregate risk levels across interest rate risk, longevity risk, or asset return volatility risk (i.e., the risk on non-fixed-income investments having substantial volatility of returns, such as common stocks and real estate investments). The company shall provide the certification and documentation supporting the certification to the commissioner upon request.~~

Commented [A47]: We recommend removing "pension risk transfer business" from products scoped out of SET certification method. It is unclear why this business would be treated differently from individually issued business for testing intended to capture interest rate risk.

Guidance Note: The qualified actuary should develop documentation to support the actuarial certification that presents his or her analysis clearly and in detail sufficient for another actuary to understand the analysis and reasons for the actuary's conclusion that the group of contracts is not subject to material interest rate risk, longevity risk, or asset return volatility risk. Examples of methods a qualified actuary could use to support the actuarial certification include, but are not limited to:

- a) A demonstration that using requirements under VM-A and VM-C for the group of contracts calculated are at least as great as the assets required to support the group of contracts using the company's cash-flow testing model under each of the 16 scenarios identified in this section or alternatively each of the New York seven scenarios.
- b) A demonstration that the group of contracts passed the SERT within 36 months prior to the valuation date and the company has not had a material change in its interest rate risk.
- c) A qualitative risk assessment of the group of contracts that concludes that the group of contracts does not have material interest rate risk or asset return volatility. Such assessment would include an analysis of product guarantees, the company's non-guaranteed elements (NGEs) policy, assets backing the group of contracts and the company's investment strategy.

C. Stochastic Exclusion Ratio Test

1. **In order to exclude a group of contracts from the stochastic reserve requirements under the stochastic exclusion ratio test (SERT), a company shall demonstrate that the ratio of $(b-a)/a$ is less than $[x]\%$ where:**
 - a. a = the adjusted scenario reserve described in Paragraph C.2.a.i below using economic scenario 9, the baseline economic scenario, as described in Appendix 1.E of VM-20.
 - b. b = the largest adjusted scenario reserve described in Paragraph C.2.b below under any of the other 15 economic scenarios described in Appendix 1.E of VM-20 under both $[95]\%$ and $[105]\%$ of anticipated experience mortality excluding margins.

Commented [A48]: As written, the SERT assumes a single premium product given the change of the denominator to the scenario reserve. Alternative product designs (such as longevity swap) could result in unintended results. We recommend maintaining consistency with VM-20 and using a denominator of future benefits (annuity payments, DBs, etc., excluding premium considerations, expenses, etc.).

Guidance Note: Note that the numerator should be the largest adjusted scenario reserve for scenarios other than the baseline economic scenario, minus the adjusted scenario reserve for the baseline economic scenario. This is not necessarily the same as the biggest difference from the adjusted scenario reserve for the baseline economic scenario, or the absolute value of the biggest difference from the adjusted scenario reserve for the baseline economic scenario, both of which could lead to an incorrect test result.

2. In calculating the ratio in subsection (1) above:
 - a. The company shall calculate an adjusted scenario reserve for the group of contracts for the 16 scenarios that is equal to either (i) or (ii) below:
 - i. The scenario reserve defined in Section 4, but with the following differences:
 - a) Using anticipated experience assumptions with no margins, with the exception of mortality factors described in Paragraph C.1.b of this section.
 - b) Using the interest rates and equity return assumptions specific to each scenario.
 - c) Using NAER and discount rates defined in Section 4 specific to each scenario to discount the cash flows.

- d) Shall reflect future mortality improvement in line with anticipated experience assumptions.
- e) Shall not reflect correlation between longevity and economic risks.
- ii. The gross premium reserve developed from the cash flows from the company’s asset adequacy analysis models, using the experience assumptions of the company’s cash-flow analysis, but with the following differences:
 - a) Using the interest rates and equity return assumptions specific to each scenario.
 - b) Using the mortality scalars described in Paragraph C.1.b of this section.
 - c) Using the methodology to determine NAER and discount rates defined in Section 4 specific to each scenario to discount the cash flows, but using the company’s cash-flow testing assumptions for default costs and reinvestment earnings.
- b. The company shall use the most current 16 economic scenarios published by the NAIC. The methodology for creating these scenarios can be found in Appendix 1 of VM-20.
- c. The company shall use assumptions within each scenario that are dynamically adjusted as appropriate for consistency with each tested scenario.
- d. The company may not group together contract types with significantly different risk profiles for purposes of calculating this ratio.
- e. If the company has reinsurance arrangements that are pro rata coinsurance and do not materially impact the interest rate risk, longevity risk, or asset return volatility in the contract, then the company may elect to not conduct the exclusion test under a pre-reinsurance-ceded basis upon determining the pre-reinsurance reserve-ceded aggregate reserve.
- 3. If the ratio calculated in this section is less than [x]% pre-non-proportional reinsurance, but is greater than [x]% post-non-proportional reinsurance, the group of contracts will still pass the SERT if the company can demonstrate that the sensitivity of the adjusted scenario reserve to economic scenarios is comparable pre- and post-non-proportional reinsurance.
 - a. An example of an acceptable demonstration:
 - i. For convenience in notation • $SERT = \frac{(b-a)}{a}$ defined in Section 7.C.1 above
 - a) The pre-non-proportional reinsurance results are “gross of non-proportional,” with a subscript “gn,” so denoted $SERT_{gn}$
 - b) The post-non-proportional results are “net of non-proportional,” with subscript “nn,” so denoted $SERT_{nn}$

Commented [A49]: Clarification is needed around reference to “significantly different risk profiles”.

Commented [A50]: We request clarification or definition of the term “non-proportional reinsurance”.

- ii. If a block of business being tested is subject to one or more non-proportional reinsurance cessions as well as other forms of reinsurance, such as pro rata coinsurance, take “gross of non-proportional” to mean net of all prorata reinsurance but ignoring the non-proportional contract(s), and “net of non-proportional” to mean net of *all* reinsurance contracts. That is, treat non-proportional reinsurance as the last reinsurance in, and compute certain values below with and without that last component.

iii. So, if $SERT_{gn} \leq [x]$ but $SERT_{nn} > [x]$, then compute the largest percent increase in reserve $(LPIR) = (b-a)/a$, both “gross of non-proportional” and “net of non-proportional.”

$$LPIR_{gn} = (b_{gy} - a_{gy})/a_{gn}$$

$$LPIR_{nn} = (b_{ny} - a_{ny})/a_{nn}$$

Note that the scenario underlying b_{gn} could be different from the scenario underlying b_{nn} .

If $SERT_{gn} \times LPIR_{nn}/LPIR_{gn} < [x]$, then the block of contracts passes the SERT.

- b. Another more qualitative approach is to calculate the adjusted scenario reserves for the 16 scenarios both gross and net of reinsurance to demonstrate that there is a similar pattern of sensitivity by scenario.
4. The SERT may not be used for a group of contracts if, using the current year’s data, (i) the stochastic exclusion demonstration test defined in Section 7.D had already been attempted using the method in this section and did not pass; or (ii) the qualified actuary had actively undertaken to perform the certification method in this section and concluded that such certification could not legitimately be made.

Commented [A51]: We believe subscript “gy” should be “gn”.

D. Stochastic Exclusion Demonstration Test

- 1. In order to exclude a group of contracts from the stochastic reserve requirements using the methodology in this section, the company must provide a demonstration in the PBR Actuarial Report in the first year and at least once every three calendar years thereafter that complies with the following:

- a. The demonstration shall provide a reasonable assurance that if the stochastic reserve was calculated on a stand-alone basis for the group of contracts subject to the stochastic reserve exclusion, the resulting stochastic reserve for those groups of contracts would not be higher than the statutory reserve determined pursuant to the applicable requirements in VM-A and VM-C. The demonstration shall take into account whether changing conditions over the current and two subsequent calendar years would be likely to change the conclusion to exclude the group of contracts from the stochastic reserve requirements.
- b. If, as of the end of any calendar year, the company determines the aggregate reserve for the group of contracts no longer adequately provides for all material risks, the exclusion shall be discontinued, and the company fails the SERT for those contracts.

Commented [A52]: Does this statement imply a floor reserve of VM-A and VM-C? VM-20 does require the NPR as the floor of the reserve but as written, VM-22 does not require a floor reserve. Recommend removing 1.a. Same statement with the 2.a statement demonstration. This requirement does not apply to the other permitted tests, which seemed counterintuitive.

- c. The demonstration may be based on analysis from a date that precedes the valuation date for the initial year to which it applies if the demonstration includes an explanation of why the use of such a date will not produce a material change in the outcome, as compared to results based on an analysis as of the valuation date.
 - d. The demonstration shall provide an effective evaluation of the residual risk exposure remaining after risk mitigation techniques, such as derivative programs and reinsurance.
2. The company may use one of the following or another method acceptable to the insurance commissioner to demonstrate compliance with subsection 7.D.1 above:
- a. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the stochastic reserve calculated on a stand-alone basis.
 - b. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the scenario reserve that results from each of a sufficient number of adverse deterministic scenarios.
 - c. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the stochastic reserve calculated on a stand-alone basis, but using a representative sample of contracts in the stochastic reserve calculations.
 - d. Demonstrate that any risk characteristics that would otherwise cause the stochastic reserve calculated on a stand-alone basis to exceed the statutory reserve calculated in accordance with VM-A and VM-C, are not present or have been substantially eliminated through actions such as hedging, investment strategy, reinsurance or passing the risk on to the policyholder by contract provision.

E. Deterministic Certification Option

1. The company has the option to determine the stochastic reserve for a group of contracts using a single deterministic economic scenario, subject to the following conditions.
- a. The company certifies that economic conditions do not materially influence anticipated contract holder behavior for the group of policies. Examples of contract holder options that are materially influenced by economic conditions include surrender benefits, recurring premium payments, and guaranteed living benefits.
 - b. The company certifies that the group of policies is not supported by a reinvestment strategy that contains future hedge purchases.
 - c. The company must perform and disclose results from the stochastic exclusion ratio test following the requirements in Section 7.C, thereby disclosing the scenario reserve volatility across various economic scenarios.

- d. The company must disclose a description of contracts and associated features in the certification.

Drafting Note: Consider revisiting Paragraph E.1.c to possibly either require i) falling below a preset threshold for the exclusion ratio test under a single longevity/mortality scenario; or ii) to pass the exclusion test if longevity is not included as part of the ratio test.

2. The stochastic reserve for the group of contracts under the Deterministic Certification Option is determined as follows:
 - a. Cash flows are projected in compliance with the applicable requirements in Section 4, Section 5, Section 10, and Section 11 of VM-22 over a single economic scenario (scenario 12 found in Appendix 1 of VM-20).
 - b. The stochastic reserve equals the scenario reserve following the requirements for Section 4.

Guidance Note: The Deterministic Certification Option is intended to provide a non-stochastic option for Single Premium Immediate Annuities (SPIAs) and similar payout annuity products that contain limited or no optionality in the asset and liability cash flow projections.

Section 8: To Be Determined (Scenario Generation for VM-21)

Section 9: Modeling Hedges under a Future Hedging Strategy

A. Initial Considerations

- i. This section applies to modeling of hedges other than situations where the company (a) only hedges index credits, or (b) clearly separates index credit hedging from other hedging. In those situations, the modeling of hedges supporting index credits can be simplified including applying an index credit hedge margin, following the requirements in Section 4.A.4.b.i.
- 2. The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the calculation of the stochastic reserve, determined in accordance with Section 3.D and Section 4.D.
- 3. The company shall take into account the costs and benefits of hedge positions expected to be held by the company in the future along each scenario. Company management is responsible for developing, documenting, executing and evaluating the investment strategy for future hedge purchases. Prior to reflection in projections, the strategy for future hedge purposes shall be the actual practice of the company for a period of time not less than [6] months.
- 4. For this purpose, the investment assets refer to all the assets, including derivatives supporting covered products and guarantees. This also is referred to as the investment portfolio. The investment strategy is the set of all asset holdings at all points in time in all scenarios. The hedging portfolio, which also is referred to as the hedging assets, is a subset of the investment assets. The hedging strategy is the hedging asset holdings at all points in time in all scenarios. There is no attempt to distinguish what is the hedging portfolio and what is the investment portfolio in this section. Nor is the distinction between investment strategy and hedging strategy formally made here. Where necessary to give effect to the intent of this section, the requirements applicable to the hedging portfolio or the hedging strategy are to apply to the overall investment portfolio and investment strategy.
- 5. This particularly applies to restrictions on the reasonableness or acceptability of the models that make up the stochastic cash-flow model used to perform the projections, since these restrictions are inherently restrictions on the joint modeling of the hedging and non-hedging portfolio. To give effect to these requirements, they must apply to the overall investment strategy and investment portfolio.

Commented [A53]: Section 4.A.4 (Modeling of Hedges) has some relationship with this section, we request clarification around the applicability of these two areas of hedge guidance.

Commented [A54]: We seek clarification of this text: if a company only hedges indices or separates index crediting from other hedges, does this apply, or does it only apply to any other hedging?

Commented [A55]: The sentence "Prior to reflection in projections, the strategy for future hedge purposes shall be the actual practice of the company for a period of time not less than [6] months." seems to suggest you would do something other than the actual hedging strategy after [6] months. In this case, what are you assuming for modeling? We suggest clarification of this sentence.

B. Modeling Approaches

- 1. The analysis of the impact of the hedging strategy on cash flows is typically performed using either one of two types of methods as described below. Although a hedging strategy normally would be expected to reduce risk provisions, the nature of the hedging strategy and the costs to implement the strategy may result in an increase in the amount of the stochastic reserve otherwise calculated.
- 2. The fundamental characteristic of the first type of method, referred to as the "explicit method," is that hedging positions and their resulting cash flows are included in the stochastic cash-flow model used to determine the scenario reserve, as discussed in Section 3.D, for each scenario.

3. The fundamental characteristic of the second type of method, referred to as the “implicit method,” is that the effectiveness of the current hedging strategy on future cash flows is evaluated, in part or in whole, outside of the stochastic cash-flow model. There are multiple ways that this type of modeling can be implemented. In this case, the reduction to the stochastic reserve otherwise calculated should be commensurate with the degree of effectiveness of the hedging strategy in reducing accumulated deficiencies otherwise calculated.
4. Regardless of the methodology used by the company, the ultimate effect of the current hedging strategy (including currently held hedge positions) on the stochastic reserve needs to recognize all risks, associated costs, imperfections in the hedges and hedging mismatch tolerances associated with the hedging strategy. The risks include, but are not limited to: basis, gap, price, parameter estimation and variation in assumptions (mortality, persistency, withdrawal, annuitization, etc.). Costs include, but are not limited to: transaction, margin (opportunity costs associated with margin requirements) and administration. In addition, the reduction to the stochastic reserve attributable to the hedging strategy may need to be limited due to the uncertainty associated with the company’s ability to implement the hedging strategy in a timely and effective manner. The level of operational uncertainty varies indirectly with the amount of time that the new or revised strategy has been in effect or mock tested.

Guidance Note: No hedging strategy is perfect. A given hedging strategy may eliminate or reduce some but not all risks, transform some risks into others, introduce new risks, or have other imperfections. For example, a delta-only hedging strategy does not adequately hedge the risks measured by the “Greeks” other than delta.

5. A safe harbor approach is permitted for those companies whose modeled hedge assets comprise only linear instruments not sensitive to implied volatility. For companies with option-based hedge strategies, electing this approach would require representing the option-based portion of the strategy as a delta-rho two-Greek hedge program. The normally modeled option portfolio would be replaced with a set of linear instruments that have the same first-order Greeks as the original option portfolio.

C. Calculation of Stochastic Reserve (Reported)

1. The company shall calculate CTE70 (best efforts)—the results obtained when the CTE70 is based on incorporating the modeling of hedges (including both currently held and future hedge positions) into the stochastic cash-flow model on a best efforts basis, including all of the factors and assumptions needed to model the hedges (e.g., stochastic implied volatility). The determination of CTE70 (best efforts) may utilize either explicit or implicit modeling techniques.
2. The company shall calculate a CTE70 (adjusted) by recalculating the CTE70 assuming the company has no hedging strategy except those to hedge interest credits and hedge assets held by the company on the valuation date, therefore following the requirements of Section 4.A.4.a and 4.A.4.b.i.
3. Because most models will include at least some approximations or idealistic assumptions, CTE70 (best efforts) may overstate the impact of the hedging strategy. To compensate for potential overstatement of the impact of the hedging strategy, the value for the stochastic reserve is given by:

$$\text{Stochastic reserve} = \text{CTE70 (best efforts)} + E \times \max[0, \text{CTE70 (adjusted)} - \text{CTE70 (best efforts)}]$$

4. The company shall specify a value for E (the “error factor”) in the range from 5% to 100% to reflect the company’s view of the potential error resulting from the level of sophistication of the stochastic cash-flow model and its ability to properly reflect the parameters of the hedging strategy (i.e., the Greeks being covered by the strategy), as well as the associated costs, risks and benefits. The greater the ability of the stochastic model to capture all risks and uncertainties, the lower the value of E . The value of E may be as low as 5% only if the model used to determine the CTE70 (best efforts) effectively reflects all of the parameters used in the hedging strategy. If certain economic risks are not hedged, yet the model does not generate scenarios that sufficiently capture those risks, E must be in the higher end of the range, reflecting the greater likelihood of error. Likewise, simplistic hedge cash-flow models shall assume a higher likelihood of error.
5. The company shall conduct a formal back-test, based on an analysis of at least the most recent 12 months, to assess how well the model is able to replicate the hedging strategy in a way that supports the determination of the value used for E .
6. Such a back-test shall involve one of the following analyses:
 - a. For companies that model hedge cash flows directly (“explicit method”), replace the stochastic scenarios used in calculating the CTE70 (best efforts) with a single scenario that represents the market path that actually manifested over the selected back-testing period and compare the projected hedge asset gains and losses against the actual hedge asset gains and losses – both realized and unrealized – observed over the same time period. For this calculation, the model assumptions may be replaced with parameters that reflect actual experience during the back-testing period. In order to isolate the comparison between the modeled hedge results and actual hedge results for this calculation, the projected liabilities should accurately reflect the actual liabilities throughout the back-testing period; therefore, adjustments that facilitate this accuracy (e.g. reflecting actual experience instead of model assumptions, including new business, etc.) are permissible.

To support the choice of a low value of E , the company should ascertain that the projected hedge asset gains and losses are within close range of 100% (e.g., 80–125%) of the actual hedge asset gains and losses. The company may also support the choice of a low value of E by achieving a high R-squared (e.g., 0.80 or higher) when using a regression analysis technique.
 - b. For companies that model hedge cash flows implicitly by quantifying the cost and benefit of hedging using the fair value of the hedged item (an “implicit method” or “cost of reinsurance method”), calculate the delta, rho and vega coverage ratios in each month over the selected back-testing period in the following manner:
 - i. Determine the hedge asset gains and losses—both realized and unrealized—incurred over the month attributable to equity, interest rate, and implied volatility movements.
 - ii. Determine the change in the fair value of the hedged item over the month attributable to equity, interest rate, and implied volatility movements. The hedged item should be defined in a manner that reflects the proportion of risks hedged (e.g., if a company elects to hedge 50% of a contract’s market risks, it should quantify the fair value of the hedged item as 50% of the fair value of the contract).
 - iii. Calculate the delta coverage ratio as the ratio between (i) and (ii) attributable to equity movements.

- iv. Calculate the rho coverage ratio as the ratio between (i) and (ii) attributable to interest rate movements.
 - v. Calculate the vega coverage ratio as the ratio between (i) and (ii) attributable to implied volatility movements.
 - vi. To support the company's choice of a low value of E, the company should be able to demonstrate that the delta and rho coverage ratios are both within close range of 100 % (e.g., 80–125%) consistently across the back-testing period.
 - vii. In addition, the company should be able to demonstrate that the vega coverage ratio is within close range of 100 % in order to use the prevailing implied volatility levels as of the valuation date in quantifying the fair value of the hedged item for the purpose of calculating CTE70 (best efforts). Otherwise, the company shall quantify the fair value of the hedged item for the purpose of calculating CTE70 (best efforts) in a manner consistent with the realized volatility of the scenarios captured in the CTE (best efforts).
- c. Companies that do not model hedge cash flows explicitly, but that also do not use the implicit method as outlined in Section 9.C.6.b above, shall conduct the formal back-test in a manner that allows the company to clearly illustrate the appropriateness of the selected method for reflecting the cost and benefit of hedging, as well as the value used for E.
7. A company that does not have 12 months of experience to date shall set E to a value that reflects the amount of experience available, and the degree and nature of any change to the hedge program. For a material change in strategy, with no history, E should be at least 0.50. However, E may be lower than 0.50 if some reliable experience is available and/or if the change in strategy is a refinement rather than a substantial change in strategy.

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily large (e.g., $\geq 50\%$) for substantial changes in hedge methodology (e.g., moving from a fair-value based strategy to a stop-loss strategy) where the company has not been able to provide a meaningful simulation of hedge performance based on the new strategy.
- A temporary moderate increase (e.g., 15–30%) in error factor should be used for substantial modifications to hedge programs or modeling where meaningful simulation has not been created (e.g., adding second-order hedging, such as gamma or rate convexity).
- No increase in the error factor may be used for incremental modifications to the hedge strategy (e.g., adding death benefits to a program that previously covered only living benefits, or moving from swaps to Treasury Department futures).

D. Specific Considerations and Requirements

- 1. As part of the process of choosing a methodology and assumptions for estimating the future effectiveness of the current hedging strategy (including currently held hedge positions) for

purposes of reducing the stochastic reserve, the company should review actual historical hedging effectiveness. The company shall evaluate the appropriateness of the assumptions on future trading, transaction costs, other elements of the model, the strategy, the mix of business and other items that are likely to result in materially adverse results. This includes an analysis of model assumptions that, when combined with the reliance on the hedging strategy, are likely to result in adverse results relative to those modeled. The parameters and assumptions shall be adjusted (based on testing contingent on the strategy used and other assumptions) to levels that fully reflect the risk based on historical ranges and foreseeable future ranges of the assumptions and parameters. If this is not possible by parameter adjustment, the model shall be modified to reflect them at either anticipated experience or adverse estimates of the parameters.

2. A discontinuous hedging strategy is a hedging strategy where the relationships between the sensitivities to equity markets and interest rates (commonly referred to as the Greeks) associated with the guaranteed contract holder options embedded in the fixed indexed annuities and other in-scope products and these same sensitivities associated with the hedging assets are subject to material discontinuities. This includes, but is not limited to, a hedging strategy where material hedging assets will be obtained when the fixed indexed annuity account balances reach a predetermined level in relationship to the guarantees. Any hedging strategy, including a delta hedging strategy, can be a discontinuous hedging strategy if implementation of the strategy permits material discontinuities between the sensitivities to equity markets and interest rates associated with the guaranteed contract holder options embedded in the fixed indexed annuities and other in-scope products and these same sensitivities associated with the hedging assets. There may be scenarios that are particularly costly to discontinuous hedging strategies, especially where those result in large discontinuous changes in sensitivities (Greeks) associated with the hedging assets. Where discontinuous hedging strategies contribute materially to a reduction in the stochastic reserve, the company must evaluate the interaction of future trigger definitions and the discontinuous hedging strategy, in addition to the items mentioned in the previous paragraph. This includes an analysis of model assumptions that, when combined with the reliance on the discontinuous hedging strategy, may result in adverse results relative to those modeled.
3. A strategy that has a strong dependence on acquiring hedging assets at specific times that depend on specific values of an index or other market indicators may not be implemented as precisely as planned.
4. The combination of elements of the stochastic cash-flow model—including the initial actual market asset prices, prices for trading at future dates, transaction costs and other assumptions—should be analyzed by the company as to whether the stochastic cash-flow model permits hedging strategies that make money in some scenarios without losing a reasonable amount in some other scenarios. This includes, but is not limited to:
- a. Hedging strategies with no initial investment that never lose money in any scenario and in some scenarios make money.
 - b. Hedging strategies that, with a given amount of initial money, never make less than accumulation at the one-period risk-free rates in any scenario but make more than this in one or more scenarios.
5. If the stochastic cash-flow model allows for such situations, the company should be satisfied that the results do not materially rely directly or indirectly on the use of such strategies. If the results do materially rely directly or indirectly on the use of such strategies, the strategies may not be used to reduce the stochastic reserve otherwise calculated.

Commented [A56]: Suggest replacing “indexed” with “fixed” since this would apply to all fixed annuities.

6. In addition to the above, the method used to determine prices of financial instruments for trading in scenarios should be compared to actual initial market prices. In addition to comparisons to initial market prices, there should be testing of the pricing models that are used to determine subsequent prices when scenarios involve trading financial instruments. This testing should consider historical relationships. For example, if a method is used where recent volatility in the scenario is one of the determinants of prices for trading in that scenario, then that model should approximate actual historic prices in similar circumstances in history.

Section 10: Guidance and Requirements for Setting Contract Holder Behavior Prudent Estimate Assumptions

A. General

Contract holder behavior assumptions encompass actions such as lapses, withdrawals, transfers, recurring deposits, benefit utilization, option election, etc. Contract holder behavior is difficult to predict accurately, and variance in behavior assumptions can significantly affect the results. In the absence of relevant and fully credible empirical data, the company should set behavior assumptions as guided by Principle 3 in Section 1.B.

In setting behavior assumptions, the company should examine, but not be limited by, the following considerations:

1. Behavior can vary by product, market, distribution channel, index performance, interest credited (current and guaranteed rates), time/product duration, etc.
2. Options embedded in the product may affect behavior.
3. Utilization of options may be elective or non-elective in nature. Living benefits often are elective, and death benefit options are generally non-elective.
4. Elective contract holder options may be more driven by economic conditions than non-elective options.
5. As the value of a product option increases, there is an increased likelihood that contract holders will behave in a manner that maximizes their financial interest (e.g., lower lapses, higher benefit utilization, etc.).
6. Behavior formulas may have both rational and irrational components (irrational behavior is defined as situations where some contract holders may not always act in their best financial interest). The rational component should be dynamic, but the concept of rationality need not be interpreted in strict financial terms and might change over time in response to observed trends in contract holder behavior based on increased or decreased financial efficiency in exercising their contractual options.
7. Options that are ancillary to the primary product features may not be significant drivers of behavior. Whether an option is ancillary to the primary product features depends on many things, such as:
 - a. For what purpose was the product purchased?
 - b. Is the option elective or non-elective?
 - c. Is the value of the option well-known?
8. External influences may affect behavior.

Commented [A57]: We would suggest rewording this section to be considerations rather than posed as questions.

B. Aggregate vs. Individual Margins

1. Prudent estimate assumptions are developed by applying a margin for uncertainty to the anticipated experience assumption. The issue of whether the level of the margin applied to the anticipated experience assumption is determined in aggregate or independently for each and every behavior assumption is discussed in Principle 3 in Section 1.B.
2. Although this principle discusses the concept of determining the level of margins in aggregate, it notes that the application of this concept shall be guided by evolving practice and expanding knowledge. From a practical standpoint, it may not always be possible to

completely apply this concept to determine the level of margins in aggregate for all behavior assumptions.

3. Therefore, the company shall determine prudent estimate assumptions independently for each behavior (e.g., mortality, lapses and benefit utilization), using the requirements and guidance in this section and throughout these requirements, unless the company can demonstrate that an appropriate method was used to determine the level of margin in aggregate for two or more behaviors.

C. Sensitivity Testing

The impact of behavior can vary by product, time period, etc. For any assumption that is not prescribed or stochastically modeled, the qualified actuary to whom responsibility for this group of contracts is assigned shall use sensitivity testing to ensure that the assumption is set at the conservative end of the plausible range. The company shall sensitivity test:

- Surrenders.
- Partial withdrawals.
- Benefit utilization.
- Other behavior assumptions if relevant to the risks in the product.

Sensitivity testing of assumptions is required and shall be more complex than, for example, base lapse assumption plus or minus X% across all contracts. A more appropriate sensitivity test in this example might be to devise parameters in a dynamic lapse formula to reflect more out-of-the-money contracts lapsing and/or more holders of in-the-money contracts persisting and eventually using the guarantee. The company should apply more caution in setting assumptions for behaviors where testing suggests that stochastic modeling results are sensitive to small changes in such assumptions. For such sensitive behaviors, the company shall use higher margins when the underlying experience is less than fully relevant and credible.

The company shall examine the results of sensitivity testing to understand the materiality of prudent estimate assumptions on the modeled reserve. The company shall update the sensitivity tests periodically as appropriate, considering the materiality of the results of the tests. The company may update the tests less frequently when the tests show less sensitivity of the modeled reserve to changes in the assumptions being tested or the experience is not changing rapidly. Providing there is no material impact on the results of the sensitivity testing, the company may perform sensitivity testing:

1. Using samples of the contracts in force rather than performing the entire valuation for each alternative assumption set.
2. Using data from prior periods.

D. Specific Considerations and Requirements

1. Within materiality considerations, the company should consider all relevant forms of contract holder behavior and persistency, including, but not limited to, the following:
 - a. Mortality (additional guidance and requirements regarding mortality is contained in Section 11).

Commented [A58]: Suggest updating bullet to “Other material behavior assumptions if relevant to the risks in the product.”

- b. Surrenders.
 - c. Partial withdrawals (systematic and elective).
 - d. Account transfers (switching/exchanges).
 - e. Resets/ratchets of the guaranteed amounts (automatic and elective).
 - f. Future deposits.
 - g. Income start date
 - h. Commutation of benefit (from periodic payment to lump sum)
2. It may be acceptable to ignore certain items that might otherwise be explicitly modeled in an ideal world, particularly if the inclusion of such items reduces the calculated provisions.
- For example:
- a. The impact of account transfers (intra-contract index “switching”) might be ignored, unless required under the terms of the contract (e.g., automatic asset re-allocation/rebalancing,) or if the contract provisions incentivize the contract holders to transfer between accounts.
 - b. Future deposits might be excluded from the model, unless required by the terms of the contracts under consideration and then only in such cases where future premiums can reasonably be anticipated (e.g., with respect to timing and amount).
 - c. For some non-elective benefits (nursing home benefits for example), a zero incidence rate after the surrender charge has ended, or the cash value has depleted, may be acceptable since use of a non-zero rate could reduce the modeled reserve.
3. However, the company should exercise caution in assuming that current behavior will be indefinitely maintained. For example, it might be appropriate to test the impact of a shifting asset mix and/or consider future deposits to the extent they can reasonably be anticipated and increase the calculated amounts.
4. Normally, the underlying model assumptions would differ according to the attributes of the contract being valued. This would typically mean that contract holder behavior and persistency may be expected to vary according to such characteristics as (this is not an exhaustive list):
- a. Gender.
 - b. Attained age.
 - c. Issue age.
 - d. Contract duration.
 - e. Time to maturity.
 - f. Tax status.
 - g. Account value.
 - h. Interest credited (current and guaranteed).
 - i. Available indices.
 - j. Guaranteed benefit amounts.
 - k. Surrender charges, transfer fees or other contract charges.
 - l. Distribution channel.
5. Unless there is clear evidence to the contrary, behavior assumptions should be no less conservative than past experience. Margins for contract holder behavior assumptions shall assume, without relevant and credible experience or clear evidence to the contrary, that contract holders’ efficiency will increase over time.

6. In determining contract holder behavior assumptions, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience), whether or not the segment is directly written by the company. If data from a similar business segment are used, the assumption shall be adjusted to reflect differences between the two segments. Margins shall reflect the data uncertainty associated with using data from a similar but not identical business segment.
7. Where relevant and fully credible empirical data do not exist for a given contract holder behavior assumption, the company shall set the contract holder behavior assumption to reflect the increased uncertainty such that the contract holder behavior assumption is shifted towards the conservative end of the plausible range of expected experience that serves to increase the stochastic reserve. If there are no relevant data, the company shall set the contract holder behavior assumption to reflect the increased uncertainty such that the contract holder behavior assumption is at the conservative end of the range. Such adjustments shall be consistent with the definition of prudent estimate, with the principles described in Section I.B, and with the guidance and requirements in this section.
8. Ideally, contract holder behavior would be modeled dynamically according to the simulated economic environment and/or other conditions. It is important to note, however, that contract holder behavior should neither assume that all contract holders act with 100% efficiency in a financially rational manner nor assume that contract holders will always act irrationally. These extreme assumptions may be used for modeling efficiency if the result is more conservative.

Commented [A59]: This section states that “contract holder behavior should neither assume that all contract holders act with 100% efficiency in a financially rational manner nor assume that contract holders will always act irrationally.” This text seems to directly contradict Section II. Reserve Requirements 6.H.2 which states “When advantageous, policyholders will commence living benefit payouts if not started yet.”. We suggest revising 6.H.2 to align with the text of 10.D.8.

E. Dynamic Assumptions

1. Consistent with the concept of prudent estimate assumptions described earlier, the liability model should incorporate margins for uncertainty for all risk factors that are not dynamic (i.e., the non-scenario tested assumptions) and are assumed not to vary according to the financial interest of the contract holder.
2. The company should exercise care in using static assumptions when it would be more natural and reasonable to use a dynamic model or other scenario-dependent formulation for behavior. With due regard to considerations of materiality and practicality, the use of dynamic models is encouraged, but not mandatory. Risk factors that are not scenario tested but could reasonably be expected to vary according to a stochastic process, or future states of the world (especially in response to economic drivers) may require higher margins and/or signal a need for higher margins for certain other assumptions.
3. Risk factors that are modeled dynamically should encompass the plausible range of behavior consistent with the economic scenarios and other variables in the model, including the non-scenario tested assumptions. The company shall test the sensitivity of results to understand the materiality of making alternate assumptions and follow the guidance discussed above on setting assumptions for sensitive behaviors.

Commented [A60]: Suggest replacing “Risk factors that are not scenario tested but” with “Static assumptions that” to improve clarity in the wording.

F. Consistency with the CTE Level

1. All behaviors (i.e., dynamic, formulaic and non-scenario tested) should be consistent with the scenarios used in the CTE calculations (generally, the top 30% of the loss distribution). To maintain such consistency, it is not necessary to iterate (i.e., successive runs of the model) in order to determine exactly which scenario results are included in the CTE measure. Rather, in light of the products being valued, the company should be mindful of

the general characteristics of those scenarios likely to represent the tail of the loss distribution and consequently use prudent estimate assumptions for behavior that are reasonable and appropriate in such scenarios. For fixed annuities, these “valuation” scenarios would typically display one or more of the following attributes:

- a. Declining and/or volatile index values, where applicable.
- b. Price gaps and/or liquidity constraints.
- c. Rapidly changing interest rates or persistently low interest rates.
- d. Volatile credit spreads.

Commented [A61]: Suggesting deleting as we are not aware of dynamic credit spreads typically being modeled.

- 2. The behavior assumptions should be logical and consistent both individually and in aggregate, especially in the scenarios that govern the results. In other words, the company should not set behavior assumptions in isolation, but give due consideration to other elements of the model. The interdependence of assumptions (particularly those governing customer behaviors) makes this task difficult and by definition requires professional judgment, but it is important that the model risk factors and assumptions:
 - a. Remain logically and internally consistent across the scenarios tested.
 - b. Represent plausible outcomes.
 - c. Lead to appropriate, but not excessive, asset requirements.
- 4. The company should remember that the continuum of “plausibility” should not be confined or constrained to the outcomes and events exhibited by historic experience.
- 5. Companies should attempt to track experience for all assumptions that materially affect their risk profiles by collecting and maintaining the data required to conduct credible and meaningful studies of contract holder behavior.

G. Additional Considerations and Requirements for Assumptions Applicable to Guaranteed Living Benefits

Experience for contracts without guaranteed living benefits may be of limited use in setting a lapse assumption for contracts with in-the-money or at-the-money guaranteed living benefits. Such experience may only be used if it is appropriate (e.g., lapse experience on contracts without a living benefit may have relevance to the early durations of contracts with living benefits) and relevant to the business.

H. Policy Loans

If policy loans are applicable for the block of business, the company shall determine cash flows for each projection interval for policy loan assets by modeling existing loan balances either explicitly or by substituting assets that are a proxy for policy loans (e.g., bonds, cash, etc.) subject to the following:

- 1. If the company substitutes assets that are a proxy for policy loans, the company must demonstrate that such substitution:
 - a. Produces reserves that are no less than those that would be produced by modeling existing loan balances explicitly.
 - b. Complies with the contract holder behavior requirements stated in Section 10 above in this section.

2. If the company models policy loans explicitly, the company shall:
 - a. Treat policy loan activity as an aspect of contract holder behavior and subject to the requirements above in this section.
 - b. Assign loan balances either to exactly match each policy's utilization or to reflect average utilization over a model segment or sub-segments.
 - c. Model policy loan interest in a manner consistent with policy provisions and with the scenario. Include interest paid in cash as a positive policy loan cash flow in that projection interval, but do not include interest added to the loan balance as a policy loan cash flow. (The increased balance will require increased repayment cash flows in future projection intervals.)
 - d. Model policy loan principal repayments, including those that occur automatically upon death or surrender. Include policy loan principal repayments as a positive policy loan cash flow, per Section 4.A.1.h.
 - e. Model additional policy loan principal. Include additional policy loan principal as a negative policy loan cash flow, per Section 4.A.1.h (but do not include interest added to the loan balance as a negative policy loan cash flow).
 - f. Model any investment expenses allocated to policy loans and include them either with policy loan cash flows or insurance expense cash flows.

I. Non-Guaranteed Elements

Consistent with the definition in VM-01, Non-Guaranteed Elements (NGEs) are elements within a contract that affect policy costs or values and not guaranteed or not determined at issue. NGEs consist of elements affecting contract holder costs or values that are both established and subject to change at the discretion of the insurer.

Examples of NGEs specific to fixed annuities include but are not limited to the following: fixed credited rates, index parameters (caps, spreads, participation rates, etc.), rider fees, rider benefit features being subject to change (rollup rates, rollup period, etc.), account value charges, and dividends under participating policies or contracts.

1. Except as noted below in Section 10.J.5, the company shall include NGE in the models to project future cash flows beyond the time the company has authorized their payment or crediting.
2. The projected NGE shall reflect factors that include, but are not limited to, the following (not all of these factors will necessarily be present in all situations):
 - a. The nature of contractual guarantees.
 - b. The company's past NGE practices and established NGE policies.
 - c. The timing of any change in NGE relative to the date of recognition of a change in experience.
 - d. The benefits and risks to the company of continuing to authorize NGE.
3. Projected NGE shall be established based on projected experience consistent with how actual NGE are determined.

4. Projected levels of NGE in the cash-flow model must be consistent with the experience assumptions used in each scenario. Contract holder behavior assumptions in the model must be consistent with the NGE assumed in the model.
5. The company may exclude any portion of an NGE that:
 - a. Is not based on some aspect of the policy's or contract's experience.
 - b. Is authorized by the board of directors and documented in the board minutes, where the documentation includes the amount of the NGE that arises from other sources.

However, if the board has guaranteed a portion of the NGE into the future, the company must model that amount. In other words, the company cannot exclude from its model any NGE that the board has guaranteed for future years, even if it could have otherwise excluded them, based on this subsection.
6. The liability for contract holder dividends declared but not yet paid that has been established according to statutory accounting principles as of the valuation date is reported separately from the statutory reserve. The contract holder dividends that give rise to this dividend liability as of the valuation date may or may not be included in the cash-flow model at the company's option.
 - a. If the contract holder dividends that give rise to the dividend liability are not included in the cash-flow model, then no adjustment is needed to the resulting aggregate stochastic reserve.
 - b. If the contract holder dividends that give rise to the dividend liability are included in the cash-flow model, then the resulting aggregate stochastic reserve should be reduced by the amount of the dividend liability.
7. All projected cash flows associated with NGEs shall reflect margins for adverse deviations and estimation error in prudent estimate assumptions.

Section 11: Guidance and Requirements for Setting Prudent Estimate Mortality Assumptions

Commented [A62]: Specific requirements will require further discussion, particularly what if any industry experience is identified for the SPA. Ideally, updated and appropriate assumptions should be used for better alignment and to avoid any false positives flagged as an outlier by the SPA.

A. Overview

1. Intent

The guidance and requirements in this section apply to setting prudent estimate mortality assumptions when determining the stochastic reserve. The intent is for prudent estimate mortality assumptions to be based on facts, circumstances and appropriate actuarial practice, with only a limited role for unsupported actuarial judgment. (Where more than one approach to appropriate actuarial practice exists, the company should select the practice that the company deems most appropriate under the circumstances.)

2. Description

Prudent estimate mortality assumptions shall be determined by first developing expected mortality curves based on either available experience or published tables. Where necessary, margins shall be applied to the experience to reflect data uncertainty. The expected mortality curves shall then be adjusted based on the credibility of the experience used to determine the expected mortality curve. Section 11.B addresses guidance and requirements for determining expected mortality curves, and Section 11.C addresses guidance and requirements for adjusting the expected mortality curves to determine prudent estimate mortality.

Finally, the credibility-adjusted tables shall be adjusted for mortality improvement (where such adjustment is permitted or required) using the guidance and requirements in Section 11.D.

3. Business Segments

For purposes of setting prudent estimate mortality assumptions, the products falling under the scope of these requirements shall be grouped into business segments with different mortality assumptions. The grouping, at a minimum, should differentiate between payout annuities or deferred annuity contracts that contain GLBs, and deferred annuity contracts with no guaranteed benefits or only GMDBs. Where appropriate, the grouping should also differentiate between segments which are known or expected to contain contract holders with sociodemographic, geographic, or health factors reasonably expected to impact the mortality assumptions for the segment (e.g., annuitants drawn from different countries, geographic areas, industry groups, or impaired lives on individually underwritten contracts such as structured settlements). The grouping should also generally follow the pricing, marketing, management and/or reinsurance programs of the company.

Guidance Note: This paragraph contemplates situations where it may be appropriate to differentiate mortality assumptions by segment or even by contract due to varying sociodemographic, geographic, or health factors. Particularly, though not exclusively, in the context of group payout annuity contracts, companies may have credible, contract-specific mortality experience data or relevant pooled data from annuitants drawn from similar industries or geographies that may be used to sub-divide inforce blocks into business segments for purposes of setting prudent estimate mortality assumptions.

For example, a company may sell group PRT contracts both to union plans in the U.S. and to private single-employer plans in another country. While both are “PRT contracts,” it would be appropriate to differentiate them for mortality assumption purposes, similar to

how payout annuities vs. deferred annuities are distinguished.

Guidance Note: Distinct mortality or liability assumptions among different contracts within a group of contracts does not in itself preclude the group of contracts from being aggregated for the purposes of the broader stochastic reserve calculation.

- 4. **Margin for Data Uncertainty**
 The expected mortality curves that are determined in Section 11.B may need to include a margin for data uncertainty. The margin could be in the form of an increase or a decrease in mortality, depending on the business segment under consideration. The margin shall be applied in a direction (i.e., increase or decrease in mortality) that results in a higher reserve. A sensitivity test may be needed to determine the appropriate direction of the provision for uncertainty to mortality. The test could be a prior year mortality sensitivity analysis of the business segment or an examination of current representative cells of the segment.

Commented [A63]: Termining the segments "mortality (longevity) segments" would be easier to understand than "plus (minus) segments".

For purposes of this section, if mortality must be increased (decreased) to provide for uncertainty, the business segment is referred to as a plus (minus) segment.

It may be necessary, because of a change in the mortality risk profile of the segment, to reclassify a business segment from a plus (minus) segment to a minus (plus) segment to the extent compliance with this section requires such a reclassification. For example, a segment could require reclassification depending on whether it is gross or net of reinsurance.

B. Determination of Expected Mortality Curves

1. Experience Data

In determining expected mortality curves, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience). See Section 11.B.2. for additional considerations. Finally, if there is no data, the company shall use the applicable table, as required in Section 11.B.3.

2. Data Other Than Direct Experience

Adjustments shall be applied to the data to reflect differences between the business segments, and margins shall be applied to the adjusted expected mortality curves to reflect the data uncertainty associated with using data from a similar but not identical business segment.

To the extent the mortality of a business segment is reinsured, any mortality charges that are consistent with the company's own pricing and applicable to a substantial portion of the mortality risk also may be a reasonable starting point for the determination of the company's expected mortality curves.

3. No Data Requirements

- i. When little or no experience or information is available on a business segment, the company shall use expected mortality curves that would produce expected deaths no less than:

- a. [2021 SOA Deferred Annuity Mortality Table] with [Projection Scale G2] for individual deferred annuities that do not contain guaranteed living benefits

$$q_x^{20XX+n} = q_x^{20XX}(1 - G2_x)^n$$

- ii. When little or no experience or information is available on a business segment, the company shall use expected mortality curves that would produce expected deaths no greater than:

- a. [The appropriate percentage (F_x) from Table 11.1 applied to the 2012 IAM Basic Mortality Table] with [Projection Scale G2] for individual payout annuity contracts and deferred annuity contracts with guaranteed living benefits

$$q_x^{2012+n} = q_x^{2012}(1 - G2_x)^n * F_x$$

- b. [1983 Table “a”] for structured settlements or other contracts with impaired mortality
- c. [1994 GAR Table] with [Projection Scale AA] for group annuities

$$q_x^{1994+n} = q_x^{1994}(1 - AA_x)^n$$

Commented [A64]: For PRT an assumption based on a third-party data provider would be better than the industry table to get contract specific mortality assumptions. Is this permitted? The guidance note in A.3 seems to get at this, but it’s not clear in B.3.ii.c whether this is allowed. This is an important distinction as PRT population can vary from those populations the tables are based upon.

Table 11.1

iii. For a business segment with non-U.S. insureds, an established industry or national mortality table may be used, with approval from the domiciliary commissioner.

Commented [A65]: The phrase “When little or no experience or information is available on a business segment” is not included, unlike in (i) and (ii) of the same sub-section. It appears to be the intent that this is the only situation in which this would apply, but it would be helpful to make this explicit.

4. Additional Considerations Involving Data

The following considerations shall apply to mortality data specific to the business segment for which assumptions are being determined (i.e., direct data discussed in Section 11.B.1 or other than direct data discussed in Section 11.B.2).

a. Underreporting of Deaths

Mortality data shall be examined for possible underreporting of deaths. Adjustments shall be made to the data if there is any evidence of underreporting. Alternatively, exposure by lives or amounts on contracts for which death benefits were in the money may be used to determine expected mortality curves. Underreporting on such exposures should be minimal; however, this reduced subset of data will have less credibility.

b. Experience by Contract Duration

Experience of a plus segment shall be examined to determine if mortality by contract duration increases materially due to selection at issue. In the absence of information, the company shall assume that expected mortality will increase by contract duration for an appropriate select period. As an alternative, if the company determines that mortality is affected by selection, the company could apply margins to the expected mortality in such a way that the actual mortality modeled does not depend on contract duration.

c. Modification and Relevance of Data

Even for a large company, the quantity of life exposures and deaths are such that a significant amount of smoothing may be required to determine expected mortality curves from mortality experience. Expected mortality curves, when applied to the recent historic exposures (e.g., three to seven years), should not result in an estimate of aggregate number of deaths less (greater) than the actual number deaths during the exposure period for plus (minus) segments.

In determining expected mortality curves (and the credibility of the underlying data), older data may no longer be relevant. The “age” of the experience data used to determine expected mortality curves should be documented.

d. Other Considerations

In determining expected mortality curves, consideration should be given to factors that include, but are not limited to, trends in mortality experience, trends in exposure, volatility in year-to-year A/E mortality ratios, mortality by lives relative to mortality by amounts, changes in the mix of business and product features that could lead to mortality selection.

C. Adjustment for Credibility to Determine Prudent Estimate Mortality

1. Adjustment for Credibility

The expected mortality curves determined in Section 11.B shall be adjusted based on the credibility of the experience used to determine the curves in order to arrive at prudent estimate mortality. The adjustment for credibility shall result in blending the expected mortality curves with the mortality assumption described in Section 11.B.3. The approach used to adjust the curves shall suitably account for credibility.

Commented [A66]: Both plan and industry data should get weighted for business such as PRT. This text says to blend with prescribed tables, but that might not make sense unless additional experience data was unavailable.

Guidance Note: For example, when credibility is zero, an appropriate approach should result in a mortality assumption consistent with 100% of the mortality table used in the blending.

2. Adjustment of Statutory Valuation Mortality for Improvement

For purposes of the adjustment for credibility, the mortality table for a plus segment may be and the mortality table for a minus segment must be adjusted for mortality improvement. Such adjustment shall reflect the mortality improvement scale described in Section 11.B.3 from the effective date of the respective mortality table to the experience weighted average date underlying the data used to develop the expected mortality curves.

Commented [A67]: Mortality improvement should be consistent with the underlying tables used, so we would suggest this being based on available experience subject to appropriate guardrails.

3. Credibility Procedure

The credibility procedure used shall:

- a. Produce results that are reasonable.
- b. Not tend to bias the results in any material way.
- c. Be practical to implement.
- d. Give consideration to the need to balance responsiveness and stability.
- e. Take into account not only the level of aggregate claims but the shape of the mortality curve.

- f. Contain criteria for full credibility and partial credibility that have a sound statistical basis and be appropriately applied.
4. Further Adjustment of the Credibility-Adjusted Table for Mortality Improvement

The credibility-adjusted table used for plus segments may be and the credibility adjusted table used for minus segments must be adjusted for mortality improvement using the applicable mortality improvement scale described in Section 11.B.3 from the experience weighted average date underlying the company experience used in the credibility process to the valuation date.

Any adjustment for mortality improvement beyond the valuation date is discussed in Section 11.D.

D. Future Mortality Improvement

The mortality assumption resulting from the requirements of Section 11.C shall be adjusted for mortality improvements beyond the valuation date if such an adjustment would serve to increase the resulting stochastic reserve. If such an adjustment would reduce the stochastic reserve, such assumptions are permitted, but not required. In either case, the assumption must be based on current relevant data with a margin for uncertainty (increasing assumed rates of improvement if that results in a higher reserve or reducing them otherwise).

Section 12: Allocation of Aggregate Reserves to the Contract Level

Commented [A68]: We believe discussion of allocation of aggregate reserves should be analyzed as part of the field study.

Section 3.F states that the aggregate reserve shall be allocated to the contracts falling within the scope of these requirements. That allocation should be done for both the pre- and post-reinsurance ceded reserves. Contracts that have passed the stochastic exclusion test as defined in Section 7.B will not be included in the allocation of the aggregate reserve. For the purpose of this section, if a contract does not have a cash surrender value, then the cash surrender value is assumed to be zero.

Contracts for which the Deterministic Certification Option is elected in Section 7.E are intended to use the methodology described in this section to allocate aggregate reserves in excess of the cash surrender value to individual contracts.

The contract-level reserve for each contract shall be the sum of the following:

- A. The contract’s cash surrender value.

Drafting Note: The American Academy of Actuaries Annuity Reserves and Capital Work Group is including two potential options for allocating the excess portion of the aggregate reserve over cash surrender value: (1) Use the same approach as VM-21 (2) Allocate based on an actuarial present value calculation.

The Work Group did not reach a consensus between these two approaches, so wording for both is included in the text below. The Work Group recommends field testing both approaches and considering the results in determining future decisions.

Option 1: VM-21 Approach

- B. An allocated portion of the excess of the aggregate reserve over the aggregate cash surrender value shall be allocated to each contract based on a measure of the risk of that product relative to its cash surrender value in the context of the company’s in force contracts (assuming zero cash value for contracts that do not contain such). The measure of risk should consider the impact of risk mitigation programs, including hedge programs and reinsurance, that would affect the risk of the product. The specific method of assessing that risk and how it contributes to the company’s aggregate reserve shall be defined by the company. The method should provide for an equitable allocation based on risk analysis.
 - 1. As an example, consider a company with the results of the following three contracts:

Table 12.1: Sample Allocation of Aggregate Reserve

Contract (i)	1	2	3	Total
Cash Surrender Value, C	28	40	52	120
Risk adjusted measure, R	38	52	50	
Aggregate Reserve				140
Allocation Basis for the excess of the Aggregate Reserve over the Cash Surrender Value $A_i = \text{Max}(R_i - C_i, 0)$	10	12	0	22

Allocation of the excess of the Aggregate Reserve over the Cash Surrender Value $Li = (Ai) \sum Ai * [Aggregate Reserve - \sum Ci]$	9.09	10.91	0.00	20
Contract-level reserve $Ci + Li$	37.09	50.91	52.00	140.00

2. In this example, the Aggregate Reserve exceeds the aggregate Cash Surrender Value by 20. The 20 is allocated proportionally across the three contracts based on the allocation basis of the larger of (i) zero; and (ii) a risk adjusted measure based on reserve principles. Therefore, contracts 1 and 2 receive 45% (9/22) and 55% (11/22), respectively, of the excess Aggregate Reserve. As Contract 3 presents no risk in excess of its cash surrender value, it does not receive an allocation of the excess Aggregate Reserve.

Option 2: Actuarial Present Value Approach

- B. The excess of the aggregate reserve over the aggregate cash surrender value is allocated to policies based on a calculation of the actuarial present value of projected liability cash flows in excess of the cash surrender value:
 1. Discount the liability cash flows at the NAER, pursuant to requirements in Section 4, for the scenario that produces the scenario reserve closest to, but not less than the stochastic reserve defined in Section 3.D.
 - a. Groups of contracts that elect the Deterministic Certification Option defined in Section 7.E shall use the NAER in the single scenario used to calculate the reserve to discount liability cash flows.
 2. If the actuarial present value is less than the cash surrender value, then the excess actuarial present value to be used for allocating the excess aggregate reserve over the cash value shall be floored at zero.
 - a. If all contracts have an excess actuarial present value that is floored at zero, then use the cash surrender value to allocate any excess aggregate reserve over the aggregate cash surrender value.
 3. For projecting future liability cash flows, assume the same liability assumptions that were used to calculate the stochastic reserve defined in 3.D.
 4. As a hypothetical example, consider a company with the results of the following five contracts:

Table 12.1: Hypothetical Sample Allocation of Aggregate Reserve

Contract	Example Product Type	CSV* (1)	Scenario APV (2)	Excess (Floored) of the scenario APV over CSV* (3) = $\text{Max}[(2), 0]$	Aggregate Reserve CTE 70 (4)	Excess of Aggregate Reserve over Aggregate CSV* (5) = $\text{Max}[(4 \text{ Total}) - (1 \text{ Total}), 0]$	Allocated Excess Reserve (6) = (3) x $[(5 \text{ Total}) / (3 \text{ Total})]$	Total Contract Level Reserve (7) = (1) + (6)
Contract 1:	Indexed Annuity with no GLWB**	95.0	90.0	0.0			0.0	95.0
Contract 2:	Indexed Annuity with low benefit GLWB**	92.0	95.0	3.0			3.6	95.6
Contract 3:	Indexed Annuity with medium benefit GLWB**	90.0	100.0	10.0			12.0	102.0
Contract 4:	Indexed Annuity with high benefit GLWB**	88.0	105.0	17.0			20.4	108.4
Contract 5:	Fixed Life Contingent Payout Annuity	0.0	70.0	70.0			84.0	84.0
Total		365.0		100.0	485.0	120.0	120.0	485.0

*Cash Surrender Value

**Guaranteed Lifetime Withdrawal Benefit

Guidance Note: The actuarial present value (APV) in the section above is separate from the Guarantee Actuarial Present Value (GAPV) referred to in the additional standard projection amount calculation in VM-21. The GAPV is only applicable to guaranteed minimum benefits and uses prescribed liability assumptions. In contrast, the APV in this section applies to the entire contract, irrespective of whether guaranteed benefits are attached, and uses company prudent estimate liability assumptions.

Section 13: Statutory Maximum Valuation Interest Rates for Income Annuity Formulaic Reserves

A. Purpose and Scope

1. These requirements define for single premium immediate annuity contracts and other similar contracts, certificates and contract features the statutory maximum valuation interest rate that complies with Model #820. These are the maximum interest rate assumption requirements to be used in the CARVM and for certain contracts, the CRVM. These requirements do not preclude the use of a lower valuation interest rate assumption by the company if such assumption produces statutory reserves at least as great as those calculated using the maximum rate defined herein.
2. The following categories of contracts, certificates and contract features, whether group or individual, including both life contingent and term certain only contracts, directly written or assumed through reinsurance, with the exception of benefits arising from variable annuities, are covered in this section:
 - a. Immediate annuity contracts issued after Dec. 31, 2017;
 - b. Deferred income annuity contracts issued after Dec. 31, 2017;
 - c. Structured settlements in payout or deferred status issued after Dec. 31, 2017;
 - d. Fixed payout annuities resulting from the exercise of settlement options or annuitizations of host contracts issued after Dec. 31, 2017;
 - e. Fixed payout annuities resulting from the exercise of settlement options or annuitizations of host contracts issued during 2017, for fixed payouts commencing after Dec. 31, 2018, or, at the option of the company, for fixed payouts commencing after Dec. 31, 2017;
 - f. Supplementary contracts, excluding contracts with no scheduled payments (such as retained asset accounts and settlements at interest), issued after Dec. 31, 2017;
 - g. Fixed income payment streams, attributable to contingent deferred annuities (CDAs) issued after Dec. 31, 2017, once the underlying contract funds are exhausted;
 - h. Fixed income payment streams attributable to guaranteed living benefits associated with deferred annuity contracts issued after Dec. 31, 2017, once the contract funds are exhausted; and
 - i. Certificates with premium determination dates after Dec. 31, 2017, emanating from non-variable group annuity contracts specified in Model #820, Section 5.C.2, purchased for the purpose of providing certificate holders benefits upon their retirement.

Guidance Note: For Section 13.A.2.d, Section 13.A.2.e, Section 13.A.2.f and Section 13.A.2.h above, there is no restriction on the type of contract that may give rise to the benefit.

3. Exemptions:
 - a. With the permission of the domiciliary commissioner, for the categories of annuity contracts, certificates and/or contract features in scope as outlined in Section 13.A.2.d, Section 13.A.2.e, Section 13.A.2.f, Section 13.A.2.g or Section 13.A.2.h, the company may use the same maximum valuation interest rate used to value the payment stream in accordance with the guidance applicable to the host contract. In order to obtain such

permission, the company must demonstrate that its investment policy and practices are consistent with this approach.

4. The maximum valuation interest rates for the contracts, certificates and contract features within the scope of Section 13 of VM-22 supersede those described in Appendix VM-A and Appendix VM-C, but they do not otherwise change how those appendices are to be interpreted. In particular, *Actuarial Guideline IX-B—Clarification of Methods Under Standard Valuation Law for Individual Single Premium Immediate Annuities, Any Deferred Payments Associated Therewith, Some Deferred Annuities and Structured Settlements Contracts* (AG-9-B) (see VM-C) provides guidance on valuation interest rates and is, therefore, superseded by these requirements for contracts, certificates and contract features in scope. Likewise, any valuation interest rate references in *Actuarial Guideline IX-C—Use of Substandard Annuity Mortality Tables in Valuing Impaired Lives Under Individual Single Premium Immediate Annuities* (AG-9-C) (see VM-C) are also superseded by these requirements.

B. Definitions

1. The term “reference period” means the length of time used in assigning the Valuation Rate Bucket for the purpose of determining the statutory maximum valuation interest rate and is determined as follows:
 - a. For contracts, certificates or contract features with life contingencies and substantially similar payments, the reference period is the length of time, rounded to the nearest year, from the premium determination date to the earlier of: i) the date of the last non-life-contingent payment under the contract, certificate or contract feature; and ii) the date of the first life-contingent payment under the contract, certificate or contract feature, or
 - b. For contracts, certificates or contract features with no life-contingent payments and substantially similar payments, the reference period is the length of time, rounded to the nearest year, from the premium determination date to the date of the last non-life-contingent payment under the contract, certificate or contract feature, or
 - c. For contracts, certificates or contract features where the payments are not substantially similar, the actuary should apply prudent judgment and select the Valuation Rate Bucket with Macaulay duration that is a best fit to the Macaulay duration of the payments in question.

Guidance Note: Contracts with installment refunds or similar features should consider the length of the installment period calculated from the premium determination date as the non-life contingent period for the purpose of determining the reference period.

Guidance Note: The determination in Section 13.B.1.c above shall be made based on the materiality of the payments that are not substantially similar relative to the life-contingent payments.

2. The term “jumbo contract” means a contract with an initial consideration equal to or greater than \$250 million. Considerations for contracts issued by an insurer to the same contract holder within 90 days shall be combined for purposes of determining whether the contracts meet this threshold.

Guidance Note: If multiple contracts meet this criterion in aggregate, then each contract is a jumbo contract.

3. The term “non-jumbo contract” means a contract that does not meet the definition of a jumbo

contract.

4. The term “premium determination date” means the date as of which the valuation interest rate for the contract, certificate or contract feature being valued is determined.
5. The term “initial age” means the age of the annuitant as of his or her age last birthday relative to the premium determination date. For joint life contracts, certificates or contract features, the “initial age” means the initial age of the younger annuitant. If a contract, certificate or contract feature for an annuitant is being valued on a standard mortality table as an impaired annuitant, “initial age” means the rated age. If a contract, certificate or contract feature is being valued on a substandard mortality basis, “initial age” means an equivalent rated age.
6. The term “Table X spreads” means the prescribed VM-22 Section 13 current market benchmark spreads for the quarter prior to the premium determination date, as published on the Industry tab of the NAIC website. The process used to determine Table X spreads is the same as that specified in VM-20 Appendix 2.D for Table F, except that JP Morgan and Bank of America bond spreads are averaged over the quarter rather than the last business day of the month.
7. The term “expected default cost” means a vector of annual default costs by weighted average life. This is calculated as a weighted average of the VM-20 Table A prescribed annual default costs published on the Industry tab of the NAIC website in effect for the quarter prior to the premium determination date, using the prescribed portfolio credit quality distribution as weights.
8. The term “expected spread” means a vector of spreads by weighted average life. This is calculated as a weighted average of the Table X spreads, using the prescribed portfolio credit quality distribution as weights.
9. The term “prescribed portfolio credit quality distribution” means the following credit rating distribution:
 - a. 5% Treasuries
 - b. 15% Aa bonds (5% Aa1, 5% Aa2, 5% Aa3)
 - c. 40% A bonds (13.33% A1, 13.33% A2, 13.33% A3)*
 - d. 40% Baa bonds (13.33% Baa1, 13.33% Baa2, 13.33% Baa3)*

*40%/3 is used unrounded in the calculations.

C. Determination of the Statutory Maximum Valuation Interest Rate

1. Valuation Rate Buckets

- a. For the purpose of determining the statutory maximum valuation interest rate, the contract, certificate or contract feature being valued must be assigned to one of four Valuation Rate Buckets labeled A through D.
- b. If the contract, certificate or contract feature has no life contingencies, the Valuation Rate Bucket is assigned based on the length of the reference period (RP), as follows:

Table 3-1: Assignment to Valuation Rate Bucket by Reference Period Only

RP ≤ 5 Years	5Y < RP ≤ 10Y	10Y < RP ≤ 15Y	RP > 15Y
A	B	C	D

- c. If the contract, certificate or contract feature has life contingencies, the Valuation Rate Bucket is assigned based on the length of the RP and the initial age of the annuitant, as follows:

Table 3-2: Assignment to Valuation Rate Bucket by Reference Period and Initial Age

Initial Age	RP ≤ 5Y	5Y < RP ≤ 10Y	10Y < RP ≤ 15Y	RP > 15Y
90+	A	B	C	D
80–89	B	B	C	D
70–79	C	C	C	D
< 70	D	D	D	D

2. Premium Determination Dates

- a. The following table specifies the decision rules for setting the premium determination date for each of the contracts, certificates and contract features listed in Section 1:

Table 3-3: Premium Determination Dates

Section	Item Description	Premium determination date
A.2.a	Immediate annuity	Date consideration is determined and committed to by contract holder
A.2.b	Deferred income annuity	Date consideration is determined and committed to by contract holder
A.2.c	Structured settlements	Date consideration is determined and committed to by contract holder
A.2.d and A.2.e	Fixed payout annuities resulting from settlement options or annuitizations from host contracts	Date consideration for benefit is determined and committed to by contract holder
A.2.f	Supplementary contracts	Date of issue of supplementary contract
A.2.g	Fixed income payment streams from CDAs, AV becomes 0	Date on which AV becomes 0
A.2.h	Fixed income payment streams from guaranteed living benefits, AV becomes 0	Date on which AV becomes 0

A.2.i	Group annuity and related certificates	Date consideration is determined and committed to by contract holder
-------	--	--

Guidance Note: For the purposes of the items in the table above, the phrase “date consideration is determined and committed to by the contract holder” should be interpreted by the company in a manner that is consistent with its standard practices. For some products, that interpretation may be the issue date or the date the premium is paid.

b. Immaterial Change in Consideration

If the premium determination date is based on the consideration, and if the consideration changes by an immaterial amount (defined as a change in present value of less than 10% and less than \$1 million) subsequent to the original premium determination date, such as due to a data correction, then the original premium determination date shall be retained. In the case of a group annuity contract where a single premium is intended to cover multiple certificates, certificates added to the contract after the premium determination date that do not trigger the company’s right to reprice the contract shall be treated as if they were included in the contract as of the premium determination date.

3. Statutory Maximum Valuation Interest Rate

- a. For a given contract, certificate or contract feature, the statutory maximum valuation interest rate is determined based on its assigned Valuation Rate Bucket (Section 13.C.1) and its Premium Determination Date (Section 13.C.2) and whether the contract associated with it is a jumbo contract or a non-jumbo contract.
- b. Statutory maximum valuation interest rates for jumbo contracts are determined and published daily by the NAIC on the Industry tab of the NAIC website. For a given premium determination date, the statutory maximum valuation interest rate is the daily statutory maximum valuation interest rate published for that premium determination date.
- c. Statutory maximum valuation interest rates for non-jumbo contracts are determined and published quarterly by the NAIC on the Industry tab of the NAIC website by the third business day of the quarter. For a given premium determination date, the statutory maximum valuation interest rate is the quarterly statutory maximum valuation interest rate published for the quarter in which the premium determination date falls.
- d. Quarterly Valuation Rate:

For each Valuation Rate Bucket, the quarterly valuation rate is defined as follows:

$$I_q = R + S - D - E$$

Where:

- a. R is the reference rate for that Valuation Rate Bucket (defined in Section 13.C.4);
- b. S is the spread rate for that Valuation Rate Bucket (defined in Section 13.C.5);
- c. D is the default cost rate for that Valuation Rate Bucket (defined in Section 13.C.6);

and

d. E is the spread deduction defined as 0.25%.

e. Daily Valuation Rate:

For each Valuation Rate Bucket, the daily valuation rate is defined as follows:

$$I_d = I_q + C_{d-1} - C_q$$

Where:

- a. I_q is the quarterly valuation rate for the calendar quarter preceding the business day immediately preceding the premium determination date;
- b. C_{d-1} is the daily corporate rate (defined in Section 13.C.7) for the business day immediately preceding the premium determination date; and
- c. C_q is the average daily corporate rate (defined in Section 13.C.8) corresponding to the same period used to develop I_q .

For jumbo contracts, the daily statutory maximum valuation interest rate is the daily valuation rate (I_d) rounded to the nearest one-hundredth of one percent (1/100 of 1%).

4. Reference Rate

Reference rates are updated quarterly as described below:

- a. The “quarterly Treasury rate” is the average of the daily Treasury rates for a given maturity over the calendar quarter prior to the premium determination date. The quarterly Treasury rate is downloaded from <https://fred.stlouisfed.org>, and is rounded to two decimal places.
- b. Download the quarterly Treasury rates for two-year, five-year, 10-year and 30-year U.S. Treasuries.
- c. The reference rate for each Valuation Rate Bucket is calculated as the weighted average of the quarterly Treasury rates using Table 1 weights (defined in Section 13.C.9) effective for the calendar year in which the premium determination date falls.

5. Spread

The spreads for each Valuation Rate Bucket are updated quarterly as described below:

- a. Use the Table X spreads from the NAIC website for WALs two, five, 10 and 30 years only to calculate the expected spread.
- b. Calculate the spread for each Valuation Rate Bucket, which is a weighted average of the expected spreads for WALs two, five, 10 and 30 using Table 2 weights (defined in Section 3.I) effective for the calendar year in which the premium determination date falls.

6. Default costs for each Valuation Rate Bucket are updated annually as described below:

- a. Use the VM-20 prescribed annual default cost table (Table A) in effect for the quarter prior to the premium determination date for WAL two, WAL five and WAL 10 years only to calculate the expected default cost. Table A is updated and published annually on

the Industry tab of the NAIC website during the second calendar quarter and is used for premium determination dates starting in the third calendar quarter.

- b. Calculate the default cost for each Valuation Rate Bucket, which is a weighted average of the expected default costs for WAL two, WAL five and WAL 10, using Table 3 weights (defined in Section 13.C.9) effective for the calendar year in which the premium determination date falls.

7. Daily Corporate Rate

Daily corporate rates for each valuation rate bucket are updated daily as described below:

- a. Each day, download the Bank of America Merrill Lynch U.S. corporate effective yields as of the previous business day’s close for each index series shown in the sample below from the St. Louis Federal Reserve website: <https://research.stlouisfed.org/fred2/categories/32348>. To access a specific series, search the St. Louis Federal Reserve website for the series name by inputting the name into the search box in the upper right corner, or input the following web address: [https://research.stlouisfed.org/fred2/series/\[replace with series name from the table below\]](https://research.stlouisfed.org/fred2/series/[replace with series name from the table below]).

Table 3-4: Index Series Names

Maturity	Series Name
1Y – 3Y	BAMLC1A0C13YEY
3Y – 5Y	BAMLC2A0C35YEY
5Y – 7Y	BAMLC3A0C57YEY
7Y – 10Y	BAMLC4A0C710YEY
10Y – 15Y	BAMLC7A0C1015YEY
15Y+	BAMLC8A0C15PYEY

- b. Calculate the daily corporate rate for each valuation rate bucket, which is a weighted average of the Bank of America Merrill Lynch U.S. corporate effective yields, using Table 4 weights (defined in Section 13.C.9) effective for the calendar year in which the business date immediately preceding the premium determination date falls.

8. Average Daily Corporate Rate

Average daily corporate rates are updated quarterly as described below:

- a. Download the quarterly average Bank of America Merrill Lynch U.S. corporate effective yields for each index series shown in Section 3.G.1 from the St. Louis Federal Reserve website: <https://research.stlouisfed.org/fred2/categories/32348>. To access a specific series, search the St. Louis Federal Reserve website for the series name by inputting the name into the search box in the upper right corner, or input the following web address: [https://research.stlouisfed.org/fred2/series/\[replace with series name from Section 13.C.7.a\]](https://research.stlouisfed.org/fred2/series/[replace with series name from Section 13.C.7.a]).

- b. Calculate the average daily corporate rate for each valuation rate bucket, which is a weighted average of the quarterly average Bank of America Merrill Lynch U.S. corporate effective yields, using Table 4 weights (defined in Section 13.C.9) for the same calendar year as the weight tables (i.e. Tables 1, 2, and 3) used in calculating I_q in Section 13.C.3.e.

9. Weight Tables 1 through 4

The system for calculating the statutory maximum valuation interest rates relies on a set of four tables of weights that are based on duration and asset/liability cash-flow matching analysis for representative annuities within each valuation rate bucket. A given set of weight tables is applicable to the calculations for every day of the calendar year.

In the fourth quarter of each calendar year, the weights used within each valuation rate bucket for determining the applicable valuation interest rates for the following calendar year will be updated using the process described below. In each of the four tables of weights, the weights in a given row (valuation rate bucket) must add to exactly 100%.

Weight Table 1

The process for determining Table 1 weights is described below:

- a. Each valuation rate bucket has a set of representative annuity forms. These annuity forms are as follows:
 - i. Bucket A:
 - a) Single Life Annuity age 91 with 0 and five-year certain periods.
 - b) Five-year certain only.
 - ii. Bucket B:
 - a) Single Life Annuity age 80 and 85 with 0, five-year and 10-year certain periods.
 - b) 10-year certain only.
 - iii. Bucket C:
 - a) Single Life Annuity age 70 with 0 and 15-year certain periods.
 - b) Single Life Annuity age 75 with 0, 10-year and 15-year certain periods.
 - c) 15-year certain only.
 - iv. Bucket D:
 - a) Single Life Annuity age 55, 60 and 65 with 0 and 15-year certain periods.
 - b) 25-year certain only.
- b. Annual cash flows are projected assuming annuity payments are made at the end of each year. These cash flows are averaged for each valuation rate bucket across the annuity forms for that bucket using the statutory valuation mortality table in effect for the following calendar year for individual annuities for males (ANB).
- c. The average daily rates in the third quarter for the two-year, five-year, 10-year and 30-year U.S. Treasuries are downloaded from <https://fred.stlouisfed.org> as input to calculate the present values in Step d.
- d. The average cash flows are summed into four time period groups: years 1–3, years 4–7, years 8–15 and years 16–30. (**Note:** The present value of cash flows beyond year 30 are discounted to the end of year 30 and included in the years 16–30 group. This present value is based on the lower of 3% and the 30-year Treasury rate input in Step c.)
- e. The present value of each summed cash-flow group in Step d is then calculated by using the Step 3 U.S. Treasury rates for the midpoint of that group (and using the linearly interpolated U.S. Treasury rate when necessary).
- f. The duration-weighted present value of the cash flows is determined by multiplying the present value of the cash-flow groups by the midpoint of the time period for each applicable group.

- g. Weightings for each cash-flow time period group within a valuation rate bucket are calculated by dividing the duration weighted present value of the cash flow by the sum of the duration weighted present value of cash flow for each valuation rate bucket.

Weight Tables 2 through 4

Weight Tables 2 through 4 are determined using the following process:

- i. Table 2 is identical to Table 1.
 - ii. Table 3 is based on the same set of underlying weights as Table 1, but the 10-year and 30-year columns are combined since VM-20 default rates are only published for maturities of up to 10 years.
 - iii. Table 4 is derived from Table 1 as follows:
 - a) Column 1 of Table 4 is identical to column 1 of Table 1.
 - b) Column 2 of Table 4 is 50% of column 2 of Table 1.
 - c) Column 3 of Table 4 is identical to column 2 of Table 4.
 - d) Column 4 of Table 4 is 50% of column 3 of Table 1.
 - e) Column 5 of Table 4 is identical to column 4 of Table 4.
 - f) Column 6 of Table 4 is identical to column 4 of Table 1.
10. Group Annuity Contracts

For a group annuity purchased under a retirement or deferred compensation plan (Section 13.A.2.i), the following apply:

- a. The statutory maximum valuation interest rate shall be determined separately for each certificate, considering its premium determination date, the certificate holder's initial age, the reference period corresponding to its form of payout and whether the contract is a jumbo contract or a non-jumbo contract.

Guidance Note: Under some group annuity contracts, certificates may be purchased on different dates.

- b. In the case of a certificate whose form of payout has not been elected by the beneficiary at its premium determination date, the statutory maximum valuation interest rate shall be based on the reference period corresponding to the normal form of payout as defined in the contract or as is evidenced by the underlying pension plan documents or census file. If the normal form of payout cannot be determined, the maximum valuation interest rate shall be based on the reference period corresponding to the annuity form available to the certificate holder that produces the most conservative rate.

Guidance Note: The statutory maximum valuation interest rate will not change when the form of payout is elected.

Valuation Manual Section II, Reserve Requirements

Commented [A69]: We believe a Fixed Annuity PBR Exemption should be incorporated into draft in a manner consistent with the Life PBR Exemption.

Subsection 2: Annuity Products

- A. This subsection establishes reserve requirements for all contracts classified as annuity contracts as defined in SSAP No. 50 in the AP&P Manual.
- B. Minimum reserve requirements for variable annuity (VA) contracts and similar business, specified in VM-21, Requirements for Principle-Based Reserves for Variable Annuities, shall be those provided by VM-21. The minimum reserve requirements of VM-21 are considered PBR requirements for purposes of the *Valuation Manual*.
- C. Minimum reserve requirements for fixed annuity contracts issued prior to 1/1/2024 are those requirements as found in VM-A and VM-C as applicable, with the exception of the minimum requirements for the valuation interest rate for single premium immediate annuity contracts, and other similar contracts, issued after Dec. 31, 2017, including those fixed payout annuities emanating from host contracts issued on or after Jan. 1, 2017, and on or before Dec. 31, 2017. The maximum valuation interest rate requirements for those contracts and fixed payout annuities are defined in Section 13 of VM-22, Statutory Maximum Valuation Interest Rates for Income Annuity Formulaic Reserves.
- D. Minimum reserve requirements for fixed annuity contracts issued on 1/1/2024 and later are those requirements as found in Sections 1 through 12 of VM-22.
- E. The below principles may serve as key considerations for assessing whether VM-21 or VM-22 requirements apply:
 - 1. Index-linked or modified guaranteed annuity contracts or riders that satisfy both of the following conditions may be a key consideration for application of VM-22 requirements:
 - a. Guarantees the principal amount of purchase payments, net of any partial withdrawals, and interest credited thereto, less any deduction (without regard to its timing) for sales, administrative or other expenses or charges.
 - b. Credits a rate of interest under the contract that is at least equal to the minimum rate required to be credited by the standard nonforfeiture law in the jurisdiction in which the contract is issued.

Guidance Note: Paragraph E.1.b is intended to apply prior to the application of any market value adjustments for modified guaranteed annuities where the underlying assets are held in a separate account. If meeting Paragraph E.1.b prior to the application of any market value adjustments and Paragraph E.1.a above, it may be appropriate to value such contracts under VM-22 requirements.

- 2. Index-linked or modified guaranteed annuity contracts that do not satisfy either of the two conditions listed above in Paragraph E.1.i and E.1.ii may be a key consideration for application of VM-21 requirements.

Subsection 6: Riders and Supplemental Benefits

Guidance Note: Policies or contracts with riders and supplemental benefits which are created to simply disguise benefits subject to the Valuation Manual section describing the reserve methodology for the base product to which they are attached, or exploit a perceived loophole, must be reserved in a manner similar to more typical designs with similar riders.

- A. If a rider or supplemental benefit is attached to a health insurance product, deposit-type contract, or credit life or disability product, it may be valued with the base contract unless it is required to be separated by regulation or other requirements.
- B. For supplemental benefits on life insurance policies or annuity contracts, including Guaranteed Insurability, Accidental Death or Disability Benefits, Convertibility, Nursing Home Benefits or Disability Waiver of Premium Benefits, the supplemental benefit may be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, VM-A, and/or VM-C, as applicable.
- C. ULSG and other secondary guarantee riders on a life insurance policy shall be valued with the base policy and follow the reserve requirements for ULSG policies under VM-20, VM-A and/or VM-C, as applicable.
- D. Any guaranteed minimum benefits on life insurance policies or annuity contracts not subject to Paragraph C above including, but not limited to, Guaranteed Minimum Accumulation Benefits, Guaranteed Minimum Death Benefits, Guaranteed Minimum Income Benefits, Guaranteed Minimum Withdrawal Benefits, Guaranteed Lifetime Income Benefits, Guaranteed Lifetime Withdrawal Benefits, Guaranteed Payout Annuity Floors, Waiver of Surrender Charges, Return of Premium, Systematic Withdrawal Benefits under Required Minimum Distributions, and all similar guaranteed benefits shall be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, and VM-A and/or VM-C, as applicable.
- E. If a rider or supplemental benefit to a life insurance policy or annuity contract that is not addressed in Paragraphs B, C, or D above possesses any of the following attributes, the rider or supplemental benefit shall be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, and VM-A and/or VM-C, as applicable.
 - 1. The rider or supplemental benefit does not have a separately identified premium or charge.
 - 2. After issuance, the rider or supplemental benefit premium, charge, value or benefits are determined by referencing the base policy or contract features or performance.
 - 3. After issuance, the base policy or contract value or benefits are determined by referencing the rider or supplemental benefit features or performance. The deduction of rider or benefit premium or charge from the contract value is not sufficient for a determination by reference.
- F. If a term life insurance rider on the named insured[s] on the base life insurance policy does not meet the conditions of Paragraph E above, and either (1) guarantees level or near level premiums until a specified duration followed by a material premium increase; or (2) for a rider for which level or near level premiums are expected for a period followed by a material premium increase, the rider is separated from the base policy and follows the reserve requirements for term policies under VM20, VM-A and/or VM-C, as applicable.

- G. For all other riders or supplemental benefits on life insurance policies or annuity contracts not addressed in Paragraphs B through F above, the riders or supplemental benefits may be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, VM-A and/or VM-C, as applicable. For a given rider, the election to include riders or supplemental benefits with the base policy or contract shall be determined at the policy form level, not on a policy-by-policy basis, and shall be treated consistently from year-to-year, unless otherwise approved by the domiciliary commissioner.
- H. Any supplemental benefits and riders offered on life insurance policies or annuity contracts that would have a material impact on the reserve if elected later in the contract life, such as joint income benefits, nursing home benefits, or withdrawal provisions on annuity contracts, shall be considered when determining reserves using the following principles:
1. Policyholders with living benefits and annuitization in the same contract will generally use the more valuable of the two benefits.
 2. When advantageous, policyholders will commence living benefit payouts if not started yet.

Commented [A70]: This section states that “When advantageous, policyholders will commence living benefit payouts if not started yet.” This text seems to directly contradict VM-22 Section 6.H.2 which states “contract holder behavior should neither assume that all contract holders act with 100% efficiency in a financially rational manner nor assume that contract holders will always act irrationally”. We suggest revising 6.H.2 to align with the text of 10.D.8.

EQUITABLE

DATE: November 19, 2021

FROM: Stephen Tizzoni, Head of Actuarial Regulatory Affairs

SUBJECT: Equitable Comments on Fixed Annuity Principles Based Reserve (PBR) Proposal

Equitable appreciates the opportunity to comment on the exposed Fixed Annuity PBR framework. Below are our views on two key aspects of the framework: (1) Standard Projection Amount; and (2) Aggregation of Reserves. The remainder of our views are appropriately captured in the ACLI comment letter.

Standard Projection Amount (SPA): Equitable favors the Standard Projection Amount as a binding floor over a non-binding disclosure item. A binding Standard Projection Amount mitigates the risk of overly optimistic company assumptions feeding reserves that will ultimately be insufficient to pay for future policyholder obligations. We cite several reasons in support of its use as a binding floor:

- Success of precedent: VM-21 is the industry precedent for holding a Standard Projection Amount as a binding floor. While some argue that this aspect of the framework may produce a non-economic reserve, in practice, the VM-21 Standard Projection Amount has had no such effect; rather, we believe its enactment motivated several companies to strengthen their weakest assumptions.
- Resource prioritization: The scope of VM-22 is vast, and therefore the Standard Projection Amount assumptions may be resource-intensive to develop. We believe that making the Standard Projection a binding floor will attract appropriate focus on its calibration.
- Leverages valuable industry data: Companies have differential amounts of experience data upon which to formulate assumptions. The SPA will ensure companies without access to credible experience data have a guardrail to use in their otherwise judgmental assumption setting process.
- Safeguard against actuarial judgment for untested assumptions: The Standard Projection Amount allows regulators to safeguard the industry against historically untested assumptions, such as policyholder behavior (e.g. lapses) when interest rates change significantly from business conditions at issue, or very long-dated lapse or persistency risk.
- Addresses a priority gap in the regulatory framework: The mis-estimation of complex actuarial processes has been the root cause behind the most acute insurer insolvencies. At present, the reserve and capital framework (a) omit any RBC charge for the preponderance of complex actuarial risks and (b) the provision for adverse deviations in reserves has frequently failed to protect insurers from severe losses. The establishment of properly calibrated guardrails on assumptions material in impact and high in uncertainty will eliminate the likelihood of severe insolvencies driven by actuarial mis-estimation and rectify a gap in the regulatory framework.

We also recommend that regulators carefully define the scope of the Standard Projection Amount assumptions and, for insignificant assumptions that are difficult to develop, rely on the company's own principles-based assumptions with appropriate scrutiny and disclosure.

Aggregation of Reserves / Reserving Categories: Per Equitable’s December 2020 comment letter, we support full aggregation for purposes of calculating the VM-22 reserve as the aggregation of risk is at the core of the insurance industry. As noted previously, the key risk of including aggregation within reserving is the risk that the projected profits are not realized and are not available to supplement reserves for in-the-money contracts/product lines. As such, the risk of aggregation equates to the risk that economic and policyholder behavior assumptions on profitable product lines are not realized. These risks can be mitigated through mechanisms such as a binding Standard Projection Amount that ensures company assumptions are not idealistic.

If less than full aggregation was permitted, we support splitting products based on payout vs. accumulation phase as reflected in Option 2 in the exposure draft.

Conclusion: Equitable appreciates the opportunity to comment on the exposed VM-22 proposal and we look forward to continuing to work with regulators to reach an appropriate principle based reserving framework for fixed annuities. We are available to discuss our comments further as desired.

Sincerely,

Stephen M. Tizzoni, FSA, MAAA

Stephen Tizzoni, Head of Actuarial Regulatory Affairs

Draft: 4/27/22

Valuation Manual (VM)-22 (A) Subgroup
Virtual Meeting
April 13, 2022

The VM-22 (A) Subgroup of the Life Actuarial (A) Task Force met April 13, 2022. The following Subgroup members participated: Ben Slutsker, Chair (MN); Ahmad Kamil, Elaine Lam, and Thomas Reedy (CA); Lei Rao-Knight (CT); Mike Yanacheak (IA); Vincent Tsang (IL); Nicole Boyd (KS); William Leung (MO); Seong-min Eom (NJ); Bill Carmello and Amanda Fenwick (NY); Rachel Hemphill (TX); Tomasz Serbinowski (UT); and Craig Chupp (VA).

1. Heard an Update on Revisions to VM-22

Mr. Slutsker discussed a spreadsheet (Attachment Twenty-Six-A) developed to categorize the 378 comments on the American Academy of Actuaries' (Academy's) proposed revisions (Attachment Twenty-Six-B) to VM-22, Statutory Maximum Valuation Interest Rates for Income Annuities. He said the comments are categorized into four tiers based on significance: 1) Key Decision Points; 2) High Substance Edits; 3) Moderate Substance Edits; and 4) Noncontroversial or Low Substance Edits, with the preponderance of comments falling into the latter tier.

Mr. Slutsker said the implementation date of the VM-22 revisions is scheduled for January 2024 but hinges upon the completion of a VM-22 field test. He noted that the date of the VM-22 field test is dependent on the completion of the economic scenario generator (ESG) field test to be conducted by the Life Actuarial (A) Task Force. He said deferring the VM-22 field test to 2023 could push the VM-22 implementation date to January 2025.

Ms. Lam said the California Department of Insurance (CDI) Office of Principle-Based Reserving (OPBR) comments (Attachment Twenty-Six-C) on the revisions to VM-22 highlighted formatting and definitions that are inconsistent with what is used in VM-20, Requirements for Principle-Based Reserves for Life Products. She also suggested listing the products that are in scope ahead of the products that are not in scope.

Paul S. Graham (American Council of Life Insurers—ACLI) said the ACLI comment letter (Attachment Twenty-Six-D) advocates for a principle-based approach to determining whether an annuity product is covered by VM-22 or VM-21, Requirements for Principle-Based Reserves for Variable Annuities. Chris Conrad (Academy) said the Academy favors an exclusion approach, which would identify annuity products that are in scope for VM-21 and have all other annuities fall under VM-22. Mr. Graham said the ACLI would be comfortable with that approach. Mr. Leung suggested using the Indexed-Linked Variable Annuity (ILVA) as a test case when developing the principles. Mr. Graham agreed that the ACLI could develop draft language it could share with the Academy before presenting it to the Task Force. He suggested that once the principle-based language is deemed acceptable for VM-22, it should also be considered for use in VM-21.

Mr. Slutsker discussed the two options that the Subgroup considered in July 2021 for determining reserving categories for aggregating annuity contracts. He said the first option lists the specific products in the Payout Annuity Reserving category, and the second option uses the principle-based approach of broadly defining both the Payout Annuity Reserving category and the Accumulation Annuity Reserving category. Mr. Conrad said the Academy supports principle-based aggregation that is consistent with the company's risk management strategy and reflects any potential risk offsets. He said the same aggregation principles should be applied to exclusion testing, CTE-70 calculation grouping, and comparing final reserve components. Ms. Hemphill said while the Texas Department of Insurance (TDI) supports full aggregation, it would support the decision of the Subgroup if it chose something more conservative. She caveated that the TDI would want the Subgroup's position to be clearly defined. Mr. Carmello said the New York State Department of Financial Services (NYDFS) prefers Option 1 but

would like to see “Other” listed as the tenth product type of the list provided in Option 1. Steve Tizzoni (Equitable) said Equitable supports full aggregation as a core of the way risks are measured and managed. He said of the two available options, Equitable favors Option 2. Ms. Lam said the OPBR would be in favor of Option 2 if it also requires the company to disclose the thought behind each product categorization. Ms. Rao-Knight said she also prefers full aggregation but would support Option 2 with disclosures. Mr. Leung said he prefers Option 1, as it would provide clarity without requiring disclosures. Cindy Barnard (Pacific Life) said if a company has products with both disintermediation risk and longevity risk, the risks may fluctuate, making it difficult to disclose which is the greater risk at any given time. Mr. Slutsker called for a straw vote. Option 1 received seven votes, while Option 2 received four votes. Mr. Slutsker said Option 1 will serve as placeholder as VM-22 development continues.

Mr. Slutsker began discussion on the potential for including an exemption, like the VM-20 Life Principle-Based Reserving (PBR) exemption, in VM-22. Mr. Graham expressed the ACLI’s support of an exemption that may be applied to small blocks of business. He suggested that the exemption may be based on a comparison of reserves held in the previous year. Mr. Slutsker said exemption comments were also submitted by Erie Family Life (Attachment Twenty-Six-E). Ms. Hemphill, Mr. Leung, and Mr. Chupp agreed that an exemption of some type should exist. Mr. Tsang also agreed, but he added that the exemption should be accompanied by asset adequacy testing (AAT). Ms. Hemphill said requiring AAT concepts is more akin to an exclusion than an exemption criterion. Ms. Lam said the CDI OPBR suggested that the exemption should consider the nature of the block of business, in the same way the VM-20 exemption prohibits material universal life policies with secondary guarantees (ULSG) from exemption. Mr. Graham said he is concerned that the companies desiring exemption due to a lack of resources would also have challenges allocating the resources to AAT. The ACLI agreed to develop an initial draft of VM-22 exemption language in 45 days. John Robinson (unaffiliated) said historically, there has been concern that payout annuities are under reserved. He suggested that Subgroup members keep that issue in mind when deciding whether and how to allow exemptions.

Having no further business, the VM-22 (A) Subgroup adjourned.

Commented [X2]: Note that part of the 2022 VM updates was to replace all instances of "stochastic reserve" with "SR" other than the initial definition in VM-01.

Section 1: Background

A. Purpose

~~Sections 1 through 13 of these requirements establish the minimum reserve valuation standard for non-variable annuity contracts as defined in Section 2.A and issued on or after 1/1/2024. Section 14 of these requirements establish the maximum valuation rate for payout annuities for contracts issued on or after 1/1/2018. For all contracts encompassed by the Scope, these requirements constitute the Commissioners Annuity Reserve Valuation Method (CARVM) and, for certain contracts and certificates, the Commissioners Reserve Valuation Method (CRVM).~~

Guidance Note: CRVM requirements apply to some group pension contracts.

B. Principles

The projection methodology used to calculate the ~~stochastic reserve~~SR is based on the following set of principles. These principles should be followed when interpreting and applying the methodology in these requirements and analyzing the resulting reserves.

Guidance Note: The principles should be considered in their entirety, and it is required that companies meet these principles with respect to those contracts that fall within the scope of these requirements and are in force as of the valuation date to which these requirements are applied.

Principle 1: The objective of the approach used to determine the ~~stochastic reserve~~SR is to quantify the amount of statutory reserves needed by the company to be able to meet contractual obligations in light of the risks to which the company is exposed with an element of conservatism consistent with statutory reporting objectives.

Principle 2: The calculation of the ~~stochastic reserve~~SR is based on the results derived from an analysis of asset and liability cash flows produced by the application of a stochastic cash-flow model to equity return and interest rate scenarios. For each scenario, the greatest present value of accumulated deficiency is calculated. The analysis reflects prudent estimate assumptions for deterministic variables and is performed in aggregate (subject to limitations related to contractual provisions) to allow the natural offset of risks within a given scenario. The methodology uses a projected total cash flow analysis by including all projected income, benefit, and expense items related to the business in the model and sets the ~~stochastic reserve~~SR at a degree of confidence using the CTE measure applied to the set of scenario specific greatest present values of accumulated deficiencies that is deemed to be reasonably conservative over the span of economic cycles.

Guidance Note: Examples where full aggregation between contracts may not be possible include experience rated group contracts and the operation of reinsurance treaties.

Principle 3: The implementation of a model involves decisions about the experience assumptions and the modeling techniques to be used in measuring the risks to which the

Commented [X3]: The proposal suggests VM-22 is not operative until 1/1/2024, which contradicts Section 13 and existing requirements. We would suggest rewording this to clarify that Section 13 is effective after 12/31/2017. Further, we would suggest consistency in labeling of dates (either all text or all numeric).

Commented [CD4]: might be clearer to refer to "Section 2.A" here

Commented [X5]: The statement only addresses "contracts". Recommend adding "and certificates". Need to do a holistic review if where "and certificates" may be needed.

Commented [X6]: (Relationship to RBC Requirements): The VM-21 guidance note was not included in VM-22; however, we believe it would be appropriate to retain and reword to say, "products that calculate a stochastic reserve", since the relationship to RBC would likely be maintained.

Commented [X7]: We would support consistent application of principles across all chapters as currently VM-20 does not have a like-set of principles. We believe this could involve a broader discussion of the assorted product requirements in the VM. As a shorter-term fix, we would recommend generalizing the principles where appropriate and moving these to "Section I. Introduction" or "VM-01" and equally applying to VM-20.

Commented [CD8]: for consistency, will this edit be considered for VM-21 as well?

Commented [X9]: We support this principle but note that later sections appear to contradict this principle. For example, the statement "The analysis reflects prudent estimate assumptions for deterministic variables and is performed in aggregate (subject to limitations related to contractual provisions) to allow the natural offset of risks within a given scenario." contradicts with the introduction of additional reserve categories and other limitations (such as model segment restrictions).

Commented [X10]: Principle 2: Recommend reinstating Guidance Note in Principle 2 to be consistent with VM-21.

company is exposed. Generally, assumptions are to be based on the conservative end of the confidence interval. The choice of a conservative estimate for each assumption may result in a distorted measure of the total risk. Conceptually, the choice of assumptions and the modeling decisions should be made so that the final result approximates what would be obtained for the ~~stochastic reserve~~SR at the required CTE level if it were possible to calculate results over the joint distribution of all future outcomes. In applying this concept to the actual calculation of the ~~stochastic reserve~~SR, the company should be guided by evolving practice and expanding knowledge base in the measurement and management of risk.

Guidance Note: The intent of Principle 3 is to describe the conceptual framework for setting assumptions. Section 10 provides the requirements and guidance for setting contract holder behavior assumptions and includes alternatives to this framework if the company is unable to fully apply this principle. More guidance and requirements for setting assumptions in general are provided in Section 12.

Commented [X11]: We suggest deleting the sentence "Generally, assumptions are..." since it does not provide guidance. We also suggest tightening the remainder of the text for clarity.

Commented [X12]: Need general assumption guidance section

Principle 4: While a stochastic cash-flow model attempts to include all real-world risks relevant to the objective of the stochastic cash-flow model and relationships among the risks, it will still contain limitations because it is only a model. The calculation of the ~~stochastic reserve~~SR is based on the results derived from the application of the stochastic cash-flow model to scenarios, while the actual statutory reserve needs of the company arise from the risks to which the company is (or will be) exposed in reality. Any disconnect between the model and reality should be reflected in setting prudent estimate assumptions to the extent not addressed by other means.

Principle 5: Neither a cash-flow scenario model ~~nor a method based on factors calibrated to the results of a cash-flow scenario model~~ can completely quantify a company's exposure to risk. A model attempts to represent reality but will always remain an approximation thereto and, hence, uncertainty in future experience is an important consideration when determining the ~~stochastic reserve~~SR. ~~Therefore, the use of assumptions, methods, models, risk management strategies (e.g., hedging), derivative instruments, structured investments or any other risk transfer arrangements (such as reinsurance) that serve solely to reduce the calculated stochastic reserve~~SR without also reducing risk on scenarios similar to those used in the actual cash-flow modeling are inconsistent with these principles. The use of assumptions and risk management strategies should be appropriate to the business and not merely constructed to exploit "foreknowledge" of the components of the required methodology.

Commented [X13]: Principle 5 has the statement "nor a method based on factors calibrated to the results of a cash flow scenario model" which is intended for the Alternative Methodology in VM-21. The statement should be deleted from VM-22.

Commented [X14]: We recommend deleting the third sentence (starting with "Therefore, the use of assumptions...") because this lacks historical context and is covered by the final sentence.

C. Risks Reflected

1. The risks reflected in the calculation of reserves under these requirements arise from actual or potential events or activities that are both:
 - a. Directly related to the contracts falling under the scope of these requirements or their supporting assets; and
 - b. Capable of materially affecting the reserve.

Commented [X15]: Consistent with our comments on 1.B, we would support consistent application of risks reflected across all chapters, rather than embedding the language in each chapter. Were this to be retained in VM-22, we would suggest maintaining consistency with VM-21 to avoid any confusion.

Commented [CD16]: VM-21 has "... and Risks Not Reflected" in this section header, which should be retained here since the section on risks not reflected is still in here.

2. Categories and examples of risks reflected in the reserve calculations include, but are not necessarily limited to:

a. Asset risks

- i. Credit risks (e.g., default or rating downgrades).
- ii. Commercial mortgage loan roll-over rates (roll-over of bullet loans).
- iii. Uncertainty in the timing or duration of asset cash flows (e.g., shortening (prepayment risk) and lengthening (extension risk)).
- iv. Performance of equities, real estate, and Schedule BA assets.
- v. Call risk on callable assets.
- vi. Separate account fund performance.
- vii. Risk associated with hedge instrument (includes basis, gap, price, parameter estimation risks, and variation in assumptions).
- viii. Currency risk.

Commented [CD17]: Can a non-variable annuity have a separate account fund? I am not aware of any such annuity, that is not a variable annuity. Furthermore, all references to separate accounts and fund performance were deleted from this draft. Thus, we should consider deleting this item from the list.

b. Liability risks

- i. Reinsurer default, impairment, or rating downgrade known to have occurred before or on the valuation date.
- ii. Mortality/longevity, persistency/lapse, partial withdrawal, and premium payment risks.
- iii. Utilization risk associated with guaranteed living benefits.
- iv. Anticipated mortality trends based on observed patterns of mortality improvement or deterioration, where permitted.
- v. Annuitization risks.
- vi. Additional premium dump-ins or deposits (high interest rate guarantees in low interest rate environments).
- vii. Applicable expense risks, including fluctuation in maintenance expenses directly attributable to the business, future commission expenses, and expense inflation/growth.

Commented [CD18]: Is there a distinction between "dump-ins" and "deposits"? Why are both words needed? Also, if it's determined that both words are needed, should this same change be made in VM-21?

Commented [X19]: Recommend change to "fluctuation in" maintenance expenses for clarity.

Commented [CD20]: should this same change also be made to VM-21?

c. Combination risks

- i. Risks modeled in the company's risk assessment processes that are related to the contracts, as described above.
- ii. Disintermediation risk (including such risk related to payment of surrender or partial withdrawal benefits).

Commented [X21]: We recommend removing the bullet "Risks modeled in the company's risk assessment processes that are related to the contracts, as described above" as this is unclear and probably extraneous.

iii. Risks associated with revenue-sharing income.

3. The risks not necessarily reflected in the calculation of reserves under these requirements are:

a. Those not associated with the policies or contracts being valued, or their supporting assets.

b. Determined to not be capable of materially affecting the reserve.

Commented [X22]: We recommend removing this section. With the specific RBC language removed, the section loses meaning: "a" is unnecessary and "b" is redundant with other sections of the VM which allow for materiality considerations (language in VM-20 is likely better for this purpose and should be used consistently).

Commented [CD23]: Suggest eliminated "policies or", since customarily, annuities are "contracts"

4. Categories and examples of risks not reflected in the reserve calculations include, but are not necessarily limited to:

a. Asset risks

i. Liquidity risks associated with a sudden and significant levels of withdrawals and surrenders; "run on the bank."

Commented [CD24]: This is not in VM-21, and my suggestion would be to delete this

Commented [X25]: Proposed revision is not appropriate. Item (a) is unnecessary, and items under (b) would be addressed via simplifications and thus are indirectly reflected. Recommend deleting the whole section 1.C.3 including item (a) and item (b).

b. Liability risks

i. Reinsurer default, impairment or rating downgrade occurring after the valuation date.

ii. Catastrophic events (e.g., epidemics or terrorist events).

iii. Major breakthroughs in life extension technology that have not yet fundamentally altered recently observed mortality experience.

iv. Significant future reserve increases as an unfavorable scenario is realized.

Commented [CD26]: should this same change also be made to VM-21?

Commented [X27]: The revised language "sudden and significant levels of withdrawal and surrenders" replaces the original language "run on the bank" and is less clear. Does "significant" mean severe or extreme? Or just appreciably? Withdraws and surrenders certainly may vary by projected economic scenarios. Recommend using the original language "run on the bank" that had a clearer intent.

c. General business risks

i. Deterioration of reputation.

ii. Future changes in anticipated experience (reparameterization in the case of stochastic processes), which would be triggered if and when adverse modeled outcomes were to actually occur.

iii. Poor management performance.

iv. The expense risks associated with fluctuating amounts of new business.

v. Risks associated with future economic viability of the company.

vi. Moral hazards.

vii. Fraud and theft.

viii. Operational.

ix. Litigation.

Commented [X28]: We recommend deleting the wording "fundamentally". If a breakthrough is known to have fundamentally changed expected future mortality, but is not yet significantly reflected in historical experience, why is it not reflected? Do we know about this fundamental shift for years before it is reflected? This issue also applies to the VM-21 requirement.

Commented [X29]: We recommend removing the bullet "Significant future reserve increases as an unfavorable scenario is realized" as this is extraneous.

Commented [X30]: List could be expanded to include operational risk and litigation risk.

D. Specific Definitions for VM-22

Buffer Annuity

Interchangeable term for Registered Index-Linked Annuity (RILA). See definition for Registered Index-Linked Annuity below.

• **Deferred Income Annuity (DIA)**

An annuity which guarantees a periodic payment for the life of the annuitant or a term certain and payments begin one year, 13 months or later after (or from) the issue date if the contract holder survives to a predetermined future age.

• **Fixed Indexed Annuity (FIA)**

An annuity with an account value where the contract holder has the option for a portion or all of the account value to grow at a rate linked to an external index, subject to certain limits, typically with guaranteed principal.

• **Flexible Premium Deferred Annuity (FPDA)**

An annuity with an account value established with a premium amount but allows for additional deposits to be paid into the annuity over time, resulting in an increase to the account value. The contract also has a guaranteed interest rate during the accumulation phase and has guaranteed mortality and interest rates applicable at the time of conversion to the payout phase.

• **Funding Agreement**

A contract issued to an institutional investor (domestic and international non-qualified fixed income investors) that provides fixed or floating interest rate guarantees.

• **Guaranteed Investment Contract (GIC)**

Insurance contract typically issued to a retirement plan (defined contribution) under which the insurer accepts a deposit (or series of deposits) from the purchaser and guarantees to pay a specified interest rate on the funds deposited during a specified period of time.

• **Index Credit Hedge Margin**

A margin capturing the risk of inefficiencies in the company's hedging program supporting index credits. This includes basis risk, persistency risk, and the risk associated with modeling decisions and simplifications. It also includes any uncertainty of costs associated with managing the hedging program and changes due to investment and management decisions.

• **Index Credit**

Any interest credit, multiplier, factor, bonus, charge reduction, or other enhancement to contract policy values that is linked to an index or indices. Amounts credited to the contract policy resulting from a floor on an index account are included.

Commented [X31]: It seems the definitions included in this section are largely only used for the purpose of establishing the Scope in Section 2. Since this is intended to be a principles-based methodology, recommend a strong definition of "Fixed Annuity" instead of specific products underneath this business. The first paragraph in A. Scope seems to provide this with specific references which are out of scope. If changing the scope section, we would suggest deleting the various product definitions if not used elsewhere; if these definitions are potentially applied beyond VM-22, we would suggest moving any necessary definitions to VM-01.

Commented [CD32]: The format of this Definitions section is inconsistent with other parts of the VM. In VM-01 and VM-21, each defined term is numbered, and is defined in this format (for example):
1. The term "buffer annuity" is interchangeable with the term "registered index-linked annuity (RILA)", as defined in Section 1.D.?

Commented [X33]: The term Buffer Annuity is not interchangeable to Registered Index-Linked Annuity (RILA) since Buffer Annuity is a subset of RILA. RILA can have different downside protections such as "Buffer" or "Floor". Recommend deleting Buffer Annuity or add descriptions for Buffer Annuity as a subtype in the RILA definition.

Commented [X34]: Suggest aligning the cut off to 13 months for alignment consistent with Actuarial Guideline IX, rather than the 1 year that currently is in the VM-22 draft.

Commented [X35]: The wording "after (or from)" the issue date used in the DIA and SPIA definitions is confusing. Recommend keeping it simple as "from" the issue date.

Commented [X36]: Is "typically" intended to be a requirement in the definition? That is, to qualify as FIA does there need to be guaranteed principle?

Commented [CD37]: insert: "subject to certain limits,"

Commented [X38]: The definition of FIA describes the account value as typically with guaranteed principal. Since FIA always has the guaranteed principal, recommend deleting the wording "typically".

Commented [CD39]: should be "contract"

Commented [CD40]: should be "contract"

- **Index Crediting Strategy**

The strategy defined in a contract to determine index credits for a contract. ~~This refers to~~For example, this may refer to underlying index, index parameters, date, timing, performance triggers, and other elements of the crediting method.

- **Index Parameter**

Cap, floor, participation rate, spreads, or other features describing how the contract utilizes the index.

Commented [X41]: We would suggest adding performance trigger to the list, along with other potential crediting methods; alternatively, the definition could specify that the crediting methods listed are examples only.

- **Longevity Reinsurance**

An agreement, typically a reinsurance arrangement covering one or more group or individual annuity contracts, under which an insurance company assumes the longevity risk associated with periodic payments made to specified annuitants under one or more immediate or deferred payout annuity contracts. A common example is participants in one or more underlying retirement plans.

Commented [X42]: The definition states that "Agreements which are not treated as reinsurance under Statement of Statutory Accounting Principles (SSAP) No. 61R are not included in this definition". Why is this the case and does this imply that longevity swaps are not within the scope of VM-22? Recommend adding to the out of scope list in "2.A. Scope" if that is the case. Clarification would also be helpful on what guidance should be used for these agreements if out of scope for VM-22. Further, we would suggest removing "typically" from the definition.

- Typically, the reinsurer pays a portion of the actual benefits due to the underlying annuitants (or, in some cases, a pre-agreed amount per annuitant), while the ceding insurance company retains the assets supporting the reinsured annuity payments and pays periodic, ongoing premiums to the reinsurer over the expected lifetime of benefits paid to the specified annuitants. Such agreements may contain net settlement provisions such that only one party makes ongoing cash payments in a particular period. Under these agreements, longevity risk may be transferred on either a permanent basis or for a prespecified period of time, and these agreements may or may not permit early termination.

Commented [VM2243R42]: Target resolving definition of longevity reinsurance prior to addressing NJ comment letter on using a potential net premium method

Commented [VM2244]: New Jersey comment letter: due to future premiums, longevity reinsurance may generate negative reserves, which can be used to eliminate or reduce other immediate annuity reserves. Suggest using net premium methodology, solving for a k-factor at issue to solve for $PV(\text{premiums}) = PV(\text{benefits})$.

- Agreements which are not treated as reinsurance under Statement of Statutory Accounting Principles (SSAP) No. 61R are not included in this definition. In particular, contracts under which payments are made based on the aggregate mortality experience of a population of lives which are not covered by an underlying group or individual annuity contract (e.g., mortality index-based longevity swaps) are not included in this definition.

Commented [VM2245R44]: Target resolving definition of longevity reinsurance prior to addressing NJ comment.

- **Market Value Adjustment (MVA) Annuity**

An annuity with an account value where withdrawals and full surrenders are subject to adjustments based on interest rates or index returns at the time of withdrawal/surrender. There could be ceilings and floors on the amount of the market-value adjustment.

- **Modified Guaranteed Annuity (MGA)**

A type of market-value adjusted annuity contract where the underlying assets are most commonly held in an insurance company separate account and the value of which are guaranteed if held for specified periods of time. The contract contains nonforfeiture values and death benefits that are based upon a market-value adjustment formula if held for shorter periods.

Commented [X46]: We recommend editing the definition as follows "A type of market-value adjusted annuity contract where the underlying assets are most commonly held in an insurance company separate account..."

Commented [X47]: To clarify definition of MGA, recommend adding "death benefits".

- **Multiple-Year Guaranteed Annuity (MYGA)**
 A type of fixed annuity that provides a pre-determined and contractually guaranteed interest rate for specified periods of time, after which there is typically an annual reset or renewal of a multiple year guarantee period.
- **Pension Risk Transfer (PRT) Annuity**
 An annuity, typically a group contract or reinsurance agreement, issued by an insurance company providing periodic payments to annuitants receiving immediate or deferred benefits from one or more retirement plans. Typically, the insurance company holds the assets supporting the benefits, which may be held in the general or separate account, and retains not only longevity risk but also asset risks (e.g., credit risk and reinvestment risk).
- **Registered Index-Linked Annuity (RILA)**
 An annuity with an account value where the contract holder has the option for a portion or all of the account value to grow at a rate linked to an external index, similar to a Fixed Indexed Annuity, but with downside risk exposure that may not guarantee full principal repayment. These contracts may include a cap on upside returns, and may also include a floor on downside returns which may be below zero percent.
- **Single Premium Immediate Annuity (SPIA)**
 An annuity purchased with a single premium amount which guarantees a periodic payment for the life of the annuitant or a term certain and payments begin within 13 months one year after (or from) the issue date issue date.
- **Single Premium Deferred Annuity (SPDA)**
 An annuity with an account value established with a single premium amount that grows with a guaranteed interest rate during the accumulation phase and has guaranteed mortality and interest rates applicable at the time of conversion to the payout phase. May also include cases where the premium is accepted for a limited amount of time early in the contract life, such as only in the first duration.
- **Stable Value Contract**
 A contract that provides limited investment guarantees, typically preserving principal while crediting steady, positive returns and protecting against losses or declines in yield. Underlying asset portfolios typically consist of fixed income securities, which may sit in the insurer's general account, a separate account, or in a third-party trust. These contracts often support defined contribution or defined benefit retirement plan liabilities.
- **Structured Settlement Contract (SSC)**
 A contract that provides periodic benefits and is purchased with a single premium amount stemming from various types of claims pertaining to court settlements or out-of-court settlements from tort actions arising from accidents, medical malpractice, and other causes. Adverse mortality is typically expected for these contracts.
- **Synthetic Guaranteed Investment Contract (Synthetic GIC)**

Commented [CD48]: should this be "Multi-Year" instead of "Multiple Year"? The former is the more commonly used term for MYGA

Commented [CD49]: "fixed annuity" is not defined. Is it better to change all instances of "fixed annuity" to "non-variable annuity" to be consistent with the terminology introduced in Section 1.A (and to be aligned with the actual VM-22 chapter name)? An alternative could be to add a definition for "fixed annuity", with the definition of it being a "non-variable annuity"

Commented [CD50]: ok to keep this as "multiple year"

Commented [X51]: Is "typically" intended to be a requirement in the definition? That is, to qualify as PRT must the insurance company have the asset risk? Consistent with the comment on Longevity Reinsurance, it would be helpful to clarify where a longevity swap contract falls within these definitions. Notably, index-based longevity swaps should be out of scope as they do not meet definition of "annuity contract" in SSAP 50. It should also be made explicit that PRT contracts can include lump sum benefits, death benefits and cash balance benefits as well.

Commented [X52]: It is unclear to us why RILA is defined in VM-22 when it is being used to exclude the product from VM-22 requirements.

Commented [X53]: If need to address Buffer Annuity (not sure this is needed), can add here as a subset of RILA.

Commented [X54]: Suggest aligning the cut off to 13 months for alignment consistent with Actuarial Guideline IX, rather than the 1 year that currently is in the VM-22 draft.

Commented [X55]: The wording "after (or from)" the issue date used in the DIA and SPIA definitions is confusing. Recommend keeping it simple as "from" the issue date.

Commented [X56]: Suggest striking sentence "Adverse mortality is typically expected for these contracts." from definition. Additionally, it is possible that there may be non-standard settlements.

Commented [CD57]: suggest spelling out GIC first, followed by the acronym

Contract that simulates the performance of a traditional GIC through a wrapper, swap, or other financial instruments, with the main difference being that the assets are owned by the contract policyholder or plan trust.

Commented [CD58]: should be "contract holder"

• **Term Certain Payout Annuity**

A contract issued, which offers guaranteed periodic payments for a specified period of time, not contingent upon mortality or morbidity of the annuitant.

• **Two-Tiered Annuity**

A deferred annuity with two tiers of account values. One, with a higher accumulation interest rate, is only available for annuitization or death. The other typically contains a lower accumulation interest rate, and is only available upon surrender.

The term "cash surrender value" means, for the purposes of these requirements, the amount available to the contract holder upon surrender of the contract. Generally, it is equal to the account value less any applicable surrender charges, where the surrender charge reflects the availability of any free partial surrender options. However, for contracts where all or a portion of the amount available to the contract holder upon surrender is subject to a market value adjustment, the cash surrender value shall reflect the market value adjustment consistent with the required treatment of the underlying assets. That is, the cash surrender value shall reflect any market value adjustments where the underlying assets are reported at market value, but it shall not reflect any market value adjustments where the underlying assets are reported at book value.

Commented [CD59]: this definition still applies, should we keep it?

The term "guaranteed minimum death benefit" (GMDB) means a provision (or provisions) for a guaranteed benefit payable on the death of a contract holder, annuitant, participant or insured where the amount payable is either (i) a minimum amount; or (ii) exceeds the minimum amount and is:

Commented [CD60]: this definition still applies, should we keep it?

- is increased by an amount that may be either specified by or computed from other policy or contract values; and

- has the potential to produce a contractual total amount payable on such death that exceeds the account value; or

- in the case of an annuity providing income payments, guarantees payment upon such death of an amount payable on death in addition to the continuation of any guaranteed income payments.

E. Materiality

The company shall establish a standard containing the criteria for determining whether an assumption, risk factor, or other element of the principle-based valuation has a material impact on the size of the reserve. This standard shall be applied when identifying material risks.

Commented [X61]: Add consistent with VM-21 Section 1.E, which was added to the 2022 VM.

Commented [X62]: Consistent with our comment in Section 1, the language around effective date should be clear this only applies to new PBR methodology, and rates in Section 13 have a different effective date.

Section 2: Scope and Effective Date

A. Scope

Subject to the requirements of ~~this Sections 1 to 13~~ of VM-22 are annuity contracts, certificates and contract features, whether group or individual, including both life contingent and term-certain-only, directly written or assumed through reinsurance issued on or after 1/1/2024, with the exception of contracts or benefits listed below.

Products out of scope include:

1. ~~Contracts or benefits that are subject to VM 21 (such as variable annuities, RILAs, buffer annuities, and structured annuities)~~
2. ~~GICs~~
3. ~~Synthetic GICs~~
4. ~~Stable Value Contracts~~
5. ~~Funding Agreements~~

Products in scope of VM-22 include ~~non-variable fixed annuities~~ which consist of, but are not limited to, the following ~~the~~ list:

▪ **Account Value Based Annuities**

1. Deferred Annuities (SPDA & FPDA)
2. Multi-Year Guarantee Annuities (MYGA)
3. Fixed Indexed Annuities (FIA)
4. Market Value Adjustments (MVA)
5. Two-tiered Annuities
6. Guarantees/Benefits/Riders on Non-Variable Fixed Annuity Contracts

▪ **Payout Annuities**

1. Single Premium Immediate Annuities (SPIA)
2. Deferred Income Annuities (DIA)
3. Term Certain Payout Annuities
4. Pension Risk Transfer Annuities (PRT)
5. Structured Settlement Contracts (SSC)
6. Longevity Reinsurance

Products out of scope include:

1. Contracts or benefits that are subject to VM-21 (such as variable annuities and RILAs)
2. GICs
3. Synthetic GICs
4. Stable Value Contracts
5. Funding Agreements

~~The company may elect to exclude one or more groups of contracts from the stochastic reserveSR calculation in certain situations, pursuant to the exclusion test requirements defined in Section 3.E of VM 22.~~

B. Effective Date & Transition

Effective Date

These requirements apply for valuation dates on or after January 1, 2024.

Commented [X63]: We would support reworking this section to rely on principles, rather than definitions to determine what is in and out of scope. As product innovation continues, a simple list may not appropriately accommodate the applicability of this chapter. However, if such a list is included, then we believe it should align with the full list presented in Section 13.

Commented [X64]: The reserving categories for VM-22 are not included in Scope. Recommend including the defined reserving categories in the section when outlining Scope.

Commented [VM2265R64]: See NY comment letter; supports option 1, with additional category for "other" for any other contract with supporting assets such that there is greater reinvestment and longevity risks, than disintermediation risk and other risks associated with policyholder behavior as of the valuation date.

Commented [VM2266R64]: See Equitable comment letter; supports full aggregation, but if choosing betwe ... [1]

Commented [CD67]: suggest numbering the paragraphs within this section

Commented [CD68]: suggest swapping the order of this section. That is, start with the "in scope" list, rather th ... [2]

Commented [X69]: Since buffer annuities are a subset of RILA, recommend deleting buffer annuities.

Commented [CD70]: this is not defined in the Definition section. should it be?

Commented [X71]: This needs to be revised to be in line with VM-21 Section 2.A. Consider removing "such as" ... [3]

Commented [CD72]: should this be "non-variable annuities" since that is term used in Section 1.A?

Commented [X73]: Typo. Delete extra "the".

Commented [CD74]: grammar - delete "the"

Commented [CD75]: should have space instead of dash

Commented [CD76]: delete the "s" and add "Annuities"

Commented [CD77]: should this be "Non-Variable Annuity"? Otherwise, should "Fixed Annuity" be defin ... [4]

Commented [CD78]: for consistency, make plural; i.e., change to "ies"

Commented [X79]: We suggest moving or deleting the sentence "The company may elect to exclude one or n ... [5]

Commented [CD80]: self-referencing "VM-22" is not necessary

Commented [X81]: Does this belong in Scope? Do these still follow the other VM-22 requirements (if the old V ... [6]

Commented [CD82]: again, suggest numbering the paragraphs within this section

Commented [X83]: We still have a question about whether RBC factors are still at an appropriate level, if ... [7]

Transition

A company may elect to establish minimum reserves pursuant to applicable requirements in VM-A and VM-C for business otherwise subject to VM-22 PBR requirements and issued during the first three years following the effective date of VM-22 PBR. If a company during the ~~three years~~ year transition period elects to apply VM-22 PBR to a block of such business, then a company must continue to apply the requirements of VM-22 PBR for future issues of this business. Irrespective of the transition date, a company shall apply VM-22 PBR requirements to applicable blocks of business on a prospective basis starting at least three years after the effective date.

Commented [X84]: Need to clarify what is meant by "VM-22 PBR Requirements". Add specific section references, or update proposal to have the PBR and non-PBR sections of this VM-22 draft in different chapters. After having reviewed, we think it would be much more clear to reconsider the use of "VM-23" for the PBR requirements to avoid ambiguity around scope/exclusions. The non-PBR sections also just don't seem to fit in this draft, and there is now ambiguity around whether other parts of VM-22 apply to them (scope, effective date, principles, etc.).

Commented [X85]: To be more clear, recommend adding "transition period" to "the three years".

Commented [X86]: Can a company wait until the end of the transition period to start PBR, but then apply PBR to the issues from during the transition period? This was unclear for VM-20, and still seems unclear here. Need to be explicit one way or the other.

Commented [CD87]: Will we (or should we) allow for any early adopters (like we did for VM-21)? It would seem reasonable to us to consider accommodating early adopters

Section 3: Reserve Methodology

A. Aggregate Reserve

The aggregate reserve for contracts falling within the scope of these requirements shall equal the ~~stochastic reserve~~SR (following the requirements of Section 4) ~~plus the additional standard projection amount (following the requirements of Section 6) plus the DR for those contracts satisfying the Deterministic Certification Option,~~ less any applicable PIMR for all contracts not valued under applicable requirements in VM-A and VM-C, plus the reserve for any contracts valued under applicable requirements in VM-A and VM-C.

Commented [X88]: Reinstate and modify later as needed - SPA being developed in separate workflow.

Commented [X89]: One of the most confused parts of the draft was referring to a DR as the SR for certain contracts. Need to handle and refer to separately.

Guidance Note: Contracts valued under applicable requirements in VM-A and VM-C are ones that pass the exclusion test and elect to not model PBR ~~stochastic reserves~~SRs, per the requirements in Section 3.E.

B. Impact of Reinsurance | ~~Ceded~~ |

All components in the aggregate reserve shall be determined post-reinsurance ceded, that is net of any reinsurance cash flows arising from treaties that meet the statutory requirements that allow the treaty to be accounted for as reinsurance. A pre-reinsurance ceded reserve also needs to be determined by ignoring all reinsurance cash flows (costs and benefits) in the reserve calculation.

Commented [X90]: Guidance is needed on how a pre-reinsurance reserve is to be determined.

~~C. To Be Determined~~The Additional Standard Projection Amount

D. The Stochastic Reserve

~~The stochastic reserve~~

The additional standard projection amount is determined by applying one of the two standard projection methods defined in Section 6. The same method must be used for all contracts within a group of contracts that are aggregated together to determine the reserve. The company shall elect which method they will use to determine the additional standard projection amount. The company may not change that election for a future valuation without the approval of the domiciliary commissioner.

Commented [X91]: Reinstate and modify later as needed - SPA being developed in separate workflow.

D. The SR

1. The SR shall be determined based on asset and liability projections for the contracts falling within the scope of these requirements, excluding those contracts valued using the methodology pursuant to applicable requirements in VM-A and VM-C, over a broad range of stochastically generated projection scenarios described in Section 8 and using prudent estimate assumptions as required in Section ~~3.GF~~ herein.
2. The ~~stochastic reserve~~SR amount for any group of contracts shall be determined as CTE70 of the scenario reserves following the requirements of Section 4, with the exception of groups of contracts for which a company elects the Deterministic Certification Option in Section 7.E, which shall be determined as the ~~scenario reserve~~DR following the requirements of Section 4.
3. The reserve may be determined in aggregate across various groups of contracts as a single model segment when determining the ~~stochastic reserve if the business and risks are not managed separately or are part of the same integrated risk management program. Aggregation is permitted if a resulting group of contracts (or model segment) follows the listed principles;~~SR

Commented [CD92]: Should this be Section 3.G?

Commented [X93]: Recommend replacing "the scenario reserve" with "the deterministic reserve". Note that we also disagree with calling the deterministic reserve a stochastic reserve (later in draft), which adds a good deal of confusion.

a. Aggregate in a manner that is consistent with the company's risk management strategy and reflects the likelihood of any change in risk offsets that could arise from shifts between product types, and

a.
b.

b. Using prudent actuarial judgement, consider the following elements when aggregating groups of contracts: whether groups of contracts are part of the same portfolio (or different portfolios that interact), same integrated risk management system, administered/managed together

4. Do not aggregate groups of contracts for which the company elects to use the Deterministic Certification Option in Section 7.E with any groups of contracts that do not use such option.

5.4. To the extent that these limits on the aggregation results results in more than one model segment, the stochastic reserve SR shall equal the sum of the stochastic reserve SR amounts computed for each model segment and scenario reserve DR amounts computed for each model segment for which the company elects to use the Deterministic Certification Option in Section 7.E.

E. Exclusion Test

1. To the extent that certain groups of contracts pass one of the defined the stochastic exclusion tests in Section 7.B, these groups of contracts may be valued using the methodology pursuant to applicable requirements in VM-A and VM-C, with the statutory maximum valuation rate for immediate annuities specified in Section 13.

a. For dividend-paying contracts, a dividend liability shall be established upon following requirements in VM-A and VM-C, as described above, for the base contract.

Guidance Note: The intention of contracts that pass the stochastic exclusion test is to provide the option to value contracts under VM-A and VM-C. This may apply to pre-PBR CARVM requirements in accordance with Actuarial Guideline XXXIII (AG33) methodology with type A, B, C rates for SPIAs issued before 2018; AG33 methodology with pre-PBR VM-22 rates for SPIAs issued on/after 2018; Actuarial Guideline XXXV (AG35) pre-PBR methodology for Fixed Indexed Annuities; and AG33 methodology (with interest rate updates for modernization initiatives on new contracts) for non-SPIAs.

2. The approach for grouping contracts company may not group together contract types with significantly different risk profiles when performing the exclusion tests should follow the same principles that underlie the aggregation approach for model segments discussed for Stochastic Reserves in Section D above test.

F. Allocation of the Aggregate Reserve to Contracts

The aggregate reserve shall be allocated to the contracts falling within the scope of these requirements using the method outlined in Section 4.2.1.3, with the exception of contract following Section 3.E which are to be calculated on a seriatim basis.

G. Prudent Estimate Assumptions:

1. With respect to the Stochastic Reserve SR in Section 3.D, the company shall establish the prudent estimate assumption for each risk factor in compliance with the requirements

Commented [X94]: As we have seen with VM-20, these types of extremely fuzzy requirements lead to full aggregation. If full aggregation is the intent, just explicitly allow it. We do recommend granular disclosures of the aggregation benefit for FIAs w/ GLBs, FIAs w/o GLBs, FDAs w/ GLBs, FDAs w/o GLBs, SPIAs, PRT, DIAs, and SSC.

Commented [VM2295R94]: In addition, consider NJ comment letter about longevity reinsurance, and how this fits into the above categories.

Commented [X96]: The term "Deterministic Certification Option" may be confusing, as there is no "deterministic" reserve, unlike VM-20. We recommend consideration of an alternative term. In addition, we recommend changing the phrasing to "with the exception of groups of contracts for which a company elects the [Deterministic Certification Option], following the requirements of Section 7.E."

Commented [X97]: Recommend replacing "the scenario reserve" with "the deterministic reserve". Note that we also disagree with calling the deterministic reserve a stochastic reserve (later in draft), which adds a good deal of confusion.

Commented [CD98]: suggest expanding header to "Stochastic Exclusion Test", for clarity

Commented [X99]: Seems to imply that only SPIAs would pass due to the linkage to Section 13. But the reference to interest rates should be broader, if even necessary. Suggest editing as:

"these groups of contracts may be valued using the methodology and statutory maximum valuation rate ... [8]"

Commented [CD100]: Suggest rewording to just say "the stochastic exclusion test". There is only 1 SET, with 3 ... [9]"

Commented [X101]: Typo. Delete for clarity.

Commented [X102]: We believe this guidance note is unnecessary as the intent of the section is clear, and ... [10]"

Commented [X103]: The statement in this section is not acceptable as discussed in the previous TX comment ... [11]"

Commented [X104]: This section seems to indicate that the grouping of contracts in exclusion testing should ... [12]"

Commented [CD105]: for clarity, change this reference to "Section 3.D"

Commented [CD106]: again, suggest rewording this to just say "the stochastic exclusion test"

Commented [X107]: Based on VM-20 language.

Commented [X108]: Either in this item or in Section 12 allocation to contracts not covered by PBR methodol ... [13]"

Commented [X109]: This sub-section seems more appropriate in Section 4 (or pulled out completely an ... [14]"

Commented [CD110]: VM-21 Section 3.H on simplifications, approximations, and modeling efficie ... [15]"

Commented [CD111]: should this be "Section 3.D"?

in Section 12 of Model #820 and must ~~periodically~~ at least every 3 years review and update the assumptions as appropriate in accordance with these requirements.

Commented [X112]: Recommend to periodically review at least every three years.

2. The qualified actuary, to whom responsibility for this group of contracts is assigned, shall annually review relevant emerging experience for the purpose of assessing the appropriateness of the anticipated experience assumption. If the results of ~~statistical testing or other testing~~ the review indicate that previously anticipated experience for a given factor is inadequate, then the ~~qualified actuary/Company~~ shall set a new, adequate, anticipated experience assumption for the factor.

Commented [CD113]: Should this be "the company... shall", rather than the "qualified actuary... shall"? Not sure why this particular task falls on the QA, when "the company" generally has responsibility for PBR and, in the subsection directly before this one, the company is assigned the task of establishing prudent estimate assumptions.

3. To determine the prudent estimate assumptions, the ~~stochastic reserve~~ SR shall also follow the requirements in Sections 4 and general assumptions including Section 9 for asset assumptions, Section 10 for ~~contract/policy holder~~ behavior assumptions, and Section 11 for mortality assumptions, and Section 12 for general guidance and expense assumptions.

Commented [X114]: Suggest replacing "If the results of statistical testing or other testing" with "If the results of the review" to simplify language and avoid possible confusion.

Commented [X115]: Recommend replacing "the qualified actuary" with "the Company" consistent with general PBR requirements that the company set assumptions.

H. A company may use simplifications, approximations, and modeling efficiency techniques to calculate the SR and/or the additional standard projection amount required by this section if the company can demonstrate that the use of such techniques does not understate the reserve by a material amount, and the expected value of the reserve calculated using simplifications, approximations, and modeling efficiency techniques is not less than the expected value of the reserve calculated that does not use them.

Commented [CD116]: should this be "the company"? See prior comment.

Commented [CD117]: should this be "contract holder"?

Commented [X118]: Need a new section for the general assumptions, including specifics for the expense assumptions. APF currently exposed for VM-21. We should be consistent with any edits.

Guidance Note:

Examples of modeling efficiency techniques include, but are not limited to:

1. Choosing a reduced set of scenarios from a larger set consistent with prescribed models and parameters.
2. Generating a smaller liability or asset model to represent the full seriatim model using grouping compression techniques or other similar simplifications.

There are multiple ways of providing the demonstration required by Section 3.H. The complexity of the demonstration depends upon the simplifications, approximations or modeling efficiency techniques used. Examples include, but are not limited to:

1. Rounding at a transactional level in a direction that is clearly and consistently conservative or is clearly and consistently unbiased with an obviously immaterial impact on the result (e.g., rounding to the nearest dollar) would satisfy 3.H without needing a demonstration. However, rounding to too few significant digits relative to the quantity being rounded, even in an unbiased way, may be material and in that event, the company may need to provide a demonstration that the rounding would not produce a material understatement of the reserve.
2. A brute force demonstration involves calculating the minimum reserve both with and without the simplification, approximation or modeling efficiency technique, and making a direct comparison between the resulting reserve. Regardless of the specific simplification, approximation or modeling efficiency technique used, brute force demonstrations always satisfy the requirements of Section 3.H.

3. Choosing a reduced set of scenarios from a larger set consistent with prescribed models and parameters and providing a detailed demonstration of why it did not understate the reserve by a material amount and the expected value of the reserve would not be less than the expected value of the reserve that would otherwise be calculated. This demonstration may be a theoretical, statistical or mathematical argument establishing, to the satisfaction of the insurance commissioner, general bounds on the potential deviation in the reserve estimate rather than a brute force demonstration.

4. Justify the use of randomly sampling withdrawal ages for each contract instead of following the exact prescribed WDCM method by demonstrating that the random sampling method is materially equivalent to the exact prescribed approach, and the simplification does not materially reduce the Additional Standard Projection Amount and the final reported reserve. In particular, the company should demonstrate that the statistical variability of the results based on the random sampling approach is immaterial by testing different random sets, e.g., if randomly selecting a withdrawal age for each contract, the probability distribution of the withdrawal age should be stable and not vary significantly when using different random number sets.

Commented [X119]: Specific example should be tailored based on the SPA developed.

Commented [X120]: Added consistent with VM-21 Section 3.H, which was added to the 2022 VM.

Section 4: Determination of ~~Stochastic Reserve~~SR

A. Projection of Accumulated Deficiencies

1. General Description of Projection

The projection of accumulated deficiencies shall be made ignoring federal income tax in both cash flows and discount rates, and it shall reflect the dynamics of the expected cash flows for the entire group of contracts, reflecting all product features, including any guarantees provided under the contracts using prudent estimate liability assumptions defined in Sections 10 and 11 and asset assumptions defined in ~~Sections 4 and 9.D~~. The company shall project cash flows including the following:

Commented [CD121]: Should this refer to Section 4 and Section 9?

a. ~~Revenues~~Gross premium received by the company including gross premiums received from the ~~policyholder~~ policyholder/contract holder (including any due premiums as of the projected start date).

Commented [CD122]: "contract holder"?

Commented [X123]: If due premium as of the projected start date is included in the modeling, the final reported reserve should be adjusted by adding the due premium, otherwise there would be a double counting of the due premium asset. This needs to be clarified - see guidance note added below.
Recommend specifying the revenue in this bullet to be gross premium since there are other revenue items that are discussed in other bullets.

Guidance Note: If due premiums are modeled, the final reported reserve needs to be adjusted by adding the due premium asset.

b. Other revenues, including contractual fees and charges, and revenue-sharing income received by the company (net of applicable expenses).

c. All material benefits projected to be paid to ~~contract~~ policyholders including, but not limited to, death claims, surrender benefits and withdrawal benefits—reflecting the impact of all guarantees and adjusted to take into account amounts projected to be charged to account values on general account business. Any guarantees, in addition to market value adjustments assessed on projected withdrawals or surrenders, shall be taken into account.

Commented [CD124]: "contract holders"

~~Guidance Note: Amounts charged to account values on general account business are not revenue; examples include rider charges and expense charges.~~

Commented [X125]: The purpose of this guidance note is not clear as these charges would be reflected in the cash flows.

~~a.d.~~ Non-Guaranteed Elements (NGE) cash flows as described in Section 10.14.

Commented [CD126]: should this be Section 10.1?

~~b.e.~~ Insurance company expenses (including overhead and investment maintenance expense), commissions, contractual fees and charges, and revenue-sharing income received by the company (net of applicable expenses) other acquisition expenses associated with business in force as of the valuation date.

Commented [X127]: Changed investment expense to be maintenance expense so that it does not repeat what is included in bullet h.
Commented [X128]: Added acquisition expenses.

~~e.f.~~ ~~Net~~Cash flows associated with any reinsurance.

Commented [X129]: Take out the revenues that covers the investment expenses and added a separate bullet under bullet "a" for other revenues.

~~e.g.~~ Cash flows from hedging instruments as described in Section 4.A.4.

Commented [CD130]: Both net and gross cash flows have to be considered, so I don't agree with the addition of "Net" here

e.h. Cash receipts or disbursements associated with invested assets (other than policy loans) as described in Section 4.D.4, including investment income, realized capital

gains and losses, principal repayments, asset default costs, investment expenses, asset prepayments, and asset sales.

- fi. If modeled explicitly, cash flows related to policy loans as described in Section 10.I.2, including interest income, new loan payments and principal repayments.

Guidance Note: Future net policy loan cash flows include: policy loan interest paid in cash plus repayments of policy loan principal, including repayments occurring at death or surrender (note that the future benefits in Section 4.A.1.b are before consideration of policy loans), less additional policy loan principal (but excluding policy loan interest that is added to the policy loan principal balance).

Guidance Note: Section 4.A.1 requires market value adjustments (MVAs) on liability cash flows to be reflected because in a cash flow model, assets are assumed to be liquidated at market value to cover the cash outflow of the cash surrender; therefore, inclusion of the market value adjustment aligns the asset and liability cash flows. This may differ from the treatment of MVAs in the definition of cash surrender value (Section 1.D), which defines the statutory reserve floor for which the values must be aligned with the annual statement value of the assets.

Commented [X131]: Guidance Note regarding the market value adjustment seems still applies and should not be deleted. We reinstated the guidance note.

2. Grouping of Index Crediting Strategies

Index crediting strategies for fixed indexed annuities may be grouped for modeling using an approach that recognizes the investment guidelines and objectives of each index crediting strategy. In assigning each index crediting strategy to a grouping for projection purposes, the fundamental characteristics of the index crediting strategy shall be reflected, and the parameters shall have the appropriate relationship to the stochastically generated projection scenarios described in Section 8. The grouping shall reflect characteristics of the efficient frontier (i.e., returns generally cannot be increased without assuming additional risk).

Commented [X132]: Suggest editing the first sentence to note scope is FIAs and to avoid confusion regarding the term “investment guideline” as follows: “Index crediting strategies for fixed indexed annuities may be grouped for modeling using an approach that recognizes the investment guidelines and objectives of each index crediting strategy.”

Index accounts sharing similar index crediting strategies may also be grouped for modeling to an appropriately crafted proxy strategy normally expressed as a linear combination of recognized market indices, sub-indices or funds, in order to develop the investment return paths and associated interest crediting. Each index crediting strategy’s specific risk characteristics, associated index parameters, and relationship to the stochastically generated scenarios in Section 8 should be considered before grouping or assigning to a proxy strategy. Grouping and/or development of a proxy strategy may not be done in a manner that intentionally understates the resulting reserve.

3. Model Cells

Projections may be performed for each contract in force on the date of valuation or by assigning contracts into representative cells of model plans using all characteristics and criteria having a material impact on the size of the reserve. Assigning contracts to model cells may not be done in a manner that intentionally understates the resulting reserve.

Commented [X133]: Given that Section 9 covers hedging, we would suggest considering moving parts of Section 4.A.4 to that section.

Commented [X134]: VM-22 took out the CDHS requirement and replaced it with “future hedging program”. Future hedging should not materially reduce reserves or TAR if it is not well documented. The hedging DG is currently working on this for VM-20/VM-21. We will work with VM-22 subgroup to edit VM-22 accordingly.

4. Modeling of Hedges

- a. For a company that does not have a future hedging program ~~hed directly to supporting~~ the contracts falling under the scope of VM-22 ~~stochastic reserve~~ SR requirements:
 - i. The company shall not consider the cash flows from any future hedge purchases or any rebalancing of existing hedge assets in its modeling.
 - ii. Existing hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the starting assets. ~~The hedge assets may then be considered in one of two ways:~~
 - a) ~~Include the asset cash flows from any contractual payments and maturity values in the projection model; or~~
 - b) ~~No hedge positions in which case the hedge positions held on the valuation date are replaced with cash and/or other general account assets in an amount equal to the aggregate market value of these hedge positions.~~

Commented [X135]: Suggest rewording "Future hedging program" to "hedging program with future transactions" to avoid ambiguity.

Commented [CD136]: The word "future" to describe the "hedging program" here is confusing. What about current hedging programs with expected future hedge purchases? Why not just say "hedging program"? Also, I wanted to note that removing the concept of CDHS creates inconsistency with both VM-20 and VM-21. Why not retain it?

Guidance Note: If the hedge positions held on the valuation date are replaced with cash, then as with any other cash, such amounts may then be invested following the company's investment strategy.

A company may switch from method a) to method b) at any time, but it may only change from b) to a) with the approval of the domiciliary commissioner.

- b. For a company that has a future hedging program ~~hed directly to supporting~~ the contracts falling under the scope of VM-22 ~~stochastic reserve~~ SR requirements:
 - i. For a hedging program with hedge payoffs that offset interest credits associated with indexed interest strategies (indexed interest credits):
 - a) In modeling cash flows, the company shall include the cash flows from future hedge purchases or any rebalancing of existing hedge assets that are intended solely to offset interest credits to ~~policyholders~~ contract holders.
 - b) Existing hedging instruments that are currently held by the company for ~~this purpose~~ offsetting the indexed credits in support of the contracts falling under the scope of these requirements shall be included in the starting assets. Existing hedging instruments that are currently held by the company ~~not for any other purpose~~ offsetting the indexed credits should be modeled consistently with the requirements of Section 4.A.4.a.ii.
 - c) An Index Credit Hedge Margin for these hedge instruments shall be reflected by reducing index interest credit hedge payoffs by a margin multiple that shall be justified by sufficient and credible company experience and be no less than [X%] multiplicatively of

Commented [CD137]: same comment as above, about the word "future" being confusing

Commented [CD138]: "contract holders"

Commented [X139]: "Any other purpose" in the last sentence seems overly broad and should be narrowed.

Commented [X140]: Specify "for this purpose" as "for offsetting the indexed credits", specify "for any other purposes" as "not for offsetting the indexed credits".

Commented [X141]: We believe the company should determine the appropriate margin based on their demonstration of effectiveness. Any guardrails on these undetermined values should be minimal, including as low as 0, subject to the appropriate demonstration of effectiveness. Further, we believe that documentation of effective product management should be contemplated in addition to historical effectiveness.

Commented [CD142]: clarify verbiage by saying "hedge instruments" or "derivative instruments"

the interest credited. In the absence of sufficient and credible company experience, a margin of [Y%] shall be assumed. There is no cap on the index credit hedge margin if company experience indicates actual error is greater than [Y%]. It is permissible to substitute stress-testing for sufficient and credible experience if such stress-testing comprehensively considers a robust range of future market conditions.

ii. For a company that hedges any contractual obligation or risks other than indexed interest credits, the detailed requirements for the modeling of hedges are defined in Section 9. The following requirements do not supersede the detailed requirements.

a) The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the projections used in the determination of the ~~stochastic reserve~~ SR.

b) The projections shall take into account the appropriate costs and benefits of hedge positions expected to be held in the future. Because models do not always accurately portray the results of hedge programs, the company shall, through back-testing and other means, assess the accuracy of the hedge modeling. The company shall determine a ~~stochastic reserve~~ SR as the weighted average of two CTE values; first, a CTE70 (“best efforts”) representing the company’s projection of all of the hedge cash flows, including future hedge purchases, and a second CTE70 (“adjusted”) which shall use only hedge assets held by the company on the valuation date and only future hedge purchases associated with indexed interest credited. These are discussed in greater detail in Section 9.

c) ~~Consistent with Section 4.A.4.b.i., if the company has an indexed credit hedging program, the index credit hedge margin for instruments associated with indexed interest credited shall be reflected by reducing hedge payoffs by a margin multiple as defined in Section 4.A.4.b.i.c); in both the “best efforts” run and the “adjusted” run.~~

d) The use of products not falling under the scope of ~~these~~ VM-22 PBR Section 1 through 13 requirements (e.g., variable annuities) (e.g., equity indexed annuities) as a hedge shall not be recognized in the determination of accumulated deficiencies.

Commented [X143]: It is not clear how the stress testing can be used to support the index credit hedge margin. It is a test of the modeled strategy not actual performance and does not reflect any model error. We suggest that both back testing and stress testing be required and elaborated further:
Clearly specify method and metrics used for the back testing with focus on all available recent relevant history, not limited to 12 months
Recommend defined stress periods for stress testing, e.g., 2008 financial crisis, 2020 COVID impaired market conditions.

Commented [X144R143]: We will repeat the comment from our first letter: “Regarding hedge breakage expense assumptions, are both sources of error reflected here - error in the hedging itself, and error in the ability to accurately model it? Should we be separately considering the two limitations to make sure they are both clear: 1) the real-world hedging error and 2) the modeling error in reflecting the future hedging? Current error factor discussions seem muddled.”

Commented [X145]: Again, need to coordinate with Hedging DG.

Commented [X146]: Margins are discussed in a different section, so recommend deleting.

Commented [X147]: Edits were made to provide context and clarification for the requirements.

Commented [X148]: Clarify that “these requirements” should be specified as “VM-22 PBR requirements”. Again, we suggest reconsidering the use of “VM-23”, though.

Commented [CD149]: it might be helpful to keep the parenthetical statement, with “variable annuities” as the example

Guidance Note: Section 4.A.4.b.i is intended to address common situations for products with index crediting strategies where the company only hedges index credits or clearly separates index credit hedging from other hedging. In this case the hedge positions are considered similarly to other fixed income assets supporting the contracts, and a margin is reflected rather than modeling using

a CTE70 adjusted run with no future hedge purchases. If a company has a more comprehensive hedge strategy combining index credits, guaranteed benefit, and other risks (e.g., full fair value or economic hedging), an appropriate and documented bifurcation method should be used in the application of sections 4.A.4.b.i and 4.A.4.b.ii above for the hedge modeling and justification. Such bifurcation methods may quantify the specific risk exposure attributable to index credit liabilities versus other liabilities such as guaranteed living benefits, and apply such for the basis for allocation.

Guidance Note: The requirements of Section 4.A.4 govern the determination of reserves for annuity contracts and do not supersede any statutes, laws or regulations of any state or jurisdiction related to the use of derivative instruments for hedging purposes and should not be used in determining whether a company is permitted to use such instruments in any state or jurisdiction.

5. Revenue Sharing

If applicable, projections of accumulated deficiencies may include income from projected future revenue sharing, net of applicable projected expenses (net revenue-sharing income) if each of the following requirements set forth in VM-21 Sections 4.A.5.a through 4.A.5.f are met.

Commented [X150]: Unclear why Revenue Sharing is considered for non-variable products, can probably delete.

6. Length of Projections

Projections of accumulated deficiencies shall be run for as many future years as needed so that no materially greater reserve value would result from longer projection periods. Obligations remain at the end of the projection periods. Company can choose to run a shorter projection period but not shorter than 20 years and include the present value of the terminal benefits and expenses in the accumulated deficiency calculation.

Commented [X151]: Clarify that for revenue sharing, the entire subsection of VM-21 Section 4.A.5 applies.

Commented [CD152]: The "requirements are met" list is only in Section 4.A.5.a. Was the intent also to define the amount of net revenue-sharing income allowed in the projections? If so, will need to add verbiage to reference VM-21 Section 4.A.5.a through 4.A.5.f.

7. Interest Maintenance Reserve (IMR)

The IMR shall be handled consistently with the treatment in the company's cash flow testing, and the amounts should be adjusted to a pre-tax basis.

Commented [X153]: We recommend that the projection period requirement be in line with that of VM-20. Instead of meeting the immateriality requirement, calculate the present value of the terminal benefits and expenses and include it in the accumulated deficiency calculation.

Commented [VM22154]: See Bill Wilton's comment letter, expressing opposition to inclusion of pre-tax IMR.

B. Determination of Scenario Reserve

1. For a given scenario, the scenario reserve shall be determined using one of two methods described below:

Commented [CD155]: should we consider these changes to VM-21 as well, for consistency?

Commented [X156]: Section does not specify what the reserve floor shall be (if any) for contracts without cash surrender value.

a) The starting asset amount plus the greatest present value, as of the projection start date, of the projected accumulated deficiencies; or

Guidance Note: The greatest present value of accumulated deficiencies can be negative.

b) The direct iteration method, where the scenario reserve is determined by solving for the amount of starting assets which, when projected along with all contract cash flows, result in the defeasement of all projected future benefits and expenses at the end of the projection horizon with no positive accumulated deficiencies at the end of any projection year during the projection period.

The scenario reserve for any given scenario shall not be less than the cash surrender value with market value adjustment in aggregate on the valuation date for the group of contracts modeled in the projection.

Commented [X157]: For products that do not have a cash surrender value, it is recommended that VM-22 use a “working reserve” concept, similar to VM-21 Section 3.G requirement. Otherwise, there will be an issue aggregating those with and without CSV.

2. Discount Rates

In determining the scenario reserve, unless using the direct iteration method pursuant to Section 4.B.1.b, the accumulated deficiencies shall be discounted at the NAER on additional assets, as defined in Section 4.B.3.

Commented [X158]: For products with market value adjustment, needs to be floored at cash surrender value with MVA.

3. Determination of NAER on Additional Invested Asset Portfolio

a. The additional invested asset portfolio for a scenario is a portfolio of general account assets as of the valuation date, outside of the starting asset portfolio, that is required in that projection scenario so that the projection would not have a positive accumulated deficiency at the end of any projection year. This portfolio may include only (i) General Account assets available to the company on the valuation date that do not constitute part of the starting asset portfolio; and (ii) cash assets.

Commented [X159]: We believe that assets held in the separate account with performance not impacting policyholder benefits should be modeled consistent with how the business is managed.

Guidance Note:

Additional invested assets should be selected in a manner such that if the starting asset portfolio were revised to include the additional invested assets, the projection would not be expected to experience any positive accumulated deficiencies at the end of any projection year.

It is assumed that the accumulated deficiencies for this scenario projection are known.

- b. To determine the NAER on additional invested assets for a given scenario:
 - i. Project the additional invested asset portfolio as of the valuation date to the end of the projection period,
 - a) Investing any cash in the portfolio and reinvesting all investment proceeds using the company’s investment policy.
 - b) Excluding any liability cash flows.
 - c) Incorporating the appropriate returns, defaults and investment expenses for the given scenario.
 - ii. If the value of the projected additional invested asset portfolio does not equal or exceed the accumulated deficiencies at the end of each projection year for the scenario, increase the size of the initial additional invested asset portfolio as of the valuation date, and repeat the preceding step.
 - iii. Determine a vector of annual earned rates that replicates the growth in the additional invested asset portfolio from the valuation date to the end of the

projection period for the scenario. This vector will be the NAER for the given scenario.

- iv. If the depletion of assets within the projection results in an unreasonably high negative NAER upon borrowing, the NAER may be set to the assumed cost of borrowing associated with each projected time period, in accordance with Section 4.D.3.c, as a safe harbor.

Guidance Note: There are multiple ways to select the additional invested asset portfolio at the valuation date. Similarly, there are multiple ways to determine the earned rate vector. The company shall be consistent in its choice of methods, from one valuation to the next.

Commented [X160]: The wording “unreasonably high” is not clear or appropriate. Recommend this requirement be revised as part of a holistic fix to address extreme outliers in NAER both on the low and high side to handle anomalies for all of VM-20, VM-21, and VM-22. Some upper/lower cutoffs could be used that depend on scenario returns.

Commented [CD161]: “unreasonably high” is not well defined. Also, do we need to consider guardrails in the case of “unreasonably high” positive NAERs, not just negative NAERs?

C. Projection Scenarios

1. Number of Scenarios

The number of scenarios for which the scenario reserve shall be computed shall be the responsibility of the company, and it shall be considered to be sufficient if any resulting understatement in the ~~stochastic reserve~~ SR, as compared with that resulting from running additional scenarios, is not material.

2. Economic Scenario Generation

Treasury Department interest rate curves, as well as investment return paths for index funds, equities, and fixed income assets shall be determined on a stochastic basis using the methodology described in Section 8. If the company uses a proprietary generator to develop scenarios, the company shall demonstrate that the resulting scenarios meet the requirements described in Section 8.

D. Projection of Assets

1. Starting Asset Amount

- a. For the projections of accumulated deficiencies, the value of assets at the start of the projection shall be set equal to the approximate value of statutory reserves at the start of the projection plus the allocated amount of PIMR attributable to the assets selected. Assets shall be valued consistently with their annual statement values. The amount of such asset values shall equal the sum of the following items, all as of the start of the projection:

- i. Any hedge instruments held in support of the contracts being valued; and
- ii. An amount of assets held in the general account equal to the approximate value of statutory reserves as of the start of the projections less the amount in (i).

- b. If the amount of initial general account assets is negative, the model should reflect a projected interest expense. General account assets chosen for use as described

above shall be selected on a consistent basis from one reserve valuation hereunder to the next.

2. Valuation of Projected Assets

For purposes of determining the projected accumulated deficiencies, the value of projected assets shall be determined in a manner consistent with their value at the start of the projection. For assets assumed to be purchased during a projection, the value shall be determined in a manner consistent with the value of assets at the start of the projection that have similar investment characteristics. However, for derivative instruments that are used in hedging and are not assumed to be sold during a particular projection interval, the company may account for them at an amortized cost in an appropriate manner elected by the company.

Guidance Note: Accounting for hedge assets should recognize any methodology prescribed by a company’s state of domicile.

3. General Account Assets

- a. General account assets shall be projected, net of projected defaults, using assumed investment returns consistent with their book value and expected to be realized in future periods as of the date of valuation. Initial assets that mature during the projection and positive cash flows projected for future periods shall be invested in a manner that is representative of and consistent with the company’s investment policy, subject to the following requirements:
 - i. The final maturities and cash flow structures of assets purchased in the model, such as the patterns of gross investment income and principal repayments or a fixed or floating rate interest basis, shall be determined by the company as part of the model representation;
 - ii. The combination of price and structure for fixed income investments and derivative instruments associated with fixed income investments shall appropriately reflect the projected Treasury Department curve along the relevant scenario and the requirements for gross asset spread assumptions stated below;
 - iii. For purchases of public non-callable corporate bonds, follow the requirements defined in VM-20 Sections 7.E, 7.F and 9.F. The prescribed spreads reflect current market conditions as of the model start date and grade to long-term conditions based on historical data at the start of projection year four;
 - iv. For transactions of derivative instruments associated with fixed income investments, reflect the prescribed assumptions in VM-20 Section 9.F for interest rate swap spreads;
 - v. For purchases of other fixed income investments, if included in ~~the model~~modeled company investment strategy, set assumed gross asset spreads over U.S. Treasuries in a manner that is consistent with, and results

Commented [X162]: This change was adopted for VM-20 and VM-21 for the 2022 VM.

in reasonable relationships to, the prescribed spreads for public non-callable corporate bonds and interest rate swaps.

- b. Notwithstanding the above requirements, the ~~model aggregate reserve shall be the higher of that produced by the modeled company investment strategy and any non-prescribed asset spreads shall be adjusted as necessary so that the aggregate reserve is not less than that which would be obtained produced~~ by substituting an alternative investment strategy in which all the fixed income reinvestment assets ~~are~~ have the same weighted average life (WAL) as the reinvestment assets in the modeled company investment strategy and are all public non-callable corporate bonds with gross asset spreads, asset default costs, and investment expenses by projection year that are consistent with a credit quality blend of:
 - i. ~~5% Treasury~~
 - ii. ~~15~~ 20% PBR credit rating 3 (Aa2/AA)
 - iii. ~~40~~ 80% PBR credit rating 6 (A2/A)
 - iv. ~~40~~ 40% PBR credit rating 9 (Baa/BBB)

Commented [CD163]: should this be "stochastic reserve", since this is within Section 4: Determination of Stochastic Reserve

Commented [X164]: This change was adopted for VM-20 and VM-21 for the 2022 VM.

Commented [CD165]: Suggest making this plural ("Treasuries") to be consistent with Section 13.B.9

- c. Any disinvestment shall be modeled in a manner that is consistent with the company's investment policy and that reflects the company's cost of borrowing where applicable, provided that the assumed cost of borrowing is not lower than the rate at which positive cash flows are reinvested in the same time period, taking into account duration, ratings, and other attributes of the borrowing mechanism. Gross asset spreads used in computing market values of assets sold in the model shall be consistent with, but not necessarily the same as, the gross asset spreads in Section 4.D.4.a.iii and Section 4.D.4.a.iv, recognizing that initial assets that mature during the projection may have different characteristics than modeled reinvestment assets.

Commented [X166]: The proposed reinvestment mix comes from a different assumption context in current VM-22, i.e., it is designed to calculate the maximum allowed valuation interest rates, while the reinvestment mix for VM-22 PBR draft is to put a guardrail around the fixed income reinvestment assets. A guardrail is not intended to identify outliers and should not be tied to an average. The biggest concern is with the higher allocation percentage in BBB assets. The valuation manual should build an appropriate level of conservatism in the valuation standards instead of reflecting industry trends. By moving from VM-20 and VM-21 required mix of 50%/50% AA/A to the proposed mix, the gross spreads increased by 20-30 bps for almost all WAL. We do not object to using a lower credit quality guardrail to get rid of any excessive conservatism. We recommend considering and comparing with other alternative allocations, something between the current and the proposed, e.g., 20% AA and 80% A. This will help regulators make informed decisions. In any case, we should be consistent with VM-20 and VM-21. If a change is made, it needs to be for all three.

Commented [CD167]: These references should be Section 4.D.3.a.iii and 4.D.3.a.v

Guidance Note: This limitation is being referred to Life Actuarial (A) Task Force for review. The simple language above "provided that the assumed cost of borrowing is not lower than the rate at which positive cash flows are reinvested in the same time period" is not intended to impose a literal requirement. It is intended to reflect a general concept to prevent excessively optimistic borrowing assumptions. It is recognized that borrowing parameters and rules can be complicated, such that modeling limitations may not allow for literal compliance, in every time step, as long as the reserve is not materially affected. However, if the company is unable to fully apply this restriction, prudence dictates that a company shall not allow borrowing assumptions to materially reduce the reserve.

4. Cash Flows from Invested Assets

- a. Cash flows from general account fixed income assets, including starting and reinvestment assets, shall be reflected in the projection as follows:

- i. Model gross investment income and principal repayments in accordance with the contractual provisions of each asset and in a manner consistent with each scenario.
 - ii. Reflect asset default costs as prescribed in VM-20 Section 9.F and anticipated investment expenses through deductions to the gross investment income.
 - iii. Model the proceeds arising from modeled asset sales and determine the portion representing any realized capital gains and losses.
 - iv. Reflect any uncertainty in the timing and amounts of asset cash flows related to the paths of interest rates, equity returns or other economic values directly in the projection of asset cash flows. Asset defaults are not subject to this requirement, since asset default assumptions must be determined by the prescribed method in VM-20 Sections 7.E, 7.F and 9.F, as noted in 4.a.ii above.
- b. ~~Cash flows from general account index funds and general account equity assets—~~ i.e., non-fixed income assets having substantial volatility of returns, such as common stocks and real estate— including starting and reinvestment assets, shall be reflected in the projection as follows:
- i. Determine the grouping for asset categories and the allocation of specific assets to each category in a manner that is consistent with that used for index crediting strategies, as discussed in Section 4.A.2.
 - ii. Project the gross investment return including realized and unrealized capital gains in a manner that is consistent with the stochastically generated scenarios.
 - iii. Model the timing of an asset sale in a manner that is consistent with the investment policy of the company for that type of asset. Reflect expenses through a deduction to the gross investment return using prudent estimate assumptions.
- c. Cash flows for each projection interval for policy loan assets shall follow the requirements in Section ~~10.HI~~.

Commented [X168]: Correct an inaccurate VM section reference. The prescribed asset default spreads assumption should be referred to VM-20 Section 9.F. VM-20 Section 7.E and 7.F are requirements for reinvestment assets, disinvestment and cash flows for invested assets. In 7.F, VM-20 just refers to 9.F for defaults.

Commented [X169]: Request clarification around the meaning of "general account index funds".

Commented [CD170]: should this reference Section 10.H?

Commented [CD171]: is there a difference between "purchase rates" and "payout rates"? Both terms are used, so that makes the language unclear. If they are they same, suggest sticking with "purchase rates".

Commented [X172]: Suggest deleting "In contrast, for payouts specified at issue, the payout rates modeled should be consistent with those specified in the contract." as it appears to be covered by E.1.a.

Commented [X173]: Reinstate the parenthetical content "(including annuitizations stemming from the election of a GMIB)" since there are GMIB riders attached to fixed annuity products.

E. Projection of Annuitization Benefits

1. Assumed Annuitization Purchase Rates

- a. For payouts specified at issue (such as single premium immediate annuities, deferred income annuities, and certain structured settlements), such ~~purchase~~ ~~rates~~ shall reflect the payout rate specified in the contract.
- b. ~~For~~ purposes of projecting future elective annuitization benefits ~~(including annuitizations stemming from the election of a GMIB)~~ and withdrawal amounts from GMWBs, the projected annuitization purchase rates shall be determined

assuming that market interest rates available at the time of election are the interest rates used to project general account assets, as determined in Section 4.D.4. ~~In contrast, for payouts specified at issue, the payout rates modeled should be consistent with those specified in the contract.~~

Commented [X174]: Delete sentence since it repeats 4.E.1.a.

2. Projected Election of GMIBs, GMWBs and Other Annuitization Options

- a. For contracts projected to elect future annuitization options (including annuitizations stemming from the election of a GMIB) or for projections of GMWB benefits once the account value has been depleted, the projections ~~may~~ shall assume the contract will stay in force, the projected periodic payments are paid, and the associated maintenance expenses are incurred.

Commented [X175]: Suggest deleting "may" as there appears to be only option.

F. Frequency of Projection and Time Horizon

- 1. Use of an annual cash-flow frequency ("timestep") is generally acceptable for benefits/features that are not sensitive to projection frequency. The lack of sensitivity to projection frequency should be validated by testing wherein the company should determine that the use of a more frequent—i.e., shorter—time step does not materially increase reserves. A more frequent time increment should always be used when the product features are sensitive to projection period frequency.

Commented [X176]: Projection Period is already covered in 4.A.6. Should not be in two places with different guidance.

Care must be taken in simulating fee income and expenses when using an annual time step. ~~For example, recognizing fee income at the end of each period after market movements, but prior to persistency decrements, would normally be an inappropriate assumption. It is also important that the frequency of the investment return model be linked appropriately to the projection horizon in the liability model. In particular, the horizon should be sufficiently long so as to capture the vast majority of costs (on a present value basis) from the scenarios.~~

Commented [X177]: Reinstate the deleted example of "For example, recognizing fee income at the end of each period after market movements, but prior to persistency decrements, would normally be an inappropriate assumption."

Guidance Note: As a general guide, the forecast horizon should not be less than 20 years.

G. Compliance with ASOPs

When determining a stochastic reserve SR, the analysis shall conform to the ASOPs as promulgated from time to time by the ASB.

Under these requirements, an actuary will make various determinations, verifications and certifications. The company shall provide the actuary with the necessary information sufficient to permit the actuary to fulfill the responsibilities set forth in these requirements and responsibilities arising from each applicable ASOP.

Section 5: Reinsurance Ceded and Assumed

A. Treatment of Reinsurance Ceded in the Aggregate Reserve

1. Aggregate Reserve Pre- and Post-Reinsurance Ceded

As noted in Section 3.B, the aggregate reserve is determined both pre-reinsurance ceded and post-reinsurance ceded—i.e., the stochastic reserve additional standard projection amount, the SR, DR, and/or the reserve amount valued using requirements in VM-A and VM-C, as applicable—on both bases. Sections 5.A.2 and 5.A.3 discuss adjustments to inputs necessary to determine these components on both a post-reinsurance ceded and a pre-reinsurance ceded basis. Note that due allowance for reasonable approximations may be used where appropriate.

2. Stochastic Reserve

Reflection of Reinsurance Cash Flows in the DR or SR

- a. In order to determine the aggregate reserve post-reinsurance ceded, accumulated deficiencies, scenario reserves, and the resulting stochastic reserve SR and DR shall be determined reflecting the effects of reinsurance treaties that meet the statutory requirements that would allow the treaty to be accounted for as reinsurance within statutory accounting. This involves including, where appropriate, all projected reinsurance premiums or other costs and all reinsurance recoveries, where the reinsurance cash flows reflect all the provisions in the reinsurance agreement, using prudent estimate assumptions.
 - i. In this section, reinsurance includes retrocession, and assuming company includes retrocessionaire.
 - ii. All significant terms and provisions within reinsurance treaties shall be reflected. In addition, it shall be assumed that each party is knowledgeable about the treaty provisions and will exercise them to their advantage.

Guidance Note: Renegotiation of the treaty upon the expiration of an experience refund provision or at any other time shall not be assumed if such would be beneficial to the company and not beneficial to the counterparty. This is applicable to both the ceding party and assuming party within a reinsurance arrangement.

iii. If the company has knowledge that a counterparty is financially impaired, the company shall establish a margin for the risk of default by the counterparty. In the absence of knowledge that the counterparty is financially impaired, the company is not required to establish a margin for the risk of default by the counterparty.

iv. A company shall include the cash flows from a reinsurance agreement or amendment in calculating the stochastic aggregate reserve if such qualifies for credit in compliance with Appendix A-791 of the Accounting Practices and Procedures Manual. If a reinsurance agreement or amendment does not qualify for credit for reinsurance but treating the reinsurance agreement or amendment as if it did so qualify would result in a reduction to the company's surplus, then the company shall increase the minimum aggregate reserve by the absolute value of such reductions in surplus.

Commented [X178]: The wording and titling may need to be tightened due to clarify which items apply to assumed and ceded reinsurance in the text.

Commented [X179]: Delete and just have title be "Reinsurance". Should structure be more like VM-20?

Commented [X180R179]: I, II (and III –VM-21 needs edits)

Commented [CD181]: "and Assumed" is added here, but there is still only a subsection 5.A that addresses reinsurance ceded (at least in the section header).

Commented [CD182]: need to add "and Assumed" here?

Commented [X183]: reinstate

Commented [X184]: Can take out vague approximation references, since now have a general allowance for appropriate approximations.

Commented [X185]: Consistent with VM-20

Commented [X186]: VM-20 Section 8.A.1 makes sense here as well.

Commented [CD187]: should this be "stochastic reserve"?

Commented [X188]: VM-22 draft so far uses aggregate, not minimum.

- b. In order to determine the ~~stochastic reserve~~ SR and DR on a pre-reinsurance ceded basis, accumulated deficiencies, scenario reserves, and the resulting ~~stochastic reserve~~ SR and DR shall be determined ignoring the effects of reinsurance ceded within the projections. Different approaches may be used to determine the starting assets on the ceded portion of the contracts, dependent upon the characteristics of a given treaty:
 - i. For a standard coinsurance treaty, where the assets supporting the ceded liabilities were transferred to the assuming reinsurer, one acceptable approach involves a projection based on using starting assets on the ceded portion of the policies that are similar to those supporting the retained portion of the ceded policies or supporting similar types of policies. Scaling up each asset supporting the retained portion of the contract is also an acceptable method.

Guidance Note: For standard pro rata insurance treaties ~~(does that do not include experience refunds)~~, where allocated expenses are similar to the renewal expense allowance, reflecting the quota share applied to the present value of future reinsurance cash flows pertaining to the reinsured block of business may be considered as a possible approach to determine the ceded reserves.

Commented [X189]: Correct phrasing.

- ii. Alternatively, a treaty may contain an identifiable portfolio of assets associated with the ceded liabilities. This could be the case for several forms of reinsurance: funds withheld coinsurance; modified coinsurance; coinsurance with a trust. To the extent these assets would be available to the cedant, an acceptable approach could involve modeling this portfolio of assets. To the extent that these assets were insufficient to defease the ceded liabilities, the modeling would partially default to the approach discussed for a standard coinsurance treaty. To the extent these assets exceeded what might be needed to defease the ceded liabilities (perhaps an over collateralization requirement in a trust), the inclusion of such assets shall be limited.

Guidance Note: Section 3.5.2 in ASOP No. 52, *Principle-Based Reserves for Life Products under the NAIC Valuation Manual*, provides possible methods for constructing a hypothetical pre-reinsurance asset portfolio, if necessary, for purposes of the pre-reinsurance reserve calculation.

- c. An assuming company shall use assumptions to project cash flows to and from ceding companies that reflect the assuming company’s experience for the business segment to which the reinsured policies belong and reflect the terms of the reinsurance agreement.
- d. The company shall assume that the counterparties to a reinsurance agreement are knowledgeable about the contingencies involved in the agreement and likely to exercise the terms of the agreement to their respective advantage, taking into account the context of the agreement in the entire economic relationship between the parties. In setting assumptions for the NGE in reinsurance cash flows, the company shall include, but not be limited to, the following:
 - i. The usual and customary practices associated with such agreements.
 - ii. Past practices by the parties concerning the changing of terms, in an economic environment similar to that projected.
 - iii. Any limits placed upon either party’s ability to exercise contractual options in the reinsurance agreement.
 - iv. The ability of the direct-writing company to modify the terms of its policies in response to changes in reinsurance terms.
 - v. Actions that might be taken by a party if the counterparty is in financial difficulty.

Commented [X190]: VM-20 Section 8.C.7 seems particularly applicable. We encourage others to also review VM-20 Section 8 for other sections that should also apply. VM-20 Section 8 is much more developed than VM-21 Section 5 with many more considerations for assumption-setting, and we would suggest the VM-22 subgroup consider rewriting starting with VM-20 instead of VM-21.

3. Reserve Determined Upon Passing the Exclusion Test

If a company passes the stochastic exclusion test and elects to use a methodology pursuant to applicable Sections VM-A and VM-C, as allowed in Section 3.E, it is important to note that the methodology produces reserves on a pre-reinsurance ceded basis. Therefore, the reserve must be adjusted for any reinsurance ceded accordingly. In addition, reserves valued under applicable Sections in VM-A and VM-C, unadjusted for reinsurance, shall be applied to the contracts falling under the scope of these requirements to determine the aggregate reserve prior to reinsurance.

It should be noted that the ~~pre-reinsurance-ceded~~ and ~~post-reinsurance-ceded~~ reserves may result in different outcomes for the exclusion test. In particular, it is possible that the ~~pre-reinsurance-ceded~~ reserves would pass the relevant exclusion test (and allow the use of VM-A and VM-C) while the ~~post-reinsurance-ceded~~ reserves might not, or vice versa.

Commented [X191]: Both referring to reinsurance ceded. Should be clarified.

Commented [X192]: ceded

Commented [X193]: ceded

Commented [X194]: Opposite could also be true.

4. Additional Standard Projection Amount

Where reinsurance is ceded, the additional standard projection amount shall be calculated as described in Section 6 to reflect the reinsurance costs and reinsurance recoveries under the reinsurance treaties. The additional standard projection amount shall also be calculated pre-reinsurance ceded using the methods described in Section 6 but ignoring the effects of the reinsurance ceded.

Commented [X195]: The current VM-21 language here looks to work for VM-22 without needing to know the specific assumptions, etc., for the SPA.

Section 6: To Be Determined

Commented [VM22196]: NY Comment Letter: Current CARVM standards should be a minimum floor for VM-22 policies, and only the stochastic reserve should permit grouping whereas the minimum floor should be seriatim.

Commented [X197]: SPA Section placement here still makes sense, but SPA under development.

Commented [VM22198]: Refer to equitable comment letter, which expresses support for the standard projection amount as a binding floor, with the suggestion to rely on company-specific assumptions for insignificant assumptions that are difficult to develop.

~~Section 6: To Be Determined~~

Section 7: Exclusion Testing

A. Stochastic Exclusion Test Requirement Overview

1. The company may elect to exclude one or more groups of contracts from the stochastic reserve SR calculation if the stochastic exclusion test (SET) is satisfied for ~~that each of the group of contracts~~. The company has the option to calculate or not calculate the SET.
 - a. If the company does not elect to calculate the SET for one or more groups of contracts, or the company calculates the SET and fails the test for such groups of contracts, the reserve methodology described in Section 4 shall be used for calculating the aggregate reserve for those groups of contracts.
 - b. If the company elects to calculate the SET for one or more groups of contracts, and passes the test for such groups of contracts, then for each group of contracts that passes the SET, the company shall choose whether or not to use the reserve methodology described in Section 4 for ~~those groups that group of contracts~~. If the reserve methodology described in Section 4 is not used for one or more groups of contracts, then the company shall use the reserve methodology pursuant to applicable requirements in VM-A and VM-C ~~to calculate the aggregate reserve for those groups of contracts~~.
 - c. A company may not exclude a group of contracts from the stochastic reserve SR requirements if there are one or more future hedging programs ~~associated with supporting~~ the contracts, with the exception of hedging programs solely supporting index credits as described in Section 9.A.1.

Commented [X199]: Need to modify exclusion testing section to reflect SPA.

Commented [X200]: Inconsistent groups vs. group references.

Commented [CD201]: should this be "stochastic reserve", since Section 4 is about determining the stochastic reserve.

Commented [VM22202R201]: Follow Section 4 method of stochastic reserve for Section 3 aggregate reserve if not using the SET

Commented [X203]: Decision is independent for each group the SET is performed on.

Commented [CD204]: suggest deleting this highlighted part of the sentence

Commented [CD205]: see earlier comment about the phrase "future hedge program" being confusing.

Commented [X206]: Is "associated with the contracts" the same as the earlier use of "supporting the contracts"? Should the same verbiage be used here? If there is asset hedging for the assets supporting the contracts, it should be included. Need to define "solely supporting" index credits, and also have criteria on the effectiveness/error and documentation of any such hedging that is allowed for excluded business.

B. Requirement to Pass the ~~Types of~~ Stochastic Exclusion Tests

Groups of contracts pass the SET if one of the following is met:

1. Stochastic Exclusion Ratio Test (SERT)—Annually within 12 months before the valuation date ~~within 12 months before the valuation date~~ the company demonstrates that the groups of contracts pass the SERT defined in Section 7.C.
2. Stochastic Exclusion Demonstration Test—In the first year and at least once every three calendar years thereafter, the company provides a demonstration in the PBR Actuarial Report as specified in Section 7.D.
3. ~~SET~~ Certification Method—For groups of contracts that do not have guaranteed living benefits, ~~future hedging programs, or pension risk transfer business~~, in the first year and at least every third calendar year thereafter, the company provides a certification by a qualified actuary that the group of contracts is not subject to material ~~aggregate risk levels across interest rate risk, mortality and/or longevity risk, or asset return volatility risk~~ (i.e., the risk on non-fixed-income investments having substantial volatility of returns, such as common stocks and real estate investments). ~~The company shall provide the certification and documentation supporting the certification to the commissioner upon request.~~

Commented [CD207]: Suggest renaming this section header/name to "Requirements to Pass the SET". There is only 1 SET, but 3 ways to pass it (SERT, Demonstration or Certifications). The language gets confusing (here and elsewhere) when you start saying there are different "types" of SETs.

Commented [CD208]: not sure why this part is deleted. Suggest adding it back in.

Commented [X209]: We recommend removing "pension risk transfer business" from products scoped out of SET certification method. It is unclear why this business ... [16]

Commented [VM22210R209]: Determine whether to address longevity reinsurance in this topic, in light of ... [17]

Commented [CD211]: See earlier comments about the use of "future"

Commented [X212]: Needs to be defined.

Commented [X213]: Needs a comma

Commented [CD214]: need comma after "business"

Commented [CD215]: what is meant by "aggregate risk levels"? Aggregated across what? Need clarification ... [18]

Commented [X216]: This is not in VM-20 and would substantially change the exclusion. The intent is not ... [19]

Commented [X217]: This is covered by VM-31

Commented [CD218]: note, there is no insertion of "aggregate risk levels across" here, like there was ab ... [20]

Guidance Note: The qualified actuary should develop documentation to support the actuarial certification that presents his or her analysis clearly and in detail sufficient for another actuary to understand the analysis and reasons for the actuary's conclusion that the group of contracts is not subject to material interest rate risk, mortality and/or longevity risk, or asset return volatility risk.

Examples of methods a qualified actuary could use to support the actuarial certification include, but are not limited to:

- a) A demonstration that, using requirements under VM-A and VM-C for the group of contracts, reserves calculated using requirements under VM-A and VM-C are at least as great as the assets required to support the group of contracts and certificates using the company's cash-flow testing model under each of the 1648 scenarios identified in this section Section 7.C.1 or alternatively each of the New York seven scenarios, economic scenarios, under each of the three mortality adjustment factors identified in Section 7.C.1.
- b) A demonstration that the group of contracts passed the SERT within 36 months prior to the valuation date and the company has not had a material change in its interest rate risk, mortality and/or longevity risk, or asset return volatility risk.
- c) A qualitative risk assessment of the group of contracts that concludes that the group of contracts does not have material interest rate risk, mortality and/or longevity risk, or asset return volatility. Such assessment would include an analysis of product guarantees, the company's non-guaranteed elements (NGEs) policy, assets backing the group of contracts, the company's longevity risk, and the company's investment strategy.

Commented [CD219]: This wording is a little clunky here. My suggestion:
"A demonstration that, for the group of contracts, reserves calculated using requirements under VM-A and VM-C are at least as great..."

Commented [X220]: Replace all "contracts" with "contracts and certificates"

Commented [X221]: Need mortality stresses if using NY7

Commented [X222]: Need complete list of risks

Commented [CD223]: need to insert "longevity risk" here

Commented [X224]: Need complete list of risks

Commented [X225]: Need to add a review of the company's mortality and/or longevity risk.

Commented [X226]: As written, the SERT assumes a single premium product given the change of the denominator to the scenario reserve. Alternative product designs (such as longevity swap) could result in unintended results. We recommend maintaining consistency with VM-20 and using a denominator of future benefits (annuity payments, DBs, etc., excluding premium considerations, expenses, etc.).

Commented [X227]: Using (a) in the denominator instead of VM-20's (c) which is a PV of benefits could make this ratio unstable when the scenario reserve (a) is very small. This is particularly applicable if the block being tested does not have CSV.

Commented [X228]: The variability should be assured to be immaterial based on the company's materiality standard.

Commented [X229]: Correcting reference

Commented [CD230]: better to keep the reference to the full Section (i.e., Section 7.C.2.a.i)

Commented [X231]: Correcting reference

Commented [CD232]: better to keep the reference to the full Section (i.e., Section 7.C.2.b)

Commented [X233]: Need to modify in case largest result is just from the mortality stress on the same scenario.

Commented [X234]: Need to modify in case largest result is just from the economic stress on the same mortality level.

Commented [X235]: Need to ensure we have captured a prudent level of mortality variation for any given company in this test.

Commented [X236]: Updating to reflect mortality/economic scenario combinations.

C. Stochastic Exclusion Ratio Test

- 1. In order to exclude a group of contracts from the stochastic reserve SR requirements under the stochastic exclusion ratio test (SERT), a company shall demonstrate that the ratio of (b-a)/a is less than the greater of [x]% where x is the percentage change that would trigger the company's materiality standard, where:
 - a. a = the adjusted scenario reserve described in Paragraph 7.C.2.a below using economic scenario 9, and 100% as the adjustment factor for mortality, the baseline economic scenario, as described in Appendix 1.E of VM-20.
 - b. b = the largest adjusted scenario reserve described in Paragraph 7.C.2.b-a below under any of the other 1516 economic scenarios described in Appendix 1.E of VM-20 under both [95]%, 100%, and [105]% of anticipated experience mortality excluding margins. Because mortality variability may differ by company, if the magnitude of the company's margin for mortality exceeds 5%, then the company shall use the baseline mortality and the mortality augmented by plus and minus the company's margin for this exercise.

Guidance Note: Note that the numerator should be the largest adjusted scenario reserve for scenarios other than the baseline economic scenario, minus the adjusted scenario reserve for the baseline economic scenario, and 100% as the adjustment factor for mortality. This is not necessarily the same as the biggest difference from the adjusted scenario reserve for the baseline economic scenario and 100% as the adjustment factor for mortality, or the absolute value of the biggest difference from the adjusted scenario reserve for the baseline economic scenario and 100% as the adjustment factor for mortality, both of which could lead to an incorrect test result.

There are 47 (=16x3-1) combined economic and mortality scenarios that should be compared for the determination of b.

Commented [X237]: For clarity

2. In calculating the ratio in ~~subsection (Section 7.C.1)~~ above:

Commented [X238]: Be consistent with standard VM references

a. The company shall calculate an adjusted scenario reserve for the group of contracts for ~~each of each of the 16 scenarios~~ economic scenarios using the three levels of mortality adjustment factors that is equal to either (i) or (ii) below:

Commented [CD239]: better to keep the reference to the full Section (i.e., Section 7.C.1)

Commented [CD240]: why delete this? seems like it wouldn't hurt to keep this language, for additional clarity

i. The scenario reserve defined in Section 4, but with the following differences:

a) Using anticipated experience assumptions with no margins, with the exception of mortality factors described in ~~Paragraph Section 7.C.1.b~~ of this section.

Commented [X241]: Be consistent with standard VM references

b) Using the interest rates and equity return assumptions specific to each scenario.

Commented [CD242]: better to reference the full Section (i.e., Section 7.C.1.b)

c) Using NAER and discount rates defined in Section 4 specific to each scenario to discount the cash flows.

d) Shall reflect future mortality improvement in line with anticipated experience assumptions.

e) Shall not reflect correlation between longevity and economic risks.

ii. The gross premium reserve developed from the cash flows from the company's asset adequacy analysis models, using the experience assumptions of the company's cash-flow analysis, but with the following differences:

a) Using the interest rates and equity return assumptions specific to each scenario.

b) Using the mortality scalars described in ~~Paragraph Section 7.C.1.b~~ of this section.

Commented [X243]: Be consistent with standard VM references

Commented [CD244]: better to reference the full Section

c) Using the methodology to determine NAER and discount rates defined in Section 4 specific to each scenario to discount the cash flows, but using the company's cash-flow testing assumptions for default costs and reinvestment earnings.

b. The company shall use the most current 16 available baseline economic scenario and the 15 other-economic scenarios published by the NAIC. The methodology for creating these scenarios can be found in Appendix 1 of VM-20.

Commented [X245]: No reason for change/inconsistency with other chapters - reject edit.

c. The company shall use assumptions within each scenario that are dynamically adjusted as appropriate for consistency with each tested scenario.

d. The company may not group together contract types with significantly different risk profiles for purposes of calculating this ratio.

Commented [X246]: Clarification is needed around reference to "significantly different risk profiles".

e. If the company has reinsurance arrangements that are pro rata coinsurance and do not materially impact the interest rate risk, longevity risk, or asset return volatility in the contract, then the company may elect to not conduct the stochastic exclusion ratio test ~~under only a pre-reinsurance-ceded basis upon determining the~~ either pre-reinsurance-ceded basis upon determining the pre or post-reinsurance-reserve-ceded aggregate reserve.

Commented [CD247]: to be more specific, say "stochastic exclusion ratio test"

Commented [X248]: Original did not make sense. Also, the point is that you just need one basis, either pre-reinsurance or post-reinsurance.

3. If the ratio calculated in this section is less than [x] % pre-non-proportional reinsurance, but is greater than [x] % post-non-proportional reinsurance, the group of contracts will still pass the SERT if the company can demonstrate that the sensitivity of the adjusted scenario reserve to economic scenarios is comparable pre- and post-non-proportional reinsurance.

Commented [X249]: We request clarification or definition of the term "non-proportional reinsurance".

Commented [X250]: Does this make sense for VM-20 as well?

a. An example of an acceptable demonstration:

i. For convenience in notation • SERT = the ratio (b-a)/a defined in Section 7.C.1 above

- a) The pre-non-proportional reinsurance results are "gross of non-proportional," with a subscript "gn," so denoted SERT_{gn}
- b) The post-non-proportional results are "net of non-proportional," with subscript "nn," so denoted SERT_{nn}

ii. If a block of business being tested is subject to one or more non-proportional reinsurance cessions as well as other forms of reinsurance, such as pro rata coinsurance, take "gross of non-proportional" to mean net of all prorata reinsurance but ignoring the non-proportional contract(s), and "net of non-proportional" to mean net of *all* reinsurance contracts. That is, treat non-proportional reinsurance as the last reinsurance in, and compute certain values below with and without that last component.

iii. So, if SERT_{gn} ≤ [x] % but SERT_{nn} > [x] %, then compute the largest percent increase in reserve (LPIR) = (b-a)/a, both "gross of non-proportional" and "net of non-proportional."

Commented [X251]: We believe subscript "gy" should be "gn".

Commented [X252]: % missing

$$LPIR_{gn} = (b_{gy} - a_{gy}) / (b_{gn} - a_{gn}) / a_{gn}$$

$$LPIR_{nn} = (b_{ny} - a_{ny}) / (b_{nn} - a_{nn}) / a_{nn}$$

Commented [X253]: Note that LPIR is just the SERT using the VM-22 formulation (b-a)/a.

Note that the scenario underlying b_{gn} could be different from the scenario underlying b_{nn}.

If SERT_{gn} × LPIR_{nn} / LPIR_{gn} < [x] %, then the block of contracts passes the SERT.

Commented [X254]: The first and last terms on the left side of this equation cancel out, so it just ends up with needing to pass the SERT on the net basis again. This worked when (c) was the denominator, but now with (a) in the denominator this adjustment is meaningless. Take out the whole example, or revise the SERT to use benefits in the denominator again. Or some new formulation for SERT.

b. Another more qualitative approach is to calculate the adjusted scenario reserves for the 4648 combined economic and mortality scenarios both gross and net of reinsurance to demonstrate that there is a similar pattern of sensitivity by scenario.

- 4. The SERT may not be used for a group of contracts if, using the current year’s data, (i) the stochastic exclusion demonstration test defined in Section 7.D had already been attempted using the method in this section of Section 7.D.2.a or Section 7.D.2.b and did not pass; or (ii) the qualified actuary had actively undertaken to perform the certification method in this section and concluded that such certification could not legitimately be made.

Commented [X255]: In VM-20, it is only prohibited for the clearly sufficiently robust attempts of the demonstration method where failing shows the SR would be greater. The other two options could have been incomplete demonstrations and not necessarily imply the SR would be dominant.

D. Stochastic Exclusion Demonstration Test

- 1. In order to exclude a group of contracts from the stochastic reserve SR requirements using the methodology in this section Stochastic Exclusion Demonstration Test, the company must provide a demonstration in the PBR Actuarial Report in the first year and at least once every three calendar years thereafter that complies with the following:

Commented [X256]: Clearer language

- a. The demonstration shall provide a reasonable assurance that if the stochastic reserve SR was calculated on a stand-alone basis for the group of contracts subject to the stochastic reserve SR exclusion, the resulting stochastic reserve for those groups of contracts would not be higher than the statutory reserve determined pursuant to the applicable requirements in VM-A and VM-C. The demonstration shall take into account whether changing conditions over the current and two subsequent calendar years would be likely to change the conclusion to exclude the group of contracts from the stochastic reserve SR requirements.

Commented [X257]: Does this statement imply a floor reserve of VM-A and VM-C? VM-20 does require the NPR as the floor of the reserve but as written, VM-22 does not require a floor reserve. Recommend removing 1.a. Same statement with the 2.a statement demonstration. This requirement does not apply to the other permitted tests, which seemed counterintuitive.

- b. If, as of the end of any calendar year, the company determines the aggregate statutory reserve determined pursuant to the applicable requirements in VM-A and VM-C for the group of contracts no longer adequately provides for all material risks, the exclusion shall be discontinued, and the company fails the SERT SET for those contracts.

Commented [CD258]: should this, instead, refer to the "statutory reserve determined pursuant to the applicable requirements in VM-A and VM-C?"

Commented [X259]: Typo is also in VM-20

- c. The demonstration may be based on analysis from a date that precedes the valuation date for the initial year to which it applies if the demonstration includes an explanation of why the use of such a date will not produce a material change in the outcome, as compared to results based on an analysis as of the valuation date.
- d. The demonstration shall provide an effective evaluation of the residual risk exposure remaining after risk mitigation techniques, such as derivative programs and reinsurance.

- 2. The company may use one of the following or another method acceptable to the insurance commissioner to demonstrate compliance with subsection Section 7.D.1 above:

Commented [CD260]: should say "Section"

- a. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the stochastic reserve SR calculated on a stand-alone basis.
- b. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the scenario reserve that results from each of a sufficient number of adverse deterministic scenarios.

- c. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the ~~stochastic reserve~~SR calculated on a stand-alone basis, but using a representative sample of contracts in the ~~stochastic reserve~~SR calculations.
- d. Demonstrate that any risk characteristics that would otherwise cause the ~~stochastic reserve~~SR calculated on a stand-alone basis to exceed the statutory reserve calculated in accordance with VM-A and VM-C, are not present or have been substantially eliminated through actions such as hedging, investment strategy, reinsurance or passing the risk on to the ~~contract policyholder~~ by contract provision.

Commented [CD261]: "contract holder"

E. Deterministic Certification Option

Commented [X262]: Need SPA for DR as well as SR

- 1. The company ~~has the option to may~~ determine the ~~stochastic reserve~~SR for a group of contracts using a single deterministic economic scenario, subject to the following conditions.

Commented [CD263]: suggest saying "may" instead of "has the option to"

- a. The company certifies that economic conditions do not materially influence anticipated contract holder behavior for the group of ~~policies, contracts and certificates~~. Examples of contract holder options that are materially influenced by economic conditions include surrender benefits, recurring premium payments, and guaranteed living benefits.

Commented [CD264]: "contracts"

- b. The company certifies that the group of ~~policies, contracts and certificates~~ is not supported by a reinvestment strategy that contains ~~future hedge purchases~~.

Commented [X265]: Clarify if this was the intent to exclude contracts supported by index hedging.

- c. ~~The company must perform and disclose results from the stochastic exclusion ratio test following the requirements in Section 7.C, thereby disclosing and the scenario reserve volatility across various company must pass the SERT when considering only the 16 economic scenarios, paired with the 100% mortality scenario.~~

Commented [X266]: This is needed to assure the SR is not needed. Otherwise, this section is incomplete and does not support using a DR.

- d. The company must disclose a description of contracts and associated features in ~~the certification~~.

Commented [X267]: Agree with drafting note. Edits above.

Drafting Note: Consider revisiting Paragraph E.1.c to possibly either require i) falling below a preset threshold for the exclusion ratio test under a single longevity/mortality scenario; or ii) to pass the exclusion test if longevity is not included as part of the ratio test.

Commented [X268]: It may not be appropriate to use scenario 12 to calculate the scenario reserve for SPIA. See this article <https://www.soa.org/sections/financial-reporting/financial-reporting-newsletter/2021/july/fr-2021-07-su/>

"in an increasing interest rate environment for business where policyholder behavior is sensitive to prevailing interest rates, life insurers may face an increase in disintermediation risk (i.e., the risk of having to sell assets, potentially at a loss, to fund policyholder surrender benefits) For example, rising interest rates, particularly sudden jumps (e.g., New York 7 pop-up scenario with an immediate interest rate increase of 3 percent), may lead to higher actual and projected policyholder surrenders as policyholders seek out higher yielding investment opportunities. These increasing cash demands may require fixed income assets to be sold at depressed prices, and resultant projected losses (or lower gains) may result in reserve insufficiencies, necessitating the need for AAT reserves."

- 2. The ~~stochastic reserve~~SR for the group of contracts under the Deterministic Certification Option is determined as follows:
 - a. Cash flows are projected in compliance with the applicable requirements in Section 4, Section 5, Section 10, and Section 11 of VM-22 over a single economic scenario (scenario 12 found in Appendix 1 of VM-20).
 - b. The ~~stochastic reserve~~SR equals the scenario reserve following the requirements for Section 4.

Guidance Note: The Deterministic Certification Option is intended to provide a non-stochastic option for Single Premium Immediate Annuities (SPIAs) and similar payout annuity products that contain limited or no optionality in the asset and liability cash flow projections.

Commented [X269]: Recommend deleting guidance note, as it doesn't provide full or clear scope of what may be excluded, so could be misread to either guarantee option for certain products or exclude the option for other products.

Section 8: To Be Determined (Scenario Generation for VM-21)

Section 9: Modeling Hedges under a Future Non-Index Credit Hedging Strategy

A. Initial Considerations

- 1. This section applies to modeling of hedges other than situations where the company (a) only hedges index credits. If the company, or (b) clearly separates index credit hedging from other hedging, then only the section only pertains to the other hedging if the index hedging follows. In those situations, the modeling of hedges supporting index credits can be simplified including applying an index credit hedge margin, following the requirements in Section 4.A.4.b.i.
- 2. The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the calculation of the stochastic reserve SR, determined in accordance with Section 3.D and Section 4.D.
- 3. The company shall take into account the costs and benefits of hedge positions expected to be held by the company in the future along each scenario. Company management is responsible for developing, documenting, executing and evaluating the investment strategy for future hedge purchases. Prior to reflection in projections, the strategy for future hedge purposes shall be the actual practice of the company for a period of time not less than [6] months, including the hedging strategy, used to implement the investment policy.
- 4. For this purpose, the investment assets refer to all the assets, including derivatives supporting covered products and guarantees. This also is referred to as the investment portfolio. The investment strategy is the set of all asset holdings at all points in time in all scenarios. The hedging portfolio, which also is referred to as the hedging assets, is a subset of the investment assets. The hedging strategy is the hedging asset holdings at all points in time in all scenarios. There is no attempt to distinguish what is the hedging portfolio and what is the investment portfolio in this section. Nor is the distinction between investment strategy and hedging strategy formally made here. Where necessary to give effect to the intent of this section, the requirements applicable to the hedging portfolio or the hedging strategy are to apply to the overall investment portfolio and investment strategy.
- 5. This particularly applies to restrictions on the reasonableness or acceptability of the models that make up the stochastic cash-flow model used to perform the projections, since these restrictions are inherently restrictions on the joint modeling of the hedging and non-hedging portfolio. To give effect to these requirements, they must apply to the overall investment strategy and investment portfolio.

Commented [X270]: Section 4.A.4 (Modeling of Hedges) has some relationship with this section, we request clarification around the applicability of these two areas of hedge guidance.

Commented [CD271]: see previous comments about use of the word "future" to describe "hedging strategy"

Commented [X272]: We seek clarification of this text: if a company only hedges indices or separates index crediting from other hedges, does this apply, or does it only apply to any other hedging?

Commented [X273]: The sentence "Prior to reflection in projections, the strategy for future hedge purposes shall be the actual practice of the company for a period of time not less than [6] months." seems to suggest you would do something other than the actual hedging strategy after [6] months. In this case, what are you assuming for modeling? We suggest clarification of this sentence.

Commented [CD274]: is this a typo? should this be "purchases"?

Commented [X275]: This 6 month exclusion creates unintended optionality for inclusion/exclusion based on whether a hedge strategy is considered "new". Instead, this should be addressed through the Error factor for new programs being temporarily larger.

Commented [X276]: Reinstate the original sentence which puts the reflection of hedging into the greater context of reflecting the company's investment policy.

Commented [X277]: Agree that the uncertainty associated with new strategies should be handled via the E factor, not through blanket exclusion.

B. Modeling Approaches

- 1. The analysis of the impact of the hedging strategy on cash flows is typically performed using either one of two types of methods as described below. Although a hedging strategy normally would be expected to reduce risk provisions, the nature of the hedging strategy and the costs to implement the strategy may result in an increase in the amount of the stochastic reserve SR otherwise calculated.
- 2. The fundamental characteristic of the first type of method, referred to as the "explicit method," is that hedging positions and their resulting cash flows are included in the stochastic cash-flow model used to determine the scenario reserve, as discussed in Section 3.D, for each scenario.

3. The fundamental characteristic of the second type of method, referred to as the “implicit method,” is that the effectiveness of the current hedging strategy on future cash flows is evaluated, in part or in whole, outside of the stochastic cash-flow model. There are multiple ways that this type of modeling can be implemented. In this case, the reduction to the ~~stochastic reserve~~SR otherwise calculated should be commensurate with the degree of effectiveness of the hedging strategy in reducing accumulated deficiencies otherwise calculated.
4. Regardless of the methodology used by the company, the ultimate effect of the current hedging strategy (including currently held hedge positions) on the ~~stochastic reserve~~SR needs to recognize all risks, associated costs, imperfections in the hedges and hedging mismatch tolerances associated with the hedging strategy. The risks include, but are not limited to: basis, gap, price, parameter estimation and variation in assumptions (mortality, persistency, withdrawal, annuitization, etc.). Costs include, but are not limited to: transaction, margin (opportunity costs associated with margin requirements) and administration. In addition, the reduction to the ~~stochastic reserve~~SR attributable to the hedging strategy may need to be limited due to the uncertainty associated with the company’s ability to implement the hedging strategy in a timely and effective manner. The level of operational uncertainty varies indirectly with the amount of time that the new or revised strategy has been in effect or ~~mode~~ tested.

Guidance Note: No hedging strategy is perfect. A given hedging strategy may eliminate or reduce some but not all risks, transform some risks into others, introduce new risks, or have other imperfections. For example, a delta-only hedging strategy does not adequately hedge the risks measured by the “Greeks” other than delta.

5. A safe harbor approach is permitted for those companies whose modeled hedge assets comprise only linear instruments not sensitive to implied volatility. For companies with option-based hedge strategies, electing this approach would require representing the option-based portion of the strategy as a delta-rho two-Greek hedge program. The normally modeled option portfolio would be replaced with a set of linear instruments that have the same first-order Greeks as the original option portfolio.

Commented [X278]: Is delta-only hedging common in VM-22 hedging? Could the example be replaced with something more relevant to VM-22 hedging?

C. Calculation of ~~Stochastic Reserve~~SR (Reported)

1. The company shall calculate CTE70 (best efforts)—the results obtained when the CTE70 is based on incorporating the modeling of hedges (including both currently held and future hedge positions) into the stochastic cash-flow model on a best efforts basis, including all of the factors and assumptions needed to model the hedges (e.g., stochastic implied volatility). The determination of CTE70 (best efforts) may utilize either explicit or implicit modeling techniques.
2. The company shall calculate a CTE70 (adjusted) by recalculating the CTE70 assuming the company has ~~no future hedging purchases strategy~~ except those to hedge interest credits and hedge assets held by the company on the valuation date, therefore following the requirements of Section 4.A.4.a and 4.A.4.b.i.
3. Because most models will include at least some approximations or idealistic assumptions, CTE70 (best efforts) may overstate the impact of the hedging strategy. To compensate for potential overstatement of the impact of the hedging strategy, the value for the ~~stochastic reserve~~SR is given by:

Commented [X279]: The Hedging DG is currently working on language and we will want to be consistent across VM-20, VM-21, and VM-22.

Commented [CD280]: perhaps better to say “no future hedge purchases...”

$$\text{Stochastic reserve SR} = \text{CTE70 (best efforts)} + E \times \max[0, \text{CTE70 (adjusted)} - \text{CTE70 (best efforts)}]$$

4. The company shall specify a value for *E* (the “error factor”) in the range from 5% to 100% to reflect the company’s view of the potential error resulting from the level of sophistication of the stochastic cash-flow model and its ability to properly reflect the parameters of the hedging strategy (i.e., the Greeks being covered by the strategy), as well as the associated costs, risks and benefits. The greater the ability of the stochastic model to capture all risks and uncertainties, the lower the value of *E*. The value of *E* may be as low as 5% only if the model used to determine the CTE70 (best efforts) effectively reflects all of the parameters used in the hedging strategy. If certain economic risks are not hedged, yet the model does not generate scenarios that sufficiently capture those risks, *E* must be in the higher end of the range, reflecting the greater likelihood of error. Likewise, simplistic hedge cash-flow models shall assume a higher likelihood of error.

5. The company shall conduct a formal back-test, based on an analysis of ~~at least the most recent~~ available relevant period of data (but no less than 12 months), to assess how well the model is able to replicate the hedging strategy in a way that supports the determination of the value used for *E*.

6. Such a back-test shall involve one of the following analyses:
 - a. For companies that model hedge cash flows directly (“explicit method”), replace the stochastic scenarios used in calculating the CTE70 (best efforts) with a single scenario that represents the market path that actually manifested over the selected back-testing period and compare the projected hedge asset gains and losses against the actual hedge asset gains and losses – both realized and unrealized – observed over the same time period. For this calculation, the model assumptions may be replaced with parameters that reflect actual experience during the back-testing period. In order to isolate the comparison between the modeled hedge results and actual hedge results for this calculation, the projected liabilities should accurately reflect the actual liabilities throughout the back-testing period; therefore, adjustments that facilitate this accuracy (e.g. reflecting actual experience instead of model assumptions, including new business, etc.) are permissible.

To support the choice of a low value of *E*, the company should ascertain that the projected hedge asset gains and losses are within close range of 100% (e.g., 80–125%) of the actual hedge asset gains and losses. The company may also support the choice of a low value of *E* by achieving a high R-squared (e.g., 0.80 or higher) when using a regression analysis technique.

 - b. For companies that model hedge cash flows implicitly by quantifying the cost and benefit of hedging using the fair value of the hedged item (an “implicit method” or “cost of reinsurance method”), calculate the delta, rho and vega coverage ratios in each month over the selected back-testing period in the following manner:
 - i. Determine the hedge asset gains and losses—both realized and unrealized—incurred over the month attributable to equity, interest rate, and implied volatility movements.

 - ii. Determine the change in the fair value of the hedged item over the month attributable to equity, interest rate, and implied volatility movements. The hedged item should be defined in a manner that reflects the proportion of risks hedged (e.g., if a company elects to hedge 50% of a contract’s market risks, it should quantify the fair value of the hedged item as 50% of the fair value of the contract).

Commented [X281]: We have been getting weak E factor support, with minimum backtesting due to the current phrasing.

Commented [X282R281]: Recommend adding stress testing language similar to [Section 4.A.4.b.i.c](#)) but with edits based on TD’s comments/suggestions to [Section 4.A.4.b.i.c](#).

Commented [X283]: Recommend adding reporting requirement to VM-31 to disclose if company has switched between explicit method and implicit method, discuss rationale of the change and the change impact.

- iii. Calculate the delta coverage ratio as the ratio between (i) and (ii) attributable to equity movements.
 - iv. Calculate the rho coverage ratio as the ratio between (i) and (ii) attributable to interest rate movements.
 - v. Calculate the vega coverage ratio as the ratio between (i) and (ii) attributable to implied volatility movements.
 - vi. To support the company's choice of a low value of E, the company should be able to demonstrate that the delta and rho coverage ratios are both within close range of 100 % (e.g., 80–125%) consistently across the back-testing period.
 - vii. In addition, the company should be able to demonstrate that the vega coverage ratio is within close range of 100 % in order to use the prevailing implied volatility levels as of the valuation date in quantifying the fair value of the hedged item for the purpose of calculating CTE70 (best efforts). Otherwise, the company shall quantify the fair value of the hedged item for the purpose of calculating CTE70 (best efforts) in a manner consistent with the realized volatility of the scenarios captured in the CTE (best efforts).
- c. Companies that do not model hedge cash flows explicitly, but that also do not use the implicit method as outlined in Section 9.C.6.b above, shall conduct the formal back-test in a manner that allows the company to clearly illustrate the appropriateness of the selected method for reflecting the cost and benefit of hedging, as well as the value used for E.
7. A company that does not have 12 months of experience to date shall set E to a value that reflects the amount of experience available, and the degree and nature of any change to the hedge program. For a material change in strategy, with ~~no less than 6 months of history~~, E should be ~~at least 1.0-50~~. However, E may be lower than ~~1.0-50~~ if ~~some~~ at least 6 months of reliable experience is available and/or if the change in strategy is a minor refinement rather than a ~~substantial~~ material change in strategy.

Commented [X284]: 6 month restriction should be handled in the error factor. Other language for clarity. Edited guidance note below to be consistent with this.

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily large (e.g., $\geq 50\%$) for substantial changes in hedge methodology (e.g., moving from a fair-value based strategy to a stop-loss strategy) where the company has not been able to provide a meaningful simulation of hedge performance based on the new strategy.
- A temporary moderate increase (e.g., 15–30%) in error factor should be used for substantial modifications to hedge programs or modeling where meaningful simulation has not been created (e.g., adding second-order hedging, such as gamma or rate convexity).
- No increase in the error factor may be used for incremental modifications to the hedge strategy (e.g., adding death benefits to a program that previously covered only living benefits, or moving from swaps to Treasury Department futures).

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily large (e.g., $\geq 50\%$) for substantial changes in hedge methodology (e.g., moving from a fair value based strategy to a stop-loss strategy) where the company has not been able to provide a meaningful simulation of hedge performance based on the new strategy.
- A temporary moderate increase (e.g., 15–30%) in error factor should be used for substantial modifications to hedge programs or modeling where meaningful simulation has not been created (e.g., adding second-order hedging, such as gamma or rate convexity).
- No increase in the error factor may be used for incremental modifications to the hedge strategy (e.g., adding death benefits to a program that previously covered only living benefits, or moving from swaps to Treasury Department futures).

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily 100% for material changes in hedge methodology (e.g., moving from a fair-value based strategy to a stop-loss strategy).
- An increase in the error factor may not always be needed for minor refinements to the hedge strategy (e.g., moving from swaps to Treasury futures).

8. The company shall set the value of E reflecting the extent to which the future hedging program is clearly defined. To support a value of E below 1.0, there should be very robust documentation outlining the future hedging program. To the extent that documentation outlining the future hedging program is incomplete, the value of E shall be increased. Any increases required to the value of E to reflect that documentation is not available to support that the future hedging program is clearly defined shall be in addition to increases to the value of E to reflect a lack of historical experience or to reflect the back-testing results.

Commented [X285]: Work is being done by the hedging DG. This is a placeholder. Need to reflect how clearly defined and well documented the hedge program is, to be able to rely on the backtesting provided. To the extent that hedge programs are not clearly defined, E should be increased to reflect that the backtesting cannot be relied on as an indicator of future effectiveness.

E. Additional Considerations for CTE70 (best efforts)

If the company is following a CDHS, the fair value of the portfolio of contracts falling within the scope of these requirements shall be computed and compared to the CTE70 (best efforts) and CTE70 (adjusted). If the CTE70 (best efforts) is below both the fair value and CTE70 (adjusted), the company should be prepared to explain why that result is reasonable.

For the purposes of this analysis, the SR and fair value calculations shall be done without requiring the scenario reserve for any given scenario to be equal to or in excess of the cash surrender value in aggregate for the group of contracts modeled in the projection.

Commented [X286]: Reinstate this disclosure item, which is a rough reasonability check for regulator review/information on the modeled hedge benefit and can prompt further discussion.

D. Specific Considerations and Requirements

1. As part of the process of choosing a methodology and assumptions for estimating the future effectiveness of the current hedging strategy (including currently held hedge positions) for purposes of reducing the ~~stochastic reserve~~ SR, the company should review actual historical hedging effectiveness. The company shall evaluate the appropriateness of the assumptions

Commented [CD287]: not sure why this section is being deleted? Perhaps references to CDHS could be deleted, but otherwise this section still seems applicable.

on future trading, transaction costs, other elements of the model, the strategy, the mix of business and other items that are likely to result in materially adverse results. This includes an analysis of model assumptions that, when combined with the reliance on the hedging strategy, are likely to result in adverse results relative to those modeled. The parameters and assumptions shall be adjusted (based on testing contingent on the strategy used and other assumptions) to levels that fully reflect the risk based on historical ranges and foreseeable future ranges of the assumptions and parameters. If this is not possible by parameter adjustment, the model shall be modified to reflect them at either anticipated experience or adverse estimates of the parameters.

2. A discontinuous hedging strategy is a hedging strategy where the relationships between the sensitivities to equity markets and interest rates (commonly referred to as the Greeks) associated with the guaranteed contract holder options embedded in the variable fixed indexed annuities and other in-scope products and these same sensitivities associated with the hedging assets are subject to material discontinuities. This includes, but is not limited to, a hedging strategy where material hedging assets will be obtained when the fixed indexed annuity and other in-scope products account balances reach a predetermined level in relationship to the guarantees. Any hedging strategy, including a delta hedging strategy, can be a discontinuous hedging strategy if implementation of the strategy permits material discontinuities between the sensitivities to equity markets and interest rates associated with the guaranteed contract holder options embedded in the variable fixed indexed annuities and other in-scope products and these same sensitivities associated with the hedging assets. There may be scenarios that are particularly costly to discontinuous hedging strategies, especially where those result in large discontinuous changes in sensitivities (Greeks) associated with the hedging assets. Where discontinuous hedging strategies contribute materially to a reduction in the stochastic reserveSR, the company must evaluate the interaction of future trigger definitions and the discontinuous hedging strategy, in addition to the items mentioned in the previous paragraph. This includes an analysis of model assumptions that, when combined with the reliance on the discontinuous hedging strategy, may result in adverse results relative to those modeled.
3. A strategy that has a strong dependence on acquiring hedging assets at specific times that depend on specific values of an index or other market indicators may not be implemented as precisely as planned.
4. The combination of elements of the stochastic cash-flow model—including the initial actual market asset prices, prices for trading at future dates, transaction costs and other assumptions—should be analyzed by the company as to whether the stochastic cash-flow model permits hedging strategies that make money in some scenarios without losing a reasonable amount in some other scenarios. This includes, but is not limited to:
 - a. Hedging strategies with no initial investment that never lose money in any scenario and in some scenarios make money.
 - b. Hedging strategies that, with a given amount of initial money, never make less than accumulation at the one-period risk-free rates in any scenario but make more than this in one or more scenarios.
5. If the stochastic cash-flow model allows for such situations, the company should be satisfied that the results do not materially rely directly or indirectly on the use of such strategies. If the results do materially rely directly or indirectly on the use of such strategies, the strategies may not be used to reduce the stochastic reserveSR otherwise calculated.

Commented [X288]: Suggest replacing “indexed” with “fixed” since this would apply to all fixed annuities.

Commented [X289]: Editorial change of “variable fixed indexed annuity” to be “fixed indexed annuity and other in-scope products”.

Commented [X290]: Recommend deleting “including a delta hedging strategy” as it is already covered by “any hedging strategy” and it is not clear if delta hedging strategy is the most common strategy in VM-22 hedging to be used as a general example.

6. In addition to the above, the method used to determine prices of financial instruments for trading in scenarios should be compared to actual initial market prices. In addition to comparisons to initial market prices, there should be testing of the pricing models that are used to determine subsequent prices when scenarios involve trading financial instruments. This testing should consider historical relationships. For example, if a method is used where recent volatility in the scenario is one of the determinants of prices for trading in that scenario, then that model should approximate actual historic prices in similar circumstances in history.

Section 10: Guidance and Requirements for Setting Contract Holder Behavior Prudent Estimate Assumptions

A. General

Contract holder behavior assumptions encompass actions such as lapses, withdrawals, transfers, recurring deposits, benefit utilization, option election, etc. Contract holder behavior is difficult to predict accurately, and variance in behavior assumptions can significantly affect the ~~results~~ reserves level. In the absence of relevant and fully credible empirical data, the company should set behavior assumptions as guided by Principle 3 in Section 1.B and Section 12.

Commented [X291]: Editorial clarification

Commented [X292]: Need general assumption setting section, see APF 2021-11.

In setting behavior assumptions, the company should examine, but not be limited by, the following considerations:

1. Behavior can vary by product, market, distribution channel, index performance, interest credited (current and guaranteed rates), time/product duration, etc.
2. Options embedded in the product may affect behavior.
3. Utilization of options may be elective or non-elective in nature. Living benefits often are elective, and death benefit options are generally non-elective.
4. Elective contract holder options may be more driven by economic conditions than non-elective options.
5. As the value of a product option increases, there is an increased likelihood that contract holders will behave in a manner that maximizes their financial interest (e.g., lower lapses, higher benefit utilization, etc.).
6. Behavior formulas may have both rational and irrational components (irrational behavior is defined as situations where some contract holders may not always act in their best financial interest). The rational component should be dynamic, but the concept of rationality need not be interpreted in strict financial terms and might change over time in response to observed trends in contract holder behavior based on increased or decreased financial efficiency in exercising their contractual options.
7. Options that are ancillary to the primary product features may or may not be significant drivers of behavior. Whether an option is ancillary to the primary product features depends on many things, such as:
 - a. For what purpose was the product purchased?
 - b. Is the option elective or non-elective?
 - c. Is the value of the option well-known?
8. External influences may affect behavior.

Commented [X293]: We would suggest rewording this section to be considerations rather than posed as questions.

Commented [X294]: Editorial clarification

Commented [X295]: Recommend adding some examples here if this is included.

B. Aggregate vs. Individual Margins

1. Prudent estimate assumptions are developed by applying a margin for uncertainty to the anticipated experience assumption. The issue of whether the level of the margin applied to the anticipated experience assumption is determined in aggregate or independently for each and every behavior assumption is discussed in Principle 3 in Section 1.B.

2. Although this principle discusses the concept of determining the level of margins in aggregate, it notes that the application of this concept shall be guided by evolving practice and expanding knowledge. From a practical standpoint, it may not always be possible to completely apply this concept to determine the level of margins in aggregate for all behavior assumptions.
3. Therefore, the company shall determine prudent estimate assumptions independently for each behavior (e.g., mortality, lapses and benefit utilization), using the requirements and guidance in this section and throughout these requirements, unless the company can demonstrate that an appropriate method was used to determine the level of margin in aggregate for two or more material behavior assumptions, if relevant to the risks in the product, and thus the approach will not understate the reserve.

Commented [X296]: Clarification

C. Sensitivity Testing

Commented [X297]: Suggest updating bullet to "Other material behavior assumptions if relevant to the risks in the product."

The impact of behavior can vary by product, time period, etc. For any assumption that is not prescribed or stochastically modeled, the ~~company/qualified actuary to whom responsibility for this group of contracts is assigned~~ shall use sensitivity testing to ensure that the assumption is set at the conservative end of the plausible range. The company shall sensitivity test:

Commented [X298]: Sensitivity testing is covered by the submitted APF 2021-11 for VM-21, and we should be consistent. VM-21 is currently lacking on sensitivity testing.

- Surrenders.
- Partial withdrawals.
- Benefit utilization.
- Account transfers.
- Future deposits.
- Other behavior assumptions if relevant to the risks in the product.

Commented [VM22299R298]: Make edits to be consistent with VM-21 APFs prior to adoption of VM-22

Commented [CD300]: why assign this specifically to the QA rather than leaving it as the responsibility of "the company", like we do elsewhere in the requirements?

Commented [X301]: Include for completion

Sensitivity testing of assumptions is required and shall be more complex than, for example, base lapse assumption plus or minus X% across all contracts. A more appropriate sensitivity test in this example might be to devise parameters in a dynamic lapse formula to reflect more out-of-the-money contracts lapsing and/or more holders of in-the-money contracts persisting and eventually using the guarantee. The company should apply more caution in setting assumptions for behaviors where testing suggests that stochastic modeling results are sensitive to small changes in such assumptions. For such sensitive behaviors, the company shall use higher margins when the underlying experience is less than fully relevant and credible.

The company shall examine the results of sensitivity testing to understand the materiality of prudent estimate assumptions on the modeled reserve. The company shall update the sensitivity tests periodically as appropriate, considering the materiality of the results of the tests. The company may update the tests less frequently ~~(but no less than every 3 years)~~ when the tests show less sensitivity of the modeled reserve to changes in the assumptions being tested or the experience is not changing rapidly. Providing there is no material impact on the results of the sensitivity testing, the company may perform sensitivity testing:

Commented [X302]: Consistent with APF 2021-11.

1. Using samples of the contracts in force rather than performing the entire valuation for each alternative assumption set.

- 2. Using data from prior periods.

D. Specific Considerations and Requirements

- 1. Within materiality considerations, the company should consider all relevant forms of contract holder behavior and persistency, including, but not limited to, the following:
 - a. Mortality (additional guidance and requirements regarding mortality is contained in Section 11).
 - b. Surrenders.
 - c. Partial withdrawals (systematic and elective).
 - d. Account transfers (switching/exchanges).
 - e. Resets/ratchets of the guaranteed amounts (automatic and elective).
 - f. Future deposits.
 - g. Income start date for the benefit utilization.
 - h. Commutation of benefit (from periodic payment to lump sum) or vice versa.
- 2. It may be acceptable to ignore certain items that might otherwise be explicitly modeled in an ideal world, particularly if the inclusion of such items reduces the calculated provisions.

Commented [X303]: Clarification

Commented [X304]: clarification

For example:

- a. The impact of account transfers (intra-contract index “switching”) might be ignored, unless required under the terms of the contract (e.g., automatic asset re-allocation/rebalancing,) or if the contract provisions incentivize the contract holders to transfer between accounts.
- b. Future deposits might be excluded from the model, unless required by the terms of the contracts under consideration and then only in such cases where future premiums can reasonably be anticipated (e.g., with respect to timing and amount).
- c. For some non-elective benefits (nursing home benefits for example), a zero incidence rate after the surrender charge has ended, or the cash value has depleted, may be acceptable since use of a non-zero rate could reduce the modeled reserve.

Commented [CD305]: delete this word

Commented [X306]: Reviewing, this guidance note does not exist in the 2019, 2020, 2021, or 2022 versions of VM-21. Where is this from? Should this be added to VM-21?

Guidance Note: For some non elective benefits (nursing home benefits for example), unless relevant company experience exists to the contrary, the use of incidence rates greater than zero after the surrender charge has ended, or the cash value was depleted might be inappropriate may not be prudent since it would reduce the modeled reserve.

- 3. However, the company should exercise caution in assuming that current behavior will be indefinitely maintained. For example, it might be appropriate to test the impact of a shifting asset mix and/or consider future deposits to the extent they can reasonably be anticipated and increase the calculated amounts.

- 4. Normally, the underlying model assumptions would differ according to the attributes of the contract being valued. This would typically mean that contract holder behavior and persistency may be expected to vary according to such characteristics as (this is not an exhaustive list):
 - a. Gender.
 - b. Attained age.
 - c. Issue age.
 - d. Contract duration.
 - e. Time to maturity.
 - f. Tax status.
 - g. Account value.
 - h. Interest credited (current and guaranteed).
 - i. Available indices.
 - j. Guaranteed benefit amounts.
 - k. Surrender charges, ~~transaction~~ fees or other contract charges.
 - l. Distribution channel.

- 5. Unless there is clear evidence to the contrary, behavior assumptions should be no less conservative than past experience. Margins for contract holder behavior assumptions shall assume, without relevant and credible experience or clear evidence to the contrary, that contract holders' efficiency will increase over time.

- 6. In determining contract holder behavior assumptions, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience), whether or not the segment is directly written by the company. If data from a similar business segment are used, the assumption shall be adjusted to reflect differences between the two segments. Margins shall reflect the data uncertainty associated with using data from a similar but not identical business segment.

- 7. Where relevant and fully credible empirical data do not exist for a given contract holder behavior assumption, the company shall set the contract holder behavior assumption to reflect the increased uncertainty such that the contract holder behavior assumption is shifted towards the conservative end of the plausible range of expected experience that serves to increase the ~~stochastic reserve~~ SR. If there are no relevant data, the company shall set the contract holder behavior assumption to reflect the increased uncertainty such that the contract holder behavior assumption is at the conservative end of the range. Such adjustments shall be consistent with the definition of prudent estimate, with the principles described in Section 1.B, and with the guidance and requirements in this section.

- 8. Ideally, contract holder behavior would be modeled dynamically according to the simulated economic environment and/or other conditions. It is important to note, however, that contract holder behavior should neither assume that all contract holders act with 100%

Commented [X307]: This also applies to VM-21, as there are fixed accounts. Is there any reason not to be consistent?

Commented [X308]: This is not a synonym (perhaps transfer fees is a subset of transaction fees) - why would transaction fees apply for VM-21, but only transfer fees for VM-22?

Commented [X309]: This section states that "contract holder behavior should neither assume that all contract holders act with 100% efficiency in a financially rational manner nor assume that contract holders will always act irrationally." This text seems to directly contradict Section II. Reserve Requirements 6.H.2 which states "When advantageous, policyholders will commence living benefit payouts if not started yet.". We suggest revising 6.H.2 to align with the text of 10.D.8.

efficiency in a financially rational manner nor assume that contract holders will always act irrationally. These extreme assumptions may be used for modeling efficiency if the result is more conservative.

E. Dynamic Assumptions

1. Consistent with the concept of prudent estimate assumptions described earlier, the liability model should incorporate margins for uncertainty for all risk factors that are not dynamic (i.e., the non-scenario tested assumptions) and are assumed not to vary according to the financial interest of the contract holder stochastically modeled.
2. ~~The company should exercise care in using static assumptions when it would be more natural and reasonable~~ appropriate to use a dynamic model or other scenario-dependent formulation for behavior. With due regard to considerations of materiality and practicality ~~allowance for appropriate simplifications, approximations and modeling efficiency techniques~~, the use of dynamic models is encouraged, but not mandatory. Static assumptions ~~Risk factors that are not scenario tested but could reasonably be expected to vary according to a stochastic process, or future states of the world (especially in response to economic drivers), may require higher margins and/or signal a need for higher margins for certain other assumptions.~~
3. Risk factors that are modeled dynamically should encompass the plausible range of behavior consistent with the economic scenarios and other variables in the model, including the non-scenario tested assumptions. The company shall test the sensitivity of results to understand the materiality of making alternate assumptions and follow the guidance discussed above on setting assumptions for sensitive behaviors.

Commented [X310]: Recommend replacing “dynamic” with “stochastic.” Risk factors with dynamic assumptions still need margins (although for an assumption that was part fixed and part dynamic, only one piece may have the margin but still the risk factor would have a margin).

Commented [X311]: Suggest replacing “Risk factors that are not scenario tested but” with “Static assumptions that” to improve clarity in the wording.

Commented [X312]: Get rid of some of the vague adjectives and be consistent with VM framework for simplifications.

F. Consistency with the CTE Level

1. All behaviors (i.e., dynamic, formulaic and non-scenario tested) should be consistent with the scenarios used in the CTE calculations (generally, the top 30% of the loss distribution). To maintain such consistency, it is not necessary to iterate (i.e., successive runs of the model) in order to determine exactly which scenario results are included in the CTE measure. Rather, in light of the products being valued, the company should be mindful of the general characteristics of those scenarios likely to represent the tail of the loss distribution and consequently use prudent estimate assumptions for behavior that are reasonable and appropriate in such scenarios. For ~~non-variable~~ fixed annuities, these “valuation” scenarios would typically display one or more of the following attributes:
 - a. ~~Declining-, increasing~~ and/or volatile index values, where applicable.
 - b. Price gaps and/or liquidity constraints.
 - c. ~~Rapidly changing~~ Volatile interest rates or persistently low interest rates.
 - d. ~~Volatile credit spreads.~~
2. The behavior assumptions should be logical and consistent both individually and in aggregate, especially in the scenarios that govern the results. In other words, the company should not set behavior assumptions in isolation, but give due consideration to other elements of the model. The interdependence of assumptions (particularly those governing customer behaviors) makes this task difficult and by definition requires professional judgment, but it is important that the model risk factors and assumptions:

Commented [CD313]: “non-variable”?

Commented [X314]: Editorial clarification to cover scenarios for all products/guarantees in scope

Commented [X315]: Editorial for consistency with (a) above

Commented [X316]: Suggesting deleting as we are not aware of dynamic credit spreads typically being modeled.

- a. Remain logically and internally consistent across the scenarios tested.
 - b. Represent plausible outcomes.
 - c. Lead to appropriate, but not excessive, asset requirements.
4. The company should remember that the continuum of “plausibility” should not be confined or constrained to the outcomes and events exhibited by historic experience.
 5. Companies should attempt to track experience for all assumptions that materially affect their risk profiles by collecting and maintaining the data required to conduct credible and meaningful studies of contract holder behavior.

G. Additional Considerations and Requirements for Assumptions Applicable to Guaranteed Living Benefits

Experience for contracts without guaranteed living benefits may be of limited use in setting a lapse assumption for contracts with in-the-money or at-the-money guaranteed living benefits. Such experience may only be used if it is appropriate (e.g., lapse experience on contracts without a living benefit may have relevance to the early durations of contracts with living benefits) and relevant to the business.

H. Policy Loans

If policy loans are applicable for the block of business, the company shall determine cash flows for each projection interval for policy loan assets by modeling existing loan balances either explicitly or by substituting assets that are a proxy for policy loans (e.g., bonds, cash, etc.) subject to the following:

1. If the company substitutes assets that are a proxy for policy loans, the company must demonstrate that such substitution:
 - a. Produces reserves that are no less than those that would be produced by modeling existing loan balances explicitly.
 - b. Complies with the contract holder behavior requirements stated in Section 10.A to Section 10.G above in this section.
2. If the company models policy loans explicitly, the company shall:
 - a. Treat policy loan activity as an aspect of contract holder behavior and subject to the requirements above in this section.
 - b. Assign loan balances either to exactly match each policy's contract's utilization or to reflect average utilization over a model segment or sub-segments if the results are materially similar.
 - c. Model policy loan interest in a manner consistent with policy contract provisions and with the scenario. Include interest paid in cash as a positive policy loan cash flow in that projection interval, but do not include interest added to the loan balance as a policy loan cash flow. (The increased balance will require increased repayment cash flows in future projection intervals.)

Commented [CD317]: Okay to keep the term "Policy Loans"

Commented [X318]: Clarify reference to be more specific.

Commented [X319]: Editorial - VM-22 should consistently use contracts

Commented [CD320]: "contract's"

Commented [X321]: We have concern that reflecting average utilization may have material impact on benefit projections. Recommend adding "if the results are materially similar". This change is also applied to VM-20 and added to VM-21.

Commented [X322]: Editorial - VM-22 should consistently use contracts

Commented [CD323]: "contract"

- d. Model policy loan principal repayments, including those that occur automatically upon death or surrender. Include policy loan principal repayments as a positive policy loan cash flow, per Section 4.A.1.h.
- e. Model ~~additional~~ policy loan principal. Include additional policy loan principal as a negative policy loan cash flow, per Section 4.A.1.h (but do not include interest added to the loan balance as a negative policy loan cash flow).
- f. Model any investment expenses allocated to policy loans and include them either with negative policy loan cash flows or insurance expense cash flows.

Commented [CD324]: The wording of "additional" is unclear. Does this mean maintaining a certain level of policy loan utilization throughout the projection (i.e., adding principal as repayments are made), or actually increasing policy loan utilization (i.e., adding more principal) over time? The former would seem more appropriate than the latter.

Commented [X325]: Clarification

I. Non-Guaranteed Elements

Consistent with the definition in VM-01, Non-Guaranteed Elements (NGEs) are elements within a contract that affect ~~policy contract~~ costs or values and are not guaranteed or not determined at issue. NGEs consist of elements affecting contract holder costs or values that are both established and subject to change at the discretion of the insurer.

Commented [CD326]: suggest: "contract holder"

Commented [X327]: Editorial - VM-22 should consistently use contracts

Examples of NGEs specific to ~~non-variable~~ fixed annuities include but are not limited to the following: ~~fixed~~ the credited rates on fixed accounts, index parameters (caps, spreads, participation rates, etc.), rider fees, rider benefit features being subject to change (rollup rates, rollup period, etc.), account value charges, and dividends under participating policies or contracts.

Commented [CD328]: suggest: "are not"

Commented [CD329]: suggest: "non-variable annuities"

Commented [X330]: Clarity

- 1. Except as noted below in Section ~~10.H.5~~, the company shall include NGE in the models to project future cash flows beyond the time the company has authorized their payment or crediting.
- 2. The projected NGE shall reflect factors that include, but are not limited to, the following (not all of these factors will necessarily be present in all situations):
 - a. The nature of contractual guarantees.
 - b. The company's past NGE practices and established NGE policies.
 - c. The timing of any change in NGE relative to the date of recognition of a change in experience.
 - d. The benefits and risks to the company of continuing to authorize NGE.
- 3. Projected NGE shall be established based on projected experience consistent with how actual NGE are determined.
- 4. Projected levels of NGE in the cash-flow model must be consistent with the experience assumptions used in each scenario. Contract holder behavior assumptions in the model must be consistent with the NGE assumed in the model.
- 5. The company may exclude any portion of an NGE that:
 - a. Is not based on some aspect of the ~~policy's or~~ contract's experience.
 - b. Is authorized by the board of directors and documented in the board minutes, where the documentation includes the amount of the NGE that arises from other sources.

Commented [X331]: Correct section reference

Commented [CD332]: delete "policy's or"

However, if the board has guaranteed a portion of the NGE into the future, the company must model that amount. In other words, the company cannot exclude

Commented [X333]: Why does being authorized mean it can be excluded? This seems backwards. Does this mean it has already transpired?

from its model any NGE that the board has guaranteed for future years, even if it could have otherwise excluded them, based on this subsection.

6. The liability for contract holder dividends declared but not yet paid that has been established according to statutory accounting principles as of the valuation date is reported separately from the statutory reserve. The contract holder dividends that give rise to this dividend liability as of the valuation date may or may not be included in the cash-flow model at the company's option.
 - a. If the contract holder dividends that give rise to the dividend liability are not included in the cash-flow model, then no adjustment is needed to the resulting ~~aggregate stochastic reserve~~SR.
 - b. If the contract holder dividends that give rise to the dividend liability are included in the cash-flow model, then the resulting ~~aggregate stochastic reserve~~SR should be reduced by the amount of the dividend liability.
7. All projected cash flows associated with NGEs shall reflect margins for adverse deviations and estimation error in prudent estimate assumptions.

Commented [CD334]: delete "aggregate"

Commented [CD335]: delete "aggregate"

Section 11: Guidance and Requirements for Setting Prudent Estimate Mortality Assumptions

A. Overview

1. Intent

The guidance and requirements in this section apply to setting prudent estimate mortality assumptions when determining the ~~stochastic reserve SR~~. The intent is for prudent estimate mortality assumptions to be based on facts, circumstances and appropriate actuarial practice, with only a limited role for unsupported actuarial judgment. ~~(Where more than one approach to appropriate actuarial practice exists, the company should select the practice that the company deems most appropriate under the circumstances.)~~

Commented [X336]: Specific requirements will require further discussion, particularly what if any industry experience is identified for the SPA. Ideally, updated and appropriate assumptions should be used for better alignment and to avoid any false positives flagged as an outlier by the SPA.

Commented [VM22337R336]: Will address SPA separately

2. Description

Prudent estimate mortality assumptions shall be determined by first developing expected mortality curves based on either available experience or published tables. Where necessary, margins shall be applied to the experience to reflect data uncertainty. The expected mortality curves shall then be adjusted based on the credibility of the experience used to determine the expected mortality curve. Section 11.B addresses guidance and requirements for determining expected mortality curves, and Section 11.C addresses guidance and requirements for adjusting the expected mortality curves to determine prudent estimate mortality.

Commented [X338]: Recommend removing reference to actuarial judgment being "unsupported" from VM-21 and VM-22 because actuarial judgment should always be supportable - it is "judgment" not an arbitrary decision.

Finally, the credibility-adjusted tables shall be adjusted for mortality improvement (where such adjustment is permitted or required) using the guidance and requirements in Section 11.D.

3. Business Segments

For purposes of setting prudent estimate mortality assumptions, the products falling under the scope of these requirements shall be grouped into business segments with different mortality assumptions. The grouping, at a minimum, should differentiate between payout annuities or deferred annuity contracts that contain GLBs, and deferred annuity contracts with no guaranteed benefits or only GMDBs. Where appropriate, the grouping should also differentiate between segments which are known or expected to contain contract holders with sociodemographic, geographic, or health factors reasonably expected to impact the mortality assumptions for the segment (e.g., annuitants drawn from different countries, geographic areas, industry groups, or impaired lives on individually underwritten contracts such as structured settlements). The grouping should also generally follow the pricing, marketing, management and/or reinsurance programs of the company.

Guidance Note: This paragraph contemplates situations where it may be appropriate to differentiate mortality assumptions by segment or even by contract due to varying sociodemographic, geographic, or health factors. Particularly, though not exclusively, in the context of group payout annuity contracts, companies may have credible, contract-specific mortality experience data or relevant pooled data from annuitants drawn from similar industries or geographies that may be used to sub-divide inforce blocks into business segments for purposes of setting prudent estimate mortality assumptions.

For example, a company may sell group PRT contracts both to union plans in the U.S. and to private single-employer plans in another country. While both are "PRT contracts," it would be appropriate to differentiate them for mortality assumption purposes, similar to

how payout annuities vs. deferred annuities are distinguished.

Guidance Note: Distinct mortality or liability assumptions among different contracts within a group of contracts does not in itself preclude the group of contracts from being aggregated for the purposes of the broader stochastic reserve calculation.

4. Margin for Data Uncertainty

The expected mortality curves that are determined in Section 11.B may need to include a margin for data uncertainty. The margin could be in the form of an increase or a decrease in mortality, depending on the business segment under consideration. The margin shall be applied in a direction (i.e., increase or decrease in mortality) that results in a higher reserve. A sensitivity test may be needed to determine the appropriate direction of the provision for uncertainty to mortality. The test could be a prior year mortality sensitivity analysis of the business segment or an examination of current representative cells of the segment.

For purposes of this section, if mortality must be increased (decreased) to provide for uncertainty, the business segment is referred to as a ~~plus (minus)~~ mortality (longevity) segment.

It may be necessary, because of a change in the mortality risk profile of the segment, to reclassify a business segment from a ~~mortality (longevity) plus (minus)~~ segment to a ~~longevity (mortality) minus (plus)~~ segment to the extent compliance with this section requires such a reclassification. For example, a segment could require reclassification depending on whether it is gross or net of reinsurance.

Commented [X339]: Recommend deleting this guidance note since it is unnecessary - there is no such restriction for any of VM-20, VM-21 or VM-22. It would be an absurd level of granular distinction, such that it is not clear you could actually perform the projection, given that assumptions vary by attained age, etc.

Commented [X340]: Terming the segments "mortality (longevity) segments" would be easier to understand than "plus (minus) segments".

B. Determination of Expected Mortality Curves

1. Experience Data

In determining expected mortality curves, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience). See Section 11.B.2 for additional considerations. Finally, if there is no data, the company shall use the applicable table, as required in Section 11.B.3.

Commented [X341]: It is unclear how to interpretate the statement and how to review it for both VM-21 and VM-22. If a company reinsures GMWB riders, then does it mean that on a net basis the segment would no longer be considered as minus? So, there would be distinct designations for the pre and post reinsurance runs? Recommend discussing the statement and adding additional language or a guidance note to make it clear.

Commented [X342]: Delete period, it is a typo

2. Data Other Than Direct Experience

Adjustments shall be applied to the data to reflect differences between the business segments, and margins shall be applied to the adjusted expected mortality curves to reflect the data uncertainty associated with using data from a similar but not identical business segment.

To the extent the mortality of a business segment is reinsured, any mortality charges that are consistent with the company's own pricing and applicable to a substantial portion of the mortality risk also may be a reasonable starting point for the determination of the company's expected mortality curves.

3. No Data Requirements

Commented [X343]: Does this need to be edited to be consistent with "little or no" data?

- i. When little or no experience or information is available on a business segment, the company shall use expected mortality curves that would produce expected deaths no less than:

[2021 SOA Deferred Annuity Mortality Table] with [Projection Scale G2] for individual deferred annuities that do not contain guaranteed living benefits

$$q_x^{20XX+n} = q_x^{20XX}(1 - G2_x)^n$$

- ii. When little or no experience or information is available on a business segment, the company shall use expected mortality curves that would produce expected deaths no greater than:

- a. [The appropriate percentage (F_x) from Table 11.1 applied to the 2012 IAM Basic Mortality Table] with [Projection Scale G2] for individual payout annuity contracts and deferred annuity contracts with guaranteed living benefits

$$q_x^{2012+n} = q_x^{2012}(1 - G2_x)^n * F_x$$

- b. [1983 Table "a"] for structured settlements or other contracts with impaired mortality
- c. [1994 GAR Table] with [Projection Scale AA] for group annuities

$$q_x^{1994+n} = q_x^{1994}(1 - AA_x)^n$$

Table 11.1

Attained Age (x)	F _x	
<=65	80.0%	
66	81.5%	
67	83.0%	
68	84.5%	
69	86.0%	
70	87.5%	
71	89.0%	
72	90.5%	
73	92.0%	
74	93.5%	
75	95.0%	
76	96.5%	
77	98.0%	
78	99.5%	
79	101.0%	
80	102.5%	
81	104.0%	

Commented [X344]: Section 11.B.3.i only has one item "a". There is no need to specifically have a single item "a". Recommend delete the notation "a" and have "Section 11.B.3.i" only.

Commented [VM22345R344]: Will be updated upon SPA assumption development

Commented [X346]: For PRT an assumption based on a third-party data provider would be better than the industry table to get contract specific mortality assumptions. Is this permitted? The guidance note in A.3 seems to get at this, but it's not clear in B.3.ii.c whether this is allowed. This is an important distinction as PRT population can vary from those populations the tables are based upon.

Commented [X347]: The 1983 Table "a" and 1994 GAR are used for structured settlements and group annuities, respectively. These tables seem to be out of date. If Standard Projected Amount work develops more granular and up to date tables, should these tables be updated to use consistent tables?

Commented [VM22348R347]: Will be updated upon SPA assumption development

Commented [X349]: The percentage factors (F_x) are over 100% from attained age 79 to age 104. Is it appropriate to set the factors above 100% for the older ages with no credibility?

Commented [VM22350R349]: Will be updated upon SPA assumption development

Commented [CD351]: does the F_x factor need any consideration for FIAs with GLBs?

Commented [VM22352R351]: Will be updated upon SPA assumption development

82	105.5%	
83	107.0%	
84	108.5%	
85	110.0%	
86	110.0%	
87	110.0%	
88	110.0%

92	110.0%	
93	110.0%	
94	110.0%	
95	110.0%	
96	109.0%	
97	108.0%	
98	107.0%	
99	106.0%	
100	105.0%	
101	104.0%	
102	103.0%	
103	102.0%	
104	101.0%	
>=105	100.0%	

iii. For a business segment with non-U.S. insureds, when little or no experience or information is available on a business segment, an established industry or national mortality table and mortality improvement scale may be used, with approval from the domiciliary commissioner.

Commented [X353]: The phrase “When little or no experience or information is available on a business segment” is not included, unlike in (i) and (ii) of the same sub-section. It appears to be the intent that this is the only situation in which this would apply, but it would be helpful to make this explicit.

4. Additional Considerations Involving Data

The following considerations shall apply to mortality data specific to the business segment for which assumptions are being determined (i.e., direct data discussed in Section 11.B.1 or other than direct data discussed in Section 11.B.2).

Commented [X354]: Reference to the MI scale missing for international business

a. Underreporting of Deaths

Mortality data shall be examined for possible underreporting of deaths. Adjustments shall be made to the data if there is any evidence of underreporting. Alternatively, exposure by lives or amounts on contracts for which death benefits were in the money may be used to determine expected mortality curves. Underreporting on such exposures should be minimal; however, this reduced subset of data will have less credibility.

b. Experience by Contract Duration

Experience of a plus segment shall be examined to determine if mortality by contract duration increases materially due to selection at issue. In the absence of information, the company shall assume that expected mortality will increase by

contract duration for an appropriate select period. As an alternative, if the company determines that mortality is affected by selection, the company could apply margins to the expected mortality in such a way that the actual mortality modeled does not depend on contract duration.

c. Modification and Relevance of Data

Even for a large company, the quantity of life exposures and deaths are such that a significant amount of smoothing may be required to determine expected mortality curves from mortality experience. Expected mortality curves, when applied to the recent historic exposures (e.g., three to seven years), should not result in an estimate of aggregate number of deaths less (greater) than the actual number deaths during the exposure period for plus (minus) segments.

In determining expected mortality curves (and the credibility of the underlying data), older data may no longer be relevant. The “age” of the experience data used to determine expected mortality curves should be documented.

d. Other Considerations

In determining expected mortality curves, consideration should be given to factors that include, but are not limited to, trends in mortality experience, trends in exposure, volatility in year-to-year A/E mortality ratios, mortality by lives relative to mortality by amounts, changes in the mix of business and product features that could lead to mortality selection.

C. Adjustment for Credibility to Determine Prudent Estimate Mortality

1. Adjustment for Credibility

The expected mortality curves determined in Section 11.B shall be adjusted based on the credibility of the experience used to determine the curves in order to arrive at prudent estimate mortality. The adjustment for credibility shall result in blending the expected mortality curves including margins for uncertainty with the mortality assumption assumptions described in Section 11.B.3. The approach used to adjust the curves shall suitably account for credibility.

Guidance Note: For example, when credibility is zero, an appropriate approach should result in a mortality assumption consistent with 100% of the industry mortality assumption described in Section 11.B.3 table used in the blending.

2. Adjustment of Statutory Valuation Industry Mortality for Improvement

For purposes of the adjustment for credibility, the industry mortality table for a plus segment may be and the industry mortality table for a minus segment must be adjusted for mortality improvement. Such adjustment shall reflect the mortality improvement scale described in Section 11.B.3 from the effective date of the respective industry mortality table to the experience weighted average date underlying the data used to develop the expected mortality curves.

3. Credibility Procedure

The credibility procedure used shall:

- a. Produce results that are reasonable.

Commented [X355]: Both plan and industry data should get weighted for business such as PRT. This text says to blend with prescribed tables, but that might not make sense unless additional experience data was unavailable.

Commented [X356]: Clarification

Commented [X357]: Editorial

Commented [X358]: The “statutory valuation” is struck out in the guidance note. Recommend replacing “statutory valuation” with either “reference of Section 11.B.3” or “industry”. Otherwise, it is a vague reference since we have both a company mortality table and an industry mortality table.

Commented [CD359]: need to reference “the mortality assumption described in Section 11.B.3” here? Otherwise, the sentence is unclear.

Commented [X360]: Mortality improvement should be consistent with the underlying tables used, so we would suggest this being based on available experience subject to appropriate guardrails.

Commented [X361]: “Statutory Valuation” was stricken from all the body, but left in this title. Consider replacing with “industry”.

Commented [CD362]: for consistency, need to delete this reference to “Statutory Valuation”

- b. Not tend to bias the results in any material way.
 - c. Be practical to implement.
 - d. Give consideration to the need to balance responsiveness and stability.
 - e. Take into account not only the level of aggregate claims but the shape of the mortality curve.
 - f. Contain criteria for full credibility and partial credibility that have a sound statistical basis and be appropriately applied.
4. Further Adjustment of the Credibility-Adjusted Table for Mortality Improvement

The credibility-adjusted table used for plus segments may be and the credibility adjusted table used for minus segments must be adjusted for mortality improvement using the applicable mortality improvement scale described in Section 11.B.3 from the experience weighted average date underlying the company experience used in the credibility process to the valuation date.

Any adjustment for mortality improvement beyond the valuation date is discussed in Section 11.D.

D. Future Mortality Improvement

The mortality assumption resulting from the requirements of Section 11.C shall be adjusted for mortality improvements beyond the valuation date if such an adjustment would serve to increase the resulting ~~stochastic reserve~~SR. If such an adjustment would reduce the ~~stochastic reserve~~SR, such assumptions are permitted, but not required. In either case, the assumption must be based on current relevant data with a margin for uncertainty (increasing assumed rates of improvement if that results in a higher reserve or reducing them otherwise).

Section 12: Other Guidance and Requirements for Assumptions

A. Overview

This section provides guidance and requirements in general for setting prudent estimate assumptions when determining either the SR or DR. It also provides specific guidance and requirements for expense assumptions.

B. General Assumption Requirements

1. The company shall use prudent estimate assumptions for risk factors that are not stochastically modeled by applying margins to the anticipated experience assumptions if such risk factors have been categorized as material risks by following Section 1.B Principle 3 and requirements in Section 12.C.
2. The company shall establish the prudent estimate assumptions for risk factors in compliance with the requirements in Section 12 of Model #820 and must periodically review and update the assumptions as appropriate in accordance with these requirements.
3. The company shall model the following risk factors stochastically unless the company elects the stochastic modeling exclusion defined in Section 7:
 - a. Interest rate movements (i.e., Treasury interest rate curves).
 - b. Equity performance (e.g., Standard & Poor’s 500 index [S&P 500] returns and returns of other equity investments).
4. If the company elects to stochastically model risk factors in addition to the economic scenarios, the requirements in this section for determining prudent estimate assumptions for these risk factors do not apply.

Guidance Note: It is expected that companies will not stochastically model risk factors other than the economic scenarios, such as contract holder behavior or mortality, until VM-22 has more specific guidance and requirements available. Companies shall discuss with domiciliary regulators if they wish to stochastically model other risk factors.

5. The company shall use its own experience, if relevant and credible, to establish an anticipated experience assumption for any risk factor. To the extent that company experience is not available or credible, the company may use industry experience or other data to establish the anticipated experience assumption, making modifications as needed to reflect the circumstances of the company.
 - a. For risk factors (such as mortality) to which statistical credibility theory may be appropriately applied, the company shall establish anticipated experience assumptions for the risk factor by combining relevant company experience with industry experience data, tables or other applicable data in a manner that is consistent with credibility theory and accepted actuarial practice.

Commented [X363]: We believe discussion of allocation of aggregate reserves should be analyzed as part of the field study.

Commented [X364]: Need to add a Section 12 for general guidance on prudent assumption setting and on expenses. For VM-21, APF 2021-11 is currently exposed. Should be consistent with that APF, after any tweaks are made.
https://content.naic.org/sites/default/files/inline-files/APF%202021-11%20VM21%20assumptions_20211021-exposed.docx

- b. For risk factors (such as utilization of guaranteed living benefits) that do not lend themselves to the use of statistical credibility theory, and for risk factors (such as some of the lapse assumptions) to which statistical credibility theory can be appropriately applied but cannot currently be applied due to lack of industry data, the company shall establish anticipated experience assumptions in a manner that is consistent with accepted actuarial practice and that reflects any available relevant company experience, any available relevant industry experience, or any other experience data that are available and relevant. Such techniques include:
- i. Adopting standard assumptions published by professional, industry or regulatory organizations to the extent they reflect any available relevant company experience or reasonable expectations.
 - ii. Applying factors to relevant industry experience tables or other relevant data to reflect any available relevant company experience and differences in expected experience from that underlying the base tables or data due to differences between the risk characteristics of the company experience and the risk characteristics of the experience underlying the base tables or data.
 - iii. Blending any available relevant company experience with any available relevant industry experience and/or other applicable data using weightings established in a manner that is consistent with accepted actuarial practice and that reflects the risk characteristics of the underlying contracts and/or company practices.
- c. For risk factors that have limited or no experience or other applicable data to draw upon, the assumptions shall be established using sound actuarial judgment and the most relevant data available, if such data exists.
- d. For any assumption that is set in accordance with the requirements of Section 12.B.5.c, the qualified actuary to whom responsibility for this group of contracts is assigned shall use sensitivity testing and disclose the analysis performed to ensure that the assumption is set at the conservative end of the plausible range.
- e. The qualified actuary, to whom responsibility for this group of contracts is assigned, shall annually review relevant emerging experience for the purpose of assessing the appropriateness of the anticipated experience assumption. If the results of statistical or other testing indicate that previously anticipated experience for a given factor is inadequate, then the qualified actuary shall set a new, adequate, anticipated experience assumption for the factor.
6. The company shall sensitivity test risk factors that are not stochastically modeled and examine the impact on the stochastic reserve. The company shall update the sensitivity tests periodically as appropriate. The company may update the tests less frequently, but no less than every 3 years, when the tests show less sensitivity of the stochastic reserve to changes in the assumptions being tested or the experience is not changing rapidly. Providing there is no material impact on the results of the sensitivity testing, the company

may perform sensitivity testing:

- a. Using samples of the contracts in force rather than performing the entire valuation for each alternative assumption set.
- b. Using data from prior periods.

Guidance Note: Sensitivity testing every risk factor on an annual basis is not required. For some risk factors, it may be reasonable, in lieu of sensitivity testing, to employ statistical measures for margins, such as adding one or more standard deviations to the anticipated experience assumption.

- 7. The company shall vary the prudent estimate assumptions from scenario to scenario within the stochastic reserve calculation in an appropriate manner to reflect the scenario-dependent risks.

C. Assumption Margins

The company shall include margins to provide for adverse deviations and estimation error in the prudent estimate assumption for each risk factor that is not stochastically modeled or prescribed, subject to the following:

- 1. The level of margin applied to the anticipated experience assumptions may be determined in aggregate or independently as discussed in Section 1.B Principle 3. It is not permissible to set a margin less toward the conservative end of the spectrum to recognize, in whole or in part, implicit or prescribed margins that are present, or are believed to be present, in other risk factors.

Risks that are stochastically modeled (e.g., interest rates, equity returns) or have prescribed margins or guardrails (e.g., assets, revenue sharing) shall be considered material risks. Other risks generally considered to be material include, but are not limited to, mortality, contract holder behavior, maintenance and overhead expenses, inflation and implied volatility. In some cases, the list of material risks may also include acquisition expenses, partial withdrawals, policy loans, annuitizations, account transfers and deposits, and/or option elections that contain an element of anti-selection.

Commented [X365]: Edit for VM-22 vs. VM-21?

- 2. The greater the uncertainty in the anticipated experience assumption, the larger the required margin, with the margin added or subtracted as needed to produce a larger Sr or DR than would otherwise result. For example, the company shall use a larger margin when:
 - a. The experience data have less relevance or lower credibility.
 - b. The experience data are of lower quality, such as incomplete, internally inconsistent or not current.
 - c. There is doubt about the reliability of the anticipated experience assumption, such as, but not limited to, recent changes in circumstances or changes in company policies.
 - d. There are constraints in the modeling that limit an effective reflection of the risk factor.

3. In complying with the sensitivity testing requirements in Section 12.B.6 above, greater analysis and more detailed justification are needed to determine the level of uncertainty when establishing margins for risk factors that produce greater sensitivity on the stochastic reserve.
4. A margin is permitted but not required for assumptions that do not represent material risks.
5. A margin should reflect the magnitude of fluctuations in historical experience of the company for the risk factor, as appropriate.
6. The company shall apply the method used to determine the margin consistently on each valuation date but is permitted to change the method from the prior year if the rationale for the change and the impact on the stochastic reserve is disclosed.

D. Expense Assumptions

1. General Prudent Estimate Expense Assumption Requirements

In determining prudent estimate expense assumptions, the company:

- a. May spread certain information technology development costs and other capital expenditures over a reasonable number of years in accordance with accepted statutory accounting principles as defined in the Statements of Statutory Accounting Principles.

Guidance Note: Care should be taken with regard to the potential interaction with the inflation assumption below.

- b. Shall assume that the company is a going concern.
- c. Shall choose an appropriate expense basis that properly aligns the actual expense to the assumption. If values are not significant, they may be aggregated into a different base assumption.

Guidance Note: For example, death benefit expenses should be modeled with an expense assumption that is per death incurred.

- d. Shall reflect the impact of inflation.
- e. Shall not assume future expense improvements.
- f. Shall not include assumptions for federal income taxes (and expenses paid to provide fraternal benefits in lieu of federal income taxes) and foreign income taxes.
- g. Shall use assumptions that are consistent with other related assumptions.
- h. Shall use fully allocated expenses.

Guidance Note: Expense assumptions should reflect the direct costs associated with the block of contracts being modeled, as well as indirect costs and overhead costs that have been allocated to the modeled contracts.

- i. Shall allocate expenses using an allocation method that is consistent across

company lines of business. Such allocation must be determined in a manner that is within the range of actuarial practice and methodology and consistent with applicable ASOPs. Allocations may not be done for the purpose of decreasing the stochastic reserve.

- j. Shall reflect expense efficiencies that are derived and realized from the combination of blocks of business due to a business acquisition or merger in the expense assumption only when any future costs associated with achieving the efficiencies are also recognized.

Guidance Note: For example, the combining of two similar blocks of business on the same administrative system may yield some expense savings on a per unit basis, but any future cost of the system conversion should also be considered in the final assumption. If all costs for the conversion are in the past, then there would be no future expenses to reflect in the valuation.

- k. Shall reflect the direct costs associated with the contracts being modeled, as well as an appropriate portion of indirect costs and overhead (i.e., expense assumptions representing fully allocated expenses should be used), including expenses categorized in the annual statement as “taxes, licenses and fees” (Exhibit 3 of the annual statement) in the expense assumption.

- l. Shall include acquisition expenses associated with business in force as of the valuation date and significant non-recurring expenses expected to be incurred after the valuation date in the expense assumption.

- m. For contracts sold under a new policy form or due to entry into a new product line, the company shall use expense factors that are consistent with the expense factors used to determine anticipated experience assumptions for contracts from an existing block of mature contracts taking into account:

- i. Any differences in the expected long-term expense levels between the block of new contacts and the block of mature contracts.
- ii. That all expenses must be fully allocated as required under Section 12.D.1.h above.

2. Margins for Prudent Estimate Expense Assumptions

The company shall determine margins for expense assumptions following Section 12.C.

Section 13: Allocation of Aggregate Reserves to the Contract Level

Section 3.F states that the aggregate reserve shall be allocated to the contracts falling within the scope of these requirements. That allocation should be done for both the pre- and post-reinsurance ceded reserves. Contracts that have passed the stochastic exclusion test as defined in Section 7.B will not be included in the allocation of the aggregate reserve. For the purpose of this section, if a contract does not have a cash surrender value, then the cash surrender value is assumed to be zero.

Contracts for which the Deterministic Certification Option is elected in Section 7.E are intended to use the methodology described in this section to allocate aggregate reserves in excess of the cash surrender value to individual contracts.

The contract-level reserve for each contract shall be the sum of the following:

- A. The contract’s cash surrender value.

Drafting Note: The American Academy of Actuaries Annuity Reserves and Capital Work Group is including two potential options for allocating the excess portion of the aggregate reserve over cash surrender value: (1) Use the same approach as VM-21 (2) Allocate based on an actuarial present value calculation.

The Work Group did not reach a consensus between these two approaches, so wording for both is included in the text below. The Work Group recommends field testing both approaches and considering the results in determining future decisions.

Option 1: VM-21 Approach

- B. An allocated portion of the excess of the aggregate reserve over the aggregate cash surrender value shall be allocated to each contract based on a measure of the risk of that product relative to its cash surrender value in the context of the company’s in force contracts (assuming zero cash value for contracts that do not contain such). The allocation shall be made separately for DR and SR. The measure of risk should consider the impact of risk mitigation programs, including hedge programs and reinsurance, that would affect the risk of the product. The specific method of assessing that risk and how it contributes to the company’s aggregate reserve shall be defined by the company. The method should provide for an equitable allocation based on risk analysis.

Commented [X366]: This method only makes sense if done separately for the DR and SR.

- 1. As an example, consider a company with the results of the following three contracts:

Table 12.1: Sample Allocation of Aggregate Reserve

Contract (i)	1	2	3	Total
Cash Surrender Value, C	28	40	52	120
Risk adjusted measure, R	38	52	50	
Aggregate Reserve				140
Allocation Basis for the excess of the Aggregate Reserve over the Cash Surrender Value $A_i = \text{Max}(R_i - C_i, 0)$	10	12	0	22

Allocation of the excess of the Aggregate Reserve over the Cash Surrender Value $Li = (Ai)/\sum Ai * [Aggregate Reserve - \sum Ci]$	9.09	10.91	0.00	20
Contract-level reserve $C_i + Li$	37.09	50.91	52.00	140.00

2. In this example, the Aggregate Reserve exceeds the aggregate Cash Surrender Value by 20. The 20 is allocated proportionally across the three contracts based on the allocation basis of the larger of (i) zero; and (ii) a risk adjusted measure based on reserve principles. Therefore, contracts 1 and 2 receive 45% (9/22) and 55% (11/22), respectively, of the excess Aggregate Reserve. As Contract 3 presents no risk in excess of its cash surrender value, it does not receive an allocation of the excess Aggregate Reserve.

Option 2: Actuarial Present Value Approach

- B. The excess of the aggregate reserve over the aggregate cash surrender value is allocated to policies based on a calculation of the actuarial present value of projected liability cash flows in excess of the cash surrender value:
 1. Discount the liability cash flows at the NAER, pursuant to requirements in Section 4, for the scenario that produces the scenario reserve closest to, but not less than the ~~stochastic reserve~~ SR defined in Section 3.D.
 - a. Groups of contracts that elect the Deterministic Certification Option defined in Section 7.E shall use the NAER in the single scenario used to calculate the reserve to discount liability cash flows, as well as any cash flows that are scenario dependent.
 2. If the actuarial present value is less than the cash surrender value, then the excess actuarial present value to be used for allocating the excess aggregate reserve over the cash value shall be floored at zero.
 - a. If all contracts have an excess actuarial present value that is floored at zero, then use the cash surrender value to allocate any excess aggregate reserve over the aggregate cash surrender value.
 3. For projecting future liability cash flows, assume the same liability assumptions that were used to calculate the ~~stochastic reserve~~ SR defined in Section 3.D.
 4. As a hypothetical example, consider a company with the results of the following five contracts:

Commented [X367]: This method depends on the NAER, so would not work for companies that use direct iteration.

Commented [X368]: This could give an unstable allocation if there is an even mix of products with different risk profiles, so that the tail is populated with some scenarios where Product A does poorly and some where Product B does poorly. The single scenario will only reflect the riskiness of one of the products.

Commented [X369]: Not just the NAER, but the cashflows are also scenario dependent.

Commented [CD370]: "Section 3.D"

Table 12.1: Hypothetical Sample Allocation of Aggregate Reserve

Contract	Example Product Type	CSV* (1)	Scenario APV (2)	Excess (Floored) of the scenario APV over CSV* (3) = $\text{Max}[(2)-(1), 0]$	Aggregate Reserve CTE 70 (4)	Excess of Aggregate Reserve over Aggregate CSV* (5) = $\text{Max}[(4 \text{ Total}) - (1 \text{ Total}), 0]$	Allocated Excess Reserve (6) = (3) x $[(5 \text{ Total}) / (3 \text{ Total})]$	Total Contract Level Reserve (7) = (1) + (6)
Contract 1:	Indexed Annuity with no GLWB**	95.0	90.0	0.0			0.0	95.0
Contract 2:	Indexed Annuity with low benefit GLWB**	92.0	95.0	3.0			3.6	95.6
Contract 3:	Indexed Annuity with medium benefit GLWB**	90.0	100.0	10.0			12.0	102.0
Contract 4:	Indexed Annuity with high benefit GLWB**	88.0	105.0	17.0			20.4	108.4
Contract 5:	Fixed Life Contingent Payout Annuity	0.0	70.0	70.0			84.0	84.0
Total		365.0		100.0	485.0	120.0	120.0	485.0

Commented [CD371]: should be "Max[(2)-(1), 0]"

*Cash Surrender Value
**Guaranteed Lifetime Withdrawal Benefit

Guidance Note: The actuarial present value (APV) in the section above is separate from the Guarantee Actuarial Present Value (GAPV) referred to in the additional standard projection amount calculation in VM-21. The GAPV is only applicable to guaranteed minimum benefits and uses prescribed liability assumptions. In contrast, the APV in this section applies to the entire contract, irrespective of whether guaranteed benefits are attached, and uses company prudent estimate liability assumptions.

Section ~~13~~14: Statutory Maximum Valuation Interest Rates for Income Annuity Formulaic Reserves

A. Purpose and Scope

1. These requirements define for single premium immediate annuity contracts and other similar contracts, certificates and contract features the statutory maximum valuation interest rate that complies with Model #820. These are the maximum interest rate assumption requirements to be used in the CARVM and for certain contracts, the CRVM. These requirements do not preclude the use of a lower valuation interest rate assumption by the company if such assumption produces statutory reserves at least as great as those calculated using the maximum rate defined herein.
2. The following categories of contracts, certificates and contract features, whether group or individual, including both life contingent and term certain only contracts, directly written or assumed through reinsurance, with the exception of benefits arising from variable annuities, ~~are covered in this section, and all contracts not passing the SET covered by Sections 1 through 13 of VM-22, are covered Section 14 of VM-22:~~
 - a. Immediate annuity contracts issued after Dec. 31, 2017;
 - b. Deferred income annuity contracts issued after Dec. 31, 2017;
 - c. Structured settlements in payout or deferred status issued after Dec. 31, 2017;
 - d. Fixed payout annuities resulting from the exercise of settlement options or annuitizations of host contracts issued after Dec. 31, 2017;
 - e. Fixed payout annuities resulting from the exercise of settlement options or annuitizations of host contracts issued during 2017, for fixed payouts commencing after Dec. 31, 2018, or, at the option of the company, for fixed payouts commencing after Dec. 31, 2017;
 - f. Supplementary contracts, excluding contracts with no scheduled payments (such as retained asset accounts and settlements at interest), issued after Dec. 31, 2017;
 - g. Fixed income payment streams, attributable to contingent deferred annuities (CDAs) issued after Dec. 31, 2017, once the underlying contract funds are exhausted;
 - h. Fixed income payment streams attributable to guaranteed living benefits associated with deferred annuity contracts issued after Dec. 31, 2017, once the contract funds are exhausted; and
 - i. Certificates with premium determination dates after Dec. 31, 2017, emanating from non-variable group annuity contracts specified in Model #820, Section 5.C.2, purchased for the purpose of providing certificate holders benefits upon their retirement.

Commented [X372]: Under A.2: need to exclude contracts being covered by the earlier sections of VM-22 not passing the exclusion tests and need a clearer reference instead of "covered in this section"

Guidance Note: For Section ~~13~~14.A.2.d, Section ~~13~~14.A.2.e, Section ~~13~~14.A.2.f and Section ~~13~~14.A.2.h above, there is no restriction on the type of contract that may give rise to the benefit.

3. Exemptions:
 - a. With the permission of the domiciliary commissioner, for the categories of annuity contracts, certificates and/or contract features in scope as outlined in Section ~~13~~14.A.2.d, Section ~~13~~14.A.2.e, Section ~~13~~14.A.2.f, Section ~~13~~14.A.2.g or Section ~~13~~14.A.2.h, the

company may use the same maximum valuation interest rate used to value the payment stream in accordance with the guidance applicable to the host contract. In order to obtain such permission, the company must demonstrate that its investment policy and practices are consistent with this approach.

4. The maximum valuation interest rates for the contracts, certificates and contract features within the scope of Section ~~13~~14 of VM-22 supersede those described in Appendix VM-A and Appendix VM-C, but they do not otherwise change how those appendices are to be interpreted. In particular, *Actuarial Guideline IX-B—Clarification of Methods Under Standard Valuation Law for Individual Single Premium Immediate Annuities, Any Deferred Payments Associated Therewith, Some Deferred Annuities and Structured Settlements Contracts* (AG-9-B) (see VM-C) provides guidance on valuation interest rates and is, therefore, superseded by these requirements for contracts, certificates and contract features in scope. Likewise, any valuation interest rate references in *Actuarial Guideline IX-C—Use of Substandard Annuity Mortality Tables in Valuing Impaired Lives Under Individual Single Premium Immediate Annuities* (AG-9-C) (see VM-C) are also superseded by these requirements.

B. Definitions

1. The term “reference period” means the length of time used in assigning the Valuation Rate Bucket for the purpose of determining the statutory maximum valuation interest rate and is determined as follows:
 - a. For contracts, certificates or contract features with life contingencies and substantially similar payments, the reference period is the length of time, rounded to the nearest year, from the premium determination date to the earlier of: i) the date of the last non-life-contingent payment under the contract, certificate or contract feature; and ii) the date of the first life-contingent payment under the contract, certificate or contract feature, or
 - b. For contracts, certificates or contract features with no life-contingent payments and substantially similar payments, the reference period is the length of time, rounded to the nearest year, from the premium determination date to the date of the last non-life-contingent payment under the contract, certificate or contract feature, or
 - c. For contracts, certificates or contract features where the payments are not substantially similar, the actuary should apply prudent judgment and select the Valuation Rate Bucket with Macaulay duration that is a best fit to the Macaulay duration of the payments in question.

Guidance Note: Contracts with installment refunds or similar features should consider the length of the installment period calculated from the premium determination date as the non-life contingent period for the purpose of determining the reference period.

Guidance Note: The determination in Section ~~13~~14.B.1.c above shall be made based on the materiality of the payments that are not substantially similar relative to the life-contingent payments.

2. The term “jumbo contract” means a contract with an initial consideration equal to or greater than \$250 million. Considerations for contracts issued by an insurer to the same contract holder within 90 days shall be combined for purposes of determining whether the contracts meet this threshold.

Guidance Note: If multiple contracts meet this criterion in aggregate, then each contract is a jumbo contract.

3. The term “non-jumbo contract” means a contract that does not meet the definition of a jumbo contract.
4. The term “premium determination date” means the date as of which the valuation interest rate for the contract, certificate or contract feature being valued is determined.
5. The term “initial age” means the age of the annuitant as of his or her age last birthday relative to the premium determination date. For joint life contracts, certificates or contract features, the “initial age” means the initial age of the younger annuitant. If a contract, certificate or contract feature for an annuitant is being valued on a standard mortality table as an impaired annuitant, “initial age” means the rated age. If a contract, certificate or contract feature is being valued on a substandard mortality basis, “initial age” means an equivalent rated age.
6. The term “Table X spreads” means the prescribed VM-22 Section ~~13~~¹⁴ current market benchmark spreads for the quarter prior to the premium determination date, as published on the Industry tab of the NAIC website. The process used to determine Table X spreads is the same as that specified in VM-20 Appendix 2.D for Table F, except that JP Morgan and Bank of America bond spreads are averaged over the quarter rather than the last business day of the month.
7. The term “expected default cost” means a vector of annual default costs by weighted average life. This is calculated as a weighted average of the VM-20 Table A prescribed annual default costs published on the Industry tab of the NAIC website in effect for the quarter prior to the premium determination date, using the prescribed portfolio credit quality distribution as weights.
8. The term “expected spread” means a vector of spreads by weighted average life. This is calculated as a weighted average of the Table X spreads, using the prescribed portfolio credit quality distribution as weights.
9. The term “prescribed portfolio credit quality distribution” means the following credit rating distribution:
 - a. 5% Treasuries
 - b. 15% Aa bonds (5% Aa1, 5% Aa2, 5% Aa3)
 - c. 40% A bonds (13.33% A1, 13.33% A2, 13.33% A3)*
 - d. 40% Baa bonds (13.33% Baa1, 13.33% Baa2, 13.33% Baa3)*

*40%/3 is used unrounded in the calculations.

C. Determination of the Statutory Maximum Valuation Interest Rate

1. Valuation Rate Buckets
 - a. For the purpose of determining the statutory maximum valuation interest rate, the contract, certificate or contract feature being valued must be assigned to one of four Valuation Rate Buckets labeled A through D.
 - b. If the contract, certificate or contract feature has no life contingencies, the Valuation Rate Bucket is assigned based on the length of the reference period (RP), as follows:

Table 3-1: Assignment to Valuation Rate Bucket by Reference Period Only

RP ≤ 5 Years	5Y < RP ≤ 10Y	10Y < RP ≤ 15Y	RP > 15Y
A	B	C	D

- c. If the contract, certificate or contract feature has life contingencies, the Valuation Rate Bucket is assigned based on the length of the RP and the initial age of the annuitant, as follows:

Table 3-2: Assignment to Valuation Rate Bucket by Reference Period and Initial Age

Initial Age	RP ≤ 5Y	5Y < RP ≤ 10Y	10Y < RP ≤ 15Y	RP > 15Y
90+	A	B	C	D
80–89	B	B	C	D
70–79	C	C	C	D
< 70	D	D	D	D

2. Premium Determination Dates

- a. The following table specifies the decision rules for setting the premium determination date for each of the contracts, certificates and contract features listed in Section 1:

Table 3-3: Premium Determination Dates

Section	Item Description	Premium determination date
A.2.a	Immediate annuity	Date consideration is determined and committed to by contract holder
A.2.b	Deferred income annuity	Date consideration is determined and committed to by contract holder
A.2.c	Structured settlements	Date consideration is determined and committed to by contract holder
A.2.d and A.2.e	Fixed payout annuities resulting from settlement options or annuitizations from host contracts	Date consideration for benefit is determined and committed to by contract holder
A.2.f	Supplementary contracts	Date of issue of supplementary contract
A.2.g	Fixed income payment streams from CDAs, AV becomes 0	Date on which AV becomes 0
A.2.h	Fixed income payment streams from guaranteed living benefits, AV becomes 0	Date on which AV becomes 0

A.2.i	Group annuity and related certificates	Date consideration is determined and committed to by contract holder
-------	--	--

Guidance Note: For the purposes of the items in the table above, the phrase “date consideration is determined and committed to by the contract holder” should be interpreted by the company in a manner that is consistent with its standard practices. For some products, that interpretation may be the issue date or the date the premium is paid.

b. Immaterial Change in Consideration

If the premium determination date is based on the consideration, and if the consideration changes by an immaterial amount (defined as a change in present value of less than 10% and less than \$1 million) subsequent to the original premium determination date, such as due to a data correction, then the original premium determination date shall be retained. In the case of a group annuity contract where a single premium is intended to cover multiple certificates, certificates added to the contract after the premium determination date that do not trigger the company’s right to reprice the contract shall be treated as if they were included in the contract as of the premium determination date.

3. Statutory Maximum Valuation Interest Rate

- a. For a given contract, certificate or contract feature, the statutory maximum valuation interest rate is determined based on its assigned Valuation Rate Bucket (Section 1314.C.1) and its Premium Determination Date (Section 1314.C.2) and whether the contract associated with it is a jumbo contract or a non-jumbo contract.
- b. Statutory maximum valuation interest rates for jumbo contracts are determined and published daily by the NAIC on the Industry tab of the NAIC website. For a given premium determination date, the statutory maximum valuation interest rate is the daily statutory maximum valuation interest rate published for that premium determination date.
- c. Statutory maximum valuation interest rates for non-jumbo contracts are determined and published quarterly by the NAIC on the Industry tab of the NAIC website by the third business day of the quarter. For a given premium determination date, the statutory maximum valuation interest rate is the quarterly statutory maximum valuation interest rate published for the quarter in which the premium determination date falls.

d. Quarterly Valuation Rate:

For each Valuation Rate Bucket, the quarterly valuation rate is defined as follows:

$$I_q = R + S - D - E$$

Where:

- a. R is the reference rate for that Valuation Rate Bucket (defined in Section 1314.C.4);
- b. S is the spread rate for that Valuation Rate Bucket (defined in Section 1314.C.5);
- c. D is the default cost rate for that Valuation Rate Bucket (defined in Section 1314.C.6);

and

d. E is the spread deduction defined as 0.25%.

e. Daily Valuation Rate:

For each Valuation Rate Bucket, the daily valuation rate is defined as follows:

$$I_d = I_q + C_{d-1} - C_q$$

Where:

- a. I_q is the quarterly valuation rate for the calendar quarter preceding the business day immediately preceding the premium determination date;
- b. C_{d-1} is the daily corporate rate (defined in Section ~~13~~14.C.7) for the business day immediately preceding the premium determination date; and
- c. C_q is the average daily corporate rate (defined in Section ~~13~~14.C.8) corresponding to the same period used to develop I_q .

For jumbo contracts, the daily statutory maximum valuation interest rate is the daily valuation rate (I_d) rounded to the nearest one-hundredth of one percent (1/100 of 1%).

4. Reference Rate

Reference rates are updated quarterly as described below:

- a. The “quarterly Treasury rate” is the average of the daily Treasury rates for a given maturity over the calendar quarter prior to the premium determination date. The quarterly Treasury rate is downloaded from <https://fred.stlouisfed.org>, and is rounded to two decimal places.
- b. Download the quarterly Treasury rates for two-year, five-year, 10-year and 30-year U.S. Treasuries.
- c. The reference rate for each Valuation Rate Bucket is calculated as the weighted average of the quarterly Treasury rates using Table 1 weights (defined in Section ~~13~~14.C.9) effective for the calendar year in which the premium determination date falls.

5. Spread

The spreads for each Valuation Rate Bucket are updated quarterly as described below:

- a. Use the Table X spreads from the NAIC website for WALs two, five, 10 and 30 years only to calculate the expected spread.
- b. Calculate the spread for each Valuation Rate Bucket, which is a weighted average of the expected spreads for WALs two, five, 10 and 30 using Table 2 weights (defined in Section 3.I) effective for the calendar year in which the premium determination date falls.

6. Default costs for each Valuation Rate Bucket are updated annually as described below:

- a. Use the VM-20 prescribed annual default cost table (Table A) in effect for the quarter prior to the premium determination date for WAL two, WAL five and WAL 10 years only to calculate the expected default cost. Table A is updated and published annually on

the Industry tab of the NAIC website during the second calendar quarter and is used for premium determination dates starting in the third calendar quarter.

- b. Calculate the default cost for each Valuation Rate Bucket, which is a weighted average of the expected default costs for WAL two, WAL five and WAL 10, using Table 3 weights (defined in Section 4314.C.9) effective for the calendar year in which the premium determination date falls.

7. Daily Corporate Rate

Daily corporate rates for each valuation rate bucket are updated daily as described below:

- a. Each day, download the Bank of America Merrill Lynch U.S. corporate effective yields as of the previous business day’s close for each index series shown in the sample below from the St. Louis Federal Reserve website: <https://research.stlouisfed.org/fred2/categories/32348>. To access a specific series, search the St. Louis Federal Reserve website for the series name by inputting the name into the search box in the upper right corner, or input the following web address: [https://research.stlouisfed.org/fred2/series/\[replace with series name from the table below\]](https://research.stlouisfed.org/fred2/series/[replace with series name from the table below]).

Table 3-4: Index Series Names

Maturity	Series Name
1Y – 3Y	BAMLC1A0C13YEY
3Y – 5Y	BAMLC2A0C35YEY
5Y – 7Y	BAMLC3A0C57YEY
7Y – 10Y	BAMLC4A0C710YEY
10Y – 15Y	BAMLC7A0C1015YEY
15Y+	BAMLC8A0C15PYEY

- b. Calculate the daily corporate rate for each valuation rate bucket, which is a weighted average of the Bank of America Merrill Lynch U.S. corporate effective yields, using Table 4 weights (defined in Section 4314.C.9) effective for the calendar year in which the business date immediately preceding the premium determination date falls.

8. Average Daily Corporate Rate

Average daily corporate rates are updated quarterly as described below:

- a. Download the quarterly average Bank of America Merrill Lynch U.S. corporate effective yields for each index series shown in Section 3.G.1 from the St. Louis Federal Reserve website: <https://research.stlouisfed.org/fred2/categories/32348>. To access a specific series, search the St. Louis Federal Reserve website for the series name by inputting the name into the search box in the upper right corner, or input the following web address: [https://research.stlouisfed.org/fred2/series/\[replace with series name from Section 4314.C.7.a\]](https://research.stlouisfed.org/fred2/series/[replace with series name from Section 4314.C.7.a]).

- b. Calculate the average daily corporate rate for each valuation rate bucket, which is a weighted average of the quarterly average Bank of America Merrill Lynch U.S. corporate effective yields, using Table 4 weights (defined in Section 14.C.9) for the same calendar year as the weight tables (i.e. Tables 1, 2, and 3) used in calculating I_q in Section 14.C.3.e.

9. Weight Tables 1 through 4

The system for calculating the statutory maximum valuation interest rates relies on a set of four tables of weights that are based on duration and asset/liability cash-flow matching analysis for representative annuities within each valuation rate bucket. A given set of weight tables is applicable to the calculations for every day of the calendar year.

In the fourth quarter of each calendar year, the weights used within each valuation rate bucket for determining the applicable valuation interest rates for the following calendar year will be updated using the process described below. In each of the four tables of weights, the weights in a given row (valuation rate bucket) must add to exactly 100%.

Weight Table 1

The process for determining Table 1 weights is described below:

- a. Each valuation rate bucket has a set of representative annuity forms. These annuity forms are as follows:
- i. Bucket A:
 - a) Single Life Annuity age 91 with 0 and five-year certain periods.
 - b) Five-year certain only.
 - ii. Bucket B:
 - a) Single Life Annuity age 80 and 85 with 0, five-year and 10-year certain periods.
 - b) 10-year certain only.
 - iii. Bucket C:
 - a) Single Life Annuity age 70 with 0 and 15-year certain periods.
 - b) Single Life Annuity age 75 with 0, 10-year and 15-year certain periods.
 - c) 15-year certain only.
 - iv. Bucket D:
 - a) Single Life Annuity age 55, 60 and 65 with 0 and 15-year certain periods.
 - b) 25-year certain only.
- b. Annual cash flows are projected assuming annuity payments are made at the end of each year. These cash flows are averaged for each valuation rate bucket across the annuity forms for that bucket using the statutory valuation mortality table in effect for the following calendar year for

individual annuities for males (ANB).

- c. The average daily rates in the third quarter for the two-year, five-year, 10-year and 30-year U.S. Treasuries are downloaded from <https://fred.stlouisfed.org> as input to calculate the present values in Step d.
- d. The average cash flows are summed into four time period groups: years 1–3, years 4–7, years 8–15 and years 16–30. (**Note:** The present value of cash flows beyond year 30 are discounted to the end of year 30 and included in the years 16–30 group. This present value is based on the lower of 3% and the 30-year Treasury rate input in Step c.)
- e. The present value of each summed cash-flow group in Step d is then calculated by using the Step 3 U.S. Treasury rates for the midpoint of that group (and using the linearly interpolated U.S. Treasury rate when necessary).
- f. The duration-weighted present value of the cash flows is determined by multiplying the present value of the cash-flow groups by the midpoint of the time period for each applicable group.
- g. Weightings for each cash-flow time period group within a valuation rate bucket are calculated by dividing the duration weighted present value of the cash flow by the sum of the duration weighted present value of cash flow for each valuation rate bucket.

Weight Tables 2 through 4

Weight Tables 2 through 4 are determined using the following process:

- i. Table 2 is identical to Table 1.
 - ii. Table 3 is based on the same set of underlying weights as Table 1, but the 10-year and 30-year columns are combined since VM-20 default rates are only published for maturities of up to 10 years.
 - iii. Table 4 is derived from Table 1 as follows:
 - a) Column 1 of Table 4 is identical to column 1 of Table 1.
 - b) Column 2 of Table 4 is 50% of column 2 of Table 1.
 - c) Column 3 of Table 4 is identical to column 2 of Table 4.
 - d) Column 4 of Table 4 is 50% of column 3 of Table 1.
 - e) Column 5 of Table 4 is identical to column 4 of Table 4.
 - f) Column 6 of Table 4 is identical to column 4 of Table 1.
10. Group Annuity Contracts

For a group annuity purchased under a retirement or deferred compensation plan (Section ~~13~~14.A.2.i), the following apply:

- a. The statutory maximum valuation interest rate shall be determined separately for each certificate, considering its premium determination date, the certificate holder's initial age, the reference period corresponding to its form of payout and whether the contract is a jumbo contract or a non-jumbo contract.

Guidance Note: Under some group annuity contracts, certificates may be purchased on different

dates.

- b. In the case of a certificate whose form of payout has not been elected by the beneficiary at its premium determination date, the statutory maximum valuation interest rate shall be based on the reference period corresponding to the normal form of payout as defined in the contract or as is evidenced by the underlying pension plan documents or census file. If the normal form of payout cannot be determined, the maximum valuation interest rate shall be based on the reference period corresponding to the annuity form available to the certificate holder that produces the most conservative rate.

Guidance Note: The statutory maximum valuation interest rate will not change when the form of payout is elected.

This page intentionally left blank

Valuation Manual Section II, Reserve Requirements

Subsection 2: Annuity Products

- A. This subsection establishes reserve requirements for all contracts classified as annuity contracts as defined in SSAP No. 50 in the AP&P Manual.
- B. Minimum reserve requirements for variable annuity (VA) contracts and similar business, specified in VM-21, Requirements for Principle-Based Reserves for Variable Annuities, shall be those provided by VM-21. The minimum reserve requirements of VM-21 are considered PBR requirements for purposes of the *Valuation Manual*.
- C. Minimum reserve requirements for ~~non-variable~~ fixed annuity contracts issued prior to 1/1/2024 are those requirements as found in VM-A and VM-C as applicable, with the exception of the minimum requirements for the valuation interest rate for single premium immediate annuity contracts, and other similar contracts, issued after Dec. 31, 2017, including those fixed payout annuities emanating from host contracts issued on or after Jan. 1, 2017, and on or before Dec. 31, 2017. The maximum valuation interest rate requirements for those contracts and fixed payout annuities are defined in ~~Section 13.14~~ of VM-22, Statutory Maximum Valuation Interest Rates for Income Annuity Formulaic Reserves.
- D. Minimum reserve requirements for ~~non-variable~~ fixed annuity contracts issued on 1/1/2024 and later are those requirements as found in Sections 1 through ~~12~~ 13 of VM-22.

Commented [X373]: We believe a Fixed Annuity PBR Exemption should be incorporated into draft in a manner consistent with the Life PBR Exemption.

Commented [VM22374R373]: Waylon Peoples comment letter: Extend small company exemption in place for life PBR (VM-20) to VM-22.

Commented [CD375]: "non-variable annuity"?

Commented [X376]: "Section 13 of VM-22" may need to be updated if it is decided to have separate chapters for VM-22 VIR and VM-22 PBR.

Commented [CD377]: "non-variable annuity"?

Commented [CD378]: Consider adding the sentence: "The minimum reserve requirements of VM-22 are considered PBR requirements for purposes of the Valuation Manual." This is so VM-G will apply to VM-22, which would be appropriate.

The requirements in this section are still considered a part of PBR requirements and therefore are applicable to VM-G.

The below principles may serve as key considerations for assessing whether VM 21 or VM 22 requirements apply:

D. Minimum reserve requirements apply:

- E. ~~Index for~~ index-linked or modified guaranteed annuity contracts or riders that satisfy both of the following conditions ~~may be a key consideration for application of VM 22 requirements and are issued on 1/1/2024 and later are those requirements; as found in Sections 1 through 13 of VM-22.:~~

Commented [X379]: "Index-linked" annuity is not defined – only RILA and FIA in VM-22, recommend to revise the language or add a definition to define "index linked".

- 1. Guarantees the principal amount of purchase payments, net of any partial withdrawals, and interest credited thereto, less any deduction (without regard to its timing) for sales, administrative or other expenses or charges.
- 2.b. Credits a rate of interest under the contract prior to the application of any market value adjustments that is at least equal to the minimum rate required to be credited by the standard nonforfeiture law in the jurisdiction in which the contract is issued.

~~Guidance Note: Paragraph E.1.b is intended to apply prior to the application of any market value adjustments for modified guaranteed annuities where the underlying assets are held in a separate account. If meeting Paragraph E.1.b prior to the application of any market value adjustments and Paragraph E.1.a above, it may be appropriate to value such contracts under VM 22 requirements.~~

Minimum reserve requirements.

Commented [X380]: Recommend adding this part to E.1.b and delete the Guidance Note.

for index

F. ~~2. Index-linked or modified guaranteed annuity contracts or riders that do not satisfy either of the two conditions listed above criteria in Paragraph Section 2.E.1 and Section 2.E.2 above and E.1.ii may be a key consideration for application of VM-21 are issued on 1/1/2024 and later are those requirements as found in VM-21.~~

Commented [X381]: VM-21 specifically says “These requirements do not apply to contracts falling under the scope of VM-A-255: Modified Guaranteed Annuities; however, they do apply to contracts listed above that include one or more subaccounts containing features similar in nature to those contained in modified guaranteed annuities (MGAs) (e.g., market value adjustments).” Is this a contradiction?

Commented [X382]: Consistent with E above.

Subsection 6: Riders and Supplemental Benefits

Guidance Note: Policies ~~Designs~~ of policies or contracts with riders and supplemental benefits which are created to simply disguise benefits subject to the Valuation Manual section describing the reserve methodology for the base product to which they are attached, or exploit a perceived loophole, must be reserved in a manner similar to more typical designs with similar riders.

Commented [X383]: Still need the word “designs” otherwise this is saying the whole policy/contract was only created to disguise benefits, which would never be true.

A. If a rider or supplemental benefit is attached to a health insurance product, deposit-type contract, or credit life or disability product, it may be valued with the base contract unless it is required to be separated by regulation or other requirements.

B. For supplemental benefits on life insurance policies or annuity contracts, including Guaranteed Insurability, Accidental Death or Disability Benefits, Convertibility, ~~Nursing Home Benefits~~ or Disability Waiver of Premium Benefits, the supplemental benefit may be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, VM-A, and/or VM-C, as applicable.

Commented [X384]: This reference is another place where there would be a benefit distinguishing the PBR sections of VM-22 from the non-PBR sections.

~~C. ULSG and other secondary guarantee riders on a life insurance policy shall be valued with the base policy and follow the reserve requirements for ULSG policies under VM-20, VM-A and/or VM-C, as applicable.~~

~~D.C. Any~~ any guaranteed minimum benefits on life insurance policies or annuity contracts ~~not subject to Paragraph C above~~ including, but not limited to, Guaranteed Minimum Accumulation Benefits, Guaranteed Minimum Death Benefits, Guaranteed Minimum Income Benefits, Guaranteed Minimum Withdrawal Benefits, Guaranteed Lifetime Income Benefits, Guaranteed Lifetime Withdrawal Benefits, Guaranteed Payout Annuity Floors, Waiver of Surrender Charges, Return of Premium, Systematic Withdrawal Benefits under Required Minimum Distributions, and all similar guaranteed benefits shall be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, and VM-A and/or VM-C, as applicable.

Commented [X385]: These parallel requirements can be combined.

~~E.D.~~ E.D. If a rider or supplemental benefit to a life insurance policy or annuity contract that is not addressed in Paragraphs B, C, or D above possesses any of the following attributes, the rider or supplemental benefit shall be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, and VM-A and/or VM-C, as applicable.

1. The rider or supplemental benefit does not have a separately identified premium or charge.
2. After issuance, the rider or supplemental benefit premium, charge, value or benefits are determined by referencing the base policy or contract features or performance.
3. After issuance, the base policy or contract value or benefits are determined by referencing the rider or supplemental benefit features or performance. The deduction of rider or benefit premium or charge from the contract value is not sufficient for a determination by reference.

~~F.E.~~ F.E. If a term life insurance rider on the named insured[s] on the base life insurance policy does not meet the conditions of Paragraph E above, and either (1) guarantees level or near level premiums until a specified duration followed by a material premium increase; or (2) for a rider for which level or near level premiums are expected for a period followed by a material premium increase, the rider is

separated from the base policy and follows the reserve requirements for term policies under VM20, VM-A and/or VM-C, as applicable.

G.F. For all other riders or supplemental benefits on life insurance policies or annuity contracts not addressed in Paragraphs B through F above, the riders or supplemental benefits may be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, VM-A and/or VM-C, as applicable. For a given rider, the election to include riders or supplemental benefits with the base policy or contract shall be determined at the policy form level, not on a policy-by-policy basis, and shall be treated consistently from year-to-year, unless otherwise approved by the domiciliary commissioner.

H.G. Any supplemental benefits and riders offered on life insurance policies or annuity contracts that would have a material impact on the reserve (for VM-20 and VM-22) or TAR (for VM-21) if elected later in the contract life, such as joint income benefits, nursing home benefits, or withdrawal provisions on annuity contracts, shall be considered when determining reserves (for VM-20 and VM-22) or reserves and TAR (for VM-21) using the following principles:

1. Policyholders with living benefits and annuitization in the same contract will generally use the more valuable of the two benefits.
2. When advantageous, policyholders will commence living benefit payouts if not started yet.

Commented [X386]: Simplifications are judged relative to reserves for VM-20/VM-21 and TAR for VM-21.

Commented [X387]: This section states that “When advantageous, policyholders will commence living benefit payouts if not started yet.” This text seems to directly contradict VM-22 Section 6.H.2 which states “contract holder behavior should neither assume that all contract holders act with 100% efficiency in a financially rational manner nor assume that contract holders will always act irrationally”. We suggest revising 6.H.2 to align with the text of 10.D.8.

Page 11: [1] Commented [VM2266R64] VM-22 Subgroup 3/2/2022 4:12:00 PM

See Equitable comment letter: supports full aggregation, but if choosing between the two exposed options for two reserving categories, prefers option 2.

Page 11: [2] Commented [CD68] CA DOI 12/30/2021 3:27:00 PM

suggest swapping the order of this section. That is, start with the "in scope" list, rather than the "out of scope" list.

Also, it seems like there should be specific mentions of GMDBs and GLBs, as there are in VM-21, since those guarantees can also be found on FIAs.

Page 11: [3] Commented [X71] TDI 11/9/2021 9:17:00 AM

This needs to be revised to be in line with VM-21 Section 2.A. Consider removing "such as" list and adding a cross-reference to VM-21 Section 2.A.

Page 11: [4] Commented [CD77] CA DOI 12/30/2021 3:31:00 PM

should this be "Non-Variable Annuity"? Otherwise, should "Fixed Annuity" be defined in the Definitions section?

Page 11: [5] Commented [X79] ACLI

We suggest moving or deleting the sentence "The company may elect to exclude one or more groups of contracts from the stochastic reserve calculation in certain situations, pursuant to the exclusion test requirements defined in Section 3.E of VM-22." from this section as it does not seem fitting here.

Page 11: [6] Commented [X81] TDI 11/9/2021 9:19:00 AM

Does this belong in Scope? Do these still follow the other VM-22 requirements (if the old VM-22 interest rate determinations are left in the same chapter as the VM-22 PBR requirements)?

It is normal to then list what requirements such excluded contracts would follow. However, the statement here is more problematic because you can be excluded from the SR but still subject to VM-22.

Page 11: [7] Commented [X83] TDI 11/9/2021 9:25:00 AM

We still have a question about whether RBC factors are still at an appropriate level, if principles-based capital is not developed. Were they set assuming that this reserve was at a CTE(70) level in the first place, or were they dependent on the prior framework?

Page 14: [8] Commented [X99] ACLI

Seems to imply that only SPIAs would pass due to the linkage to Section 13. But the reference to interest rates should be broader, if even necessary. Suggest editing as:

"these groups of contracts may be valued using the methodology and statutory maximum valuation rate pursuant to applicable requirements in VM-A, and VM-C, and with the statutory maximum valuation rate for immediate annuities specified in Section 13."

Page 14: [9] Commented [CD100] CA DOI 12/30/2021 3:36:00 PM

Suggest rewording to just say "the stochastic exclusion test". There is only 1 SET, with 3 ways of passing it. Therefore, the current wording is confusing because it suggests that there are multiple SETs.

Page 14: [10] Commented [X102] ACLI

We believe this guidance note is unnecessary as the intent of the section is clear, and the wording is possibly confusing.

Page 14: [11] Commented [X103] TDI 11/9/2021 9:57:00 AM

The statement in this section is not acceptable as discussed in the previous TX comment letter. This will have the effect of potentially masking blocks that need PBR.

Page 14: [12] Commented [X104] ACLI

This section seems to indicate that the grouping of contracts in exclusion testing should be the same as the grouping of contracts for aggregation. This might cause fewer product types to be qualifying for exclusion if the test must be performed at a higher level of aggregation.

Page 14: [13] Commented [X108] ACLI

Either in this item or in Section 12 allocation to contracts not covered by PBR methodology in VM-22 needs to be addressed e.g., carve out because reserves calculated on seriatim formulaic basis.

Page 14: [14] Commented [X109] ACLI

This sub-section seems more appropriate in Section 4 (or pulled out completely and consolidated within "I. Introduction" or "VM-01" and applied to all PBR methods).

Page 14: [15] Commented [CD110] CA DOI 12/30/2021 3:43:00 PM

VM-21 Section 3.H on simplifications, approximations, and modeling efficiency techniques is missing (including the Guidance Note). Would it make sense to add it?

Page 33: [16] Commented [X209] ACLI

We recommend removing "pension risk transfer business" from products scoped out of SET certification method. It is unclear why this business would be treated differently from individually issued business for testing intended to capture interest rate risk.

Page 33: [17] Commented [VM22210R209] VM-22 Subgroup 3/2/2022 2:51:00 PM

Determine whether to address longevity reinsurance in this topic, in light of NJ comment letter.

Page 33: [18] Commented [CD215] CA DOI 12/30/2021 4:14:00 PM

what is meant by "aggregate risk levels"? Aggregated across what? Need clarification on the intentions for adding this phrase, when it is not in VM-20. Otherwise, I would suggest deleting this.

Page 33: [19] Commented [X216] TDI 11/18/2021 9:49:00 PM

This is not in VM-20 and would substantially change the exclusion. The intent is not to allow you to group a block that has material interest rate risk with a larger block that is insensitive to interest rate risks and thereby pass. If

"aggregate" referred to potential compounding of interest rate, longevity, or asset risk then this could be redrafted to clearly call out a 4th category of risk due to a combination of the first three. However, I think this is already implicitly covered.

Page 33: [20] Commented [CD218] CA DOI 12/30/2021 4:15:00 PM

note, there is no insertion of "aggregate risk levels across" here, like there was above. (to be clear, i don't support adding it.)

Subject: Comments on ARCWG-Proposed Draft of VM-22: PBR for Non-Variable Annuities

General comments:

1. Need to change “policy/policies” to “contract/contracts” throughout the document. Similarly, “policyholder(s)” should be changed to “contract holder(s)”.
 - a. The one exception is for the term “policy loan”, which we should keep.
2. Need to incorporate changes (as appropriate) from the most recently adopted version of the VM, including any APFs adopted since that last version of the VM.
3. Should there be an exercise to consider which changes herein should also be made to VM-21 and/or VM-20, for consistency purposes?
4. Need to double check all section references (perhaps not needed until we get closer to a final draft).
5. Need to double check usage of “aggregate reserve” vs. “stochastic reserve”.
6. Adding page numbers to future drafts would be very helpful.

Specific comments:

7. Detailed comments are embedded within the PDF of the exposure draft (appended to this cover letter).

AMERICAN ACADEMY of ACTUARIES

Objective. Independent. Effective.™

July 16, 2021
Bruce Sartain, Chair
Valuation Manual (VM)-22 (A) Subgroup
Life Actuarial (A) Task Force
National Association of Insurance Commissioners (NAIC)

Dear Mr. Sartain,

The American Academy of Actuaries¹ Annuity Reserves and Capital Work Group (ARCWG) presented a fixed annuity principle-based reserving (PBR) framework proposal to the VM-22 Subgroup during its October 21, 2020 meeting. This document provides ARCWG's initial draft of NAIC Valuation Manual Section II and VM-22 requirements associated with the ARCWG proposal. We ask for the VM-22 Subgroup's consideration of the language herein as a foundation for further drafting efforts, in your efforts to advance toward an NAIC fixed annuity PBR framework.

Please let us know if you have any follow-up inquiries in response to this document. Again, we appreciate the opportunity to propose the fixed annuity framework and all of the efforts made by the VM-22 Subgroup to focus on this topic.

Sincerely,
Ben Slutsker
Chairperson, Annuity Reserves and Capital Work Group
American Academy of Actuaries

¹ The American Academy of Actuaries is a 19,500-member professional association whose mission is to serve the public and the U.S. actuarial profession. For more than 50 years, the Academy has assisted public policymakers on all levels by providing leadership, objective expertise, and actuarial advice on risk and financial security issues. The Academy also sets qualification, practice, and professionalism standards for actuaries in the United States.

VM-22 PBR:- Requirements for Principle-Based Reserves for Non-Variable Annuities

Drafting Overview: This document is the ARCWG-proposed draft Valuation Manual wording for VM-22 PBR for non-variable annuities. The edits reflected in this draft are made in association with the recommendations in the Annuity Reserves Work Group-proposed VM-22 presentation, exposed by the VM-22 Subgroup in October 2020. Each section shows editorial mark-ups compared to existing VM-20 or VM-21 wording, which is included as a draft note at the beginning of each section (with the only exceptions being Sections 1 and 2 that do not contain mark-ups to existing Valuation Manual wording).

Section 1: Background

Drafting Note: All revisions shown in this section are in comparison to Section 1 in VM-21.

A. Purpose

These requirements establish the minimum reserve valuation standard for non-variable annuity ~~VA and certain other policies and contracts (“contracts”)~~ as defined in the Section 2.A, and issued on or after 1/1/2024 ~~operative date of the Valuation Manual as required by Model #820.~~ ~~For all contracts encompassed by the Scope,~~ these requirements constitute the Commissioners Annuity Reserve Valuation Method (CARVM) and, for certain contracts ~~encompassed in Section 2.A,~~ the Commissioners Reserve Valuation Method (CRVM).

Guidance Note: CRVM requirements apply to some group pension contracts.

The contracts subject to these requirements may be aggregated with the contracts subject to *Actuarial Guideline XLIII – CARVM for Variable Annuities (AG 43)*, published in Appendix C of the AP&P Manual, for purposes of performing and documenting the reserve calculations.

Guidance Note:

Effectively, through reference in AG 43, the reserve requirements in VM 21 also apply to those contracts issued prior to Jan. 1, 2017, that would not otherwise be encompassed by the scope of VM 21. Reserves for contracts subject to VM 21 or AG 43 may be computed as a single group. If a company chooses to aggregate business subject to AG 43 with business subject to VM 21 in calculating the reserve, then the provisions in VM G apply to this aggregate principle based valuation.

Guidance Note:

Relationship to RBC Requirements

These requirements anticipate that the projections described herein are used for the determination of RBC for all of the contracts falling within the scope of these requirements. These requirements and the RBC requirements for the topics covered within Sections 4.A through 4.E are identical. However, while the projections described in these requirements are performed on a basis that ignores federal income tax, a company may elect to conduct the projections for calculating the RBC requirements by including projected federal income tax in the cash flows and reducing the discount interest rates used to reflect the effect of federal income tax as described in the RBC requirements. A company that has elected to calculate RBC requirements in this manner may not switch back to using a calculation that ignores the effect of federal income tax without approval from the domiciliary commissioner.

B. Principles

The projection methodology used to calculate the stochastic reserve, ~~as well as the approach used to develop the Alternative Methodology,~~ is based on the following set of principles. These principles should be followed when interpreting and applying the methodology in these requirements and analyzing the resulting reserves.

Guidance Note: The principles should be considered in their entirety, and it is required that companies meet these principles with respect to those contracts that fall within the scope of these requirements and are in force as of the valuation date to which these requirements are applied.

Principle 1: The objective of the approach used to determine the stochastic reserve is to quantify the amount of statutory reserves needed by the company to be able to meet contractual obligations in light of the risks to which the company is exposed with an element of conservatism consistent with statutory reporting objectives.

Principle 2: The calculation of the stochastic reserve is based on the results derived from an analysis of asset and liability cash flows produced by the application of a stochastic cash-flow model to equity return and interest rate scenarios. For each scenario, the greatest present value of accumulated deficiency is calculated. The analysis reflects prudent estimate assumptions for deterministic variables and is performed in aggregate (subject to limitations related to contractual provisions) to allow the natural offset of risks within a given scenario. The methodology uses a projected total cash flow analysis by including all projected income, benefit, and expense items related to the business in the model and sets the stochastic reserve at a degree of confidence using the CTE measure applied to the set of scenario specific greatest present values of accumulated deficiencies that is deemed to be reasonably conservative over the span of economic cycles.

~~**Guidance Note:** Examples where full aggregation between contracts may not be possible include experience rated group contracts and the operation of reinsurance treaties.~~

Principle 3: The implementation of a model involves decisions about the experience assumptions and the modeling techniques to be used in measuring the risks to which the company is exposed. Generally, assumptions are to be based on the conservative end of the confidence interval. The choice of a conservative estimate for each assumption may result in a distorted measure of the total risk. Conceptually, the choice of assumptions and the modeling decisions should be made so that the final result approximates what would be obtained for the stochastic reserve at the required CTE level if it were possible to calculate results over the joint distribution of all future outcomes. In applying this concept to the actual calculation of the stochastic reserve, the company should be guided by evolving practice and expanding knowledge base in the measurement and management of risk.

Guidance Note: The intent of Principle 3 is to describe the conceptual framework for setting assumptions. Section 10 provides the requirements and guidance for setting contract holder behavior assumptions and includes alternatives to this framework if the company is unable to fully apply this principle.

Principle 4: While a stochastic cash-flow model attempts to include all real-world risks relevant to the objective of the stochastic cash-flow model and relationships among the risks, it will still contain limitations because it is only a model. The calculation of the stochastic reserve is based on the results derived from the application of the stochastic cash-flow model to scenarios, while the actual statutory reserve needs of the company arise from the risks to

which the company is (or will be) exposed in reality. Any disconnect between the model and reality should be reflected in setting prudent estimate assumptions to the extent not addressed by other means.

Principle 5: Neither a cash-flow scenario model nor a method based on factors calibrated to the results of a cash-flow scenario model can completely quantify a company’s exposure to risk. A model attempts to represent reality but will always remain an approximation thereto and, hence, uncertainty in future experience is an important consideration when determining the stochastic reserve. Therefore, the use of assumptions, methods, models, risk management strategies (e.g., hedging), derivative instruments, structured investments or any other risk transfer arrangements (such as reinsurance) that serve solely to reduce the calculated stochastic reserve without also reducing risk on scenarios similar to those used in the actual cash-flow modeling are inconsistent with these principles. The use of assumptions and risk management strategies should be appropriate to the business and not merely constructed to exploit “foreknowledge” of the components of the required methodology.

C. Risks Reflected

1. The risks reflected in the calculation of reserves under these requirements arise from actual or potential events or activities that are both:
 - a. Directly related to the contracts falling under the scope of these requirements or their supporting assets; and
 - b. Capable of materially affecting the reserve.
2. Categories and examples of risks reflected in the reserve calculations include, but are not necessarily limited to:
 - a. Asset risks
 - ~~i.~~ ~~Separate account fund performance.~~
 - ii. Credit risks (e.g., default or rating downgrades).
 - iii. Commercial mortgage loan roll-over rates (roll-over of bullet loans).
 - ~~iiii.~~ Uncertainty in the timing or duration of asset cash flows (e.g., shortening (prepayment risk) and lengthening (extension risk)).
 - iv. Performance of equities, real estate, and Schedule BA assets.
 - v. Call risk on callable assets.
 - ~~vi.~~ ~~Separate account fund performance.~~
 - vii. Risk associated with hedge instrument (includes basis, gap, price, parameter estimation risks, and variation in assumptions).
 - viii. Currency risk.

- b. Liability risks
 - i. Reinsurer default, impairment, or rating downgrade known to have occurred before or on the valuation date.
 - ii. Mortality/longevity, persistency/lapse, partial withdrawal, and premium payment risks.
 - iii. Utilization risk associated with guaranteed living benefits.
 - iv. Anticipated mortality trends based on observed patterns of mortality improvement or deterioration, where permitted.
 - v. Annuitization risks.
 - vi. Additional premium dump-ins or deposits (high interest rate guarantees in low interest rate environments).
 - vii. Applicable expense risks, including fluctuation maintenance expenses directly attributable to the business, future commission expenses, and expense inflation/growth.
 - c. Combination risks
 - i. Risks modeled in the company's risk assessment processes that are related to the contracts, as described above.
 - ii. Disintermediation risk (including such risk related to payment of surrender or partial withdrawal benefits).
 - iii. Risks associated with revenue-sharing income.
3. The risks not necessarily reflected in the calculation of reserves under these requirements are:
- a. ~~Those not reflected in the determination of RBC.~~
 - b. ~~Those reflected in the determination of RBC but arising from obligations of the company not directly related to the contracts falling under the scope of these requirements, or their supporting assets, as described above.~~
 - a. Those not associated with the policies or contracts being valued, or their supporting assets.
 - b. Determined to not be capable of materially affecting the reserve.
4. Categories and examples of risks not reflected in the reserve calculations include, but are not necessarily limited to:
- a. Asset risks

- i. Liquidity risks associated with a sudden and significant levels of withdrawals and surrenders~~“run on the bank.”~~
- b. Liability risks
 - i. Reinsurer default, impairment or rating downgrade occurring after the valuation date.
 - ii. Catastrophic events (e.g., epidemics or terrorist events).
 - iii. Major breakthroughs in life extension technology that have not yet fundamentally altered recently observed mortality experience.
 - iv. Significant future reserve increases as an unfavorable scenario is realized.
- c. General business risks
 - i. Deterioration of reputation.
 - ii. Future changes in anticipated experience (reparameterization in the case of stochastic processes), which would be triggered if and when adverse modeled outcomes were to actually occur.
 - iii. Poor management performance.
 - iv. The expense risks associated with fluctuating amounts of new business.
 - v. Risks associated with future economic viability of the company.
 - vi. Moral hazards.
 - vii. Fraud and theft.

D. Specific Definitions for VM-22

Buffer Annuity

Interchangeable term for Registered Index-Linked Annuity (RILA). See definition for Registered Index-Linked Annuity below.

Deferred Income Annuity (DIA)

An annuity which guarantees a periodic payment for the life of the annuitant or a term certain and payments begin one year or later after (or from) the issue date if the contract holder survives to a predetermined future age.

Fixed Indexed Annuity (FIA)

An annuity with an account value where the contract holder has the option for a portion or all of the account value to grow at a rate linked to an external index, typically with guaranteed principal.

Flexible Premium Deferred Annuity (FPDA)

An annuity with an account value established with a premium amount but allows for additional deposits to be paid into the annuity over time, resulting in an increase to the account value. The contract also has a guaranteed interest rate during the accumulation phase and has guaranteed mortality and interest rates applicable at the time of conversion to the payout phase.

Funding Agreement

A contract issued to an institutional investor (domestic and international non-qualified fixed income investors) that provides fixed or floating interest rate guarantees.

Guaranteed Investment Contract (GIC)

Insurance contract typically issued to a retirement plan (defined contribution) under which the insurer accepts a deposit (or series of deposits) from the purchaser and guarantees to pay a specified interest rate on the funds deposited during a specified period of time.

Index Credit Hedge Margin

A margin capturing the risk of inefficiencies in the company's hedging program supporting index credits. This includes basis risk, persistency risk, and the risk associated with modeling decisions and simplifications. It also includes any uncertainty of costs associated with managing the hedging program and changes due to investment and management decisions.

Index Credit

Any interest credit, multiplier, factor, bonus, charge reduction, or other enhancement to policy values that is linked to an index or indices. Amounts credited to the policy resulting from a floor on an index account are included.

Index Crediting Strategy

The strategy defined in a contract to determine index credits for a contract. This refers to underlying index, index parameters, date, timing, and other elements of the crediting method.

Index Parameter

Cap, floor, participation rate, spreads, or other features describing how the contract utilizes the index.

Longevity Reinsurance

An agreement, typically a reinsurance arrangement covering one or more group or individual annuity contracts, under which an insurance company assumes the longevity risk associated with periodic payments made to specified annuitants under one or more immediate or deferred payout annuity contracts. A common example is participants in one or more underlying retirement plans.

Typically, the reinsurer pays a portion of the actual benefits due to the underlying annuitants (or, in some cases, a pre-agreed amount per annuitant), while the ceding insurance company retains the assets supporting the reinsured annuity payments and pays periodic, ongoing premiums to the reinsurer over the expected lifetime of benefits paid to the specified annuitants. Such agreements may contain net settlement provisions such that only one party makes ongoing cash payments in a particular period. Under these agreements, longevity risk may be transferred on either a

permanent basis or for a prespecified period of time, and these agreements may or may not permit early termination.

Agreements which are not treated as reinsurance under Statement of Statutory Accounting Principles (SSAP) No. 61R are not included in this definition. In particular, contracts under which payments are made based on the aggregate mortality experience of a population of lives which are not covered by an underlying group or individual annuity contract (e.g., mortality index-based longevity swaps) are not included in this definition.

Market Value Adjustment (MVA) Annuity

An annuity with an account value where withdrawals and full surrenders are subject to adjustments based on interest rates or index returns at the time of withdrawal/surrender. There could be ceilings and floors on the amount of the market-value adjustment.

Modified Guaranteed Annuity (MGA)

A type of market-value adjusted annuity contract where the underlying assets are held in an insurance company separate account and the value of which are guaranteed if held for specified periods of time. The contract contains nonforfeiture values that are based upon a market-value adjustment formula if held for shorter periods.

Multiple Year Guaranteed Annuity (MYGA)

A type of fixed annuity that provides a pre-determined and contractually guaranteed interest rate for specified periods of time, after which there is typically an annual reset or renewal of a multiple year guarantee period.

Pension Risk Transfer (PRT) Annuity

An annuity, typically a group contract or reinsurance agreement, issued by an insurance company providing periodic payments to annuitants receiving immediate or deferred benefits from one or more retirement plans. Typically, the insurance company holds the assets supporting the benefits, which may be held in the general or separate account, and retains not only longevity risk but also asset risks (e.g., credit risk and reinvestment risk).

Registered Index-Linked Annuity (RILA)

An annuity with an account value where the contract holder has the option for a portion or all of the account value to grow at a rate linked to an external index, similar to a Fixed Indexed Annuity, but with downside risk exposure that may not guarantee full principal repayment. These contracts may include a cap on upside returns, and may also include a floor on downside returns which may be below zero percent.

Single Premium Immediate Annuity (SPIA)

An annuity purchased with a single premium amount which guarantees a periodic payment for the life of the annuitant or a term certain and payments begin within one year after (or from) the issue date.

Single Premium Deferred Annuity (SPDA)

An annuity with an account value established with a single premium amount that grows with a guaranteed interest rate during the accumulation phase and has guaranteed mortality and interest

rates applicable at the time of conversion to the payout phase. May also include cases where the premium is accepted for a limited amount of time early in the contract life, such as only in the first duration.

Stable Value Contract

A contract that provides limited investment guarantees, typically preserving principal while crediting steady, positive returns and protecting against losses or declines in yield. Underlying asset portfolios typically consist of fixed income securities, which may sit in the insurer’s general account, a separate account, or in a third-party trust. These contracts often support defined contribution or defined benefit retirement plan liabilities.

Structured Settlement Contract (SSC)

A contract that provides periodic benefits and is purchased with a single premium amount stemming from various types of claims pertaining to court settlements or out-of-court settlements from tort actions arising from accidents, medical malpractice, and other causes. Adverse mortality is typically expected for these contracts.

Synthetic GIC

Contract that simulates the performance of a traditional GIC through a wrapper, swap, or other financial instruments, with the main difference being that the assets are owned by the policyholder or plan trust.

Term Certain Payout Annuity

A contract issued, which offers guaranteed periodic payments for a specified period of time, not contingent upon mortality or morbidity of the annuitant.

Two-Tiered Annuity

A deferred annuity with two tiers of account values. One, with a higher accumulation interest rate, is only available for annuitization or death. The other typically contains a lower accumulation interest rate, and is only available upon surrender.

1. ~~The term “cash surrender value” means, for the purposes of these requirements, the amount available to the contract holder upon surrender of the contract. Generally, it is equal to the account value less any applicable surrender charges, where the surrender charge reflects the availability of any free partial surrender options. However, for contracts where all or a portion of the amount available to the contract holder upon surrender is subject to a market value adjustment, the cash surrender value shall reflect the market value adjustment consistent with the required treatment of the underlying assets. That is, the cash surrender value shall reflect any market value adjustments where the underlying assets are reported at market value, but it shall not reflect any market value adjustments where the underlying assets are reported at book value.~~
2. ~~The term “clearly defined hedging strategy” (CDHS) is defined in VM 01. In order to be designated as a CDHS, the strategy must meet the principles outlined in Section 1.B (particularly Principle 5) and shall, at a minimum, identify:~~
 - a. ~~The specific risks being hedged (e.g., delta, rho, vega, etc.).~~
 - b. ~~The hedge objectives.~~
 - e. ~~The risks not being hedged (e.g., variation from expected mortality, withdrawal,~~

- and other utilization or decrement rates assumed in the hedging strategy, etc.).
- d. The financial instruments that will be used to hedge the risks.
 - e. The hedge trading rules, including the permitted tolerances from hedging objectives.
 - f. The metric(s) for measuring hedging effectiveness.
 - g. The criteria that will be used to measure hedging effectiveness.
 - h. The frequency of measuring hedging effectiveness.
 - i. The conditions under which hedging will not take place.
 - j. The person or persons responsible for implementing the hedging strategy.

Guidance Note: It is important to note that strategies involving the offsetting of the risks associated with VA guarantees with other products outside of the scope of these requirements (e.g., equity-indexed annuities) do not currently qualify as a clearly defined hedging strategy under these requirements.

3. The term “guaranteed minimum death benefit” (GMDB) means a provision (or provisions) for a guaranteed benefit payable on the death of a contract holder, annuitant, participant or insured where the amount payable is either (i) a minimum amount; or (ii) exceeds the minimum amount and is:
- is increased by an amount that may be either specified by or computed from other policy or contract values; and
 - has the potential to produce a contractual total amount payable on such death that exceeds the account value; or
 - in the case of an annuity providing income payments, guarantees payment upon such death of an amount payable on death in addition to the continuation of any guaranteed income payments.

Guidance Note: The definition of GMDB includes benefits that are based on a portion of the excess of the account value over the net of premiums paid less partial withdrawals made (e.g., an earnings enhanced death benefit).

4. The term “total asset requirement” (TAR) means the sum of the reserve determined from the VM-21 requirements prior to any adjustment for the elective phase in pursuant to Section 2.B plus the C3 RBC amount from LR027 step (paragraph D) prior to any adjustment for phase in or smoothing.

Section 2: Scope and Effective Date

Drafting Note: There are no revisions shown in this section compared to VM-21 or other chapters Valuation Manual, since the write-up is largely new for VM-22.

A. **Scope**

Subject to the requirements of this VM-22 are annuity contracts, certificates and contract features, whether group or individual, including both life contingent and term-certain-only, directly written or assumed through reinsurance issued on or after 1/1/2024, with the exception of contracts or benefits listed below.

Products out of scope include:

- Contracts or benefits that are subject to VM-21 (such as variable annuities, RILAs, buffer annuities, and structured annuities)
- GICs
- Synthetic GICs
- Stable Value Contracts
- Funding Agreements

Products in scope of VM-22 include fixed annuities which consist of, but are not limited to, the following the list:

- **Account Value Based Annuities**
 - Deferred Annuities (SPDA & FPDA)
 - Multi-Year Guarantee Annuities (MYGA)
 - Fixed Indexed Annuities (FIA)
 - Market-Value Adjustments (MVA)
 - Two-tiered Annuities
 - Guarantees/Benefits/Riders on Fixed Annuity Contracts
- **Payout Annuities**
 - Single Premium Immediate Annuities (SPIA)
 - Deferred Income Annuities (DIA)
 - Term Certain Payout Annuity
 - Pension Risk Transfer Annuities (PRT)
 - Structured Settlement Contracts (SSC)
 - Longevity Reinsurance

The company may elect to exclude one or more groups of contracts from the stochastic reserve calculation in certain situations, pursuant to the exclusion test requirements defined in Section 3.E of VM-22.

B. **Effective Date & Transition****Effective Date**

These requirements apply for valuation dates on or after January 1, 2024.

Transition

A company may elect to establish minimum reserves pursuant to applicable requirements in VM-A and VM-C for business otherwise subject to VM-22 PBR requirements and issued during the first three years following the effective date of VM-22 PBR. If a company during the three years elects to apply VM-22 PBR to a block of such business, then a company must continue to apply the requirements of VM-22 PBR for future issues of this business. Irrespective of the transition date, a company shall apply VM-22 PBR requirements to applicable blocks of business on a prospective basis starting at least three years after the effective date.

Section 3: Reserve Methodology

Drafting Note: All revisions shown in this section are in comparison to Section 3 in VM-21.

A. Aggregate Reserve

The aggregate reserve for contracts falling within the scope of these requirements shall equal the stochastic reserve (following the requirements of Section 4) ~~plus the additional standard projection amount (following the requirements of Section 6) less any applicable PIMR for all contracts not valued under applicable requirements in VM-A and VM-C the Alternative Methodology (Section 7), plus the reserve for any contracts determined using the Alternative Methodology valued under applicable requirements in VM-A and VM-C (following the requirements of Section 7).~~

Guidance Note: Contracts valued under applicable requirements in VM-A and VM-C are ones that pass the exclusion test and elect to not model PBR stochastic reserves, per the requirements in Section 3.E.

B. Impact of Reinsurance Ceded

~~Where reinsurance is ceded for all or a portion of the contracts, a~~ All components in the aggregate reserve shall be determined post-reinsurance ceded, that is net of any reinsurance cash flows arising from treaties that meet the statutory requirements that ~~would allow the treaty to be accounted for as reinsurance, A, and pre-reinsurance ceded reserve also needs to be determined by, that is ignoring all reinsurance cash flows (such costs and benefits) in the reserve calculation.~~

C. ~~To Be Determined~~ The Additional Standard Projection Amount

~~The additional standard projection amount is determined by applying one of the two standard projection methods defined in Section 6. The same method must be used for all contracts within a group of contracts that are aggregated together to determine the reserve, and the additional standard projection amount excluding any contracts whose reserve is determined using the Alternative Methodology. The company shall elect which method they will use to determine the additional standard projection amount. The company may not change that election for a future valuation without the approval of the domiciliary commissioner.~~

D. The Stochastic Reserve

1. The stochastic reserve shall be determined based on asset and liability projections for the contracts falling within the scope of these requirements, excluding those contracts valued using the ~~methodology pursuant to applicable requirements in VM-A and VM-C~~ Alternative Methodology, over a broad range of stochastically generated projection scenarios described in Section 8 and using prudent estimate assumptions as required ~~in Section 3.F~~ herein. ~~The stochastic reserve may be determined in aggregate for all contracts falling within the scope of these requirements—i.e., a single model segment—or, at the option of the company, it may be determined by subgrouping contracts into model segments,~~
2. The stochastic reserve amount for any group of contracts shall be determined as CTE70 of the scenario reserves following the requirements of Section 4, ~~with the exception of groups of contracts for which a company elects the Deterministic Certification Option in Section 7.E, which shall be determined as the scenario reserve following the requirements of Section 4.~~

3. The reserve may be determined in aggregate across various groups of contracts as a single model segment when determining the stochastic reserve if the business and risks are not managed separately or are part of the same integrated risk management program. Aggregation is permitted if a resulting group of contracts (or model segment) follows the listed principles:
 - a. Aggregate in a manner that is consistent with the company’s risk management strategy and reflects the likelihood of any change in risk offsets that could arise from shifts between product types, and
 - b. Using prudent actuarial judgement, consider the following elements when aggregating groups of contracts: whether groups of contracts are part of the same portfolio (or different portfolios that interact), same integrated risk management system, administered/managed together
4. Do not aggregate groups of contracts for which the company elects to use the Deterministic Certification Option in Section 7.E with any groups of contracts that do not use such option.
5. To the extent that these limits on aggregation result in more than one model segment, the stochastic reserve shall equal the sum of the stochastic reserve amounts computed for each model segment and scenario reserve amounts computed for each model segment for which the company elects to use the Deterministic Certification Option in Section 7.E.

E. Exclusion TestAlternative Methodology

~~For a group of variable deferred annuity contracts that contain either no guaranteed benefits or only GMDBs— i.e., no VAGLBs—the reserve may be determined using the Alternative Methodology described in Section 7 rather than using the approach described in Section 3.C and Section 3.D. However, in the event that the approach described in Section 3.C and Section 3.D has been used in prior valuations for that group of contracts, the Alternative Methodology may not be used without approval from the domiciliary commissioner.~~

~~The reserve for the group of contracts to which the Alternative Methodology is applied shall not be less than the aggregate cash surrender value of those contracts.~~

1. To the extent that certain groups of contracts pass one of the defined stochastic exclusion tests in Section 7.B, these groups of contracts may be valued using the methodology pursuant to applicable requirements in VM-A and VM-C, with the statutory maximum valuation rate for immediate annuities specified in Section 13.
 - a. For dividend-paying contracts, a dividend liability shall be established upon following requirements in VM-A and VM-C, as described above, for the base contract.

Guidance Note: The intention of contracts that pass the stochastic exclusion test is to provide the option to value contracts under VM-A and VM-C. This may apply to pre-PBR CARVM requirements in accordance with Actuarial Guideline XXXIII (AG33) methodology with type A, B, C rates for SPIAs issued before 2018; AG33 methodology with pre-PBR VM-22 rates for SPIAs issued on/after 2018; Actuarial Guideline XXXV (AG35) pre-PBR methodology for Fixed Indexed Annuities; and AG33 methodology (with interest rate updates for modernization initiatives on new contracts) for non-SPIAs.

2. The approach for grouping contracts when performing the exclusion tests should follow the same principles that underlie the aggregation approach for model segments discussed for Stochastic Reserves in Section D above.

F. Allocation of the Aggregate Reserve to Contracts

The aggregate reserve shall be allocated to the contracts falling within the scope of these requirements using the method outlined in Section 12.

G. Prudent Estimate Assumptions:

1. With respect to the Stochastic Reserve in Section 3.C, the company shall establish the prudent estimate assumption for each risk factor in compliance with the requirements in Section 12 of Model #820 and must periodically review and update the assumptions as appropriate in accordance with these requirements.
2. The qualified actuary, to whom responsibility for this group of contracts is assigned, shall annually review relevant emerging experience for the purpose of assessing the appropriateness of the anticipated experience assumption. If the results of statistical testing or other testing indicate that previously anticipated experience for a given factor is inadequate, then the qualified actuary shall set a new, adequate, anticipated experience assumption for the factor.
- 4-3. To determine the prudent estimate assumptions, the stochastic reserve shall also follow the requirements in Sections 4 and 9 for asset assumptions, Section 10 for policyholder behavior assumptions, and Section 11 for mortality assumptions.

G. Reserve to Be Held in the General Account

The portion of the aggregate reserve held in the general account shall not be less than the excess of the aggregate reserve over the aggregate cash surrender value held in the separate account and attributable to the separate account portion of all such contracts. For contracts for which a cash surrender value is not defined, the company shall substitute for cash surrender value held in the separate account the implicit amount for which the contract holder is entitled to receive income based on the performance of the separate account. For example, for a variable payout annuity for which a specific number of units is payable, the implicit amount could be the present value of that number of units, discounted at the assumed investment return and defined mortality, times the unit value as of the valuation date.

Guidance Note: This approach is equivalent to assuming that the separate account performance is equal to the assumed investment return.

Section 4: Determination of Stochastic Reserve

Drafting Note: All revisions shown in this section are in comparison to Section 4 in VM-21.

A. Projection of Accumulated Deficiencies

1. General Description of Projection

The projection of accumulated deficiencies shall be made ignoring federal income tax in both cash flows and discount rates, and it shall reflect the dynamics of the expected cash flows for the entire group of contracts, reflecting all product features, including any guarantees provided under the contracts using prudent estimate liability assumptions defined in Sections 10 and 11 and asset assumptions defined in Section 4.D. The company shall project cash flows including the following:

- a. Revenues received by the company including gross premiums received from the policyholder (including any due premiums as of the projected start date).
- b. All material benefits projected to be paid to policyholders—including, but not limited to, death claims, surrender benefits and withdrawal benefits—reflecting the impact of all guarantees and adjusted to take into account amounts projected to be charged to account values on general account business. Any guarantees, in addition to market value adjustments assessed on projected withdrawals or surrenders, shall be taken into account.

Guidance Note: Amounts charged to account values on general account business are not revenue; examples include rider charges and expense charges.

- c. Non-Guaranteed Elements (NGE) cash flows as described in Section 10.J.
- d. Insurance company expenses (including overhead and investment expense), ~~commissions~~ fund expenses, contractual fees and charges, and revenue-sharing income received by the company (net of applicable expenses), ~~and~~
- e. Net cash flows associated with any reinsurance. ~~or~~
- f. Cash flows from hedging instruments as described in Section 4.A.4. ~~are to be reflected on a basis consistent with the requirements herein.~~
- g. Cash receipts or disbursements associated with invested assets (other than policy loans) as described in Section 4.D.4, including investment income, realized capital gains and losses, principal repayments, asset default costs, investment expenses, asset prepayments, and asset sales.
- ~~a.h.~~ If modeled explicitly, cash flows related to policy loans as described in Section 10.I.2, including interest income, new loan payments and principal repayments.

Guidance Note: Future net policy loan cash flows include: policy loan interest paid in cash plus repayments of policy loan principal, including repayments occurring at death or surrender (note that the future benefits in Section 4.A.1.b are before consideration of policy loans), less additional policy loan principal (but excluding policy loan interest that is added to the policy loan principal balance). Cash flows from any fixed account options also shall be included. Any market value adjustment assessed on projected withdrawals or surrenders also shall be included (whether or not the cash surrender value reflects market value adjustments). Throughout the projection, all assumptions shall be determined based on the requirements herein. Accumulated deficiencies shall be determined at the end of each projection year as the sum of the accumulated deficiencies for all contracts within each model segment.

Guidance Note: Section 4.A.1 requires market value adjustments (MVAs) on liability cash flows to be reflected because in a cash flow model, assets are assumed to be liquidated at market value to cover the cash outflow of the cash surrender; therefore, inclusion of the market value adjustment aligns the asset and liability cash flows. This may differ from the treatment of MVAs in the definition of cash surrender value (Section 1.D), which defines the statutory reserve floor for which the values must be aligned with the annual statement value of the assets.

2. Grouping of Variable Funds and Subaccounts Index Crediting Strategies

~~The portion of the starting asset amount held in the separate account represented by the variable funds and the corresponding account values~~ Index crediting strategies may be grouped for modeling using an approach that recognizes the investment guidelines and objectives of ~~the funds~~ each index crediting strategy. In assigning each ~~variable fund and the variable subaccounts~~ index crediting strategy to a grouping for projection purposes, the fundamental characteristics of the ~~fund~~ index crediting strategy shall be reflected, and the parameters shall have the appropriate relationship to the stochastically generated projection scenarios described in Section 8. The grouping shall reflect characteristics of the efficient frontier (i.e., returns generally cannot be increased without assuming additional risk).

Index accounts sharing similar index crediting strategies may also be grouped for modeling to an appropriately crafted proxy strategy normally expressed as a linear combination of recognized market indices, sub-indices or funds, in order to develop the investment return paths and associated interest crediting. Each index crediting strategy's specific risk characteristics, associated index parameters, and relationship to the stochastically generated scenarios in Section 8 should be considered before grouping or assigning to a proxy strategy. Grouping and/or development of a proxy strategy may not be done in a manner that intentionally understates the resulting reserve.

~~An appropriate proxy fund for each variable subaccount shall be designed in order to develop the investment return paths. The development of the scenarios for the proxy funds is a fundamental step in the modeling and can have a significant impact on results. As such, the company must map each variable account to an appropriately crafted proxy fund normally expressed as a linear combination of recognized market indices, sub-indices or funds.~~

3. Model Cells

Projections may be performed for each contract in force on the date of valuation or by assigning contracts into representative cells of model plans using all characteristics and criteria having a material impact on the size of the reserve. Assigning contracts to model cells may not be done in a manner that intentionally understates the resulting reserve.

4. Modeling of Hedges

- a. For a company that does not have a CDHS future hedging program tied directly to the contracts falling under the scope of VM-22 stochastic reserve requirements:
- i. The company shall not consider the cash flows from any future hedge purchases or any rebalancing of existing hedge assets in its modeling.
 - ii. Existing hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the starting assets. The hedge assets may then be considered in one of two ways:
 - a) Include the asset cash flows from any contractual payments and maturity values in the projection model; or
 - b) No hedge positions—in which case the hedge positions held on the valuation date are replaced with cash and/or other general account assets in an amount equal to the aggregate market value of these hedge positions.

Guidance Note: If the hedge positions held on the valuation date are replaced with cash, then as with any other cash, such amounts may then be invested following the company's investment strategy.

A company may switch from method a) to method b) at any time, but it may only change from b) to a) with the approval of the domiciliary commissioner.

- b. For a company ~~with a CDHS~~ that has a future hedging program tied directly to the contracts falling under the scope of VM-22 stochastic reserve requirements:
- i. For a hedging program with hedge payoffs that offset interest credits associated with indexed interest strategies (indexed interest credits):
 - a) In modeling cash flows, the company shall include the cash flows from future hedge purchases or any rebalancing of existing hedge assets that are intended solely to offset interest credits to policyholders
 - b) Existing hedging instruments that are currently held by the company for this purpose in support of the contracts falling under the scope of these requirements shall be included in the starting assets. -Existing hedging instruments that are currently held by the

company for any other purpose should be modeled consistently with the requirements of Section 4.A.4.a.ii.

- c) An Index Credit Hedge Margin for these instruments shall be reflected by reducing index interest credit hedge payoffs by a margin multiple that shall be justified by sufficient and credible company experience and be no less than [X%] multiplicatively of the interest credited. In the absence of sufficient and credible company experience, a margin of [Y%] shall be assumed. There is no cap on the index credit hedge margin if company experience indicates actual error is greater than [Y%]. It is permissible to substitute stress-testing for sufficient and credible experience if such stress-testing comprehensively considers a robust range of future market conditions.
- ii. For a company that hedges any contractual obligation or risks other than indexed interest credits, the detailed requirements for the modeling of hedges are defined in Section 9. The following requirements do not supersede the detailed requirements.
- a) The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the projections used in the determination of the stochastic reserve.
- b) The projections shall take into account the appropriate costs and benefits of hedge positions expected to be held in the future through the execution of CDHS. Because models do not always accurately portray the results of hedge programs, the company shall, through back-testing and other means, assess the accuracy of the hedge modeling. The company shall determine a stochastic reserve as the weighted average of two CTE values; first, a CTE70 (“best efforts”) representing the company’s projection of all of the hedge cash flows, including future hedge purchases, and a second CTE70 (“adjusted”) which shall use only hedge assets held by the company on the valuation date and ~~no~~only future hedge purchases associated with indexed interest credited. These are discussed in greater detail in Section 9. ~~The stochastic reserve shall be the weighted average of the two CTE70 values, where the weights reflect the error factor (E) determined following the guidance of Section 9.C.4.~~
- c) Consistent with Section 4.A.4.b.i., the index credit hedge margin for instruments associated with indexed interest credited shall be reflected by reducing hedge payoffs by a margin multiple as defined in Section 4.A.4.b.i.c).

- d) _____ The use of products not falling under the scope of these requirements (e.g., equity indexed annuities) as a hedge shall not be recognized in the determination of accumulated deficiencies.

Guidance Note: Section 4.A.4.b.i is intended to address common situations for products with index crediting strategies where the company only hedges index credits or clearly separates index credit hedging from other hedging.- In this case the hedge positions are considered similarly to other fixed income assets supporting the contracts, and a margin is reflected rather than modeling using a CTE70 adjusted run with no future hedge purchases. If a company has a more comprehensive hedge strategy combining index credits, guaranteed benefit, and other risks (e.g., full fair value or economic hedging), an appropriate and documented bifurcation method should be used in the application of sections 4.A.4.b.i and 4.A.4.b.ii above for the hedge modeling and justification. Such bifurcation methods may quantify the specific risk exposure attributable to index credit liabilities versus other liabilities such as guaranteed living benefits, and apply such for the basis for allocation.

Guidance Note: The requirements of Section 4.A.4 govern the determination of reserves for annuity contracts and do not supersede any statutes, laws or regulations of any state or jurisdiction related to the use of derivative instruments for hedging purposes and should not be used in determining whether a company is permitted to use such instruments in any state or jurisdiction.

5. Revenue Sharing

~~If applicable, P~~projections of accumulated deficiencies may include income from projected future revenue sharing, net of applicable projected expenses (net revenue-sharing income) if each of the ~~following~~ requirements set forth in VM 21 Section 4.A.5 are met.:

~~The net revenue sharing income is received by the company~~company receives the net revenue sharing income.

Guidance Note: For purposes of this section, net revenue sharing income is considered to be received by the company if it is paid directly to the company through a contractual agreement with either the entity providing the net revenue sharing income or an affiliated company that receives the net revenue sharing income. Net revenue sharing income also would be considered to be received if it is paid to a subsidiary that is owned by the company and if 100% of the statutory income from that subsidiary is reported as statutory income of the company. In this case, the company needs to assess the likelihood that future net revenue sharing income is reduced due to the reported statutory income of the subsidiary being less than future net revenue sharing income received.

~~Signed contractual agreement(s) are in place as of the valuation date and support the current payment of the net revenue sharing income.~~

~~The net revenue sharing income is not already accounted for directly or indirectly as a company asset.~~

~~The amount of net revenue sharing income to be used shall reflect the company's assessment of factors that include, but are not limited to, the following (not all of these factors will necessarily be present in all situations):~~

~~The terms and limitations of the agreement(s), including anticipated revenue, associated expenses and any contingent payments incurred or made by either the company or the entity providing the net revenue sharing as part of the agreement(s).~~

~~The relationship between the company and the entity providing the net revenue sharing income that might affect the likelihood of payment and the level of expenses.~~

~~The benefits and risks to both the company and the entity paying the net revenue sharing income of continuing the arrangement.~~

~~The likelihood that the company will collect the net revenue sharing income during the term(s) of the agreement(s) and the likelihood of continuing to receive future revenue after the agreement(s) has ended.~~

~~The ability of the company to replace the services provided to it by the entity providing the net revenue sharing income or to provide the services itself, along with the likelihood that the replaced or provided services will cost more to provide.~~

~~The ability of the entity providing the net revenue sharing income to replace the services provided to it by the company or to provide the services itself, along with the likelihood that the replaced or provided services will cost more to provide.~~

~~The amount of projected net revenue sharing income shall reflect a margin (which decreases the assumed net revenue sharing income) directly related to the uncertainty of the revenue. The greater the uncertainty, the larger the margin. Such uncertainty is driven by many factors, including the potential for changes in the securities laws and regulations, mutual fund board responsibilities and actions, and industry trends. Since it is prudent to assume that uncertainty increases over time, a larger margin shall be applied as time that has elapsed in the projection increases.~~

~~All expenses required or assumed to be incurred by the company in conjunction with the arrangement providing the net revenue sharing income, as well as any expenses assumed to be incurred by the company in conjunction with the assumed replacement of the services provided to it (as discussed in Section 4.A.5.b.v), shall be included in the projections as a company expense under the requirements of Section 4.A.1. In addition, expenses incurred by either the entity providing the net revenue sharing income or an affiliate of the company shall be included in the applicable expenses discussed in Section 4.A.1 and Section 4.A.5.a that reduce the net revenue sharing income.~~

~~The company is responsible for reviewing the revenue sharing agreements and verifying compliance with these requirements.~~

~~The amount of net revenue sharing income assumed in a given scenario shall not exceed the sum of (i) and (ii), where:~~

~~Is the contractually guaranteed net revenue sharing income projected under the scenario;
and~~

~~Is the company's estimate of non contractually guaranteed net revenue sharing income
before reflecting any margins for uncertainty multiplied by the following factors:~~

~~1.00 in the first projection year.~~

~~0.95 in the second projection year.~~

~~0.90 in the third projection year.~~

~~0.85 in the fourth projection year.~~

~~0.80 in the fifth and all subsequent projection years.~~

6. Length of Projections

Projections of accumulated deficiencies shall be run for as many future years as needed so that no materially greater reserve value would result from longer projection periods.

7. Interest Maintenance Reserve (IMR)

The IMR shall be handled consistently with the treatment in the company's cash flow testing, and the amounts should be adjusted to a pre-tax basis.

B. Determination of Scenario Reserve

1. ~~General~~ For a given scenario, the scenario reserve ~~is the sum of~~ shall be determined using one of two methods described below:

- a) The ~~starting asset amount plus the~~ greatest present value, as of the projection start date, of the projected accumulated deficiencies; ~~and~~

Guidance Note: The greatest present value of accumulated deficiencies can be negative.

- b) The ~~direct iteration method, where the scenario reserve is determined by solving for the amount of starting assets which, when projected along with all contract cash flows, result in the defeasement of all projected future benefits and expenses at the end of the projection horizon with no positive accumulated deficiencies at the end of any projection year during the projection period~~ starting asset amount. ~~When using the direct Iteration method, the scenario reserve will equal the final starting asset amount determined according to Section 4.B.4.~~

The scenario reserve for any given scenario shall not be less than the cash surrender value in aggregate on the valuation date for the group of contracts modeled in the projection.

2. Discount Rates

In determining the scenario reserve, unless using the direct iteration method pursuant to Section 4.B.1.b, the accumulated deficiencies shall be discounted at the NAER on additional assets, as defined in Section 4.B.3.

3. Determination of NAER on Additional Invested Asset Portfolio

- a. The additional invested asset portfolio for a scenario is a portfolio of general account assets as of the valuation date, outside of the starting asset portfolio, that is required in that projection scenario so that the projection would not have a positive accumulated deficiency at the end of any projection year. This portfolio may include only (i) General Account assets available to the company on the valuation date that do not constitute part of the starting asset portfolio; and (ii) cash assets.

Guidance Note:

Additional invested assets should be selected in a manner such that if the starting asset portfolio were revised to include the additional invested assets, the projection would not be expected to experience any positive accumulated deficiencies at the end of any projection year.

It is assumed that the accumulated deficiencies for this scenario projection are known.

- b. To determine the NAER on additional invested assets for a given scenario:
- i. Project the additional invested asset portfolio as of the valuation date to the end of the projection period,
 - a) Investing any cash in the portfolio and reinvesting all investment proceeds using the company's investment policy.
 - b) Excluding any liability cash flows.
 - c) Incorporating the appropriate returns, defaults and investment expenses for the given scenario.
 - ii. If the value of the projected additional invested asset portfolio does not equal or exceed the accumulated deficiencies at the end of each projection year for the scenario, increase the size of the initial additional invested asset portfolio as of the valuation date, and repeat the preceding step.
 - iii. Determine a vector of annual earned rates that replicates the growth in the additional invested asset portfolio from the valuation date to the end of the projection period for the scenario. This vector will be the NAER for the given scenario.
 - ~~iii~~.iv. If the depletion of assets within the projection results in an unreasonably high negative NAER upon borrowing, the NAER may be set to the assumed cost of borrowing associated with each projected time period, in accordance with Section 4.D.3.c, as a safe harbor.

Guidance Note: There are multiple ways to select the additional invested asset portfolio at the valuation date. Similarly, there are multiple ways to determine the earned rate vector. The company shall be consistent in its choice of methods, from one valuation to the next.

~~4. Direct Iteration In lieu of the method described in Section 4.B.2 and Section 4.B.3 above, the company may solve for the amount of starting assets which, when projected along with all contract cash flows, result in the defeasement of all projected future benefits and expenses at the end of the projection horizon with no accumulated deficiencies at the end of any projection year during the projection period.~~

C. Projection Scenarios

1. Number of Scenarios

The number of scenarios for which the scenario reserve shall be computed shall be the responsibility of the company, and it shall be considered to be sufficient if any resulting understatement in the stochastic reserve, as compared with that resulting from running additional scenarios, is not material.

2. Economic Scenario Generation

Treasury Department interest rate curves, as well as investment return paths for ~~general account equity index funds, equities, and fixed income assets and separate account fund performance~~ shall be determined on a stochastic basis using the methodology described in Section 8. If the company uses a proprietary generator to develop scenarios, the company shall demonstrate that the resulting scenarios meet the requirements described in Section 8.

D. Projection of Assets

1. Starting Asset Amount

a. For the projections of accumulated deficiencies, the value of assets at the start of the projection shall be set equal to the approximate value of statutory reserves at the start of the projection plus the allocated amount of PIMR attributable to the assets selected. Assets shall be valued consistently with their annual statement values. The amount of such asset values shall equal the sum of the following items, all as of the start of the projection:

~~i. All of the separate account assets supporting the contracts;~~

~~ii. Any hedge instruments held in support of the contracts being valued; and~~

~~iii. An amount of assets held in the general account equal to the approximate value of statutory reserves as of the start of the projections less the amount in (i) and (ii).~~

~~**Guidance Note:** Deferred hedge gains/losses developed under SSAP No. 108—Derivatives Hedging Variable Annuity Guarantees are not included in the starting assets.~~

- b. If the amount of initial general account assets is negative, the model should reflect a projected interest expense. General account assets chosen for use as described above shall be selected on a consistent basis from one reserve valuation hereunder to the next.

~~To the extent that the sum of the value of hedge assets, or cash, or other general account assets in an amount equal to the aggregate market value of such hedge assets, and the value of separate account assets supporting the contracts is greater than the approximate value of statutory reserves as of the start of the projections, then the company shall include enough negative general account assets or cash such that the starting asset amount equals the approximate value of statutory reserves as of the start of the projections.~~

2. Valuation of Projected Assets

For purposes of determining the projected accumulated deficiencies, the value of projected assets shall be determined in a manner consistent with their value at the start of the projection. For assets assumed to be purchased during a projection, the value shall be determined in a manner consistent with the value of assets at the start of the projection that have similar investment characteristics. However, for derivative instruments that are used in hedging and are not assumed to be sold during a particular projection interval, the company may account for them at an amortized cost in an appropriate manner elected by the company.

Guidance Note: Accounting for hedge assets should recognize any methodology prescribed by a company's state of domicile.

3. ~~Separate Account Assets~~

~~For purposes of determining the starting asset amounts in Section 4.D.1 and the valuation of projected assets in Section 4.D.2, assets held in a separate account shall be summarized into asset categories determined by the company as discussed in Section 4.A.2.~~

4.3. General Account Assets

- a. General account assets shall be projected, net of projected defaults, using assumed investment returns consistent with their book value and expected to be realized in future periods as of the date of valuation. Initial assets that mature during the projection and positive cash flows projected for future periods shall be invested in a manner that is representative of and consistent with the company's investment policy, subject to the following requirements:
- i. The final maturities and cash flow structures of assets purchased in the model, such as the patterns of gross investment income and principal repayments or a fixed or floating rate interest basis, shall be determined by the company as part of the model representation;
 - ii. The combination of price and structure for fixed income investments and derivative instruments associated with fixed income investments shall

appropriately reflect the projected Treasury Department curve along the relevant scenario and the requirements for gross asset spread assumptions stated below;

- iii. For purchases of public non-callable corporate bonds, follow the requirements defined in VM-20 Sections 7.E, 7.F and 9.F. The prescribed spreads reflect current market conditions as of the model start date and grade to long-term conditions based on historical data at the start of projection year four;
 - iv. For transactions of derivative instruments associated with fixed income investments, reflect the prescribed assumptions in VM-20 Section 9.F for interest rate swap spreads;
 - v. For purchases of other fixed income investments, if included in the model investment strategy, set assumed gross asset spreads over U.S. Treasuries in a manner that is consistent with, and results in reasonable relationships to, the prescribed spreads for public non-callable corporate bonds and interest rate swaps.
- b. Notwithstanding the above requirements, the model investment strategy and any non-prescribed asset spreads shall be adjusted as necessary so that the aggregate reserve is not less than that which would be obtained by substituting an alternative investment strategy in which all fixed income reinvestment assets are public non-callable corporate bonds with gross asset spreads, asset default costs, and investment expenses by projection year that are consistent with a credit quality blend of:
- i. ~~-5% Treasury~~
 - ii. ~~150% PBR credit rating 3 (Aa2/AA)~~
 - iii. ~~40% 6 (A2/A) and 50% PBR credit rating 63 (Aa2/AA)~~
 - ~~vi.iv. 40% PBR credit rating 9 (Baa/BBB)~~

~~Policy loans, equities and derivative instruments associated with the execution of a clearly defined hedging strategy are not affected by this requirement.~~

~~**Drafting Note:** This limitation is being referred to Life Actuarial (A) Task Force for review.~~

- ~~b.c. Any disinvestment shall be modeled in a manner that is consistent with the company's investment policy and that reflects the company's cost of borrowing where applicable, provided that the assumed cost of borrowing is not lower than the rate at which positive cash flows are reinvested in the same time period, taking into account duration, ratings, and other attributes of the borrowing mechanism. Gross asset spreads used in computing market values of assets sold in the model shall be consistent with, but not necessarily the same as, the gross asset spreads in Section 4.D.4.a.iii and Section 4.D.4.a.iv, recognizing that initial assets that mature~~

during the projection may have different characteristics than modeled reinvestment assets.

Guidance Note: This limitation is being referred to Life Actuarial (A) Task Force for review. The simple language above “provided that the assumed cost of borrowing is not lower than the rate at which positive cash flows are reinvested in the same time period” is not intended to impose a literal requirement. It is intended to reflect a general concept to prevent excessively optimistic borrowing assumptions. It is recognized that borrowing parameters and rules can be complicated, such that modeling limitations may not allow for literal compliance, in every time step, as long as the reserve is not materially affected. However, if the company is unable to fully apply this restriction, prudence dictates that a company shall not allow borrowing assumptions to materially reduce the reserve.

5.4. Cash Flows from Invested Assets

- a. Cash flows from general account fixed income assets, including starting and reinvestment assets, shall be reflected in the projection as follows:
 - i. Model gross investment income and principal repayments in accordance with the contractual provisions of each asset and in a manner consistent with each scenario.
 - ii. Reflect asset default costs as prescribed in VM-20 Section 9.F and anticipated investment expenses through deductions to the gross investment income.
 - iii. Model the proceeds arising from modeled asset sales and determine the portion representing any realized capital gains and losses.
 - iv. Reflect any uncertainty in the timing and amounts of asset cash flows related to the paths of interest rates, equity returns or other economic values directly in the projection of asset cash flows. Asset defaults are not subject to this requirement, since asset default assumptions must be determined by the prescribed method in VM-20 Sections 7.E, 7.F and 9.F.
- b. Cash flows from general account index funds and equity assets—i.e., non-fixed income assets having substantial volatility of returns, such as common stocks and real estate— including starting and reinvestment assets, shall be reflected in the projection as follows:
 - i. Determine the grouping for asset categories and the allocation of specific assets to each category in a manner that is consistent with that used for ~~separate account assets~~ index crediting strategies, as discussed in Section 4.A.2.
 - ii. Project the gross investment return including realized and unrealized capital gains in a manner that is consistent with the stochastically generated scenarios.

- iii. Model the timing of an asset sale in a manner that is consistent with the investment policy of the company for that type of asset. Reflect expenses through a deduction to the gross investment return using prudent estimate assumptions.
- c. Cash flows for each projection interval for policy loan assets shall follow the requirements in Section 10.I.
- E. Projection of Annuitization Benefits ~~(Including GMIBs and GMWBs)~~
1. ~~Assumed Annuitization Purchase Rates at Election~~
- a. For payouts specified at issue (such as single premium immediate annuities, deferred income annuities, and certain structured settlements), such payout rates shall reflect the payout rate specified in the contract.
- a.b. For purposes of projecting future elective annuitization benefits (including annuitizations stemming from the election of a GMIB) and withdrawal amounts from GMWBs, the projected annuitization purchase rates shall be determined assuming that market interest rates available at the time of election are the interest rates used to project general account assets, as determined in Section 4.D.4. In contrast, for payouts specified at issue, the payout rates modeled should be consistent with those specified in the contract.
2. ~~Projected Election of GMIBs, GMWBs and Other Annuitization Options~~
- a. ~~For contracts projected to elect future annuitization options (including annuitizations stemming from the election of a GMIB) or for projections of GMWB benefits once the account value has been depleted, the projections may assume one of the following at the company's option:~~
- ~~The contract is treated as if surrendered at an amount equal to the statutory reserve that would be required at such time for a fixed payout annuity benefit equivalent to the guaranteed benefit amount (e.g., GMIB or GMWB benefit payments)~~
- ~~The contract is assumed to will stay in force, and the projected periodic payments are paid, and the associated maintenance expenses are incurred.~~
- b. ~~Where mortality improvement is used to project future annuitization purchase rates, as discussed in Section 4.E.1 above, mortality improvement also shall be reflected on a consistent basis in either the determination of the reserve in Section 4.E.2.a.i above or the projection of the periodic payments in Section 4.E.2.a.ii.~~
3. ~~Projected Statutory Reserve for Payout Annuity Benefits~~
- ~~If the statutory reserve for payout annuity benefits referenced above in Section 4.E.2.a requires a parameter that is not determined in a formulaic fashion, the company must make a reasonable and supportable assumption regarding this parameter.~~

F. Frequency of Projection and Time Horizon

1. Use of an annual cash-flow frequency (“timestep”) is generally acceptable for benefits/features that are not sensitive to projection frequency. The lack of sensitivity to projection frequency should be validated by testing wherein the company should determine that the use of a more frequent—i.e., shorter—time step does not materially increase reserves. A more frequent time increment should always be used when the product features are sensitive to projection period frequency.
2. Care must be taken in simulating fee income and expenses when using an annual time step. ~~For example, recognizing fee income at the end of each period after market movements, but prior to persistency decrements, would normally be an inappropriate assumption.~~ It is also important that the frequency of the investment return model be linked appropriately to the projection horizon in the liability model. In particular, the horizon should be sufficiently long so as to capture the vast majority of costs (on a present value basis) from the scenarios.

Guidance Note: As a general guide, the forecast horizon should not be less than 20 years.

G. Compliance with ASOPs

When determining a stochastic reserve, the analysis shall conform to the ASOPs as promulgated from time to time by the ASB.

Under these requirements, an actuary will make various determinations, verifications and certifications. The company shall provide the actuary with the necessary information sufficient to permit the actuary to fulfill the responsibilities set forth in these requirements and responsibilities arising from each applicable ASOP.

Section 5: Reinsurance Ceded and Assumed

Drafting Note: All revisions shown in this section are in comparison to Section 5 in VM-21.

A. Treatment of Reinsurance Ceded in the Aggregate Reserve

1. Aggregate Reserve Pre- and Post-Reinsurance Ceded

As noted in Section 3.B, the aggregate reserve is determined both pre-reinsurance ceded and post-reinsurance ceded. Therefore, it is necessary to determine the components needed to determine the aggregate reserve—i.e., ~~the additional standard projection amount, the stochastic reserve determined using projections, and/or the reserve amount valued using requirements in VM-A and VM-C determined using the Alternative Methodology, as applicable~~—on both bases. Sections 5.A.2 and through 5.A.34 discuss adjustments to inputs necessary to determine these components on both a post-reinsurance ceded and a pre-reinsurance ceded basis. Note that due allowance for reasonable approximations may be used where appropriate.

2. Stochastic Reserve

- a. In order to determine the aggregate reserve post-reinsurance ceded, accumulated deficiencies, scenario reserves, and the resulting stochastic reserve shall be determined reflecting the effects of reinsurance treaties that meet the statutory requirements that would allow the treaty to be accounted for as reinsurance within statutory accounting. This involves including, where appropriate, all ~~anticipated~~ projected reinsurance premiums or other costs and all reinsurance recoveries, where the reinsurance cash flows reflect all the provisions in the reinsurance agreement, using prudent estimate assumptions ~~both premiums and recoveries are determined by recognizing any limitations in the reinsurance treaties, such as caps on recoveries or floors on premiums.~~
 - i. All significant terms and provisions within reinsurance treaties shall be reflected. In addition, it shall be assumed that each party is knowledgeable about the treaty provisions and will exercise them to their advantage.

Guidance Note: Renegotiation of the treaty upon the expiration of an experience refund provision or at any other time shall not be assumed if such would be beneficial to the company and not beneficial to the counterparty. This is applicable to both the ceding party and assuming party within a reinsurance arrangement.

- ii. If the company has knowledge that a counterparty is financially impaired, the company shall establish a margin for the risk of default by the counterparty. In the absence of knowledge that the counterparty is financially impaired, the company is not required to establish a margin for the risk of default by the counterparty.
- iii. A company shall include the cash flows from a reinsurance agreement or amendment in calculating the aggregate reserve if such qualifies for credit in compliance with Appendix A-791 of the Accounting Practices and Procedures Manual. If a reinsurance agreement or amendment does not qualify for credit for reinsurance but treating the reinsurance agreement or amendment as if it did so qualify would result in a reduction to the company's surplus, then the company shall increase the minimum reserve by the absolute value of such reductions in surplus.

- b. In order to determine the stochastic reserve on a pre-reinsurance ceded basis, accumulated deficiencies, scenario reserves, and the resulting stochastic reserve shall be determined ignoring the effects of reinsurance ceded within the projections. Different approaches may be used to determine the starting assets on the ceded portion of the contracts, dependent upon the characteristics of a given treaty:
- i. For a standard coinsurance treaty, where the assets supporting the ceded liabilities were transferred to the assuming reinsurer, ~~One acceptable approach involves a projection based on using the same starting assets on the ceded portion of the policies that are similar to those supporting the retained portion of the ceded policies or supporting similar types of policies. Scaling up each asset supporting the retained portion of the contract is also an acceptable method amount as for the aggregate reserve post reinsurance ceded and by ignoring, where appropriate, all anticipated reinsurance premiums or other costs and all reinsurance recoveries in the projections.~~

Guidance Note: For standard pro rata insurance treaties (does not include experience refunds), where allocated expenses are similar to the renewal expense allowance, reflecting the quota share applied to the present value of future reinsurance cash flows pertaining to the reinsured block of business may be considered as a possible approach to determine the ceded reserves.

- ii. Alternatively, a treaty may contain an identifiable portfolio of assets associated with the ceded liabilities. This could be the case for several forms of reinsurance: funds withheld coinsurance; modified coinsurance; coinsurance with a trust. To the extent these assets would be available to the cedant, an acceptable approach could involve modeling this portfolio of assets. To the extent that these assets were insufficient to defease the ceded liabilities, the modeling would partially default to the approach discussed for a standard coinsurance treaty. To the extent these assets exceeded what might be needed to defease the ceded liabilities (perhaps an over collateralization requirement in a trust), the inclusion of such assets shall be limited.

Guidance Note: Section 3.5.2 in ASOP No. 52, *Principle-Based Reserves for Life Products under the NAIC Valuation Manual*, provides possible methods for constructing a hypothetical pre-reinsurance asset portfolio, if necessary, for purposes of the pre-reinsurance reserve calculation.

- c. An assuming company shall use assumptions to project cash flows to and from ceding companies that reflect the assuming company's experience for the business segment to which the reinsured policies belong and reflect the terms of the reinsurance agreement.

3. Reserve Determined Upon Passing the Exclusion Test ~~using the Alternative Methodology~~

If a company passes ~~chooses to use the Alternative Methodology~~ stochastic exclusion test and elects to use a methodology pursuant to applicable Sections VM-A and VM-C, as allowed in Section 3.E, it is important to note that the methodology produces reserves on a pre-reinsurance ceded basis. Therefore, where reinsurance is ceded, the Alternative Methodology reserve must be modified to reflect the reinsurance costs and reinsurance recoveries under the reinsurance treaties in the determination of the aggregate reserve post reinsurance ceded adjusted for any reinsurance ceded accordingly. In addition, the reserves valued under applicable Sections in VM-A and VM-C ~~Alternative Methodology~~, unadjusted for reinsurance, shall be applied to the contracts falling under the scope of these requirements to determine the aggregate reserve prior to reinsurance.

It should be noted that the pre-reinsurance and post-reinsurance reserves may result in different outcomes for the exclusion test. In particular, it is possible that the pre-reinsurance reserves would pass the relevant exclusion test (and allow the use of VM-A and VM-C) while the post-reinsurance reserves might not.

4. ~~To Be Determined~~ Additional Standard Projection Amount

~~Where reinsurance is ceded, the additional standard projection amount shall be calculated as described in Section 6 to reflect the reinsurance costs and reinsurance recoveries under the reinsurance treaties. The additional standard projection amount shall also be calculated pre reinsurance ceded using the methods described in Section 6 but ignoring the effects of the reinsurance ceded.~~

Section 6: To Be Determined

Section 7: Exclusion Testing

Drafting Note: All revisions shown in this section are in comparison to Section 6 in VM-20.

A. Stochastic Exclusion Test Requirement Overview

1. ~~Requirements to pass the Stochastic Exclusion Test:~~

1. The company may elect to exclude one or more groups of contracts from the stochastic reserve calculation if the stochastic exclusion test (SET) is satisfied for that group of contracts. The company has the option to calculate or not calculate the SET.
 - a. If the company does not elect to calculate the SET for one or more groups of contracts, or the company calculates the SET and fails the test for such groups of contracts, the reserve methodology described in Section 4 shall be used for calculating the aggregate reserve for those groups of contracts.
 - b. If the company elects to calculate the SET for one or more groups of contracts, and passes the test for such groups of contracts, then the company shall choose whether or not to use the reserve methodology described in Section 4 for those groups of contracts. If the reserve methodology described in Section 4 is not used for one or more groups of contracts, then the company shall use the reserve methodology pursuant to applicable requirements in VM-A and VM-C to calculate the aggregate reserve for those groups of contracts.
 - c. A company may not exclude a group of contracts from the stochastic reserve requirements if there are one or more future hedging programs associated with the contracts, with the exception of hedging programs solely supporting index credits as described in Section 9.A.1.

B. Types of Stochastic Exclusion Tests

Groups of contracts pass the SET if one of the following is met:

1. Stochastic Exclusion Ratio Test (SERT)—Annually and within 12 months before the valuation date the company demonstrates that the groups of ~~contracts~~policies pass the SERT defined in Section 7.C6.A.2.
2. Stochastic Exclusion Demonstration Test—In the first year and at least once every three calendar years thereafter, the company provides a demonstration in the PBR Actuarial Report as specified in Section 7.D6.A.3.
3. SET Certification Method—For groups of ~~contracts~~policies other than variable life that do not have guaranteed living benefits, future hedging programs, or ~~ULSG~~pension risk transfer business in the first year and at least every third calendar year thereafter, the company provides a certification by a qualified actuary that the group of ~~contracts~~policies is not subject to material aggregate risk levels across interest rate risk, longevity risk, or asset return volatility risk (i.e., the risk on non-fixed-income investments having substantial volatility of returns, such as common stocks and real estate investments). The company shall provide the certification and documentation supporting the certification to the commissioner upon request.

Guidance Note: The qualified actuary should develop documentation to support the actuarial certification that presents his or her analysis clearly and in detail sufficient for another actuary to

understand the analysis and reasons for the actuary's conclusion that the group of ~~policies~~contracts is not subject to material interest rate risk, longevity risk, or asset return volatility risk. Examples of methods a qualified actuary could use to support the actuarial certification include, but are not limited to:

- a) A demonstration that ~~NPR~~using requirements under VM-A and VM-C for the group of ~~policies~~contracts calculated according to Section 3 are at least as great as the assets required to support the group of ~~policies~~contracts using the company's cash-flow testing model under each of the 16 scenarios identified in ~~Section 6~~this section or alternatively each of the New York seven scenarios.
- b) A demonstration that the group of ~~policies~~contracts passed the SERT within 36 months prior to the valuation date and the company has not had a material change in its interest rate risk.
- c) A qualitative risk assessment of the group of ~~policies~~contracts that concludes that the group of ~~policies~~contracts does not have material interest rate risk or asset return volatility. Such assessment would include an analysis of product guarantees, the company's non-guaranteed elements (NGEs) policy, assets backing the group of ~~policies~~contracts and the company's investment strategy.

C. Stochastic Exclusion Ratio Test

1. In order to exclude a group of ~~policies~~contracts from the stochastic reserve requirements using the method allowed under ~~Section 6.A.1.a~~the stochastic exclusion ratio test (SERT), a company shall demonstrate that the ratio of $(b-a)/ea$ is less than ~~6%~~ $[x]\%$ where:

- a. ~~a = the adjusted deterministic scenario reserve described in Section 6.A.2.b.i~~Paragraph C.2.a.i below using economic scenario 9, the baseline economic scenario, as described in Appendix 1.E of VM-20.
- b. ~~b = the largest adjusted scenario reserve described in Section 6.A.2.b.i~~Paragraph C.2.b below under any of the other 15 economic scenarios described in Appendix 1.E of VM-20 under both ~~[95]%~~ and ~~[105]%~~ of anticipated experience mortality excluding margins.
- ~~iii. c = an amount calculated from the baseline economic scenario described in Appendix 1.E that represents the present value of benefits for the policies, adjusted for reinsurance by subtracting ceded benefits. For clarity, premium, ceded premium, expense, reinsurance expense allowance, modified coinsurance reserve adjustment and reinsurance experience refund cash flows shall not be considered "benefits," but items such as death benefits, surrender or withdrawal benefits and policyholder dividends shall be. For this purpose, the company shall use the benefits cash flows from the calculation of quantity "a" and calculate the present value of those cash flows using the same path of discount rates as used for "a."~~

Guidance Note: Note that the numerator should be the largest adjusted ~~DR~~scenario reserve for scenarios other than the baseline economic scenario, minus the adjusted ~~DR~~scenario reserve for

the baseline economic scenario. This is not necessarily the same as the biggest difference from the adjusted ~~DR~~scenario reserve for the baseline economic scenario, or the absolute value of the biggest difference from the adjusted ~~DR~~scenario reserve for the baseline economic scenario, both of which could lead to an incorrect test result.

2. In calculating the ratio in ~~Section 6.A.2.a~~subsection (1) above:
 - a. The company shall calculate an adjusted ~~deterministic~~scenario reserve for the group of ~~contracts~~policies for ~~each of the~~ 16 scenarios that is equal to either (a) or (b) below:
 - i. The ~~deterministic~~scenario reserve defined in Section 4.A, but with the following differences:
 - a) Using anticipated experience assumptions with no margins, with the exception of mortality factors described in Paragraph C.1.b of this section.
 - b) Using the interest rates and equity return assumptions specific to each scenario.
 - c) Using NAER and discount rates defined in Section ~~7.H4~~ specific to each scenario to discount the cash flows.
 - d) Shall reflect future mortality improvement in line with anticipated experience assumptions.
 - e) Shall not reflect correlation between longevity and economic risks.
 - ii. The gross premium reserve developed from the cash flows from the company's asset adequacy analysis models, using the experience assumptions of the company's cash-flow analysis, but with the following differences:
 - a) Using the interest rates and equity return assumptions specific to each scenario.
 - b) Using the mortality scalars described in Paragraph C.1.b of this section.
 - c) Using the methodology to determine NAER and discount rates defined in Section ~~7.H4~~ specific to each scenario to discount the cash flows, but using the company's cash-flow testing assumptions for default costs and reinvestment earnings.
 - b. The company shall use the most current ~~available baseline economic scenario and the 15 other~~ 16 economic scenarios published by the NAIC. The methodology for creating these scenarios can be found in Appendix 1 of VM-20.
 - c. The company shall use assumptions within each scenario that are dynamically adjusted as appropriate for consistency with each tested scenario.
 - d. The company may not group together contract types with significantly different risk profiles for purposes of calculating this ratio.

- e. ~~Mortality improvement beyond the projection start date may not be reflected in the mortality assumption for the purpose of the calculating the stochastic exclusion ratio.~~
- e. If the company has reinsurance arrangements that are pro rata coinsurance and do not materially impact the interest rate risk, longevity risk, or asset return volatility in the contract, then the company may elect to not conduct the exclusion test under a pre-reinsurance-ceded basis upon determining the pre-reinsurance reserve-ceded aggregate reserve.
3. If the ratio calculated in Section 6.A.2.a above this section is less than 6%[x]% pre-YRTnon-proportional reinsurance, but is greater than 6%[x]% post-YRTnon-proportional reinsurance, the group of ~~contracts~~ policies will still pass the SERT if the company can demonstrate that the sensitivity of the adjusted ~~deterministic~~ scenario reserve to economic scenarios is comparable pre- and post-YRTnon-proportional reinsurance.
- a. An example of an acceptable demonstration:
- i. For convenience in notation • SERT = the ratio $(b-a)/ea$ defined in Section 7.C.1(a) above
- a) The pre-YRTnon-proportional reinsurance results are “gross of YRTnon-proportional,” with a subscript “gygn,” so denoted $SERT_{gy}, SERT_{gn}$
- b) The post-YRTnon-proportional results are “net of YRTnon-proportional,” with subscript “nynn,” so denoted $SERT_{ny}, SERT_{nn}$
- ii. If a block of business being tested is subject to one or more YRTnon-proportional reinsurance cessions as well as other forms of reinsurance, such as pro rata coinsurance, take “gross of YRTnon-proportional” to mean net of all ~~non-YRTprorata~~ reinsurance but ignoring the YRTnon-proportional contract(s), and “net of YRTnon-proportional” to mean net of *all* reinsurance contracts. That is, treat YRTnon-proportional reinsurance as the last reinsurance in, and compute certain values below with and without that last component.
- iii. So, if $SERT_{gy} \leq 0.060, SERT_{gn} \leq [x]$ but $SERT_{ny} > 0.060, SERT_{nn} > [x]$, then compute the largest percent increase in reserve (LPIR) = $(b-a)/a$, both “gross of YRTnon-proportional” and “net of YRTnon-proportional.”
- $$LPIR_{gy}, LPIR_{gn} = (b_{gy} - a_{gy})/a_{gy}, a_{gn}$$
- $$LPIR_{ny}, LPIR_{nn} = (b_{ny} - a_{ny})/a_{ny}, a_{nn}$$
- Note that the scenario underlying b_{gy}, b_{gn} could be different from the scenario underlying b_{ny}, b_{nn} .
- If $SERT_{gy} \times LPIR_{ny}/LPIR_{gy} < 0.060, SERT_{gn} \times LPIR_{nn}/LPIR_{gn} < [x]$, then the block of ~~contracts~~ policies passes the SERT.

- b. Another more qualitative approach is to calculate the adjusted ~~deterministic~~ scenario reserves for the 16 scenarios both gross and net of reinsurance to demonstrate that there is a similar pattern of sensitivity by scenario.
4. The SERT may not be used for a group of ~~contracts~~ policies if, using the current year's data, (i) the stochastic exclusion demonstration test defined in Section 7.D had already been attempted using the method of ~~Section 6.A.3.b.i or Section 6.A.3.b.ii~~ in this section and did not pass; or (ii) the qualified actuary had actively undertaken to perform the certification method of ~~Section 6.A.1.a.iii~~ in this section and concluded that such certification could not legitimately be made.

D. Stochastic Exclusion Demonstration Test

1. In order to exclude a group of ~~contracts~~ policies from the stochastic reserve requirements ~~using the methodology using the method as allowed under Section 6.A.1.a.ii above~~ in this section, the company must provide a demonstration in the PBR Actuarial Report in the first year and at least once every three calendar years thereafter that complies with the following:
 - a. The demonstration shall provide a reasonable assurance that if the stochastic reserve was calculated on a stand-alone basis for the group of ~~contracts~~ policies subject to the stochastic reserve exclusion, the resulting stochastic minimum reserve for those groups of ~~policies~~ contracts would not be higher than the statutory reserve determined pursuant to the applicable requirements in VM-A and VM-C ~~increase~~. The demonstration shall take into account whether changing conditions over the current and two subsequent calendar years would be likely to change the conclusion to exclude the group of ~~policies~~ contracts from the stochastic reserve requirements.
 - b. If, as of the end of any calendar year, the company determines the ~~minimum~~ aggregate reserve for the group of ~~policies~~ contracts no longer adequately provides for all material risks, the exclusion shall be discontinued, and the company fails the SERT for those ~~policies~~ contracts.
 - c. The demonstration may be based on analysis from a date that precedes the valuation date for the initial year to which it applies if the demonstration includes an explanation of why the use of such a date will not produce a material change in the outcome, as compared to results based on an analysis as of the valuation date.
 - d. The demonstration shall provide an effective evaluation of the residual risk exposure remaining after risk mitigation techniques, such as derivative programs and reinsurance.
2. The company may use one of the following or another method acceptable to the insurance commissioner to demonstrate compliance with ~~Section 6.A.3.a~~ subsection 7.D.1 above:
 - a. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C ~~greater of [the quantity A and the quantity B]~~ is greater than the stochastic reserve calculated on a stand-alone basis, ~~where:~~

~~A = the deterministic reserve, and~~

~~B = the NPR less any associated due and deferred premium asset.~~

~~bii. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C greater of [the quantity A and the quantity B] is greater than the scenario reserve that results from each of a sufficient number of adverse deterministic scenarios, where:~~

~~A = the deterministic reserve, and~~

~~B = the NPR less any associated due and deferred premium asset.~~

~~c. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C greater of [the quantity A and the quantity B] is greater than the stochastic reserve calculated on a stand-alone basis, but using a representative sample of contracts/policies in the stochastic reserve calculations, where:~~

~~A = the deterministic reserve, and~~

~~B = the NPR less any associated due and deferred premium asset.~~

~~d. Demonstrate that any risk characteristics that would otherwise cause the stochastic reserve calculated on a stand-alone basis to exceed greater of the deterministic reserve and the NPR, less any associated due and deferred premium asset the statutory reserve calculated in accordance with VM-A and VM-C, are not present or have been substantially eliminated through actions such as hedging, investment strategy, reinsurance or passing the risk on to the policyholder by contract provision.~~

E. Deterministic Certification Option

1. The company has the option to determine the stochastic reserve for a group of contracts using a single deterministic economic scenario, subject to the following conditions.

a. The company certifies that economic conditions do not materially influence anticipated contract holder behavior for the group of policies. Examples of contract holder options that are materially influenced by economic conditions include surrender benefits, recurring premium payments, and guaranteed living benefits.

b. The company certifies that the group of policies is not supported by a reinvestment strategy that contains future hedge purchases.

c. The company must perform and disclose results from the stochastic exclusion ratio test following the requirements in Section 7.C, thereby disclosing the scenario reserve volatility across various economic scenarios.

d. The company must disclose a description of contracts and associated features in the certification.

Drafting Note: Consider revisiting Paragraph E.1.c to possibly either require i) falling below a preset threshold for the exclusion ratio test under a single longevity/mortality scenario; or ii) to pass the exclusion test if longevity is not included as part of the ratio test.

2. The stochastic reserve for the group of contracts under the Deterministic Certification Option is determined as follows:
- a. Cash flows are projected in compliance with the applicable requirements in Section 4, Section 5, Section 10, and Section 11 of VM-22 over a single economic scenario (scenario 12 found in Appendix 1 of VM-20).
 - b. The stochastic reserve equals the scenario reserve following the requirements for Section 4.

Guidance Note: The Deterministic Certification Option is intended to provide a non-stochastic option for Single Premium Immediate Annuities (SPIAs) and similar payout annuity products that contain limited or no optionality in the asset and liability cash flow projections.

Section 8: To Be Determined (Scenario Generation for VM-21)

Section 9: Modeling Hedges under a Future Hedging Strategy

Drafting Note: All revisions shown in this section are in comparison to Section 9 in VM-21.

A. Initial Considerations

1. This section applies to modeling of hedges other than situations where the company (a) only hedges index credits, or (b) clearly separates index credit hedging from other hedging. In those situations, the modeling of hedges supporting index credits can be simplified including applying an index credit hedge margin, following the requirements in Section 4.A.4.b.i.
- ~~21.~~ Subject to Section 9.C.2, †The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the calculation of the stochastic reserve, determined in accordance with Section 3.D and Section 4.D.
- ~~32.~~ If the company is following a CDHS, in accordance with an investment policy adopted by the board of directors, or a committee of board members, †The company shall take into account the costs and benefits of hedge positions expected to be held by the company in the future along each scenario based on the execution of the hedging strategy, and it is eligible to reduce the amount of the stochastic reserve using projections otherwise calculated. The investment policy must clearly articulate the company's hedging objectives, including the metrics that drive rebalancing/trading. This specification could include maximum tolerable values for investment losses, earnings, volatility, exposure, etc. in either absolute or relative terms over one or more investment horizons vis à vis the chance of occurrence. Company management is responsible for developing, documenting, executing and evaluating the investment strategy for future hedge purchases. Prior to reflection in projections, the strategy for future hedge purposes shall be the actual practice of the company for a period of time not less than [6] months. , including the hedging strategy, used to implement the investment policy.
- ~~43.~~ For this purpose, the investment assets refer to all the assets, including derivatives supporting covered products and guarantees. This also is referred to as the investment portfolio. The investment strategy is the set of all asset holdings at all points in time in all scenarios. The hedging portfolio, which also is referred to as the hedging assets, is a subset of the investment assets. The hedging strategy is the hedging asset holdings at all points in time in all scenarios. There is no attempt to distinguish what is the hedging portfolio and what is the investment portfolio in this section. Nor is the distinction between investment strategy and hedging strategy formally made here. Where necessary to give effect to the intent of this section, the requirements applicable to the hedging portfolio or the hedging strategy are to apply to the overall investment portfolio and investment strategy.
- ~~54.~~ This particularly applies to restrictions on the reasonableness or acceptability of the models that make up the stochastic cash-flow model used to perform the projections, since these restrictions are inherently restrictions on the joint modeling of the hedging and non-hedging portfolio. To give effect to these requirements, they must apply to the overall investment strategy and investment portfolio. Before either a new or revised hedging strategy can be used to reduce the amount of the stochastic reserve otherwise calculated, the hedging strategy should be in place (i.e., effectively implemented by the company) for at least three months. The company may meet the time requirement by having evaluated

~~the effective implementation of the hedging strategy for at least three months without actually having executed the trades indicated by the hedging strategy (e.g., mock testing or by having effectively implemented the strategy with similar annuity products for at least three months).~~

B. Modeling Approaches

1. The analysis of the impact of the hedging strategy on cash flows is typically performed using either one of two types of methods as described below. Although a hedging strategy normally would be expected to reduce risk provisions, the nature of the hedging strategy and the costs to implement the strategy may result in an increase in the amount of the stochastic reserve otherwise calculated.
2. The fundamental characteristic of the first type of method, referred to as the “explicit method,” is that hedging positions and their resulting cash flows are included in the stochastic cash-flow model used to determine the scenario reserve, as discussed in Section 3.D, for each scenario.
3. The fundamental characteristic of the second type of method, referred to as the “implicit method,” is that the effectiveness of the current hedging strategy on future cash flows is evaluated, in part or in whole, outside of the stochastic cash-flow model. There are multiple ways that this type of modeling can be implemented. In this case, the reduction to the stochastic reserve otherwise calculated should be commensurate with the degree of effectiveness of the hedging strategy in reducing accumulated deficiencies otherwise calculated.
4. Regardless of the methodology used by the company, the ultimate effect of the current hedging strategy (including currently held hedge positions) on the stochastic reserve needs to recognize all risks, associated costs, imperfections in the hedges and hedging mismatch tolerances associated with the hedging strategy. The risks include, but are not limited to: basis, gap, price, parameter estimation and variation in assumptions (mortality, persistency, withdrawal, annuitization, etc.). Costs include, but are not limited to: transaction, margin (opportunity costs associated with margin requirements) and administration. In addition, the reduction to the stochastic reserve attributable to the hedging strategy may need to be limited due to the uncertainty associated with the company’s ability to implement the hedging strategy in a timely and effective manner. The level of operational uncertainty varies indirectly with the amount of time that the new or revised strategy has been in effect or mock tested.

Guidance Note: No hedging strategy is perfect. A given hedging strategy may eliminate or reduce some but not all risks, transform some risks into others, introduce new risks, or have other imperfections. For example, a delta-only hedging strategy does not adequately hedge the risks measured by the “Greeks” other than delta. ~~Another example is that financial indices underlying typical hedging instruments typically do not perform exactly like the separate account funds, and hence the use of hedging instruments has the potential for introducing basis risk~~

5. A safe harbor approach is permitted ~~for CDHS reflection~~ for those companies whose modeled hedge assets comprise only linear instruments not sensitive to implied volatility. For companies with option-based hedge strategies, electing this approach would require representing the option-based portion of the strategy as a delta-rho two-Greek hedge program. The normally modeled option portfolio would be replaced with a set of linear instruments that have the same first-order Greeks as the original option portfolio.

C. Calculation of Stochastic Reserve (Reported)

1. The company shall calculate CTE70 (best efforts)—the results obtained when the CTE70 is based on incorporating the ~~CDHS modeling of hedges~~ (including both currently held and future hedge positions) into the stochastic cash-flow model on a best efforts basis, including all of the factors and assumptions needed to ~~execute the CDHS model the hedges~~ (e.g., stochastic implied volatility). The determination of CTE70 (best efforts) may utilize either explicit or implicit modeling techniques.
2. The company shall calculate a CTE70 (adjusted) by recalculating the CTE70 assuming the company has no ~~CDHS hedging strategy except those to hedge interest credits and hedge assets held by the company on the valuation date~~, therefore following the requirements of Section 4.A.4.a and 4.A.4.b.i.
3. Because most models will include at least some approximations or idealistic assumptions, CTE70 (best efforts) may overstate the impact of the hedging strategy. To compensate for potential overstatement of the impact of the hedging strategy, the value for the stochastic reserve is given by:

$$\text{Stochastic reserve} = \text{CTE70 (best efforts)} + E \times \max[0, \text{CTE70 (adjusted)} - \text{CTE70 (best efforts)}]$$

4. The company shall specify a value for E (the “error factor”) in the range from 5% to 100% to reflect the company’s view of the potential error resulting from the level of sophistication of the stochastic cash-flow model and its ability to properly reflect the parameters of the hedging strategy (i.e., the Greeks being covered by the strategy), as well as the associated costs, risks and benefits. The greater the ability of the stochastic model to capture all risks and uncertainties, the lower the value of E . The value of E may be as low as 5% only if the model used to determine the CTE70 (best efforts) effectively reflects all of the parameters used in the hedging strategy. If certain economic risks are not hedged, yet the model does not generate scenarios that sufficiently capture those risks, E must be in the higher end of the range, reflecting the greater likelihood of error. Likewise, simplistic hedge cash-flow models shall assume a higher likelihood of error.
5. The company shall conduct a formal back-test, based on an analysis of at least the most recent 12 months, to assess how well the model is able to replicate the hedging strategy in a way that supports the determination of the value used for E .
6. Such a back-test shall involve one of the following analyses:
 - a. For companies that model hedge cash flows directly (“explicit method”), replace the stochastic scenarios used in calculating the CTE70 (best efforts) with a single scenario that represents the market path that actually manifested over the selected back-testing period and compare the projected hedge asset gains and losses against the actual hedge asset gains and losses – both realized and unrealized – observed over the same time period. For this calculation, the model assumptions may be replaced with parameters that reflect actual experience during the back-testing period. In order to isolate the comparison between the modeled hedge ~~results strategy~~ and actual hedge results for this calculation, the projected liabilities should accurately reflect the actual liabilities throughout the back-testing period; therefore, adjustments that facilitate this accuracy (e.g. reflecting actual experience instead of model assumptions, including new business, etc.) are permissible.

To support the choice of a low value of E, the company should ascertain that the projected hedge asset gains and losses are within close range of 100% (e.g., 80–125%) of the actual hedge asset gains and losses. The company may also support the choice of a low value of E by achieving a high R-squared (e.g., 0.80 or higher) when using a regression analysis technique.

- b. For companies that model hedge cash flows implicitly by quantifying the cost and benefit of hedging using the fair value of the hedged item (an “implicit method” or “cost of reinsurance method”), calculate the delta, rho and vega coverage ratios in each month over the selected back-testing period in the following manner:
 - i. Determine the hedge asset gains and losses—both realized and unrealized—incurred over the month attributable to equity, interest rate, and implied volatility movements.
 - ii. Determine the change in the fair value of the hedged item over the month attributable to equity, interest rate, and implied volatility movements. The hedged item should be defined in a manner that reflects the proportion of risks hedged (e.g., if a company elects to hedge 50% of a contract’s market risks, it should quantify the fair value of the hedged item as 50% of the fair value of the contract).
 - iii. Calculate the delta coverage ratio as the ratio between (i) and (ii) attributable to equity movements.
 - iv. Calculate the rho coverage ratio as the ratio between (i) and (ii) attributable to interest rate movements.
 - v. Calculate the vega coverage ratio as the ratio between (i) and (ii) attributable to implied volatility movements.
 - vi. To support the company’s choice of a low value of E, the company should be able to demonstrate that the delta and rho coverage ratios are both within close range of 100 % (e.g., 80–125%) consistently across the back-testing period.
 - vii. In addition, the company should be able to demonstrate that the vega coverage ratio is within close range of 100 % in order to use the prevailing implied volatility levels as of the valuation date in quantifying the fair value of the hedged item for the purpose of calculating CTE70 (best efforts). Otherwise, the company shall quantify the fair value of the hedged item for the purpose of calculating CTE70 (best efforts) in a manner consistent with the realized volatility of the scenarios captured in the CTE (best efforts).
 - c. Companies that do not model hedge cash flows explicitly, but that also do not use the implicit method as outlined in Section 9.C.6.b above, shall conduct the formal back-test in a manner that allows the company to clearly illustrate the appropriateness of the selected method for reflecting the cost and benefit of hedging, as well as the value used for E.
7. A company that does not have 12 months of experience to date shall set E to a value that reflects the amount of experience available, and the degree and nature of any change to the hedge program. For a material change in strategy, with no history, E should be at least 0.50.

However, E may be lower than 0.50 if some reliable experience is available and/or if the change in strategy is a refinement rather than a substantial change in strategy.

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily large (e.g., $\geq 50\%$) for substantial changes in hedge methodology (e.g., moving from a fair-value based strategy to a stop-loss strategy) where the company has not been able to provide a meaningful simulation of hedge performance based on the new strategy.
- A temporary moderate increase (e.g., 15–30%) in error factor should be used for substantial modifications to hedge programs or ~~CDHS~~-modeling where meaningful simulation has not been created (e.g., adding second-order hedging, such as gamma or rate convexity).
- No increase in the error factor may be used for incremental modifications to the hedge strategy (e.g., adding death benefits to a program that previously covered only living benefits, or moving from swaps to Treasury Department futures).

~~E. Additional Considerations for CTE70 (best efforts)~~

~~If the company is following a CDHS, the fair value of the portfolio of contracts falling within the scope of these requirements shall be computed and compared to the CTE70 (best efforts) and CTE70 (adjusted). If the CTE70 (best efforts) is below both the fair value and CTE70 (adjusted), the company should be prepared to explain why that result is reasonable.~~

~~For the purposes of this analysis, the stochastic reserve and fair value calculations shall be done without requiring the scenario reserve for any given scenario to be equal to or in excess of the cash surrender value in aggregate for the group of contracts modeled in the projection.~~

D. Specific Considerations and Requirements

1. As part of the process of choosing a methodology and assumptions for estimating the future effectiveness of the current hedging strategy (including currently held hedge positions) for purposes of reducing the stochastic reserve, the company should review actual historical hedging effectiveness. The company shall evaluate the appropriateness of the assumptions on future trading, transaction costs, other elements of the model, the strategy, the mix of business and other items that are likely to result in materially adverse results. This includes an analysis of model assumptions that, when combined with the reliance on the hedging strategy, are likely to result in adverse results relative to those modeled. The parameters and assumptions shall be adjusted (based on testing contingent on the strategy used and other assumptions) to levels that fully reflect the risk based on historical ranges and foreseeable future ranges of the assumptions and parameters. If this is not possible by parameter adjustment, the model shall be modified to reflect them at either anticipated experience or adverse estimates of the parameters.
2. A discontinuous hedging strategy is a hedging strategy where the relationships between the sensitivities to equity markets and interest rates (commonly referred to as the Greeks) associated with the guaranteed contract holder options embedded in the ~~variable-fixed indexed~~ annuities and other in-scope products and these same sensitivities associated with the hedging assets are subject to material discontinuities. This includes, but is not limited

to, a hedging strategy where material hedging assets will be obtained when the ~~variable~~ fixed indexed annuity account balances reach a predetermined level in relationship to the guarantees. Any hedging strategy, including a delta hedging strategy, can be a discontinuous hedging strategy if implementation of the strategy permits material discontinuities between the sensitivities to equity markets and interest rates associated with the guaranteed contract holder options embedded in the ~~variable~~-fixed indexed annuities and other in-scope products and these same sensitivities associated with the hedging assets. There may be scenarios that are particularly costly to discontinuous hedging strategies, especially where those result in large discontinuous changes in sensitivities (Greeks) associated with the hedging assets. Where discontinuous hedging strategies contribute materially to a reduction in the stochastic reserve, the company must evaluate the interaction of future trigger definitions and the discontinuous hedging strategy, in addition to the items mentioned in the previous paragraph. This includes an analysis of model assumptions that, when combined with the reliance on the discontinuous hedging strategy, may result in adverse results relative to those modeled.

3. A strategy that has a strong dependence on acquiring hedging assets at specific times that depend on specific values of an index or other market indicators may not be implemented as precisely as planned.
4. The combination of elements of the stochastic cash-flow model—including the initial actual market asset prices, prices for trading at future dates, transaction costs and other assumptions—should be analyzed by the company as to whether the stochastic cash-flow model permits hedging strategies that make money in some scenarios without losing a reasonable amount in some other scenarios. This includes, but is not limited to:
 - a. Hedging strategies with no initial investment that never lose money in any scenario and in some scenarios make money.
 - b. Hedging strategies that, with a given amount of initial money, never make less than accumulation at the one-period risk-free rates in any scenario but make more than this in one or more scenarios.
5. If the stochastic cash-flow model allows for such situations, the company should be satisfied that the results do not materially rely directly or indirectly on the use of such strategies. If the results do materially rely directly or indirectly on the use of such strategies, the strategies may not be used to reduce the stochastic reserve otherwise calculated.
6. In addition to the above, the method used to determine prices of financial instruments for trading in scenarios should be compared to actual initial market prices. In addition to comparisons to initial market prices, there should be testing of the pricing models that are used to determine subsequent prices when scenarios involve trading financial instruments. This testing should consider historical relationships. For example, if a method is used where recent volatility in the scenario is one of the determinants of prices for trading in that scenario, then that model should approximate actual historic prices in similar circumstances in history.

Section 10: Guidance and Requirements for Setting Contract Holder Behavior Prudent Estimate Assumptions

Drafting Note: All revisions shown in this section are in comparison to Section 10 in VM-21.

A. General

Contract holder behavior assumptions encompass actions such as lapses, withdrawals, transfers, recurring deposits, benefit utilization, option election, etc. Contract holder behavior is difficult to predict accurately, and variance in behavior assumptions can significantly affect the results. In the absence of relevant and fully credible empirical data, the company should set behavior assumptions as guided by Principle 3 in Section 1.B.

In setting behavior assumptions, the company should examine, but not be limited by, the following considerations:

1. Behavior can vary by product, market, distribution channel, ~~fund index~~ performance, interest credited (current and guaranteed rates), time/product duration, etc.
2. Options embedded in the product may affect behavior.
3. Utilization of options may be elective or non-elective in nature. Living benefits often are elective, and death benefit options are generally non-elective.
4. Elective contract holder options may be more driven by economic conditions than non-elective options.
5. As the value of a product option increases, there is an increased likelihood that contract holders will behave in a manner that maximizes their financial interest (e.g., lower lapses, higher benefit utilization, etc.).
6. Behavior formulas may have both rational and irrational components (irrational behavior is defined as situations where some contract holders may not always act in their best financial interest). The rational component should be dynamic, but the concept of rationality need not be interpreted in strict financial terms and might change over time in response to observed trends in contract holder behavior based on increased or decreased financial efficiency in exercising their contractual options.
7. Options that are ancillary to the primary product features may not be significant drivers of behavior. Whether an option is ancillary to the primary product features depends on many things, such as:
 - a. For what purpose was the product purchased?
 - b. Is the option elective or non-elective?
 - c. Is the value of the option well-known?
8. External influences may affect behavior.

B. Aggregate vs. Individual Margins

1. Prudent estimate assumptions are developed by applying a margin for uncertainty to the anticipated experience assumption. The issue of whether the level of the margin applied to

the anticipated experience assumption is determined in aggregate or independently for each and every behavior assumption is discussed in Principle 3 in Section 1.B.

2. Although this principle discusses the concept of determining the level of margins in aggregate, it notes that the application of this concept shall be guided by evolving practice and expanding knowledge. From a practical standpoint, it may not always be possible to completely apply this concept to determine the level of margins in aggregate for all behavior assumptions.
3. Therefore, the company shall determine prudent estimate assumptions independently for each behavior (e.g., mortality, lapses and benefit utilization), using the requirements and guidance in this section and throughout these requirements, unless the company can demonstrate that an appropriate method was used to determine the level of margin in aggregate for two or more behaviors.

C. Sensitivity Testing

The impact of behavior can vary by product, time period, etc. For any assumption that is not prescribed or stochastically modeled, the qualified actuary to whom responsibility for this group of contracts is assigned shall use sensitivity testing to ensure that the assumption is set at the conservative end of the plausible range. The company shall sensitivity test:

- Surrenders.
- ~~•~~ Partial withdrawals.
- Benefit utilization.
- Other behavior assumptions if relevant to the risks in the product.

Sensitivity testing of assumptions is required and shall be more complex than, for example, base lapse assumption plus or minus $\pm X\%$ across all contracts. A more appropriate sensitivity test in this example might be to devise parameters in a dynamic lapse formula to reflect more out-of-the-money contracts lapsing and/or more holders of in-the-money contracts persisting and eventually using the guarantee. The company should apply more caution in setting assumptions for behaviors where testing suggests that stochastic modeling results are sensitive to small changes in such assumptions. For such sensitive behaviors, the company shall use higher margins when the underlying experience is less than fully relevant and credible.

The company shall examine the results of sensitivity testing to understand the materiality of prudent estimate assumptions on the modeled reserve. The company shall update the sensitivity tests periodically as appropriate, considering the materiality of the results of the tests. The company may update the tests less frequently when the tests show less sensitivity of the modeled reserve to changes in the assumptions being tested or the experience is not changing rapidly. Providing there is no material impact on the results of the sensitivity testing, the company may perform sensitivity testing:

1. Using samples of the contracts in force rather than performing the entire valuation for each alternative assumption set.
- ~~1.2.~~ Using data from prior periods.

D. Specific Considerations and Requirements

1. Within materiality considerations, the company should consider all relevant forms of contract holder behavior and persistency, including, but not limited to, the following:
 - a. Mortality (additional guidance and requirements regarding mortality is contained in Section 11).
 - b. Surrenders.
 - c. Partial withdrawals (systematic and elective).
 - d. ~~Fund Account~~ transfers (switching/exchanges).
 - e. Resets/ratchets of the guaranteed amounts (automatic and elective).
 - f. Future deposits.
 - g. Income start date
 - h. Commutation of benefit (from periodic payment to lump sum)
2. It may be acceptable to ignore certain items that might otherwise be explicitly modeled in an ideal world, particularly if the inclusion of such items reduces the calculated provisions.

For example:

- a. The impact of ~~fund—account~~ transfers (intra-contract ~~fundindex~~ “switching”) might be ignored, unless required under the terms of the contract (e.g., automatic asset re-allocation/rebalancing, ~~dollar—cost averaging accounts, etc.~~) or if the contract provisions incentivize the contract holders to transfer between accounts.
- b. Future deposits might be excluded from the model, unless required by the terms of the contracts under consideration and then only in such cases where future premiums can reasonably be anticipated (e.g., with respect to timing and amount).
- c. For some non-elective benefits (nursing home benefits for example), a zero incidence rate after the surrender charge has ended, or the cash value has depleted, may be acceptable since use of a non-zero rate could reduce the modeled reserve.

~~**Guidance Note:** For some non elective benefits (nursing home benefits for example), unless relevant company experience exists to the contrary, the use of incidence rates greater than zero after the surrender charge has ended, or the cash value was depleted might be inappropriate may not be prudent since it would reduce the modeled reserve.~~

3. However, the company should exercise caution in assuming that current behavior will be indefinitely maintained. For example, it might be appropriate to test the impact of a shifting asset mix and/or consider future deposits to the extent they can reasonably be anticipated and increase the calculated amounts.

4. Normally, the underlying model assumptions would differ according to the attributes of the contract being valued. This would typically mean that contract holder behavior and persistency may be expected to vary according to such characteristics as (this is not an exhaustive list):
- a. Gender.
 - b. Attained age.
 - c. Issue age.
 - d. Contract duration.
 - e. Time to maturity.
 - f. Tax status.
 - g. Fund Account value.
 - g.h. Interest credited (current and guaranteed).
 - h.i. Investment option. Available indices.
 - i.j. Guaranteed benefit amounts.
 - j.k. Surrender charges, ~~transaction-transfer~~ fees or other contract charges.
 - k.l. Distribution channel.
5. Unless there is clear evidence to the contrary, behavior assumptions should be no less conservative than past experience. Margins for contract holder behavior assumptions shall assume, without relevant and credible experience or clear evidence to the contrary, that contract holders' efficiency will increase over time.
6. In determining contract holder behavior assumptions, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience), whether or not the segment is directly written by the company. If data from a similar business segment are used, the assumption shall be adjusted to reflect differences between the two segments. Margins shall reflect the data uncertainty associated with using data from a similar but not identical business segment.
7. Where relevant and fully credible empirical data do not exist for a given contract holder behavior assumption, the company shall set the contract holder behavior assumption to reflect the increased uncertainty such that the contract holder behavior assumption is shifted towards the conservative end of the plausible range of expected experience that serves to increase the stochastic reserve. If there are no relevant data, the company shall set the contract holder behavior assumption to reflect the increased uncertainty such that the contract holder behavior assumption is at the conservative end of the range. Such adjustments shall be consistent with the definition of prudent estimate, with the principles described in Section 1.B, and with the guidance and requirements in this section.
8. Ideally, contract holder behavior would be modeled dynamically according to the simulated economic environment and/or other conditions. It is important to note, however, that contract holder behavior should neither assume that all contract holders act with 100%

efficiency in a financially rational manner nor assume that contract holders will always act irrationally. These extreme assumptions may be used for modeling efficiency if the result is more conservative.

E. Dynamic Assumptions

1. Consistent with the concept of prudent estimate assumptions described earlier, the liability model should incorporate margins for uncertainty for all risk factors that are not dynamic (i.e., the non-scenario tested assumptions) and are assumed not to vary according to the financial interest of the contract holder.
2. The company should exercise care in using static assumptions when it would be more natural and reasonable to use a dynamic model or other scenario-dependent formulation for behavior. With due regard to considerations of materiality and practicality, the use of dynamic models is encouraged, but not mandatory. Risk factors that are not scenario tested but could reasonably be expected to vary according to a stochastic process, or future states of the world (especially in response to economic drivers) may require higher margins and/or signal a need for higher margins for certain other assumptions.
3. Risk factors that are modeled dynamically should encompass the plausible range of behavior consistent with the economic scenarios and other variables in the model, including the non-scenario tested assumptions. The company shall test the sensitivity of results to understand the materiality of making alternate assumptions and follow the guidance discussed above on setting assumptions for sensitive behaviors.

F. Consistency with the CTE Level

1. All behaviors (i.e., dynamic, formulaic and non-scenario tested) should be consistent with the scenarios used in the CTE calculations (generally, the top 30% of the loss distribution). To maintain such consistency, it is not necessary to iterate (i.e., successive runs of the model) in order to determine exactly which scenario results are included in the CTE measure. Rather, in light of the products being valued, the company should be mindful of the general characteristics of those scenarios likely to represent the tail of the loss distribution and consequently use prudent estimate assumptions for behavior that are reasonable and appropriate in such scenarios. For ~~variable-fixed~~ annuities, these “valuation” scenarios would typically display one or more of the following attributes:
 - a. Declining and/or volatile ~~separate account asset~~index values, where applicable.
 - b. ~~Market index volatility,~~ Price gaps and/or liquidity constraints.
 - c. Rapidly changing interest rates or persistently low interest rates.
 - d. Volatile credit spreads.
2. The behavior assumptions should be logical and consistent both individually and in aggregate, especially in the scenarios that govern the results. In other words, the company should not set behavior assumptions in isolation, but give due consideration to other elements of the model. The interdependence of assumptions (particularly those governing customer behaviors) makes this task difficult and by definition requires professional judgment, but it is important that the model risk factors and assumptions:
 - a. Remain logically and internally consistent across the scenarios tested.

- b. Represent plausible outcomes.
 - c. Lead to appropriate, but not excessive, asset requirements.
4. The company should remember that the continuum of “plausibility” should not be confined or constrained to the outcomes and events exhibited by historic experience.
 5. Companies should attempt to track experience for all assumptions that materially affect their risk profiles by collecting and maintaining the data required to conduct credible and meaningful studies of contract holder behavior.
- G. Additional Considerations and Requirements for Assumptions Applicable to Guaranteed Living Benefits

Experience for contracts without guaranteed living benefits may be of limited use in setting a lapse assumption for contracts with in-the-money or at-the-money guaranteed living benefits. Such experience may only be used if it is appropriate (e.g., lapse experience on contracts without a living benefit may have relevance to the early durations of contracts with living benefits) and relevant to the business.

H. Policy Loans

If policy loans are applicable for the block of business, the company shall determine cash flows for each projection interval for policy loan assets by modeling existing loan balances either explicitly or by substituting assets that are a proxy for policy loans (e.g., bonds, cash, etc.) subject to the following:

1. If the company substitutes assets that are a proxy for policy loans, the company must demonstrate that such substitution:
 - a. Produces reserves that are no less than those that would be produced by modeling existing loan balances explicitly.
 - b. Complies with the contract holder behavior requirements stated in Section 10 above in this section.
2. If the company models policy loans explicitly, the company shall:
 - a. Treat policy loan activity as an aspect of contract holder behavior and subject to the requirements above in this section.
 - b. Assign loan balances either to exactly match each policy’s utilization or to reflect average utilization over a model segment or sub-segments.
 - c. Model policy loan interest in a manner consistent with policy provisions and with the scenario. Include interest paid in cash as a positive policy loan cash flow in that projection interval, but do not include interest added to the loan balance as a policy loan cash flow. (The increased balance will require increased repayment cash flows in future projection intervals.)
 - d. Model policy loan principal repayments, including those that occur automatically upon death or surrender. Include policy loan principal repayments as a positive policy loan cash flow, per Section 4.A.1.h.

- e. Model additional policy loan principal. Include additional policy loan principal as a negative policy loan cash flow, per Section 4.A.1.h (but do not include interest added to the loan balance as a negative policy loan cash flow).
- f. Model any investment expenses allocated to policy loans and include them either with policy loan cash flows or insurance expense cash flows.

I. Non-Guaranteed Elements

Consistent with the definition in VM-01, Non-Guaranteed Elements (NGEs) are elements within a contract that affect policy costs or values and not guaranteed or not determined at issue. NGEs consist of elements affecting contract holder costs or values that are both established and subject to change at the discretion of the insurer.

Examples of NGEs specific to fixed annuities include but are not limited to the following: fixed credited rates, index parameters (caps, spreads, participation rates, etc.), rider fees, rider benefit features being subject to change (rollup rates, rollup period, etc.), account value charges, and dividends under participating policies or contracts.

1. Except as noted below in Section 10.J.5, the company shall include NGE in the models to project future cash flows beyond the time the company has authorized their payment or crediting.
2. The projected NGE shall reflect factors that include, but are not limited to, the following (not all of these factors will necessarily be present in all situations):
 - a. The nature of contractual guarantees.
 - b. The company's past NGE practices and established NGE policies.
 - c. The timing of any change in NGE relative to the date of recognition of a change in experience.
 - d. The benefits and risks to the company of continuing to authorize NGE.
3. Projected NGE shall be established based on projected experience consistent with how actual NGE are determined.
4. Projected levels of NGE in the cash-flow model must be consistent with the experience assumptions used in each scenario. Contract holder behavior assumptions in the model must be consistent with the NGE assumed in the model.
5. The company may exclude any portion of an NGE that:
 - a. Is not based on some aspect of the policy's or contract's experience.
 - b. Is authorized by the board of directors and documented in the board minutes, where the documentation includes the amount of the NGE that arises from other sources.

However, if the board has guaranteed a portion of the NGE into the future, the company must model that amount. In other words, the company cannot exclude from its model any NGE that the board has guaranteed for future years, even if it could have otherwise excluded them, based on this subsection.

6. The liability for contract holder dividends declared but not yet paid that has been established according to statutory accounting principles as of the valuation date is reported separately from the statutory reserve. The contract holder dividends that give rise to this dividend liability as of the valuation date may or may not be included in the cash-flow model at the company's option.
 - a. If the contract holder dividends that give rise to the dividend liability are not included in the cash-flow model, then no adjustment is needed to the resulting aggregate stochastic reserve.
 - b. If the contract holder dividends that give rise to the dividend liability are included in the cash-flow model, then the resulting aggregate stochastic reserve should be reduced by the amount of the dividend liability.
7. All projected cash flows associated with NGEs shall reflect margins for adverse deviations and estimation error in prudent estimate assumptions.

Section 11: Guidance and Requirements for Setting Prudent Estimate Mortality Assumptions

Drafting Note: All revisions shown in this section are in comparison to Section 11 in VM-21.

A. Overview

1. Intent

The guidance and requirements in this section apply to setting prudent estimate mortality assumptions when determining either the stochastic reserve or the reserve for any contracts determined using the Alternative Methodology. The intent is for prudent estimate mortality assumptions to be based on facts, circumstances and appropriate actuarial practice, with only a limited role for unsupported actuarial judgment. (Where more than one approach to appropriate actuarial practice exists, the company should select the practice that the company deems most appropriate under the circumstances.)

2. Description

Prudent estimate mortality assumptions shall be determined by first developing expected mortality curves based on either available experience or published tables. Where necessary, margins shall be applied to the experience to reflect data uncertainty. The expected mortality curves shall then be adjusted based on the credibility of the experience used to determine the expected mortality curve. Section 11.B addresses guidance and requirements for determining expected mortality curves, and Section 11.C addresses guidance and requirements for adjusting the expected mortality curves to determine prudent estimate mortality.

Finally, the credibility-adjusted tables shall be adjusted for mortality improvement (where such adjustment is permitted or required) using the guidance and requirements in Section 11.D.

3. Business Segments

For purposes of setting prudent estimate mortality assumptions, the products falling under the scope of these requirements shall be grouped into business segments with different mortality assumptions. The grouping, at a minimum, should differentiate between whether the payout annuities or deferred annuity contracts that contain VA GLBs, and where the no VA GLB segments would include both deferred annuity contracts with no guaranteed benefits and contracts with only GMDBs. Where appropriate, the grouping should also differentiate between segments which are known or expected to contain contract holders with sociodemographic, geographic, or health factors reasonably expected to impact the mortality assumptions for the segment (e.g., annuitants drawn from different countries, geographic areas, industry groups, or impaired lives on individually underwritten contracts such as structured settlements). The grouping should also generally follow the pricing, marketing, management and/or reinsurance programs of the company.

Guidance Note: This paragraph contemplates situations where it may be appropriate to differentiate mortality assumptions by segment or even by contract due to varying sociodemographic, geographic, or health factors. Particularly, though not exclusively, in the context of group payout annuity contracts, companies may have credible, contract-specific mortality experience data or relevant pooled data from annuitants drawn from

similar industries or geographies that may be used to sub-divide inforce blocks into business segments for purposes of setting prudent estimate mortality assumptions.

For example, a company may sell group PRT contracts both to union plans in the U.S. and to private single-employer plans in another country. While both are “PRT contracts,” it would be appropriate to differentiate them for mortality assumption purposes, similar to how payout annuities vs. deferred annuities are distinguished.

Guidance Note: Distinct mortality or liability assumptions among different contracts within a group of contracts does not in itself preclude the group of contracts from being aggregated for the purposes of the broader stochastic reserve calculation.

4. Margin for Data Uncertainty

The expected mortality curves that are determined in Section 11.B may need to include a margin for data uncertainty. The margin could be in the form of an increase or a decrease in mortality, depending on the business segment under consideration. The margin shall be applied in a direction (i.e., increase or decrease in mortality) that results in a higher reserve. A sensitivity test may be needed to determine the appropriate direction of the provision for uncertainty to mortality. The test could be a prior year mortality sensitivity analysis of the business segment or an examination of current representative cells of the segment.

For purposes of this section, if mortality must be increased (decreased) to provide for uncertainty, the business segment is referred to as a plus (minus) segment.

It may be necessary, because of a change in the mortality risk profile of the segment, to reclassify a business segment from a plus (minus) segment to a minus (plus) segment to the extent compliance with this section requires such a reclassification. For example, a segment could require reclassification depending on whether it is gross or net of reinsurance.

B. Determination of Expected Mortality Curves

1. Experience Data

In determining expected mortality curves, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience). See Section 11.B.2. for additional considerations. Finally, if there is no data, the company shall use the applicable table, as required in Section 11.B.3.

2. Data Other Than Direct Experience

Adjustments shall be applied to the data to reflect differences between the business segments, and margins shall be applied to the adjusted expected mortality curves to reflect the data uncertainty associated with using data from a similar but not identical business segment.

To the extent the mortality of a business segment is reinsured, any mortality charges that are consistent with the company’s own pricing and applicable to a substantial portion of the mortality risk also may be a reasonable starting point for the determination of the company’s expected mortality curves.

3. No Data Requirements

i. When little or no experience or information is available on a business segment, the company shall use expected mortality curves that would produce expected deaths no less than:

a. [2021 SOA Deferred Annuity Mortality Table] with [Projection Scale G2] for individual deferred annuities that do not contain guaranteed living benefits

$$q_x^{20XX+n} = q_x^{20XX}(1 - G2_x)^n$$

ii. When little or no experience or information is available on a business segment, the company shall use expected mortality curves that would produce expected deaths no greater than:

a. [The appropriate percentage (F_x) from Table 11.1 applied to the 2012 IAM Basic Mortality Table] with [Projection Scale G2] for individual payout annuity contracts and deferred annuity contracts with guaranteed living benefits

$$q_x^{2012+n} = q_x^{2012}(1 - G2_x)^n * F_x$$

b. [1983 Table “a”] for structured settlements or other contracts with impaired mortality

c. [1994 GAR Table] with [Projection Scale AA] for group annuities

$$q_x^{1994+n} = q_x^{1994}(1 - AA_x)^n$$

~~the appropriate percentage (F_x) from Table 1 of the 2012 IAM Basic Table with Projection Scale G2 for contracts with no VAGLBs and expected deaths no greater than the appropriate percentage (F_x) from Table 1 of the 2012 IAM Basic Mortality Table with Projection Scale G2 for contracts with VAGLBs. If mortality experience on the business segment is expected to be atypical (e.g., demographics of target markets are known to have higher [lower] mortality than typical), these “no data” mortality requirements may not be adequate.~~

Table 11.1

Attained Age (x)	F _x for VA with GLB	F _x for All Other
<=65	80.0%	100.0%
66	81.5%	102.0%
67	83.0%	104.0%
68	84.5%	106.0%
69	86.0%	108.0%
70	87.5%	110.0%
71	89.0%	112.0%
72	90.5%	114.0%
73	92.0%	116.0%
74	93.5%	118.0%
75	95.0%	120.0%
76	96.5%	119.0%

77	98.0%	118.0%
78	99.5%	117.0%
79	101.0%	116.0%
80	102.5%	115.0%
81	104.0%	114.0%
82	105.5%	113.0%
83	107.0%	112.0%
84	108.5%	111.0%
85	110.0%	110.0%
86	110.0%	110.0%
87	110.0%	110.0%
88	110.0%	110.0%
89	110.0%	110.0%
90	110.0%	110.0%
91	110.0%	110.0%
92	110.0%	110.0%
93	110.0%	110.0%
94	110.0%	110.0%
95	110.0%	110.0%
96	109.0%	109.0%
97	108.0%	108.0%
98	107.0%	107.0%
99	106.0%	106.0%
100	105.0%	105.0%
101	104.0%	104.0%
102	103.0%	103.0%
103	102.0%	102.0%
104	101.0%	101.0%
>=105	100.0%	100.0%

iii. For a business segment with non-U.S. insureds, an established industry or national mortality table may be used, with approval from the domiciliary commissioner.

4. Additional Considerations Involving Data

The following considerations shall apply to mortality data specific to the business segment for which assumptions are being determined (i.e., direct data discussed in Section 11.B.1 or other than direct data discussed in Section 11.B.2).

a. Underreporting of Deaths

Mortality data shall be examined for possible underreporting of deaths. Adjustments shall be made to the data if there is any evidence of underreporting. Alternatively, exposure by lives or amounts on contracts for which death benefits were in the money may be used to determine expected mortality curves. Underreporting on such exposures should be minimal; however, this reduced subset of data will have less credibility.

b. Experience by Contract Duration

Experience of a plus segment shall be examined to determine if mortality by contract duration increases materially due to selection at issue. In the absence of information, the company shall assume that expected mortality will increase by contract duration for an appropriate select period. As an alternative, if the company determines that mortality is affected by selection, the company could apply margins to the expected mortality in such a way that the actual mortality modeled does not depend on contract duration.

c. Modification and Relevance of Data

Even for a large company, the quantity of life exposures and deaths are such that a significant amount of smoothing may be required to determine expected mortality curves from mortality experience. Expected mortality curves, when applied to the recent historic exposures (e.g., three to seven years), should not result in an estimate of aggregate number of deaths less (greater) than the actual number deaths during the exposure period for plus (minus) segments.

In determining expected mortality curves (and the credibility of the underlying data), older data may no longer be relevant. The “age” of the experience data used to determine expected mortality curves should be documented.

d. Other Considerations

In determining expected mortality curves, consideration should be given to factors that include, but are not limited to, trends in mortality experience, trends in exposure, volatility in year-to-year A/E mortality ratios, mortality by lives relative to mortality by amounts, changes in the mix of business and product features that could lead to mortality selection.

C. Adjustment for Credibility to Determine Prudent Estimate Mortality

1. Adjustment for Credibility

The expected mortality curves determined in Section 11.B shall be adjusted based on the credibility of the experience used to determine the curves in order to arrive at prudent estimate mortality. The adjustment for credibility shall result in blending the expected mortality curves with the mortality assumption described in Section 11.B.3.a ~~mortality table consistent with a statutory valuation mortality table. For contracts with no VAGLBs, the table shall be consistent with the appropriate percentage (F_x) from Table 1 of the 2012 IAM Basic Table with Projection Scale G2; and for contracts with VAGLBs, the table shall be consistent with the appropriate percentage (F_x) from Table 1 of the 2012 IAM Basic Mortality Table with Projection Scale G2.~~ The approach used to adjust the curves shall suitably account for credibility.

Guidance Note: For example, when credibility is zero, an appropriate approach should result in a mortality assumption consistent with 100% of the ~~statutory valuation~~ mortality table used in the blending.

2. Adjustment of Statutory Valuation Mortality for Improvement

For purposes of the adjustment for credibility, the ~~statutory valuation~~ mortality table for a plus segment may be and the ~~statutory valuation~~ mortality table for a minus segment must be adjusted for mortality improvement. Such adjustment shall reflect the mortality improvement scale described in Section 11.B.3~~Projection Scale G2~~ from the effective date of the respective ~~statutory valuation~~ mortality table to the experience weighted average date underlying the data used to develop the expected mortality curves ~~(discussed in Section 11.B)~~.

3. Credibility Procedure

The credibility procedure used shall:

- a. Produce results that are reasonable.
- b. Not tend to bias the results in any material way.
- c. Be practical to implement.
- d. Give consideration to the need to balance responsiveness and stability.
- e. Take into account not only the level of aggregate claims but the shape of the mortality curve.
- f. Contain criteria for full credibility and partial credibility that have a sound statistical basis and be appropriately applied.

4. Further Adjustment of the Credibility-Adjusted Table for Mortality Improvement

The credibility-adjusted table used for plus segments may be and the credibility adjusted table used for minus segments must be adjusted for mortality improvement using the applicable mortality improvement scale described in Section 11.B.3 from the experience weighted average date underlying the company experience used in the credibility process to the valuation date.

Any adjustment for mortality improvement beyond the valuation date is discussed in Section 11.D.

D. Future Mortality Improvement

The mortality assumption resulting from the requirements of Section 11.C shall be adjusted for mortality improvements beyond the valuation date if such an adjustment would serve to increase the resulting stochastic reserve. If such an adjustment would reduce the stochastic reserve, such assumptions are permitted, but not required. In either case, the assumption must be based on current relevant data with a margin for uncertainty (increasing assumed rates of improvement if that results in a higher reserve or reducing them otherwise).

Section 12: Allocation of Aggregate Reserves to the Contract Level

Drafting Note: All revisions shown in this section are in comparison to Section 11 in VM-21.

Section 23.F states that the aggregate reserve shall be allocated to the contracts falling within the scope of these requirements. That allocation should be done for both the pre- and post-reinsurance ceded reserves. Contracts that have passed the stochastic exclusion test as defined in Section 7.B will not be included in the allocation of the aggregate reserve. For the purpose of this section, if a contract does not have a cash surrender value, then the cash surrender value is assumed to be zero.

Contracts for which the Deterministic Certification Option is elected in Section 7.E are intended to use the methodology described in this section to allocate aggregate reserves in excess of the cash surrender value to individual contracts.

The contract-level reserve for each contract shall be the sum of the following:

- A. The contract’s cash surrender value.

Drafting Note: The American Academy of Actuaries Annuity Reserves and Capital Work Group is including two potential options for allocating the excess portion of the aggregate reserve over cash surrender value: (1) Use the same approach as VM-21 (2) Allocate based on an actuarial present value calculation.

The Work Group did not reach a consensus between these two approaches, so wording for both is included in the text below. The Work Group recommends field testing both approaches and considering the results in determining future decisions.

Option 1: VM-21 Approach

- B. An allocated portion of the excess of the aggregate reserve over the aggregate cash surrender value shall be allocated to each contract based on a measure of the risk of that product relative to its cash surrender value in the context of the company’s in force contracts (assuming zero cash value for contracts that do not contain such). The measure of risk should consider the impact of risk mitigation programs, including hedge programs and reinsurance, that would affect the risk of the product. The specific method of assessing that risk and how it contributes to the company’s aggregate reserve shall be defined by the company. The method should provide for an equitable allocation based on risk analysis. ~~For contracts valued under the alternative methodology, the alternative methodology calculations provide a contract level calculation that may be a reasonable basis for allocation.~~
 - 1. As an example, consider a company with the results of the following three contracts:

Table 12.1: Sample Allocation of Aggregate Reserve

Contract (i)	1	2	3	Total
Cash Surrender Value, C	28	40	52	120
Risk adjusted measure, R	38	52	50	
Aggregate Reserve				140

Allocation Basis for the excess of the Aggregate Reserve over the Cash Surrender Value $A_i = \text{Max}(R_i - C_i, 0)$	10	12	0	22
Allocation of the excess of the Aggregate Reserve over the Cash Surrender Value $L_i = (A_i) / \sum A_i * [\text{Aggregate Reserve} - \sum C_i]$	9.09	10.91	0.00	20
Contract-level reserve $C_i + L_i$	37.09	50.91	52.00	140.00

2. In this example, the Aggregate Reserve exceeds the aggregate Cash Surrender Value by 20. The 20 is allocated proportionally across the three contracts based on the allocation basis of the larger of (i) zero; and (ii) a risk adjusted measure based on reserve principles. Therefore, contracts 1 and 2 receive 45% (9/22) and 55% (11/22), respectively, of the excess Aggregate Reserve. As Contract 3 presents no risk in excess of its cash surrender value, it does not receive an allocation of the excess Aggregate Reserve.

Option 2: Actuarial Present Value Approach

B. An allocated portion of tThe excess of the aggregate reserve over the aggregate cash surrender value is allocated to policies based on a calculation of the actuarial present value of projected liability cash flows in excess of the cash surrender value:

1. Discount the liability cash flows at the NAER, pursuant to requirements in Section 4, for the scenario that produces the scenario reserve closest to, but not less than the stochastic reserve defined in Section 3.D.
 - a. Groups of contracts that elect the Deterministic Certification Option defined in Section 7.E shall use the NAER in the single scenario used to calculate the reserve to discount liability cash flows.
2. If the actuarial present value is less than the cash surrender value, then the excess actuarial present value to be used for allocating the excess aggregate reserve over the cash value shall be floored at zero.
 - a. If all contracts have an excess actuarial present value that is floored at zero, then use the cash surrender value to allocate any excess aggregate reserve over the aggregate cash surrender value.
3. For projecting future liability cash flows, assume the same liability assumptions that were used to calculate the stochastic reserve defined in 3.D.
4. As a hypothetical example, consider a company with the results of the following five contracts:

Table 12.1: Hypothetical Sample Allocation of Aggregate Reserve

Contract	Example Product Type	CSV* (1)	Scenario APV (2)	Excess (Floored) of the scenario APV over CSV* (3) = $\text{Max}[(2), 0]$	Aggregate Reserve CTE 70 (4)	Excess of Aggregate Reserve over Aggregate CSV* (5) = $\text{Max}[(4) \text{ Total} - (1) \text{ Total}, 0]$	Allocated Excess Reserve (6) = $(3) \times [(5) \text{ Total}] / (3) \text{ Total}]$	Total Contract Level Reserve (7) = (1) + (6)
Contract 1:	Indexed Annuity with no GLWB**	95.0	90.0	0.0			0.0	95.0
Contract 2:	Indexed Annuity with low benefit GLWB**	92.0	95.0	3.0			3.6	95.6
Contract 3:	Indexed Annuity with medium benefit GLWB**	90.0	100.0	10.0			12.0	102.0
Contract 4:	Indexed Annuity with high benefit GLWB**	88.0	105.0	17.0			20.4	108.4
Contract 5:	Fixed Life Contingent Payout Annuity	0.0	70.0	70.0			84.0	84.0
Total		365.0		100.0	485.0	120.0	120.0	485.0

*Cash Surrender Value

**Guaranteed Lifetime Withdrawal Benefit

Guidance Note: The actuarial present value (APV) in the section above is separate from the Guarantee Actuarial Present Value (GAPV) referred to in the additional standard projection amount calculation in VM-21. The GAPV is only applicable to guaranteed minimum benefits and uses prescribed liability assumptions. In contrast, the APV in this section applies to the entire contract, irrespective of whether guaranteed benefits are attached, and uses company prudent estimate liability assumptions.

3. shall be allocated to each contract based on a measure of the risk of that product relative to its cash surrender value in the context of the company’s in force contracts. The measure of risk should consider the impact of risk mitigation programs, including hedge programs and reinsurance, that would affect the risk of the product. The specific method of assessing that risk and how it contributes to the company’s aggregate reserve shall be defined by the company. The method should provide for an equitable allocation based on risk analysis. For contracts valued under the alternative methodology, the alternative methodology calculations provide a contract level calculation that may be a reasonable basis for allocation.

4. As an example, consider a company with the results of the following three contracts:

Table 12.1: Sample Allocation of Aggregate Reserve

In this example, the Aggregate Reserve exceeds the aggregate Cash Surrender Value by 20. The 20 is allocated proportionally across the three contracts based on the allocation basis of the larger of (i) zero; and (ii) a risk-adjusted measure based on reserve principles. Therefore, contracts 1 and 2 receive 45% (9/22) and 55% (11/22), respectively, of the excess Aggregate Reserve. As Contract 3 presents no risk in excess of its cash surrender value, it does not receive an allocation of the excess Aggregate Reserve.

Section 13: Statutory Maximum Valuation Interest Rates for Income Annuity Formulaic Reserves

Drafting Note: All revisions shown in this section are in comparison to the current VM-22 requirements.

A. Purpose and Scope

1. These requirements define for single premium immediate annuity contracts and other similar contracts, certificates and contract features the statutory maximum valuation interest rate that complies with Model #820. These are the maximum interest rate assumption requirements to be used in the CARVM and for certain contracts, the CRVM. These requirements do not preclude the use of a lower valuation interest rate assumption by the company if such assumption produces statutory reserves at least as great as those calculated using the maximum rate defined herein.
2. The following categories of contracts, certificates and contract features, whether group or individual, including both life contingent and term certain only contracts, directly written or assumed through reinsurance, with the exception of benefits arising from variable annuities, are covered in this section ~~by VM-22~~:
 - a. Immediate annuity contracts issued after Dec. 31, 2017;
 - b. Deferred income annuity contracts issued after Dec. 31, 2017;
 - c. Structured settlements in payout or deferred status issued after Dec. 31, 2017;
 - d. Fixed payout annuities resulting from the exercise of settlement options or annuitizations of host contracts issued after Dec. 31, 2017;
 - e. Fixed payout annuities resulting from the exercise of settlement options or annuitizations of host contracts issued during 2017, for fixed payouts commencing after Dec. 31, 2018, or, at the option of the company, for fixed payouts commencing after Dec. 31, 2017;
 - f. Supplementary contracts, excluding contracts with no scheduled payments (such as retained asset accounts and settlements at interest), issued after Dec. 31, 2017;
 - g. Fixed income payment streams, attributable to contingent deferred annuities (CDAs) issued after Dec. 31, 2017, once the underlying contract funds are exhausted;
 - h. Fixed income payment streams attributable to guaranteed living benefits associated with deferred annuity contracts issued after Dec. 31, 2017, once the contract funds are exhausted; and
 - i. Certificates with premium determination dates after Dec. 31, 2017, emanating from non-variable group annuity contracts specified in Model #820, Section 5.C.2, purchased for the purpose of providing certificate holders benefits upon their retirement.

Guidance Note: For Section ~~13.A.2.d+B-4~~, Section ~~13.A.2.e+B-5~~, Section ~~13.A.2.f+B-6~~ and Section ~~13.A.2.h+B-8~~ above, there is no restriction on the type of contract that may give rise to the benefit.

3. Exemptions:
 - a. With the permission of the domiciliary commissioner, for the categories of annuity contracts, certificates and/or contract features in scope as outlined in Section

13.A.2.d1-B.4, Section 13.A.2.e1-B.5, Section 13.A.2.f1-B.6, Section 13.A.2.g1-B.7 or Section 13.A.2.h1-B.8, the company may use the same maximum valuation interest rate used to value the payment stream in accordance with the guidance applicable to the host contract. In order to obtain such permission, the company must demonstrate that its investment policy and practices are consistent with this approach.

4. The maximum valuation interest rates for the contracts, certificates and contract features within the scope of Section 13 of VM-22 supersede those described in Appendix VM-A and Appendix VM-C, but they do not otherwise change how those appendices are to be interpreted. In particular, *Actuarial Guideline IX-B—Clarification of Methods Under Standard Valuation Law for Individual Single Premium Immediate Annuities, Any Deferred Payments Associated Therewith, Some Deferred Annuities and Structured Settlements Contracts (AG-9-B)* (see VM-C) provides guidance on valuation interest rates and is, therefore, superseded by these requirements for contracts, certificates and contract features in scope. Likewise, any valuation interest rate references in *Actuarial Guideline IX-C—Use of Substandard Annuity Mortality Tables in Valuing Impaired Lives Under Individual Single Premium Immediate Annuities (AG-9-C)* (see VM-C) are also superseded by these requirements.

B. Definitions

1. The term “reference period” means the length of time used in assigning the Valuation Rate Bucket for the purpose of determining the statutory maximum valuation interest rate and is determined as follows:
 - a. For contracts, certificates or contract features with life contingencies and substantially similar payments, the reference period is the length of time, rounded to the nearest year, from the premium determination date to the earlier of: i) the date of the last non-life-contingent payment under the contract, certificate or contract feature; and ii) the date of the first life-contingent payment under the contract, certificate or contract feature, or
 - b. For contracts, certificates or contract features with no life-contingent payments and substantially similar payments, the reference period is the length of time, rounded to the nearest year, from the premium determination date to the date of the last non-life-contingent payment under the contract, certificate or contract feature, or
 - c. For contracts, certificates or contract features where the payments are not substantially similar, the actuary should apply prudent judgment and select the Valuation Rate Bucket with Macaulay duration that is a best fit to the Macaulay duration of the payments in question.

Guidance Note: Contracts with installment refunds or similar features should consider the length of the installment period calculated from the premium determination date as the non-life contingent period for the purpose of determining the reference period.

Guidance Note: The determination in Section 13.B.1.c2.A.3 above shall be made based on the materiality of the payments that are not substantially similar relative to the life-contingent payments.

2. The term “jumbo contract” means a contract with an initial consideration equal to or greater than \$250 million. Considerations for contracts issued by an insurer to the same contract holder within 90 days shall be combined for purposes of determining whether the contracts meet this threshold.

Guidance Note: If multiple contracts meet this criterion in aggregate, then each contract is a jumbo contract.

3. The term “non-jumbo contract” means a contract that does not meet the definition of a jumbo contract.
4. The term “premium determination date” means the date as of which the valuation interest rate for the contract, certificate or contract feature being valued is determined.
5. The term “initial age” means the age of the annuitant as of his or her age last birthday relative to the premium determination date. For joint life contracts, certificates or contract features, the “initial age” means the initial age of the younger annuitant. If a contract, certificate or contract feature for an annuitant is being valued on a standard mortality table as an impaired annuitant, “initial age” means the rated age. If a contract, certificate or contract feature is being valued on a substandard mortality basis, “initial age” means an equivalent rated age.
6. The term “Table X spreads” means the prescribed VM-22 [Section 13](#) current market benchmark spreads for the quarter prior to the premium determination date, as published on the Industry tab of the NAIC website. The process used to determine Table X spreads is the same as that specified in VM-20 Appendix 2.D for Table F, except that JP Morgan and Bank of America bond spreads are averaged over the quarter rather than the last business day of the month.
7. The term “expected default cost” means a vector of annual default costs by weighted average life. This is calculated as a weighted average of the VM-20 Table A prescribed annual default costs published on the Industry tab of the NAIC website in effect for the quarter prior to the premium determination date, using the prescribed portfolio credit quality distribution as weights.
8. The term “expected spread” means a vector of spreads by weighted average life. This is calculated as a weighted average of the Table X spreads, using the prescribed portfolio credit quality distribution as weights.
9. The term “prescribed portfolio credit quality distribution” means the following credit rating distribution:
 - a. 5% Treasuries
 - b. 15% Aa bonds (5% Aa1, 5% Aa2, 5% Aa3)
 - c. 40% A bonds (13.33% A1, 13.33% A2, 13.33% A3)*
 - d. 40% Baa bonds (13.33% Baa1, 13.33% Baa2, 13.33% Baa3)*

*40%/3 is used unrounded in the calculations.

C. Determination of the Statutory Maximum Valuation Interest Rate

1. Valuation Rate Buckets

- a. For the purpose of determining the statutory maximum valuation interest rate, the contract, certificate or contract feature being valued must be assigned to one of four Valuation Rate Buckets labeled A through D.

- b. If the contract, certificate or contract feature has no life contingencies, the Valuation Rate Bucket is assigned based on the length of the reference period (RP), as follows:

Table 3-1: Assignment to Valuation Rate Bucket by Reference Period Only

RP ≤ 5 Years	5Y < RP ≤ 10Y	10Y < RP ≤ 15Y	RP > 15Y
A	B	C	D

- c. If the contract, certificate or contract feature has life contingencies, the Valuation Rate Bucket is assigned based on the length of the RP and the initial age of the annuitant, as follows:

Table 3-2: Assignment to Valuation Rate Bucket by Reference Period and Initial Age

Initial Age	RP ≤ 5Y	5Y < RP ≤ 10Y	10Y < RP ≤ 15Y	RP > 15Y
90+	A	B	C	D
80–89	B	B	C	D
70–79	C	C	C	D
< 70	D	D	D	D

2. Premium Determination Dates

- a. The following table specifies the decision rules for setting the premium determination date for each of the contracts, certificates and contract features listed in Section 1:

Table 3-3: Premium Determination Dates

Section	Item Description	Premium determination date
A.2.a	Immediate annuity	Date consideration is determined and committed to by contract holder
A.2.b	Deferred income annuity	Date consideration is determined and committed to by contract holder
A.2.c	Structured settlements	Date consideration is determined and committed to by contract holder
A.2.d and A.2.e	Fixed payout annuities resulting from settlement options or annuitizations from host contracts	Date consideration for benefit is determined and committed to by contract holder
A.2.f	Supplementary contracts	Date of issue of supplementary contract

A.2.g	Fixed income payment streams from CDAs, AV becomes 0	Date on which AV becomes 0
A.2.h	Fixed income payment streams from guaranteed living benefits, AV becomes 0	Date on which AV becomes 0
A.2.i	Group annuity and related certificates	Date consideration is determined and committed to by contract holder

Guidance Note: For the purposes of the items in the table above, the phrase “date consideration is determined and committed to by the contract holder” should be interpreted by the company in a manner that is consistent with its standard practices. For some products, that interpretation may be the issue date or the date the premium is paid.

b. Immaterial Change in Consideration

If the premium determination date is based on the consideration, and if the consideration changes by an immaterial amount (defined as a change in present value of less than 10% and less than \$1 million) subsequent to the original premium determination date, such as due to a data correction, then the original premium determination date shall be retained. In the case of a group annuity contract where a single premium is intended to cover multiple certificates, certificates added to the contract after the premium determination date that do not trigger the company’s right to reprice the contract shall be treated as if they were included in the contract as of the premium determination date.

3. Statutory Maximum Valuation Interest Rate

- a. For a given contract, certificate or contract feature, the statutory maximum valuation interest rate is determined based on its assigned Valuation Rate Bucket (Section 13.C.1A) and its Premium Determination Date (Section 13.C.2-B) and whether the contract associated with it is a jumbo contract or a non-jumbo contract.
- b. Statutory maximum valuation interest rates for jumbo contracts are determined and published daily by the NAIC on the Industry tab of the NAIC website. For a given premium determination date, the statutory maximum valuation interest rate is the daily statutory maximum valuation interest rate published for that premium determination date.
- c. Statutory maximum valuation interest rates for non-jumbo contracts are determined and published quarterly by the NAIC on the Industry tab of the NAIC website by the third business day of the quarter. For a given premium determination date, the statutory maximum valuation interest rate is the quarterly statutory maximum valuation interest rate published for the quarter in which the premium determination date falls.
- d. Quarterly Valuation Rate:

For each Valuation Rate Bucket, the quarterly valuation rate is defined as follows:

$$I_q = R + S - D - E$$

Where:

- a. R is the reference rate for that Valuation Rate Bucket (defined in Section 13.C.4D);
 - b. S is the spread rate for that Valuation Rate Bucket (defined in Section 13.C.5E);
 - c. D is the default cost rate for that Valuation Rate Bucket (defined in Section 13.C.6F);
- and
- d. E is the spread deduction defined as 0.25%.
- e. Daily Valuation Rate:

For each Valuation Rate Bucket, the daily valuation rate is defined as follows:

$$I_d = I_q + C_{d-1} - C_q$$

Where:

- a. I_q is the quarterly valuation rate for the calendar quarter preceding the business day immediately preceding the premium determination date;
- b. C_{d-1} is the daily corporate rate (defined in Section 13.C.7G) for the business day immediately preceding the premium determination date; and
- c. C_q is the average daily corporate rate (defined in Section 13.C.8H) corresponding to the same period used to develop I_q .

For jumbo contracts, the daily statutory maximum valuation interest rate is the daily valuation rate (I_d) rounded to the nearest one-hundredth of one percent (1/100 of 1%).

4. Reference Rate

Reference rates are updated quarterly as described below:

- a. The “quarterly Treasury rate” is the average of the daily Treasury rates for a given maturity over the calendar quarter prior to the premium determination date. The quarterly Treasury rate is downloaded from <https://fred.stlouisfed.org>, and is rounded to two decimal places.
- b. Download the quarterly Treasury rates for two-year, five-year, 10-year and 30-year U.S. Treasuries.
- c. The reference rate for each Valuation Rate Bucket is calculated as the weighted average of the quarterly Treasury rates using Table 1 weights (defined in Section 13.C.9F) effective for the calendar year in which the premium determination date falls.

5. Spread

The spreads for each Valuation Rate Bucket are updated quarterly as described below:

- a. Use the Table X spreads from the NAIC website for WALs two, five, 10 and 30 years only to calculate the expected spread.

- b. Calculate the spread for each Valuation Rate Bucket, which is a weighted average of the expected spreads for WALs two, five, 10 and 30 using Table 2 weights (defined in Section 3.I) effective for the calendar year in which the premium determination date falls.
6. Default costs for each Valuation Rate Bucket are updated annually as described below:
- a. Use the VM-20 prescribed annual default cost table (Table A) in effect for the quarter prior to the premium determination date for WAL two, WAL five and WAL 10 years only to calculate the expected default cost. Table A is updated and published annually on the Industry tab of the NAIC website during the second calendar quarter and is used for premium determination dates starting in the third calendar quarter.
 - b. Calculate the default cost for each Valuation Rate Bucket, which is a weighted average of the expected default costs for WAL two, WAL five and WAL 10, using Table 3 weights (defined in Section 13.C.9~~4~~) effective for the calendar year in which the premium determination date falls.
7. Daily Corporate Rate

Daily corporate rates for each valuation rate bucket are updated daily as described below:

- a. Each day, download the Bank of America Merrill Lynch U.S. corporate effective yields as of the previous business day’s close for each index series shown in the sample below from the St. Louis Federal Reserve website: <https://research.stlouisfed.org/fred2/categories/32348>. To access a specific series, search the St. Louis Federal Reserve website for the series name by inputting the name into the search box in the upper right corner, or input the following web address: [https://research.stlouisfed.org/fred2/series/\[replace with series name from the table below\]](https://research.stlouisfed.org/fred2/series/[replace with series name from the table below]).

Table 3-4: Index Series Names

Maturity	Series Name
1Y – 3Y	BAMLC1A0C13YEY
3Y – 5Y	BAMLC2A0C35YEY
5Y – 7Y	BAMLC3A0C57YEY
7Y – 10Y	BAMLC4A0C710YEY
10Y – 15Y	BAMLC7A0C1015YEY
15Y+	BAMLC8A0C15PYEY

- b. Calculate the daily corporate rate for each valuation rate bucket, which is a weighted average of the Bank of America Merrill Lynch U.S. corporate effective yields, using Table 4 weights (defined in Section 13.C.9~~4~~) effective for the calendar year in which the business date immediately preceding the premium determination date falls.
8. Average Daily Corporate Rate

Average daily corporate rates are updated quarterly as described below:

- a. Download the quarterly average Bank of America Merrill Lynch U.S. corporate effective yields for each index series shown in Section 3.G.1 from the St. Louis Federal Reserve website: <https://research.stlouisfed.org/fred2/categories/32348>. To access a specific series, search the St. Louis Federal Reserve website for the series name by inputting the name into the search box in the upper right corner, or input the following web address: [https://research.stlouisfed.org/fred2/series/\[replace with series name from Section 13.C.7.aG.1\]](https://research.stlouisfed.org/fred2/series/[replace with series name from Section 13.C.7.aG.1]).
 - b. Calculate the average daily corporate rate for each valuation rate bucket, which is a weighted average of the quarterly average Bank of America Merrill Lynch U.S. corporate effective yields, using Table 4 weights (defined in Section 13.C.9f) for the same calendar year as the weight tables (i.e. Tables 1, 2, and 3) used in calculating I_q in Section 13.C.3.e5.
9. Weight Tables 1 through 4

The system for calculating the statutory maximum valuation interest rates relies on a set of four tables of weights that are based on duration and asset/liability cash-flow matching analysis for representative annuities within each valuation rate bucket. A given set of weight tables is applicable to the calculations for every day of the calendar year.

In the fourth quarter of each calendar year, the weights used within each valuation rate bucket for determining the applicable valuation interest rates for the following calendar year will be updated using the process described below. In each of the four tables of weights, the weights in a given row (valuation rate bucket) must add to exactly 100%.

Weight Table 1

The process for determining Table 1 weights is described below:

- a. Each valuation rate bucket has a set of representative annuity forms. These annuity forms are as follows:
 - i. Bucket A:
 - a) Single Life Annuity age 91 with 0 and five-year certain periods.
 - b) Five-year certain only.
 - ii. Bucket B:
 - a) Single Life Annuity age 80 and 85 with 0, five-year and 10-year certain periods.
 - b) 10-year certain only.
 - iii. Bucket C:
 - a) Single Life Annuity age 70 with 0 and 15-year certain periods.
 - b) Single Life Annuity age 75 with 0, 10-year and 15-year certain periods.
 - c) 15-year certain only.
 - iv. Bucket D:

- a) Single Life Annuity age 55, 60 and 65 with 0 and 15-year certain periods.
- b) 25-year certain only.
- b. Annual cash flows are projected assuming annuity payments are made at the end of each year. These cash flows are averaged for each valuation rate bucket across the annuity forms for that bucket using the statutory valuation mortality table in effect for the following calendar year for individual annuities for males (ANB).
- c. The average daily rates in the third quarter for the two-year, five-year, 10-year and 30-year U.S. Treasuries are downloaded from <https://fred.stlouisfed.org> as input to calculate the present values in Step d4.
- d. The average cash flows are summed into four time period groups: years 1–3, years 4–7, years 8–15 and years 16–30. (**Note:** The present value of cash flows beyond year 30 are discounted to the end of year 30 and included in the years 16–30 group. This present value is based on the lower of 3% and the 30-year Treasury rate input in Step c3.)
- e. The present value of each summed cash-flow group in Step d4 is then calculated by using the Step 3 U.S. Treasury rates for the midpoint of that group (and using the linearly interpolated U.S. Treasury rate when necessary).
- f. The duration-weighted present value of the cash flows is determined by multiplying the present value of the cash-flow groups by the midpoint of the time period for each applicable group.
- g. Weightings for each cash-flow time period group within a valuation rate bucket are calculated by dividing the duration weighted present value of the cash flow by the sum of the duration weighted present value of cash flow for each valuation rate bucket.

Weight Tables 2 through 4

Weight Tables 2 through 4 are determined using the following process:

- i. Table 2 is identical to Table 1.
 - ii. Table 3 is based on the same set of underlying weights as Table 1, but the 10-year and 30-year columns are combined since VM-20 default rates are only published for maturities of up to 10 years.
 - iii. Table 4 is derived from Table 1 as follows:
 - a) Column 1 of Table 4 is identical to column 1 of Table 1.
 - b) Column 2 of Table 4 is 50% of column 2 of Table 1.
 - c) Column 3 of Table 4 is identical to column 2 of Table 4.
 - d) Column 4 of Table 4 is 50% of column 3 of Table 1.
 - e) Column 5 of Table 4 is identical to column 4 of Table 4.
 - f) Column 6 of Table 4 is identical to column 4 of Table 1.
10. Group Annuity Contracts

For a group annuity purchased under a retirement or deferred compensation plan (Section 13.A.2.iB-9), the following apply:

- a. The statutory maximum valuation interest rate shall be determined separately for each certificate, considering its premium determination date, the certificate holder's initial age, the reference period corresponding to its form of payout and whether the contract is a jumbo contract or a non-jumbo contract.

Guidance Note: Under some group annuity contracts, certificates may be purchased on different dates.

- b. In the case of a certificate whose form of payout has not been elected by the beneficiary at its premium determination date, the statutory maximum valuation interest rate shall be based on the reference period corresponding to the normal form of payout as defined in the contract or as is evidenced by the underlying pension plan documents or census file. If the normal form of payout cannot be determined, the maximum valuation interest rate shall be based on the reference period corresponding to the annuity form available to the certificate holder that produces the most conservative rate.

Guidance Note: The statutory maximum valuation interest rate will not change when the form of payout is elected.

Valuation Manual Section II. Reserve Requirements

Subsection 2: Annuity Products

- A. This subsection establishes reserve requirements for all contracts classified as annuity contracts as defined in SSAP No. 50 in the AP&P Manual.
- B. Minimum reserve requirements for variable annuity (VA) contracts and similar business, specified in VM-21, Requirements for Principle-Based Reserves for Variable Annuities, shall be those provided by VM-21. The minimum reserve requirements of VM-21 are considered PBR requirements for purposes of the *Valuation Manual*.
- C. Minimum reserve requirements for fixed annuity contracts issued prior to 1/1/2024 are those requirements as found in VM-A and VM-C as applicable, with the exception of the minimum requirements for the valuation interest rate for single premium immediate annuity contracts, and other similar contracts, issued after Dec. 31, 2017, including those fixed payout annuities emanating from host contracts issued on or after Jan. 1, 2017, and on or before Dec. 31, 2017. The maximum valuation interest rate requirements for those contracts and fixed payout annuities are defined in Section 13 of VM-22, Statutory Maximum Valuation Interest Rates for Income Annuity Formulaic Reserves.
- ~~C.D.~~ Minimum reserve requirements for fixed annuity contracts issued on 1/1/2024 and later are those requirements as found in Sections 1 through 12 of VM-22.
- E. The below principles may serve as key considerations for assessing whether VM-21 or VM-22 requirements apply:
1. Index-linked or modified guaranteed annuity contracts or riders that satisfy both of the following conditions may be a key consideration for application of VM-22 requirements:
 - a. Guarantees the principal amount of purchase payments, net of any partial withdrawals, and interest credited thereto, less any deduction (without regard to its timing) for sales, administrative or other expenses or charges.
 - b. Credits a rate of interest under the contract that is at least equal to the minimum rate required to be credited by the standard nonforfeiture law in the jurisdiction in which the contract is issued.
- Guidance Note:** Paragraph E.1.b is intended to apply prior to the application of any market value adjustments for modified guaranteed annuities where the underlying assets are held in a separate account. If meeting Paragraph E.1.b prior to the application of any market value adjustments and Paragraph E.1.a above, it may be appropriate to value such contracts under VM-22 requirements.
2. Index-linked or modified guaranteed annuity contracts that do not satisfy either of the two conditions listed above in Paragraph E.1.i and E.1.ii may be a key consideration for application of VM-21 requirements.

Subsection 6: Riders and Supplemental Benefits

Drafting Note: All revisions shown in this section are in comparison to Subsection 6 in Section II of the Valuation Manual.

Guidance Note: ~~Policies designs, or contracts with riders and supplemental benefits~~ which are created to simply disguise ~~benefits riders~~ subject to the Valuation Manual section describing the reserve methodology for the base product to which they are attached, VM-20 Section 3.A.1 or exploit a perceived loophole, must be reserved in a manner similar to more typical designs with similar riders.

- A. If a rider or supplemental benefit is attached to a health insurance product, ~~annuity product, deposit-type contract, or credit life or disability product~~, it may be valued with the base contract unless it is required to be separated by regulation or other requirements.
- B. For supplemental benefits on life insurance policies or annuity contracts, including Guaranteed Insurability, Accidental Death or Disability Benefits, Convertibility, Nursing Home Benefits or Disability Waiver of Premium Benefits, the supplemental benefit may be ~~included~~ valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, VM-A, and/or VM-C, as applicable.
- C. ULSG and other secondary guarantee riders on a life insurance policy shall be valued with the base policy and follow the reserve requirements for ULSG policies under VM-20, VM-A and/or VM-C, as applicable.
- D. Any guaranteed minimum benefits on life insurance policies or annuity contracts not subject to Paragraph C above including, but not limited to, Guaranteed Minimum Accumulation Benefits, Guaranteed Minimum Death Benefits, Guaranteed Minimum Income Benefits, Guaranteed Minimum Withdrawal Benefits, Guaranteed Lifetime Income Benefits, Guaranteed Lifetime Withdrawal Benefits, Guaranteed Payout Annuity Floors, Waiver of Surrender Charges, Return of Premium, Systematic Withdrawal Benefits under Required Minimum Distributions, and all similar guaranteed benefits shall be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, and VM-A and/or VM-C, as applicable.
- ~~D.E.~~ If a rider or supplemental benefit to a life insurance policy or annuity contract that is not addressed in Paragraphs B, C, or D above possesses any of the following attributes, the rider or supplemental benefit shall be included valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, and VM-A and/or VM-C, as applicable.
1. The rider or supplemental benefit does not have a separately identified premium or charge.
 2. ~~The~~ After issuance, the rider or supplemental benefit premium, charge, value or benefits are determined by referencing the base policy or policy contract features or performance.
 3. ~~The~~ After issuance, the base policy or policy contract value or benefits are determined by referencing the rider or supplemental benefit features or performance. The deduction of rider or benefit premium or charge from the contract value is not sufficient for a determination by reference.

~~E.F.~~ If a term life insurance rider on the named insured[s] on the base life insurance policy does not meet the conditions of ~~p~~Paragraph ~~DE~~ above, and either (1) guarantees level or near level premiums until a specified duration followed by a material premium increase; or (2) for a rider for which level or near level premiums are expected for a period followed by a material premium increase, the rider is separated from the base policy and follows the reserve requirements for term policies under VM20, VM-A and/or VM-C, as applicable.

~~F.G.~~ For all other riders or supplemental benefits on life insurance policies or annuity contracts not addressed in Paragraphs B through ~~EF~~ above, the riders or supplemental benefits may be ~~included~~ valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, VM-A and/or VM-C, as applicable. For a given rider, the election to include riders or supplemental benefits with the base policy or contract shall be determined at the policy form level, not on a policy-by-policy basis, and shall be treated consistently from year-to-year, unless otherwise approved by the domiciliary commissioner.

~~G.H.~~ Any supplemental benefits and riders offered on life insurance policies or annuity contracts that would have a material impact on the reserve if elected later in the contract life, such as joint income benefits, nursing home benefits, or withdrawal provisions on annuity contracts, shall be considered when determining reserves using the following principles:

1. Policyholders with living benefits and annuitization in the same contract will generally use the more valuable of the two benefits.
2. When advantageous, policyholders will commence living benefit payouts if not started yet.

AMERICAN ACADEMY of ACTUARIES

Objective. Independent. Effective.™

July 16, 2021
Bruce Sartain, Chair
Valuation Manual (VM)-22 (A) Subgroup
Life Actuarial (A) Task Force
National Association of Insurance Commissioners (NAIC)

Dear Mr. Sartain,

The American Academy of Actuaries¹ Annuity Reserves and Capital Work Group (ARCWG) presented a fixed annuity principle-based reserving (PBR) framework proposal to the VM-22 Subgroup during its October 21, 2020 meeting. This document provides ARCWG's initial draft of NAIC Valuation Manual Section II and VM-22 requirements associated with the ARCWG proposal. We ask for the VM-22 Subgroup's consideration of the language herein as a foundation for further drafting efforts, in your efforts to advance toward an NAIC fixed annuity PBR framework.

Please let us know if you have any follow-up inquiries in response to this document. Again, we appreciate the opportunity to propose the fixed annuity framework and all of the efforts made by the VM-22 Subgroup to focus on this topic.

Sincerely,
Ben Slutsker
Chairperson, Annuity Reserves and Capital Work Group
American Academy of Actuaries

¹ The American Academy of Actuaries is a 19,500-member professional association whose mission is to serve the public and the U.S. actuarial profession. For more than 50 years, the Academy has assisted public policymakers on all levels by providing leadership, objective expertise, and actuarial advice on risk and financial security issues. The Academy also sets qualification, practice, and professionalism standards for actuaries in the United States.

VM-22 PBR: Requirements for Principle-Based Reserves for Non-Variable Annuities

Drafting Overview: This document is the ARCWG-proposed draft Valuation Manual wording for VM-22 PBR for non-variable annuities. The edits reflected in this draft are made in association with the recommendations in the Annuity Reserves Work Group-proposed VM-22 presentation, exposed by the VM-22 Subgroup in October 2020. Each section shows editorial mark-ups compared to existing VM-20 or VM-21 wording, which is included as a draft note at the beginning of each section (with the only exceptions being Sections 1 and 2 that do not contain mark-ups to existing Valuation Manual wording).

- Valuation Manual Section II. Reserve Requirements71
 - Subsection 2: Annuity Products71
 - Subsection 6: Riders and Supplemental Benefits72

Section 1: Background

A. Purpose

These requirements establish the minimum reserve valuation standard for non-variable annuity contracts as defined in Section 2.A and issued on or after 1/1/2024. For all contracts encompassed by the Scope, these requirements constitute the Commissioners Annuity Reserve Valuation Method (CARVM) and, for certain contracts, the Commissioners Reserve Valuation Method (CRVM).

Guidance Note: CRVM requirements apply to some group pension contracts.

B. Principles

The projection methodology used to calculate the stochastic reserve is based on the following set of principles. These principles should be followed when interpreting and applying the methodology in these requirements and analyzing the resulting reserves.

Guidance Note: The principles should be considered in their entirety, and it is required that companies meet these principles with respect to those contracts that fall within the scope of these requirements and are in force as of the valuation date to which these requirements are applied.

Principle 1: The objective of the approach used to determine the stochastic reserve is to quantify the amount of statutory reserves needed by the company to be able to meet contractual obligations in light of the risks to which the company is exposed with an element of conservatism consistent with statutory reporting objectives.

Principle 2: The calculation of the stochastic reserve is based on the results derived from an analysis of asset and liability cash flows produced by the application of a stochastic cash-flow model to equity return and interest rate scenarios. For each scenario, the greatest present value of accumulated deficiency is calculated. The analysis reflects prudent estimate assumptions for deterministic variables and is performed in aggregate (subject to limitations related to contractual provisions) to allow the natural offset of risks within a given scenario. The methodology uses a projected total cash flow analysis by including all projected income, benefit, and expense items related to the business in the model and sets the stochastic reserve at a degree of confidence using the CTE measure applied to the set of scenario specific greatest present values of accumulated deficiencies that is deemed to be reasonably conservative over the span of economic cycles.

Principle 3: The implementation of a model involves decisions about the experience assumptions and the modeling techniques to be used in measuring the risks to which the company is exposed. Generally, assumptions are to be based on the conservative end of the confidence interval. The choice of a conservative estimate for each assumption may result in a distorted measure of the total risk. Conceptually, the choice of assumptions and the modeling decisions should be made so that the final result approximates what would be obtained for the

stochastic reserve at the required CTE level if it were possible to calculate results over the joint distribution of all future outcomes. In applying this concept to the actual calculation of the stochastic reserve, the company should be guided by evolving practice and expanding knowledge base in the measurement and management of risk.

Guidance Note: The intent of Principle 3 is to describe the conceptual framework for setting assumptions. Section 10 provides the requirements and guidance for setting contract holder behavior assumptions and includes alternatives to this framework if the company is unable to fully apply this principle.

Principle 4: While a stochastic cash-flow model attempts to include all real-world risks relevant to the objective of the stochastic cash-flow model and relationships among the risks, it will still contain limitations because it is only a model. The calculation of the stochastic reserve is based on the results derived from the application of the stochastic cash-flow model to scenarios, while the actual statutory reserve needs of the company arise from the risks to which the company is (or will be) exposed in reality. Any disconnect between the model and reality should be reflected in setting prudent estimate assumptions to the extent not addressed by other means.

Principle 5: Neither a cash-flow scenario model nor a method based on factors calibrated to the results of a cash-flow scenario model can completely quantify a company’s exposure to risk. A model attempts to represent reality but will always remain an approximation thereto and, hence, uncertainty in future experience is an important consideration when determining the stochastic reserve. Therefore, the use of assumptions, methods, models, risk management strategies (e.g., hedging), derivative instruments, structured investments or any other risk transfer arrangements (such as reinsurance) that serve solely to reduce the calculated stochastic reserve without also reducing risk on scenarios similar to those used in the actual cash-flow modeling are inconsistent with these principles. The use of assumptions and risk management strategies should be appropriate to the business and not merely constructed to exploit “foreknowledge” of the components of the required methodology.

C. Risks Reflected

1. The risks reflected in the calculation of reserves under these requirements arise from actual or potential events or activities that are both:
 - a. Directly related to the contracts falling under the scope of these requirements or their supporting assets; and
 - b. Capable of materially affecting the reserve.
2. Categories and examples of risks reflected in the reserve calculations include, but are not necessarily limited to:
 - a. Asset risks
 - i. Credit risks (e.g., default or rating downgrades).

- ii. Commercial mortgage loan roll-over rates (roll-over of bullet loans).
 - iii. Uncertainty in the timing or duration of asset cash flows (e.g., shortening (prepayment risk) and lengthening (extension risk)).
 - iv. Performance of equities, real estate, and Schedule BA assets.
 - v. Call risk on callable assets.
 - vi. Separate account fund performance.
 - vii. Risk associated with hedge instrument (includes basis, gap, price, parameter estimation risks, and variation in assumptions).
 - viii. Currency risk.
- b. Liability risks
- i. Reinsurer default, impairment, or rating downgrade known to have occurred before or on the valuation date.
 - ii. Mortality/longevity, persistency/lapse, partial withdrawal, and premium payment risks.
 - iii. Utilization risk associated with guaranteed living benefits.
 - iv. Anticipated mortality trends based on observed patterns of mortality improvement or deterioration, where permitted.
 - v. Annuitization risks.
 - vi. Additional premium dump-ins or deposits (high interest rate guarantees in low interest rate environments).
 - vii. Applicable expense risks, including fluctuation maintenance expenses directly attributable to the business, future commission expenses, and expense inflation/growth.
- c. Combination risks
- i. Risks modeled in the company’s risk assessment processes that are related to the contracts, as described above.
 - ii. Disintermediation risk (including such risk related to payment of surrender or partial withdrawal benefits).
 - iii. Risks associated with revenue-sharing income.
3. The risks not necessarily reflected in the calculation of reserves under these requirements are:

- a. Those not associated with the policies or contracts being valued, or their supporting assets.
 - b. Determined to not be capable of materially affecting the reserve.
4. Categories and examples of risks not reflected in the reserve calculations include, but are not necessarily limited to:
- a. Asset risks
 - i. Liquidity risks associated with sudden and significant levels of withdrawals and surrenders.
 - b. Liability risks
 - i. Reinsurer default, impairment or rating downgrade occurring after the valuation date.
 - ii. Catastrophic events (e.g., epidemics or terrorist events).
 - iii. Major breakthroughs in life extension technology that have not yet fundamentally altered recently observed mortality experience.
 - iv. Significant future reserve increases as an unfavorable scenario is realized.
 - c. General business risks
 - i. Deterioration of reputation.
 - ii. Future changes in anticipated experience (reparameterization in the case of stochastic processes), which would be triggered if and when adverse modeled outcomes were to actually occur.
 - iii. Poor management performance.
 - iv. The expense risks associated with fluctuating amounts of new business.
 - v. Risks associated with future economic viability of the company.
 - vi. Moral hazards.
 - vii. Fraud and theft.

D. Specific Definitions for VM-22

Buffer Annuity

Interchangeable term for Registered Index-Linked Annuity (RILA). See definition for Registered Index-Linked Annuity below.

Deferred Income Annuity (DIA)

An annuity which guarantees a periodic payment for the life of the annuitant or a term certain and payments begin one year or later after (or from) the issue date if the contract holder survives to a predetermined future age.

Fixed Indexed Annuity (FIA)

An annuity with an account value where the contract holder has the option for a portion or all of the account value to grow at a rate linked to an external index, typically with guaranteed principal.

Flexible Premium Deferred Annuity (FPDA)

An annuity with an account value established with a premium amount but allows for additional deposits to be paid into the annuity over time, resulting in an increase to the account value. The contract also has a guaranteed interest rate during the accumulation phase and has guaranteed mortality and interest rates applicable at the time of conversion to the payout phase.

Funding Agreement

A contract issued to an institutional investor (domestic and international non-qualified fixed income investors) that provides fixed or floating interest rate guarantees.

Guaranteed Investment Contract (GIC)

Insurance contract typically issued to a retirement plan (defined contribution) under which the insurer accepts a deposit (or series of deposits) from the purchaser and guarantees to pay a specified interest rate on the funds deposited during a specified period of time.

Index Credit Hedge Margin

A margin capturing the risk of inefficiencies in the company's hedging program supporting index credits. This includes basis risk, persistency risk, and the risk associated with modeling decisions and simplifications. It also includes any uncertainty of costs associated with managing the hedging program and changes due to investment and management decisions.

Index Credit

Any interest credit, multiplier, factor, bonus, charge reduction, or other enhancement to policy values that is linked to an index or indices. Amounts credited to the policy resulting from a floor on an index account are included.

Index Crediting Strategy

The strategy defined in a contract to determine index credits for a contract. This refers to underlying index, index parameters, date, timing, and other elements of the crediting method.

Index Parameter

Cap, floor, participation rate, spreads, or other features describing how the contract utilizes the index.

Longevity Reinsurance

An agreement, typically a reinsurance arrangement covering one or more group or individual annuity contracts, under which an insurance company assumes the longevity risk associated with

periodic payments made to specified annuitants under one or more immediate or deferred payout annuity contracts. A common example is participants in one or more underlying retirement plans.

Typically, the reinsurer pays a portion of the actual benefits due to the underlying annuitants (or, in some cases, a pre-agreed amount per annuitant), while the ceding insurance company retains the assets supporting the reinsured annuity payments and pays periodic, ongoing premiums to the reinsurer over the expected lifetime of benefits paid to the specified annuitants. Such agreements may contain net settlement provisions such that only one party makes ongoing cash payments in a particular period. Under these agreements, longevity risk may be transferred on either a permanent basis or for a prespecified period of time, and these agreements may or may not permit early termination.

Agreements which are not treated as reinsurance under Statement of Statutory Accounting Principles (SSAP) No. 61R are not included in this definition. In particular, contracts under which payments are made based on the aggregate mortality experience of a population of lives which are not covered by an underlying group or individual annuity contract (e.g., mortality index-based longevity swaps) are not included in this definition.

Market Value Adjustment (MVA) Annuity

An annuity with an account value where withdrawals and full surrenders are subject to adjustments based on interest rates or index returns at the time of withdrawal/surrender. There could be ceilings and floors on the amount of the market-value adjustment.

Modified Guaranteed Annuity (MGA)

A type of market-value adjusted annuity contract where the underlying assets are held in an insurance company separate account and the value of which are guaranteed if held for specified periods of time. The contract contains nonforfeiture values that are based upon a market-value adjustment formula if held for shorter periods.

Multiple Year Guaranteed Annuity (MYGA)

A type of fixed annuity that provides a pre-determined and contractually guaranteed interest rate for specified periods of time, after which there is typically an annual reset or renewal of a multiple year guarantee period.

Pension Risk Transfer (PRT) Annuity

An annuity, typically a group contract or reinsurance agreement, issued by an insurance company providing periodic payments to annuitants receiving immediate or deferred benefits from one or more retirement plans. Typically, the insurance company holds the assets supporting the benefits, which may be held in the general or separate account, and retains not only longevity risk but also asset risks (e.g., credit risk and reinvestment risk).

Registered Index-Linked Annuity (RILA)

An annuity with an account value where the contract holder has the option for a portion or all of the account value to grow at a rate linked to an external index, similar to a Fixed Indexed Annuity, but with downside risk exposure that may not guarantee full principal repayment. These contracts may include a cap on upside returns, and may also include a floor on downside returns which may be below zero percent.

Single Premium Immediate Annuity (SPIA)

An annuity purchased with a single premium amount which guarantees a periodic payment for the life of the annuitant or a term certain and payments begin within one year after (or from) the issue date.

Single Premium Deferred Annuity (SPDA)

An annuity with an account value established with a single premium amount that grows with a guaranteed interest rate during the accumulation phase and has guaranteed mortality and interest rates applicable at the time of conversion to the payout phase. May also include cases where the premium is accepted for a limited amount of time early in the contract life, such as only in the first duration.

Stable Value Contract

A contract that provides limited investment guarantees, typically preserving principal while crediting steady, positive returns and protecting against losses or declines in yield. Underlying asset portfolios typically consist of fixed income securities, which may sit in the insurer's general account, a separate account, or in a third-party trust. These contracts often support defined contribution or defined benefit retirement plan liabilities.

Structured Settlement Contract (SSC)

A contract that provides periodic benefits and is purchased with a single premium amount stemming from various types of claims pertaining to court settlements or out-of-court settlements from tort actions arising from accidents, medical malpractice, and other causes. Adverse mortality is typically expected for these contracts.

Synthetic GIC

Contract that simulates the performance of a traditional GIC through a wrapper, swap, or other financial instruments, with the main difference being that the assets are owned by the policyholder or plan trust.

Term Certain Payout Annuity

A contract issued, which offers guaranteed periodic payments for a specified period of time, not contingent upon mortality or morbidity of the annuitant.

Two-Tiered Annuity

A deferred annuity with two tiers of account values. One, with a higher accumulation interest rate, is only available for annuitization or death. The other typically contains a lower accumulation interest rate, and is only available upon surrender.

Section 2: Scope and Effective Date

A. Scope

Subject to the requirements of this VM-22 are annuity contracts, certificates and contract features, whether group or individual, including both life contingent and term-certain-only, directly written or assumed through reinsurance issued on or after 1/1/2024, with the exception of contracts or benefits listed below.

Products out of scope include:

- Contracts or benefits that are subject to VM-21 (such as variable annuities, RILAs, buffer annuities, and structured annuities)
- GICs
- Synthetic GICs
- Stable Value Contracts
- Funding Agreements

Products in scope of VM-22 include fixed annuities which consist of, but are not limited to, the following the list:

- **Account Value Based Annuities**
 - Deferred Annuities (SPDA & FPDA)
 - Multi-Year Guarantee Annuities (MYGA)
 - Fixed Indexed Annuities (FIA)
 - Market-Value Adjustments (MVA)
 - Two-tiered Annuities
 - Guarantees/Benefits/Riders on Fixed Annuity Contracts
- **Payout Annuities**
 - Single Premium Immediate Annuities (SPIA)
 - Deferred Income Annuities (DIA)
 - Term Certain Payout Annuity
 - Pension Risk Transfer Annuities (PRT)
 - Structured Settlement Contracts (SSC)
 - Longevity Reinsurance

The company may elect to exclude one or more groups of contracts from the stochastic reserve calculation in certain situations, pursuant to the exclusion test requirements defined in Section 3.E of VM-22.

B. Effective Date & Transition

Effective Date

These requirements apply for valuation dates on or after January 1, 2024.

Transition

A company may elect to establish minimum reserves pursuant to applicable requirements in VM-A and VM-C for business otherwise subject to VM-22 PBR requirements and issued during the

first three years following the effective date of VM-22 PBR. If a company during the three years elects to apply VM-22 PBR to a block of such business, then a company must continue to apply the requirements of VM-22 PBR for future issues of this business. Irrespective of the transition date, a company shall apply VM-22 PBR requirements to applicable blocks of business on a prospective basis starting at least three years after the effective date.

Section 3: Reserve Methodology

A. Aggregate Reserve

The aggregate reserve for contracts falling within the scope of these requirements shall equal the stochastic reserve (following the requirements of Section 4) less any applicable PIMR for all contracts not valued under applicable requirements in VM-A and VM-C, plus the reserve for any contracts valued under applicable requirements in VM-A and VM-C.

Guidance Note: Contracts valued under applicable requirements in VM-A and VM-C are ones that pass the exclusion test and elect to not model PBR stochastic reserves, per the requirements in Section 3.E.

B. Impact of Reinsurance Ceded

All components in the aggregate reserve shall be determined post-reinsurance ceded, that is net of any reinsurance cash flows arising from treaties that meet the statutory requirements that allow the treaty to be accounted for as reinsurance. A pre-reinsurance ceded reserve also needs to be determined by ignoring all reinsurance cash flows (costs and benefits) in the reserve calculation.

C. To Be Determined

D. The Stochastic Reserve

1. The stochastic reserve shall be determined based on asset and liability projections for the contracts falling within the scope of these requirements, excluding those contracts valued using the methodology pursuant to applicable requirements in VM-A and VM-C, over a broad range of stochastically generated projection scenarios described in Section 8 and using prudent estimate assumptions as required in Section 3.F herein.
2. The stochastic reserve amount for any group of contracts shall be determined as CTE70 of the scenario reserves following the requirements of Section 4, with the exception of groups of contracts for which a company elects the Deterministic Certification Option in Section 7.E, which shall be determined as the scenario reserve following the requirements of Section 4.
3. The reserve may be determined in aggregate across various groups of contracts as a single model segment when determining the stochastic reserve if the business and risks are not managed separately or are part of the same integrated risk management program. Aggregation is permitted if a resulting group of contracts (or model segment) follows the listed principles:
 - a. Aggregate in a manner that is consistent with the company's risk management strategy and reflects the likelihood of any change in risk offsets that could arise from shifts between product types, and
 - b. Using prudent actuarial judgement, consider the following elements when aggregating groups of contracts: whether groups of contracts are part of the same portfolio (or different portfolios that interact), same integrated risk management system, administered/managed together
4. Do not aggregate groups of contracts for which the company elects to use the Deterministic Certification Option in Section 7.E with any groups of contracts that do not use such option.

5. To the extent that these limits on aggregation result in more than one model segment, the stochastic reserve shall equal the sum of the stochastic reserve amounts computed for each model segment and scenario reserve amounts computed for each model segment for which the company elects to use the Deterministic Certification Option in Section 7.E.

E. Exclusion Test

1. To the extent that certain groups of contracts pass one of the defined stochastic exclusion tests in Section 7.B, these groups of contracts may be valued using the methodology pursuant to applicable requirements in VM-A and VM-C, with the statutory maximum valuation rate for immediate annuities specified in Section 13.
 - a. For dividend-paying contracts, a dividend liability shall be established upon following requirements in VM-A and VM-C, as described above, for the base contract.

Guidance Note: The intention of contracts that pass the stochastic exclusion test is to provide the option to value contracts under VM-A and VM-C. This may apply to pre-PBR CARVM requirements in accordance with Actuarial Guideline XXXIII (AG33) methodology with type A, B, C rates for SPIAs issued before 2018; AG33 methodology with pre-PBR VM-22 rates for SPIAs issued on/after 2018; Actuarial Guideline XXXV (AG35) pre-PBR methodology for Fixed Indexed Annuities; and AG33 methodology (with interest rate updates for modernization initiatives on new contracts) for non-SPIAs.

2. The approach for grouping contracts when performing the exclusion tests should follow the same principles that underlie the aggregation approach for model segments discussed for Stochastic Reserves in Section D above.

F. Allocation of the Aggregate Reserve to Contracts

The aggregate reserve shall be allocated to the contracts falling within the scope of these requirements using the method outlined in Section 12.

G. Prudent Estimate Assumptions:

1. With respect to the Stochastic Reserve in Section 3.C, the company shall establish the prudent estimate assumption for each risk factor in compliance with the requirements in Section 12 of Model #820 and must periodically review and update the assumptions as appropriate in accordance with these requirements.
2. The qualified actuary, to whom responsibility for this group of contracts is assigned, shall annually review relevant emerging experience for the purpose of assessing the appropriateness of the anticipated experience assumption. If the results of statistical testing or other testing indicate that previously anticipated experience for a given factor is inadequate, then the qualified actuary shall set a new, adequate, anticipated experience assumption for the factor.
3. To determine the prudent estimate assumptions, the stochastic reserve shall also follow the requirements in Sections 4 and 9 for asset assumptions, Section 10 for policyholder behavior assumptions, and Section 11 for mortality assumptions.

Section 4: Determination of Stochastic Reserve

A. Projection of Accumulated Deficiencies

1. General Description of Projection

The projection of accumulated deficiencies shall be made ignoring federal income tax in both cash flows and discount rates, and it shall reflect the dynamics of the expected cash flows for the entire group of contracts, reflecting all product features, including any guarantees provided under the contracts using prudent estimate liability assumptions defined in Sections 10 and 11 and asset assumptions defined in Section 4.D. The company shall project cash flows including the following:

- a. Revenues received by the company including gross premiums received from the policyholder (including any due premiums as of the projected start date).
- b. All material benefits projected to be paid to policyholders—including, but not limited to, death claims, surrender benefits and withdrawal benefits—reflecting the impact of all guarantees and adjusted to take into account amounts projected to be charged to account values on general account business. Any guarantees, in addition to market value adjustments assessed on projected withdrawals or surrenders, shall be taken into account.

Guidance Note: Amounts charged to account values on general account business are not revenue; examples include rider charges and expense charges.

- c. Non-Guaranteed Elements (NGE) cash flows as described in Section 10.J.
- d. Insurance company expenses (including overhead and investment expense), commissions, contractual fees and charges, and revenue-sharing income received by the company (net of applicable expenses).
- e. Net cash flows associated with any reinsurance.
- f. Cash flows from hedging instruments as described in Section 4.A.4.
- g. Cash receipts or disbursements associated with invested assets (other than policy loans) as described in Section 4.D.4, including investment income, realized capital gains and losses, principal repayments, asset default costs, investment expenses, asset prepayments, and asset sales.
- h. If modeled explicitly, cash flows related to policy loans as described in Section 10.I.2, including interest income, new loan payments and principal repayments.

Guidance Note: Future net policy loan cash flows include: policy loan interest paid in cash plus repayments of policy loan principal, including repayments occurring at death or surrender (note that the future benefits in Section 4.A.1.b are before consideration of policy

loans), less additional policy loan principal (but excluding policy loan interest that is added to the policy loan principal balance).

2. Grouping of Index Crediting Strategies

Index crediting strategies may be grouped for modeling using an approach that recognizes the investment guidelines and objectives of each index crediting strategy. In assigning each index crediting strategy to a grouping for projection purposes, the fundamental characteristics of the index crediting strategy shall be reflected, and the parameters shall have the appropriate relationship to the stochastically generated projection scenarios described in Section 8. The grouping shall reflect characteristics of the efficient frontier (i.e., returns generally cannot be increased without assuming additional risk).

Index accounts sharing similar index crediting strategies may also be grouped for modeling to an appropriately crafted proxy strategy normally expressed as a linear combination of recognized market indices, sub-indices or funds, in order to develop the investment return paths and associated interest crediting. Each index crediting strategy's specific risk characteristics, associated index parameters, and relationship to the stochastically generated scenarios in Section 8 should be considered before grouping or assigning to a proxy strategy. Grouping and/or development of a proxy strategy may not be done in a manner that intentionally understates the resulting reserve.

3. Model Cells

Projections may be performed for each contract in force on the date of valuation or by assigning contracts into representative cells of model plans using all characteristics and criteria having a material impact on the size of the reserve. Assigning contracts to model cells may not be done in a manner that intentionally understates the resulting reserve.

4. Modeling of Hedges

a. For a company that does not have a future hedging program tied directly to the contracts falling under the scope of VM-22 stochastic reserve requirements:

- i. The company shall not consider the cash flows from any future hedge purchases or any rebalancing of existing hedge assets in its modeling.
- ii. Existing hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the starting assets. The hedge assets may then be considered in one of two ways:
 - a) Include the asset cash flows from any contractual payments and maturity values in the projection model; or
 - b) No hedge positions—in which case the hedge positions held on the valuation date are replaced with cash and/or other general account assets in an amount equal to the aggregate market value of these hedge positions.

Guidance Note: If the hedge positions held on the valuation date are replaced with cash, then as with any other cash, such amounts may then be invested following the company's investment strategy.

A company may switch from method a) to method b) at any time, but it may only change from b) to a) with the approval of the domiciliary commissioner.

- b. For a company that has a future hedging program tied directly to the contracts falling under the scope of VM-22 stochastic reserve requirements:
 - i. For a hedging program with hedge payoffs that offset interest credits associated with indexed interest strategies (indexed interest credits):
 - a) In modeling cash flows, the company shall include the cash flows from future hedge purchases or any rebalancing of existing hedge assets that are intended solely to offset interest credits to policyholders
 - b) Existing hedging instruments that are currently held by the company for this purpose in support of the contracts falling under the scope of these requirements shall be included in the starting assets. Existing hedging instruments that are currently held by the company for any other purpose should be modeled consistently with the requirements of Section 4.A.4.a.ii.
 - c) An Index Credit Hedge Margin for these instruments shall be reflected by reducing index interest credit hedge payoffs by a margin multiple that shall be justified by sufficient and credible company experience and be no less than [X%] multiplicatively of the interest credited. In the absence of sufficient and credible company experience, a margin of [Y%] shall be assumed. There is no cap on the index credit hedge margin if company experience indicates actual error is greater than [Y%]. It is permissible to substitute stress-testing for sufficient and credible experience if such stress-testing comprehensively considers a robust range of future market conditions.
 - ii. For a company that hedges any contractual obligation or risks other than indexed interest credits, the detailed requirements for the modeling of hedges are defined in Section 9. The following requirements do not supersede the detailed requirements.
 - a) The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the projections used in the determination of the stochastic reserve.
 - b) The projections shall take into account the appropriate costs and benefits of hedge positions expected to be held in the future.

Because models do not always accurately portray the results of hedge programs, the company shall, through back-testing and other means, assess the accuracy of the hedge modeling. The company shall determine a stochastic reserve as the weighted average of two CTE values; first, a CTE70 (“best efforts”) representing the company’s projection of all of the hedge cash flows, including future hedge purchases, and a second CTE70 (“adjusted”) which shall use only hedge assets held by the company on the valuation date and only future hedge purchases associated with indexed interest credited. These are discussed in greater detail in Section 9.

- c) Consistent with Section 4.A.4.b.i., the index credit hedge margin for instruments associated with indexed interest credited shall be reflected by reducing hedge payoffs by a margin multiple as defined in Section 4.A.4.b.i.c).
- d) The use of products not falling under the scope of these requirements as a hedge shall not be recognized in the determination of accumulated deficiencies.

Guidance Note: Section 4.A.4.b.i is intended to address common situations for products with index crediting strategies where the company only hedges index credits or clearly separates index credit hedging from other hedging. In this case the hedge positions are considered similarly to other fixed income assets supporting the contracts, and a margin is reflected rather than modeling using a CTE70 adjusted run with no future hedge purchases. If a company has a more comprehensive hedge strategy combining index credits, guaranteed benefit, and other risks (e.g., full fair value or economic hedging), an appropriate and documented bifurcation method should be used in the application of sections 4.A.4.b.i and 4.A.4.b.ii above for the hedge modeling and justification. Such bifurcation methods may quantify the specific risk exposure attributable to index credit liabilities versus other liabilities such as guaranteed living benefits, and apply such for the basis for allocation.

Guidance Note: The requirements of Section 4.A.4 govern the determination of reserves for annuity contracts and do not supersede any statutes, laws or regulations of any state or jurisdiction related to the use of derivative instruments for hedging purposes and should not be used in determining whether a company is permitted to use such instruments in any state or jurisdiction.

5. Revenue Sharing

If applicable, projections of accumulated deficiencies may include income from projected future revenue sharing, net of applicable projected expenses (net revenue-sharing income) if each of the requirements set forth in VM 21 Section 4.A.5 are met.

6. Length of Projections

Projections of accumulated deficiencies shall be run for as many future years as needed so that no materially greater reserve value would result from longer projection periods.

7. Interest Maintenance Reserve (IMR)

The IMR shall be handled consistently with the treatment in the company's cash flow testing, and the amounts should be adjusted to a pre-tax basis.

B. Determination of Scenario Reserve

1. For a given scenario, the scenario reserve shall be determined using one of two methods described below:

- a) The starting asset amount plus the greatest present value, as of the projection start date, of the projected accumulated deficiencies; or

Guidance Note: The greatest present value of accumulated deficiencies can be negative.

- b) The direct iteration method, where the scenario reserve is determined by solving for the amount of starting assets which, when projected along with all contract cash flows, result in the defeasement of all projected future benefits and expenses at the end of the projection horizon with no positive accumulated deficiencies at the end of any projection year during the projection period.

The scenario reserve for any given scenario shall not be less than the cash surrender value in aggregate on the valuation date for the group of contracts modeled in the projection.

2. Discount Rates

In determining the scenario reserve, unless using the direct iteration method pursuant to Section 4.B.1.b, the accumulated deficiencies shall be discounted at the NAER on additional assets, as defined in Section 4.B.3.

3. Determination of NAER on Additional Invested Asset Portfolio

- a. The additional invested asset portfolio for a scenario is a portfolio of general account assets as of the valuation date, outside of the starting asset portfolio, that is required in that projection scenario so that the projection would not have a positive accumulated deficiency at the end of any projection year. This portfolio may include only (i) General Account assets available to the company on the valuation date that do not constitute part of the starting asset portfolio; and (ii) cash assets.

Guidance Note:

Additional invested assets should be selected in a manner such that if the starting asset portfolio were revised to include the additional invested assets, the projection would not be expected to experience any positive accumulated deficiencies at the end of any projection year.

It is assumed that the accumulated deficiencies for this scenario projection are known.

- b. To determine the NAER on additional invested assets for a given scenario:

- i. Project the additional invested asset portfolio as of the valuation date to the end of the projection period,
 - a) Investing any cash in the portfolio and reinvesting all investment proceeds using the company’s investment policy.
 - b) Excluding any liability cash flows.
 - c) Incorporating the appropriate returns, defaults and investment expenses for the given scenario.
- ii. If the value of the projected additional invested asset portfolio does not equal or exceed the accumulated deficiencies at the end of each projection year for the scenario, increase the size of the initial additional invested asset portfolio as of the valuation date, and repeat the preceding step.
- iii. Determine a vector of annual earned rates that replicates the growth in the additional invested asset portfolio from the valuation date to the end of the projection period for the scenario. This vector will be the NAER for the given scenario.
- iv. If the depletion of assets within the projection results in an unreasonably high negative NAER upon borrowing, the NAER may be set to the assumed cost of borrowing associated with each projected time period, in accordance with Section 4.D.3.c, as a safe harbor.

Guidance Note: There are multiple ways to select the additional invested asset portfolio at the valuation date. Similarly, there are multiple ways to determine the earned rate vector. The company shall be consistent in its choice of methods, from one valuation to the next.

C. Projection Scenarios

1. Number of Scenarios

The number of scenarios for which the scenario reserve shall be computed shall be the responsibility of the company, and it shall be considered to be sufficient if any resulting understatement in the stochastic reserve, as compared with that resulting from running additional scenarios, is not material.

2. Economic Scenario Generation

Treasury Department interest rate curves, as well as investment return paths for index funds, equities, and fixed income assets shall be determined on a stochastic basis using the methodology described in Section 8. If the company uses a proprietary generator to develop scenarios, the company shall demonstrate that the resulting scenarios meet the requirements described in Section 8.

D. Projection of Assets

1. Starting Asset Amount

- a. For the projections of accumulated deficiencies, the value of assets at the start of the projection shall be set equal to the approximate value of statutory reserves at the start of the projection plus the allocated amount of PIMR attributable to the assets selected. Assets shall be valued consistently with their annual statement values. The amount of such asset values shall equal the sum of the following items, all as of the start of the projection:
 - i. Any hedge instruments held in support of the contracts being valued; and
 - ii. An amount of assets held in the general account equal to the approximate value of statutory reserves as of the start of the projections less the amount in (i).
- b. If the amount of initial general account assets is negative, the model should reflect a projected interest expense. General account assets chosen for use as described above shall be selected on a consistent basis from one reserve valuation hereunder to the next.

2. Valuation of Projected Assets

For purposes of determining the projected accumulated deficiencies, the value of projected assets shall be determined in a manner consistent with their value at the start of the projection. For assets assumed to be purchased during a projection, the value shall be determined in a manner consistent with the value of assets at the start of the projection that have similar investment characteristics. However, for derivative instruments that are used in hedging and are not assumed to be sold during a particular projection interval, the company may account for them at an amortized cost in an appropriate manner elected by the company.

Guidance Note: Accounting for hedge assets should recognize any methodology prescribed by a company's state of domicile.

3. General Account Assets

- a. General account assets shall be projected, net of projected defaults, using assumed investment returns consistent with their book value and expected to be realized in future periods as of the date of valuation. Initial assets that mature during the projection and positive cash flows projected for future periods shall be invested in a manner that is representative of and consistent with the company's investment policy, subject to the following requirements:
 - i. The final maturities and cash flow structures of assets purchased in the model, such as the patterns of gross investment income and principal repayments or a fixed or floating rate interest basis, shall be determined by the company as part of the model representation;

- ii. The combination of price and structure for fixed income investments and derivative instruments associated with fixed income investments shall appropriately reflect the projected Treasury Department curve along the relevant scenario and the requirements for gross asset spread assumptions stated below;
 - iii. For purchases of public non-callable corporate bonds, follow the requirements defined in VM-20 Sections 7.E, 7.F and 9.F. The prescribed spreads reflect current market conditions as of the model start date and grade to long-term conditions based on historical data at the start of projection year four;
 - iv. For transactions of derivative instruments associated with fixed income investments, reflect the prescribed assumptions in VM-20 Section 9.F for interest rate swap spreads;
 - v. For purchases of other fixed income investments, if included in the model investment strategy, set assumed gross asset spreads over U.S. Treasuries in a manner that is consistent with, and results in reasonable relationships to, the prescribed spreads for public non-callable corporate bonds and interest rate swaps.
- b. Notwithstanding the above requirements, the model investment strategy and any non-prescribed asset spreads shall be adjusted as necessary so that the aggregate reserve is not less than that which would be obtained by substituting an alternative investment strategy in which all fixed income reinvestment assets are public non-callable corporate bonds with gross asset spreads, asset default costs, and investment expenses by projection year that are consistent with a credit quality blend of:
- i. 5% Treasury
 - ii. 15% PBR credit rating 3 (Aa2/AA)
 - iii. 40% PBR credit rating 6 (A2/A)
 - iv. 40% PBR credit rating 9 (Baa/BBB)
- c. Any disinvestment shall be modeled in a manner that is consistent with the company's investment policy and that reflects the company's cost of borrowing where applicable, provided that the assumed cost of borrowing is not lower than the rate at which positive cash flows are reinvested in the same time period, taking into account duration, ratings, and other attributes of the borrowing mechanism. Gross asset spreads used in computing market values of assets sold in the model shall be consistent with, but not necessarily the same as, the gross asset spreads in Section 4.D.4.a.ii and Section 4.D.4.a.iv, recognizing that initial assets that mature during the projection may have different characteristics than modeled reinvestment assets.

Guidance Note: This limitation is being referred to Life Actuarial (A) Task Force for review. The simple language above “provided that the assumed cost of borrowing is not lower than the rate at which positive cash flows are reinvested in the same time period” is not intended to impose a literal requirement. It is intended to reflect a general concept to prevent excessively optimistic borrowing assumptions. It is recognized that borrowing parameters and rules can be complicated, such that modeling limitations may not allow for literal compliance, in every time step, as long as the reserve is not materially affected. However, if the company is unable to fully apply this restriction, prudence dictates that a company shall not allow borrowing assumptions to materially reduce the reserve.

4. Cash Flows from Invested Assets
 - a. Cash flows from general account fixed income assets, including starting and reinvestment assets, shall be reflected in the projection as follows:
 - i. Model gross investment income and principal repayments in accordance with the contractual provisions of each asset and in a manner consistent with each scenario.
 - ii. Reflect asset default costs as prescribed in VM-20 Section 9.F and anticipated investment expenses through deductions to the gross investment income.
 - iii. Model the proceeds arising from modeled asset sales and determine the portion representing any realized capital gains and losses.
 - iv. Reflect any uncertainty in the timing and amounts of asset cash flows related to the paths of interest rates, equity returns or other economic values directly in the projection of asset cash flows. Asset defaults are not subject to this requirement, since asset default assumptions must be determined by the prescribed method in VM-20 Sections 7.E, 7.F and 9.F.
 - b. Cash flows from general account index funds and equity assets—i.e., non-fixed income assets having substantial volatility of returns, such as common stocks and real estate— including starting and reinvestment assets, shall be reflected in the projection as follows:
 - i. Determine the grouping for asset categories and the allocation of specific assets to each category in a manner that is consistent with that used for index crediting strategies, as discussed in Section 4.A.2.
 - ii. Project the gross investment return including realized and unrealized capital gains in a manner that is consistent with the stochastically generated scenarios.
 - iii. Model the timing of an asset sale in a manner that is consistent with the investment policy of the company for that type of asset. Reflect expenses through a deduction to the gross investment return using prudent estimate assumptions.

- c. Cash flows for each projection interval for policy loan assets shall follow the requirements in Section 10.I.

E. Projection of Annuitization Benefits

1. Assumed Annuitization Purchase Rates

- a. For payouts specified at issue (such as single premium immediate annuities, deferred income annuities, and certain structured settlements), such payout rates shall reflect the payout rate specified in the contract.
- b. For purposes of projecting future elective annuitization benefits and withdrawal amounts from GMWBs, the projected annuitization purchase rates shall be determined assuming that market interest rates available at the time of election are the interest rates used to project general account assets, as determined in Section 4.D.4. In contrast, for payouts specified at issue, the payout rates modeled should be consistent with those specified in the contract.

2. Projected Election of GMIBs, GMWBs and Other Annuitization Options

For contracts projected to elect future annuitization options (including annuitizations stemming from the election of a GMIB) or for projections of GMWB benefits once the account value has been depleted, the projections may assume the contract will stay in force, the projected periodic payments are paid, and the associated maintenance expenses are incurred.

F. Frequency of Projection and Time Horizon

- 1. Use of an annual cash-flow frequency (“timestep”) is generally acceptable for benefits/features that are not sensitive to projection frequency. The lack of sensitivity to projection frequency should be validated by testing wherein the company should determine that the use of a more frequent—i.e., shorter—time step does not materially increase reserves. A more frequent time increment should always be used when the product features are sensitive to projection period frequency.
- 2. Care must be taken in simulating fee income and expenses when using an annual time step. It is also important that the frequency of the investment return model be linked appropriately to the projection horizon in the liability model. In particular, the horizon should be sufficiently long so as to capture the vast majority of costs (on a present value basis) from the scenarios.

Guidance Note: As a general guide, the forecast horizon should not be less than 20 years.

G. Compliance with ASOPs

When determining a stochastic reserve, the analysis shall conform to the ASOPs as promulgated from time to time by the ASB.

Under these requirements, an actuary will make various determinations, verifications and certifications. The company shall provide the actuary with the necessary information sufficient to

permit the actuary to fulfill the responsibilities set forth in these requirements and responsibilities arising from each applicable ASOP.

Section 5: Reinsurance Ceded and Assumed

A. Treatment of Reinsurance Ceded in the Aggregate Reserve

1. Aggregate Reserve Pre- and Post-Reinsurance Ceded

As noted in Section 3.B, the aggregate reserve is determined both pre-reinsurance ceded and post-reinsurance ceded. Therefore, it is necessary to determine the components needed to determine the aggregate reserve—i.e., the stochastic reserve and/or the reserve amount valued using requirements in VM-A and VM-C, as applicable—on both bases. Sections 5.A.2 and 5.A.3 discuss adjustments to inputs necessary to determine these components on both a post-reinsurance ceded and a pre-reinsurance ceded basis. Note that due allowance for reasonable approximations may be used where appropriate.

2. Stochastic Reserve

- a. In order to determine the aggregate reserve post-reinsurance ceded, accumulated deficiencies, scenario reserves, and the resulting stochastic reserve shall be determined reflecting the effects of reinsurance treaties that meet the statutory requirements that would allow the treaty to be accounted for as reinsurance within statutory accounting. This involves including, where appropriate, all projected reinsurance premiums or other costs and all reinsurance recoveries, where the reinsurance cash flows reflect all the provisions in the reinsurance agreement, using prudent estimate assumptions.
 - i. All significant terms and provisions within reinsurance treaties shall be reflected. In addition, it shall be assumed that each party is knowledgeable about the treaty provisions and will exercise them to their advantage.

Guidance Note: Renegotiation of the treaty upon the expiration of an experience refund provision or at any other time shall not be assumed if such would be beneficial to the company and not beneficial to the counterparty. This is applicable to both the ceding party and assuming party within a reinsurance arrangement.

- ii. If the company has knowledge that a counterparty is financially impaired, the company shall establish a margin for the risk of default by the counterparty. In the absence of knowledge that the counterparty is financially impaired, the company is not required to establish a margin for the risk of default by the counterparty.
 - iii. A company shall include the cash flows from a reinsurance agreement or amendment in calculating the aggregate reserve if such qualifies for credit in compliance with Appendix A-791 of the Accounting Practices and Procedures Manual. If a reinsurance agreement or amendment does not qualify for credit for reinsurance but treating the reinsurance agreement or amendment as if it did so qualify would result in a reduction to the company's surplus, then the company shall increase the minimum reserve by the absolute value of such reductions in surplus.
- b. In order to determine the stochastic reserve on a pre-reinsurance ceded basis, accumulated deficiencies, scenario reserves, and the resulting stochastic reserve shall be determined ignoring the effects of reinsurance ceded within the projections. Different approaches may be used to determine the starting assets on the ceded portion of the contracts, dependent upon the characteristics of a given treaty:
 - i. For a standard coinsurance treaty, where the assets supporting the ceded liabilities were transferred to the assuming reinsurer, one acceptable approach involves a projection

based on using starting assets on the ceded portion of the policies that are similar to those supporting the retained portion of the ceded policies or supporting similar types of policies. Scaling up each asset supporting the retained portion of the contract is also an acceptable method.

Guidance Note: For standard pro rata insurance treaties (does not include experience refunds), where allocated expenses are similar to the renewal expense allowance, reflecting the quota share applied to the present value of future reinsurance cash flows pertaining to the reinsured block of business may be considered as a possible approach to determine the ceded reserves.

- ii. Alternatively, a treaty may contain an identifiable portfolio of assets associated with the ceded liabilities. This could be the case for several forms of reinsurance: funds withheld coinsurance; modified coinsurance; coinsurance with a trust. To the extent these assets would be available to the cedant, an acceptable approach could involve modeling this portfolio of assets. To the extent that these assets were insufficient to defease the ceded liabilities, the modeling would partially default to the approach discussed for a standard coinsurance treaty. To the extent these assets exceeded what might be needed to defease the ceded liabilities (perhaps an over collateralization requirement in a trust), the inclusion of such assets shall be limited.

Guidance Note: Section 3.5.2 in ASOP No. 52, *Principle-Based Reserves for Life Products under the NAIC Valuation Manual*, provides possible methods for constructing a hypothetical pre-reinsurance asset portfolio, if necessary, for purposes of the pre-reinsurance reserve calculation.

- c. An assuming company shall use assumptions to project cash flows to and from ceding companies that reflect the assuming company's experience for the business segment to which the reinsured policies belong and reflect the terms of the reinsurance agreement.

3. Reserve Determined Upon Passing the Exclusion Test

If a company passes the stochastic exclusion test and elects to use a methodology pursuant to applicable Sections VM-A and VM-C, as allowed in Section 3.E, it is important to note that the methodology produces reserves on a pre-reinsurance ceded basis. Therefore, the reserve must be adjusted for any reinsurance ceded accordingly. In addition, reserves valued under applicable Sections in VM-A and VM-C, unadjusted for reinsurance, shall be applied to the contracts falling under the scope of these requirements to determine the aggregate reserve prior to reinsurance.

It should be noted that the pre-reinsurance and post-reinsurance reserves may result in different outcomes for the exclusion test. In particular, it is possible that the pre-reinsurance reserves would pass the relevant exclusion test (and allow the use of VM-A and VM-C) while the post-reinsurance reserves might not.

4. To Be Determined

Section 6: To Be Determined

Section 7: Exclusion Testing

A. Stochastic Exclusion Test Requirement Overview

1. The company may elect to exclude one or more groups of contracts from the stochastic reserve calculation if the stochastic exclusion test (SET) is satisfied for that group of contracts. The company has the option to calculate or not calculate the SET.
 - a. If the company does not elect to calculate the SET for one or more groups of contracts, or the company calculates the SET and fails the test for such groups of contracts, the reserve methodology described in Section 4 shall be used for calculating the aggregate reserve for those groups of contracts.
 - b. If the company elects to calculate the SET for one or more groups of contracts, and passes the test for such groups of contracts, then the company shall choose whether or not to use the reserve methodology described in Section 4 for those groups of contracts. If the reserve methodology described in Section 4 is not used for one or more groups of contracts, then the company shall use the reserve methodology pursuant to applicable requirements in VM-A and VM-C to calculate the aggregate reserve for those groups of contracts.
 - c. A company may not exclude a group of contracts from the stochastic reserve requirements if there are one or more future hedging programs associated with the contracts, with the exception of hedging programs solely supporting index credits as described in Section 9.A.1.

B. Types of Stochastic Exclusion Tests

Groups of contracts pass the SET if one of the following is met:

1. Stochastic Exclusion Ratio Test (SERT)—Annually the company demonstrates that the groups of contracts pass the SERT defined in Section 7.C.
2. Stochastic Exclusion Demonstration Test—In the first year and at least once every three calendar years thereafter, the company provides a demonstration in the PBR Actuarial Report as specified in Section 7.D.
3. SET Certification Method—For groups of contracts that do not have guaranteed living benefits, future hedging programs, or pension risk transfer business in the first year and at least every third calendar year thereafter, the company provides a certification by a qualified actuary that the group of contracts is not subject to material aggregate risk levels across interest rate risk, longevity risk, or asset return volatility risk (i.e., the risk on non-fixed-income investments having substantial volatility of returns, such as common stocks and real estate investments). The company shall provide the certification and documentation supporting the certification to the commissioner upon request.

Guidance Note: The qualified actuary should develop documentation to support the actuarial certification that presents his or her analysis clearly and in detail sufficient for another actuary to understand the analysis and reasons for the actuary’s conclusion that the group of contracts is not subject to material interest rate risk, longevity risk, or asset return volatility risk. Examples of methods a qualified actuary could use to support the actuarial certification include, but are not limited to:

- a) A demonstration that using requirements under VM-A and VM-C for the group of contracts calculated are at least as great as the assets required to support the group of contracts using the company's cash-flow testing model under each of the 16 scenarios identified in this section or alternatively each of the New York seven scenarios.
- b) A demonstration that the group of contracts passed the SERT within 36 months prior to the valuation date and the company has not had a material change in its interest rate risk.
- c) A qualitative risk assessment of the group of contracts that concludes that the group of contracts does not have material interest rate risk or asset return volatility. Such assessment would include an analysis of product guarantees, the company's non-guaranteed elements (NGEs) policy, assets backing the group of contracts and the company's investment strategy.

C. Stochastic Exclusion Ratio Test

1. In order to exclude a group of contracts from the stochastic reserve requirements under the stochastic exclusion ratio test (SERT), a company shall demonstrate that the ratio of $(b-a)/a$ is less than $[x]\%$ where:
 - a. a = the adjusted scenario reserve described in Paragraph C.2.a.i below using economic scenario 9, the baseline economic scenario, as described in Appendix 1.E of VM-20.
 - b. b = the largest adjusted scenario reserve described in Paragraph C.2.b below under any of the other 15 economic scenarios described in Appendix 1.E of VM-20 under both $[95]\%$ and $[105]\%$ of anticipated experience mortality excluding margins.

Guidance Note: Note that the numerator should be the largest adjusted scenario reserve for scenarios other than the baseline economic scenario, minus the adjusted scenario reserve for the baseline economic scenario. This is not necessarily the same as the biggest difference from the adjusted scenario reserve for the baseline economic scenario, or the absolute value of the biggest difference from the adjusted scenario reserve for the baseline economic scenario, both of which could lead to an incorrect test result.

2. In calculating the ratio in subsection (1) above:
 - a. The company shall calculate an adjusted scenario reserve for the group of contracts for the 16 scenarios that is equal to either (i) or (ii) below:
 - i. The scenario reserve defined in Section 4, but with the following differences:
 - a) Using anticipated experience assumptions with no margins, with the exception of mortality factors described in Paragraph C.1.b of this section.
 - b) Using the interest rates and equity return assumptions specific to each scenario.
 - c) Using NAER and discount rates defined in Section 4 specific to each scenario to discount the cash flows.

- d) Shall reflect future mortality improvement in line with anticipated experience assumptions.
 - e) Shall not reflect correlation between longevity and economic risks.
- ii. The gross premium reserve developed from the cash flows from the company's asset adequacy analysis models, using the experience assumptions of the company's cash-flow analysis, but with the following differences:
- a) Using the interest rates and equity return assumptions specific to each scenario.
 - b) Using the mortality scalars described in Paragraph C.1.b of this section.
 - c) Using the methodology to determine NAER and discount rates defined in Section 4 specific to each scenario to discount the cash flows, but using the company's cash-flow testing assumptions for default costs and reinvestment earnings.
- b. The company shall use the most current 16 economic scenarios published by the NAIC. The methodology for creating these scenarios can be found in Appendix 1 of VM-20.
- c. The company shall use assumptions within each scenario that are dynamically adjusted as appropriate for consistency with each tested scenario.
- d. The company may not group together contract types with significantly different risk profiles for purposes of calculating this ratio.
- e. If the company has reinsurance arrangements that are pro rata coinsurance and do not materially impact the interest rate risk, longevity risk, or asset return volatility in the contract, then the company may elect to not conduct the exclusion test under a pre-reinsurance-ceded basis upon determining the pre-reinsurance reserve-ceded aggregate reserve.
3. If the ratio calculated in this section is less than [x]% pre-non-proportional reinsurance, but is greater than [x]% post-non-proportional reinsurance, the group of contracts will still pass the SERT if the company can demonstrate that the sensitivity of the adjusted scenario reserve to economic scenarios is comparable pre- and post-non-proportional reinsurance.
- a. An example of an acceptable demonstration:
 - i. For convenience in notation • $SERT = \frac{(b-a)}{a}$ defined in Section 7.C.1 above
 - a) The pre-non-proportional reinsurance results are “gross of non-proportional,” with a subscript “gn,” so denoted $SERT_{gn}$
 - b) The post-non-proportional results are “net of non-proportional,” with subscript “nn,” so denoted $SERT_{nn}$

- ii. If a block of business being tested is subject to one or more non-proportional reinsurance cessions as well as other forms of reinsurance, such as pro rata coinsurance, take “gross of non-proportional” to mean net of all prorata reinsurance but ignoring the non-proportional contract(s), and “net of non-proportional” to mean net of *all* reinsurance contracts. That is, treat non-proportional reinsurance as the last reinsurance in, and compute certain values below with and without that last component.
- iii. So, if $SERT_{gn} \leq [x]$ but $SERT_{nn} > [x]$, then compute the largest percent increase in reserve (LPIR) = $(b-a)/a$, both “gross of non-proportional” and “net of non-proportional.”

$$LPIR_{gn} = (b_{gy} - a_{gy})/a_{gn}$$

$$LPIR_{nn} = (b_{ny} - a_{ny})/a_{nn}$$

Note that the scenario underlying b_{gn} could be different from the scenario underlying b_{nn} .

If $SERT_{gn} \times LPIR_{nn}/LPIR_{gn} < [x]$, then the block of contracts passes the SERT.

- b. Another more qualitative approach is to calculate the adjusted scenario reserves for the 16 scenarios both gross and net of reinsurance to demonstrate that there is a similar pattern of sensitivity by scenario.
4. The SERT may not be used for a group of contracts if, using the current year’s data, (i) the stochastic exclusion demonstration test defined in Section 7.D had already been attempted using the method in this section and did not pass; or (ii) the qualified actuary had actively undertaken to perform the certification method in this section and concluded that such certification could not legitimately be made.

D. Stochastic Exclusion Demonstration Test

- 1. In order to exclude a group of contracts from the stochastic reserve requirements using the methodology in this section, the company must provide a demonstration in the PBR Actuarial Report in the first year and at least once every three calendar years thereafter that complies with the following:
 - a. The demonstration shall provide a reasonable assurance that if the stochastic reserve was calculated on a stand-alone basis for the group of contracts subject to the stochastic reserve exclusion, the resulting stochastic reserve for those groups of contracts would not be higher than the statutory reserve determined pursuant to the applicable requirements in VM-A and VM-C. The demonstration shall take into account whether changing conditions over the current and two subsequent calendar years would be likely to change the conclusion to exclude the group of contracts from the stochastic reserve requirements.
 - b. If, as of the end of any calendar year, the company determines the aggregate reserve for the group of contracts no longer adequately provides for all material risks, the exclusion shall be discontinued, and the company fails the SERT for those contracts.

- c. The demonstration may be based on analysis from a date that precedes the valuation date for the initial year to which it applies if the demonstration includes an explanation of why the use of such a date will not produce a material change in the outcome, as compared to results based on an analysis as of the valuation date.
 - d. The demonstration shall provide an effective evaluation of the residual risk exposure remaining after risk mitigation techniques, such as derivative programs and reinsurance.
2. The company may use one of the following or another method acceptable to the insurance commissioner to demonstrate compliance with subsection 7.D.1 above:
- a. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the stochastic reserve calculated on a stand-alone basis.
 - b. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the scenario reserve that results from each of a sufficient number of adverse deterministic scenarios.
 - c. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the stochastic reserve calculated on a stand-alone basis, but using a representative sample of contracts in the stochastic reserve calculations.
 - d. Demonstrate that any risk characteristics that would otherwise cause the stochastic reserve calculated on a stand-alone basis to exceed the statutory reserve calculated in accordance with VM-A and VM-C, are not present or have been substantially eliminated through actions such as hedging, investment strategy, reinsurance or passing the risk on to the policyholder by contract provision.

E. Deterministic Certification Option

- 1. The company has the option to determine the stochastic reserve for a group of contracts using a single deterministic economic scenario, subject to the following conditions.
 - a. The company certifies that economic conditions do not materially influence anticipated contract holder behavior for the group of policies. Examples of contract holder options that are materially influenced by economic conditions include surrender benefits, recurring premium payments, and guaranteed living benefits.
 - b. The company certifies that the group of policies is not supported by a reinvestment strategy that contains future hedge purchases.
 - c. The company must perform and disclose results from the stochastic exclusion ratio test following the requirements in Section 7.C, thereby disclosing the scenario reserve volatility across various economic scenarios.

- d. The company must disclose a description of contracts and associated features in the certification.

Drafting Note: Consider revisiting Paragraph E.1.c to possibly either require i) falling below a preset threshold for the exclusion ratio test under a single longevity/mortality scenario; or ii) to pass the exclusion test if longevity is not included as part of the ratio test.

2. The stochastic reserve for the group of contracts under the Deterministic Certification Option is determined as follows:
 - a. Cash flows are projected in compliance with the applicable requirements in Section 4, Section 5, Section 10, and Section 11 of VM-22 over a single economic scenario (scenario 12 found in Appendix 1 of VM-20).
 - b. The stochastic reserve equals the scenario reserve following the requirements for Section 4.

Guidance Note: The Deterministic Certification Option is intended to provide a non-stochastic option for Single Premium Immediate Annuities (SPIAs) and similar payout annuity products that contain limited or no optionality in the asset and liability cash flow projections.

Section 8: To Be Determined (Scenario Generation for VM-21)

Section 9: Modeling Hedges under a Future Hedging Strategy

A. Initial Considerations

1. This section applies to modeling of hedges other than situations where the company (a) only hedges index credits, or (b) clearly separates index credit hedging from other hedging. In those situations, the modeling of hedges supporting index credits can be simplified including applying an index credit hedge margin, following the requirements in Section 4.A.4.b.i.
2. The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the calculation of the stochastic reserve, determined in accordance with Section 3.D and Section 4.D.
3. The company shall take into account the costs and benefits of hedge positions expected to be held by the company in the future along each scenario. Company management is responsible for developing, documenting, executing and evaluating the investment strategy for future hedge purchases. Prior to reflection in projections, the strategy for future hedge purposes shall be the actual practice of the company for a period of time not less than [6] months.
4. For this purpose, the investment assets refer to all the assets, including derivatives supporting covered products and guarantees. This also is referred to as the investment portfolio. The investment strategy is the set of all asset holdings at all points in time in all scenarios. The hedging portfolio, which also is referred to as the hedging assets, is a subset of the investment assets. The hedging strategy is the hedging asset holdings at all points in time in all scenarios. There is no attempt to distinguish what is the hedging portfolio and what is the investment portfolio in this section. Nor is the distinction between investment strategy and hedging strategy formally made here. Where necessary to give effect to the intent of this section, the requirements applicable to the hedging portfolio or the hedging strategy are to apply to the overall investment portfolio and investment strategy.
5. This particularly applies to restrictions on the reasonableness or acceptability of the models that make up the stochastic cash-flow model used to perform the projections, since these restrictions are inherently restrictions on the joint modeling of the hedging and non-hedging portfolio. To give effect to these requirements, they must apply to the overall investment strategy and investment portfolio.

B. Modeling Approaches

1. The analysis of the impact of the hedging strategy on cash flows is typically performed using either one of two types of methods as described below. Although a hedging strategy normally would be expected to reduce risk provisions, the nature of the hedging strategy and the costs to implement the strategy may result in an increase in the amount of the stochastic reserve otherwise calculated.
2. The fundamental characteristic of the first type of method, referred to as the “explicit method,” is that hedging positions and their resulting cash flows are included in the stochastic cash-flow model used to determine the scenario reserve, as discussed in Section 3.D, for each scenario.

3. The fundamental characteristic of the second type of method, referred to as the “implicit method,” is that the effectiveness of the current hedging strategy on future cash flows is evaluated, in part or in whole, outside of the stochastic cash-flow model. There are multiple ways that this type of modeling can be implemented. In this case, the reduction to the stochastic reserve otherwise calculated should be commensurate with the degree of effectiveness of the hedging strategy in reducing accumulated deficiencies otherwise calculated.
4. Regardless of the methodology used by the company, the ultimate effect of the current hedging strategy (including currently held hedge positions) on the stochastic reserve needs to recognize all risks, associated costs, imperfections in the hedges and hedging mismatch tolerances associated with the hedging strategy. The risks include, but are not limited to: basis, gap, price, parameter estimation and variation in assumptions (mortality, persistency, withdrawal, annuitization, etc.). Costs include, but are not limited to: transaction, margin (opportunity costs associated with margin requirements) and administration. In addition, the reduction to the stochastic reserve attributable to the hedging strategy may need to be limited due to the uncertainty associated with the company’s ability to implement the hedging strategy in a timely and effective manner. The level of operational uncertainty varies indirectly with the amount of time that the new or revised strategy has been in effect or mock tested.

Guidance Note: No hedging strategy is perfect. A given hedging strategy may eliminate or reduce some but not all risks, transform some risks into others, introduce new risks, or have other imperfections. For example, a delta-only hedging strategy does not adequately hedge the risks measured by the “Greeks” other than delta.

5. A safe harbor approach is permitted for those companies whose modeled hedge assets comprise only linear instruments not sensitive to implied volatility. For companies with option-based hedge strategies, electing this approach would require representing the option-based portion of the strategy as a delta-rho two-Greek hedge program. The normally modeled option portfolio would be replaced with a set of linear instruments that have the same first-order Greeks as the original option portfolio.

C. Calculation of Stochastic Reserve (Reported)

1. The company shall calculate CTE70 (best efforts)—the results obtained when the CTE70 is based on incorporating the modeling of hedges (including both currently held and future hedge positions) into the stochastic cash-flow model on a best efforts basis, including all of the factors and assumptions needed to model the hedges (e.g., stochastic implied volatility). The determination of CTE70 (best efforts) may utilize either explicit or implicit modeling techniques.
2. The company shall calculate a CTE70 (adjusted) by recalculating the CTE70 assuming the company has no hedging strategy except those to hedge interest credits and hedge assets held by the company on the valuation date, therefore following the requirements of Section 4.A.4.a and 4.A.4.b.i.
3. Because most models will include at least some approximations or idealistic assumptions, CTE70 (best efforts) may overstate the impact of the hedging strategy. To compensate for potential overstatement of the impact of the hedging strategy, the value for the stochastic reserve is given by:

Stochastic reserve = CTE70 (best efforts) + E × max[0, CTE70 (adjusted) – CTE70 (best efforts)]

4. The company shall specify a value for E (the “error factor”) in the range from 5% to 100% to reflect the company’s view of the potential error resulting from the level of sophistication of the stochastic cash-flow model and its ability to properly reflect the parameters of the hedging strategy (i.e., the Greeks being covered by the strategy), as well as the associated costs, risks and benefits. The greater the ability of the stochastic model to capture all risks and uncertainties, the lower the value of E . The value of E may be as low as 5% only if the model used to determine the CTE70 (best efforts) effectively reflects all of the parameters used in the hedging strategy. If certain economic risks are not hedged, yet the model does not generate scenarios that sufficiently capture those risks, E must be in the higher end of the range, reflecting the greater likelihood of error. Likewise, simplistic hedge cash-flow models shall assume a higher likelihood of error.
5. The company shall conduct a formal back-test, based on an analysis of at least the most recent 12 months, to assess how well the model is able to replicate the hedging strategy in a way that supports the determination of the value used for E .
6. Such a back-test shall involve one of the following analyses:
 - a. For companies that model hedge cash flows directly (“explicit method”), replace the stochastic scenarios used in calculating the CTE70 (best efforts) with a single scenario that represents the market path that actually manifested over the selected back-testing period and compare the projected hedge asset gains and losses against the actual hedge asset gains and losses – both realized and unrealized – observed over the same time period. For this calculation, the model assumptions may be replaced with parameters that reflect actual experience during the back-testing period. In order to isolate the comparison between the modeled hedge results and actual hedge results for this calculation, the projected liabilities should accurately reflect the actual liabilities throughout the back-testing period; therefore, adjustments that facilitate this accuracy (e.g. reflecting actual experience instead of model assumptions, including new business, etc.) are permissible.

To support the choice of a low value of E , the company should ascertain that the projected hedge asset gains and losses are within close range of 100% (e.g., 80–125%) of the actual hedge asset gains and losses. The company may also support the choice of a low value of E by achieving a high R-squared (e.g., 0.80 or higher) when using a regression analysis technique.
 - b. For companies that model hedge cash flows implicitly by quantifying the cost and benefit of hedging using the fair value of the hedged item (an “implicit method” or “cost of reinsurance method”), calculate the delta, rho and vega coverage ratios in each month over the selected back-testing period in the following manner:
 - i. Determine the hedge asset gains and losses—both realized and unrealized—incurred over the month attributable to equity, interest rate, and implied volatility movements.
 - ii. Determine the change in the fair value of the hedged item over the month attributable to equity, interest rate, and implied volatility movements. The hedged item should be defined in a manner that reflects the proportion of risks hedged (e.g., if a company elects to hedge 50% of a contract’s market risks, it should quantify the fair value of the hedged item as 50% of the fair value of the contract).
 - iii. Calculate the delta coverage ratio as the ratio between (i) and (ii) attributable to equity movements.

- iv. Calculate the rho coverage ratio as the ratio between (i) and (ii) attributable to interest rate movements.
 - v. Calculate the vega coverage ratio as the ratio between (i) and (ii) attributable to implied volatility movements.
 - vi. To support the company's choice of a low value of E, the company should be able to demonstrate that the delta and rho coverage ratios are both within close range of 100 % (e.g., 80–125%) consistently across the back-testing period.
 - vii. In addition, the company should be able to demonstrate that the vega coverage ratio is within close range of 100 % in order to use the prevailing implied volatility levels as of the valuation date in quantifying the fair value of the hedged item for the purpose of calculating CTE70 (best efforts). Otherwise, the company shall quantify the fair value of the hedged item for the purpose of calculating CTE70 (best efforts) in a manner consistent with the realized volatility of the scenarios captured in the CTE (best efforts).
- c. Companies that do not model hedge cash flows explicitly, but that also do not use the implicit method as outlined in Section 9.C.6.b above, shall conduct the formal back-test in a manner that allows the company to clearly illustrate the appropriateness of the selected method for reflecting the cost and benefit of hedging, as well as the value used for E.
7. A company that does not have 12 months of experience to date shall set E to a value that reflects the amount of experience available, and the degree and nature of any change to the hedge program. For a material change in strategy, with no history, E should be at least 0.50. However, E may be lower than 0.50 if some reliable experience is available and/or if the change in strategy is a refinement rather than a substantial change in strategy.

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily large (e.g., $\geq 50\%$) for substantial changes in hedge methodology (e.g., moving from a fair-value based strategy to a stop-loss strategy) where the company has not been able to provide a meaningful simulation of hedge performance based on the new strategy.
- A temporary moderate increase (e.g., 15–30%) in error factor should be used for substantial modifications to hedge programs or modeling where meaningful simulation has not been created (e.g., adding second-order hedging, such as gamma or rate convexity).
- No increase in the error factor may be used for incremental modifications to the hedge strategy (e.g., adding death benefits to a program that previously covered only living benefits, or moving from swaps to Treasury Department futures).

D. Specific Considerations and Requirements

1. As part of the process of choosing a methodology and assumptions for estimating the future effectiveness of the current hedging strategy (including currently held hedge positions) for

purposes of reducing the stochastic reserve, the company should review actual historical hedging effectiveness. The company shall evaluate the appropriateness of the assumptions on future trading, transaction costs, other elements of the model, the strategy, the mix of business and other items that are likely to result in materially adverse results. This includes an analysis of model assumptions that, when combined with the reliance on the hedging strategy, are likely to result in adverse results relative to those modeled. The parameters and assumptions shall be adjusted (based on testing contingent on the strategy used and other assumptions) to levels that fully reflect the risk based on historical ranges and foreseeable future ranges of the assumptions and parameters. If this is not possible by parameter adjustment, the model shall be modified to reflect them at either anticipated experience or adverse estimates of the parameters.

2. A discontinuous hedging strategy is a hedging strategy where the relationships between the sensitivities to equity markets and interest rates (commonly referred to as the Greeks) associated with the guaranteed contract holder options embedded in the fixed indexed annuities and other in-scope products and these same sensitivities associated with the hedging assets are subject to material discontinuities. This includes, but is not limited to, a hedging strategy where material hedging assets will be obtained when the fixed indexed annuity account balances reach a predetermined level in relationship to the guarantees. Any hedging strategy, including a delta hedging strategy, can be a discontinuous hedging strategy if implementation of the strategy permits material discontinuities between the sensitivities to equity markets and interest rates associated with the guaranteed contract holder options embedded in the fixed indexed annuities and other in-scope products and these same sensitivities associated with the hedging assets. There may be scenarios that are particularly costly to discontinuous hedging strategies, especially where those result in large discontinuous changes in sensitivities (Greeks) associated with the hedging assets. Where discontinuous hedging strategies contribute materially to a reduction in the stochastic reserve, the company must evaluate the interaction of future trigger definitions and the discontinuous hedging strategy, in addition to the items mentioned in the previous paragraph. This includes an analysis of model assumptions that, when combined with the reliance on the discontinuous hedging strategy, may result in adverse results relative to those modeled.
3. A strategy that has a strong dependence on acquiring hedging assets at specific times that depend on specific values of an index or other market indicators may not be implemented as precisely as planned.
4. The combination of elements of the stochastic cash-flow model—including the initial actual market asset prices, prices for trading at future dates, transaction costs and other assumptions—should be analyzed by the company as to whether the stochastic cash-flow model permits hedging strategies that make money in some scenarios without losing a reasonable amount in some other scenarios. This includes, but is not limited to:
 - a. Hedging strategies with no initial investment that never lose money in any scenario and in some scenarios make money.
 - b. Hedging strategies that, with a given amount of initial money, never make less than accumulation at the one-period risk-free rates in any scenario but make more than this in one or more scenarios.
5. If the stochastic cash-flow model allows for such situations, the company should be satisfied that the results do not materially rely directly or indirectly on the use of such strategies. If the results do materially rely directly or indirectly on the use of such strategies, the strategies may not be used to reduce the stochastic reserve otherwise calculated.

6. In addition to the above, the method used to determine prices of financial instruments for trading in scenarios should be compared to actual initial market prices. In addition to comparisons to initial market prices, there should be testing of the pricing models that are used to determine subsequent prices when scenarios involve trading financial instruments. This testing should consider historical relationships. For example, if a method is used where recent volatility in the scenario is one of the determinants of prices for trading in that scenario, then that model should approximate actual historic prices in similar circumstances in history.

Section 10: Guidance and Requirements for Setting Contract Holder Behavior Prudent Estimate Assumptions

A. General

Contract holder behavior assumptions encompass actions such as lapses, withdrawals, transfers, recurring deposits, benefit utilization, option election, etc. Contract holder behavior is difficult to predict accurately, and variance in behavior assumptions can significantly affect the results. In the absence of relevant and fully credible empirical data, the company should set behavior assumptions as guided by Principle 3 in Section 1.B.

In setting behavior assumptions, the company should examine, but not be limited by, the following considerations:

1. Behavior can vary by product, market, distribution channel, index performance, interest credited (current and guaranteed rates), time/product duration, etc.
2. Options embedded in the product may affect behavior.
3. Utilization of options may be elective or non-elective in nature. Living benefits often are elective, and death benefit options are generally non-elective.
4. Elective contract holder options may be more driven by economic conditions than non-elective options.
5. As the value of a product option increases, there is an increased likelihood that contract holders will behave in a manner that maximizes their financial interest (e.g., lower lapses, higher benefit utilization, etc.).
6. Behavior formulas may have both rational and irrational components (irrational behavior is defined as situations where some contract holders may not always act in their best financial interest). The rational component should be dynamic, but the concept of rationality need not be interpreted in strict financial terms and might change over time in response to observed trends in contract holder behavior based on increased or decreased financial efficiency in exercising their contractual options.
7. Options that are ancillary to the primary product features may not be significant drivers of behavior. Whether an option is ancillary to the primary product features depends on many things, such as:
 - a. For what purpose was the product purchased?
 - b. Is the option elective or non-elective?
 - c. Is the value of the option well-known?
8. External influences may affect behavior.

B. Aggregate vs. Individual Margins

1. Prudent estimate assumptions are developed by applying a margin for uncertainty to the anticipated experience assumption. The issue of whether the level of the margin applied to the anticipated experience assumption is determined in aggregate or independently for each and every behavior assumption is discussed in Principle 3 in Section 1.B.

2. Although this principle discusses the concept of determining the level of margins in aggregate, it notes that the application of this concept shall be guided by evolving practice and expanding knowledge. From a practical standpoint, it may not always be possible to completely apply this concept to determine the level of margins in aggregate for all behavior assumptions.
3. Therefore, the company shall determine prudent estimate assumptions independently for each behavior (e.g., mortality, lapses and benefit utilization), using the requirements and guidance in this section and throughout these requirements, unless the company can demonstrate that an appropriate method was used to determine the level of margin in aggregate for two or more behaviors.

C. Sensitivity Testing

The impact of behavior can vary by product, time period, etc. For any assumption that is not prescribed or stochastically modeled, the qualified actuary to whom responsibility for this group of contracts is assigned shall use sensitivity testing to ensure that the assumption is set at the conservative end of the plausible range. The company shall sensitivity test:

- Surrenders.
- Partial withdrawals.
- Benefit utilization.
- Other behavior assumptions if relevant to the risks in the product.

Sensitivity testing of assumptions is required and shall be more complex than, for example, base lapse assumption plus or minus X% across all contracts. A more appropriate sensitivity test in this example might be to devise parameters in a dynamic lapse formula to reflect more out-of-the-money contracts lapsing and/or more holders of in-the-money contracts persisting and eventually using the guarantee. The company should apply more caution in setting assumptions for behaviors where testing suggests that stochastic modeling results are sensitive to small changes in such assumptions. For such sensitive behaviors, the company shall use higher margins when the underlying experience is less than fully relevant and credible.

The company shall examine the results of sensitivity testing to understand the materiality of prudent estimate assumptions on the modeled reserve. The company shall update the sensitivity tests periodically as appropriate, considering the materiality of the results of the tests. The company may update the tests less frequently when the tests show less sensitivity of the modeled reserve to changes in the assumptions being tested or the experience is not changing rapidly. Providing there is no material impact on the results of the sensitivity testing, the company may perform sensitivity testing:

1. Using samples of the contracts in force rather than performing the entire valuation for each alternative assumption set.
2. Using data from prior periods.

D. Specific Considerations and Requirements

1. Within materiality considerations, the company should consider all relevant forms of contract holder behavior and persistency, including, but not limited to, the following:

- a. Mortality (additional guidance and requirements regarding mortality is contained in Section 11).
- b. Surrenders.
- c. Partial withdrawals (systematic and elective).
- d. Account transfers (switching/exchanges).
- e. Resets/ratchets of the guaranteed amounts (automatic and elective).
- f. Future deposits.
- g. Income start date
- h. Commutation of benefit (from periodic payment to lump sum)

2. It may be acceptable to ignore certain items that might otherwise be explicitly modeled in an ideal world, particularly if the inclusion of such items reduces the calculated provisions.

For example:

- a. The impact of account transfers (intra-contract index “switching”) might be ignored, unless required under the terms of the contract (e.g., automatic asset re-allocation/rebalancing,) or if the contract provisions incentivize the contract holders to transfer between accounts.
 - b. Future deposits might be excluded from the model, unless required by the terms of the contracts under consideration and then only in such cases where future premiums can reasonably be anticipated (e.g., with respect to timing and amount).
 - c. For some non-elective benefits (nursing home benefits for example), a zero incidence rate after the surrender charge has ended, or the cash value has depleted, may be acceptable since use of a non-zero rate could reduce the modeled reserve.
3. However, the company should exercise caution in assuming that current behavior will be indefinitely maintained. For example, it might be appropriate to test the impact of a shifting asset mix and/or consider future deposits to the extent they can reasonably be anticipated and increase the calculated amounts.
 4. Normally, the underlying model assumptions would differ according to the attributes of the contract being valued. This would typically mean that contract holder behavior and persistency may be expected to vary according to such characteristics as (this is not an exhaustive list):
 - a. Gender.
 - b. Attained age.
 - c. Issue age.
 - d. Contract duration.
 - e. Time to maturity.

- f. Tax status.
 - g. Account value.
 - h. Interest credited (current and guaranteed).
 - i. Available indices.
 - j. Guaranteed benefit amounts.
 - k. Surrender charges, transfer fees or other contract charges.
 - l. Distribution channel.
5. Unless there is clear evidence to the contrary, behavior assumptions should be no less conservative than past experience. Margins for contract holder behavior assumptions shall assume, without relevant and credible experience or clear evidence to the contrary, that contract holders' efficiency will increase over time.
 6. In determining contract holder behavior assumptions, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience), whether or not the segment is directly written by the company. If data from a similar business segment are used, the assumption shall be adjusted to reflect differences between the two segments. Margins shall reflect the data uncertainty associated with using data from a similar but not identical business segment.
 7. Where relevant and fully credible empirical data do not exist for a given contract holder behavior assumption, the company shall set the contract holder behavior assumption to reflect the increased uncertainty such that the contract holder behavior assumption is shifted towards the conservative end of the plausible range of expected experience that serves to increase the stochastic reserve. If there are no relevant data, the company shall set the contract holder behavior assumption to reflect the increased uncertainty such that the contract holder behavior assumption is at the conservative end of the range. Such adjustments shall be consistent with the definition of prudent estimate, with the principles described in Section 1.B, and with the guidance and requirements in this section.
 8. Ideally, contract holder behavior would be modeled dynamically according to the simulated economic environment and/or other conditions. It is important to note, however, that contract holder behavior should neither assume that all contract holders act with 100% efficiency in a financially rational manner nor assume that contract holders will always act irrationally. These extreme assumptions may be used for modeling efficiency if the result is more conservative.

E. Dynamic Assumptions

1. Consistent with the concept of prudent estimate assumptions described earlier, the liability model should incorporate margins for uncertainty for all risk factors that are not dynamic (i.e., the non-scenario tested assumptions) and are assumed not to vary according to the financial interest of the contract holder.
2. The company should exercise care in using static assumptions when it would be more natural and reasonable to use a dynamic model or other scenario-dependent formulation for behavior. With due regard to considerations of materiality and practicality, the use of

dynamic models is encouraged, but not mandatory. Risk factors that are not scenario tested but could reasonably be expected to vary according to a stochastic process, or future states of the world (especially in response to economic drivers) may require higher margins and/or signal a need for higher margins for certain other assumptions.

3. Risk factors that are modeled dynamically should encompass the plausible range of behavior consistent with the economic scenarios and other variables in the model, including the non-scenario tested assumptions. The company shall test the sensitivity of results to understand the materiality of making alternate assumptions and follow the guidance discussed above on setting assumptions for sensitive behaviors.

F. Consistency with the CTE Level

1. All behaviors (i.e., dynamic, formulaic and non-scenario tested) should be consistent with the scenarios used in the CTE calculations (generally, the top 30% of the loss distribution). To maintain such consistency, it is not necessary to iterate (i.e., successive runs of the model) in order to determine exactly which scenario results are included in the CTE measure. Rather, in light of the products being valued, the company should be mindful of the general characteristics of those scenarios likely to represent the tail of the loss distribution and consequently use prudent estimate assumptions for behavior that are reasonable and appropriate in such scenarios. For fixed annuities, these “valuation” scenarios would typically display one or more of the following attributes:
 - a. Declining and/or volatile index values, where applicable.
 - b. Price gaps and/or liquidity constraints.
 - c. Rapidly changing interest rates or persistently low interest rates.
 - d. Volatile credit spreads.
2. The behavior assumptions should be logical and consistent both individually and in aggregate, especially in the scenarios that govern the results. In other words, the company should not set behavior assumptions in isolation, but give due consideration to other elements of the model. The interdependence of assumptions (particularly those governing customer behaviors) makes this task difficult and by definition requires professional judgment, but it is important that the model risk factors and assumptions:
 - a. Remain logically and internally consistent across the scenarios tested.
 - b. Represent plausible outcomes.
 - c. Lead to appropriate, but not excessive, asset requirements.
4. The company should remember that the continuum of “plausibility” should not be confined or constrained to the outcomes and events exhibited by historic experience.
5. Companies should attempt to track experience for all assumptions that materially affect their risk profiles by collecting and maintaining the data required to conduct credible and meaningful studies of contract holder behavior.

G. Additional Considerations and Requirements for Assumptions Applicable to Guaranteed Living Benefits

Experience for contracts without guaranteed living benefits may be of limited use in setting a lapse assumption for contracts with in-the-money or at-the-money guaranteed living benefits. Such experience may only be used if it is appropriate (e.g., lapse experience on contracts without a living benefit may have relevance to the early durations of contracts with living benefits) and relevant to the business.

H. Policy Loans

If policy loans are applicable for the block of business, the company shall determine cash flows for each projection interval for policy loan assets by modeling existing loan balances either explicitly or by substituting assets that are a proxy for policy loans (e.g., bonds, cash, etc.) subject to the following:

1. If the company substitutes assets that are a proxy for policy loans, the company must demonstrate that such substitution:
 - a. Produces reserves that are no less than those that would be produced by modeling existing loan balances explicitly.
 - b. Complies with the contract holder behavior requirements stated in Section 10 above in this section.
2. If the company models policy loans explicitly, the company shall:
 - a. Treat policy loan activity as an aspect of contract holder behavior and subject to the requirements above in this section.
 - b. Assign loan balances either to exactly match each policy's utilization or to reflect average utilization over a model segment or sub-segments.
 - c. Model policy loan interest in a manner consistent with policy provisions and with the scenario. Include interest paid in cash as a positive policy loan cash flow in that projection interval, but do not include interest added to the loan balance as a policy loan cash flow. (The increased balance will require increased repayment cash flows in future projection intervals.)
 - d. Model policy loan principal repayments, including those that occur automatically upon death or surrender. Include policy loan principal repayments as a positive policy loan cash flow, per Section 4.A.1.h.
 - e. Model additional policy loan principal. Include additional policy loan principal as a negative policy loan cash flow, per Section 4.A.1.h (but do not include interest added to the loan balance as a negative policy loan cash flow).
 - f. Model any investment expenses allocated to policy loans and include them either with policy loan cash flows or insurance expense cash flows.

I. Non-Guaranteed Elements

Consistent with the definition in VM-01, Non-Guaranteed Elements (NGEs) are elements within a contract that affect policy costs or values and not guaranteed or not determined at issue. NGEs consist of elements affecting contract holder costs or values that are both established and subject to change at the discretion of the insurer.

Examples of NGEs specific to fixed annuities include but are not limited to the following: fixed credited rates, index parameters (caps, spreads, participation rates, etc.), rider fees, rider benefit features being subject to change (rollup rates, rollup period, etc.), account value charges, and dividends under participating policies or contracts.

1. Except as noted below in Section 10.J.5, the company shall include NGE in the models to project future cash flows beyond the time the company has authorized their payment or crediting.
2. The projected NGE shall reflect factors that include, but are not limited to, the following (not all of these factors will necessarily be present in all situations):
 - a. The nature of contractual guarantees.
 - b. The company's past NGE practices and established NGE policies.
 - c. The timing of any change in NGE relative to the date of recognition of a change in experience.
 - d. The benefits and risks to the company of continuing to authorize NGE.
3. Projected NGE shall be established based on projected experience consistent with how actual NGE are determined.
4. Projected levels of NGE in the cash-flow model must be consistent with the experience assumptions used in each scenario. Contract holder behavior assumptions in the model must be consistent with the NGE assumed in the model.
5. The company may exclude any portion of an NGE that:
 - a. Is not based on some aspect of the policy's or contract's experience.
 - b. Is authorized by the board of directors and documented in the board minutes, where the documentation includes the amount of the NGE that arises from other sources.

However, if the board has guaranteed a portion of the NGE into the future, the company must model that amount. In other words, the company cannot exclude from its model any NGE that the board has guaranteed for future years, even if it could have otherwise excluded them, based on this subsection.
6. The liability for contract holder dividends declared but not yet paid that has been established according to statutory accounting principles as of the valuation date is reported separately from the statutory reserve. The contract holder dividends that give rise to this dividend liability as of the valuation date may or may not be included in the cash-flow model at the company's option.
 - a. If the contract holder dividends that give rise to the dividend liability are not included in the cash-flow model, then no adjustment is needed to the resulting aggregate stochastic reserve.
 - b. If the contract holder dividends that give rise to the dividend liability are included in the cash-flow model, then the resulting aggregate stochastic reserve should be reduced by the amount of the dividend liability.
7. All projected cash flows associated with NGEs shall reflect margins for adverse deviations and estimation error in prudent estimate assumptions.

Section 11: Guidance and Requirements for Setting Prudent Estimate Mortality Assumptions

A. Overview

1. Intent

The guidance and requirements in this section apply to setting prudent estimate mortality assumptions when determining the stochastic reserve. The intent is for prudent estimate mortality assumptions to be based on facts, circumstances and appropriate actuarial practice, with only a limited role for unsupported actuarial judgment. (Where more than one approach to appropriate actuarial practice exists, the company should select the practice that the company deems most appropriate under the circumstances.)

2. Description

Prudent estimate mortality assumptions shall be determined by first developing expected mortality curves based on either available experience or published tables. Where necessary, margins shall be applied to the experience to reflect data uncertainty. The expected mortality curves shall then be adjusted based on the credibility of the experience used to determine the expected mortality curve. Section 11.B addresses guidance and requirements for determining expected mortality curves, and Section 11.C addresses guidance and requirements for adjusting the expected mortality curves to determine prudent estimate mortality.

Finally, the credibility-adjusted tables shall be adjusted for mortality improvement (where such adjustment is permitted or required) using the guidance and requirements in Section 11.D.

3. Business Segments

For purposes of setting prudent estimate mortality assumptions, the products falling under the scope of these requirements shall be grouped into business segments with different mortality assumptions. The grouping, at a minimum, should differentiate between payout annuities or deferred annuity contracts that contain GLBs, and deferred annuity contracts with no guaranteed benefits or only GMDBs. Where appropriate, the grouping should also differentiate between segments which are known or expected to contain contract holders with sociodemographic, geographic, or health factors reasonably expected to impact the mortality assumptions for the segment (e.g., annuitants drawn from different countries, geographic areas, industry groups, or impaired lives on individually underwritten contracts such as structured settlements). The grouping should also generally follow the pricing, marketing, management and/or reinsurance programs of the company.

Guidance Note: This paragraph contemplates situations where it may be appropriate to differentiate mortality assumptions by segment or even by contract due to varying sociodemographic, geographic, or health factors. Particularly, though not exclusively, in the context of group payout annuity contracts, companies may have credible, contract-specific mortality experience data or relevant pooled data from annuitants drawn from similar industries or geographies that may be used to sub-divide inforce blocks into business segments for purposes of setting prudent estimate mortality assumptions.

For example, a company may sell group PRT contracts both to union plans in the U.S. and to private single-employer plans in another country. While both are “PRT contracts,” it would be appropriate to differentiate them for mortality assumption purposes, similar to

how payout annuities vs. deferred annuities are distinguished.

Guidance Note: Distinct mortality or liability assumptions among different contracts within a group of contracts does not in itself preclude the group of contracts from being aggregated for the purposes of the broader stochastic reserve calculation.

4. Margin for Data Uncertainty

The expected mortality curves that are determined in Section 11.B may need to include a margin for data uncertainty. The margin could be in the form of an increase or a decrease in mortality, depending on the business segment under consideration. The margin shall be applied in a direction (i.e., increase or decrease in mortality) that results in a higher reserve. A sensitivity test may be needed to determine the appropriate direction of the provision for uncertainty to mortality. The test could be a prior year mortality sensitivity analysis of the business segment or an examination of current representative cells of the segment.

For purposes of this section, if mortality must be increased (decreased) to provide for uncertainty, the business segment is referred to as a plus (minus) segment.

It may be necessary, because of a change in the mortality risk profile of the segment, to reclassify a business segment from a plus (minus) segment to a minus (plus) segment to the extent compliance with this section requires such a reclassification. For example, a segment could require reclassification depending on whether it is gross or net of reinsurance.

B. Determination of Expected Mortality Curves

1. Experience Data

In determining expected mortality curves, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience). See Section 11.B.2. for additional considerations. Finally, if there is no data, the company shall use the applicable table, as required in Section 11.B.3.

2. Data Other Than Direct Experience

Adjustments shall be applied to the data to reflect differences between the business segments, and margins shall be applied to the adjusted expected mortality curves to reflect the data uncertainty associated with using data from a similar but not identical business segment.

To the extent the mortality of a business segment is reinsured, any mortality charges that are consistent with the company's own pricing and applicable to a substantial portion of the mortality risk also may be a reasonable starting point for the determination of the company's expected mortality curves.

3. No Data Requirements

- i. When little or no experience or information is available on a business segment, the company shall use expected mortality curves that would produce expected deaths no less than:

- a. [2021 SOA Deferred Annuity Mortality Table] with [Projection Scale G2] for individual deferred annuities that do not contain guaranteed living benefits

$$q_x^{20XX+n} = q_x^{20XX}(1 - G2_x)^n$$
