RE: NCCI Examination Report

The examination of the National Council on Compensation Insurance (NCCI) has been completed. This letter accompanies your copy of the examination report and executive summary. This examination was performed by Milliman and Robertson with Arthur Andersen as primary subcontractor under the supervision of the participating insurance departments (Florida, Maine, Nebraska and Utah) and through the coordination of the NAIC. The exam began in late 1990 with an ultimate cost of \$3.2 million. In addition, substantial amounts of unbilled time were expended by the NCCI, participating departments and the NAIC. In short, it was a major undertaking.

Why did we undertake this examination? There were a number of reasons, including an anticipated conversion to loss costs, but the primary reasons were:

1. Many regulators have expressed reservations concerning NCCI rate filings. We wanted to make certain that the data underlying these filings was accurate.
2. Workers' compensation rate filings are complex documents which most states only see once each year. A number of the ratemaking techniques contained therein are unique to workers' compensation and the NCCI is virtually the only entity which updates them.

How did we address these questions? The examination was divided into three sections:

- (a) Section I documented NCCI data handling and evaluated the quality of the data processed by the NCCI. The intent was to open the NCCI "black box" where company data was accumulated for use in rate filings. Company data was tracked from receipt by the NCCI through computer programs and manual processing to input for inclusion in NCCI rate filings and experience modification calculations.

- (b) Section II analyzed NCCI ratemaking methods. NCCI procedures and the assumptions underlying these procedures were analyzed and tested.
- (c) Section III analyzed the practical considerations in implementing a loss cost system for workers' compensation. The loss cost portion of the examination was completed and released last December.

How does this exam relate to the indicated handling of NCCI rate change requests? Most ratemaking criticisms and recommendations concern various adjustments and are to be expected in such a complex system. While such adjustments can have a minimal effect on overall rate level indications, this will not always be the case. The report criticisms and recommendations relating to data quality were substantially more fundamental, but no evidence was found to indicate that data handling weaknesses might result in biased rate level indications.

The following is a sampling of the findings of the examination:

1. NCCI data processing systems are poorly integrated and are not well documented. Excessive amounts of manual intervention are required and data quality and timeliness policies are not adequately defined and enforced. These system faults notwithstanding, the examination found NCCI data processing to be acceptably accurate, with no biases which should cause rate requests to be inflated. (The NCCI already has plans in motion to address many of these concerns.)
2. NCCI's ratemaking system has a number of areas in which it can be improved, but it still constitutes a sophisticated system which can generally be expected to produce reasonable loss projections.
3. Expense provisions in NCCI filings run to the high side, notably the provision for production expenses.
4. Until just recently, the NCCI utilized linear trending models. The experience period which was examined (1983 through 1988) involved unprecedented rates of increase for both medical and indemnity losses. As a result, linear trending, which tends to give lower trend estimates, did a generally poorer job of keeping up with these trends than would have been the result with an exponential trend model. The report finds that models using exponential trending are acceptable for use in workers' compensation, but this is a subject that is impossible to describe adequately in anything less than the full report.
5. Standard NCCI procedures ignore changes in experience rating off-balances, which can distort trends and rate-need indications. These distortions have tended to be downward in the recent past, but would appear to have a greater potential for upward distortions in the next few years.

These examples only hint at the scope of the exam and do nothing to demonstrate the degree of complexity involved. Many findings in the report, particularly those in the complex classification ratemaking and experience rating areas, are less than absolutely final. In some cases, a fairer characterization would be that research done during the examination provided a meaningful indication of the sorts of changes that would be beneficial, but it was agreed that further testing would be necessary before implementation would be prudent.

It is not possible to adequately cover the nature of these complications in an executive summary; hence it is particularly important that the entire portion

of the report dealing with a specific subject be studied before it forms the basis for regulatory action. How these items relate to the next rate request in a specific state will depend on many factors.

What didn't the examination cover? Major areas/questions not covered by the examination include:

- (a) Ratemaking: The examination did not address the proper assumptions for underwriting profit in NCCI manual rates. Upon request, the NCCI will provide documentation which seeks to demonstrate that a manual rate underwriting profit provision of 2.5% (sometimes 0%) will produce a reasonable return on capital after deviations and dividends have been considered. While the examining states were not convinced that the rates should permit insurers to earn a 2.5% underwriting profit, it does not necessarily follow that a 2.5% provision in manual rates (which are subject to deviations, dividends, and the like) would be improper. The exam did not cover investment income because of the move to loss costs, but it should also be noted that investment income and profitability have already been addressed extensively by many researchers, including the NAIC.
- (b) Data collection: Company data was not examined prior to its receipt by the NCCI. While a complete evaluation of workers' compensation data quality would require comparison of NCCI data to original company documents, this was an examination of the NCCI, not of its member companies. (In addition, audits of insurer data would have added greatly to the expense and the duration of the examination.) Generally, audits of insurer data should occur through individual financial and market conduct examinations.
- (c) Other areas: not covered related to NCCI performance in the application of experience rating, NCCI classification inspection services and NCCI administration of residual market mechanisms. Performance in these areas might be expected to vary among NCCI's various servicing offices and we are aware that a number of states have conducted examinations in these areas.

For a regulatory oversight group, this report will provide a blueprint for a cooperative effort with the NCCI to improve its data and ratemaking systems. The NAIC intends to establish such a group to oversee implementation of the consultants' recommendations. The NCCI has committed to such an effort. For individual insurance departments, this will represent the latest but not the final word on the subject of workers' compensation ratemaking. We urge that the appropriate staff within each department take the time to study the full report.

Should you have further questions with regard to this report, please contact either of the two casualty actuaries who acted as coordinators. Jim Watford's telephone number at the Florida Department is (904) 922-3146, extension 5368, and Alan Wickman's telephone number at the Nebraska Department is (402) 471-4646.

NCCI EXAM

NCCI COMMENTS

Section I: Data Collection and Data Quality

Summary and Conclusion

NCCI believes the exam to be a fair and accurate representation of NCCI's data collection and data quality processes and systems.

The findings of the exam, in summary, are that NCCI maintains high data quality throughout its systems and processes. However, NCCI's data processes are inefficient, and NCCI needs to strengthen the appropriate policies and procedures, along with accompanying internal systems changes, to effect improvements. NCCI has development initiatives in process or planned that are intended to resolve the major deficiencies of its current systems.

The exam's major findings are on the mark, and NCCI strongly supports the exam's major recommendations.

1) *Data Quality*

NCCI takes pride in maintaining quality data throughout its systems and as used in its ratemaking procedures. As expected, the exam confirmed that the data used in NCCI's ratemaking procedures accurately reflects the data submitted by insurers.

2) *Data quality and timeliness policies*

NCCI recognizes the need to strengthen and develop new policies on data quality and timeliness, and has been working closely with its member insurers to effect the necessary changes. These changes were not reviewed by the NAIC examiners as they were in progress during the exam, and were thus not within the exam scope. However, the examiners did acknowledge these initiatives and have cited instances where shortcomings they identified are intended to be addressed by these efforts. The Unit Report Control (URC), Unit Report Quality (URQ), Detailed Claim Information (DCI), and Policy Review initiatives all address data quality and timeliness, and include specific penalties for failure to comply.

3) *Data handling systems and procedures*

NCCI has long recognized the need to improve efficiency in working with data. NCCI also recognized there was no short-term "quick fix" solution; rather, sweeping changes were required to set the stage for the future, and these changes must be implemented while maintaining current high data quality. As above, the examiners cited NCCI's initiatives aimed at improving efficiency in working with its data, even though these projects were out of the scope of the exam.

The examiners noted that these findings are more applicable to WCSP systems than to aggregate ratemaking systems. The aggregate ratemaking process is the most important determinant of overall rate levels. While there remains a significant manual validation effort, this is by design, as actuaries examine the data for anomalies and deal directly with insurers supplying the data. NCCI's WCSP processing constitutes the bulk of its data validation efforts, and most improvement initiatives are focused in this area.

Several key components of NCCI's efficiency improvement efforts were completed during and shortly following the exam. The most important of these, the WCSP (unit report) database, positions NCCI to automate its unit report quality validations, link unit report data with corresponding policies, eliminate hard copy printouts of data and the associated files, and move its data validation efforts to the point of receipt of the data. With these changes, NCCI has not merely automated its data processes, but has and is re-engineering those processes to take advantage of modern data processing technology.

4) *Current NCCI initiatives*

The NAIC examiners appropriately cited NCCI's systems initiatives as they relate to their findings. NCCI believes this serves as an endorsement of its current improvement activities. Although the examiners did not review these initiatives in detail, they did, through an addendum to the exam contract, review the new DCI development project. NCCI used modern systems development techniques to develop this system, now in production. NCCI is pleased the DCI exam conclusions were positive, and that the examiners approve NCCI's systems development procedures. NCCI has used, and is using, these same techniques with all its systems development initiatives.

Priority Recommendations

NCCI agrees with and strongly supports the four priority recommendations of the NAIC examination. In fact, the recommendations serve to endorse the objectives and direction of most of NCCI's current initiatives. The following are NCCI's responses to the four priority recommendations.

1) *Clearly define data quality policies and standards*

NCCI is working with the industry to develop data policies that meet the needs of rating bureaus and insurers alike, while ensuring the right data are collected to maintain the long-term viability of the workers compensation insurance system. At the July 1991 meeting, NCCI's Board of Directors unanimously passed a resolution that directs staff in conjunction with appropriate Board committees to define unified data objectives, policies, and implementation plans. The following is an excerpt from this resolution:

NCCI recognizes the importance of information that is complete, accurate, and timely. Reliable information is fundamental to an equitable workers compensation system that provides for fairly priced services, effective reform when needed, and protection from fraud/profitteering.

In concert with the industry, NCCI has initiated several key programs to enhance the data that are collected, both in terms of comprehensiveness and quality; these programs include the expanded DCI format, the unit report control timeliness and quality projects, and NCCI's broadened policy review responsibilities. In addition, NCCI has initiated a number of internal projects, guided by the recently developed Enterprise Data Model, which will result in significant improvements to NCCI's data collection and access capabilities/efficiencies.

These policies will place primary responsibility for data verification and error correction with NCCI's data suppliers; insurance companies. NCCI has developed a proposed data integrity plan addressing six dimensions; completeness, quality, timeliness, assurance, efficiency, and accessibility. This plan will be presented to the NCCI Board for review in December 1991.

NCCI also supports the development of industry standards, and stands ready to work with the NAIC and industry representatives. NCCI believes the implementation of the Workers Compensation Data Monitoring (WCDM) program with the expanded DCI program can serve as a model to be applied to all other areas of data collection. This effort, undertaken to support the NAIC model data reporting regulation, was a successful first step toward industry-wide data quality policies and standards.

- 2) *Measure and report carrier and NCCI performance against those standards*
- 3) *Build effective incentives to achieve performance objectives*

Measurement and reporting of performance to standards is an essential element of WCDM. Data quality principles being developed with the unit report quality, unit report control timeliness, and the WCDM efforts will be applied to all data collection activities in the future.

Likewise, effective incentives are integral to the enforcement of standards and, as detailed in the following section, appropriate incentives are incorporated into existing and future programs.

- 4) *Build integrated systems which support policies and objectives*

The examiners recommended NCCI build integrated systems that support policies and objectives, and listed 10 specific systems initiatives that should be included in NCCI's systems plan. NCCI agrees, and as shown below, is already working on each.

NCCI has begun a comprehensive long-range systems planning process that includes an enterprise data model, a strategic information systems planning function, development of a tactical systems plan, and an overall "vision of the future" of how NCCI should operate. Several systems projects have been completed or are under way in building toward the plan. These initiatives will deliver on the recommendations in the NAIC examination.

- a) *NCCI should implement systems to track and control the due date and receipt of all information submitted by carriers*

Aggregate financial data submissions are controlled via independent sources such as insurance company financial statements and A.M. Best information on premium writings. Workers Compensation Statistical Plan (WCSP) data are controlled through the "unit report control" (URC) program, which now applies to all experience rated sized reports. URC is planned for extension to all WCSP data in 1992. Policies will be controlled through the "automated policy review" initiative, which will include a tracking mechanism similar to that used in URC to monitor policy renewals. DCI data are currently controlled via sample control forms and periodic cross-validation against aggregate claim information.

- b) *NCCI should develop an electronic data transfer mechanism for submission of data from the carriers to NCCI.*

NCCI's 1991 objectives include implementing electronic data interchange (EDI) with its member carriers. NCCI has an established electronic communications capability via the IBM Information Network, and is in a position to conduct bi-directional communications with its data suppliers.

NCCI is testing the ability to print reports at company sites, distribute information electronically, and accept data submissions via the network. NCCI has already established a product (the DCI edit package) which includes options for electronic updates of edit tables via the network.

- c) *NCCI should develop data validation software and distribute it to carriers.*

NCCI has had the "financial calls on disk" product available for more than two years, which provides suppliers of aggregate financial information with a PC-based data validation package. The DCI edit package has been developed and is in production; this provides suppliers of detailed claim information with on-site data validation edits. The "unit report quality" project is under way; a principal component of this effort is to deliver an edit package for suppliers of WCSP data in late 1992.

- d) *NCCI should develop systems which validate all data at the time of receipt.*

Aggregate financial data, policy data, and DCI data have always been validated at the point of receipt. Policy data validations are being expanded significantly through the automated policy review effort. The new "unit report system" (URS), installed in production in August, 1991, now provides the capability to centralize all WCSP data validation on receipt. The "unit report quality" effort will implement those front-end edits and place the burden of correction of WCSP data on the data suppliers.

- e) *NCCI should develop systems which provide regular carrier performance reporting.*

The DCI system includes carrier performance reports. The "automated policy review" effort will deliver comprehensive edits, automated criticism of data failing edits, automated follow up for corrections, and performance reports for carriers. The "unit report quality" project will deliver comprehensive edits, follow-up, and performance reports for WCSP data quality. The "unit report control" system, in production now, delivers performance reports for WCSP submission timeliness.

- f) *NCCI should develop systems which support consistent, effective financial incentive programs to encourage carrier compliance with timeliness and quality standards.*

Financial incentive programs are now in place for many types of data: aggregate financial data, WCSP timeliness, DCI data quality, WCSP electronic submission, and policy electronic submission. Some of these incentive programs are credits for early reporting or for using electronic formats. Others are penalties for late reporting or for data failing edits. As the "unit report control" and "unit report quality" systems take effect, they will establish a standard in how NCCI will implement financial incentive programs consistently across all areas.

- g) NCCI should develop an integrated corporate database.**

The construction of the WCSP database as an integral part of NCCI's "unit report system" is the final cornerstone to an integrated corporate database. NCCI's policy database, WCSP database, and related databases for residual market, DCI, and other insured-related information may now be linked at the insured level. A "risk information system" project is now underway to create this linkage and integrate these key databases.

- h) NCCI should re-engineer and automate many of its current manually intensive areas.**

The construction of the WCSP database, and the installation of the "risk information system" are the keys to this objective. Much of NCCI's manually intensive operations are in data validation (which will be automated via "unit report quality", "automated policy review," and "automated auditing") and document filing and handling (which are planned for automation via database storage and image processing). NCCI now has several "effectiveness projects" under way, each focusing on specific business areas with the objective of streamlining operations and improving efficiency.

- i) NCCI should explore alternatives and decide upon an appropriate identification number for insured businesses.**

NCCI is now exploring these options, which are an integral part of its plans for the "risk information system." NCCI plans to establish positive identification for all data, where it now maintains risk identification only for experience rated insureds. NCCI is researching the federal employee identification number as an alternative to an internally-generated NCCI number, but either will meet its needs. Furthermore, NCCI is designing its systems to avoid requiring submission of an identification number from data suppliers except where absolutely necessary.

- j) NCCI should implement more stringent controls over its end user computing environments. NCCI should move stable, regularly executed end user applications into a production environment.**

A new end user computing policy has been developed, to be administered by Information Resources (data processing). The policy calls for strict controls over system availability, documentation, backup and recovery, and program change control for key business systems. These controls will be similar to those established and proven for NCCI's mainframe production systems.

The examiners also recommended NCCI use modern software engineering techniques, follow a structured systems development methodology and use consistent documentation standards for development of new systems.

Since 1985, NCCI has used the Spectrum systems development lifecycle methodology, which provides a structured development method and requires appropriate levels of documentation. In addition, NCCI has maintained a "standards and procedures" committee and manual. A change control area monitors all new and enhanced systems prior to placing them in production. NCCI's new Detailed Claim Information system, reviewed in this examination, is an example of how systems are developed at NCCI. Furthermore, NCCI is now implementing more modern tools and techniques, including an on-line time management and project status reporting tool, PC-based project management tools, sophisticated code generation software, and a new systems development methodology using modern information engineering techniques.

Section II: Ratemaking Procedures

Summary and Conclusion

NCCI is pleased with the overall tone of the report, since it validates the thrust of NCCI's current rate making methodology. No major errors were found. All actuarial principles have been followed. A careful reading of all the reports leads to the conclusion that for the areas studied, NCCI has asked for reasonable rate levels. NCCI will follow up on the areas for which further research is recommended.

Milliman & Robertson, Inc. did not find any significant deficiencies in the NCCI actuarial area. In particular there are no elements of the M&R report that would lead to the conclusion that the NCCI has asked for rate indications that are too high. Indeed, after reading the report, the conclusion would be that NCCI has understated the rate level need over the past few years.

In particular, three areas were identified in which there is the possibility of aggregate rate level inaccuracy: trend, loss development and expenses. Both trend and loss development have, by M&R's analysis, been understated by NCCI. The underestimate, for an average state, could be in the range of 10 percent to 20 percent. The only area of overestimation was expenses. In particular, production expense and general expense provisions may have been overstated between 2 percent to 4 percent.

NCCI had already moved to implement several of the recommendations. The M&R report recommends the use of exponential trend for medical costs. For indemnity losses, the M&R results, while not conclusive, tend to favor exponential trend. Over the past year, NCCI has been moving to use exponential trend where appropriate.

In the area of loss development, NCCI has been analyzing additional methods as part of the standard procedure. The M&R report recommends the combination of two procedures as showing promise. NCCI will continue to investigate all methods, and use the most appropriate method or combination of methods. In particular, NCCI agrees with the M&R finding that all methods tended to understate the ultimate losses. Our concern remains that all methods, including the M&R proposed methods, will still underestimate ultimate losses.

In the area of expenses, NCCI will continue to analyze their recommendations. In the past, most expense provisions were calculated on a net premium basis. We have recently begun to review all expenses on a direct premium basis, as recommendations suggest. Also, as indicated in the report, the inclusion of stock and mutual company data will not materially change the indicated general expense provision.

There are many areas where the current NCCI procedure was examined as part of the RFP, and found acceptable. For example, the area of law amendments was, by the conclusion on page 13 of the summary, found to yield satisfactory results.

Another area of approval was the alternate exposure base, which has been a very controversial item in the past. The conclusion on page 13 states that while no single exposure base is ideal, the current method of unlimited payroll appears to be the most reasonable compromise between theoretical and practical considerations for most insureds. A possible alternate method for a very restricted number of cases is proposed; NCCI will investigate and move to implementation if feasible.

The revised experience rating plan (RERP) was found to perform better than the prior rating plan. While an alternate experience rating formula was tested, it showed no material improvement over NCCI's RERP.

There are a substantial number of recommendations included in the report. The majority of them are to be implemented if additional testing by NCCI for more states and time periods substantiates the results of the limited testing which M & R was able to perform. We endorse performing the indicated further testing to determine the appropriateness of the recommendations. The following are NCCI's responses to the specific recommendations.

Section II-B Part 1: Premium and Loss Development Factors

It is important to mention that for the time period studied, the report showed conclusively that all the loss development methodologies on average, understated ultimate losses by approximately 10 percent for indemnity losses and approximately 4 percent for medical losses. Thus total losses on average were understated by approximately 8 percent. We believe the conditions that led to this understatement of ultimate losses still hold today in workers compensation. While the report acknowledges that a trended loss development factor would have produced more accurate results during the time period studied, it implies that proof is needed that the trend will continue in order to utilize trended factors. NCCI strongly believes that when a strong trend is recognizable in the historical factors, trended loss development factors are warranted and lead to a more accurate prediction of ultimate losses.

"That future NCCI filings develop projections of ultimate trended loss ratios based on the latest two or three policy years or the latest two or three policy and accident years."

Although this recommendation was not tested in the report, it seems reasonable. Due to the lengthening of the trend period, care would have to be taken to make sure that the accurate rate level is achieved. The report also discusses a variable weighting system when using more than one year of experience. NCCI believes an equal weighting system has the benefit of not being subject to any subjective criteria, which probably tends to outweigh the advantages of variable weights.

"That an average of the ultimate losses resulting from paid and paid plus outstanding projection methods be used as the primary basis for the rate indications."

Although there is no testing in the report to support this procedure and the resulting formula seems fairly arbitrary, the suggestion is not unreasonable. The report does endorse deviations from the primary methodology if it is felt that a more accurate result can be achieved.

"That NCCI expand the diagnostic tests to enhance their ability to analyze loss development patterns."

NCCI agrees that more tests are needed and will do more research to determine which ones will be most useful.

"The collection of additional claim count data for use in diagnostic tests of loss development."

NCCI agrees that this data would be useful as an additional diagnostic tool.

"That NCCI also utilize tail factors based on paid losses and paid plus outstanding losses."

The report is very complimentary regarding NCCI's current procedure for calculating tail factors; saying that NCCI makes best use of available incurred loss data. While the suggested method is an interesting idea, it is not tested in the report to make sure that it works as well as the present formula.

"That NCCI review at least four years of premium development factors, and that a three year average be used as the standard procedure."

NCCI strongly agrees with this recommendation and will implement early next year with rate levels that utilize 12/91 data.

"The adjustment of calendar year earned premium to current rate level does not take into account the contributions to calendar year premium arising from audit adjustments to older policy years."

NCCI agrees that this is an idea worth pursuing and is already investigating what modification to make to the present procedure.

Section II-B Part 2: Expenses

"NCCI expense provisions have overstated the amount of expenses incurred by the companies."

For calendar years 1987-1989, actual general expenses were one-half percent to 1 percent lower than the provision in the rates. Total market actual production expenses for stock companies were 2 percent to 3 percent lower than the provision in the rates. Based on the M&R analysis, 1.5 to 2.0 points of this difference may be explained by the lower commission levels in involuntary business and the remaining difference is due to 1) the expense gradations, and 2) the fact that some stock companies use the non-stock premium discount table.

M&R acknowledges that negative underwriting results may have reduced the amount of commission rates or contingent commissions paid to agents. M&R also states that the "relatively dramatic decline in commission rates during the last five years may reverse itself if underwriting results improve and the residual market is depopulated."

In addition to the M&R points, NCCI believes negotiated commissions on larger accounts result in lower actual commissions.

"To the extent that verifiable trends are apparent, NCCI should reflect them."

NCCI has not reflected trends in the calculation of expense provisions in the past. Recognition of trends would tend to decrease the general expense provision and increase the loss adjustment expense provision.

"NCCI compares general expense to net earned premium. We recommend that NCCI compare general expenses to direct earned premium."

NCCI agrees with this recommendation. The 1991 review of general expenses based on 1990 data used both direct general expenses as a ratio to direct earned premium and net general expenses as a ratio to net earned premium. Both methods produced similar results.

"NCCI should combine the expense experience of stock and mutual companies in establishing general expense indications. Based on recent experience this is not expected to have a material impact on the selected expense provisions."

NCCI agrees with this recommendation. For the past two years, NCCI has reviewed the general expenses of stock and mutual companies individually.

"The expense study by size of risk should incorporate all production expenses (i.e., commission brokerage and other acquisition expenses) in order to determine the appropriateness of the expense gradations."

The NCCI expense by size of risk call included other acquisition expenses but not commissions and brokerages. The Actuarial Committee did not approve the inclusion of commissions and brokerage in previous calls.

"We recommend that NCCI review production expenses annually, as it does for other expenses, in establishing production expense provisions."

The NCCI annual review of production expenses shows that a 15 percent provision in voluntary rates is appropriate for stock companies.

"We recommend that NCCI rely on the special call data (direct experience) by accident year in establishing the LAE provision. Based on reviewing the special call data, a LAE provision between 12 percent and 12.5 percent is indicated."

NCCI believes that a provision of at least 12.5 percent of losses is indicated, based upon the recent special call data (direct experience).

"We recommend that NCCI collect Allocated Loss Adjustment Expense (ALAE) experience by claim and that ALAE be treated like losses for ratemaking purposes."

NCCI agrees with this recommendation. We are currently in the process of working with NCCI committees and other rating bureaus to finalize a definition of ALAE and potential changes to the Workers Compensation Statistical Plan.

"We recommend that loss costs include ALAE and ULAE where not prohibited by statute or regulation."

NCCI agrees with this recommendation. This is NCCI's current procedure.

"The NAIC RFP asked M&R to address the following question -- 'Should expense loadings for an individual state be tempered when that state experiences a rate increase larger than the countrywide average?' While we concluded that tempering is not appropriate, the analysis led to valuable research in the area of state-specific

expense levels ... The following factors suggest that tempering expenses is not appropriate and that the current NCCI procedure is appropriate.

- "1. If expenses are reflected correctly on a countrywide basis, any adjustment for large rate increases will result in an inadequate countrywide expense provision.*
- "2. The downward trend in general expense, noted above, is due in part to the level of rate increases implemented in the past.*
- "3. If rates are deficient over a period of time, it is likely that expenses are also deficient.*
- "4. There are a number of factors to mediate the expense impact of a large rate increase in a state including the fact that more than 40 percent of the premium is from multi-state risks and the majority of the countrywide premium is generated from risks subject to the premium discount tables."*

NCCI agrees with this recommendation.

"NCCI data suggest that there are variations from state to state and we recommend that additional research be performed to determine the appropriateness of varying expense levels by state."

NCCI agrees that additional research is necessary. However, based on M&R's survey of 16 companies, 13 of the 16 companies allocate general expenses based on earned or written premium. Therefore, it appears it will be difficult to determine actual differences by state.

Section II-B Part 3: Trend

NCCI endorses the major recommendations included in the NAIC Trend report. As the report shows, the move from linear to exponential trend, which NCCI instituted in 1990, represents a significant improvement in ratemaking methodology. The testing included in the report for the time period studied, showed, on average, linear trend understated medical losses by more than 11 percent, while indemnity losses were understated by more than 5 percent. Thus, total losses for this time period were underestimated by approximately 8 percent. This testing showed that even the exponential trend underestimated medical losses by approximately 5 percent. NCCI strongly believes the conditions that held for the time period used in the testing still hold today, and the use of exponential trends will lead to more accurate (and adequate) rate level indications.

Other recommendations included in the report were:

"That adjustments be made to the lengths of the trend periods to reflect distributions of premium writings by month."

NCCI agrees that this represents an improvement over present procedure and will implement beginning early next year with rate level calculations using 12/91 data.

"That, when sufficient claim count data are available, NCCI perform tests of the projection accuracy of frequency and severity trends."

NCCI agrees the availability of this data would represent a significant improvement in our ratemaking tools.

"That projection accuracy may be improved through the use of double exponential smoothing."

NCCI believes this is an idea that deserves further investigation, although there is concern that the selection of the smoothing constant necessary in this approach leaves NCCI open to criticism of being overly subjective.

"That NCCI consider extending the experience period to seven or eight years"-

NCCI believes this is a suggestion worth pursuing and, in fact, has begun to do some research to determine what the optimum number of years should be.

"That NCCI move toward the adoption of a Bayesian Credibility approach."

Although this was not tested at all in the report, NCCI believes Bayesian Credibility is a very reasonable approach, and is committed to testing it in the future to see if it is an improvement over our current procedure. This testing will include looking into the use of a "volume plus a constant" technique that is discussed in the report.

"That NCCI perform extensive analysis of econometric models."

NCCI is in favor of the use of economic analysis in ratemaking and, in 1991, has reinstated an economic research unit that will concentrating on econometric modeling.

"Further analysis of historical experience to evaluate which benefit changes have tended to have a predictable impact on trend."

The report is generally complimentary regarding NCCI's procedures for recognizing the impact of major benefit changes (including medical fee schedules) on trend. If anything, the report implies NCCI has assumed that many benefit changes will be more effective in lowering benefit costs than they actually turn out to be, thus overstating the downward impact on rates. NCCI is somewhat concerned regarding the suggestions in the report on how to categorize fee versus non-fee states. NCCI's current methodology has the advantage of being relatively objective in its implementation.

"That the alternative approach (adjustments for automatic benefit changes) be adopted."

NCCI agrees this modification to the benefit on-level calculation may be a slight theoretical improvement, but has strong practical concerns regarding the implications of joining the benefit component of the rate filing with the trend. The trend factor has been received by some people as controversial, while the benefit change has not.

Section II-B Part 4: Classification Ratemaking

Classification Ratemaking at NCCI distributes the overall rate level indication derived from aggregate financial data to three industry groups -- manufacturing, contracting and all other -- and then to the approximately 600 classifications. Therefore, Classification Ratemaking has no impact on the statewide indication. Recommendations and NCCI's responses follow.

"...none of the alternative number of years tested proved to generally provide more accurate identification of relative differences among industry groups than the others."

The current method of developing industry group differentials was found to be at least as good as any alternatives.

"Our tests indicated that increasing the length of the experience period ... from three to five years enhances the consistency of the ratemaking methodology... Furthermore, our accuracy tests, which were necessarily limited to first report for only one policy year and five states, suggest that this aspect of the ratemaking process would also improve with a longer experience period."

"We recognize the possibility, however, that the tests using other policy years, more mature data and other states may result in different conclusions."

NCCI is not opposed to using five years of data but we believe additional testing is necessary to provide sufficient proof this is a better predictor of class experience.

"The consistency tests reflect similar indications. This should not be surprising since the use of more years of experience automatically adds to the number of years necessary to completely replace the data in the methodology."

"This regional pure premium application generally showed small differences... There appears to be little evidence to support making any change in this direction at this time."

NCCI agrees.

"We tested several alternatives to NCCI's classification ratemaking credibility formulas. None of the alternatives tested proved to be generally more accurate or more consistent in identifying relative cost differences than the current formula."

NCCI agrees.

"None of our alternatives to the current loss limitations proved to significantly improve upon the current methodology."

NCCI is considering using a loss limit based on the State Reference Point used in the Revised Experience Rating Plan. Milliman and Robertson agrees with this, having found nominal improvement from a lowering of the current loss limit to a similar value. The more losses are limited, the increased importance of distributing the excess.

"An apparent inconsistency of loss limits used in the various components of the partial pure premiums."

NCCI has implemented a change in the classification ratemaking procedure to correct the inconsistency in the three partial pure premiums. Given that the excess losses above the current limit represent 3 percent to 5 percent of total losses, the impact of this change will be minor. Within each industry group, classifications with high credibility, such as office workers, trucking, and restaurants, will receive a slight rate increase. Classification with low state and national credibility and therefore a high reliance on the current rate, will receive a slight decrease.

"NCCI should further examine the extent that classes have different expected losses in excess of the limitation contained in classification ratemaking data."

NCCI's current procedure treats excess losses as random events within each industry group. To the extent that classifications within the industry group have different excess losses expectations, for example proportional to other serious losses, NCCI will modify its procedure. This issue increases in importance if the loss limit is significantly reduced.

"...calculating separate trend factors by policy year makes the least difference of all tested alternatives in all but one state."

NCCI will implement separate trend factors by policy year.

"We reviewed the composition of the 'All Other' industry group. We recommend that NCCI further investigate subdividing this industry group into smaller, more homogeneous industry groups."

NCCI agrees to review subdividing the "All Other" industry groups into two or more smaller groups of classifications. This review will include input from the Underwriting Committee.

"...NCCI modify its (F classifications) procedure to reflect the effect of such trend."

NCCI will implement trend in F classifications.

Section II-B Part 5: Law Amendments

"For "formula" benefit changes, NCCI's pricing methodology seems to be working satisfactorily ("formula" benefit changes are those for which NCCI applies standard benefit tables and distributions in its cost evaluation)."

NCCI agrees with this conclusion. NCCI recognizes the need to update and refine the detailed pricing distributions. This activity has already begun to yield positive results in the form of an updated wage distribution and a distribution of medical procedures.

"In some non-formula situations, NCCI appears to apply formula techniques when those techniques are not appropriate. In other more recent cases, NCCI has applied new data sources and new estimation techniques. NCCI should improve the method of identifying law changes significant enough to require the use of "non-formula" techniques."

NCCI believes that the extent of misapplication of formula techniques is limited and does not reflect current practice and resource levels. We concur with the observation regarding non-formula techniques. An increased level of resources has been assigned to this function.

"NCCI should increase the utilization of state specific information regarding the workers compensation benefit system being analyzed."

The foundation for such refinements has already been established through the expansion of the Detailed Claim Information system to include additional data elements and to cover all states.

"NCCI should improve the explanatory material included with a benefit pricing report."

NCCI agrees additional explanatory material may be helpful. The large volume of supporting information required to determine the effect of the benefit change makes it unavoidably complex.

Section II-B Part 6: Alternative Exposure Base

"No single exposure base for workers compensation (or any other line of insurance) is ideal for all circumstances. A usable exposure base must balance theoretical and practical considerations."

NCCI clearly agrees with these and subsequent conclusions.

"Unlimited payroll appears to provide the most reasonable compromise between theoretical and practical considerations for most insureds."

Total payroll comes out substantially ahead for workers compensation as practical, always available, and verifiable.

"The introduction of the Revised Experience Rating Plan (RERP) will mitigate the premium inequities inherent in the current rating system for many insureds."

RERP is more responsive than the plan it replaced. The average high wage payer benefits from RERP.

"Residual inequity is most likely to exist for insureds with the following joint characteristics:

- "1) They are concentrated in classes with a wide range of verifiable average hourly wages.*
- "2) The wage variation has no logical relationship to occupational hazard specific to a given type of locale and activity.*
- "3) The insureds are either too small to qualify for or have low credibility under RERP.*

"The residual inequity can be further mitigated through a wage rate recognition plan limited to those classes with a demonstrated problem and with hours worked data readily available and verifiable."

NCCI agrees a study must first be done to demonstrate that any residual inequity exists. Also, hours-worked data must be verifiable. Milliman and Robertson states under Expense Impact that "The availability, quality, and verifiability of hours worked varies greatly by jurisdiction and type of employment."

Milliman and Robertson further cautions against use of wage rates for all classes of insureds:

"Such a universal change would provoke a largely unnecessary disturbance."

"There is no guarantee that such data would be available or meaningful at any cost to all insureds."

"The intent of this recommendation is to introduce wage rate differentials as a refinement of the classification system without creating new inequities or extraordinary expenses."

"It is intended to limit application of wage rate credits to employers where an identifiable problem may exist; e.g., the construction industry. This industry group has a high population of both union and non-union workers; the situation most likely to result in a residual inequity through the use of unlimited payroll."

NCCI agrees with the limited application notion, but has shown that construction workers do not necessarily have a demonstrated inequity. Higher wage earners, especially in unions, have greater expectation from medical care, more access to specialists and technology, and more knowledge of benefit programs. NCCI studies have shown that high wage earners have longer benefit durations.

Section II-B Part 7: Experience Rating Plan

"We have evaluated the accuracy of the Revised Experience Rating Plan, and find it to be more accurate, on average, than the Prior Experience Rating Plan it replaces."

"We conclude that the NCCI's method of introducing the RERP does not tend to result in a premium increase or decrease."

"There is evidence that the calculations resulting in ELR and D-ratios are appropriately checked and documented in NCCI files. Further, reasonable safeguards exist against manipulation of the data by the insured. Finally, the experience rating modification is calculated by computer, and a worksheet is produced showing the calculation and underlying data. This worksheet is sent to the carrier of record, and is made available to the insured and its agent or service provider."

M&R's testing of the Revised Experience Rating Plan (RERP) confirmed that this plan will perform better than the Prior Experience Rating Plan (PERP). The introduction of the new plan has not and will not result in significant changes to the overall premium level. Experience rating in general is fairly administered and well documented by NCCI.

"We have developed an Alternate Experience Rating Formula which directly incorporates primary losses as a predictor of future excess losses."

For risks with premiums between \$5,000 and \$500,000, RERP performed as well as the Alternate Plan. Since the premium for these risks is less likely to be modified by retrospective rating or some other large risk rating option, the performance of experience rating is of greater importance than that for the larger risks.

The Alternate Plan performs only marginally better than NCCI's RERP for risks with premiums over \$500,000.

"We conclude that if these recommended changes (to ELRs and D-ratios) are implemented and if ELRs are updated on a regular basis, any persistent off-balance that results will be due to real cost differences between experience rated risks and the average of all risks."

M&R suggests several improvements in the calculation of rating values that were not tested by M&R. Prior to the NAIC exam, NCCI had started projects addressing most of these improvements.

With adequate manual rates, NCCI's experience rating plan procedures will produce results with minimum off-balance.

"Based on our test results using the optimized RERP and Alternate Plan, it appears likely that the accuracy of the experience rating plan would be improved by expanding the experience period to five years from the current three years."

M&R's testing was limited to a relatively small number of states and they did not perform the test using NCCI's version of RERP or PERP which are the plans currently in use.

"Some policyholders already consider it inappropriate to use data as old as the oldest year currently used in experience rating..."

M&R recognized there are practical considerations against using 5 years of data.

"In addition to developing the Alternate formula, we have developed a technique for estimating the credibility parameter which best fit a given set of data."

NCCI believes the M&R technique could be used to supplement those developed for RERP. After a review of the M&R test results, it appears that the RERP credibility performs as well as the M&R credibility for risks with premium under \$500,000.

"If the decision is made to implement a CFCP (Claim Free Credit Plan), we recommend that NCCI estimate the indicated credits and debits using the method we have described...."

M&R recommends NCCI not implement CFCP for small risks that are not now subject to experience rating. NCCI agrees such a plan will result in rating inequities.

"The current split point of \$5,000 represents a reasonable compromise between minimizing 'linearization error' and maximizing the amount of data classified as primary."

NCCI agrees the current split point is reasonable and should be reviewed on a periodic basis.

"Reporting data (losses) in this way (net of deductibles) significantly complicates and degrades the application of an experience rating plan."

NCCI has been active in promoting the reporting of losses gross of any deductible. We have developed a prototype Deductible Experience Rating Formula (DERF) to be used only in the event that our efforts fail to achieve gross reporting.

Section II-B Part 8: Miscellaneous

"Minimum premium risks appear to have consistently worse loss ratios than all other risks."

"The expense provisions for small risks are moderately greater than their expense needs."

The report describes consistently worse loss ratios for minimum premium risks than other risks and an apparent slight redundancy of expense for very small risks. It should be noted that the loss ratio disparity for these risks (loss ratios more than 35 percent greater on average than those of all other risks) greatly overshadows the very slight redundancy indicated by M&R's analysis.

"Pricing of minimum premium risks should be governed by its practical effects rather than its actuarial significance."

It is NCCI's responsibility to file actuarially appropriate indications that will result in rates for all insureds that are adequate, not excessive, and not unfairly discriminatory. Any type of subsidization of one category of risks by another mandated by regulators should be identified.

"The potential future problem of double-counting adverse experience through a single set of experience modification plan parameters applied to both voluntary business and assigned risk business."

The current critical state of the residual market in terms of size and rate inadequacy should override any concerns regarding double-counting. M&R even states on pages 20-21 that:

"the overall impact of the current assigned risk plans was quite a bit less than the current assigned risk revenue shortfalls."

"At the present time, we would characterize the issue of potential double counting as a design consideration for future surcharge programs rather than as something likely to be a problem with current plans."

Furthermore, the report fails to highlight the fact that residual market differential indications are on a standard premium (i.e., after experience rating) basis. As a result, the extent to which experience mods are higher in the residual market has already been accounted for. Thus, residual market insureds on average would be paying the appropriate amount when the fully indicated differential is reflected.

In addition, NCCI notes there is justification for a uniform set of experience rating values beyond easier administration of the plan. There should be only one experience modification per insured, regardless of in which market the policy is written. This is an objective standard which can be interpreted consistently by all users of this information.

"We also recommend that NCCI strengthen the process for editing carriers' future calendar and policy year premium reports."

NCCI is investigating additional modifications to the present procedure.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Executive Summary

1. INTRODUCTION

This report presents the approach, findings and recommendations of the review of data collection and data quality at the National Council on Compensation Insurance (NCCI) performed by Arthur Andersen & Co. and Milliman & Robertson, Inc. It contains the written deliverables of Section I of the NAIC examination of NCCI.

Project Background

Milliman & Robertson, Inc. and Arthur Andersen & Co. performed an examination of the structure and operations of NCCI under the examination authorities of the Florida Department of Insurance, the Maine Bureau of Insurance, the Nebraska Department of Insurance and the Utah Department of Insurance. The National Association of Insurance Commissioners (NAIC) coordinated the activities of the four departments in administering the examination. The specific requirements and conditions of the examination are specified in the Request for Proposal for this project (included in the Appendix to Volume I).

The overall purpose of this examination was to evaluate the data collection and data handling activities of NCCI, certain aspects of its ratemaking activities and practical considerations involved in implementing a loss cost system.

The examination was conducted in three sections:

- I. Data Collection and Data Quality;
- II. Ratemaking Procedures; and
- III. Loss Cost Implementation.

Arthur Andersen & Co. had primary responsibility for Section I of the examination; Milliman & Robertson had primary responsibility for Sections II and III.

This executive summary provides an overview of Section I of the examination and outlines the contents of the Section I report.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Executive Summary

Section I Project Objectives

The primary objectives of Section I of the examination were to (1) document NCCI's data collection and data handling systems and procedures and (2) evaluate the quality of NCCI's systems, procedures and data.

Section I Project Scope

The scope of Section I of the examination included only systems and procedures currently used in ratemaking, experience rating and detailed claim information applications. It did not include systems which were in development during the examination. We have also provided comments on current NCCI development initiatives, where appropriate, but we have not formally examined systems in development.

Content and Structure of Section I Report

Our report for Section I of the examination is organized in three volumes:

- I. Overview of Findings and Recommendations;
- II. Description of Data Collection and Data Handling; and
- III. Evaluation of Data Collection and Data Quality.

Volume I includes: (1) this Executive Summary, which presents our approach, major findings and recommendations; (2) a very brief description of current NCCI data collection and handling systems and procedures (Overview of Section IA); (3) our evaluation of NCCI's data collection and data quality (Overview of Section IB); and (4) responses to eight questions concerning NCCI data collection and data quality from the NAIC Request for Proposal for this examination.

Volume II provides detailed documentation of the current NCCI systems and procedures which were within the scope of the examination.

Volume III contains a report on each functional area we examined within NCCI. Each report includes an overall evaluation of the area, a description of our evaluation approach, general observations and recommendations, and detailed findings and recommendations.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Executive Summary

2. EXAMINATION APPROACH

We conducted Section I of the examination in two phases:

- o Section IA: **Description of Data Collection and Data Handling Procedures; and**
- o Section IB: **Evaluation of Data Collection and Data Quality.**

Section IA

In Section IA of the examination, a team of Arthur Andersen and Milliman & Robertson personnel, with direct assistance from NCCI personnel, reviewed and documented the existing NCCI systems and procedures which were within the scope of the examination. We developed documentation of current systems in several forms:

- (1) An overview of current systems and procedures, which includes high-level descriptions and process flow diagrams of each major area;
- (2) Detailed data and process flow diagrams of existing systems and procedures;
- (3) Statistical call data documentation for selected calls, including a description of each call, NCCI edits performed on each data element in the call, error correction procedures and NCCI modifications to carrier data, and file documentation for key NCCI computerized data files containing call data; and
- (4) A computerized data dictionary, which cross-references data elements collected by NCCI with the NCCI computer programs which use them.

Items (1) through (3) are included in Volume II (and its Appendix) of this report. Item (4) was developed primarily to support our testing phase (Section IB) and is not included in this report.

Section IB

In Section IB of the examination, our team evaluated NCCI data collection, data handling and data quality. Our evaluation included statistical sampling of NCCI

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Executive Summary

data, detailed review of NCCI control procedures, and detailed review and analysis of NCCI's automated systems.

3. OVERVIEW OF NCCI FUNCTIONS

NCCI's stated mission is to provide information and services to support adequate rates and the long term viability of the workers compensation insurance system. NCCI's stated organizational objectives are to achieve adequate and equitable pricing and to facilitate workers compensation reform efforts.

NCCI pursues its objectives by collecting detailed financial and statistical data and using this data to produce rate filing proposals in each state in which NCCI is authorized to file rates. These rates, and the ultimate premiums charged for workers compensation coverage, are based on a three-tiered system.

Aggregate Ratemaking establishes overall rate level recommendations based on analysis of insurance company financial results. Carriers report their summarized annual results to NCCI on "financial calls". Rate levels derived from this information are the primary determinants of overall pricing, and form the basis of NCCI's filed rate change requests.

Class Ratemaking distributes the recommended overall rate change to the more than 600 individual rate classifications. These classifications are used to group insureds according to similar types of business and exposure to hazards. NCCI uses summarized exposure and loss results (unit reports) filed under the Workers Compensation Statistical Plan (WCSP) to accomplish this distribution.

Experience Rating develops factors which enable carriers to adjust an individual insured's premium. These factors reflect an insured's actual loss history relative to expected losses of insureds in the same rate classifications. As in Class Ratemaking, Experience Rating uses WCSP data, but at a detailed, insured level.

Other types of data collected by NCCI contribute to their mission. Policy data is used to assist in controlling the receipt of WCSP data and in combining WCSP data for experience rating. Detailed Claim Information (DCI) data is used to analyze the underlying factors that cause workers compensation results to change over time, and is used in proposing system reforms to control rising insurance costs.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Executive Summary

4. MAJOR FINDINGS

The major findings from Section I of our examination of NCCI may be grouped into four categories:

- 1) **Data quality:** Our findings indicate NCCI is accurately converting information received from insurers to NCCI electronic data files. We did not evaluate the quality of the data submitted by the insurers.
- 2) **Data quality and timeliness policies:** We found NCCI's data quality and timeliness policies require clarification and stronger enforcement. Current policies do not provide adequate incentives for carrier compliance.
- 3) **Data handling systems and procedures:** NCCI mission critical ratemaking and experience rating systems manage excessive hard copy input, lack integration, and perform minimal automated validation of data at the time of data capture. NCCI currently compensates through extensive manual intervention. The problems are less severe for aggregate ratemaking systems than for WCSP systems, largely due to the lower volumes of data processed for aggregate ratemaking and more timely validation of input.
- 4) **Current NCCI initiatives:** NCCI has development initiatives in process or planned which are intended to resolve the major deficiencies of its current systems. NCCI has planned a very aggressive schedule to implement these new systems. While we did not assess NCCI's progress in completing these projects, we believe NCCI's management is committed to achieving its systems development objectives.

These findings are discussed briefly on the following pages and presented in greater detail in Volume I, Overview of Section 1B, and Volume III of this report.

Data Quality

Our findings indicate NCCI is accurately converting information received from insurers to NCCI electronic data files. This finding is based on the results of our random statistical sampling and judgmental sampling of NCCI's key data files. Our detailed sampling results are presented in the Appendix to Volume III of this report and discussed in Volume I, Overview of Section 1B, and Volume I, Response to RFP Question 1.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Executive Summary

Our findings on NCCI data quality are limited by the scope of our study. We traced data in NCCI's computerized ratemaking, experience rating and detailed claim information files to input NCCI received from the insurers. We did not test the accuracy of the data submitted by the insurers.

Data Quality Policies

NCCI's data quality policies require clarification and stronger enforcement. NCCI's constitution and membership agreements provide very broad statements of data quality policies and responsibilities. Standards are currently defined and enforced for each of the major calls by the departments responsible for administering them. The effectiveness of current standards and enforcement varies greatly by department.

- o For the financial calls, data timeliness and accuracy standards are clearly defined but not effectively enforced.
- o Data timeliness and accuracy standards are less precisely defined for unit report data and no policy to impose fines for delinquent or inaccurate reports is yet in place. NCCI plans to assess fines for late or inaccurate unit reports beginning late in November, 1992.
- o NCCI's Data Administration procedures authorize NCCI staff to modify carrier data to correct certain types of unit report errors without carrier approval. The limits of this authority are not clearly defined.
- o NCCI does not have a consistent carrier performance measurement and reporting policy. In the case of financial calls, performance is measured, reported to the individual carriers, and used as a basis for assessing fines. For unit reports, carrier performance is measured, but current performance reporting does not provide an effective performance feedback mechanism.
- o NCCI's current monetary incentive programs do not provide effective incentives to improve carrier performance.
 - Under its Performance Evaluation Monetary Incentive Program (PEMIP), NCCI fines carriers for failure to meet clearly defined timeliness and accuracy standards for financial calls and credits carriers for early submission of financial calls. The fines do not appear to be large enough

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Executive Summary

to provide an effective monetary incentive to improve performance and are not imposed for failure to correct errors.

- Fines are not currently imposed for late or inaccurate unit reports.
- o NCCI does not accurately allocate error handling costs among the carriers.
 - NCCI does not currently measure the true cost of error handling for each carrier.
 - NCCI does not currently assess any penalties to cover the cost of handling errors in unit report data. NCCI plans to assess fines for late or inaccurate unit reports beginning in November, 1992.
 - Fines currently assessed for late or inaccurate financial calls are not adequate to cover the true costs of error handling.

The major consequence of the lack of clear data quality policies and enforcement at NCCI is that too much of the burden of ensuring data quality falls on NCCI, and too little on the carriers, agents and insureds. This results in a very inefficient data verification and error correction process and may not assure data quality. A potential additional consequence is inequitable distribution of processing costs among the carriers.

Current Data Handling Systems and Procedures

NCCI systems which support ratemaking and experience rating are the systems most critical to NCCI's mission. These systems have major shortcomings which include excessive reliance on hard copy input, lack of integration and minimal automated validation of data at the time of data capture. NCCI currently compensates for many of its systems shortcomings through extensive manual intervention.

System Architecture

Many of NCCI's systems reflect the outdated design techniques and development technology of the period in which they were developed. This is particularly true of the WCSP systems.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Executive Summary

- o Systems were designed to support narrow functions within departmental boundaries. Processes and data are duplicated across different functions, with little or no integration.
- o Many processes are only partially automated, require extensive manual intervention and rely upon paper inputs and outputs.
- o File structures in many systems support efficient batch processing but do not allow on-line access.
- o Application programs are poorly structured and undocumented, making modifications difficult.

These redundancies, lack of integration, barriers to access and poor structure create inefficiencies and inconsistencies throughout NCCI's systems.

Data Collection and Validation

NCCI's critical data inputs are the financial calls, used to determine overall rate levels, and the unit reports, used for class ratemaking and experience rating. Policy information will become increasingly important as NCCI begins to integrate its systems. Current NCCI systems which collect and validate these critical inputs provide incomplete control over data timeliness, completeness and accuracy. Manual procedures help compensate for system deficiencies, but the resulting process is very inefficient.

Data Collection

NCCI's current data collection systems and procedures do not effectively control the timeliness and completeness of data collected from carriers.

- o **The problem is most severe for unit report data. NCCI recently started phased implementation of the Unit Report Control (URC) system, which is ultimately intended to track all unit reports due, received and missing. Under the current schedule, this system is to be fully implemented by mid-1992.**
- o **NCCI has inadequate controls to ensure all carriers submit financial calls. The principal controls over data completeness are reasonableness tests,**

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Executive Summary

in which NCCI actuaries make year-to-year comparisons of data during aggregate ratemaking.

NCCI currently manages excessive amounts of hard copy input.

- o NCCI received approximately 1,200,000 hard copy unit cards in 1990.
- o All of this hard copy input requires data entry into NCCI's systems.
- o Unit reports received on hard copy are retained for three years in the field offices in hard copy form. Unit reports are also stored on microfilm.

Data Validation and Error Correction

NCCI's data validation and error correction systems provide incomplete validation, are poorly controlled and are very inefficient. These problems are most severe for WSCP systems and are largely the result of insufficient and ineffective automation. NCCI has several major systems development initiatives planned or in process which are intended to resolve many of the problems noted in these findings.

- o WSCP systems do not thoroughly validate data at the time of receipt.
- o Unit report validation for Class Ratemaking is a cumbersome, time consuming process which requires extensive manual effort.
- o NCCI's unit report data collection and verification systems allow entry of duplicate data.
- o There is no validation to verify that unit report data for a specific risk is consistent with policy specifications, risk inspections or previously submitted data.

End User Computing

Critical ratemaking applications are developed, maintained and controlled by actuarial personnel. These end user controlled applications do not have the degree of automated application control required of most production systems.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Executive Summary

In our control procedure tests of Overall Rate Level and Class Ratemaking end user computing applications, we did not find any errors which had resulted from weak controls. However, given the importance of end user computing to the NCCI's ratemaking process, NCCI is exposed to significant risk due to the lack of controls.

Current NCCI Initiatives

NCCI has development initiatives in process or planned which are intended to resolve the major deficiencies of its current systems. We have outlined some of the leading projects and their objectives below.

Systems Planning

NCCI's Enterprise Data Modeling (EDM) project is a key part of an ongoing Strategic Information Systems Planning effort. The stated objective of the EDM project is to define a strategic framework for designing and developing integrated systems.

The EDM report provides valuable analysis of NCCI's business functions and information requirements, and presents a very high-level model of applications and data. The EDM report also contains a very realistic assessment of NCCI's current systems. This assessment clearly acknowledges many of the major defects of NCCI's current systems.

The EDM report does not, however, present a clear vision of NCCI's future systems, a complete definition of an architecture upon which to build these systems, or a detailed data model. Additional steps are required, and NCCI has begun to take these steps.

NCCI's Information Resources management team is currently refining its vision of NCCI's future systems. They intend to present their vision and plans to achieve it to NCCI's Board of Directors in July 1991.

Systems Development

A number of systems development projects are planned or currently in process at NCCI. Four of these projects are intended to provide the core of NCCI's new information systems and provide a foundation for new ratemaking and experience rating systems.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Executive Summary

- o **URC** - The objective of the Unit Report Control (URC) system is to improve the timeliness and completeness of unit reporting.
- o **URQ** - The objectives of the Unit Report Quality (URQ) system are to provide "front end" data quality edits which validate unit report data immediately upon receipt and to provide an efficient correction process for errors.
- o **URS** - The objective of the Unit Report System (URS) is to provide an integrated unit report database to serve both experience rating and ratemaking applications.
- o **Risk Information System** - The objectives of the Risk Information System project are to develop a database that will contain risk information and establish linkages to all risk-related information in NCCI's systems.

Systems in development during the examination were beyond the scope of our project. Accordingly, we have not evaluated the designs or ongoing development of these initiatives. It is clear to us, however, that the projects noted above address NCCI's major systems deficiencies.

NCCI has planned a very aggressive schedule for implementing these new systems. By the end of 1992, NCCI plans to have designed and fully implemented seven new systems while continuing to support and enhance existing systems. Strong management, adequate resources, and effective training will be required for NCCI to succeed with its current plans.

End User Computing Standards

Recently, NCCI's Internal Audit department developed a set of guidelines for implementing new end user computing standards. NCCI executive management has approved these guidelines and development of new standards will begin soon. NCCI has not set a date for implementation of the new standards.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Executive Summary

5. PRIORITY RECOMMENDATIONS

Our detailed recommendations for each of the areas we examined are presented in Volume III of this report. They may be summarized in four major recommendations:

- 1) **Clearly define data quality policies and standards;**
- 2) **Measure and report carrier and NCCI performance against those standards;**
- 3) **Build effective incentives to achieve performance objectives; and**
- 4) **Build integrated systems which support policies and objectives.**

Clearly define data quality policies and standards.

NCCI Policy

NCCI needs a clear and unified policy on data collection and data quality. This policy should provide the overall framework within which NCCI collects and processes carrier data.

We recommend that NCCI adopt policies which place appropriate responsibility for data verification and error correction with the carriers, and sharply limit its own authority to modify carrier data. NCCI should reject data known to be in error and return it to carriers for correction. NCCI policies should also specify carrier and risk audit standards.

Industry Standards

For NCCI to be truly effective in the implementation of its data quality standards, comparable standards must be developed for carriers, agents and insureds. Every entity involved in developing data, transmitting data or processing data must be held to the same standards. The quality of data used to set rates is only as good as the weakest link in the chain.

We recommend that the NAIC, through the appropriate task force, develop a model Workers Compensation data quality regulation. The overall objective of this

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Executive Summary

regulation should be to promote consistent, timely and accurate data reporting by all parties.

Measure and report carrier and NCCI performance against the new standards.

NCCI should implement systems and procedures which measure timeliness and accuracy of carrier data reporting against very specific standards. NCCI should establish a program of regular carrier performance reporting.

NCCI should also implement systems and procedures which measure the timeliness and accuracy of its own processing.

Build effective incentives to achieve performance objectives.

The NAIC and NCCI must provide more powerful incentives for carriers to submit timely and accurate data and correct errors promptly. The model regulation noted above would be a strong first step. NCCI incentives to carriers should include mechanisms which provide an accurate allocation of NCCI's processing costs, including error handling costs, among the carriers.

Build integrated systems which support the new policies and objectives.

First, NCCI should complete and publish its Strategic Information Systems Plan. This document should provide clear direction for building systems which will support NCCI's strategic objectives. The plan should include a statement of objectives, an overall application architecture, system definitions for all mission-critical applications and an implementation schedule.

We believe the specific systems initiatives outlined below are essential to achieving NCCI's business objectives and should be included in NCCI's systems plan:

- 1) NCCI should implement systems to track and control the due date and receipt of all information submitted by carriers.
- 2) NCCI should develop an electronic data transfer mechanism for submission of data from the carriers to NCCI.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Executive Summary

- 3) NCCI should develop data validation software and distribute it to carriers.
- 4) NCCI should develop systems which validate all data at the time of receipt.
- 5) NCCI should develop systems which provide regular carrier performance reporting.
- 6) NCCI should develop systems which support consistent, effective financial incentive programs to encourage carrier compliance with timeliness and quality standards.
- 7) NCCI should develop an integrated corporate database.
- 8) NCCI should re-engineer and automate many of its current manually intensive areas.
- 9) NCCI should explore alternatives and decide upon an appropriate identification number for insured businesses.
- 10) NCCI should implement more stringent controls over its end user computing environments. NCCI should move stable, regularly executed end user applications into a production environment.

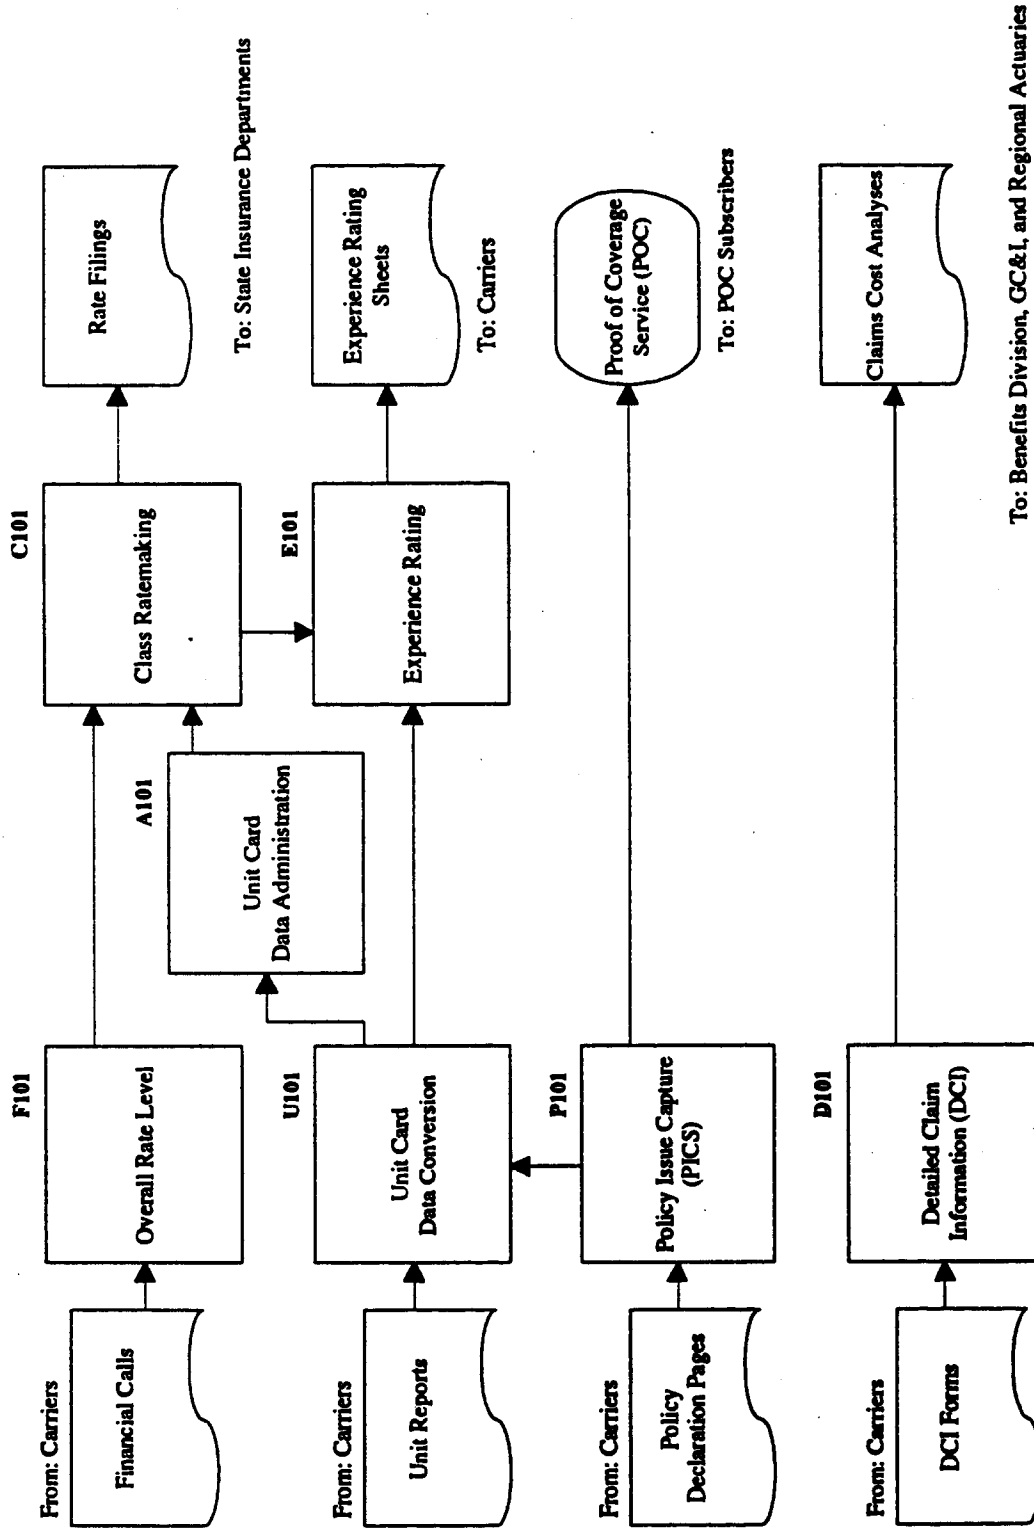

NCCI should use modern software engineering techniques, follow a structured systems development methodology and use consistent documentation standards for development of new systems. This approach will contribute to development productivity, system flexibility and maintainability.

NCCI's management supports these recommendations and has taken steps to implement them. NCCI plans to address these points in its response to this report.

OVERVIEW OF DATA COLLECTION AND DATA HANDLING PROCEDURES

This section of the report provides a high level overview of the data collection and data handling procedures at NCCI. The accompanying diagrams and text include four digit codes which reference more detailed diagrams in Volume II, Description of Data Collection and Data Handling Procedures. Readers who wish to review the detailed descriptions of NCCI procedures should refer to Volume II.

OVERVIEW OF DATA COLLECTION AND DATA HANDLING PROCEDURES

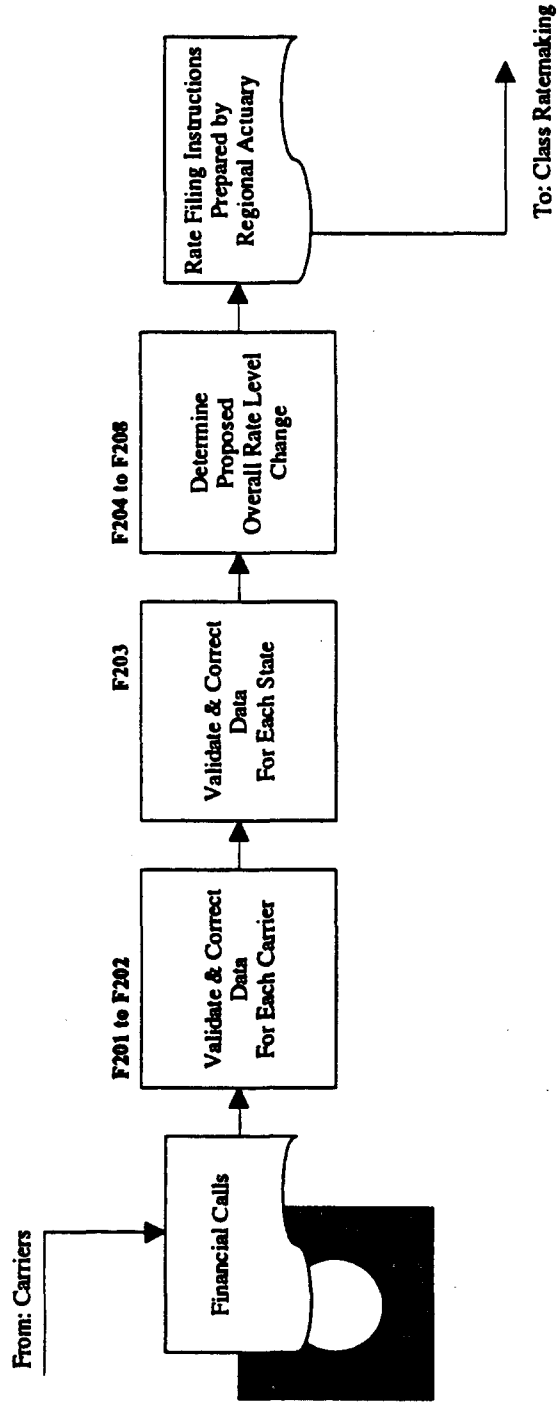

OVERVIEW OF DATA COLLECTION AND DATA HANDLING PROCEDURES

- F101:** NCCI receives aggregate premium and loss information from carriers on financial calls. This information is used to determine proposed overall rate level changes for each state.
- U101:** NCCI receives payroll, premium and loss information for specific policies from carriers on Unit Reports. This information is known as Workers Compensation Statistical Plan (WCSP) data.
- A101:** NCCI validates and summarizes WCSP data for use in ratemaking.
- C101:** NCCI uses summarized WCSP data and proposed overall rate level changes to determine proposed classification rate changes. NCCI distributes rate filings, indicating proposed overall rate levels and class rate levels, to state insurance departments. NCCI also determines key factors for use in producing experience ratings.
- E101:** NCCI validates WCSP data and key factors derived from WCSP data and uses them to calculate experience modification factors. NCCI distributes experience rating sheets indicating individual risks' historical loss experience and the resulting modification factors to insurance carriers.
- P101:** NCCI receives policy information from carriers on Policy Declaration Pages. This information is used to provide the Proof of Coverage (POC) service and to research WCSP data questions.
- D101:** NCCI receives detailed claim information (DCI) from carriers on standard forms. This information is used to analyze cost components and trends in workers compensation claims.

OVERVIEW OF DATA COLLECTION AND DATA HANDLING PROCEDURES

Overall Rate Level (F101)

OVERVIEW OF DATA COLLECTION AND DATA HANDLING PROCEDURES

Overall Rate Level (F101)

F201 to F202: NCCI clerical staff receive aggregate premium and loss information from carriers on financial calls. Carriers may submit this information on either hard copy documents or on microcomputer diskette. Overall Rate Level actuarial staff validate financial call submissions from each carrier for completeness, consistency and reasonableness. Actuarial staff resolve questions arising out of this validation process through contact with the carrier and make corrections as appropriate.

F203: Overall Rate Level actuarial staff extract the most recent aggregate premium and loss information for a state and combine it with two previous valuations of this information. Actuarial staff validate combined aggregate data for each state for completeness, consistency, and reasonableness. They resolve questions arising out of this validation through contact with carriers and make corrections as appropriate.

F204 to F208: Overall Rate Level actuarial staff use experience, development, and trend information to determine proposed overall rate level changes. An average of one policy year and one accident year are used to provide experience information. Three valuation dates (eg., 1988, 1989 and 1990) of loss and premium data are used to provide development information. Five policy years of data, valued as of the same date, are used to provide trend information. Overall rate level indications are forwarded to the appropriate Regional Actuary for analysis. The Regional Actuary then forwards the proposed overall rate level change to the Class Ratemaking area for use in calculating proposed class rate levels.

OVERVIEW OF DATA COLLECTION AND DATA HANDLING PROCEDURES

Unit Card Data Conversion (U101)

OVERVIEW OF DATA COLLECTION AND DATA HANDLING PROCEDURES

Unit Card Data Conversion (U101)

- U201 & U202:** Data Conversion clerical staff receive payroll, premium and loss information for specific policies from carriers on unit reports. Carriers may submit unit reports on either hard copy documents (unit cards) or magnetic tape. The information on unit reports is known as Workers Compensation Statistical Plan (WCSP) data.
- U203:** Data Conversion computer programs and Data Administration clerical staff identify WCSP data for experience rated policies through the use of a risk identification number (risk ID). Risk IDs uniquely identify all insured businesses subject to experience rating. NCCI uses the risk ID to associate WCSP policy experience with the proper insured business.
- U204:** Data Conversion clerical staff forward all WCSP data received to the Unit Card Data Administration area for eventual use in Class Ratemaking. Only WCSP data for experience rated risks is forwarded to the Experience Rating area.

OVERVIEW OF DATA COLLECTION AND DATA HANDLING PROCEDURES

Unit Card Data Administration (A101)

From: Unit Card
Data Conversion

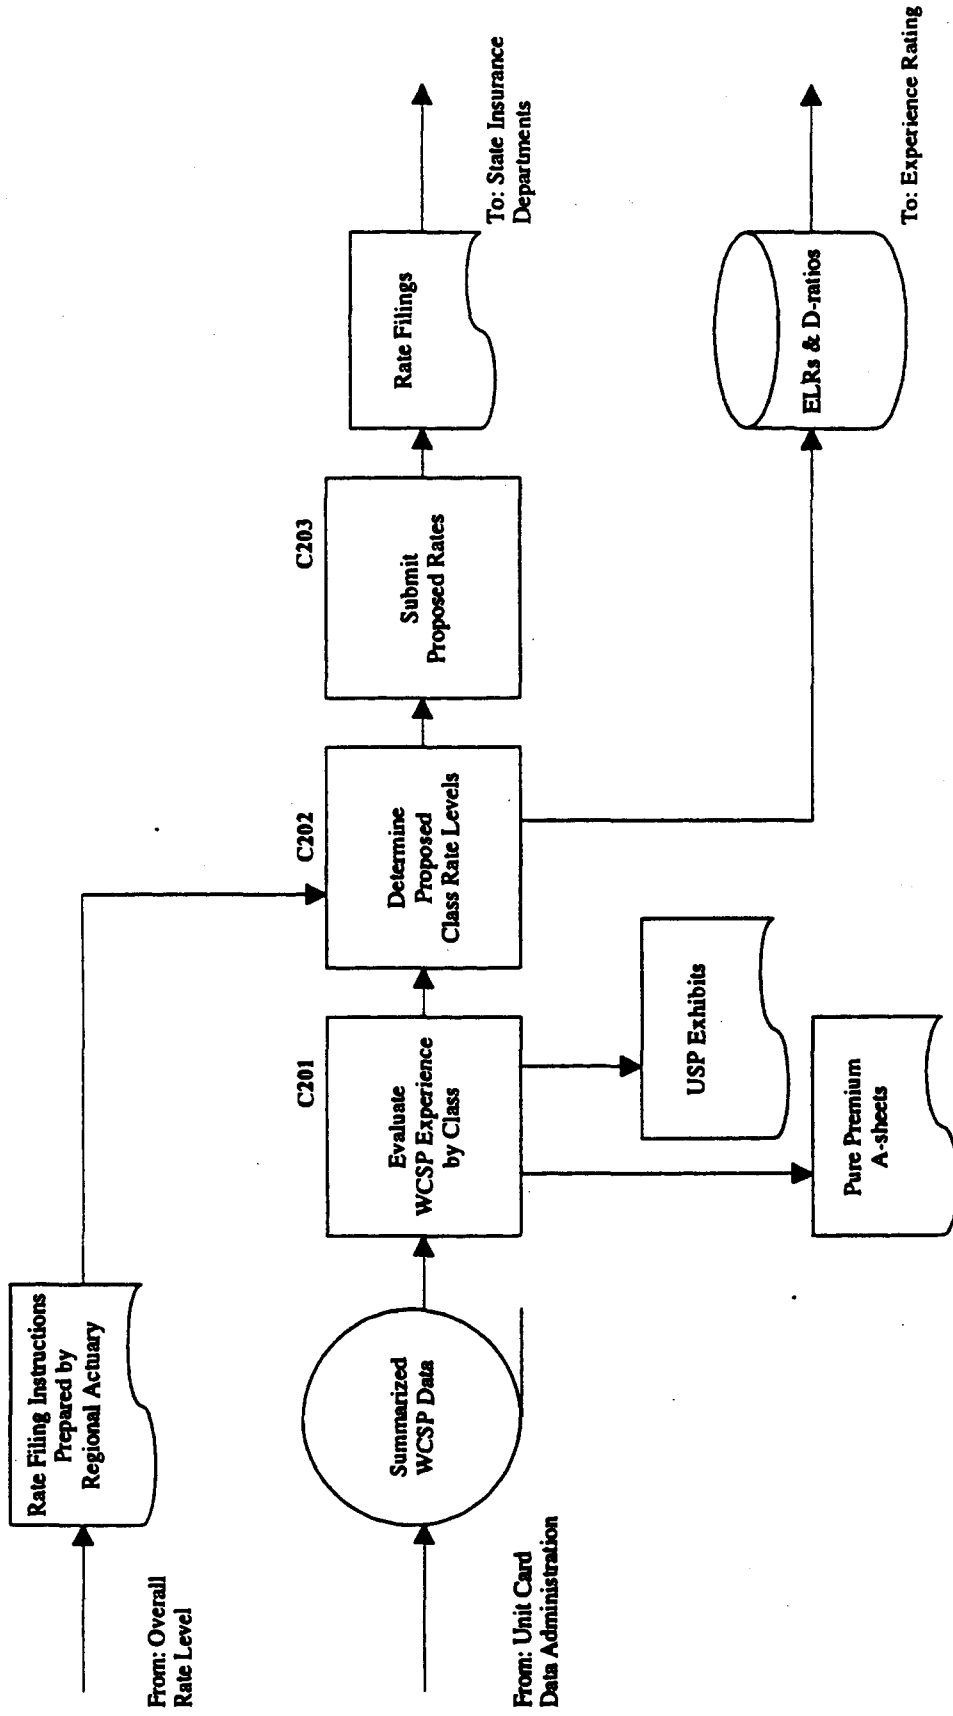

OVERVIEW OF DATA COLLECTION AND DATA HANDLING PROCEDURES

Unit Card Data Administration (A101)

- A201 to A203:** Data Administration clerical staff use automated applications to extract current year WCSP data for a state and combine it with data from the four previous years.
- A204:** Data Administration clerical staff use system generated error listings to validate five years of WCSP data for a state for completeness, reasonable loss development, reasonable payroll fluctuations by class, and to identify duplicate data. Clerical staff make corrections to WCSP data based on standard rules. In some cases, they will contact carriers to resolve WCSP data problems.
- A205:** Data Administration clerical staff execute automated applications to summarize WCSP data by payroll classification code. The summarized data is forwarded to the Class Rating area for use in determining proposed class rate levels.

OVERVIEW OF DATA COLLECTION AND DATA HANDLING PROCEDURES

Class Ratemaking (C101)

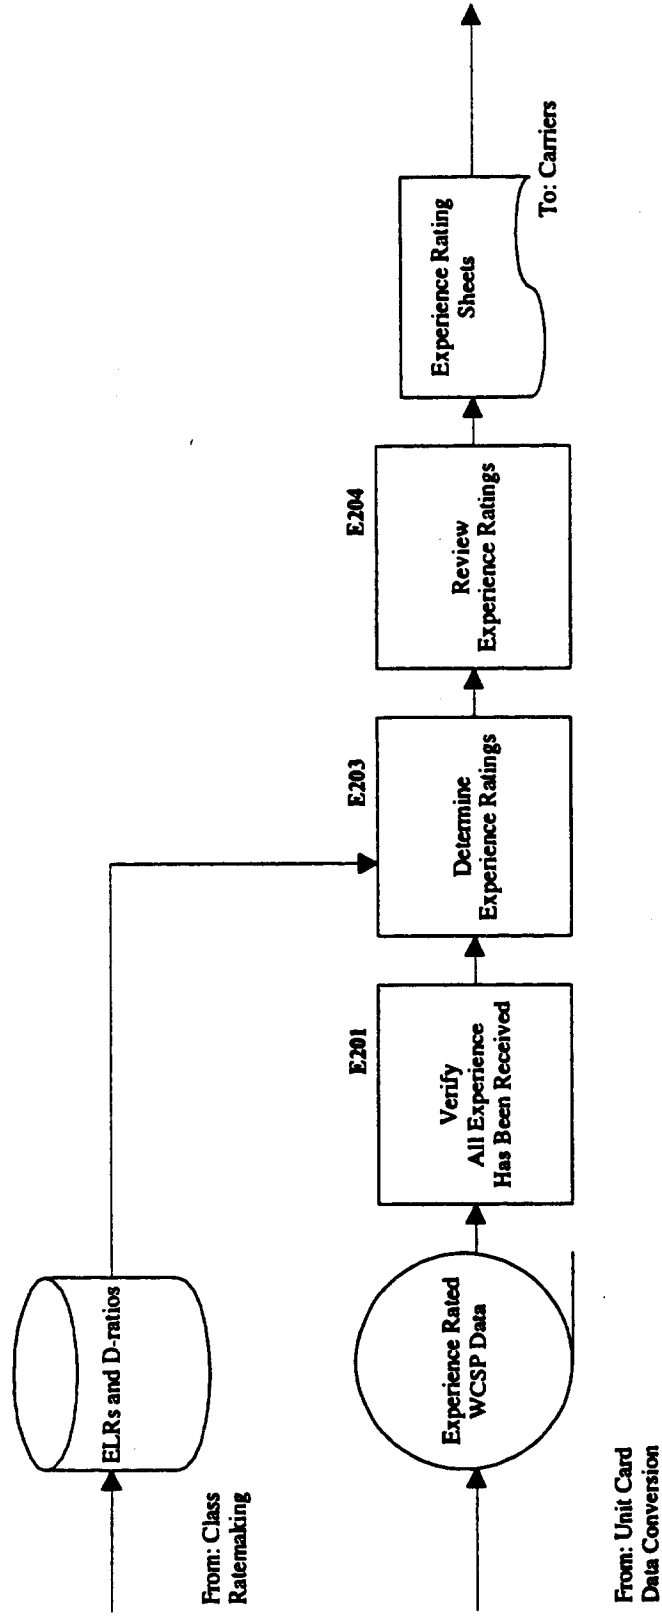

OVERVIEW OF DATA COLLECTION AND DATA HANDLING PROCEDURES

Class Ratemaking (C101)

- C201:** Class Ratemaking actuarial staff use three years of WCSP data, summarized by payroll classification, to evaluate pure premiums, and five years of summarized WCSP data to evaluate loss development. Loss trends are evaluated using trend factors provided by Overall Rate Level. A-sheets indicate pure premium required to cover current losses. USP Exhibits indicate trends and loss development.
- C202:** Class Ratemaking actuarial staff use proposed rate filing instructions from the Regional Actuary and information from A-sheets and USP Exhibits to determine the proposed class rate levels.
- Expected Loss Rates (ELRs) and D-ratios are also calculated at this time and, following rate filing approval, are forwarded to the Experience Rating area for use in calculating experience modification factors. ELRs indicate the expected losses for a classification per unit of exposure. D-ratios indicate the portion of those losses that are expected to be below a specified dollar threshold.
- C203:** NCCI submits proposed rate levels to State Insurance Departments in standard rate filing packages.

OVERVIEW OF DATA COLLECTION AND DATA HANDLING PROCEDURES

Experience Rating (E101)

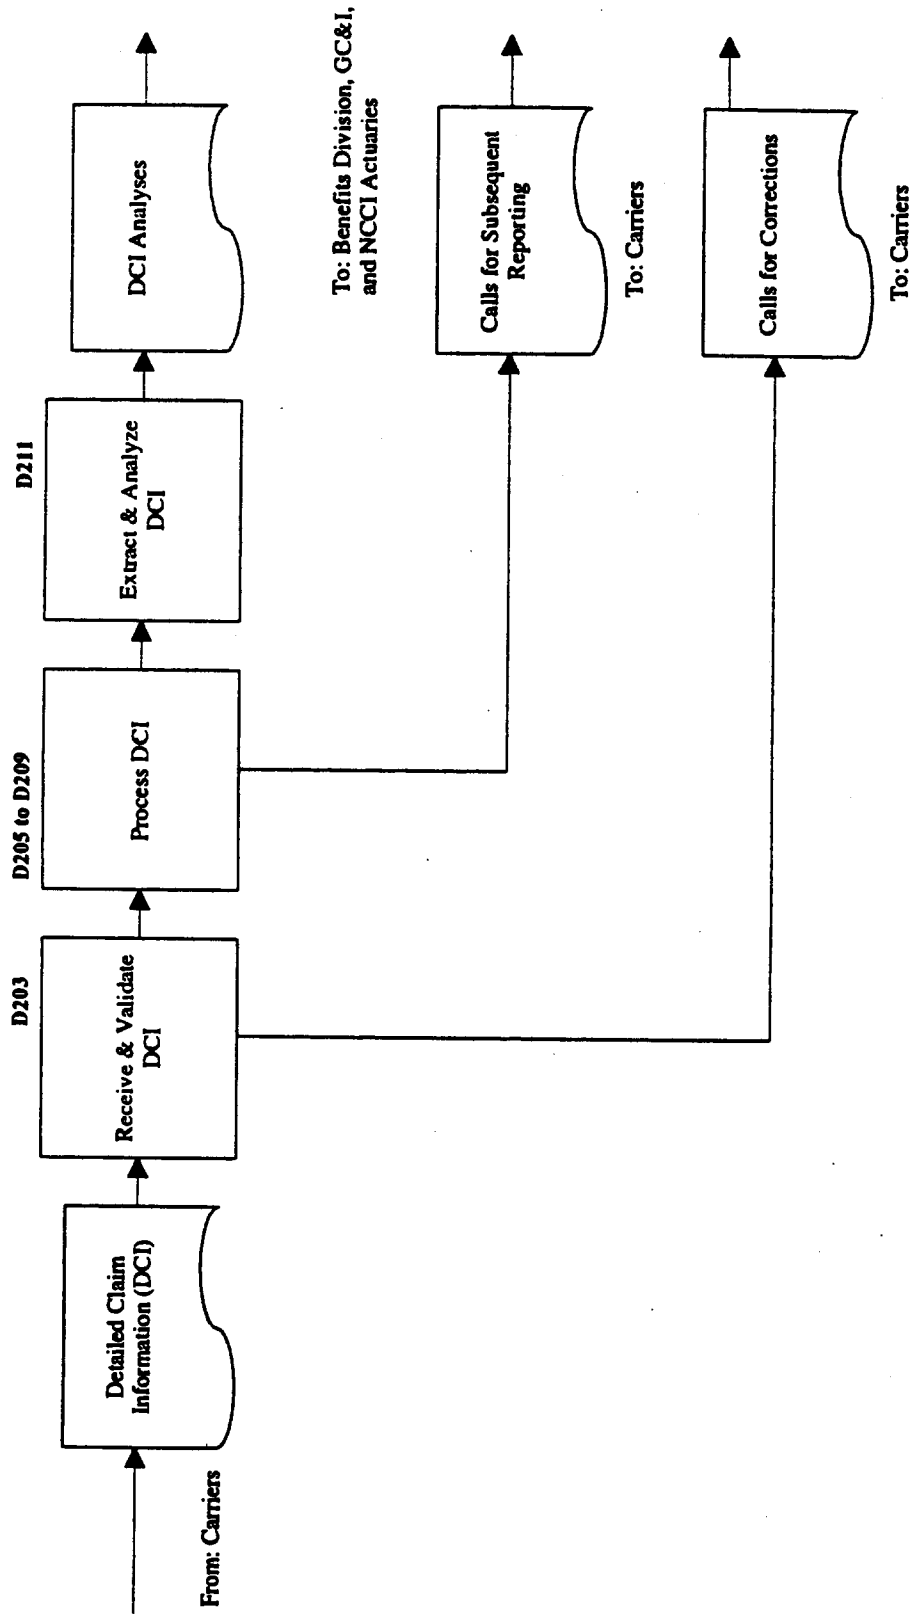

OVERVIEW OF DATA COLLECTION AND DATA HANDLING PROCEDURES

Experience Rating (E101)

- E201:** Experience Rating clerks verify that all required policy experience for the last three years has been received for rated risks. NCCI will contact carriers for missing WCSP data as necessary.
- E203:** Experience Rating clerks use all available WCSP data for the last three years for a risk and ELRs and D-ratios to calculate an experience modification factor for a risk.
- ELRs indicate the expected losses for a classification per unit of exposure. D-ratios indicate the portion of those losses that are expected to be below a specified dollar threshold.
- An experience modification factor is a number less than one for risks with fewer actual losses than expected and greater than one for risks with greater actual losses than expected. This number is used by carriers to adjust an insured's total premium.
- E204:** Experience Rating clerks visually review all experience rating sheets produced for reasonableness. Experience rating sheets indicate the actual WCSP experience used as well as the final experience modification factor. NCCI distributes rating sheets to carriers.

OVERVIEW OF DATA COLLECTION AND DATA HANDLING PROCEDURES

Detailed Claim Information (D101)

OVERVIEW OF DATA COLLECTION AND DATA HANDLING PROCEDURES

Detailed Claim Information (D101)

- D203:** Detailed Claim Information (DCI) clerks receive detailed claim information from carriers on standard forms. Detailed claim information must be reported for a specified percentage of workers compensation claims. Carriers may submit this information on either hard copy documents or magnetic tape. DCI systems validate the data for completeness and consistency. Correction requests are automatically generated for data in error. Carriers are required to correct data in error through resubmission.
- D205 to D209:** NCCI automatically generates requests for subsequent reports on established claims and forwards these requests to the carrier.
- D211:** Quarterly, DCI personnel extract detailed claim information for use in claims analysis. NCCI actuarial staff, Government, Consumer, and Industry Affairs (GC&I) personnel and Benefits division personnel use detailed claim information on an ad hoc basis to respond to requests for information.

OVERVIEW OF DATA COLLECTION AND DATA HANDLING PROCEDURES

Policy Issue Capture (P101)

OVERVIEW OF DATA COLLECTION AND DATA HANDLING PROCEDURES

Policy Issue Capture (P101)

- P201 to P204:** NCCI receives policy information from carriers in the form of policy declaration pages. Carriers may submit this information on either hard copy documents or magnetic tape. Carriers send hard copy documents to NCCI field offices. Magnetic tapes are sent directly to NCCI's headquarters for processing.
- P205 to P206:** NCCI validates policy information through a series of automated processes. Policy information is checked for correct field values, completeness and consistency. Valid policy data is loaded into the Policy Issue Capture System (PICS) database. The PICS database is used internally by NCCI for problem research and to provide the Proof of Coverage (POC) service to subscribers.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

I. INTRODUCTION

As described in the Executive Summary, we conducted Section I of the NAIC examination of NCCI in two phases:

- o Section IA: Description of Data Collection and Data Handling Procedures; and
- o Section IB: Evaluation of Data Collection and Data Quality.

In Section IA of the examination, our team reviewed and documented NCCI's current data collection and data handling systems and procedures. In Section IB of the examination, our team evaluated the quality of these systems and procedures.

This section of our report describes the approach, findings and recommendations of Section IB: Evaluation of Data Collection and Data Quality.

The scope of Section I of the examination included only systems and procedures currently used in ratemaking, experience rating and detailed claim information applications. It did not include systems which were in development during the examination. We have also provided comments on current NCCI development initiatives, where appropriate, but we have not formally examined systems in development.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

2. EVALUATION APPROACH

We applied several approaches to our evaluation, including statistical and judgmental sampling of NCCI data, detailed review of NCCI control procedures and detailed review and analysis of NCCI's automated systems. These approaches are described on the following pages.

2.1 Data Sampling

The objective of our data sampling tests was to determine the completeness and accuracy of NCCI data used for overall rate level, class ratemaking, experience rating and reporting detailed claim information. We tested ten statistical samples and two judgmental samples from NCCI data files.

Our analysis of data accuracy was limited to testing NCCI's computerized data files against the data NCCI received from insurers. We did not verify NCCI data against member company records.

Statistical Sampling

Our general approach to statistical sampling was to determine the accuracy of critical computer data files by randomly sampling records from these files and comparing the sampled records to the input data received from the carriers.

Our statistical sampling approach is outlined below:

- o Identified critical computer data files for sampling;
- o Determined the number of records in each of the selected files to identify the population sizes.
- o Defined required sample sizes, based on the population sizes, desired confidence level, tolerable error rate and expected error rate.
- o Generated random numbers for the appropriate sample size and used them to identify records for extraction from the data files;
- o Extracted samples and printed records in a form suitable for visual comparison to source documents;

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

- o Obtained supporting source documents from hard copy, microfilm or microfiche files;
- o Compared appropriate fields on the computer file records with corresponding fields from source documents and identified all discrepancies; and
- o Investigated discrepancies, identified errors and summarized results.

We used an attribute sampling approach to design and conduct our tests. Attribute sampling evaluates the occurrence rate of a condition in a population, such as the rate of errors. Consequently, our statistical inferences are based upon the number of errors encountered, rather than the magnitude of the errors. Our approach is explained in greater detail in Volume III and its Appendix.

Judgmental Sampling

A second approach we applied to data sampling was to evaluate the completeness of critical computer files by judgmentally sampling hard copy source documents and magnetic tape input.

Our judgmental sampling approach is outlined below:

- o Identified critical hard copy document files and their corresponding electronic data files;
- o Defined required sample sizes based on audit judgment;
- o Selected hard copy source documents;
- o Extracted identifying information from input documents and used it to extract records from the critical data files;
- o Compared hard copy source documents to data on critical data files; and
- o Investigated discrepancies, identified errors and summarized results.

In addition to evaluating the completeness of computer files, we used the judgmental samples to evaluate the consistency of unit report data between Experience Rating and Data Administration computer files. We also used these

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

samples to evaluate the consistency of factors calculated by Class Ratemaking and used by Experience Rating.

The specific procedures and results of each test are presented in detail in the Appendix to Volume III of this report.

2.2 Systems and Procedures Review and Analysis

Many of our Section IB findings and recommendations are the result of systems analysis. During the Section IA review and documentation phase, we reviewed available NCCI systems documentation, interviewed data processing and system user personnel, examined system inputs and outputs, reviewed computer program code, and documented data and process flows, system functions and procedures. In our Section IB evaluation, we applied these approaches to further investigate the structure and function of NCCI's systems.

2.3 Control Procedures Testing

The objective of our control procedures testing was to identify key control procedures and evaluate the adequacy of these procedures to ensure the completeness and accuracy of data used in ratemaking and experience rating.

Control procedures are intended to reduce the likelihood of errors. They may include both manual and computerized application controls. They may be designed to detect or prevent errors.

We reviewed control procedures in the following areas (the functions of each area are described in Volume II):

- o Data Conversion
- o Data Administration
- o Overall Rate Level
- o Class Ratemaking
- o Experience Rating

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

Our evaluation of each area followed the same basic approach:

- o Identified key control procedures for review in each area and designed tests for each;
- o Tested control procedures to ensure they are operating effectively;
- o Documented observations, exceptions and conclusions regarding the adequacy of control procedures tested; and
- o Documented recommendations for improvement.

2.4 Information Systems Controls Review

In assessing the effectiveness of NCCI's information systems controls, we used several approaches:

- o Reviewed NCCI systems-related Internal Audit reports and investigated current status of control deficiencies indicated in the reports;
- o Evaluated NCCI responses to a systems controls checklist designed to identify risks within the major areas of activity in computer application systems;
- o Interviewed NCCI Information Resources management personnel to address potential systems control deficiencies;
- o Examined the effectiveness of application-specific controls in computerized applications in each functional area as part of our control procedures review;
- o Reviewed controls in end user computing (EUC) applications used in ratemaking; and
- o Reviewed NCCI's emerging EUC standards.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

3. MAJOR FINDINGS

The major findings from Section I of our examination of NCCI may be grouped into four categories.

- 1) **Data quality:** Our findings indicate NCCI is accurately converting information received from the insurers to NCCI's electronic data files. We did not evaluate the quality of the data submitted by the insurers.
- 2) **Data quality and timeliness policies:** We found NCCI's data quality policies require clarification and stronger enforcement. Current policies do not provide adequate incentives for carrier compliance.
- 3) **Data handling systems and procedures:** NCCI mission critical ratemaking and experience rating systems manage excessive hard copy input, lack integration, and perform minimal automated validation of data at the time of data capture. NCCI currently compensates through extensive manual intervention. The problems are less severe for aggregate ratemaking systems than for WCSP systems, largely due to the lower volumes of data processed for aggregate ratemaking and more timely validation of input.
- 4) **Current NCCI initiatives:** NCCI has development initiatives in process or planned which are intended to resolve the major deficiencies of its current systems. NCCI has planned a very aggressive schedule to implement these new systems. While we did not assess NCCI's progress in completing these projects, we believe NCCI's management is committed to achieving its systems development objectives.

These findings are discussed briefly on the following pages and presented in greater detail in Volume III of this report.

3.1 NCCI Data Quality

Our findings indicate NCCI is accurately converting information received from insurers to NCCI electronic data files. This finding is based on the results of our random statistical sampling and judgmental sampling of NCCI's key data files. Our detailed sampling results are presented in the Appendix to Volume III of this report, are discussed in Volume I, Response to RFP Question 1, and are summarized below.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

Our statistical sampling tests compared randomly selected records from NCCI's computerized files with input data received from the carriers.

- o We tested five financial calls used in developing Overall Rate Levels: Policy Year, Calendar-Accident Year, Calendar Year, Reconciliation Report and Insurance Expense Exhibit. For each call, we tested several critical data elements. The sample size for each data element ranged from 176 to 181 data records. For each sample, an acceptable upper error limit (or tolerable error rate) of 5% was established. In the five calls sampled we did not count as an error any discrepancy of less than \$5,000, as these were deemed to be immaterial.

For one call, Calendar-Accident Year, the sample error rate ranged from 2.8 to 4.4%. The upper error limit, at a 95% confidence level, ranged from 5.7 to 7.9%. This exceeds the acceptable upper error limit, however, the higher error rates were primarily due to NCCI's procedure of excluding or "zeroing out" unusual data which the carrier cannot or does not explain. Actuarial personnel delete such unusual data to avoid distortion of overall rate level indications. In our sample, we found data for eight carriers that was either partially or completely deleted for this reason. The inclusion of these items in our error statistics presents a worst case scenario of the potential error rate. Excluding these items from the error statistics would have resulted in an actual sample error rate ranging from zero to 0.6% and an upper error limit ranging from 1.6 to 2.6%, at a 95% confidence level. The appropriateness of "zeroing-out" data is discussed further in Volume III in the Overall Rate Level section.

In four of five financial calls tested, the sample error rate ranged from zero to 1.7%. The upper error limit ranged from 1.6 to 4.2%, at a 95% confidence level. Excluding occurrences of zeroed out data from the error statistics would have resulted in an actual sample error rate ranging from zero to 0.6% and an upper error limit ranging from 1.6 to 2.6%, at a 95% confidence level.

For a more detailed discussion of our conclusion relating to the appropriateness of the zeroing out procedure, see General Observation #6 and Specific Finding #5 in the Overall Rate Level Area Report in Volume III.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

- o In our tests of **Class Ratemaking** data we tested seven critical data elements in samples of 181 each. For each sample, an acceptable upper error limit of 5% was established. In evaluating the samples every discrepancy was counted as an error regardless of dollar amount.

For six of the seven data elements tested, the actual sample error rate ranged from 1.7 to 2.8%. The upper error limit ranged from 4.2 to 5.7%, at a 95% confidence level.

One data element, "medical claim amount", had an actual sample error rate of 3.9% and an upper error limit of 7.1%. This was due to seven errors, of which three related to unlocated unit reports.

For all errors noted, the majority were related to unlocated unit reports. Other errors noted were due to duplicate records, data entry errors or other missing documentation. The inclusion of unlocated unit reports in our error statistics presents a worst case scenario of the potential error rate. Exclusion of these items would have resulted in an actual sample error rate ranging from 0.6 to 2.2% and an upper error limit ranging from 1.6 to 5.0%, at a 95% confidence level.

- o In our tests of **Experience Rating** data we tested six critical data elements in samples of 181 each. An acceptable upper error limit of 5% was established for each sample. In evaluating the samples any discrepancy was counted as an error regardless of dollar amount.

The sample error rate ranged from 0.6 to 1.1%. The upper error limit ranged from 1.6 to 3.4%, at a 95% confidence level, which is within an acceptable range. Again, approximately 50% of the errors were due to unlocated unit reports or rating sheets.

The inclusion of unlocated unit reports in our error statistics presents a worst case scenario of the potential error rate. Exclusion of these items would have resulted in an actual sample error rate ranging from 0.0 to 0.6% and an upper error limit ranging from 1.6 to 2.6%, at a 95% confidence level.

- o For **DCI**, we tested all 54 data fields on the call form. An acceptable upper error limit of 5% was established and all errors were counted, regardless of dollar amount.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

The sample error rate was .5%. The upper error limit ranged from 1.5 to 2.3%, at a 95% confidence level, which is well within the acceptable range. Errors noted were primarily due to data entry.

The low sample error rate for DCI data can partially be attributed to the fact that there were no missing DCI calls in our sample (data sampled for DCI was more recent than other NCCI data sampled -- all DCI data sampled was received after 8/1/90) and NCCI does not "zero out" DCI data. We would also expect the error rate for DCI to be lower because of NCCI's policy of editing DCI data at the time of receipt and requiring carriers to correct their own errors. These policies are not yet in effect for other types of data NCCI collects, as discussed below.

There were no errors noted in two **judgmental samples** designed to test the completeness of financial call and unit report records. We used the same samples to test the consistency of data used by both Class Ratemaking and Experience Rating. We noted one inconsistency error out of 29 records tested. This represents 3.4% of the sample.

In summary, our results indicate NCCI accurately converts carrier data to its own electronic files.

Our findings on NCCI data quality are limited by the scope of our study. We traced data in NCCI's computerized ratemaking, experience rating and detailed claim information files to input NCCI received from the insurers. We did not test the accuracy of the data originally submitted by the insurers.

3.2 NCCI Data Quality Policies

NCCI's data quality policies require clarification and stronger enforcement. NCCI's constitution and membership agreements provide only very broad statements of data quality policies and responsibilities. Standards are currently defined and enforced for each of the major calls by the departments responsible for administering them. The effectiveness of current standards and enforcement varies greatly by department.

For the financial calls, data timeliness and accuracy standards are clearly defined but not effectively enforced. A recent NCCI publication, The Reporting Guidebook for the Annual Calls for the Experience, defines specific standards and

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

responsibilities for the timeliness, accuracy and error correction of financial calls. The same publication also specifies fines for failures to meet these standards. These fines, however, are not large enough to provide an effective financial incentive for timeliness and accuracy of initial submissions, and are not currently imposed for failure to respond to inquiries concerning possible errors.

Data timeliness and accuracy standards are less precisely defined for unit report data and no policy to impose fines for delinquent or inaccurate reports is yet in place. Responsibilities for error correction of unit report data are neither clearly defined nor effectively enforced. A new system, the Unit Report Control (URC) system, is intended to provide additional control by automating requests for specific unit reports, and providing a turnaround error report for carriers to use for correcting errors. This system is in the very early stages of a phased implementation which extends into 1992. A clear definition of standards and responsibilities will be required for this initiative to succeed.

NCCI's Data Administration procedures authorize NCCI staff to modify carrier data to correct certain types of unit report errors without carrier approval. The limits of this authority are not clearly defined. NCCI's Data Administration department made approximately 513,000 corrections to unit report data last year. Although sample results suggest that 55% of corrections should involve carrier contact, NCCI contacted carriers to resolve only about 1,000 errors last year. While one error may lead to multiple corrections on NCCI's systems, it is clear that NCCI contacted carriers for only a very small percentage of corrections made to unit report data last year.

NCCI does not have a consistent carrier performance measurement and reporting policy. Carrier performance measurement is currently administered by the departments responsible for processing each of the major calls. In the case of financial calls, performance is measured, reported to the individual carriers and used as a basis for assessing fines. For unit reports, carrier performance is measured, but current performance reporting does not provide an effective performance feedback mechanism. A new system, URC, is intended to support performance measurement, performance reporting and administration of fines for unit reports. No new policy for performance measurement and reporting, or assessment of fines for errors, has yet been officially announced.

NCCI's current monetary incentive programs do not provide effective incentives to improve carrier performance.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

- o Under its Performance Evaluation Monetary Incentive Program (PEMIP), NCCI fines carriers for failure to meet clearly defined timeliness and accuracy standards for financial calls, and credits carriers for early submission of financial calls. As noted above, these fines do not appear to be large enough to provide an effective monetary incentive to improve performance.

In 1990, 565 carriers were fined for the late submissions and for failing "basic" and "actuarial" edits for their five PEMIP financial calls. The total fines assessed in 1990 were \$364,272 which is approximately 0.6% of NCCI's carrier-contributed operating budget. NCCI will bill an estimated \$245,141 of this total. \$54,806 of the remaining \$119,131 is applicable to state funds. As a matter of policy, state funds do not pay fines. The remaining discrepancy is due to limitations of fines assessed against carriers.

For early submission of PEMIP financial calls, NCCI credits carriers. Total early reporting credits calculated for 1990 were \$702,762. NCCI will apply \$462,940 of this total. Of the remaining \$239,822, \$1,067 is applicable to state funds not participating in the program, and \$238,755 is applicable to credits subject to maximum limitations.

Fines are not currently imposed for late or inaccurate unit reports. It is our understanding that the new URC system has been designed to administer fines. NCCI plans to assess fines beginning in November 1992.

NCCI does not accurately allocate error handling costs among the carriers.

- o NCCI does not currently measure the true cost of error handling for each carrier.
- o NCCI does not currently assess any penalties to cover the cost of handling errors in unit report data. NCCI plans to assess fines for late or inaccurate unit reports beginning in November 1992.
- o Fines currently assessed for late or inaccurate financial calls are not adequate to cover the true costs of error handling.

The major consequence of the lack of clear data quality policies and enforcement at NCCI is that too much of the burden of ensuring data quality

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

falls on NCCI, and too little on the carriers, agents and insureds. This results in a very inefficient data verification and error correction process and may not assure data quality. A potential additional consequence is inequitable distribution processing costs among the carriers.

3.3 Current Data Handling Systems and Procedures

The NCCI systems which support ratemaking and experience rating are the systems most critical to NCCI's mission. These systems have major shortcomings which include excessive reliance on hard copy input, lack of integration, and minimal automated validation of data at the time of data capture. NCCI currently compensates for many of its systems shortcomings through extensive manual intervention.

This section summarizes our major findings concerning NCCI's current systems and procedures. It is organized in three subsections:

- o System Architecture;
- o Data Collection and Verification; and
- o End User Computing.

System Architecture

Many of NCCI's systems reflect the outdated design techniques and development technology of the period in which they were developed. This is true of the WCSP systems.

- o Systems were designed to support narrow functions within departmental boundaries. Processes and data are duplicated across different functions, with little or no integration. The most striking examples are in the Experience Rating and Class Ratemaking systems. Unit report information is redundantly verified and corrected by two separate systems and stored in separate files for experience rating and class ratemaking, with potentially inconsistent results. There is currently no system or formal procedure to reconcile corrections made for Experience Rating with those made for Class Ratemaking.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

- o **Many processes are only partially automated, require extensive manual intervention and rely upon paper inputs and outputs.** An extreme example of this problem is the procedure used to add corrections to the financial call files. During the validation process, correction records are entered on a separate correction file. After all edits have been completed and corrections have been verified, the contents of the correction file are printed on a report. The report is then sent to NCCI's data entry service. The corrections are re-entered and transmitted back to NCCI, where they are merged with the final financial call file which will be used to produce rates in the following year. Other examples are noted below in the discussion of NCCI's data collection and verification procedures.
- o **File structures support efficient batch processing but do not allow on-line access.** The lack of on-line access results in procedural inefficiencies. Current procedures in some departments rely on hard copy or micro-image (microfilm and microfiche) information for research and verification. So great is this reliance that the 200,000 experience rated unit reports received on magnetic tape each year are subsequently printed on hard copy and microfiche and stored in the field offices.
- o **Application programs are poorly structured and undocumented, making modifications difficult.** Work-around solutions have been adopted, often increasing manual effort, until new systems can be developed. An extreme example of this problem are class ratemaking application programs which truncate the leading digit in payroll amounts of \$10 billion or more. A time-consuming manual procedure is used to determine accurate amounts and adjust program output.

These redundancies, lack of integration, barriers to access and poor structure create inefficiencies and inconsistencies throughout NCCI's systems.

Data Collection and Validation

NCCI's critical data inputs are the financial calls, used to determine the overall rate level, and the unit reports, used for class ratemaking and experience rating. Policy information will become increasingly important as NCCI begins to integrate its systems. Current NCCI systems which collect and validate these critical inputs provide incomplete control over data

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

timeliness, completeness and accuracy. Manual procedures help compensate for system deficiencies, but the resulting process is very inefficient.

Data Collection

NCCI's current data collection systems and procedures do not effectively control the timeliness and completeness of data collected from carriers. The problem is most severe for unit report data. NCCI has a new system, in the earliest stage of a phased implementation, which is intended to significantly improve this situation (see discussion below).

- o NCCI does not currently have a mechanism to ensure all required unit reports are submitted by carriers. NCCI receives approximately 250,000 unit reports each month. NCCI has a system which tracks unit reports due and received for experience rated policies. Unit reports for experience rated policies represent about 35% of unit reports due. NCCI does not have a system to identify unit reports due, received or missing for policies which are not experience rated. NCCI recently started a phased implementation of the Unit Report Control (URC) system, which is ultimately intended to track all unit reports due, received and missing. Under the current schedule, this system is to be fully implemented by July of 1992.**
- o NCCI currently uses an identification number known as "Risk ID" to uniquely identify each experience rated business. NCCI does not currently require or use Risk ID to control unit reports for businesses too small to be experience rated, even though approximately 65% of all unit reports submitted to NCCI are for non-experience rated risks.**
- o NCCI has inadequate controls to ensure all carriers submit financial calls. The current completeness control mechanism depends upon carrier responses to an annual questionnaire. This system is no longer adequate for the volume of data NCCI now manages. The principal controls over data completeness are reasonableness tests, in which NCCI actuaries make year-to-year comparisons of data during aggregate ratemaking.**
- o NCCI does not currently have a mechanism to ensure all required policy information is submitted by carriers. NCCI started capturing policy information for non-experience rated policies in May 1991. Complete policy**

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

information will become more important with the implementation of the URC system. URC will identify unit reports due on the basis of policy information.

NCCI currently manages excessive amounts of hard copy input.

- o NCCI received approximately 1,200,000 hard copy unit cards in 1990. This represents approximately 40% of the total 3,000,000 unit reports submitted last year. The remaining 60% were submitted on magnetic tape.
- o NCCI receives approximately 40,000 hard copy policies each month, which is about 35% of all policies received. The remaining policies are submitted on magnetic tape.
- o NCCI received approximately 30,000 financial calls in 1990. Approximately 95% of this total were submitted on hard copy. The remaining calls were submitted on diskettes.
- o All of this hard copy input requires data entry into NCCI's systems. The majority of this data entry is currently performed by an outside service.
- o All 1st, 2nd and 3rd unit reports received on hard copy are retained for three years in the field offices in hard copy form. Unit reports are also stored on microfilm.
- o The 200,000 experience rated unit reports received on magnetic tape each year are subsequently printed on hard copy and microfiche and stored in the field offices.

Data Validation and Error Correction

NCCI's data validation and error correction systems provide incomplete validation, are poorly controlled and are very inefficient. These problems are most severe for WCSP systems and are largely the result of insufficient and ineffective automation. NCCI has several major systems development initiatives planned or in process which are intended to resolve many of the problems noted in these findings. The most notable of these initiatives are discussed later in this section.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

- o **WCSP systems do not thoroughly validate data at the time of receipt; unit reports may be validated more than one year later when they are extracted for input to class ratemaking.**
- o **Unit report validation for Class Ratemaking is a cumbersome, time consuming process which requires extensive manual effort. The State Validation program identifies errors and potential errors and prints a validation report. Data Administration clerks review every page of this report and manually identify required corrections. These error reports are typically very long; the most recent report for Florida, for example, was more than 10,000 pages long. NCCI currently requires between five and six months to validate unit report data for large states.**
- o **NCCI applies "rules of thumb" to simplify unit report validation and error correction for class ratemaking. These rules define correction procedures which minimize research and requests for additional information from carriers for certain types of exceptions. They also create a risk of modifying data on the basis of inaccurate assumptions, rather than verification from carriers.**
- o **Despite the large number of NCCI corrections to unit report data, NCCI corrects a very small percentage of unit report data. NCCI created approximately 22,500,000 unit report detail records from the 3,000,000 unit reports captured in 1990. NCCI entered 513,000 corrections to these records last year. These corrections are approximately 2.3% of the total number of records created last year. Since we do not know the true error rate in the data provided by the carriers, we do not know how well current data validation and error correction procedures accomplish their objectives.**
- o **NCCI personnel manually review each of the 600,000 experience rating sheets NCCI produces each year. The primary purpose of this review is to verify the accuracy of the ratings. These manual audits are also a key mechanism for verifying experience rated unit report input.**
- o **NCCI's unit report data collection and verification systems allow entry of duplicate data. Systems and procedures used to remove these duplicate records before they are used in ratemaking applications require extensive manual intervention and do not eliminate all duplicates.**

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

- o NCCI does not currently perform risk-level validation for unit report data used in Class Ratemaking. **There is no validation to verify that unit report data for a specific risk is consistent with policy specifications, risk inspections or previously submitted data.**
- o NCCI currently uses an identification number known as "Risk ID" to uniquely identify each experience rated business. NCCI uses Risk ID to match unit report data with a specific insured business for developing experience ratings. **Carriers frequently omit or inaccurately report Risk ID on unit reports. Correcting these errors and omissions is a very time consuming task for NCCI. NCCI personnel manually reviewed Risk IDs on more than 1,000,000 unit reports in 1990. This function required five full-time clerks.**

End User Computing

Critical ratemaking applications are developed, maintained and controlled by actuarial personnel. These end user controlled applications do not have the degree of automated application control required of most production systems. Some of these applications could be implemented as Information Resources controlled production systems to achieve the required control objectives and increase overall efficiency. Other applications require an end user computing environment, but also require more comprehensive and effective control in that environment.

For mainframe computer based end user systems, we noted the following deficiencies:

- o There are no processing control reports or audit trails which document the activity of extraction and update programs.
- o Documentation of existing applications is limited.
- o There are no documented standards for testing new end user application programs or for testing changes to existing end user application programs.

For microcomputer based end user systems we noted all of the above and the following deficiencies:

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

- o There are no documented procedures to control program changes. It should be noted, however, that in some areas efforts have been made to provide control over program changes by assigning program maintenance responsibility to one individual.
- o There are no formal backup procedures. Although most applications and data sets are backed up, most backups are not stored off-site and a documented retention schedule does not exist.
- o Access to microcomputer applications is not restricted through use of passwords or other security measures.
- o Microcomputer applications reside on unsecured personal computers.

In our control procedure tests of Overall Rate Level and Class Ratemaking end user computing applications, we did not find any errors which had resulted from weak controls. However, given the importance of end user computing to the NCCI's ratemaking process, NCCI is exposed to significant risk due to the lack of controls. We understand that NCCI is developing an end user computing policy which is intended to address data processing controls. NCCI has not set a date for implementation of this policy.

3.4 Current NCCI Initiatives

NCCI has development initiatives in process or planned which are intended to resolve the major deficiencies of its current systems. We have outlined some of the leading projects and their objectives below.

Systems Planning

NCCI's Enterprise Data Modeling (EDM) project is a key part of an ongoing Strategic Information Systems Planning effort. The stated objective of the EDM project is to define a strategic framework for designing and developing integrated systems.

The developers of the EDM conducted their project without a clearly defined strategic business plan to guide their efforts. The EDM project added value in helping define such a plan, however. The process encouraged a rethinking of NCCI's mission and priorities and led to a better understanding of its business functions.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

The EDM report provides valuable analysis of NCCI's business functions and information requirements, and presents a very high-level model of applications and data. The EDM report also contains a very realistic assessment of NCCI's current systems. This assessment clearly acknowledges many of the major defects of NCCI's current systems.

The EDM report does not, however, present a clear vision of NCCI's future systems, a complete definition of an architecture upon which to build these systems, or a detailed data model. Additional steps are required, and NCCI has begun to take these steps.

NCCI's Information Resources management team is currently refining its vision of NCCI's future systems. They have begun to use their emerging vision statement to obtain the required commitment from NCCI's executive team. They intend to present their vision and plans to achieve it to NCCI's Board of Directors in July 1991.

NCCI's Information Resources management team has also been actively engaged in tactical planning. This includes further developing the EDM by refining the data model and application architecture to the next level of detail. It also includes reconciling the emerging vision of future systems with ongoing development projects and defining new projects. Some major ongoing projects were initiated before the EDM project began or the emerging vision of future systems had been formulated. There is some risk that the ongoing planning process will produce data and application architectures which are not entirely consistent with recently completed systems or systems in development.

Systems Development

A number of systems development projects are planned or currently underway at NCCI. Four of these projects (URC,URQ,URS, and the Risk Information System) are intended to provide the core of NCCI's new information systems and provide a foundation for new ratemaking and experience rating systems. A review of these development projects was beyond the scope of our examination. We have, however, provided a brief outline of the objectives, planned implementation schedules and some critical issues of the four core projects and four other important projects.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

- o **URC** - The objective of the Unit Report Control (URC) system is to improve the timeliness and completeness of unit reporting. The system will identify unit reports due, based on information in an existing policy information database. The system will notify carriers of unit reports due and provide the basis for assessing fines for delinquent reports. The system is also intended to provide rudimentary edits and a turnaround error report to be used by carriers to correct rejected records. The URC system is currently being tested with selected carriers. An industry-wide phased implementation is scheduled to be completed by July 1992.
- o **URQ** - The objectives of the Unit Report Quality (URQ) system are to provide "front end" data quality edits which validate unit report data immediately upon receipt and to provide an efficient correction process for errors. This system is intended to replace the "back-end" edit and correction procedures which are now part of Experience Rating and Class Ratemaking applications. URQ will provide error turnaround reports and administer fines using the processes developed for URC. NCCI also plans to develop an insurance company edit package as part of this initiative. Carriers will use this package to validate data before they submit it to NCCI. URQ is currently in the early stages of design. The system is scheduled for a phased implementation to be completed in October 1992.
- o **URS** - The objective of the Unit Report System (URS) is to provide an integrated unit report database to serve both experience rating and ratemaking applications. NCCI plans to provide on-line access to this database and to develop a "routing and retrieval system" to feed unit report data to experience rating applications. NCCI plans to capture new unit reports in the URS database in September 1991. The issue of how much historic data to convert to this database has not yet been resolved.
- o **Risk Information System** - The objectives of the Risk Information System project are to develop a database that will contain risk information and establish linkages to all risk-related information in NCCI's systems. NCCI plans to use a common Risk ID to access all information for the risk, including policies, unit report data, residual market applications and inspections. NCCI is currently evaluating whether to use their current Risk ID or the Federal tax identification number as this identifier.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

- o **PICS 3.0** - The objective of the PICS 3.0 project is to implement approximately twenty change order requests to the existing PICS system. The two most significant planned enhancements are: (1) capture of additional policy information and (2) automated name and address standardization for policy information submitted on magnetic tape. The first of these enhancements will provide the additional information necessary to validate unit report data under the URQ system. Automated name and address standardization will significantly reduce the manual standardization effort now performed by eleven clerks. The PICS 3.0 enhancements are scheduled to be implemented by January 1992.
- o **Automated Policy Review** - The objective of the Automated Policy Review system is to provide automated "front end" data quality edits which verify policy information immediately upon receipt. The system is intended to produce weekly error reports known as "criticism letters" which will be distributed to carriers. This system is also intended to identify those risks that had policies in the previous year, but do not have policies in the present year. This system is intended to replace manual review of over 1.5 million policies per year. The Automated Policy Review system is scheduled for implementation by October 1992.
- o **Automated Auditing** - The objective of the Automated Auditing system is to provide automated "back-end" data quality edits which verify experience rating sheet data. This system is intended to replace manual review of over 600,000 rating sheets per year. The Automated Auditing System is scheduled for implementation in October 1991.
- o **DCI** - The objectives of the new Detailed Claim Information (DCI) system are to increase the detailed information captured for reported claims, enhance the analysis and access of the data and conform to the DCI model data reporting regulation. This system is scheduled for a phased implementation, with the new data collection system to be completed by July 1991. The current schedule calls for all carriers to submit expanded data by January 1992. Enhanced analysis and access capabilities are to be available by June 1992.

Systems in development during the examination were beyond the scope of our project. Accordingly, we have not evaluated the designs or ongoing

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

development of these initiatives. It is clear to us, however, that the projects noted above are intended to address NCCI's major systems deficiencies.

Specific issues critical to the success of these projects include the following:

- o URC will use the Policy Information Control System (PICS) to identify unit reports due. NCCI began capturing policies for businesses not large enough to be experience rated in April 1991. URC will not provide effective control over completeness of unit report collection until PICS data is complete. There is no completeness control yet for PICS.
- o The initial implementation of the URS database is scheduled for August 1991, along with the first phase of the URQ system. NCCI plans to expand data quality edits for URQ through October 1992, and perhaps beyond. The quality of data on the URS database will be only as good as the edits in URQ. NCCI will not reap the full benefit of its integrated URS database until all "back-end" experience rating and class ratemaking edits are replaced and enhanced by "front-end" edits in URQ.
- o NCCI is currently evaluating whether to use its current Risk ID or the Federal tax identification number as the risk identifier. This is an important issue which has been debated at NCCI for a long time. The clear advantage of Federal tax ID is that it is readily available to the carriers and easily verifiable. It will be important to resolve this issue soon for NCCI's systems integration plans to proceed on schedule.

NCCI has identified the major flaws in its systems and has conceptualized viable systems development initiatives to address these flaws. NCCI has planned a very aggressive schedule for implementing these new systems. By the end of 1992, NCCI plans to have designed and fully implemented seven of the new systems previously discussed in this report, while continuing to support and enhance existing systems.

NCCI has been aware of the major flaws in its systems for some time. An NCCI internal document entitled "Technical Services Long Range Plan" dated June 1988 identified major problems with NCCI systems and proposed initiatives to resolve these problems. This report highlighted NCCI's "archaic systems" and "independent unsynchronized data."

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

Significant recommendations from this 1988 report include:

- o Automate policy name and address standardization;
- o Develop a tracking and notification process for unit cards based on policy information;
- o Develop an integrated database for unit report data;
- o Eliminate the retention of hard copy source documents;
- o Develop a risk system to link policies and unit reports; and
- o Develop an electronic submission mechanism between the carriers and NCCI for policies, unit reports and experience rating information.

While NCCI currently has initiatives in process for most of these recommendations, none of the recommendations has yet been fully implemented. Strong management, adequate resources, and effective training will be required for NCCI to succeed with its current plans.

End User Computing Standards

NCCI's Internal Audit department has conducted several audits of end user computing in ratemaking applications. Findings from these audits have generally been that controls were not commensurate with the importance of these applications to NCCI's mission. Recently, NCCI's Internal Audit department developed a set of guidelines for implementing new end user computing standards. NCCI executive management has approved these guidelines and development of new standards will begin soon. NCCI has not set a date for implementation of the new standards.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

4. PRIORITY RECOMMENDATIONS

Our detailed recommendations for each of the areas we examined are presented in Volume III of this report. They may be summarized in four major recommendations:

- 1) **Clearly define data quality policies and standards;**
- 2) **Measure and report carrier and NCCI performance against those standards;**
- 3) **Build effective incentives to achieve performance objectives; and**
- 4) **Build integrated systems which support policies and objectives.**

4.1 Clearly define data quality policies and standards.

NCCI Policy

NCCI needs a clear and unified policy on data collection and data quality. This policy should provide the overall framework within which NCCI collects and processes carrier data. This policy should clearly define:

- o Standards for timeliness, completeness and accuracy of all critical data collected from carriers;
- o Approved input media (electronic file transfer, magnetic tape, diskettes);
- o Specific responsibilities and time frames for error correction;
- o The exact limits of NCCI's authority to modify carrier data;
- o NCCI's data quality verification approach (reconciliation of policy experience to aggregate data, carrier audits, risk audits);
- o NCCI's carrier performance monitoring and reporting approach; and
- o Specific monetary incentives for carrier performance.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

We recommend that NCCI adopt policies which place appropriate responsibility for data verification and error correction with the carriers, and sharply limit its own authority to modify carrier data. NCCI should reject data known to be in error and return it to carriers for correction. Clearly, this policy must be implemented with concurrence from the insurance companies, and should be developed with their active participation via the appropriate committees and the NCCI Board of Directors.

- o It should be NCCI's responsibility to draft policies and plans to implement them.
- o It should be the Board's responsibility to approve new policies and plans to implement them.
- o It should be NCCI's responsibility to implement and enforce policies.
- o Once policies have been established, members should be required to comply.

Industry Standards

For NCCI to be truly effective in the implementation of its data quality standards, comparable standards must be developed for carriers, agents and insureds. Every entity involved in developing data, transmitting data or processing data must be held to the same standards. The quality of data used to set rates is only as good as the weakest link in the chain.

We recommend that the NAIC, through the appropriate task force, develop a model Workers Compensation data quality regulation. The overall objective of this regulation should be to promote consistent, timely and accurate data reporting by all parties.

Specific issues which should be addressed by the model regulation include the following:

- o Data requirements (type and level of detail);
- o Data timeliness and quality standards for NCCI and carriers;
- o Data timeliness and quality standards for insureds and agents;

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

- o Carrier and risk audit standards;
- o NCCI's role as a statistical agent.

4.2 Measure and report carrier and NCCI performance against the new standards.

NCCI should implement systems and procedures which measure timeliness and accuracy of carrier data reporting against very specific standards. NCCI should establish a program of regular carrier performance reporting. Carrier performance reports should be distributed to carrier operational and executive management, and possibly to regulators.

NCCI should also implement systems and procedures which measure the timeliness and accuracy of its own processing. NCCI's data quality measurement process should include tests which compare randomly selected ratemaking data to the source information collected by insurers.

4.3 Build effective incentives to achieve performance objectives.

The NAIC and NCCI must provide more powerful incentives for carriers to submit timely and accurate data and correct errors promptly. The model regulation noted above would be a strong first step. NCCI incentives to carriers should include mechanisms which provide an accurate allocation of NCCI's processing costs, including error handling costs, among the carriers.

4.4 Build integrated systems which support the new policies and objectives.

First, NCCI should complete and publish its Strategic Information Systems Plan. This document should provide clear direction for building systems which will support NCCI's strategic objectives. It should be presented in a clear, concise format suitable for executive management. It should be used to achieve agreement and commitment from NCCI and carrier executive teams and the regulators. The plan should include a statement of objectives, an overall application architecture, system definitions for all mission-critical applications and an implementation schedule.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

We believe the specific systems initiatives outlined below are essential to achieving NCCI's business objectives and should be included in NCCI's plans.

- 1) NCCI should implement systems to track and control the due date and receipt of all information submitted by carriers, including aggregate financial data, unit report data and policy data. The overall objective of these systems should be to ensure complete and timely submission of data to NCCI.
- 2) NCCI should develop an electronic data transfer mechanism for submission of data from the carriers to NCCI. Carriers should be strongly encouraged to use this mechanism for submission of aggregate financial data, unit report data, policy data and DCI data.
- 3) NCCI should develop data validation software and distribute it to carriers. Carriers should use this software to validate data before submitting it to NCCI. Such validation should be applied to aggregate financial data, unit report data, policy data and DCI data.
- 4) NCCI should develop systems which validate all data at the time of receipt, reject data found to be in error and support efficient correction of errors by the carriers.
- 5) NCCI should develop systems which provide regular carrier performance reporting.
- 6) NCCI should develop systems which support consistent, effective financial incentive programs to encourage carrier compliance with timeliness and quality standards.
- 7) NCCI should develop an integrated enterprise database. This database should provide access to aggregate financial data, unit report data, policy data, DCI data, rates, experience ratings, inspection information and risk information. The database and surrounding applications should enforce integrity between these types of data based on established relationships.
- 8) NCCI should re-engineer and automate many of its current manually intensive areas. This effort should be orchestrated from an enterprise perspective. Unintegrated departmental systems should be avoided.

OVERVIEW OF FINDINGS AND RECOMMENDATIONS

Evaluation of Data Collection and Data Quality

- 9) NCCI should explore alternatives and decide upon an appropriate identification number for insured businesses.
- 10) NCCI should implement more stringent controls over its end user computing environments.
- 11) NCCI should move stable, regularly executed end user applications into a production environment.

NCCI should use modern software engineering techniques, follow a structured systems development methodology and use consistent documentation standards for development of new systems. This approach will contribute to development productivity, system flexibility and maintainability.

NCCI should complete its strategic information system plan, refine its enterprise data model through further decomposition of functions and data, and define its computer aided software engineering (CASE) and database management systems (DBMS) strategies before undertaking major new application development projects.

NCCI management supports these recommendations and has taken steps to implement them. NCCI plans to address these points in its response to this report.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Responses to RFP Section IB Questions

This section of the report responds specifically to questions on page 14 of the Request for Proposal (RFP). The questions are reproduced on the pages which follow. Responses to the questions are based on detail tests of data collection and data handling procedures. In almost all cases, the overall question posed in the RFP consists of several questions. We have addressed each question separately where deemed appropriate. The response to a question is presented in an outline format for ease of referencing to sections of the response. Section I, Part C of this report provides more extensive detail of our approach, findings, and recommendations.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 1

RFP Question 1. (I.) How accurate is the database? (II.) Are adequate quality control procedures in place to ensure the accuracy of the data as they are reported by insurers and processed by the NCCI? (III.) How could these procedures be improved?

(I.) How accurate is the database?

A) Introduction

A fundamental objective of our examination was to assess the accuracy of the data which is used to create overall rate level indications, class rates and experience modifications. In addition, we have performed a limited examination of detailed claim data which is used for analysis of trends in workers compensation loss costs.

B) Definition of the Database

There is no single integrated database at NCCI. The data for each major system is processed and stored independently. This results in a large collection of very loosely integrated or unintegrated files. As a part of our Section I-A research, we identified the key computer files containing aggregate financial data, WCSP data and detailed claim data. The critical files used to store the data are the following:

- 1) Financial call data by state:
 - a) Policy Year library
 - b) Accident Year library
 - c) Calendar Year library
 - d) Calendar Year Reconciliation Report file
 - e) Insurance Expense Exhibit file
- 2) Payroll and Loss (P/L) Detail file which contains unit report (WCSP) data used in class ratemaking
- 3) Compress file which contains unit report (WCSP) data used in experience rating calculations

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 1

- 4) DCI Valid file which contains all edited and corrected detailed claim data.

C) Testing Approach

In order to assess the accuracy of aggregate financial data, WCSP data and detailed claim data, we randomly selected data records contained in key computer files. We tested ten random samples to evaluate the critical data inputs to overall rate levels, class rates, experience mods and DCI analyses. The data contained in key files was reconciled to other available sources of information to verify that all data was represented in the populations from which the random samples were drawn.

We tested the data using a statistical approach known as attribute sampling. This sampling method tests the frequency of errors in a population. Our statistical samples were defined to achieve a 95% confidence level in the test results. Errors were defined as unsupported differences between system stored data and data submitted by carriers. This approach allowed us to quantify NCCI's success in accurately capturing and processing data submitted by carriers. It does not allow us to evaluate the accuracy of data submitted by carriers.

In order to assess NCCI's success rate in capturing all data it receives, we selected judgmental samples of hard copy documents and attempted to locate the corresponding data stored in electronic files. Additionally, data for those unit reports with sufficient premium to be experience rated was compared between the experience rating and class ratemaking systems. We also used this unit report sample to compare the Expected Loss Rate factors and D-ratios in the Experience Rating system to the Experience Rating Plan manuals which are generated by the Class Ratemaking system.

D) Results of Statistical Sample Tests

In comparing our randomly sampled data to source documents, we encountered a high rate of initial exceptions. Difficulty in locating hard copy unit card data was a primary cause of these exceptions. For example, unit reports submitted to NCCI on magnetic tape were not microfiched for the first nine months of 1986. Another difficulty was encountered in obtaining unit reports which are not stored by NCCI, such as unit reports submitted by state funds and self-insured risks. Resolving these exceptions disclosed certain problems encountered by

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 1

NCCI. Many of these exceptions are not errors as defined for our samples; however, they indicate problems in retrieving and analyzing NCCI's data.

Detailed sampling results are documented in the Appendix to Volume III of this report. The following summarizes some of our observations and errors noted:

1) Financial Calls

a) In our sample of 180 Calendar-Accident Year calls, we noted the following:

- i) The data for eight carriers was either partially or completely deleted. We determined that this was done because the data failed validation edits and was not corrected or explained by the carrier. Actuarial personnel deleted this data to avoid distortion of overall rate level indications. See General Observation #6 and Specific Finding #5 in the Overall Rate Level Area Report in Volume III for a more detailed discussion of this finding.
- ii) One carrier-submitted correction to aggregate financial data was received after the overall rate levels had been produced. The correction was incorporated into aggregate financial data which will be used in the subsequent year rate determinations.
- iii) In three cases, aggregate financial data was associated with a "dummy" carrier code. This was done because a change in carrier reporting practices caused losses to be inconsistent from one year to the next.

When a major change in a carrier's reserving or settlement procedures is judged to distort development patterns, NCCI associates any affected data with a "dummy" carrier code. The dummy code prevents data reported under one reserving or settlement procedure from being evaluated for development against data reported under a different procedure. While deletion of the distorted data would also prevent this, use of a "dummy" carrier code allows data which is being excluded from loss and premium development to at the same time be included in cost ratio and trend calculations.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 1

- iv) Due to a change in reporting convention, NCCI backed out earned but not reported (EBNR) amounts from premium amounts reported by two carriers. This was done to avoid distortion of trend analysis. While the carriers had reported the amount of EBNR premium for both premiums net of discounts and premiums at their company level, they had failed to report the amount of EBNR premium at NCCI's designated statistical reporting (DSR) level. NCCI contacted these carriers, but was unable to obtain the needed EBNR data. NCCI then estimated the needed EBNR premium amounts. NCCI's estimation of EBNR and adjustments to premium amounts appear to have been reasonable for each of the carriers. However, in those instances where we observed that the reported earned premium data was adjusted for EBNR, there was no explanation of the methodology or magnitude of the adjustments included in the rate filing. As a result, the regulator may be unaware of an issue he or she may wish to investigate further, or may lack the information needed for the investigation.

- b) In our sample of 180 Policy Year calls, we noted the following:
 - i) The data for three carriers was deleted. We determined that this was done because the data failed validation edits and was not corrected or explained by the carrier. Actuarial personnel deleted this data to avoid distortion of overall rate level indications. See General Observation #6 and Specific Finding #5 in the Overall Rate Level Area Report in Volume III for a more detailed discussion of this finding.

 - ii) One carrier reported EBNR premium which was adjusted by NCCI, as noted above.

 - iii) Data for one carrier was assigned to dummy carrier codes. This was done because a change in carrier reporting practices caused data to be inconsistent from one year to the next, as noted above.

- c) In our sample of 176 Calendar Year calls, we noted the following:

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 1

- i) The data for two carriers was deleted. We determined that this was done because the data failed validation edits and was not corrected or explained by the carrier. Actuarial personnel deleted this data to avoid distortion of overall rate level indications. See the Overall Rate Level Area Report in Volume III of this report for a more detailed discussion of this finding.
 - ii) One carrier filed a correction call which was received after the overall rate levels were produced. The correction was incorporated into aggregate financial data which will be used in the subsequent year rate determinations.
 - d) In our sample of 181 Insurance Expense Exhibits, we noted that one amended call was not reflected in the Overall Rate Level System.
 - e) In our sample of 177 Reconciliation Reports, we noted no significant exceptions.
- 2) Unit Reports (WCSP data)
- a) In our two samples of 181 unit report data elements used to calculate class rates, we noted the following:
 - i) Two duplicate records. One of these was not eliminated because of Data Administration procedures which specify that identical exposure records should not be treated as duplicates if the payroll amount is divisible by 100. (See discussion of data administration "rules of thumb" in Volume III, Unit Card Data Administration Area Report, General Observation # 6.) The reason the other duplicate record was not removed is unclear. Despite the extensive amount of time dedicated to duplicate record identification and removal in the Data Administration validation process, duplicate records still exist in the final data. See the discussion of duplicate records in Volume III, Unit Card Data Administration Area Report, General Observations # 3, # 4, and # 7, and Specific Finding # 5.
 - ii) Seven hard copy unit reports could not be located. This was reduced from an initial number of 78 unit reports. Unit report

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 1

data had to be retrieved from several locations, including Data Administration files, field offices, state funds and carriers.

- iii) One data entry transposition error.
- iv) One instance of a carrier submitting two first unit reports for a single policy, with different payroll amounts. Since data used in class ratemaking is not validated at the risk level, there is currently no procedure in effect to detect this type of error. Class ratemaking's sensitivity to these errors is low, however, because class ratemaking distributes rate increases across classes and not to individual risks. In experience rating, where sensitivity to these errors is higher, data is validated at the risk level to provide error detection.

Ongoing NCCI systems development initiatives are intended to provide increased control over unit report collection, more thorough and timely validation of unit report collection, more thorough and timely validation of unit report data, and a centralized data base for unit reports. If these new systems have been designed properly, they should eliminate the duplicate report problem. (See the discussion of the URC, URQ and URS projects in Volume I, Overview of Section IB, Section 3.4, Current NCCI Initiatives.)

It is important to note, however, NCCI will not reap the full benefits of improved control over unit report input until these systems are fully implemented late in 1992. See the discussion of specific issues in Volume I, Overview of Section IB, Current NCCI Initiatives. Also for several years after full implementation of the new systems, NCCI will be using old data which was not edited by the new systems. (For a short term recommendation see Volume III, Unit Card Data Administration Area Report, General Observation # 4.)

- b) In our two samples of 181 unit report data elements used to produce experience modification factors (experience mods), we used experience rating sheets to identify and compare the data. As a result of our testing, we noted the following:

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 1

- i) There were 47 instances, or 13% of the sample, in which the risk identification (risk ID) number was either not reported by carriers or did not agree with the risk ID of the current rating. In some cases this was due to ownership changes or because the insured became a multistate business. Either case necessitates a change in risk ID under current NCCI standards. Inaccurate reporting of risk IDs on unit reports is a significant problem for NCCI. For experience rated policies, the matching of unit reports with the correct risk ID requires five full time clerks to perform manual research to resolve discrepancies or omissions. Approximately 45% of rated or rated size unit reports received flow through the system to Experience Rating without any manual review or correction required; the other 55% require manual review and possibly correction.
 - ii) Relevant loss experience was omitted from two ratings . In both cases, the missing data was submitted on a second unit report. One unit had the correct risk ID, while the other was reported without a risk ID.
 - iii) The rating sheet and associated unit reports could not be located for one record in our sample.
- 3) Detailed Claim Information
- a) In our sample of 200 calls for Detailed Claim Information, we noted the following:
 - i) One carrier submitted a first report indicating that the claim had been reopened. This failed an edit and was not corrected on the correction call submitted by the carrier. Since there is only one valid value for this indicator, an NCCI clerk corrected the field without contacting the carrier.
 - ii) Two data entry errors.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 1

E) Results of Judgmental Sample Tests

The testing results of our two judgmental samples indicate that NCCI adequately and accurately captures the data which it receives. Also, based on this sample, there is no evidence that the separate processing and validation of experience rating and class ratemaking data creates material inconsistencies in the WCSP data.

1) Financial Calls

We noted that all hard copy Calendar-Accident Year and Policy Year calls in our sample were captured and reside in system files.

2) Unit Reports

In our judgmental sample to test completeness of WCSP data in the experience rating and class ratemaking systems, we noted the following:

- a) One unit report was omitted from an experience rating due to late receipt of the data.
- b) We noted that all hard copy unit reports in our sample were captured and reside in the Class Ratemaking files.
- c) We noted that all unit reports which had sufficient premium to be experience rated were captured and reside in the Experience Rating files.
- d) We noted that the ELRs and D-Ratios on the experience rating sheets agreed with data from the Experience Rating Plan Manuals produced by Class Ratemaking.

F) Conclusion

Our findings indicate NCCI converts information received from the insurers to NCCI electronic data files with reasonable accuracy. This finding is based on the results of our random statistical sampling and judgmental sampling of NCCI's key data files. Our detailed sampling results are presented in the Appendix to Volume III of this report and summarized below.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section 1B Question 1

- 1) Our statistical sampling tests compared randomly sampled records from NCCI's computerized files with input data (in hard copy or microfiche format) received from the carriers.
 - a) We tested five financial calls used in developing Overall Rate Level: Policy Year, Calendar-Accident Year, Calendar Year, Reconciliation Report and Insurance Expense Exhibit. For each call, we tested several critical data elements. The sample size for each data element ranged from 176 to 181 data records. For each sample, an acceptable upper error limit (or tolerable error rate) of 5 percent was established. In the five calls sampled we did not count as an error any discrepancy of less than \$5,000 (a defined materiality threshold). However, for informational purposes, the Appendix to Volume III specifies all discrepancies noted.
 - b) In four of five financial calls tested, the actual sample error rate ranged from zero to 1.7%. At a 95% confidence level, the achieved upper error rate ranged from 1.6 to 4.2%, which is within the acceptable error range.
 - c) For one call, Calendar-Accident Year, the actual sample error rate ranged from 2.8 to 4.4%. At a 95% confidence level, the achieved upper error limit ranged from 5.7 to 7.9%. The higher error rates were primarily due to NCCI's procedure of zeroing out data which appears unusual and which the carrier cannot or does not explain. The inclusion of these items in our error statistics presents a worst case scenario of the potential error rate. For a more detailed discussion of this finding and the appropriateness of the zeroing out procedure, see Section 3.1, of the Overview of Section 1B in Volume I and General Observation #6 and Specific Finding #5 in the Overall Rate Level Area Report in Volume III.
 - d) In our tests of Class Ratemaking data we tested seven critical data elements in samples of 181 each. For each sample, an acceptable upper error limit (or tolerable error rate) of 5% was established. In evaluating the samples every discrepancy was counted as an error, regardless of dollar amount. The actual sample error rate ranged from 1.7 to 3.9%. At a 95% confidence level, the achieved upper error limit for six of seven data elements ranged from 4.2 to 5.7%, which is within an acceptable range. One data element, "medical

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 1

claim amount," had an achieved upper error limit of 7.1%. This was due to seven errors. Unlocated unit reports caused three of these errors, and the other errors consisted of one data entry error, one duplicate record, and two unexplained discrepancies. Of the errors noted in the seven data elements, the majority related to unlocated unit reports.

- e) In our tests of Experience Rating data we tested six critical data elements in samples of 181 each. For each sample, an acceptable upper error limit (or tolerable error rate) of 5% was established. In evaluating the samples every discrepancy was counted as an error, regardless of dollar amount. The sample error rate ranged from .6 to 1.1%. At a 95% confidence level, the achieved upper error limit ranged from 1.6 to 3.4%, which is within an acceptable range. Again, approximately 50% of the errors were due to unlocated unit reports or rating sheets.
 - f) For DCI, we tested all 54 data fields on the call form. An acceptable upper error limit (or tolerable error rate) of 5% was established. In evaluating the samples every discrepancy was counted as an error, regardless of dollar amount. The sample error rate was .5%. At a 95% confidence level, the achieved upper error limit ranged from 1.5 to 2.3%, which is well within the acceptable range. Errors noted were primarily due to data entry.
- 2) There were no errors noted in two judgmental samples designed to test the completeness of financial call and unit report records. The tests were based strictly on documents known to be received by NCCI. In one judgmental sample to test the consistency of unit report data used by both Class Ratemaking and Experience Rating, one inconsistency error was noted of 29 items tested. This represents 3.4% of the sample. There were no errors noted in our test of the consistency of ELR and D-Ratio data produced by Class Ratemaking.

Our findings on NCCI data quality are limited by the scope of our study. We traced data in NCCI's computerized ratemaking, experience rating and detailed claim information files to input NCCI received from the insurers. We did not test the accuracy of the data originally submitted by the insurers.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 1

(II.) Are adequate quality control procedures in place to ensure the accuracy of the data as they are reported by insurers and processed by the NCCI?

A) Introduction

The primary objective of control procedures is to ensure the accuracy, completeness and timeliness of the processing of data. We reviewed NCCI's controls to assess their effectiveness in achieving this objective. Testing techniques are described in Volume I, Section A of this report.

Detailed findings are included in the Area Reports in Volume III of this report.

B) Processing Controls

1) Processing controls are designed to ensure that the data received from carriers is accurately and completely processed into NCCI's systems. Carrier reporting controls are those controls designed to ensure that the carriers report accurate and complete data in a timely manner. The following section describes the major processing controls over aggregate financial data, WCSP data, detailed claim information and policy information.

a) Financial Calls

The primary processing controls over aggregate financial data in the Financial Data and Aggregate Ratemaking areas of the Overall Rate Level function are as follows:

- i) The Financial Data area is responsible for processing aggregate financial data into NCCI's overall rate level systems. Data handling procedures and responsibilities are defined and documented.
- ii) Financial calls are date stamped, individually logged and sorted into batches by call type. The data is tracked in manual logs up to the time it is delivered to Aggregate Ratemaking actuaries for use in rate level production. The logs are sufficiently detailed so that an individual call can be located in the system.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 1

- iii) Corrections are requested from carriers and tracked in manual logs.
- iv) Changes are not made directly to the financial call data used in calculating overall rate levels once the file is frozen for use in production. All changes are entered into a separate correction file, thereby segregating original carrier submitted data from corrections.

b) Unit Reports

The primary processing controls over unit report data used in the Class Ratemaking and Experience Rating systems are as follows:

- i) Unit reports are assigned unique administration numbers. Hard copy units are sorted into batches and tracked in manual logs up to the time they are released to Experience Rating and/or Class Ratemaking. The number of unit reports received on magnetic tape is verified to the transmittal letter sent by the carrier.
- ii) Unit report data used in class ratemaking is stored in Payroll and Loss Detail files by state. All changes to the data are made using a debit/credit approach. Although this makes working with the validation reports cumbersome, it provides a history of all modifications to the data.
- iii) Corrections are batched and controlled using manual logs.
- iv) Any changes to the data that are identified by actuaries in Class Ratemaking are processed by Data Administration.
- v) Unit report data used in experience rating calculations is passed to the experience rating system from Data Conversion. A manual reconciliation of system control totals is performed to ensure that all data is captured.
- vi) Error corrections are either made by ACS and controlled by a central group using batch controls and logs or are entered

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 1

on-line by field office personnel where on-line screens provide limited validation of corrections.

c) **Detailed Claim Information (DCI)**

The primary processing controls over detailed claim data used in the DCI system are as follows:

- i) DCI calls, in both hard copy and magnetic tape formats, are batched for processing into the system. Manual logs are kept to ensure that all data is processed. Once the batches are processed, a reconciliation of all data received to all data processed is performed.
- ii) Calls for corrected information which are caused by edit failures of hard copy original submissions are manually compared to the original submission to ensure that the data was properly processed.

2) **Findings**

- a) The results of our sample testing for data accuracy indicate that NCCI controls over the processing of the data it receives are functioning effectively.
- b) NCCI continues to process large volumes of hard copy inputs. A significant amount of effort is devoted to sorting, batching and controlling these inputs.
- c) Certain error correction processes in Data Conversion, Data Administration and Experience Rating are not well controlled. We noted cases where corrections are not reviewed sufficiently before they are processed to update files. We also noted cases where the accuracy of corrections made was not sufficiently verified.
- d) A significant amount of manual processing and handling of carrier submitted data occurs before the data is captured in electronic files. While we noted no omissions of data in our judgmental samples, these practices increase the risk that data may be lost before it can be captured.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 1

C) Carrier Reporting Controls

Carrier reporting controls are those controls designed to ensure that the carriers report accurate and complete data in a timely manner. The following section describes the major carrier reporting controls over aggregate financial data, WCSP data, detailed claim information and policy information.

1) Current Control Procedures

a) Financial Calls

The primary carrier reporting controls over aggregate financial data are as follows:

- i) Carriers are required to submit a list of all calls by state for which they will be reporting aggregate financial data. This information is used to create a control log of calls expected by NCCI.**
- ii) Financial calls are validated for completeness and arithmetic accuracy as they are received. Errors are returned to carriers for correction.**
- iii) The five calls used in overall rate level calculations and the reconciliation to carrier financial data are subject to the Performance Evaluation Monetary Incentive Program (PEMIP). This program encourages timely submission of data by providing credits to carriers. Late and inaccurate data submissions are subject to financial penalties. The financial incentive program assesses modest penalties (a total of \$364,272 was assessed in 1990).**
- iv) Premium and loss information used in calculating overall rate levels is reconciled to carrier financial statements.**
- v) Financial call data is validated by a series of application programs. The major validation programs are:**

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 1

- o Policy Year Validation; Accident Year Validation - which perform arithmetic and relational validations, both within the current year call and in comparison to prior years' data;
- o Deviation Analysis - which performs a reasonableness test of reported standard premium at Designated Statistical Reporting (DSR) level.
- o Policy Year - Accident Year (PY-AY) Check - Compares the losses by year on page 2 of the Policy Year and Accident Year calls for consistency.
- o Premium Analysis - This program verifies that calendar year premiums are consistent between years.
- o Calendar Year (CY) Check - Derives calendar year values from Calendar-Accident Year and Policy Year premium and loss values.
- o Prior Development - Analyzes the contribution, by carrier, of tenth-to-ultimate contribution to statewide development factors.
- o Development Checksheet - Identifies carriers whose policy year development factors are contributing to statewide fluctuations between years.

b) Unit Reports

The primary carrier reporting controls over unit report data are as follows:

- i) The primary control over the completeness of unit report data is the Profile system in Experience Rating. This system indicates all unit reports for experience rated policies required to produce ratings. If required unit reports have not been received, requests for missing data are sent to the appropriate carrier.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 1

- ii) The accuracy of unit report data used in calculating class rates is verified by a series of system generated exception reports in Data Administration. These are manually reviewed and corrected. The validation is performed primarily by class code or injury type. The major programs used are:
 - o RCDUPOFF - Program to automatically offset exact duplicate records with a matching credit.
 - o State Validation II - Exception report which identifies certain conditions. Examples are losses for a class code with no payroll, and losses in a premium only class code.
 - o RCDVALID - A procedure which contains nineteen reports that can be run on demand. Many edits are similar to the State Validation II program.
 - o Class Payroll Fluctuation Program (CPFI) - Program that investigates payroll by class code over a three year period. This is the primary tool used to ensure the completeness of WCSP data.
 - o Reasonableness Test - Program which examines loss development by industry group and injury type for a state. Manual research and explanation is required for certain percentages, between 70-100%, of fluctuation for flagged items.

- iii) Validation of unit report data for accuracy and consistency at the risk level is performed by Experience Rating in their manual audit of rating sheets. These procedures verify that:
 - o Name, risk ID and state agree to hard copy control document;
 - o Premium is sufficient to qualify policy for experience rating;
 - o Change in premium for two most recent years is less than 50%;

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 1

- o Class codes are consistent between years;
- o Experience modification factor has not changed by more than 25% compared to the previous modification factor;
- o Payroll has not changed by more than 50% since the prior year;
- o No duplicate records are included in the rating;
- o All applicable and required experience has been included in the rating; and,
- o Name and policy effective date agree with the data in the policy system (PICS).

If a rating fails any of these edits, unit reports are pulled to verify the data used in the rating.

c) Detailed Claim Information (DCI)

The primary carrier reporting control over detailed claim data (DCI) is to subject the data to a series of edits. Basic edits are designed to ensure that claimant and policy information agrees with data already in the DCI system for subsequent and correction calls. Field level edits are performed to ensure that data submitted is mathematically accurate, consistent among fields and that benefits are reasonable.

d) Policy Information Capture (PICS)

The primary carrier reporting controls over policy information are:

- i) NCCI field office personnel perform a limited visual review of all policy information.
- ii) NCCI systems perform limited automated verification of carrier submitted data.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 1

2) Findings

- a) The reconciliation of financial call data to carrier statements is not completed for many states until after the overall rate level calculations are completed. This does not provide timely assurance that the data used in the calculations reconciles to audited annual statements.
- b) The procedures to ensure that all financial call data is received relies on the carriers providing a list of the calls they will file. Although the total number of calls submitted is checked for reasonableness and cross-referenced with A.M. Best written premium when it becomes available, there is no control which provides absolute assurance that all financial calls which should be filed are, in fact, received by NCCI.
- c) Unit report validation is performed separately by Data Administration and Experience Rating. Experience Rating uses the data first, but there are no procedures to ensure that all changes made to unit report data during the experience rating process are included in data used by Data Administration.
- d) NCCI performs very limited validation to ensure WCSP data is reported accurately and consistently for each risk. Data Administration relies on tests of data in aggregate to identify data inaccuracies. Experience Rating performs a visual review of data for each rated risk, but this review is limited and occurs at the end of the experience rating process.
- e) There is no means of ensuring that all unit report data due is actually received. The profile system in Experience Rating only serves as a control over the completeness of unit report data for experience rated policies. Data Administration reasonableness tests may identify missing data for very large risks. These controls are not sufficient to ensure that unit reports are received for all workers compensation policies written.
- f) There are not adequate controls to ensure the accuracy of unit report data as submitted by carriers. The validations performed by NCCI only assess the reasonableness of the data. Some form of external

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 1

verification of carrier systems and reporting to NCCI should be performed to ensure data accuracy.

- g) There are not adequate controls in place to verify that policy information for all workers compensation policies written is captured by NCCI.

(III.) How could these procedures be improved?

A) Recommendations

- 1) NCCI should implement systems to track and control the due date and receipt of all information submitted by carriers including aggregate financial data, WCSP data, and policy data. The overall objective of these systems should be to ensure complete and timely submission of data to NCCI.
- 2) NCCI should validate all data at the time of receipt.
- 3) Errors identified in data submitted to NCCI by carriers should be corrected by the carriers through resubmission of data.
- 4) NCCI should develop data validation software and distribute it to carriers. Carriers should use this software to validate data before submitting it to NCCI. Such validation should be applied to aggregate financial data, WCSP data, policy data, and DCI data.
- 5) NCCI should develop an integrated enterprise database. This database should provide access to aggregate financial data, WCSP data, policy data, DCI data, rates, experience ratings, inspection information and risk information. The database and surrounding applications should enforce integrity between these types of data based on established relationships.
- 6) NCCI should develop an electronic data transfer mechanism for submission of data from the carriers to NCCI. Carriers should be strongly encouraged or required to use this mechanism for submission of aggregate financial data, WCSP data, policy data, and DCI data.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 1

- 7) NCCI should institute clear, precise, and consistent policies regarding the timeliness and quality of carrier submissions of data. These policies should apply to aggregate financial data, WCSP data, policy data, and DCI data.
- 8) NCCI should establish an internal quality control group to sample statistical data, monitor error rates and improve the quality of data. Target error rates should be established for NCCI processing departments and an incentive system should be implemented to encourage achievement of these targets.
- 9) NCCI should establish a program of regular carrier performance reporting. Carrier performance reports should be distributed to carrier operational and executive management, and possibly regulators.
- 10) NCCI should implement consistent, effective financial incentive programs and/or fines to encourage carrier compliance with timeliness and quality standards.
- 11) NCCI should automate many of its current manually intensive areas. This automation effort should be orchestrated from an enterprise perspective. Unintegrated departmental systems should be avoided.
- 12) State Insurance Regulators should establish a uniform statistical data quality standard that will require NCCI and carriers to achieve certain data quality and timeliness standards.

B) Current Initiatives

NCCI has addressed data quality concerns in its systems planning. Projects which are currently proposed or in development are as follows:

- 1) Enterprise Data Model (EDM) - This is a study of the data and processes currently in place at NCCI. Its purpose is to provide a candid appraisal of current systems and a conceptual framework for future systems.
- 2) Unit Report Control (URC) - This system is currently in the testing phase. It is designed to notify carriers of unit reports due, using the PICS database to ensure that data for all policies is captured. URC went into

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 1

production as of May 1, 1991 and phased implementation is scheduled to be completed by July 1992.

- 3) **Unit Report Quality (URQ)** - This system is currently in the design phase. It is intended to provide front end validation of unit report data. URQ is scheduled for a phased implementation ending in October 1992.
- 4) **Unit Report System (URS)** - This system is currently in the installation phase. This is intended to provide a centralized database for unit report data which will be used in the calculation of class rates and experience mods. URS is scheduled for implementation in September 1991.
- 5) **PICS 3.0** - The objective of the PICS 3.0 project is to implement approximately twenty change order requests to the existing PICS system. The two most significant planned enhancements are: 1) capture of additional policy information and 2) automated name and address standardization for policy information submitted on magtape.
- 6) **PICS Automated Policy Review** - The objective of the Automated Policy Review System is to provide automated "front end" data quality edits which verify policy information immediately upon receipt. This system is intended to replace manual review of over 1.5 million policies per year. The automated Policy Review System is scheduled for implementation by October of 1992.
- 7) **Experience Rating Automated Auditing** - The objective of the Automated Auditing System is to provide automated "back-end" data quality edits which verify experience rating sheet data. This system is intended to replace manual review of over 600,000 rating sheets per year. The Automated Auditing System is scheduled to be completed in October of 1991.

Timely implementation of these proposed systems should enhance the controls over NCCI data quality and controls.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 2

RFP Question 2. (I.) Does the NCCI reconcile data collected for ratemaking purposes with the data reported in insurers' annual statements? (II.) If so, how are these data reconciled and what is done when these data do not match? (III.) Are there additional reconciliation measures that could be beneficial?

(I.) Does the NCCI reconcile data collected for ratemaking purposes with the data reported in insurers' annual statements?

NCCI reconciles calendar year net earned premiums at company level and direct losses incurred from the financial calls to carrier financial data as reported by A.M. Best & Company. Calendar-accident year and policy year data used in calculating overall rate level indications is then reconciled to the calendar year data.

There is no reconciliation process in place to verify the accuracy of WCSP data to either the financial calls or to carrier annual statements.

(II.) If so, how are these data reconciled and what is done when these data do not match?

A) Reconciliation Calls

- 1) The financial calls used in the reconciliation process are:
 - a) Call #2 - Calendar Year Call for Compensation Experience by State
 - b) Call #6 - Insurance Expense Exhibit (IEE) - Calendar Year Basis
 - c) Call #8 - Reconciliation Report - Calendar Year Basis
 - d) Call #9 - "F" Classification Calendar Year Call for Compensation Experience by State - Calendar Year Basis
 - e) Call #18 - Annual Call for Coal Mine Compensation Experience: Calendar Period January 1 through December 31

These calls are used to reconcile the data used in calculating overall rate level indications to the annual statements.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 2

- 2) The data used in the development of overall rate level indications is taken from the following calls:
 - a) Call #3 - Policy Year Call for Compensation Experience by State Valued as of December 31
 - b) Call #5 - Calendar-Accident Year Call for Compensation Experience by State Valued as of December 31
 - c) Call #11 - "F" Classification Policy Year Call for Compensation Experience as of December 31

B) Reconciliation Process

- 1) The Reconciliation Report totals the calendar year net earned premium and direct incurred losses, respectively, for industrial classes, "F" classes, Coal Mine classes, National Defense Projects and Excess Policies data. Industrial class data is compared to call #2; "F" class data is compared to call #9; and Coal Mine data is compared to call #18.
- 2) The total of this calendar year experience is agreed to Part IV of the Insurance Expense Exhibit (IEE, call #6). The IEE is due at NCCI by April 1 of each year.
- 3) Part IV of the IEE is agreed to the A.M. Best & Company summarization of data from the Exhibit of Premiums and Losses on page 14 of the annual statement. This is done when the A.M. Best data becomes available in July.
- 4) The Policy Year (#3) and Calendar-Accident Year (#5) calls contain all workers compensation net earned premium and direct incurred losses data from the inception of writing the business. Calendar year data for industrial classes is derived by subtracting prior year cumulative to date totals from current year cumulative to date totals for both the Policy Year and Calendar-Accident Year calls. The derived calendar year experience is compared to the Calendar Year call data which is reconciled to carrier annual statements as described above.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 2

C) Additional Tests

In addition to the reconciliation process, there are other checks performed to ensure the consistency of the data among the calls:

- 1) Premiums are compared between the Policy Year and Calendar-Accident Year Calls
- 2) The difference between Standard Earned Premium at Company level (SEP) and Standard Earned Premium at Designated Statistical Reporting level (DSR) is checked for consistency with filed deviations on record at NCCI
- 3) The difference between SEP at DSR before schedule rating adjustments and SEP at DSR after schedule rating adjustments from call #10 is reviewed for reasonableness.

D) Exception Resolution

If reported data fails any of the checks or does not reconcile within +/- \$1,000, the carrier is contacted for an explanation of the discrepancy. Carriers are required to respond and are fined if they fail to comply.

E) Conclusion

NCCI's reconciliation process is sufficient to ensure that the aggregate financial data used to calculate overall rate level indications reconciles to carriers annual statements. However, due to the timing of the process, the risk exists that overall rate levels may be filed prior to the availability of the summarized annual statement data. NCCI plans to complete the reconciliations earlier beginning in 1991 by using carrier financial information summarized by the NAIC. This data is available in June whereas A.M. Best & Company data is not published until July.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 2

(III.) Are there additional reconciliation measures that could be beneficial?

A) Improvements

The lack of an integrated database at NCCI raises the question of whether the data used in NCCI systems is consistent across systems. There are currently no reconciliation procedures to ensure this. Since the financial call data is reconciled to carrier annual statements, the financial call data can be relied on to test the accuracy of other NCCI data. We recommend that the following reconciliations be performed.

- 1) Compare WCSP data to financial call data. This would provide some assurance that all WCSP data is being used to calculate class rates. However, a precise reconciliation cannot be performed due to the different valuation dates of the data. Financial call data is valued as of December 31, while WCSP data is valued 18 months after the policy inception date and every twelve months thereafter. We performed this comparison to ensure that our statistical sampling population of WCSP data used in class ratemaking was complete. We identified a problem with data missing from our sample population related to a District of Columbia filing as a result of the test. This problem did not occur in the production of class rates; however, the results of the test prove the potential benefit of performing the comparison.
- 2) Compare premium captured in the PICS database to financial call data to help assess the completeness of PICS. Another possibility would be to require carriers to submit the number of workers compensation policies written in each state on a financial call. This information could also be used to verify that all policies are captured in PICS; however, it would not provide the level of assurance that would be obtained by a reconciliation to audited financial data.
- 3) Reconcile WCSP data to policy data in the PICS database to ensure that data used in class ratemaking has been submitted for all workers compensation policies written. We understand that NCCI is implementing the Unit Report Control (URC) system. URC is designed to request unit reports from carriers for all policies in PICS. The effectiveness of URC as a timeliness and completeness control over receipt of WCSP data for class ratemaking is related to the completeness of the PICS database.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 3

RFP Question 3. (L) Does the NCCI have adequate procedures to ensure that classification data are complete and accurate? Are additional checks of the data performed when unusual classification indications appear? (II.) Does the NCCI check to be sure that insurers report reimbursements by second injury funds, subrogation and funds associated with cases determined to be noncompensable?

(I) Does the NCCI have adequate procedures to ensure that classification data are complete and accurate. Are additional checks of the data performed when unusual classification indications appear?

A. Overview of Control Procedures

Misclassification of data may impact class ratemaking and/or experience rating. Misclassifications which impact ratemaking may occur in class codes or injury codes. If misclassifications occur, payroll, loss or premium data could be distorted. They may also result in misclasses among the three major industry groupings of manufacturing, contracting and all other industries.

Control procedures to detect misclassifications are as follows:

- 1) All aggregate WCSP payroll amounts are reviewed for unreasonable fluctuations between first and second unit reports, including correction reports. Such amounts are also reviewed between policy years. The review is first performed at the state level. The review is then extended to a class level comparison in the same manner as indicated above.
- 2) If an unusual payroll variation is noted at the class level, a risk level review is then performed. Carriers are contacted by a Data Administration analyst when deemed necessary to obtain explanations for fluctuations.
- 3) Aggregate WCSP loss amounts are reviewed at a state level and injury code level for a particular state.
- 4) If unusual loss development is noted at the injury code level, a review is then made at the class level. Finally, if an unusual fluctuation is noted at this level, a review is performed at the risk level. Carriers are contacted if it is deemed necessary to obtain explanations.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 3

- 5) In connection with the explanation process, certain reports are generated to facilitate analysis. Examples of these reports are the Large Loss Exhibit (losses greater than \$500,000) and Large Accounts Listing (class codes with greater than \$100 million in payroll by insured). To identify unresolved fluctuations, an explanation letter is prepared by Data Administration personnel which is provided to Class Ratemaking and regional actuaries.
- 6) Review of experience rating sheets for each risk is performed to detect unusual fluctuations in payroll or changes in class codes.
- 7) Class level premium data is not utilized in the ratemaking process, therefore no premium validation procedures are performed by NCCI on such data.

B. Conclusions

NCCI's reasonableness tests are designed to identify basic (e.g., arithmetic) errors and actuarial edits to optimize the volume of usable data. Actuarial edits identify unusual indications in the data which are reviewed to determine whether the data is satisfactory for use in ratemaking. While NCCI performs these reasonableness reviews of the critical data elements, payroll and losses, there are limitations with their procedures. Limitations in the procedures utilized by NCCI are as follows:

- 1) Efforts to explain identified fluctuations or obtain the missing data may be unsuccessful for any number of reasons:
 - a) The data may not be received by NCCI in time for the production of the rate filing
 - b) The carrier may not have the data and may not be able to explain its absence. Also, the carrier may not respond to NCCI's request for data correction or information. NCCI estimates that no responses are received on approximately 10-15% of such requests
 - c) The risk may have become self insured, ceased operations or changed its name
 - d) The carrier may have ceased operations

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 3

- e) The risk may be reported in a different class code
- 2) In some cases, NCCI will identify class inconsistencies in the normal course of their review. However, NCCI procedures for class ratemaking validation of losses do not require class level reviews unless unusual fluctuations are noted in the injury code level review.
- 3) Finally, and most importantly, there are no procedures in effect for the verification of classification data through tests of carrier records.

In summary, for the reasons stated above, NCCI's procedures do not ensure that classification data submitted by the carrier is complete and accurate. This is the case even in situations where NCCI performs additional checks of the data because efforts to explain or obtain corrections to data may not be successful. We recommend procedures be developed wherein NCCI performs or obtains independent verification of carrier submitted data through audits of carrier records.

(II.) Does the NCCI check to be sure that insurers report reimbursements by second injury funds, subrogation and funds associated with cases determined to be noncompensable?

A. Overview of Control Procedures

The NCCI's instructions to the carriers for the preparation of financial call and WCSP data state that reimbursements from second injury funds, subrogation, etc., should be reflected in reported incurred losses.

Additionally, loss coverage codes are provided by the carrier on unit reports. The loss coverage code designates whether the loss is subject to recovery from a third party or special fund.

Financial call data is reconciled to the carrier's annual statement; specifically Part IV of the Insurance Expense Exhibit. This is largely accomplished through a separate call referred to as the Reconciliation Report Call.

There are no control procedures to verify that carriers report WCSP incurred losses net of reimbursements from second injury funds, subrogation and noncompensable cases.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 3

B. Conclusions

NCCI's control procedures do not ensure that incurred loss data is reported net of reimbursements from third parties or special funds. This conclusion is based primarily on the lack of NCCI audits of carrier data and systems. Such audits would disclose whether the carrier is properly aggregating net incurred losses for statistical reporting and annual statement purposes. While the carrier reconciles financial call data with its annual statement in the Reconciliation Report Call and provides explanations of differences, without independent verification of carrier records and reporting systems, no assurances can be given that the data is reported completely and accurately. We recommend procedures be developed wherein NCCI performs or obtains independent verification of carrier submitted data through audits of carrier records.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 4

RFP Question 4. What quality controls are used to ensure the accuracy of data collected under a detailed claim information call?

A) Introduction

The Detailed Claim Information (DCI) system collects information on a sample of all reported indemnity claims in thirteen states. Indemnity claims are reported to NCCI six months after they are reported to the carriers. Carriers continue to file reports every twelve months until a claim closes, no longer includes indemnity compensation or reaches its tenth year. Information is initially reported by carriers on a DCI call form. After the first report for a claim is processed into the system, all calls for corrected and subsequent information are generated by NCCI and sent to the carriers.

B) Quality Control Procedures

- 1) The Sample Control form submitted by carriers calculates the number of claims each carrier expects to report for each state in the sample.
 - a) The form is initially filed for each month sixty days after month end.
 - b) The total number of indemnity claims per the carrier is multiplied by the sampling ratio calculated by NCCI for each state. This calculation provides the sixty day estimate of the number of claims that the carrier will file for the month.
 - c) The form is updated six months after the month end to reflect the deletion of claims that were originally reported but do not include indemnity compensation, and to add claims reported after the first filing of the Sample Control form.
 - d) NCCI reconciles the number of claims from the Sample Control form to the actual number of claims received. However, discrepancies are not brought to carriers' attention unless there is a large difference between the numbers.
- 2) DCI calls are subjected to a series of edits as they are processed into the system. These edits can produce two types of errors which are each handled differently.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 4

- a) The more serious error condition, known as a "fatal" error, is caused by edits which verify the completeness and accuracy of claim identification data. Carrier code, policy number and claim number are tested for valid values and agreement with data in the system for all corrected and subsequent reports. In addition, these edits ensure that duplicate claims do not exist, that any previously submitted reports are corrected and exist in the valid file and that all prior reports have been received. Fatal errors are not processed into the DCI system. They are returned to the carrier for correction and must be resubmitted on the same report type which generated the error. NCCI does not have any procedures to follow up on fatal errors to ensure that they are resubmitted. Once the fatal error is returned to the carrier, NCCI loses control of it. No diary or follow-up system is utilized to maintain control.

- b) The less serious error condition occurs when data fails field level edits that verify the completeness and internal consistency of fields on the call. These edits also perform limited reasonableness checks on loss coverage codes and benefit amounts. Each field on the call is subjected to between one and ten specific edits. If a call fails any of the edits, it is processed into a suspense file and a call for corrected information is generated and sent to the carrier. This call contains the data originally submitted and a list of the edits that were failed. If the call for corrected information is not submitted by the carrier, up to three additional notices will be generated and mailed. There are no formal procedures to follow up with carriers if corrections are not submitted after the fourth request has been sent.

- c) Once a valid claim is established in the DCI system, calls for subsequent information are generated each year until the claim closes, no longer includes indemnity compensation or reaches its tenth report. The first call for subsequent information is sent by NCCI one to two months prior to the due date of the call. If the carrier does not respond, up to three more calls will be sent. There are no formal procedures in place to follow up with carriers if a subsequent report is not submitted after the fourth request has been sent.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 4

C) Conclusion

- 1) The DCI system has certain controls built into it; however they are ineffective due to a lack of enforcement of carrier reporting requirements.
 - a) Carriers should be required to either submit the total number of claims indicated on the Sample Control form or to provide explanations for claims not submitted.
 - b) NCCI should contact carriers that do not respond to requests for corrected and subsequent detailed claim information.
 - c) NCCI should implement a control to track fatal errors and ensure that they are returned by carriers.
 - d) We understand that the new DCI system, scheduled to go into production July 1,1991, has the capabilities to address the above noted control weaknesses.
- 2) The DCI system controls over data submitted on the detailed information call are not sufficient to ensure its accuracy. The current edits ensure that the data is reasonable and consistent within an individual call. However, there is no assurance that carriers' workers compensation reporting and processing systems are providing accurate data. NCCI should either obtain independent verification of these systems or obtain independent verification of the reporting of WCSP data and then compare DCI claims to WCSP data.
- 3) A data quality standard for all carriers should be promulgated by either NCCI or state regulators to require compliance by carriers in reporting DCI claims.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 5

RFP Question 5. (I.) Are the data collected and maintained in such a way that the experience from a specific policy can always be traced? If not, how could this be accomplished? (II.) Are the data for risks in the residual markets maintained in such a way that the experience can be compiled separately for the residual market versus the voluntary market?

(L) Are the data collected and maintained in such a way that the experience from a specific policy can always be traced? If not, how could this be accomplished?

A. Overview of Data Collection Procedures

The loss experience of a specific policy for experience rated and rated size policies (see Glossary) can be traced in all cases.

The experience for other policies cannot be traced in all cases. This is due to the following reasons:

- 1) Policy numbers only became part of the payroll and loss detail file (P/L file) used for ratemaking commencing in July 1987. This encompasses policy years 1986 and forward.
- 2) Policy numbers were input to Data Conversion files prior to July 1987. However, as noted above, policy numbers were not captured in the P/L detail file until mid-1987. The policy number archived on Data Conversion files is not validated; therefore it does not represent usable data in its current state.

To incorporate policy number in the P/L detail file for data received before July 1987, archived Data Conversion files would have to be fully validated or selectively merged with existing P/L detail files.

In our opinion, it would not be practical to validate the archived data files. Each year, the Data Administration area spends up to six months per state validating unit report data. To validate several years of historical data, NCCI would have to devote excessive resources to this task.

It is also not feasible to extract policy numbers from archived Data Conversion files and merge this information with validated P/L detail file information. Since P/L detail file data received before July 1987 does not contain unique

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 5

identifiers such as policy numbers, it would be impossible to match the data with corresponding data in archived Data Conversion files.

While experience rated, rated size and other policies for which unit reports were received after July 1987 are traceable, complexities related to data storage do not facilitate retrieving the data readily. The data for each state is stored in an independent file. Therefore, due to lack of file integration, it is difficult to readily retrieve the data for a policy on a country-wide basis, for instance.

For traceable policies, NCCI is able to trace experience to a specific policy through its unit card tracking system (ICT). ICT contains unit card identifying information such as risk name, carrier code, risk I.D., policy effective date, policy number, unit report number and administration (or locator) number. Due to the information maintained on ICT, it is used by the functional departments as an effective research tool.

B. Recommendations

There are several improvements which could be implemented which would enhance NCCI's ability to trace experience for all policies:

- 1) An integrated database, versus the fragmented database which currently exists, would facilitate retrieval of individual policy experience.
- 2) Risk ID numbers are currently assigned to experience rated and rated size policies only. The assignment of risk IDs to all policies would facilitate retrieval of policy experience.
- 3) Retrieval and physical access to policy experience would be significantly enhanced by the inclusion of risk ID and administration numbers on policy experience reports generated.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 5

(II.) Are the data for risks in the residual markets maintained in such a way that the experience can be compiled separately for the residual market versus the voluntary market?

A. Overview of Data Collection Procedures

The data for residual market risks (assigned risks) can be compiled separately from the voluntary market risks in most cases:

- 1) This is achieved by using an assigned risk code which is recorded on the unit report by the carrier. The code is input into NCCI's unit report files. The coding became part of the WCSP files commencing in July 1987. Therefore, the assigned risk data by policy is not accessible if it was submitted by the carrier prior to that date. However, NCCI is not currently validating or using the coding for segregation of the data.

Relative to validation of the assigned risk codes, there are no procedures in place to verify the assigned risk coding as submitted by the carrier, or to ensure that all assigned risk unit reports are coded as such. At a minimum, limited validation could be performed by matching policy numbers from the assigned risk pools serviced by NCCI with the data in the ratemaking files. NCCI administers the assigned risk pools in 33 states. This procedure, however, is not entirely effective since it cannot be performed for all states.

Currently, statewide class rates are developed using combined voluntary and assigned risk data. Twenty-four states require separate rates for the two markets. For those states, NCCI uses statewide adjustment factors to generate voluntary rates. A standard factor is then applied to the voluntary rates to arrive at assigned risk class rates.

- 2) There are three financial calls for assigned risk data. These calls became effective in 1990 requiring data to be reported for assigned risk policies written in 1989 and later. The calls are used in overall ratemaking for the development of assigned risk experience only. In addition, when used in conjunction with the Statewide Policy Year and Accident Year call, experience for the voluntary market can be developed separately. The three calls parallel data collected for all experience and are as follows:

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 5

- a) The Assigned Risk Calendar Year Call
- b) The Assigned Risk Policy Year Call
- c) The Assigned Risk Calendar-Accident Year Call.

B. Recommendations

The emerging trend in states is the requirement for separate voluntary and assigned risk rates. As a result, NCCI should develop validation procedures for assigned risk codes submitted on unit reports. They also should develop procedures which would validate this data with that submitted on the three assigned risk financial calls. To ensure proper reporting of assigned risk codes by the carrier, procedures should be developed by NCCI to perform carrier audits of such data. Other alternatives may be for the carrier to provide assurance to NCCI that the data has been audited (e.g., by external or internal auditors), or for such audits to be performed in conjunction with regulatory examinations.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 6

RFP Question 6. Is sufficient information collected and maintained to test and implement reasonable alternative ratemaking methodologies? If not, what enhancements could be made to support alternative methodologies and identify the underlying causes of rate increases?

A. Overview of Sufficiency of Data Collection

This question addresses data collected in both financial calls and the WCSP. Sufficient information is currently collected and maintained to provide a means to evaluate numerous alternative ratemaking methodologies, identify findings and generate recommendations. This conclusion is based solely upon the results of the Ratemaking Procedures and Evaluation of Ratemaking Methodologies report in Section II of the Milliman & Robertson (M&R) portion of this examination. Various parts of Section II evaluated extensively current ratemaking methodologies and investigated alternative approaches using information currently collected. Section II also recommends collecting additional information which would enhance NCCI's methodology. NCCI is just beginning to collect or is planning to capture some of this additional information. Section II recommends the collection of one additional statistic in each of the Accident Year and Policy Year Financial Calls and one additional data element in the WCSP. It also recommends more frequent receipt of Size of Risk Expense Analysis Call.

NCCI is in the process of designing a new Detailed Claim Information (DCI) database and system to replace the existing DCI version. Comments about the new DCI system are included in a separate section of this report. We understand that one purpose of the new DCI system will be to serve as a source of data for special studies since the DCI system will contain more detailed loss experience data than the WCSP data and the summarized financial call information combined.

NCCI's policy is to retain detailed and summarized WCSP data in magnetic format for ten years. This policy has been in effect for approximately five years.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 6

B. Suggested Enhancements

Enhancements which could be made to support alternative methodologies, identify underlying causes of rate increases and enhance NCCI's methodology are as follows:

- 1) **Policy Year and Calendar-Accident Year Financial Calls**
 - a) The M&R report on ratemaking procedures recommends the inclusion of a new element, "number of claims closed with indemnity" (or alternatively, the number of claims open with indemnity), which would support additional reserving techniques and diagnostic tests of loss development. The cost to implement this change would involve redesigning the call forms, modifying the overall rate level systems to include the additional data element and creation of or changes to actuarial applications for reserving and diagnostic testing. In addition, there would be carrier costs to derive this information. However, since carriers are already collecting total number of reported indemnity claims and a claim's open or closed status, we would not expect carrier costs to be significant.
 - b) The expansion of information from eight to fifteen reports by individual policy year and accident year will enhance ratemaking methodology. NCCI began collecting one additional report year of information beginning with data valued as of 12/31/87. The calls valued at 12/31/89 have data detailed for 12 years and a summarized line for all prior years. The number of additional years will increase each year until fifteen years of data is available. The additional report years will improve loss development analysis and reduce the impact of the loss development "tail" factor.
 - c) The collection of reported number of indemnity claims will be very beneficial. NCCI began to collect this data with 1989 calls received in 1990. The reported indemnity claim counts will support investigation of trends in severity and frequency in the future, and permit a reevaluation of the selection of data underlying the trend calculations.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 6

2) Size of Risk Expense Analysis Call

This call should be collected more frequently and on a regular basis. The last call was for 1982. The next call is for 1991. More frequent collection of data would entail additional NCCI processing and data collection costs.

3) Workers Compensation Statistical Plan (WCSP)

- a) Section II of the examination relating to ratemaking procedures recommends the inclusion of a new data element, "wage recognition plan subclass code", to support use of wage recognition plans. The wage recognition plan subclass code, as discussed more fully in Section II of the examination, would only be used for those states and classes of employment identified as having residual inequities after application of the Revised Experience Rating Plan to the limited payroll exposure base. This subclass code would be used in the analysis to derive subclass differentials for inclusion in rate filings. The definition of the subclass codes would need to reflect average wage groupings, probably differ by state, and consider the impact of inflation. Costs to implement this recommendation would be the costs to change the statistical plan as well as development of actuarial applications to utilize the new data for subclass differentials.
- b) The M&R report on Ratemaking also recommends the collection of hours worked or average hourly wages for certain classes of insureds where it is most feasible. This will be used to reduce some of the inequities in the use of wage rate recognition plans. The costs to collect this data would include:
 - i) Changing carrier programs for those carriers capturing WCSP data on an automated basis.
 - ii) Creating NCCI data base programs to compile and maintain the data.
 - iii) Creating NCCI programs to access the data.
 - iv) Additional insured record keeping and insurer audits.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 6

- c) NCCI's recent decision to begin collecting allocated loss adjustment expenses (ALAE) in the WCSP will be very beneficial. Such information will better support the analysis of ultimate ALAE costs and investigate relationships between loss and ALAE (e.g., differences by state).

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 7

RFP Question 7. Do the NCCI's data gathering procedures ensure that the database is not distorted by schedule rating?

A. Overall Rate Level

1) Overview of Data Collection Procedures

There are two financial calls which are critical to the determination of overall rate levels. They are the Policy Year and Calendar-Accident Year Calls. NCCI's instructions to the carriers for the preparation of these calls state that standard earned premiums at the designated statistical reporting (DSR) level should be reported prior to the application of schedule rating adjustments. Schedule rating adjustments are competitive pricing plans established by carriers in states which permit such premium adjustments. A separate call, the Supplemental Call for Schedule Rating Premium Adjustments (Schedule Rating Call), is intended to be used by NCCI to verify that carriers have properly accounted for schedule rating adjustments in the call submissions. NCCI performs the following procedures to determine whether the database may be distorted by schedule rating:

- a) NCCI reconciles DSR standard earned premiums per the Schedule Rating Call to the Policy Year Call. This is performed by reviewing variations between standard premiums prior to schedule rating (per the Policy Year Call) and standard premiums after the schedule rating (per the Schedule Rating Call). Unusual variations, or the lack of a variation, and relationship of premiums before and after schedule rating are evaluated. The carrier is contacted to obtain additional information, explain variations, or if an error is detected, to obtain corrected reports.
- b) NCCI compares the amount of reported schedule rating to the maximum limits permitted in a given state. If a state has no specified limits, NCCI compares the amount to a maximum tolerance which is reasonable relative to the other states' prescribed limits.
- c) In at least one state, NCCI is required to verify schedule rating information for each policy wherein schedule rating is applied. The

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 7

carriers provide Schedule Rating Worksheets and loss control reports by policy. This information is reviewed in conjunction with the premium audit reviews which NCCI performs at the carrier. The review determines whether loss control reports are completed within the specified time frame, the schedule rating adjustment is within the prescribed limits, and the Worksheets are properly completed. It is a compliance review and does not evaluate underwriting or other merits of the schedule rating. Exceptions noted in the compliance review are reported to the state's regulators.

- 2) Limitations in the procedures utilized by NCCI are as follows:
- a) The call data reported by the carrier is not verified through audits of carrier records. The key data element which should be audited is the standard premium at the DSR level.
 - b) The reconciliation described in the overview above is performed in August of each year, which may result in error detection subsequent to the rate filing.
 - c) If a carrier does not submit a Schedule Rating Call or does not comply with a correction/explanation request, the reconciliation cannot be performed. In addition, there are no monetary incentives or penalties associated with the calls' submission.
 - d) The stated primary reason for obtaining the Schedule Rating Call is to use the data in market analysis to measure the impact of this form of competitive pricing. Consequently, the reconciliation is not the higher priority.
 - e) The policy audits performed in one state as described above are performed on Schedule Rating Worksheets received, which may not represent the complete population of schedule rated policies.

Further, there is no reconciliation of the total premiums tested by NCCI to total premiums reported on the Schedule Rating Call, or a determination of the testing coverage achieved. It is estimated by NCCI that the testing coverage is approximately 10 percent of the schedule rating datafile for the state.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 7

3) Conclusions

NCCI data gathering procedures do not ensure that the database for overall rate levels is not distorted by schedule rating. While NCCI has reasonableness review procedures in place to assist in detecting possible distortions, this assurance can only be achieved by auditing the carrier-submitted DSR standard premium data. This is not currently done.

B. Class Ratemaking

1) Overview of Data Collection Procedures

Schedule rating premium adjustments are reported on unit reports using one of two unique classification codes:

Code 9887 - for credit adjustment amounts

Code 9889 - for debit adjustment amounts

These class codes do not flow into the calculation of class rates. Additionally, premium adjustments do not impact the calculation of the rates. Lastly, schedule rating adjustments are classified in an industry group (Group 7) which is excluded from the database used for ratemaking.

NCCI's data gathering procedures include an analytical review of class code fluctuations between years. Unusual fluctuations are investigated. Limitations with the NCCI's procedures relate to the lack of carrier audits to ensure that class code data as reported by the carrier is accurate.

2) Conclusions

NCCI's data gathering procedures do not ensure that the database for class ratemaking is not distorted by schedule rating. This conclusion is based primarily on the lack of NCCI audits of the carrier data and systems to ensure proper reporting by class code.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 7

C. Experience Rating

Premiums are not utilized in the determination of experience modifications, therefore the database is not impacted by possible schedule rating distortions.

D. Recommendations

Overall, the most effective means of providing assurance that the applicable databases are not distorted by schedule rating is for NCCI to audit the data submitted by the carrier. This would involve audits performed at the carrier's location and would include tracing the data to source documentation, including rating file level and policy level data. An alternative would be to require that the carrier provide for an independent audit of such data, with a report being issued to NCCI. This independent audit would be performed by external auditors in accordance with appropriate generally accepted auditing standards. While resources and frequency of review may be limited, another alternative may be for states to require the audit of such statistical data in examinations required by state statutes. As indicated in our Executive Summary, we recommend that the NAIC develop a model workers compensation data quality regulation, which among other standards, should specify carrier and risk audit standards.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 8

RFP Question 8. (I.) What kinds of data on insurer expenses are collected and how are they processed and maintained? (II.) What controls are in place to ensure that insurers' reporting of expenses is reasonable and accurate? (III.) Are there ways in which reporting of expense data could be improved to make it more suitable for ratemaking? (IV.) Is separate information on the cost of loss prevention services collected, and if not, could it be collected?

(I.) What kinds of data on insurer expenses are collected and how are they processed and maintained?

A. Overview of Data Collected

Data collected relating to insurer expenses is as follows:

- 1) From each carrier's Insurance Expense Exhibit, expenses relating to the workers compensation line of business only:

From Part II:

- a) Loss adjustment expenses incurred
- b) Commission and brokerage incurred
- c) Other acquisition, field supervision and collection expenses incurred
- d) General expenses incurred
- e) Taxes, licenses and fees incurred
- f) Total expenses incurred
- g) Adjusted direct loss adjustment expenses incurred
- h) Direct commission and brokerage incurred
- i) Adjusted direct commission and brokerage incurred

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 8

From Part III:

- j) Same as a) - f) above
 - k) Effect of expense graduation
- 2) From the Calendar Year Expense Data Call, expense data collected is as follows:
- a) Acquisition, field supervision and collection expenses - commission and brokerage incurred
 - b) Acquisition, field supervision and collection expenses - Branch office - state share-incurred
 - c) Acquisition, field supervision and collection expenses - Home office - state share-incurred
 - d) Unallocated loss adjustment expense incurred
 - e) Allocated loss adjustment expense paid and incurred
 - f) Boards and bureau expense incurred
 - g) Audit, inspection and other general expenses incurred
 - h) Taxes, licenses and fees
- 3) From the Call for Loss Adjustment Expenses on Countrywide Direct Workers Compensation Business:
- a) Allocated loss adjustment expense paid and outstanding for all accident years
 - b) Unallocated loss adjustment expense paid and outstanding for all accident years

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 8

B. Overview of Processing and Maintenance Procedures

The data collected as described above is input and maintained in a separate file for each call and for each year of submission. The data collected is retained from three to fifteen years depending upon the call.

(II.) What controls are in place to ensure that insurers' reporting of expenses is reasonable and accurate?

A. Overview of Control Procedures

The singular control procedure which NCCI employs relative to expense data collected is a review to determine whether the expenses are within specified parameters. NCCI utilizes programs to facilitate this review. The programs generate ratio comparisons and tolerance level deviations which are then investigated with the carrier as deemed necessary. Examples of ratios analyzed are loss adjustment expenses as a percentage of losses, brokerage and commissions as a percentage of premiums, etc. The parameters, by necessity, have a wide range.

B. Conclusions

While the performance of reasonableness reviews mitigates the risk of a material error in the data, NCCI's procedures do not provide assurance that the data is complete and accurate as reported by the carrier. To provide such assurance, audits of carrier records are necessary, including a review of the reasonableness of the formulas used to allocate expenses.

(III.) Are there ways in which the reporting of expense data could be improved to make it more suitable for ratemaking?

A. Suggested Improvements

We believe the current expense data reporting system for ratemaking purposes could be improved. Expense data reporting is accomplished primarily through the submission of the Insurance Expense Exhibit Call (IEE), Calendar Year Expense by State Call and Call for Loss Adjustment Expense. We understand that NCCI plans to include incurred allocated loss adjustment expense (ALAE)

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 8

in WCSP. We concur with this plan and encourage NCCI to implement it as soon as practical.

The Calendar Year Expense By State Call is used to help support expense allowances in states. The expenses per the IEE Call are used to establish the provisions for general expenses and loss adjustment expenses used in rate filings. While many states (approximately 39 in 1990) require this call, we question the usefulness of the Calendar Year Expense By State Call. This is due to the fact that many carriers do not or are unable, for practical reasons, i.e., multistate writers, to report actual expense data on a state level and because the allocation methods utilized vary among companies. According to NCCI records, the percentage of calls which reported actual expense data, and the percentage of calls utilizing allocation methods, were as follows:

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 8

	ALLOCATION BASIS							TOTAL	
	ACTUAL EXPENSES	WRITTEN PREMIUM	EARNED PREMIUM	LOSSES	SALARIES	TIME STUDIES	OTHER		MISSING
Calendar Year 1989:									
Commission and brokerage	47.3%	39.3%	6.7%	.3%	.0%	.0%	2%	4.4%	100.0%
State share of branch office acquisition, field supervision and collection expenses	14.2%	33.9%	10.7%	.0%	.2%	1.9%	3.3%	35.8%	100.0%

Note - Allocation basis data is not captured by NCCI for taxes, licenses and fees.

* Missing - This includes carriers with no data for that field and carriers who had data but neglected to fill in the field.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Response to RFP Section IB Question 8

As indicated above, the carrier may allocate expenses to states based on any one of several methodologies (e.g., actual expenses, written premium, earned premium, losses, salaries, time studies, etc.). The instructions for preparing the call do not explicitly define "actual expenses" however it appears to mean expenses which are directly related to the state. The call instructions are located in Volume II, Calendar Year Expense Data By State tab, page 3. We recommend the following:

- 1) NCCI should define the term "actual expenses" in the instructions for completing the Calendar Year Expense Data by State call.
- 2) Where an allocation method is utilized, the Calendar Year Expense By State Call should require detailed documentation of the basis for the allocation to the workers compensation line of business and to the state.
- 3) Consideration should be given to requiring carriers to document by expense line of business and by state the basis for allocation in sufficient detail to provide a reasonable understanding of their methodology. This would enable the states to evaluate the reasonableness of the allocation methods utilized and the appropriateness of these methods for each expense classification. It would also enable the states to review the appropriateness of the allocation to the workers compensation line of business and to the state, to consider establishing guidelines for such allocations, and to request substantiation for the methods utilized as desired.

(IV.) Is separate information on the cost of loss prevention services collected, and if not, could it be collected?

Loss prevention cost data is not collected except in two states where state law requires it. This information is submitted as an addendum to the Calendar Year Expense Data By State Call. The specific data collected in the addendum is loss control services expense, safety engineering expense, remaining general expenses, total general expenses and type of insurer. Such information could be collected by a modification to the above call requiring carriers to provide such information for all states.

I certify that this proposal is made without prior understanding, agreement, or connection with any corporation, firm, or person submitting a proposal for the same contractual services, and is in all respects true and without collusion or fraud. I agree to abide by all conditions of the proposal and certify that I am authorized to sign this proposal for the proposer and that the proposer is in compliance with all requirements of the Request for Proposal including but not limited to certification requirements in submitting a proposal to an agency for the State of Florida; the proposer offers and agrees that if the proposal is accepted, the proposer will convey all, assign or transfer to the State of Florida all rights, title and interest in and to all causes of action it may now or hereafter acquire under the Antitrust laws of the United States and the State of Florida for price fixing relating to the particular commodities or services purchased or acquired by the State of Florida. At the State's discretion such assignment shall be made and become effective at the time the purchasing agency tenders final payment to the proposer.

AUTHORIZED SIGNATURE (MANUAL)

AUTHORIZED SIGNATURE (TYPED) TITLE

GENERAL CONDITIONS

SEALED PROPOSALS: All proposal sheets and this original acknowledgement form must be enclosed and submitted in a sealed envelope. (DO NOT INCLUDE MORE THAN ONE PROPOSAL PER ENVELOPE.) The face of the envelope shall contain, in addition to the above address, the date and time of the proposal opening and the proposal number. Proposals opened not submitted on attached proposal price sheets when required shall be rejected. All proposals are subject to the conditions specified herein. Those which do not comply with these conditions are subject to rejection.

- EXECUTION OF PROPOSAL:** Proposal must contain a manual signature of authorized representative in the space provided above. Proposal must be typed or printed in ink. Use of erasable ink is not permitted. All corrections to prices made by proposer must be initialed. The company name and F.E.D. or social security number must appear on each price line on the proposal as required. If a vendor desires to do repetitive business with the State and a vendor number has not been assigned to your company, contact Department of General Services, Division of Purchasing, Room 613, Larson Bldg., Tallahassee, FL 32399-0937, 904-488-8440 immediately.
- NO PROPOSAL SUBMITTED:** If not submitting a proposal, respond by returning only the proposer acknowledgement form marking "NO PROPOSAL", and explain the reason in the space provided above. Failure to respond to a procurement solicitation without giving justifiable reasons for such failure, non-conformance to contract conditions, or other pertinent factors deemed reasonable and valid shall be cause for removal of the proposer's name from the proposal mailing list. NOTE: To qualify as a respondent, proposer must submit a "NO PROPOSAL", and it must be received no later than the stated proposal opening date and hour.
- PROPOSAL OPENING:** Shall be public, on the date, location and the time specified on the acknowledgement form. It is the proposer's responsibility to assure that his proposal is delivered at the proper time and place of the proposal opening. Proposals which for any reason are not so delivered, will not be considered. Offers by telegram or telephone are not acceptable. A proposal may not be altered after opening of the price proposal. NOTE: Proposal tabulations will be furnished upon written request with an enclosed, self-addressed stamped envelope and payment of a predetermined fee. Proposal tabulations will not be provided by telephone.
- PRICES, TERMS AND PAYMENT:** Firm prices shall be proposed and include all services rendered to the purchaser.
 - TAXES:** The State of Florida does not pay Federal Excise and Sales taxes on direct purchases of services. See tax exemption number on face of purchase order or agreement form. This exemption does not apply to purchases of services in the performance of contracts for the improvement of state-owned real property as defined in Chapter 122, Florida Statutes.
 - DISCOUNTS:** Cash discount for prompt payment shall not be considered in determining the lowest net cost for proposal evaluation purposes.
 - MISTAKES:** Proposers are expected to examine the conditions, scope of work, proposal price, extensions, and all instructions pertaining to the services involved. Failure to do so will be at proposer's risk.

- INVOICING AND PAYMENT:** The contractor shall be paid upon submission of properly certified invoices to the purchaser at the prices specified on the contract at the time the order is placed, after delivery and acceptance of goods, less deductions if any, as provided. Invoices shall contain the contract number, purchase order number and the contractor's Federal Employer Identification Number. An original and three (3) copies of the invoice shall be submitted. The final payment shall not be made until after the contract is complete unless the State has agreed otherwise. Invoices for fees or other compensation for services or expenses submitted for contractual services shall be submitted in detail sufficient for a proper audit and postaudit thereof and invoices for any travel expenses shall be submitted in accordance with the rules of or under those specified in Sections 112.061 and 287.058 F.S. Interest Penalties: Payment shall be made in accordance with Section 215.422, F.S., which states the contractor's rights and the State agency's responsibilities concerning interest penalties and time limits for payment of invoices. The Division of Purchasing shall review the conditions and circumstances surrounding non-payment and unless there is a bonafide dispute, the Division may in writing authorize the contract supplier to reject and return purchase orders from the agency until such time as the agency complies with the provisions of Section 215.422, F.S.
- ANNUAL APPROPRIATIONS:** The State of Florida's performance and obligation to pay under this contract is contingent upon an annual appropriation by the Legislature.
- CONFLICT OF INTEREST:** The award hereunder is subject to the provisions of Chapter 112, Florida Statutes. Proposers must disclose with their proposal the name of any officer, director or agent who is and an employee of the State of Florida, or any of its agencies. Further, all proposers must disclose the name of any State employee who owns, directly or indirectly, an interest of five percent (5%) or more in the proposer's firm or any of its branches, in accordance with Chapter 287, Florida Statutes, no person or firm receiving a contract that has not been procured pursuant to Section 287.057(2) or (3) to perform a feasibility study of the potential implementation of a subsequent contract, participating in the drafting or a request for proposal, or developing a program for future implementation shall be eligible to contract with the agency for any other contracts dealing with that specific subject matter; and proposers must disclose with their proposal any such conflict of interest.
- AWARDS:** As the best interest of the State may require, the right is reserved to reject any and all proposals or waive any minor irregularity or technicality in proposals received. Proposers are cautioned to make no assumptions unless their proposal has been evaluated as being responsive.
- INTERPRETATIONS/DISPUTES:** Any questions concerning conditions and specifications shall be directed in writing to this office for receipt no later than ten (10) days prior to the proposal opening. Inquiries must reference the date of proposal opening and proposal number. No interpretation shall be considered binding unless provided in writing by the State of Florida in response to requests in full compliance with this provision. Any actual or prospective proposer who disputes the reasonableness, necessity or completeness of the terms and conditions of the Request for

Proposal, proposal selection or contract award recommendation, shall file such protest in form of a petition in compliance with Rule 13A-1.006, Florida Administrative Code. Failure to file a protest within the time prescribed in Section 120.53(5), Florida Statutes, shall constitute a waiver of proceedings under Chapter 120, Florida Statutes.

8. **GOVERNMENTAL RESTRICTIONS:** In the event any governmental restrictions may be imposed which would necessitate alteration of the material quality of the services offered on this proposal prior to their completion, it shall be the responsibility of the successful proposer to notify the purchaser at once, indicating in his letter the specific regulation which required an alteration. The State reserves the right to accept any such alteration, including any price adjustments occasioned thereby, or to cancel the contract at no further expense to the State.
9. **DEFAULT:** Failure to perform according to this proposal and/or resulting contract shall be cause for your firm to be found in default in which event any and all reproduction costs may be charged against your firm. Any violations of these requirements may also result in:
 - a) Contractor's name being removed from the Division of Purchasing vendor mailing list.
 - b) All State agencies being advised not to do business with the contractor without written approval of the Division of Purchasing.
10. **LEGAL REQUIREMENTS:** Applicable provision of all Federal, State, county and local laws, and of all ordinances, rules, and regulations shall govern development, submission and evaluation of all proposals received in response hereto and shall govern any and all claims and disputes which may arise between persons submitting a proposal response hereto and the State of Florida, by and through its officers, employees and authorized representatives, or any other person, natural or otherwise, and lack of knowledge by any proposer shall not constitute a cognizable defense against the legal effect thereof.

11. **ADVERTISING:** In submitting a proposal, proposer agrees not to use the results therefrom as a part of any commercial advertising.
12. **ASSIGNMENT:** Any Contract or Purchase Order issued pursuant to this request for proposal and the monies which may become due hereunder are not assignable except with the prior written approval of the purchaser.
13. **LIABILITY:** On any contract resulting from this proposal the proposer shall hold and save the State of Florida, its officers, agents, and employees harmless against claims by third parties resulting from the contractor's breach of this contract or the contractor's negligence. This requirement does not apply to contracts between governmental agencies.
14. **FACILITIES:** The State reserves the right to inspect the proposer's facilities at any time with prior notice.
15. **CANCELLATION:** The State shall have the right of unilateral cancellation for refusal by the contractor to allow public access to all documents, papers, letters, or other material subject to the provisions of Chapter 119, Florida Statutes, and made or received by the contractor in conjunction with the contract.
16. **PUBLIC RECORDS:** Any material submitted in response to this Request for Proposal will become a public document pursuant to Section 119 07, F.S. This includes material which the responding proposer might consider to be confidential or a trade secret. Any claim of confidentiality is waived upon submission, effective after opening pursuant to Section 119 07, F.S.

NOTE:

ANY AND ALL SPECIAL CONDITIONS AND SPECIFICATIONS ATTACHED HERETO WHICH VARY FROM THESE GENERAL CONDITIONS SHALL HAVE PRECEDENCE.

ATTACHMENTS:

1. COVER SHEET, (GOLDENROD), PGS. 1 & 2
2. NOTICE/PUBLIC ENTITY FORM PUR: 7068, PGS. 3-5

4. ENTIRE CONTENTS OF RFP - PGS. 7-30

N O T I C E

Effective July 1, 1989, prior to entering into a contract in excess of the threshold amount for Category two (currently \$3,500) to provide goods or services to a public entity, a person shall file a sworn statement with the contracting officer of that public entity on Form PUR: 7068 (copy attached).

Bidders are required to complete this form to provide compliance with the law. **FORM MUST BE SIGNED, NOTARIZED, AND RETURNED WITH EACH BID.** Failure to follow these instructions shall result in rejection of bid.

SWORN STATEMENT UNDER SECTION 287.133(3)(u),
FLORIDA STATUTES, ON PUBLIC ENTITY CRIMES

THIS FORM MUST BE SIGNED IN THE PRESENCE OF A NOTARY PUBLIC OR OTHER OFFICER AUTHORIZED TO ADMINISTER OATHS.

1. This sworn statement is submitted with Bid, Proposal or Contract No. _____
for _____.
2. This sworn statement is submitted by _____
[name of entity submitting sworn statement]
whose business address is _____
_____ and
(if applicable) its Federal Employer Identification Number (FEIN) is _____.
(If the entity has no FEIN, include the Social Security Number of the individual signing this sworn statement: _____.)
3. My name is _____ and my relationship to the
[please print name of individual signing]
entity named above is _____.
4. I understand that a "public entity crime" as defined in Paragraph 287.133(1)(g), Florida Statutes, means a violation of any state or federal law by a person with respect to and directly related to the transaction of business with any public entity or with an agency or political subdivision of any other state or with the United States, including, but not limited to, any bid or contract for goods or services to be provided to any public entity or an agency or political subdivision of any other state or of the United States and involving antitrust, fraud, theft, bribery, collusion, racketeering, conspiracy, or material misrepresentation.
5. I understand that "convicted" or "conviction" as defined in Paragraph 287.133(1)(b), Florida Statutes, means a finding of guilt or a conviction of a public entity crime, with or without an adjudication of guilt, in any federal or state trial court of record relating to charges brought by indictment or information after July 1, 1989, as a result of a jury verdict, nonjury trial, or entry of a plea of guilty or nolo contendere.
6. I understand that an "affiliate" as defined in Paragraph 287.133(1)(a), Florida Statutes, means:
 1. A predecessor or successor of a person convicted of a public entity crime; or
 2. An entity under the control of any natural person who is active in the management of the entity and who has been convicted of a public entity crime. The term "affiliate" includes those officers, directors, executives, partners, shareholders, employees, members, and agents who are active in the management of an affiliate. The ownership by one person of shares constituting a controlling interest in another person, or a pooling of equipment or income among persons when not for fair market value under an arm's length agreement, shall be a prima facie case that one person controls another person. A person who knowingly enters into a joint venture with a person who has been convicted of a public entity crime in Florida during the preceding 36 months shall be considered an affiliate.
7. I understand that a "person" as defined in Paragraph 287.133(1)(e), Florida Statutes, means any natural person or entity organized under the laws of any state or of the United States with the legal power to enter into a binding contract and which bids or applies to bid on contracts for the provision of goods or services let by a public entity, or which otherwise transacts or applies to transact business with a public entity. The term "person" includes those officers, directors, executives, partners, shareholders, employees, members, and agents who are active in management of an entity.
8. Based on information and belief, the statement which I have marked below is true in relation to the entity submitting this sworn statement. [Please indicate which statement applies.]

_____ Neither the entity submitting this sworn statement, nor any officers, directors, executives, partners, shareholders, employees, members, or agents who are active in management of the entity, nor any affiliate of the entity have been charged with and convicted of a public entity crime subsequent to July 1, 1989.

_____ The entity submitting this sworn statement, or one or more of the officers, directors, executives, partners, shareholders, employees, members, or agents who are active in management of the entity, or an affiliate of the entity has been charged with and convicted of a public entity crime subsequent to July 1, 1989, AND [Please indicate which additional statement applies.]

_____ There has been a proceeding concerning the conviction before a hearing officer of the State of Florida, Division of Administrative Hearings. The final order entered by the hearing officer did not place the person or affiliate on the convicted vendor list. [Please attach a copy of the final order.]

_____ The person or affiliate was placed on the convicted vendor list. There has been a subsequent proceeding before a hearing officer of the State of Florida, Division of Administrative Hearings. The final order entered by the hearing officer determined that it was in the public interest to remove the person or affiliate from the convicted vendor list. [Please attach a copy of the final order.]

_____ The person or affiliate has not been placed on the convicted vendor list. [Please describe any action taken by or pending with the Department of General Services.]

REQUEST FOR PROPOSAL

PART I GENERAL INFORMATION

1-1 Purpose

The purpose of this request for proposal (RFP) is to provide information and guidelines for the submission of proposals to the Florida Department of Insurance (hereafter referred to as "the Department") by consulting firms for an examination of the structure and operations of the National Council on Compensation Insurance (NCCI).

This examination will be conducted under the examination authorities of the Florida Department of Insurance, the Maine Bureau of Insurance, the Nebraska Department of Insurance, and the Utah Department of Insurance. The examination is intended to address areas of concern to these states as well as other states with respect to the structure and operations of the NCCI. The National Association of Insurance Commissioners (NAIC) will be coordinating the activities of the four departments in administering the examination but is not a party to the contract with the consultants.

1-2 Issuing Office

The issuing office is the Florida Department of Insurance, Purchasing Section, Division of Administration, Room G-59, Larson Building, Tallahassee, Florida 32399-0300, 904/488-4984.

1-3 Contract Consideration

Due to the nature of the work to be performed, consideration will only be given to consultants with sufficiently qualified people in the areas of actuarial science, computer auditing, statistical analysis, financial and management consulting to undertake a detailed and comprehensive examination of a workers' compensation rating organization.

1-4 Acceptance

The Department reserves the right to accept or reject any or all proposals and to award the ensuing contract in the best interest of the State of Florida and the other participating states, as named above. Any material conflict of interest arising out of current or past work performed for the NCCI could cause the rejection of a proposal.

1-5 Developmental Costs

Neither the Department, nor the other participating departments, or the NAIC or any other state or agency of any other state is liable for any of the costs incurred by the respondent in preparing a proposal in response to this RFP.

1-6 Questions

Only questions in writing concerning this RFP will be received before July 13, 1990 by Robert Klein, Director of Research, NAIC, 120 West 12th

Street, Suite 1100, Kansas City, Missouri. A list of the questions received and written answers to those questions will then be distributed by First Class U.S. Mail to all recipients of this RFP by July 20, 1990. Questions received after July 13, 1990 will not be answered.

1-7 Agenda

Any significant change made in the RFP will be brought to the attention of those who have demonstrated interest in responding to the RFP and adequate time will be allowed for response.

1-8 Schedule

The following schedule will be strictly adhered to in all actions relative to this procurement.

- A. June 29, 1990: RFP issued.
- B. From June 29, 1990 to July 13, 1990, written questions will be received.
- C. All proposals are due by 3:00 p.m. on July 27, 1990 in the issuing office (see Part 1-15).
- D. From July 27, 1990, proposal evaluation will begin.
- E. A site visit at the offices of the NCCI on July 10, 1990 (see Part 1-17). The purpose of the site visit is to allow bidders to obtain information on the data systems and procedures of the NCCI.
- F. Oral presentation if required will be scheduled during the period August 21 to August 23. Since this will require coordination of evaluation committee members from four states and the NAIC, respondents should be prepared to attend on relatively short notice.
- G. Notice of the Department decision will be posted on August 24, 1990 in the issuing office (see Part 1-15).
- H. Following the evaluation negotiations and necessary concurrences between the Department and successful respondent, a contract award will occur.

1-9 Proposal Content and Signature

To facilitate an objective review, eleven (11) copies of the proposal will be required with a separately sealed cost proposal. All copies must be signed by a company official with power to bind the firm to its proposal for a sixty (60) day period. To be considered, all proposals must be completely responsive to the RFP.

1-10 Proposal Preparation

All respondents will provide a straightforward and concise description of their ability to meet RFP requirements (see Part IV). The

proposal must specify the approach to the development (i.e., computer programs, tables, reports, etc.) of the final product.

1-11 Prime Responsibilities

The selected respondent will be expected to assume responsibility for all services offered in his proposal. The selected respondent will be the sole point of contractual matters including payment of any and all charges resulting from the contract.

1-12 Project Control

Control of the project shall remain the total responsibility of the Department and the other participating departments.

1-13 Rules for Proposal

The signer of the proposal must declare that the only person, persons, company or parties interested in the proposals as principals, are named therein, that the proposal is made without collusion with any other person, persons, company or parties submitting a proposal, that it is in all respects fair and in good faith without collusion or fraud, and that the signer of the proposal has full authority to bind the principal.

1-14 Regulations

The selected firm or individual will be required to comply with all applicable State of Florida regulations and contract provisions. The ensuing contract shall contain such contractual provisions or conditions necessary to define a sound and complete agreement and to satisfy state regulations and statutory requirements of the Department.

1-15 Proposal Submission

The proposal must be submitted (per schedule in Section 1-8) to Ina Boykin, Purchasing Director, G-59 Larson Building, Tallahassee, Florida 32399-0300 telephone (904) 488-4984.

1-16 Proposal Timetable

The final report for the project may be completed on a section by section basis. The final report for Section III Practical Considerations in Implementing a Loss Cost System shall be submitted by November 15, 1990. The final reports for Sections I and II shall be submitted no later than May 15, 1991. If the respondent can complete reports sooner, then this should be noted in the proposal.

1-17 NCCI Site Visit

A site visit at the offices of the NCCI at 750 Park of Commerce Drive, Boca Raton, Florida, is scheduled for July 10, 1990, beginning at 9:00 a.m. The purpose of the site visit is to allow bidders to obtain information on the data systems and procedures of the NCCI. NCCI personnel will be available to answer questions at this meeting. Any other questions concerning the RFP should be submitted to Bob Klein in accordance with Part 1-6.

PART II INFORMATION REQUIRED FROM RESPONDENTS

Proposals must be submitted in the format below:

2-1 Organization and Credentials

Provide a listing showing all persons who will work on the project along with their experience and qualifications. Any work for the NCCI by any person who will be involved in this project over the past 5 years should be clearly noted and explained. Any potential conflict of interest arising out of current or past work performed for the NCCI by the respondent or any subcontractor should be clearly noted and explained. Also, provide an estimate of the number of hours per week that each person would be available. A separate listing should show those persons who would participate on a peer review basis as opposed to being active in the research or drafting of the reports. A separate section should show the computer hardware and systems capabilities that will be used in the project.

2-2 Respondent's Understanding of the Project and Workplan

Provide a precise rendering of the respondent's understanding of the project.

2-3 Subcontractors

Identification of any contemplated subcontractor(s) is required, with identification of personnel to be assigned, their qualifications, and experiences and specific details of how the subcontractor(s) will be used, the work products the subcontractor(s) will produce and the costs for these services.

2-4 Services of the Department, Other Participating Departments, the NAIC and the NCCI.

Respondents should indicate any data they might require from the NCCI or other sources as well as assistance anticipated from Department, other participating departments or the NAIC in acquiring such data.

2-5 Cost Proposals

A Cost Proposal attached to the eleven (11) copies of the proposal must be separately sealed and submitted to the Department utilizing the standard form attached to this RFP and in accordance with the provisions outlined in Part I of this RFP. A separate cost form should be submitted for each of the following parts of the project: Section I.A.; Section I.B.; Section II.A.; Section III; and under Section II.B. each of the following: 1a, 1b, 2a, 2b, 2c, 2d, 2e, 2f, 3a, 3b, 3c, 3d, 3e, 3f, 4a, 4b, 4c, 5a, 5b, 5c, 5d, 6a, 6b, 7a, 7b, 7c, 7d, 8a, 8b, and 8c. A separate cost form should show a consolidation for the entire project. Costs should be based on the hourly fees of required personnel clearly stated and the anticipated hourly involvement of such personnel.

2-6 Additional Information and Comments

Comments under this heading are encouraged and left to the discretion of the respondent. Material should be pertinent to the proposal but not otherwise required in the RFP.

PART III PROPOSAL REVIEW/CRITERIA FOR SELECTION

3-1 Submission

Proposals will be submitted initially on the most favorable terms from both technical and cost standpoints. The date and time of submission (see Part I, 1-8) will be strictly adhered to.

3-2 Proposals for Specific Parts of the Examination

The overwhelming preference is to award the contract to one entity for the entire project. The reason for this preference is the interrelationship between the various sections of the examination. Information or insight gained in one part of the examination could prove to be crucial to other areas of the examination. However, proposals to perform specific part(s) of the project will be accepted. The burden will be on the respondent to explain why and how the project can be performed by several providers and integrated into one final project.

3-3 Proposal Review

The proposals will be reviewed and necessary negotiations conducted by the Department, other participating departments and NAIC personnel. Oral presentations may be required to assist in the final selection of proposals.

3-4 Evaluation

Proposals will be evaluated and the respondent selected on the following criteria with a maximum possible total points of 100.

Weighting Factors for Evaluation of Proposals:

<u>Points</u>	<u>Weighting Criteria:</u>
15	A. The quality of the proposal submitted and the demonstrated understanding of the nature of the analysis and report required.
10	B. Time frames for completion of research and delivery of final reports.
20	C. Cost factors.
	D. The quality and adequacy of the team assembled, including computer hardware and system capabilities, to perform the underlying research and draft of the report(s). This involves consideration of the factors shown under D.(1), D.(2), and D(3). The total points

allowed for D. is 55 which is composed of 20 points for D.(1), 20 points for D.(2) and 15 points for D.(3).

- 20 (1) The experience and qualifications of the team to undertake the examination specified. The number of highly qualified persons who will be active in the research and drafting of the portions of the report relating to ratemaking and experience rating formula, as opposed to merely reading later drafts as a form of peer review. Any material conflict of interest arising out of current or past work performed for the NCCI.
- 20 (2) The number of hours per week that will be available from highly qualified persons, as well as from necessary support staff, and the computer hardware and system capabilities.
- 15 (3) The adequacy of peer review procedures. Any material conflict of interest arising out of current or past work performed for the NCCI.

100 Total Points

PART IV WORK PRODUCT REQUIRED

This examination stems from a recommendation by the NAIC's Workers' Compensation Advisory Organization Activities Working Group. The working group studied the issue of implementing a "loss cost" system in workers' compensation similar to the system being implemented in the other property-casualty lines. Under a loss cost system, advisory/rating organizations are prohibited from filing final rates but they are allowed to file "prospective lost costs" which include adjustments for development and trend.

In December of 1989, the NAIC adopted that working group's resolution which said that its present belief was that workers' compensation should not be treated differently from the other property-casualty lines with respect to permissible activities of advisory/rating organizations. However, some group members expressed concerns about the impact of a loss cost system on the marketplace as well as concerns about the performance of advisory/rating organizations within workers' compensation which would not be resolved by implementation of a loss cost system. Consequently, the group deferred recommendations on the specific details of the system to be implemented until the completion of two studies: 1) a staff economic analysis of the likely impact of a loss cost system on state workers' compensation markets; and 2) a comprehensive examination of the structure and operations of the National Council on Compensation Insurance (NCCI) conducted under the examination authority of the four states.

The purpose of this examination is to thoroughly evaluate the data collection and processing activities of the NCCI as well as certain aspects of its ratemaking activities. The examination also is intended to review the practical considerations with respect to the NCCI's operations involved in implementing a loss cost system. While the examination will be conducted under the authority of four states, it is intended to address issues of general concern to all state insurance regulators.

The examiners will be expected to fully document current NCCI procedures, evaluate the adequacy or appropriateness of those procedures, and where possible, present possible alternative approaches and the practical effects of those approaches. The examiners also will be expected to use the results of previous NCCI examination reports where possible to the extent that the results of those examinations can be verified.

The final product of the examination should be a comprehensive and detailed report that will provide insurance regulators with a good understanding of NCCI procedures as well as ideas on how those procedures might be improved. In addition, the report should identify the practical questions that would be associated with the NCCI's transition to loss costs and discuss how those areas might be handled. The report should enable insurance regulators, individually and collectively, to make specific recommendations on the features of the system that would be implemented as well as other improvements to the data collection and analysis services provided by the NCCI.

Section I. Data Collection and Data Quality

A. Description of NCCI's Data Collection and Data Handling Procedures

The consultant will be expected to fully document the NCCI's data systems by either verifying information produced by NCCI or creating documentation where necessary. The final work product will completely document the NCCI data systems from input documents to final data bases. As a general introduction to data collection, the consultant should include responses to the following:

- . What types of data does the NCCI collect?
- . What is the purpose for collecting each type of data?
- . How are the data obtained from insurers and processed into a data base?

For each statistical call, the following should be shown:

- . The fields that are entered on computer systems from the source document;
- . The edits performed on each field;
- . How errors are handled and how corrected fields are integrated into the data base.
- . Any modifications to the data from the source document;
- . A list of all data bases and fields within the data base that come from the statistical call.

Also, for each data base there should be provided a list of all fields, the source of each field, an indication of how long the data are maintained and a discussion of how the data base are used.

B. Evaluation of Data Collection and Data Quality

The consultant will be expected to evaluate NCCI data collection, data handling procedures and the quality of the NCCI data. The consultant should make suggestions for improvements in any of these areas. Part of this analysis should be accomplished by sampling actual transactions and testing computer programs within the NCCI. Answers to each of the following questions should be included in the final work product:

- (1) How accurate is the data base? Are adequate quality control procedures in place to ensure the accuracy of the data as they are reported by insurers and processed by the NCCI? How could these procedures be improved?
- (2) Does the NCCI reconcile data collected for ratemaking purposes with the data reported in insurers' annual statements? If so, how are these data reconciled and what is done when these data do not match? Are there additional reconciliation measures that could be beneficial?
- (3) Does the NCCI have adequate procedures to ensure that classification data are complete and accurate? Are additional checks of the data performed when unusual classification indications appear? Does the NCCI check to be sure that insurers report reimbursements by second injury funds, subrogation and funds associated with cases determined to be noncompensable?
- (4) What quality controls are used to ensure the accuracy of data collected under a detailed claim information call?
- (5) Are the data collected and maintained in such a way that the experience from a specific policy can always be traced? If not, how could this be accomplished? Are the data for risks in the residual markets maintained in such a way that the experience can be compiled separately for the residual market versus the voluntary market?
- (6) Is sufficient information collected and maintained to test and implement reasonable alternative ratemaking methodologies? If not, what enhancements could be made to support alternative methodologies and identify the underlying causes of rate increases?
- (7) Do the NCCI's data gathering procedures ensure that the data base is not distorted by schedule rating?
- (8) What kinds of data on insurer expenses are collected and how are they processed and maintained? What controls are in place to ensure that insurers' reporting of expenses is reasonable and accurate? Are there ways in which the reporting of expense data could be improved to make it more suitable for ratemaking? Is separate information on the cost of loss prevention services collected, and if not, could it be collected?

Section II. Ratemaking Procedures

A. Description of NCCI's Current Ratemaking Procedures

The work product must include a thorough and technically complete description of the procedures and formulas currently used by the NCCI in

producing manual rates and experience rating values. When more than one procedure is sometimes used (i.e., where the NCCI may base its rate change upon policy year incurred losses, with or without incurred but not reported losses (IBNR), or upon paid losses; or where they may average differing numbers of years, etc.), describe the different procedures and describe how the NCCI chooses among them. In areas, if any, where the NCCI will often deviate from their "normal" procedures, note whether these deviations are usually reasonable responses to unusual situations where "normal" procedures would be likely to produce inaccurate results. Describe the assumptions made by the NCCI in their procedures and describe the means used by the NCCI to verify these assumptions.

B. Evaluation of Ratemaking Methodologies

Note: Within the ratemaking methodology section, priorities of "A", "B", "C" or "D" are assigned to each question. The grading corresponds to the depth to which a topic is to be covered, with "A" topics being most important. Answers to "A" priority questions should be detailed and of such quality that they may be used to advance the "state of the art". Answers to "D" priority questions should be the highest quality answers that can be obtained at a moderate cost. As such, limitations to the responses to "D" priority questions are acceptable due to the time and cost that would be necessary to cover every possible issue in the topic area. Questions with "B" and "C" priorities should receive intermediate treatment.

Comments have also been made with regard to the extent of original research which is expected to be most appropriate. These comments are presented as an attempt to be helpful, but should be interpreted as guidelines only.

1. Premium and Loss Development Factors

While the selection of link ratios and the calculation of development factors is often considered a purely mechanical process, differences of 5-10 percent in the estimated ultimate losses for a recent policy or accident year are common between different loss development methods. In addition, differences of opinion in the selection of link ratios can occur within the same development format. Past experience has clearly shown that misestimations in this regard are only compounded by trending, because indicated trends are heavily influenced by the most recent point or two, which are those points most heavily distorted by excessive or inadequate loss development. In this context:

- (a) Evaluate the NCCI's premium and loss development techniques. Would the use of more years of data or of multistate data, with appropriate adjustments, produce superior results? Are there other techniques or improvements to current techniques that would be appropriate?

(Priority: "A". Past experience in this regard should be tabulated and reviewed. An attempt should be made to discern what differences might be appropriate for larger vs. smaller states.)

- (b) The NCCI uses different formats for loss development from state to state and from year to year. Paid losses through the 8th report may be used one time as a basis, the next time incurred losses excluding IBNR may be used, etc. The use of multiple techniques is common and considered good practice in many types of reserving applications. The results of different techniques, which normally differ, can be studied to gain insights relating to the underlying assumptions used with each technique. Evaluate the NCCI's procedures for reconciling the differences which occur between different development techniques and evaluate the effectiveness and likely accuracy of the criteria which they use to choose one format over another.

(Priority: "B". The nature and quality of NCCI analytical techniques and whether they are reasonably followed should be examined here. Original research should largely be confined to that which is relevant to answer question 1(a). It is not the intent of this question to focus on whether any sort of bias from state to state occurs, although it should be covered if an overt tendency becomes apparent.)

2. Expenses

There is some question as to whether the expense loadings filed by the NCCI are consistent with the actual experience of their member insurers. Several factors complicate this analysis including premium discounts, the interplay of stock versus non-stock discounts, the consideration of stock only expenses in some instances and not in others, plus the impact of expense constants and minimum premiums.

- (a) Does the current NCCI expense methodology tend to load more or less expenses in the overall rate level than are actually expended by insurers using stock discounts in NCCI states? If there are biases or inaccuracies, what is their source and their effect?

(Priority: "A". A detailed analysis of the NCCI's expense methodology for insurers using stock discounts should be performed.)

- (b) What would be the incremental cost of collecting allocated loss adjustment expense (ALAE) on a unit basis. Discuss the pro's and con's of having this level of detail available versus what is now available. Also, discuss whether it would be more cost efficient to collect this on a more limited survey basis, or only specific areas where problems may exist such as retrospectively rated risks and residual markets. (In these two situations, there is little economic motivation for an insurer to defend claims.)

(Priority: "A". We are aware that the NCCI has been presented with this question in the past, so it is likely that some degree of documentation may exist for the consultant to start with. Consider the costs to insurers as well as to the NCCI with this question.)

- (c) When a state's premiums and rates grow at approximately the same rate as is occurring on a national basis, it is reasonable to expect a proportional increase in the expense loading for the individual state. However, when a state's proposed rate increase considerably exceeds the national average, is it reasonable to assume that expenses increase proportionally for the state? Should large state rate increases be tempered because of less than proportional increases in expenses?

(Priority: "C". No individual research is required here. The response to this question should be well reasoned and offer, if possible, suggested changes to current methodologies.)

- (d) Discuss the advantages and disadvantages of using a budgeted approach to acquisition expenses versus basing these factors on actual expense experience.

(Priority: "C". No individual research is required here. The response to this question should be well reasoned and offer, if possible, suggested changes to current methodologies.)

- (e) Traditionally, mutual insurers utilized a non-stock discount and collected a higher premium than stock insurers. In return, however, mutual insurers following this plan would also return generous dividends which resulted in net premiums that were lower than for stock insurers. The workers compensation market has since evolved into a much more complex mechanism and the consultant should examine whether the original assumptions which supported the existence of dual expense discounts still exist. Are the higher rates collected by insurers utilizing non-stock discounts fully returned in the form of higher dividends than are paid by insurers utilizing stock discount tables? In addition, are lower expenses, if any, experienced by insurers utilizing non-stock discounts also returned in the form of higher dividends? (The analysis should be restricted to NCCI states as it relates to dividends, as a high portion of countrywide compensation dividends are paid in California, which is a non-NCCI state.)

(Priority: "B". It is presumed that the NCCI can provide expense data compilations sufficient to address this question. A degree of imprecision due to the effects of company groups would be acceptable. Basically, this question presumes that the consultant will design requests for compilations to be performed by the NCCI and that the consultant will report on the indications resulting from these compilations.)

- (f) Review premium discounts (stock and non-stock) and expense constants to determine whether the relative expense loadings are equitable for all sizes of risk. (Consideration of minimum premium size risks may be excluded here as they are the subject of a broader question under the "Miscellaneous" heading.)

(Priority: "D". The NCCI has studied these factors from time to time. Review this material and report on it.)

3. Trend

In most jurisdictions, losses have increased more quickly than wages and it is necessary to apply trend factors to losses in order to generate adequate rate level indications. Because these trend indications have often been quite large, there is some question of the NCCI trend factors even when past results on a national basis would seem to indicate that trend factors have not been excessive. In addition, the NCCI also appears to project past trends into the future without offset for any legislation attempting to mitigate the increase in workers compensation claims.

- (a) Are there any expected biases or errors present in the NCCI's general trending procedures? If so, discuss their impact.

(Priority: "A". This should be an in-depth and refined analysis of the procedure and techniques.)

- (b) Would more accurate trending be likely with a different model or with revisions to the current model?

(Priority: "B". This is an extension of question 3(a).)

- (c) Are adequate adjustments made to projections by the NCCI's trend model when significant legal or economic changes occur on a state or national level?

(Priority: "C". Traditional actuarial trending procedures presume that future loss trends will continue to be similar to past loss trends. This presumption loses validity, however, when recent legal or economic developments intervene. In response to this question, examine the extent to which the NCCI brings such events into consideration and whether this appears to be adequate.)

- (d) Contrast the current model, which puts all losses to a current benefit level, to a model which puts all past losses to the same "relative" value of prospective benefits. (In other words, if the prospective min/max benefit level and state AWW were \$100/\$300 and \$320, respectively, then no adjustment would be made to past losses if the past values were \$80/\$240 and \$256. This method would apply a steeper trend line to a lower historic loss level.)

(Priority: "D". Examine the two approaches from a theoretical point of view. No original research is expected.)

- (e) The NCCI determines the overall impact of all classification rate changes combined based on the three years of payroll used in the filing at that time. If the mix of business in a state changes over the years, this estimation of the effect of a past rate filing as it would relate to the current mix of classifications may be distorted. Estimate the likely magnitude of these distortions and discuss whether an improved procedure would be warranted.

(Priority: "D". It is presumed that the NCCI can produce data runs for a sampling of states and years so that the likely magnitude of any distortions can be examined. It would be expected that the consultant would provide the specifications for the NCCI to produce such data and that the consultant would review and comment on the results.)

- (f) The NCCI brings past losses to a current benefit level by multiplying the various law change factors estimated at about the time the law changes went into effect. Is this an accurate method?

(Priority: "D". Examine this from a theoretical point of view.)

4. Classification Ratemaking

There is a significant concern that current classification ratemaking procedures may be significantly less accurate than would be possible using more years of data and an improved methodology. There are often significant swings in class rate relativities from year to year when there is no reason to expect that underlying loss expectancies are changing so rapidly. An optimum ratemaking procedure should give the weight to state class experience that would be most likely to produce accurate estimates of future losses.

- (a) Study the NCCI's current scheme of credibilities and their practice of using three years of data as a sole indicator for most national pure premium indications and as a basic unit for determining pure premiums at the state level. (We recognize the implicit weight given to older years of state data where credibilities of less than 100% are used.) For different types of loss and different expected loss volumes, determine whether class rating accuracy could be improved through the use of more years of data, different credibilities, or both. In addition, determine whether superior results would be expected using maximum loss size limitations that vary as a function of the total expected losses by class, by state, with adjustments made to recognize the effects of these differing limitations.

(Priority: "A". While the NCCI would be expected to do the data compilation necessary to address this question, a thorough response will require a significant level of original research to be performed by the consultant. It is expected that the response to this question may involve more effort than that required to respond to any other ratemaking question.)

- (b) Could the NCCI's procedure for determining industry group relativities be enhanced by utilizing more years of data (with appropriate recognition of apparent trends)? How would this vary between large states and small states?

(Priority: "C". The NCCI would be expected to do the data compilation necessary to perform this analysis.)

- (c) In their classification ratemaking, the NCCI applies loss

development and benefit level adjustments to individual years of data, but applies a single trend factor to all three years of experience combined. Should the NCCI adjust losses to a current (or common) level by trending individual years separately rather than by applying an aggregate trend factor to all years combined?

(Priority: "D". It would be expected that this question would be approached from a theoretical point of view. If it was felt that a change would produce superior results, then the likely degree of improvement, plus any practical considerations, should be discussed.)

5. Determination of Rate Changes Due to Statutory Revisions

- (a) Review NCCI's procedures for determining expected loss changes due to changes in weekly benefits, waiting periods, escalation provisions and medical fee schedules to see if they would be expected to yield fair estimations.

(Priority: "A". A technically complete analysis of this question should be provided.)

- (b) Should the 1973 Standard Wage Distribution Table be updated?

(Priority: "C". The consultant should structure a test of indemnity losses to see if they are reasonably consistent with expectations from the 1973 table. If the NCCI has undertaken studies of this question, use them to the fullest extent possible.)

- (c) Discuss the manner and anticipated or observed effectiveness of the NCCI when presented with non-formula type law changes. Could NCCI's performance in this area be practicably improved?

(Priority: "C". Examine a sampling of recent situations where this has occurred and evaluate the NCCI's performance.)

- (d) Should different wage distribution tables be determined for major classification groupings, instead of for all occupational groups, so that differences in the job mix from state to state may be recognized?

(Priority: "D". The differences in average wages from state to state will be attributable in part to different mixes of industry as well as different overall wage levels. Without significant research, except to examine any studies which the NCCI may already have available, attempt to determine whether this is an area which warrants the extensive work which it would require to have multiple wage distribution tables.)

6. Alternate Exposure Bases

There has been significant discussion and controversy over total payroll as an exposure base for workers compensation. The controversy involving man-hours as an exposure base has largely

subsidized, but plans involving recognition of the wage rate(s) at which total payrolls are earned appear to offer the hope of more equitable rating. The consultant should largely restrict themselves to a study using data culled from previous studies, thereby avoiding the need to collect original data.

- (a) What degree of improvement could be expected from a rating system that recognized the wage rate (if available) in addition to total payroll?

(Priority: "A". The consultant should conduct a thorough review of the research which already exists relating to this question.)

- (b) Discuss the additional expenses that would be expected to result from the administration of a system utilizing this additional information.

(Priority: "B". A rating system that utilized both wage rates and total remuneration might require additional recordkeeping by employers, more time for insurer audits, and additional data elements for the NCCI and its member insurers. Estimate the magnitude of these additional costs.)

7. Experience Rating Formulas

The work product must include a thorough and technically complete description of the formulas currently used by the NCCI in their production of experience rating modifications. This should include a description of interstate and intrastate experience rating as well as a description of experience rating formulas both before and after NCCI's revised experience rating plan (RERP) filing. LRAP, schedule rating and miscellaneous state exceptions should be omitted.

- (a) Is the NCCI's RERP experience rating actuarially sound? Specifically, are there significant tendencies for the formulas to produce debits or credits such that it could reasonably be predicted that groupings of risk by any combination of classification, risk size or modification range would be likely to have excessive or inadequate rates? What changes could be made to lessen these deficiencies?

(Priority: "A". A thorough analysis of the study done by NCCI to develop RERP should be completed. Additional data should be requested, if necessary, to verify the action of RERP.)

- (b) To what extent, if any, would experience rating be expected to be more accurate if more than three years of data were used for experience rating? Specifically consider whether five years would be superior, as insurers report unit data through fifth report. Discuss additional costs, if any, that might be applicable from the use of five years of data versus three.

(Priority: "B". Data provided by the NCCI should be tested to determine if the addition of two more years of data would tend

to produce more accurate experience rating. If it would, it would be necessary to examine what additional costs would be incurred by the NCCI to use five years instead of three.)

- (c) What credits would be indicated for loss free risks that were less than the minimum size to be eligible for experience rating? To what extent would it be indicated and practicable to debit small risks for higher than expected losses?

(Priority: "B". The consultant should analyze experience runs produced by the NCCI according to specifications provided by the consultant. The consultant should evaluate whether it would be feasible to provide some degree of credits for small risks that had no losses or very low loss ratios if it could be done without endangering rate adequacy.)

- (d) Are the formulas used to calculate ELR's and "D" ratios sound? Does the NCCI method of introducing RERP tend to result in a revenue increase?

(Priority: "C". Examine current techniques to see if they are appropriate.)

8. Miscellaneous

- (a) Compare the expected loss and expense ratios of minimum premium insureds to those for all classes of insureds combined.

(Priority: "B". It would be expected that the NCCI would be able to generate the data that would be necessary to address this question. The consultant should analyze data runs produced by the NCCI according to the consultant's specifications.)

- (b) What recognition does NCCI give to additional premiums expected to be collected from surcharges imposed on policyholders in residual markets? As these markets increase or decrease, is this expected change in revenue recognized?

(Priority: "C". Examine recent filings made by the NCCI to answer this question. Examine filings where surcharge plans are introduced as well as filings where surcharges are in place to determine whether NCCI filing procedures adequately recognize this additional income.)

- (c) Does the NCCI ratemaking formula accurately account for any off-balance due to the experience rating plan? Does the NCCI adequately adjust expected loss ratios (ELR) and "D" ratios to maintain the off-balance at a reasonable level? What improvements could be made in the NCCI's procedures regarding the off-balance in the experience rating plan?

(Priority: "C". Examine NCCI procedures carefully to check for their apparent balance.)

Section III. Practical Considerations in Implementing a Loss Cost System

Under the system adopted by the NAIC for the other property-casualty lines, advisory organizations are allowed to do much of what they had done previously, short of filing final rates. Advisory organizations are allowed to collect historical loss information from insurers, adjust these data for development and trend, and distribute or file this "prospective" loss cost information with the commissioner. Advisory organizations also are allowed to develop and file supplementary rating information, rating manuals (excluding final rate pages) and policy forms and endorsements. Insurers are required to determine individually, their own expense and profit factors and file their final rates. Insurers' rate filings can reference, if necessary, the prospective loss cost and supplementary rating information filed by the advisory organization. This approach seeks to promote competition and maximize benefits to consumers by preserving efficiencies gained through the joint collection and analysis of loss information, while enforcing independence in the areas of expenses and profits which should be based on each insurer's specific methods of operation.

The examination should address the practical considerations involved in implementing a loss cost system on a national scale in workers compensation insurance. In other words, how should the NCCI's activities be modified to accommodate a loss cost system similar to that which is being implemented for the other lines? This question also encompasses how member insurers would be allowed to use NCCI information in making their own rate filings. To the extent possible, the consultant should use the system being developed for the other lines as a model but also should consider areas where workers' compensation may require different treatment. In this analysis, the consultant also will be expected to review how the NCCI and member insurers operate in states that currently have a loss cost system for workers' compensation.

The consultant's analysis should consider, but not be limited to, the following areas:

- . minimum premiums
- . rating plans
- . premium discount plans
- . schedule rating plans
- . expense constants
- . experience rating systems
- . policyholder dividend plans and practices
- . retrospective rating plans
- . anniversary date rating rules
- . other rate-related rules
- . distribution of expense data to insurers

In addition to these areas, the consultant should evaluate whether any changes

should be made to Part III of the Insurance Expense Exhibit and the approval of rate changes for policies already in effect or rate filings with retroactive effective dates in a loss cost environment.

The examination report should analyze the relevant issues with respect to these areas, as well as any other significant areas, and outline the different options that might be taken and their likely consequences. It should be assumed that the NCCI would continue to administer and make rates for the residual market.

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Introduction:

The documentation in this binder contains information on statistical calls, systems and procedures at NCCI. The statistical call information is contained in the Data Documentation section. The systems and procedures are presented graphically in a series of flow diagrams and in written descriptions of NCCI's functional areas.

There are seven functional areas identified in this documentation. These functional groupings do not necessarily correspond to NCCI's formal organizational structure. The areas represent key operations performed by NCCI in producing rates and experience modification factors. The seven areas, together with their respective flow diagram cross-reference, are:

- o Overall Rate Level (F101).
- o Unit Card Data Conversion (U101).
- o Unit Card Data Administration (A101).
- o Class Ratemaking (C101).
- o Experience Rating (E101).
- o Policy Issue Capture System (PICS) (P101).
- o Detailed Claim Information (DCI) System (D101).

The Description of Data Collection and Data Handling section provides a graphical and written presentation of NCCI information flows. The written descriptions contain cross-references to the flowcharts using index numbers. These cross references appear in parentheses, as shown above, in the text and in the upper right-hand corner of the flow diagrams.

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

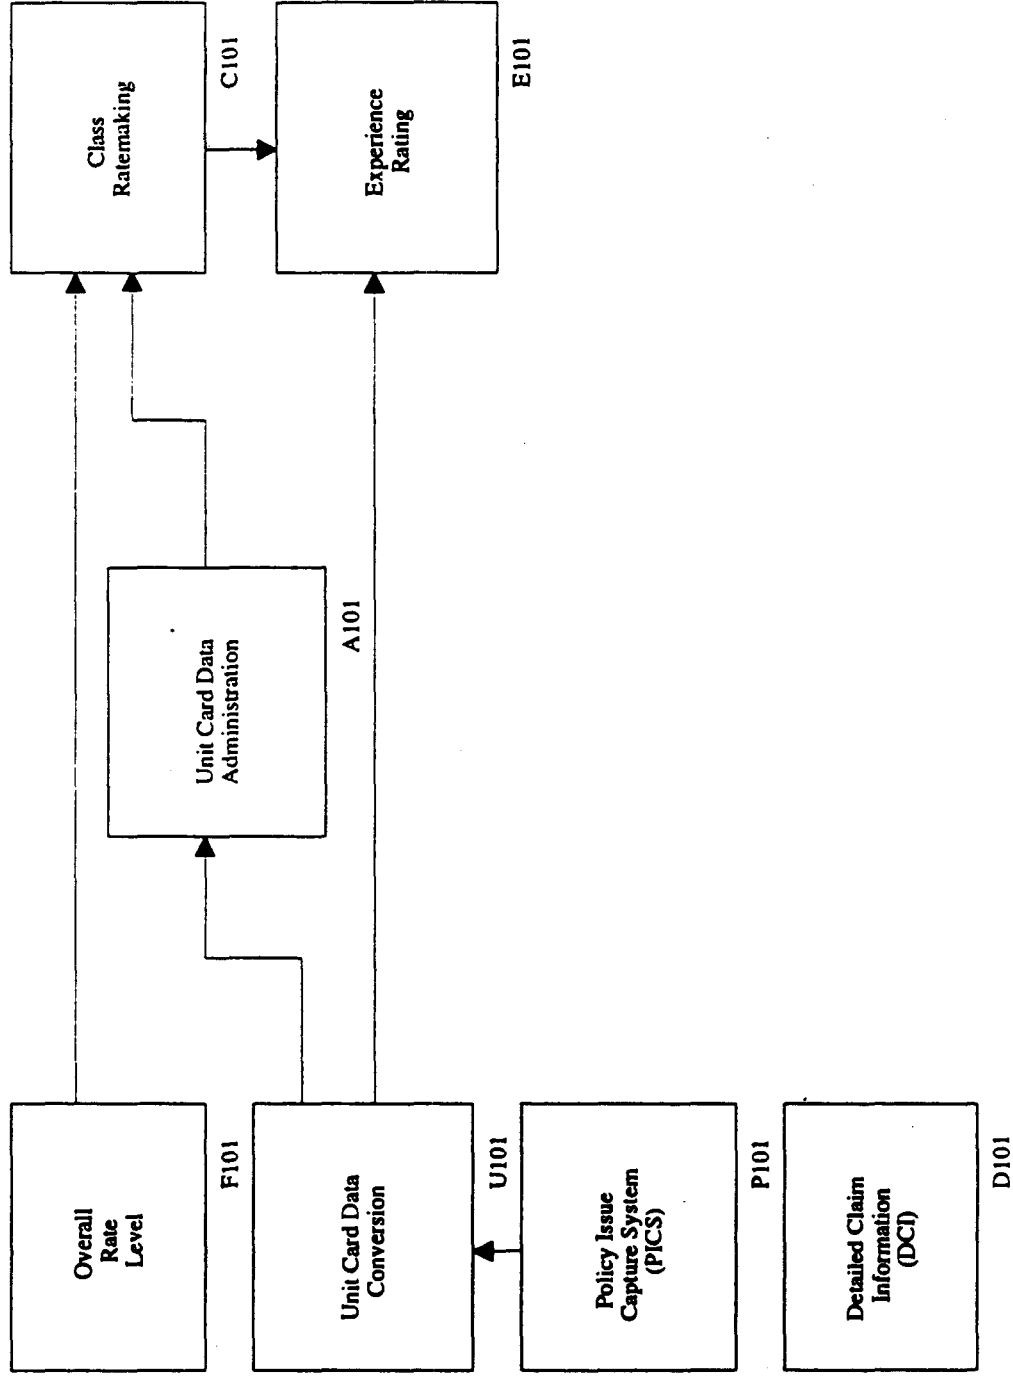

Introduction:

The Statistical Call Overview Documents provide a detailed description of the validation performed on unit report data and on data for fifteen financial calls. This documentation consists of an overview of the purpose and data elements collected in the call, a detailed description of the validation procedures for each element and the contents of key files containing data received on the call.

Only systems, procedures and data that are currently utilized at NCCI have been reviewed in detail. This documentation is limited to functions and data which directly affect the determination of workers compensation rates, experience ratings and detailed claim information. Systems under development are discussed in Volume I of this report.

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

NCCI Overview:

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

NCCI Overview:

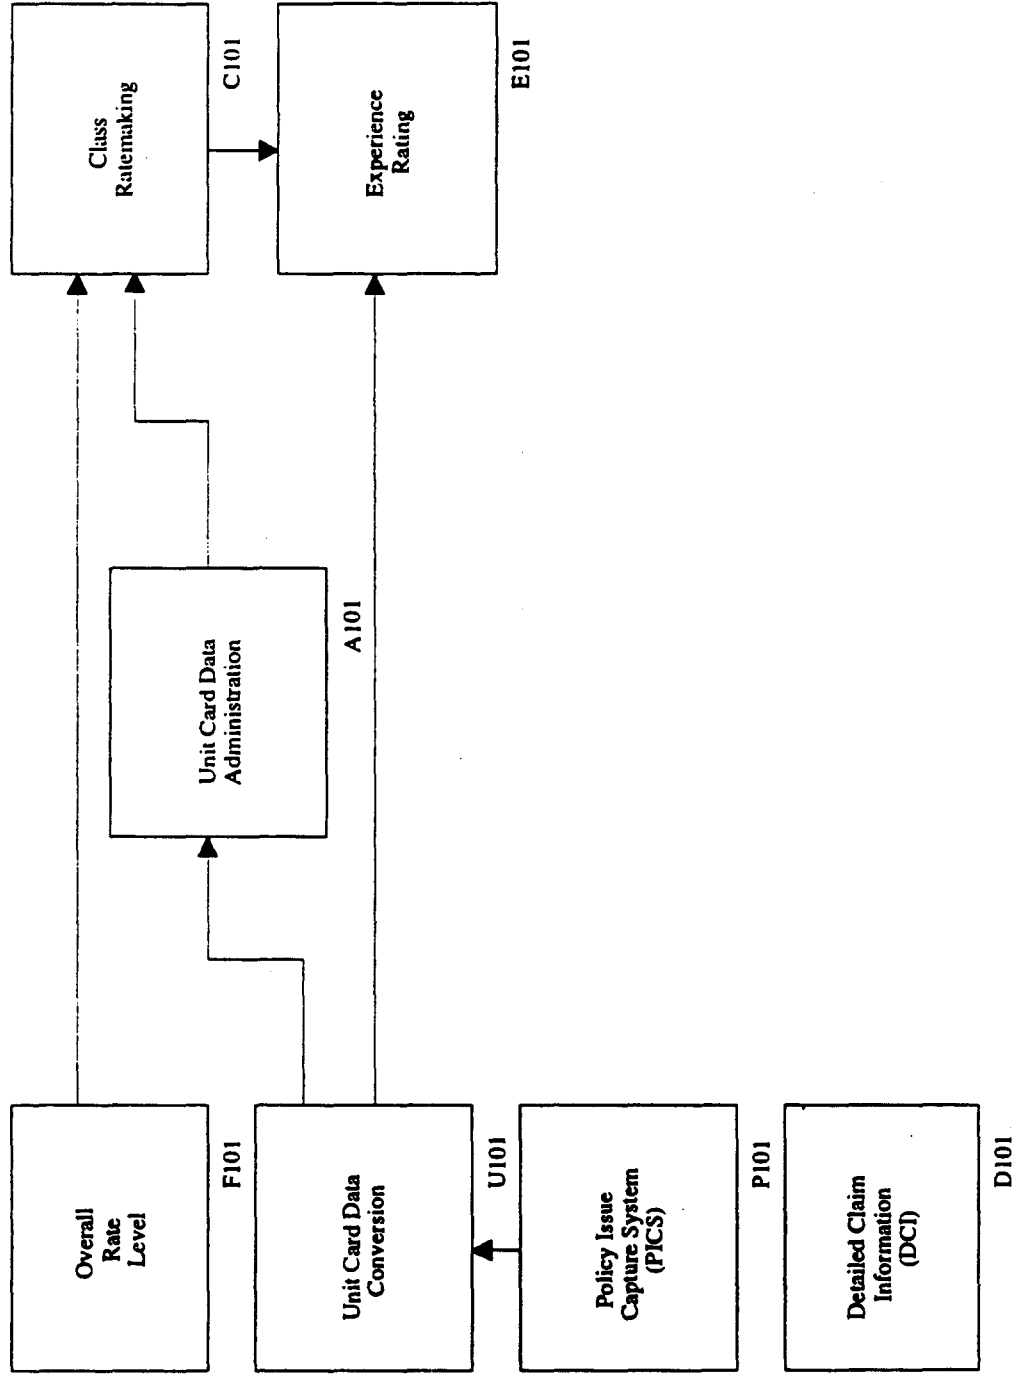

NCCI services the insurance industry by compiling data on workers compensation insurance policies and by developing premium rates and experience modifications for 33 states. NCCI collects premium, payroll, loss and other financial data on standardized reporting forms. This data is validated in a series of manual and automated processes which check accuracy and completeness. Ratemaking functions use the data to produce both overall premium rate levels and premium rates by payroll classification. The experience rating function produces modification factors for premiums based on an insured's historical loss experience compared to the experience of other insureds within the same classification. Additional information supporting these functions is provided by systems which track policy information and detailed claim information.

The processing of data and development of rates at NCCI is accomplished through a combination of manual and automated procedures. Manual procedures are performed at the home office in Boca Raton and in the eight field locations. Automated procedures are executed on both mainframe computers and microcomputers. Data is stored primarily on magnetic tape although some data is retained on-line using database technology.

Overall Rate Level (F101) collects aggregate financial information from carriers on standard forms referred to as financial calls. This data is combined with data from prior years and used to produce an overall rate recommendation for each state. The overall rate level is provided to Class Ratemaking and is included as part of the annual state rate filing.

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

NCCI Overview:

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

NCCI Overview:

Unit Card Data Conversion (U101) collects detail payroll and loss data from carriers on a standard form referred to as a unit report under the Workers Compensation Statistical Plan (WCSP). Carriers are required to submit a unit report for each year of each policy. Unit reports are collected and maintained for up to five valuation years. All unit report data is sent to Data Administration for validation and correction. Unit report data for experience rated policies is also provided to Experience Rating.

Unit Card Data Administration (A101) receives and inputs all unit report data, sorts and extracts it by state, performs a series of automated and manual validations and corrections, and provides five years of accumulated data to Class Ratemaking.

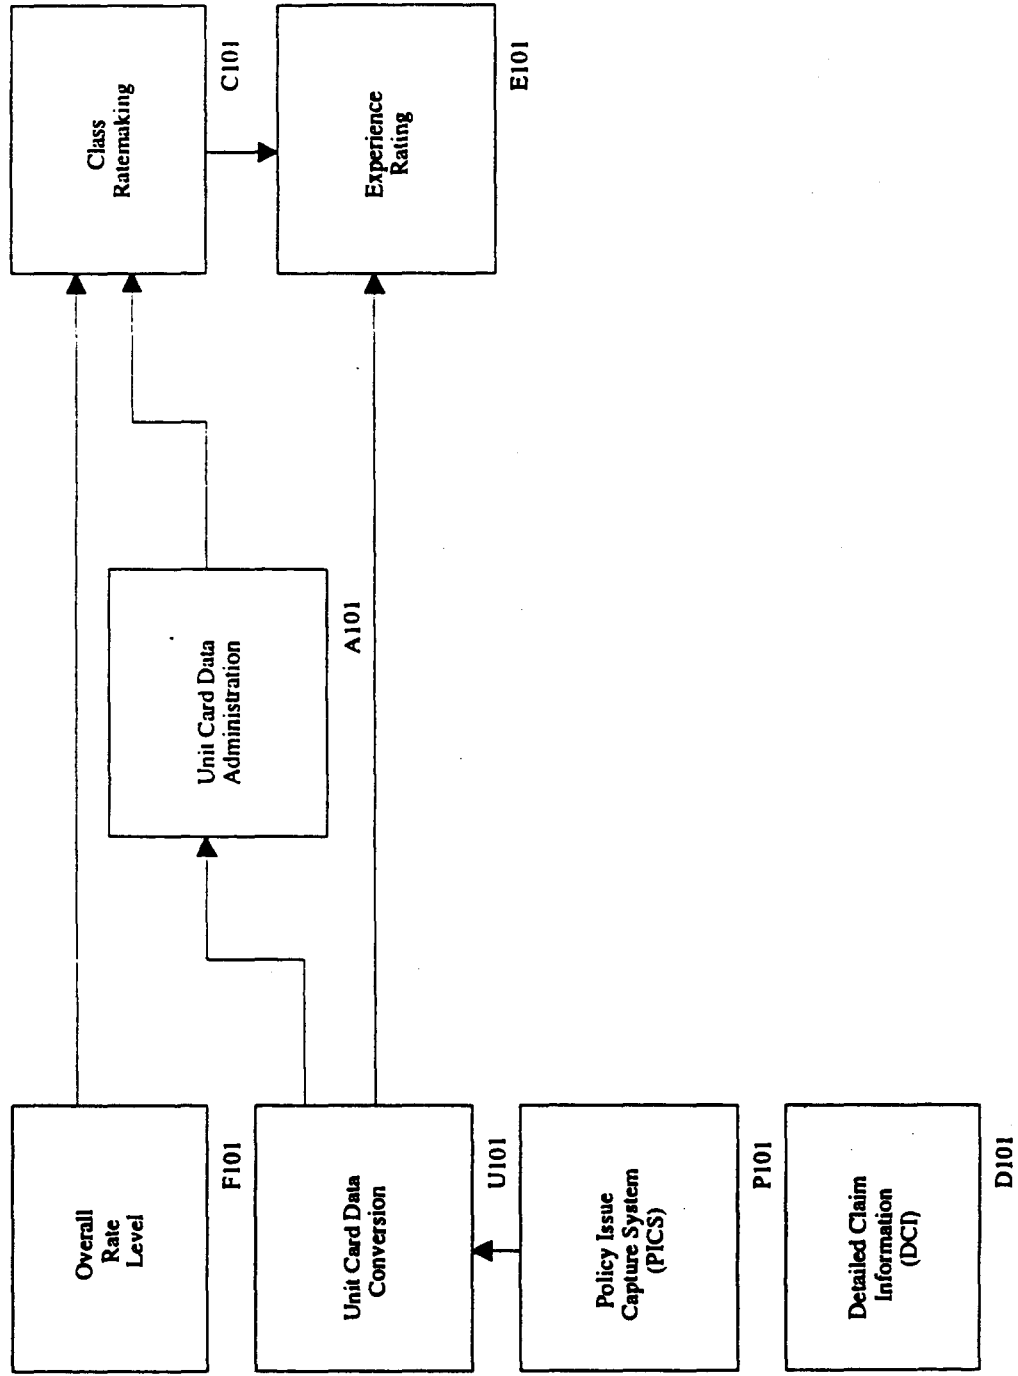

Class Ratemaking (C101) uses the overall rate level and payroll and loss data from unit reports to produce rates by payroll classification code for each state. These rates are included as part of the state rate filings. Class Ratemaking also calculates key ratios which are used by Experience Rating.

Experience Rating (E101) uses key ratios from Class Ratemaking and unit report payroll and loss data to produce experience modification factors (experience mods). These experience mods are sent to carriers and used to adjust an insured's premium.

Policy Issue Capture System (P101) collects workers compensation policy information from carriers. The information is used by both internal and external groups for research purposes.

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

NCCI Overview:

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

NCCI Overview:

Detailed Claim Information System (DI01) collects expanded detail loss and loss expense information from carriers on calls for detailed claim information. This information is used primarily for research and inquiry purposes to better understand changing workers compensation loss costs.

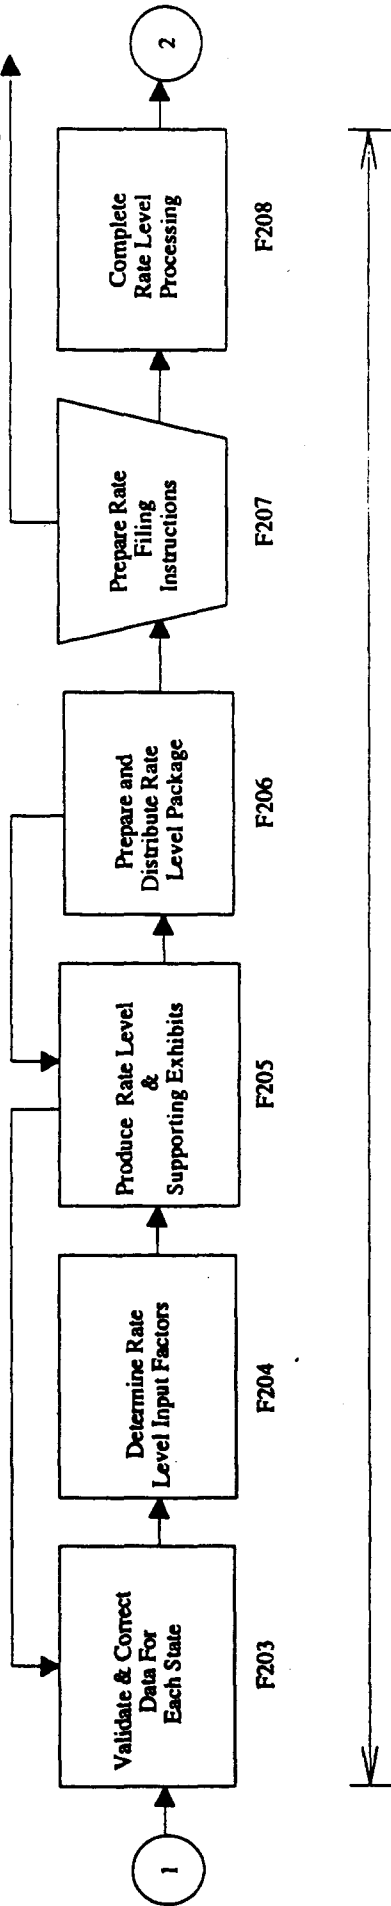

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Overall Rate Level (E101):

Pre Rate Level Production Processing

To: Class Ratemaking

Rate Level Production Processing

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Overall Rate Level (F101):

NCCI requests financial information from carriers on 22 annual financial calls and receives about 5,000 responses. The data from three of these financial calls is used to generate aggregate rate level indications. Data from other financial calls is used to reconcile the three calls to carrier financial data compiled by A.M. Best or the carrier, for expense analyses and for certain state specific calculations and regulatory reports.

The Overall Rate Level function encompasses the receipt and processing of the annual calls from the carriers to the generation of aggregate rate levels by state. Within the Overall Rate Level function, the Financial Data area controls the receipt of financial calls (F201) while the Aggregate Ratemaking area produces the overall rate levels (F201 to F208).

Early in the fourth quarter of each year, NCCI sends financial call requests to carriers for premium, loss and other experience that is required for the upcoming year's overall rate level determination. The Financial Data area receives the financial calls and related corrections during the first quarter of each year. Hardcopy financial call data is separated by call, logged in, visually reviewed for completeness and obvious errors, and sent to NCCI's outside data entry firm, Appalachian Computer Services (ACS), for data entry. Entered data is transmitted back to NCCI by modem. The data is subjected to basic system edits. Financial call data received on diskette (FCOD) is processed through a microcomputer application for validation prior to being uploaded to the mainframe.

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Overall Rate Level (F101):

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Overall Rate Level (F101):

Data rejected at this point is either returned to the carrier for correction, or corrected internally and reprocessed by ACS. (F201)

After initial edits are performed and corrections made, Aggregate Ratemaking runs several validation programs known as "Batch Validation". These programs perform reasonableness checks on accident year and policy year information, compare certain calls for consistency of similar data elements, compare certain fields to calculated equivalents and perform general data edits on an individual carrier basis. An NCCI employee reviews the reports generated and corresponds with the carriers to resolve any identified errors. If a correction applies to a state that is not yet in final rate level production, the corrections are routed through the Financial Data area and keypunched by ACS. If final rate level production has begun, corrections are forwarded to the Aggregate Ratemaking area for entry. (F202)

Aggregate Ratemaking begins the final rate level production process for a state by extracting the state's financial call data for the three most recent years and creating a state library file. A series of validation programs, known as "State Validation" programs, are applied to this file. This validation is similar to the batch validation noted above, however it includes analysis of loss and premium totals for the entire state. It also identifies unusual development within individual carrier data. Any corrections are entered into a correction file known as a "Corr" file. When the data passes these edits, additional validation programs, known as "Secondary Validations", are used to examine the statewide data and produce additional corrections. The secondary validation concentrates on analysis of loss development (F203).

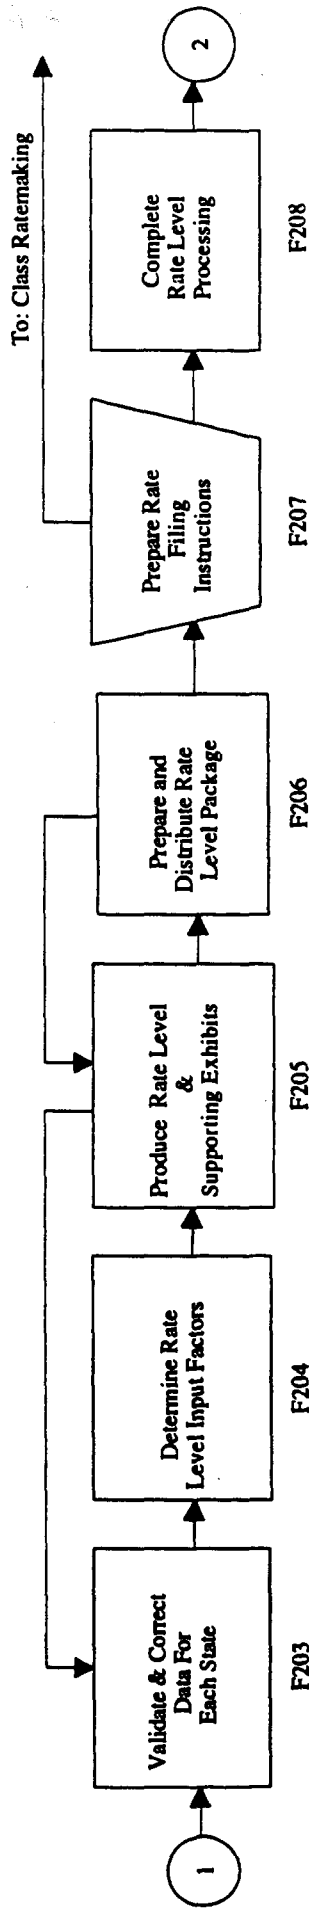

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Overall Rate Level (F101):

Pre Rate Level Production Processing

To: Class Ratemaking

Rate Level Production Processing

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Overall Rate Level (F10D):

Production of overall rate levels begins in late April. Aggregate Ratemaking calculates a set of rate levels on a mainframe computer application using experience from the state library file, the latest correction file, and a set of rate level input parameters. Aggregate Ratemaking collects some of these input parameters from Class Ratemaking, the Actuarial Committee and the Benefit Evaluations department. The remaining input parameters are calculated using mainframe and microcomputer applications. These parameters address such issues as adjusting experience for changes in benefit levels. (F204)

The rate levels and supporting exhibits are reviewed for large or unusual changes. If any carrier data distorts overall experience, it is investigated and changes may be entered into the correction file. Additional supporting exhibits (e.g., without certain carrier experience) may be provided to aid investigation. Rate level indications are compared to prior year rate levels. (F205)

Once any unusual developments are explained or corrected, the rate levels are manually modified to account for new changes in benefits and proposed changes in expenses and/or assessments. The voluntary and assigned risk loss ratio exhibit, assigned risk subsidy and other special exhibits are also prepared.

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Overall Rate Level (F101):

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Overall Rate Level (F101):

A package of rate levels and supporting exhibits is sent to the regional actuary for selection of the final rate level. (F206)

Rate levels calculated by using different loss development methodologies are compared and analyzed by the regional actuaries. Additional methodologies may be reviewed, such as rate level indications produced with experience which excludes specific carrier data that may be causing a distortion. The regional actuary selects the final rate level and presents the final rate level to the Rates Committee and Classification and Rating Committee for approval. The regional actuary then prepares and distributes filing instructions. Final rate levels in the rate filing package are reviewed by the Quality Control area.(F207)

After a rate filing is approved, data corrections are printed and keyed by ACS so that they will be incorporated into subsequent years' rate calculations. (F208)

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Unit Card Data Conversion (U10D):

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Unit Card Data Conversion (U101):

NCCI receives detail payroll and loss data by payroll class from carriers in accordance with the Workers Compensation Statistical Plan (WCSP). Carriers submit approximately 250,000 unit reports per month; roughly 60% are submitted on magnetic tape and 40% are submitted on hard copy. Carriers are required to report annually for five years on each workers compensation policy which has open claims.

Unit Card Data Conversion receives and processes unit reports and delivers data files to Unit Card Data Administration and Experience Rating. (U101)

Hard copy unit reports are processed in Boca Raton. Preprocessing begins when Data Conversion sorts the unit reports into batches. The batches are microfilmed by an outside contractor (Leahy) and keypunched by ACS. The data is electronically transmitted via modem back to NCCI from ACS and is separated by NCCI's unit report application into unit reports (free flow data) and corrections (non free flow data). (U201)

Magnetic tape unit reports are also processed by the Data Conversion area. Initial processing of the magnetic tapes includes verification of standard format, generation of microfiche copies of individual unit reports and creation of files used to print hard copy unit reports. (U202)

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Unit Card Data Conversion (U10D):

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Unit Card Data Conversion (U10D):

"Free flow" hard copy unit reports and all preprocessed magnetic tape unit reports are merged into one file. A program attempts to retrieve/validate the risk identification number (risk ID) on the unit report by comparing this file to a risk directory. The risk directory associates policy and insured information with a risk ID. Only unit reports for experience rated risks are assigned a risk ID. Approximately 45% of unit reports which have sufficient premium to be experience rated are successfully matched, 33% cannot be matched to either a risk ID or a risk name in the directory, and the rest are partial matches. (U203)

Successful matching to a risk ID and risk name causes the data to be dispersed to Experience Rating and Unit Card Data Administration. (U204) Free flow unit reports which are not matched to both a risk ID and a risk name are reported on a series of hard copy reports which are researched by the Indexing area of Data Administration. Unit reports which are manually identified (i.e., a risk ID is found) are updated on-line and released to both Experience Rating and Unit Card Data Administration. Final reports and hard copies of all printed unit reports are batched and sent to the field offices to be used as a reference. (U205) Unmatched unit reports are investigated in the field office. Any updates are noted on the report and sent back to Boca Raton for processing. Unit reports for new policies eligible for experience rating are assigned a risk ID by the field office.

At the end of each month, all batches of researched unit reports which have not been associated with a risk ID are sent to Unit Card Data Administration to complete the data which will be needed in Class Ratemaking. Data Administration and Experience Rating are responsible for ensuring completeness and accuracy of data they utilize.(U201)

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Unit Card Data Administration (A101):

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Unit Card Data Administration (A101):

Unit Card Data Administration receives all payroll and loss data from Unit Card Data Conversion, extracts it by state, performs several validation tests and corrects the data for use by Class Ratemaking. (A101)

On a daily basis, the data provided from Data Conversion is captured and stored on magnetic tape. These tapes are called day pools. Each week, day pools are combined to form week pool tapes. Every four weeks, month pools are created. (A201)

Six to eight months prior to the rate filing date for a given state, five policy years of payroll and loss data are extracted from month pools. A state payroll and loss detail file (P/L file) is created from this data. The output totals are compared to prior year totals for reasonableness. A system generated report identifies exact duplicate records which are purged. (A202, A203)

Validation of the P/L file involves several steps which may occur more than once. Logical, relational and reasonableness tests are performed.

System generated listings of potential duplicate records are produced and manually reviewed. The "State Validation" program is run to identify potential errors. The Class Payroll Fluctuation report is used to identify unreasonable fluctuations in payroll, while the WCSP Reasonableness Test is used to identify unreasonable fluctuations in losses. Carriers may be contacted to obtain missing information and/or explanations of data irregularities. (A204)

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Unit Card Data Administration (A10D):

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

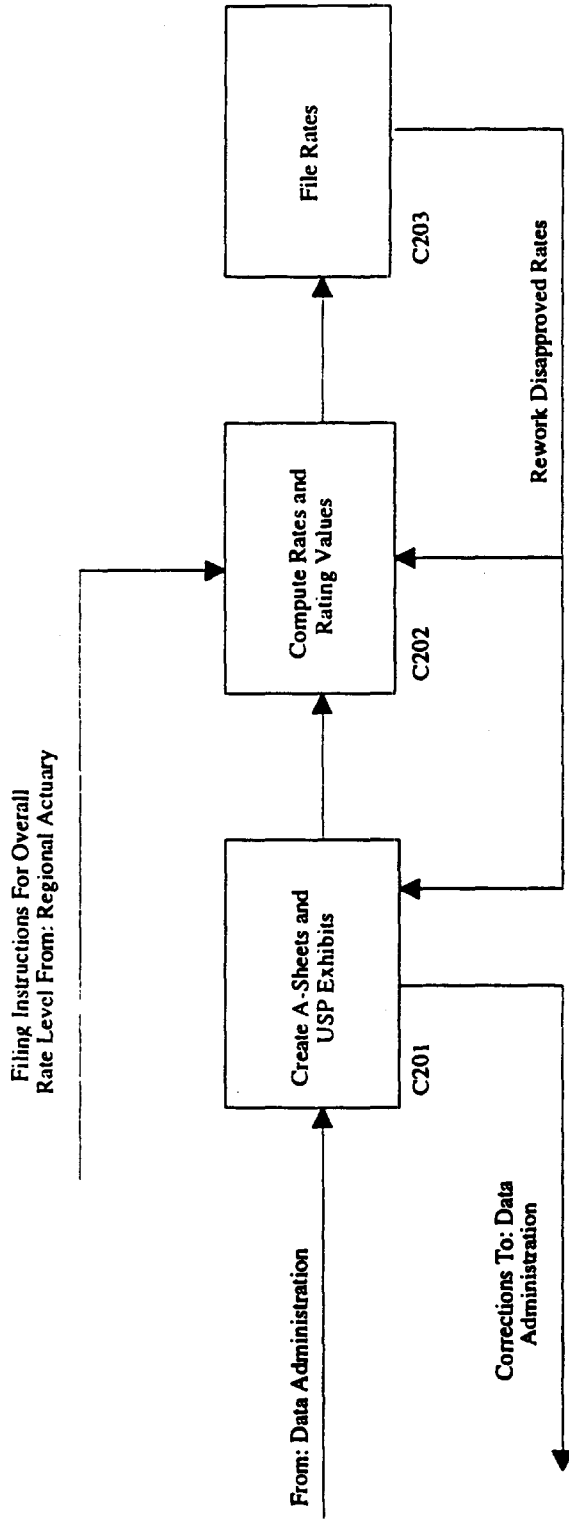

Unit Card Data Administration (A101):

The correction process for P/L file data is heavily reliant on manual reviews of system generated reports. Corrections are applied to the data through an on-line data entry system or by filling out correction sheets which are sent to ACS for data entry and transferred via modem to the NCCI system. Validation and correction are iterative processes in which the data flow and sequence of programs is dictated by the Data Administration area, based on the type and number of errors encountered. Validation and correction programs are executed on request throughout this process.(A204)

Validated payroll and loss data for a state is summarized by class code and segmented into industry groups. Industry groups identify particular types of risks. The three industry groups are manufacturing, contracting and all others. Payroll and loss data is also summarized after individual and catastrophe loss limitations have been applied to the loss amounts. This summarized information is provided to the Pure Premium area of Class Ratemaking. (A205)

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Class Ratemaking (C101):

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Class Ratemaking (C101):

Class Ratemaking receives payroll and loss data summarized by class code from Unit Card Data Administration and filing instructions from the regional actuaries. These inputs are used to distribute the proposed overall rate level change across both industry groups and payroll classification codes. The resulting rates, referred to as manual rates if they include expenses, profit and contingencies, and load and loss costs if they do not, are presented as premium per hundred dollars of payroll. (C101)

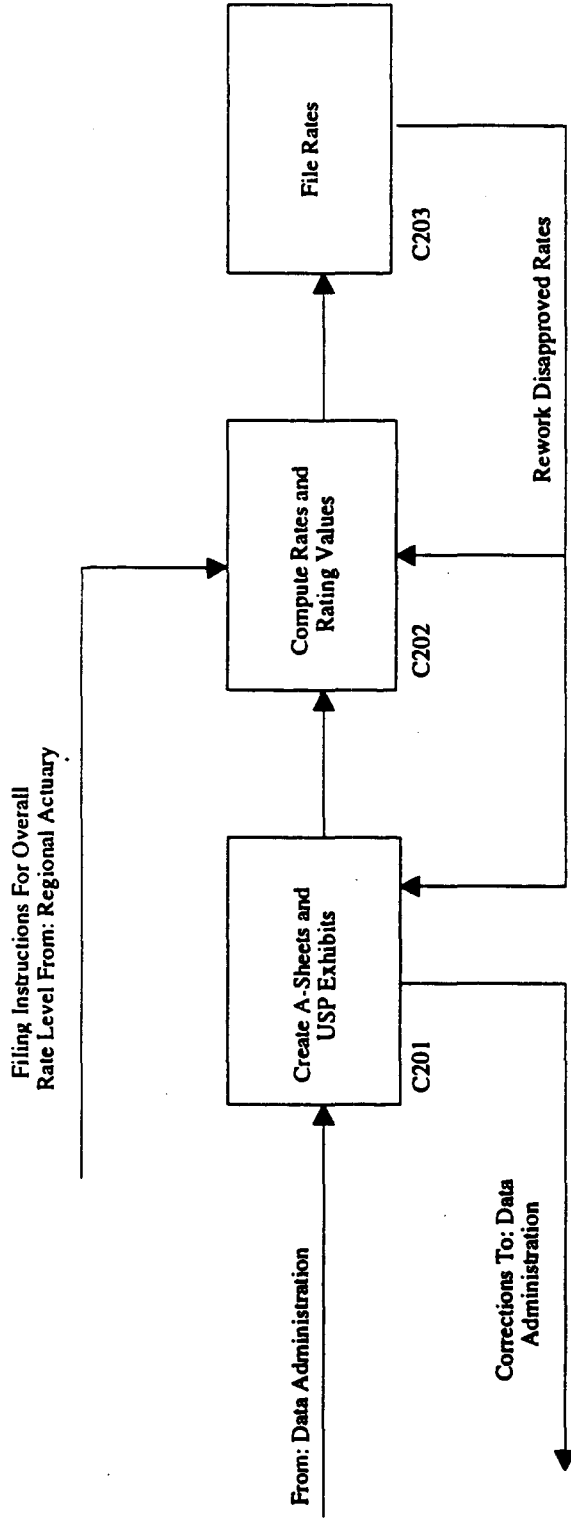

The Pure Premium area uses the summarized P/L file created and validated by Data Administration. The data is reviewed manually for reasonableness using statistical analysis programs. The reviews investigate payroll fluctuations, loss development, aggregate losses in excess of a maximum amount and premium development. Any necessary changes to the P/L file are sent to Unit Card Data Administration for correction through ACS.

The Pure Premium area derives various input factors including development factors and industry group differentials using a spreadsheet application on a microcomputer. Various exhibits are produced for ratemaking and other purposes.

The final step in the Pure Premium area is the production of A-sheets. A-sheets document the calculation of formula pure premium, which is the calculated loss per unit of payroll for each class code. The Quality Control function reviews the processing through preliminary A-sheets. (C201)

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Class Ratemaking (C10):

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Class Ratemaking (C10D):

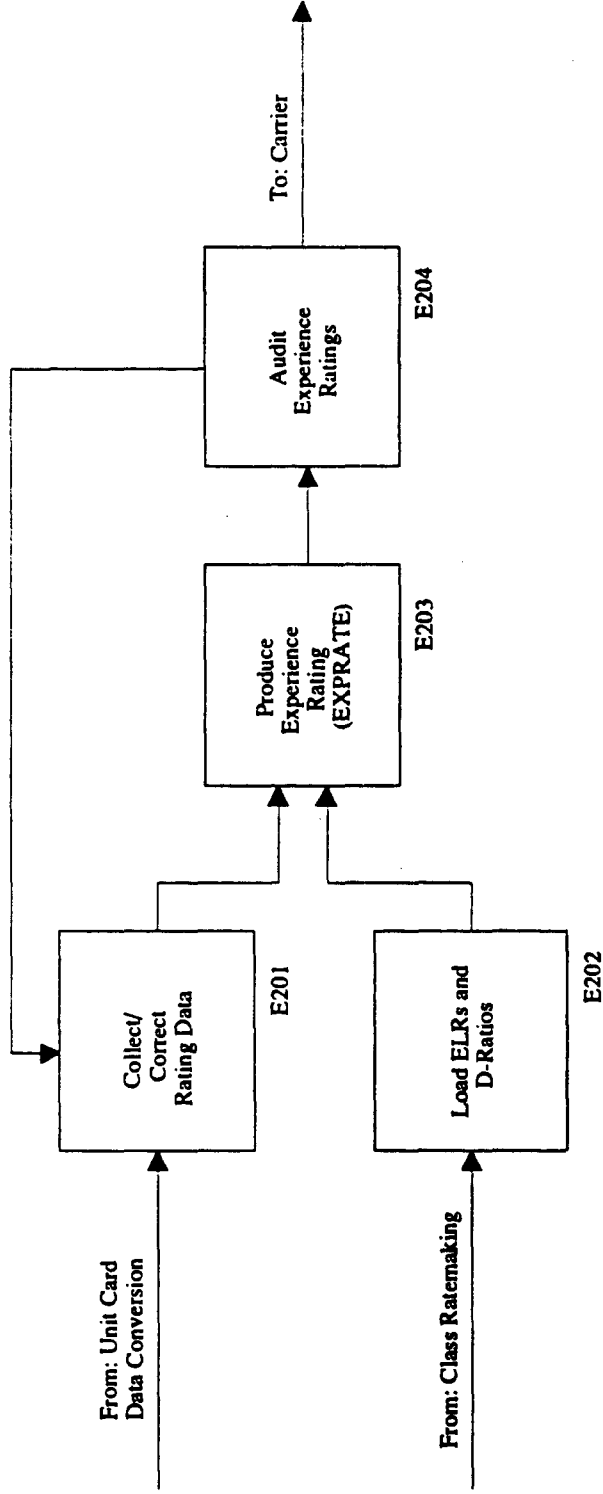

The Rates area uses the regional actuary's filing instructions, P/L data and results from A-sheet processing to produce Rate Factor Cards. The A-sheet data and Rate Factor cards are inputs to an automated procedure which computes the class rates and experience rating values. Individual class rate adjustments and sample rate calculations are performed manually. Any adjustments for specific requirements by state and/or class are input to the rates file.

From this file, the rate filing pages are produced. Miscellaneous exhibits and appendices are also produced to document the interim steps taken to arrive at the final rates. During this step, expected loss rate factors and D-ratio factors are also produced for transmittal to Experience Rating after the filing is approved. (C202)

The final filing is reviewed by Quality Control and the regional actuaries. Any necessary changes can be entered into the final rates file. The rates are filed with the state upon final Quality Control review and regional actuary approval. (C203)

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Experience Rating (E101):

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Experience Rating (E101):

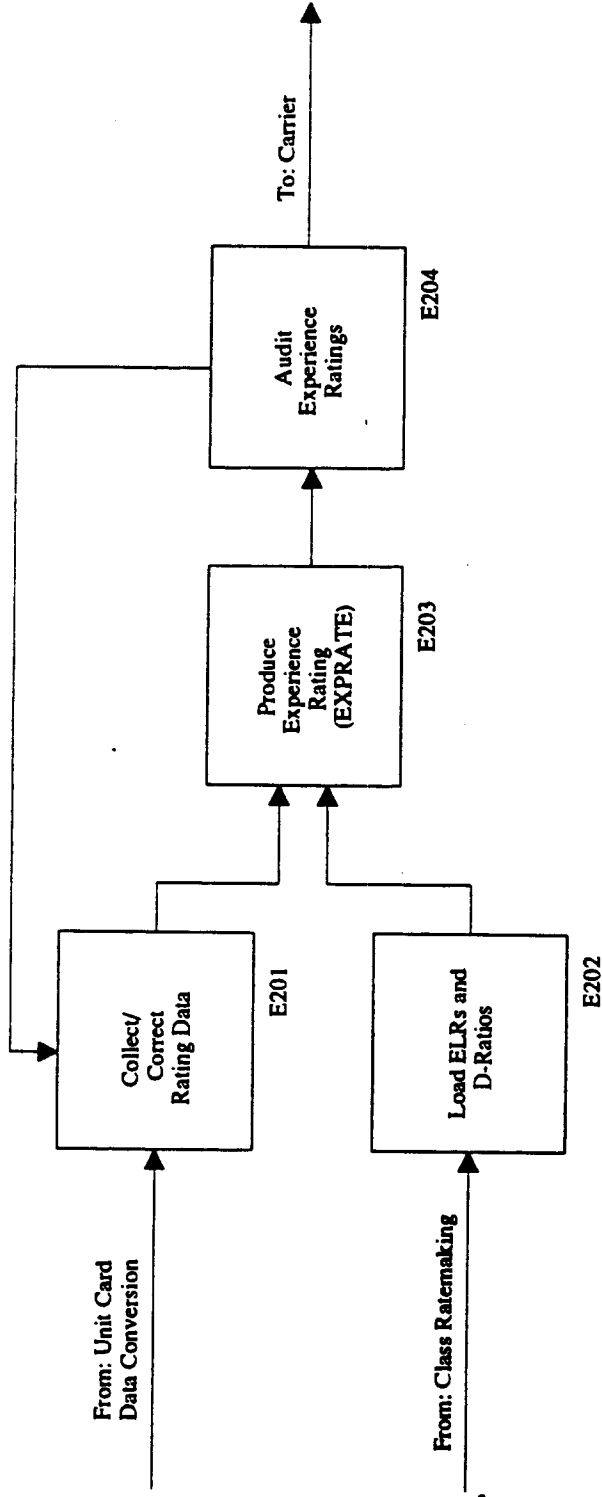

Experience modification factors (experience mods) allow carriers to adjust policy premiums based on an insured's historical loss experience. Experience mods are calculated for each insured meeting state set premium thresholds by comparing individual loss experience to classification averages. Experience Rating receives payroll, premium and loss information from Unit Card Data Conversion, and approved rating values from Class Ratemaking. Experience mods are provided to insurance carriers.

Unit card data is forwarded to Experience Rating if the insured's policy premium meets experience rating threshold amounts which are defined for each state. Currently, this threshold ranges from \$1,750 to \$5,000. An experience mod will be produced for an insured only if it meets this threshold over a three year period. If the insured meets a second threshold, usually twice the minimum, for a one or two year period, it will also be considered eligible for experience rating.

Experience Rating collects and corrects rating data received from Unit Card Data Conversion. This task begins when newly received unit card data is merged with older data to make up three years of experience data. Payroll and loss information is checked for completeness by a series of automated and manual processes. If three years of data does not exist, exception procedures are used to obtain missing information or to produce the rating with less than three years of data. Previously missing or corrected unit cards are processed through Unit Card Data Conversion and forwarded to Experience Rating and to Unit Card Data Administration as appropriate. (E201)

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Experience Rating (E10D):

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

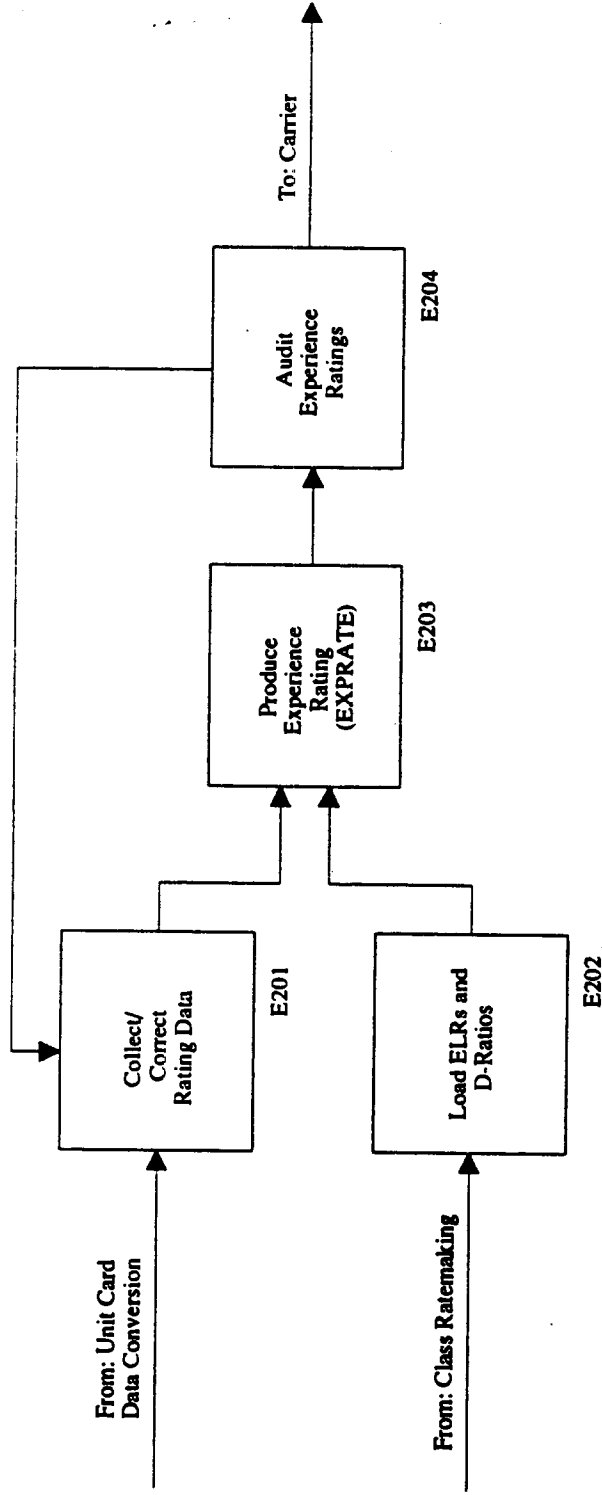

Experience Rating (E101):

Experience Rating loads the Expected Loss Rate (ELR) factors and D-ratios for each class in each state into the experience rating system. Class Ratemaking produces these factors during its rate calculations. The ELR factor specifies the amount of expected losses by payroll classification for each \$100 of payroll. D-Ratios specify what portion of expected losses are anticipated to be below a specified dollar amount. For states in which class rates have not been finalized, current information will be used to calculate preliminary experience mods until final rates are approved. (E202)

The experience rating production system consists of several automated steps to further validate data and produce experience ratings. Automated procedures validate payroll data and loss data. The validation process generates a valid rating data file and a rejected rating data file. Valid rating data is further separated into single state insureds (intrastate) and multi-state insureds (interstate) files. The valid rating files are processed through calculation programs which produce rating sheets for each insured. Rating sheets list all payroll and loss data, ELRs, and D-ratios used in producing the experience modification factor, which is also listed. Rejected rating data is reviewed, corrected and reprocessed. (E203)

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Experience Rating (E10D):

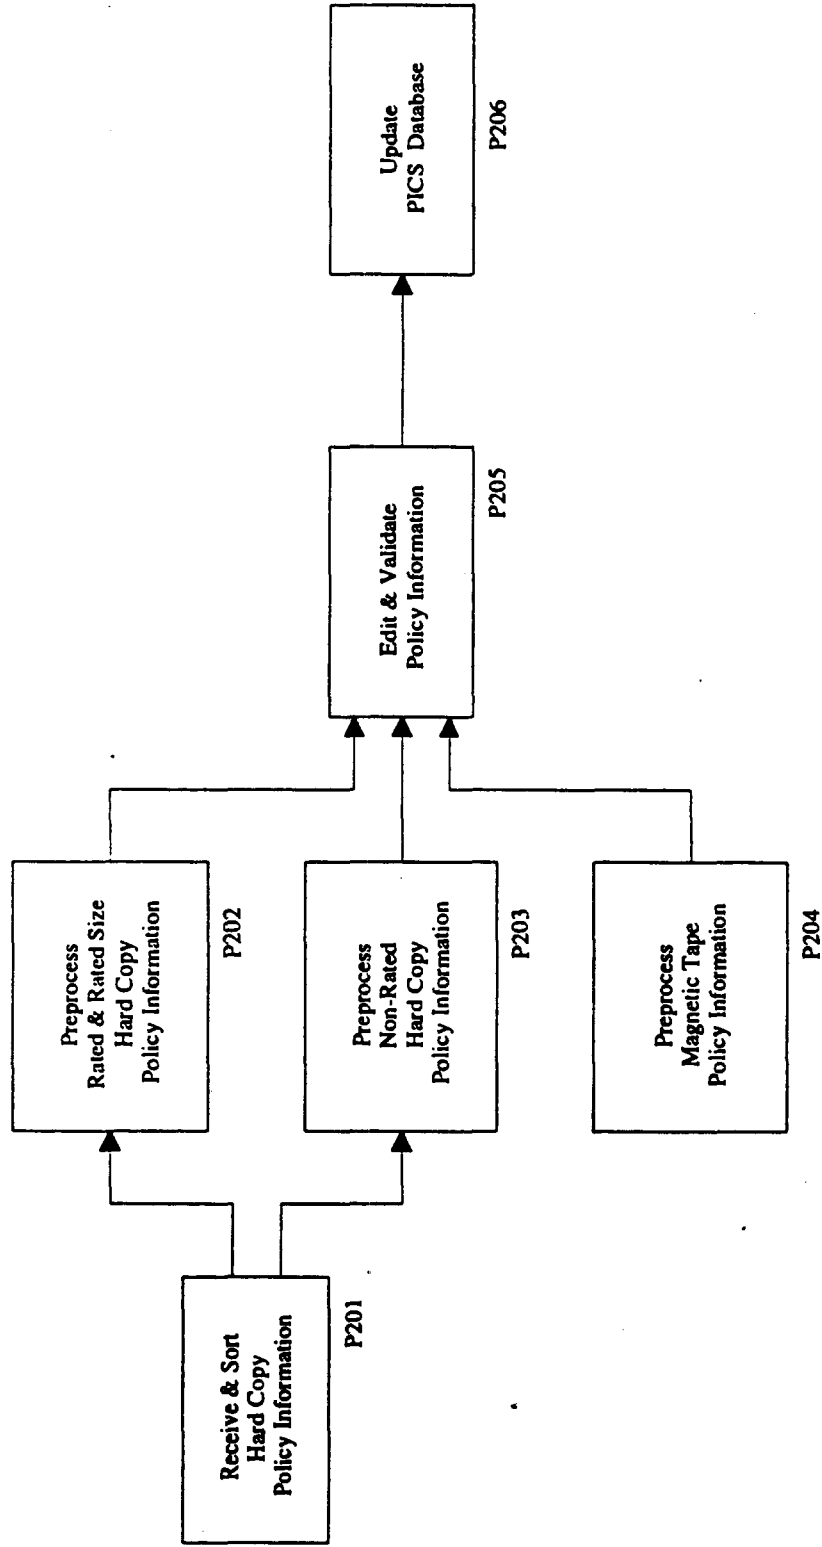

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Experience Rating (E101):

The field offices audit experience rating sheets produced by the system. Field office personnel compare payroll, loss and experience mods to prior year information, look for duplicate data and perform general reasonableness reviews. Rating sheets requiring corrections are marked and sent back through ACS or corrected on-line. Unit Card Data Conversion receives and processes correction data and then forwards it to Experience Rating and Data Administration, as appropriate. Valid preliminary rating sheets are sent to the carriers until new finalized rating sheets can be produced. NCCI sends valid final rating sheets to the appropriate carriers so that affected premiums can be adjusted. (E204)

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Policy Issue Capture System (PICS) (P101)

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Policy Issue Capture System (PICS) (P101):

Policy information is sent to NCCI by the carriers in either hardcopy format or on magnetic tape. Currently, about 39% of policies, based on premiums, are sent on hardcopy. NCCI field office personnel receive and separate hardcopy policy information into rated and non-rated groups based on the experience rating premium threshold. Policy information is retained for experience rated policies, assigned risk policies, policies in merit rating states and policies in states subscribing to NCCI's Proof of Coverage (POC) service. Policies within \$500 of the state's experience rating threshold are also retained (see Experience Rating). (P201)

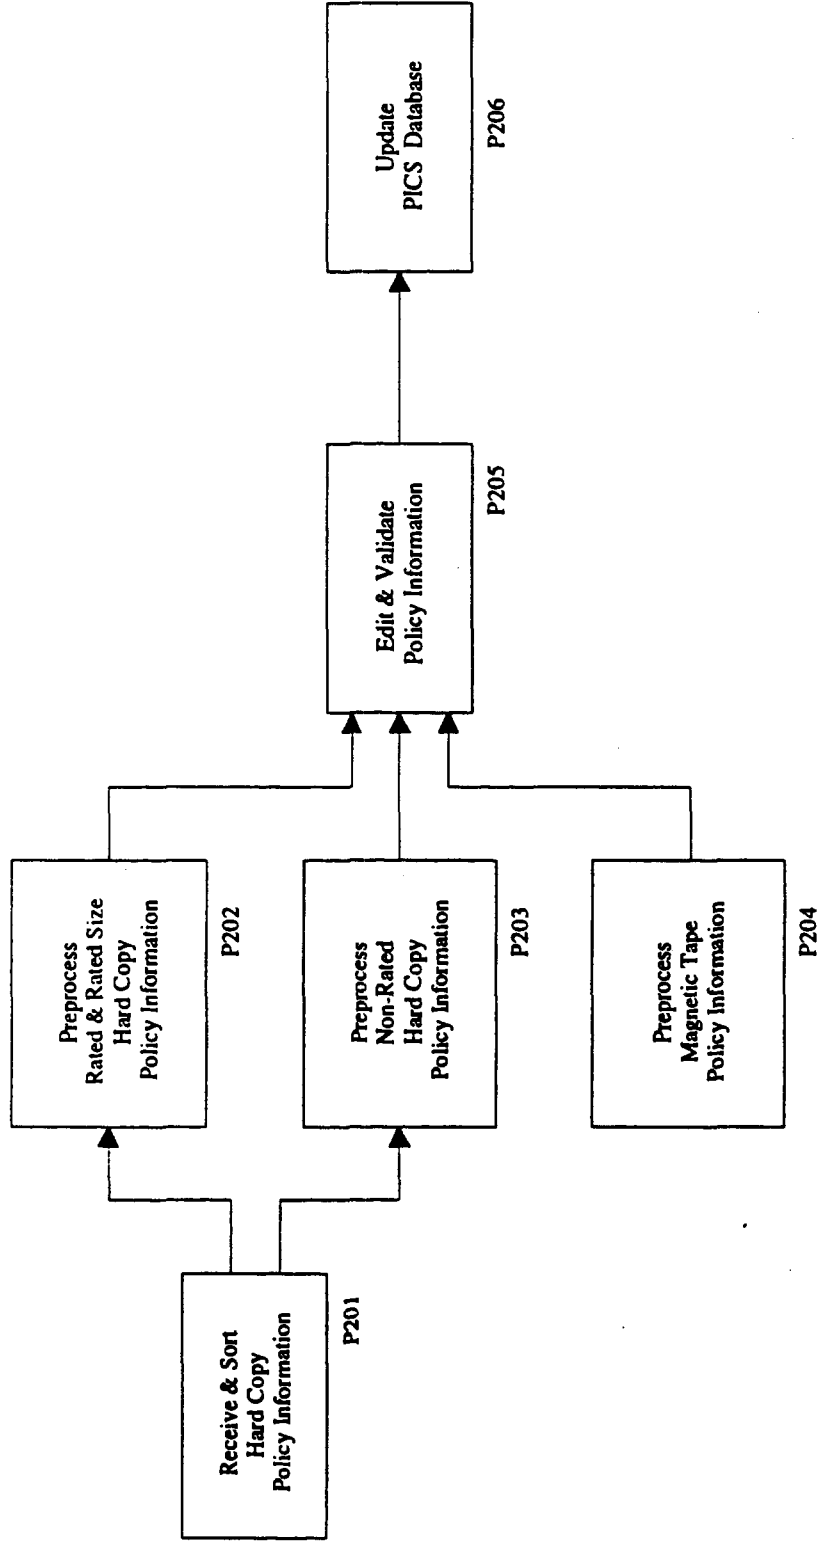

Field office personnel enter rated and rated size hardcopy policy information through a series of on-line screens. Data entered through these screens is validated before being posted to the PICS database. (P202)

The field office sends qualifying non-rated hardcopy policies to ACS for data entry. ACS transmits keyed data to NCCI in Boca Raton through an electronic data transfer. PICS programs receive non-rated hardcopy policy information and reformat it for additional processing. (P203)

NCCI receives and preprocesses magnetic tape policy information into a temporary database after deleting from the files policies which do not qualify for retention. The insured's risk name and address are modified where necessary to conform to a standard format. (204)

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Policy Information Capture System (PICS) (P101):

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Policy Information Capture System (PICS) (P101):

The PICS system edits and validates both magnetic tape and ACS keyed policies through a series of batch modules. (P205) The policy system application updates the PICS database with valid policy information. (P206) Rejected policies appear on a series of error reports and must be corrected by NCCI personnel or through carrier resubmission of data before being incorporated into the database.

The policy information database serves as a source for carrier information, risk IDs, proof of coverage (POC) information and general policy information. It is accessed by several areas including Unit Card Data Conversion, Experience Rating and POC subscribers. There are currently approximately 6 million policies in the PICS database. This number is currently growing at a rate of approximately 125,000 per month.

It is our understanding that NCCI intends to capture information for all policies.

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Detailed Claim Information (DCI) System (D101):

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Detailed Claim Information (DCI) System (D101):

The Detailed Claim Information System is used by NCCI to understand the components of changing workers compensation loss costs. It represents a sample of indemnity claims from a population of thirteen states. DCI is not integrated with the Experience Rating and Class Ratemaking systems. The data captured in DCI includes additional information concerning claimant data, indemnity benefits and payments, vocational rehabilitation benefits, medical benefits and claim administration details. NCCI processes approximately 10,000 DCI claim reports per month. The percentage received on magnetic tape varies from 10% to 30%.

Every three years, NCCI determines a sampling ratio with the objective of capturing a sample of between 1,000 and 1,500 permanent partial disability claims for each NCCI state. Carriers are subject to DCI reporting requirements in any DCI state where they write more than 0.1% of total premiums. These carriers must generate a random sample of all direct indemnity claims. The selected claim is first reported six months after the claim is filed and every twelve months thereafter until it is either closed or no longer includes indemnity compensation.(D201)

NCCI receives DCI information from the carriers throughout the year on a Call For Detailed Claim Information. Hard copy calls are keypunched by ACS and electronically returned to NCCI. Magnetic tape submissions are processed by NCCI data operations. The DCI system merges the ACS tape with the magnetic tape submissions and performs a series of logical and relational edits on the

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Detailed Claim Information (DCI) System (D101):

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Detailed Claim Information (DCI) (D101):

data. If critical fields in the call are missing or incorrect, an error condition occurs which can only be corrected by carrier resubmission of the data. Less critical errors cause the system to generate a call for corrected detailed claim information which is sent to the carrier and returned to NCCI. The data is held in a suspense file until it is corrected. (D203)

DCI processing encompasses tracking calls for corrected detailed claim information and generating additional notices as necessary, generating and tracking calls for subsequent detailed claim information and creating the quarterly file used to produce DCI analyses. If a correction call is not received, then up to three additional notices will be sent. If the carrier does not respond, the data remains in the suspense file. Once a claim is established in the DCI system, NCCI generates a call for subsequent detailed claim information every twelve months and delivers it to the carrier sixty days prior to its due date. Calls for subsequent information will continue to be sent until either the carrier indicates that the case is no longer subject to DCI reporting or the claim reaches its ninth year. Quarterly, a file of all valid DCI information is extracted for use in analyzing the data. (D205, D207, D209)

The only regularly performed analysis of DCI data is a bi-annual report produced by NCCI actuarial personnel. Regional actuaries use DCI to answer specific inquiries from state insurance departments and for research purposes. DCI data is also used by Actuarial Information Services and the Benefits Division. (D211)

DATA COLLECTION AND DATA QUALITY

Glossary of Terms

ACS	Appalachian Computer Services. An offsite data entry organization used extensively by NCCI.
A-Rates	Classifications whose diversification of experience cannot warrant normal manual rating are "a"-rated. Estimated rates are obtained from NCCI or other licensed rating organizations until an inspection of the insured 's activities can be made.
A-Sheets (Pure Premium Exhibits)	For each classification, this exhibit contains payrolls, losses on a current level, credibilities for state and national partial pure premiums, as well as the following pure premiums (see pure premiums) by serious indemnity, non-serious indemnity and medical parts: <ol style="list-style-type: none">1) Indicated by Experience2) Present on Rate Level3) Underlying Present Rates4) Indicated by National Relativity5) Derived by Formula
Accident Year	The calendar year in which an accident or loss occurred. Also called Calendar-Accident Year.
Accident Year Call	A call for premium and loss experience information on an accident year basis.
Bulk Reserves	Those outstanding reserves for general case reserve inadequacy, supplemental case reserves, cases that may reopen, or other (non IBNR) reserves which are not associated to specific claims. (Reference: Financial Calls)
Calendar Year Call	A call for premium or loss experience for a specified calendar year.
Case Reserves	Those outstanding reserves established for specific known cases. (Reference: Financial Calls)

DATA COLLECTION AND DATA QUALITY

Glossary of Terms

"Corr" File	A temporary correction file used by the Aggregate Ratemaking production team to store financial call data corrections when determination of a state's rate level is in progress.
Credibility	A weight, ranging from 0 to 1, assigned to a certain body of data. NCCI applies credibility in its trend methodology, its classification ratemaking methodology, and its experience rating formulas.
Credibility Complement	Unity less credibility.
Critical Value	The amount of indemnity losses determining whether a permanent partial claim is classified as major or minor. If the indemnity portion is greater the critical value, then the injury type is major permanent partial. If the indemnity portion is less than the critical value, then the injury type is minor permanent partial.
"D"-Ratios	Represents the average ratio of expected primary losses to total expected losses for a given classification.
"D"-Ratio Factor	Used in the "D"-ratio formula, these factors are calculated for application to serious, non-serious, and medical pure premiums by taking the ratio of primary losses to total serious, non-serious, and medical losses, respectively.
"D"-Ratio Formula	Equal to $[(\text{Serious "D" factor} \times \text{serious pure premium}) + (\text{Non-serious "D" factor} \times \text{Non-serious pure premium}) + (\text{Medical "D" factor} \times \text{medical pure premium})] / \text{Total Pure Premium}$. "D"-ratios are limited to plus or minus .1 from the last approved rate's "D"-ratios. "D"-ratios cannot be less than .25; nor can they exceed .90.
Data Request Form	Describes the policy periods to be used in the upcoming state experience filing. Also denotes critical values, current self-rating point (to limit NC-235 losses), current master and the Phase I Volume checks.

DATA COLLECTION AND DATA QUALITY

Glossary of Terms

Detailed Claim Information	Information on an individual workers compensation claim basis which provides detail on the components of loss costs.
Development Factor	Ratio of losses (premium) at a given age divided by losses (premium) at a prior age.
Excess Loss Factors	Excess Loss Factors are percentages of standard earned premium paid by the policyholder in lieu of being charged for losses above a selected limit per accident. The charges vary by hazard group to reflect the differences in expected frequency and size of claim. Excess Loss Factors are only available through the Retrospective Rating Plan.
Expected Annual Trend	Estimated annual change in loss ratio due to differences in the rate at which payrolls and losses change over time.
Expected Losses	<ol style="list-style-type: none">1. In classification ratemaking: the class payroll in hundreds multiplied by the partial pure premium underlying the current rates (not the A-Sheet pure premiums). Used to calculate state credibility.2. In experience rating: the payroll in hundreds multiplied by the expected loss rate.
Expected Loss Rate Factor	Amount of expected losses for the classification per unit of exposure, which is generally \$100 of payroll.
Expected Loss Rate (ELR)	An ELR estimates average loss levels (losses per \$100 of payroll) of a classification for the experience period. The ELR factor is calculated for each hazard group and is applied to the manual rate for each classification. Applying ELR to payroll in hundreds results in the expected losses.
Experience Modification (Mod) Factor	A factor calculated from actual case experience (unit reports) used to adjust an insured's manual premiums up or down based on the policy's loss experience compared to average class experience.

DATA COLLECTION AND DATA QUALITY

Glossary of Terms

Experience Period For Ratemaking	The time interval from which the loss and premium data was extracted.
Experience Period For Trend	The time interval from which the indemnity (medical) loss ratio data was extracted.
Experience Rating	A mandatory form of individual risk rating which takes into consideration the loss experience of the particular insured (or "risk") as a credit or debit to the manual rate for the insured's classification. (Applies only to insureds meeting premium eligibility requirements.)
Experience Rating Eligibility Requirements	The minimum premium level that qualifies an insured for experience modification. The minimum premium required for experience rating eligibility is equal to the standard earned premium generated from ten average workers. The state average earned rate and the state average wage are used in determination of the eligibility requirements.
Experience Rating Plan	The base (mathematical) rules that specify how a workers compensation experience modification must be calculated in a given state.
Exposure	Measure of propensity to risk, which is generally the total dollar amount of payroll associated with a policy. (Another exposure is number of employee years for per capita classifications.)
Extended Term	A policy term that exceeds 12 months and 15 days. Unit reports are required for each 12 month period and portion there of.
Financial Call	A request for financial information from the carrier. This information is used to generate aggregate rate level indicators, reconcile reported data for expense analysis and for certain state specific calculations and regulatory reports.

DATA COLLECTION AND DATA QUALITY

Glossary of Terms

Financial Data	Policy year, calendar-accident year and calendar year are collected on an aggregate basis and are referred to as financial data because they can be reconciled to a company's annual statement.
Financial Data Adjustment Factor	The factor to adjust the financial data loss ratio used in the A-Sheets to the final Exhibit I loss ratio. The factor is used in the calculation of the Rate Level Adjustment Factor.
First Report	For the first Workers Compensation Statistical unit report (WCSP) filing; the first report contains policy year premiums (12 months) and claims valued as of the 18th month after the policy became effective.
First Report (Financial Call)	For the policy year, 24 months after the inception of the policy years (e.g., Policy Year 19XX at 12/31/19XX+1). For accident year, 12 months after the inception (e.g., Accident Year 19XX at 12/31/XX.)
Form R	Totals by industry group and policy period, showing payroll and premium at current manual rates. Part of the Workers Compensation Statistical Plan data.
Free Flow	Unit card data which can be processed without manual intervention through the experience rating system.
Frequency	Number of losses divided by exposures in a given period.
Incurred But Not Reported (IBNR)	IBNR refers to losses estimated for events which will result in a loss and eventually a claim but have not yet been reported to insurers or reinsurers. Financial data rate levels can be done including or excluding IBNR.
Indexing	The process of assigning a risk ID to a unit report.

DATA COLLECTION AND DATA QUALITY

Glossary of Terms

Injury Type	NCCI classifies injuries as one of the following: <ol style="list-style-type: none">1) death2) permanent total3) major permanent partial4) minor permanent partial5) temporary total6) medical only
Interstate Risk	Insured with payroll (exposure) in more than one state where interstate rating has been adopted.
Intrastate Risk	Insured with payroll (exposure) in one state.
Law Amendment Factor	Factor that adjusts losses for any changes in the law.
Leahy	Offsite microfilming services used by NCCI.
Loss Adjustment Expense	Includes the cost of investigating cases, representing the employer before claims adjudicating bodies, defending lawsuits and so forth. The allowance for loss adjustment expenses includes both allocated and unallocated expense since workers compensation losses exclude all loss adjustment expense except allocated loss adjustment for Coverage B (employers liability) claims which are reported as losses.
Loss Cost	The portion of workers compensation rates allocated for projected losses. Expenses and profits are not included in loss cost.
Loss Ratio	Losses divided by premium in a given period.
Manual Premium	Payroll, in hundreds, multiplied by the manual rate.
Manual Rate	The unit cost which is multiplied by the employer's payroll in hundreds to determine manual premium.

DATA COLLECTION AND DATA QUALITY

Glossary of Terms

Master-Final Pass Rate	The final computer printout listing class codes, run and effective date of rates, approved updated pure premiums by serious, non-serious, medical and total, approved rates, disease elements and "D" ratios. This printout of classification code rates and rating values is used as the base upon which the next proposed rate change is run.
Merit Rating	State mandated program to provide a factor for premium adjustment based on past loss experience of a risk. Merit rating differs from experience rating in that merit ratings are determined on the state level for policies with premiums below the Experience Rating threshold.
Midterm Cancellation	One party cancels the insurance contract after the effective, but before the expiration date.
Minimum Premium	The minimum price for writing a Workers Compensation policy based upon the following formula: $\text{Rate (including disease loading)} \times \text{Minimum Premium Multiplier} + \text{Expense Constant}$ (Note: This formula does not apply to per capita codes.)
Minimum Premium Multiplier	The minimum premium multiplier is a component of the minimum premium formula. It was originally calculated to reflect the state average annual worker's wage in hundreds ((average weekly earnings x 52)/100), but limited to 10 point annual increases. For example, the minimum premium multiplier in Alabama should be the average annual worker's wage in hundreds rounded to the nearest 5 ((294.79 x 52/100 = 150). The Alabama minimum premium multiplier is, however, subject to the maximum increase of 10. Since the May 1, 1986 minimum premium multiplier is 105, the June 1, 1987 minimum premium multiplier cannot increase to 150. It is limited to 115.
Mod	Experience modification.

DATA COLLECTION AND DATA QUALITY

Glossary of Terms

Monopolistic State	State where workers compensation coverage is written by a state fund with no competition from commercial carriers.
National Data Base	A compilation of the latest approved indicated A-Sheet experience for every state. It is used to derive the pure premiums indicated by the National Relativity.
NC-235 Report	Compilations of Workers Compensation Statistical Plan data which show payroll, earned and manual premiums, number of cases and indemnity and medical losses by injury type. For individual class NC-235's, losses from individual claims are limited to 20% of the self-rating point, and for multiple claims, are limited to 40% of the self-rating point. (Under RERP, the A-Sheet limitation point will no longer be called the self-rating point.)
NCCI	National Council on Compensation Insurance.
NCR	Offsite microfiche service used by NCCI.
Net Premium	Premium resulting from the application of premium discounts and retrospective adjustments to standard premium.
New Business	Policies newly written by an insurance carrier.
Non-free Flow	Unit card data which requires manual intervention to continue processing through the experience rating system.
Non-rated Risk	An insured risk which is not subject to experience modification of policy premium.
On-level Factor	Factor that adjusts premium (losses) to the current premium or law level.
On-level Losses	Losses from a prior period multiplied by the on-level factor to arrive at losses on the same base as those in the current period.

DATA COLLECTION AND DATA QUALITY

Glossary of Terms

On-level Premium	Premium from a prior period multiplied by the on-level factor to arrive at premium on the same base as those in the current period.
Outstanding (Excluding IBNR) Losses	In the financial calls, this definition is intended to capture case reserves and bulk reserves (see separate definitions of these two reserve components). For some carriers, this item will include case reserves only. (Reference: Financial Calls)
Payroll/Loss Detail (P/L Detail)	The individual class records taken from unit cards for a particular state and policy period. The class records are separated into exposure (usually payroll) and loss records.
Per Capita Classification	A classification which uses the number of workers rather than payroll as the exposure base. Private residence workers (servants, drivers) fall into this category. Per capita classification rates are rounded to a whole number and the minimum premium is usually the rate + expense constant.
PEMIP	Performance Evaluation Monetary Incentive Program or fining program used by NCCI to encourage timely and accurate submission of experience by carriers. Also known as MIP.
Permissible Loss Ratio	The target cost ratio excluding loss adjustment expense.
PICS	NCCI database of carrier policy information (Policy Issue Capture System).
Policy Effective Date	Policy's effective date of coverage. Also starts WCSP unit reporting cycle.
Policy Register	A record of key data (number, effective date, coverage states, etc.) for all policies maintained in a carrier's database.
Policy Year Call	A call for premium and loss information associated with accidents which occurred during the specified policy effective period.

DATA COLLECTION AND DATA QUALITY

Glossary of Terms

Policy Year Data	The premium and loss associated with policies with effective dates in a given calendar year period.
Premium	The amount paid for by an insured for coverage.
Primary Loss	The first \$5,000 of any loss greater than \$5,000 or the entire loss amount of any loss less than or equal to \$5,000. Under the previous Expense Rating Plan, the primary loss was determined on the basis of a different formula, the maximum being \$10,000. Primary losses are established to avoid unreasonable effects of very large losses on an insured's experience in the experience rating plan.
Profile System	NCCI system containing the last calculated experience rating and unit reports received since the last rating.
Proof of Coverage Card	Document sent to the state notifying it of an insured's workers compensation coverage.
Proof of Coverage State (POC)	States that use the NCCI database to verify workers compensation coverage.
Pure Premiums (A Sheets)	<ol style="list-style-type: none">1) Indicated by Experience - Workers Compensation Statistical Plan Experience from class NC-235's adjusted to current level of benefits, loss adjustment expense, trend and financial data, developed to an ultimate (by indemnity and medical portions) and divided by payroll in units of one hundred dollars.2) Underlying Present Rates - On A-Sheets, the pure premiums from the last rate revision, adjusted for the most recent off-balance of the Experience Rating Plan and any subsequent law changes since the last rate revision.3) Present on Rate Level - The A-Sheets underlying pure premiums adjusted to the level of the current financial data.

DATA COLLECTION AND DATA QUALITY

Glossary of Terms

4) Indicated by National Relativity - See Frank Hawayne's paper, "Use of National Experience Indications in Workers Compensation Classification Ratemaking." (PCAS, Vol. LXIV, p.74). Pure premiums reflect the countrywide experience as indicated by the latest available individual classification experience for all states for which NCCI compiles data.

5) Derived by formula:

(State credibility x indicated pure premium) +
(National credibility x pure premium indicated by
national relativity) + [(1 - state credibility - national
credibility) x pure premium on present rate level]

Pure Premium
Department

The actuarial department within the NCCI that calculates development factors, industry group differentials and cost ratios and produces certain exhibits for class ratemaking.

Pure Premiums
Underlying Rates

- 1) Present: These are the serious, non-serious and medical pure premiums underlying the rates currently in effect. They are obtained from the master and are used in the application to obtain pure premiums on the next set of A-Sheets.
- 2) Proposed: These are the serious, non-serious and medical pure premiums underlying the proposed rates, obtained by rate calculations. (Note: Not to be confused with A-Sheet Pure Premiums.)

Rate Filing

The annual request for workers compensation rate changes filed with each state.

Rate Level Adjustment
Factor (RLAF)

Allowed for any factors to be applied to a reviewed classification rate calculation: (RLAF x Test Correction Factor = Composite Factor) that are not applied elsewhere in a rate filing, as well as an adjustment of financial data.

DATA COLLECTION AND DATA QUALITY

Glossary of Terms

Rate Projection Period	This is the time period from the average accident date in the experience period for ratemaking to the average accident date for the policy year starting on the effective date stated in the rate filing.
Rated Risk	An insured which is subject to experience rating modification of policy premium.
Rated Size Policy	A policy which has premiums which exceed state threshold amounts for experience modification. Policies with premium within \$500 of this threshold are also included in this group.
Ratemaking	The actuarial process of setting premium rates for new and renewal policies. Ratemaking is performed annually on a state-by-state basis.
Ratio of Manual to Earned Premium	<ol style="list-style-type: none">1) The present ratio of manual premium to earned premium divided by the proposed ratio of manual premium to earned premium is applied in A-Sheets to obtain pure premiums underlying manual rates.2) The new (proposed) ratio of manual premium to earned premium (after any adjustments - e.g., revised eligibility) is applied in the rate calculation.
Reported Data	Carrier data that has been reported to a bureau on a unit report.
Risk ID	A unique number used by NCCI to identify a rated risk.
Risk Study	A printout of risk, payroll, earned and manual premium and indemnity and medical losses by premium size for stock and non-stock companies by industry group on a first report basis. Also contains list of risks with premium greater than \$99,999 by carrier and class code.
Revised Experience Rating Plan (RERP)	A modification to the experience rating plan introduced in 1989 using updated parameters to more accurately predict the loss experience of an eligible employer.

DATA COLLECTION AND DATA QUALITY

Glossary of Terms

SAWW	Statewide Average Weekly Wage.
SL2 Process	Current NCCI process of requesting late records that should be replaced by the URC turnaround process.
Schedule "Z" (Sched-Z)	A compilation of the raw unit plan experience by policy period and by class which underlies the A-Sheets. Losses are not limited in any way. The same data on NC-235's is available on Schedule Z.
Second, Thirds, Fourths, Fifths	Subsequent WCSP reports occurring 12, 24, 36 and 48 months after the first report for a policy.
Second Report, Third Report, Etc. (Financial Calls)	Premium and loss data evaluated 12 months, 24 months, etc. after the first report.
Self-Rating Point	<p>In experience rating, the self-rating point is the amount of expected losses necessary for a risk's own experience to solely determine its experience modification. (Under RERP, however, the concept of self-rating will no longer exist.) It is also used to limit the losses considered in experience rating to 10% and 20% of the self-rating point for single and multiple claims respectively. (Under RERP, losses for experience rating will be limited using the State Reference Point.)</p> <p>The self rating point is 25 times the serious average cost per case averaged with the previous self rating point.</p> <p>In the Pure Premium Exhibits (the A-Sheets) losses are limited to 20% and 40% of the self-rating point for single and multiple claims, respectively.</p>
Severity	Volume of losses divided by number of claims in a given period.
Standard Earned Premium	Manual premium after experience rating modification and expense constants.

DATA COLLECTION AND DATA QUALITY

Glossary of Terms

Standard Exclusions	Any classification code whose experience is not found on the A-Sheets (e.g., Federal classifications, Maritime classifications, "a"-rated classifications, Explosive classifications, Non-Ratable Element Codes). These codes are listed on the master as industry group "7".
Statistical Plan	The rules that govern how workers compensation statistics must be reported to the NCCI.
Subsequent Reports	All unit reports after the First Report.
Swing Limits	Swing limits are used to control the change in rates by classification. For example, a swing limit of 25% implies that Maximum Deviation = Effect of the final change in premium level by industry group plus or minus 25% rounded to the nearest 1%.
Target Cost Ratio (TCR)	Represents the percentage of each dollar of standard premium collected available for payment of benefits including loss adjustment expense.
Test Correction Factor (TCF)	Used to determine if the required change in manual premium level has been achieved. An iterative process continually tests the proposed rates including tentative TCF's until the required change is obtained. This process also adjusts for the effect of classes limited by the upper and lower swing.
Three-Year Fixed Rate Policy	Established to permit the underwriting of small size insureds at less Policy cost. An insured whose estimated premium is not over \$700 per year may be written for a period of three years at the manual rate, provided the risk is not eligible for the Experience Rating Plan on the effective date of the policy. This rate will not change unless there is an adjustment of outstanding policies in excess of 10% as a result of a law amendment.
Trend	Change in loss ratio due to differences in the rate at which payrolls and losses change over time.

DATA COLLECTION AND DATA QUALITY

Glossary of Terms

Turnaround Document	A Listing or Report sent from NCCI to the carrier and then returned to NCCI with the appropriate Carrier Responses.
Ultimate Cost	The total paid losses to date plus an estimate of all future costs required to close the claim.
Unit Card Routing (UCR)	Future system which will provide an on-line database to store all unit reports and to serve as a foundation for improvements to data validation, Experience Rating and Class Ratemaking.
Unit Reports	Standard reporting forms completed by carriers for each insured supplying information about payroll and premium by classification, and losses for individual claims. Unit Reports are received by NCCI and compiled for each state into the Workers Compensation Statistical Plan.
Unit Report Control (URC)	Future production system that will trigger requests for unit reports for experience rated policies, provide information necessary to assess fines against carriers for late unit report submission and provide information on overall performance in delivering unit reports on time.
Unit Record Card	Report of premiums and/or claims to the state workers compensation body or rating bureau.
Unreported Data	Carrier data that has not been reported to NCCI on a unit report.
Validation	Procedures, either automated, manual or both, which check data for reasonableness, accuracy or other similar parameters.
Valuation Date	The point at which the cost of claims to date are estimated. (See First Report, Second Report, etc.)
Workers Compensation Statistical Plan (WCSP)	The reporting method by which NCCI compiles its payroll, premium and loss information through unit card summarization. The WCSP used to be referred to as the Unit Statistical Plan (USP).

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

How to Use Statistical Call Data Documentation

This binder provides a description of the validations performed to the data received on unit reports and the fifteen financial calls listed in the table of contents. These sixteen statistical calls were documented with extensive assistance from NCCI personnel. For each statistical call, the documentation includes:

- o An Overview which provides:
 - Description of the unit report or financial call
 - Description of production files/databases
 - Description of error handling
 - Description of modifications to data

- o An example of the Unit Report or an example of the financial call and filing instructions from the Reporting Guidebook for the Annual Calls for Experience.

In addition, supplemental detail is included for the following statistical calls:

- o Unit Report
- o Calendar Year Call for Net Written Workers Compensation Premium (Call #1)
- o Calendar Year Call for Compensation Experience by State (Call #2)
- o Policy Year Call for Compensation Experience by State (Call #3)
- o Calendar-Accident Year Call for Compensation Experience by State (Call #5)
- o Insurance Expense Exhibit (Call #6)
- o Calendar Year Reconciliation Report by State (Call #8)

The following supplemental information is provided for these calls:

- o Description of Data Collection and Data Handling:
 - A listing of each element on the source document
 - An indication of whether the element is captured in NCCI computer files
 - Description of validation performed

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

How to Use Statistical Call Data Documentation

- o Detailed descriptions of NCCI computer files containing statistical call information:
 - File Type (VSAM, Sequential, PDS, IDMS)
 - Device Type (Disk, Tape)
 - Retention Period
 - Element Description
 - Element Attribute (Alpha, Numeric)
 - Element Length
 - Source

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

DESCRIPTION OF UNIT REPORT:

The unit report is a statistical document submitted by the carriers for reporting workers compensation statistical plan (WCSP) data to NCCI. It includes exposure, premium and loss data by state at a payroll classification code level.

WCSP data is submitted to NCCI on unit reports for every workers compensation policy written. The first report for a policy is due at NCCI twenty months after the policy effective date. This allows six months of loss development after the policy expiration date and two months for carriers to complete preparation. Carriers are required to submit follow-up reports each year, up to four additional reports for any policy that has open claims. These follow-up reports are known as "subsequents" or individually as second, third, fourth and fifth reports.

WCSP data is used by NCCI to determine rate distribution by payroll classification in producing class rates and to evaluate the relative experience of each insured in producing experience modification factors (Experience Mods).

FILES/DATABASES:

Payroll & Loss (P/L) Detail File:

This file serves as the central repository for detailed WCSP data used for class ratemaking. This file contains five years of WCSP data. There is a separate P/L file for each state for which NCCI prepares rates.

Compress File:

This file contains payroll and loss data for each experience rated insured for the most recent three policy years. The data contained on this file represents the most recent valuation achieved by combining first and subsequent reports.

NC-235 Limited Summary File:

This file contains unit report information summarized by class and used for class ratemaking. This data is obtained by summarizing detail WCSP data in the P/L Detail File after it has been validated.

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

DESCRIPTION OF ERROR HANDLING:

The unit report data is validated visually using system generated reports as the data is processed through Data Administration. Clerks manually review these reports for reasonableness of fluctuations from one year to the next, identification of missing unit reports, data entry and carrier reporting errors.

Errors are resolved through the application of standard procedures. In some cases the carriers are sent correspondence letters to resolve errors/questionable data identified during the validation process. The carriers respond to NCCI's request either by verifying the questioned information is correct as reported or by submitting a correction unit report ("C-report"). These reports are validated upon receipt. If the carrier does not reply, the data may be eliminated from the file.

MODIFICATIONS TO DATA:

WCSP data may be modified by NCCI during validation and through resubmission/corrections provided by the carriers.

As the result of insufficient experience for rate filing purposes, class codes may be reassigned by the system according to the state master file. Class codes would be reassigned because of a lack of experience being reported for a given class code, and/or a class code being discontinued.

Modifications to the unit report data may result from loss limitations being applied for single and multiple claims. The maximum allowable loss amounts are limited by state. A single claim will be limited to 20% of the A-sheet loss limitation value, while multiple, or "catastrophe" claims are limited in total to 40% of the A-sheet loss limitation value. This process is performed by the system with no manual intervention.

Injury types may be reassigned by the system if particular reassignment criteria have been met. A new injury type will be reassigned automatically based upon these conditions. For example, if a particular unit report is reported with an injury type of five and the indemnity amount equals zero, the injury type will automatically be reassigned to six.

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

NCCI eliminates or corrects data identified during its validation process based on standard rules. These rules address elimination of duplicates, data reported outside of WCSP guidelines, data entry errors and other obvious errors.

On occasion, a carrier may have to report a revision to previously submitted information. Changes in payroll, manual rate or premium are reported on an "Exposure Correction Card" and changes in loss information are reported on a "Loss Correction Card".

All revised data is requested to be submitted on subsequent reports or correction reports. When production deadlines require a more timely response, telephone responses are accepted with the stipulation that a correction unit report will also be submitted.

When Unit Report Control (URC) becomes a production application, unit reports will be processed and some file validations performed upon receipt. All unit reports will go through a matching process whereby subsequent reports that do not have a corresponding first report will be rejected and the carrier notified of the processing error.

Unit Report:

Data Element	Captured?	Description of Validation
1. Report Number	Yes	<p>A. Checked for missing or invalid report numbers. Valid values are between 1 and 5, excluding 0 reports. (Visual review of hard copy input)</p> <p>B. As of 05/01/91, the URC process will replace the manual review via the Reject Facsimile process. If this field is missing or invalid, the unit report will be rejected from the system, and returned to the carrier for correction. The unit report will also be rejected if received prior to loss valuation date.</p>
2. Policy Number	Yes	<p>A. Checked for missing policy numbers. The policy number is a number assigned by the carrier to a policy. (Visual review of hard copy input)</p> <p>B. As of 05/01/91, the URC process will replace the manual review via the Reject Facsimile process. If this field is missing, the unit report will be rejected from the system and returned to the carrier for correction.</p> <p>C. For experience rated unit reports using PICS, the name on the policy is checked against the name shown on the rating by the Field Offices. (Visual review of an on-line inquiry screen)</p>
3. State Name	No	
4. State Code	Yes	<p>A. Checked for missing or invalid state codes. The state code is a two digit numeric code assigned by NCCI that uniquely identifies a state on the unit report. (Visual review of hard copy input)</p> <p>B. As of 05/01/91, the URC process will replace the manual review via the Reject Facsimile process. If this field is missing or invalid, the unit report will be rejected from the system, and returned to the carrier for correction.</p>
5. Carrier Name	No

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

STATISTICAL CALL NAME:

Calendar Year Call For Net Written Workers Compensation Premium (Call #1)

DESCRIPTION OF CALL:

This call contains dollar amounts for net direct written workers compensation premium detailed by state and type of workers compensation premium (Workers Compensation, USL&HW, Excess, & National Defense) for the specified calendar year. All members of NCCI and reinsurance pools managed by NCCI are required to submit this information annually.

The Calendar Year Call for Net Direct Workers Compensation is used as the base for NCCI's assessment process and as the base for the calculation of participation ratios used for distribution of the reinsurance pool's quarterly operating results to the pool membership.

FILES/DATABASES:

Premium Call Production File:

This file serves as the central repository for Call #1 data. This file contains all data received from the carriers.

DESCRIPTION OF ERROR HANDLING:

All submissions to NCCI require a copy of the carrier's annual statement Page 8 and individual states' Page 14s. Each Page 14 is manually compared to each amount entered on Call #1 for all individual states and the total on Call #1 is compared to the direct written premium amount on Page 8. When differences are detected, the carrier is contacted for correction to the call and a revision is submitted for processing. The NCCI makes no adjustments to any data submitted by the carrier.

After the manual comparison of the Page 8 and Page 14 data to the premium call, the report is batched with other financial calls and sent to NCCI's off-site data entry service (ACS). The entered information is transmitted from ACS to NCCI's Operations

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

Department where CFOPWJ01 Edit and Balance Program is run. The Premium Call Production File is the repository for all processed data and allows a further edit on potential cross-foot errors on premium. One of the captured fields is the Carrier Code. Before the information is transmitted back to NCCI from ACS, it is edited against ACS's master carrier list for validity. If the carrier code is not a valid number, it is rejected and returned to NCCI for correction. If the carrier code passes their process, it is again verified when the Edit and Balance Program is run against the NCCI Carrier Master. This double checks the code for transpositions.

The Edit and Balance Program generates a hard copy print out of the keyed data and flags any problem with the data. Cross-foot errors can be corrected through a supplemental form which, after the carrier is notified of the "arithmetic" error, is sent to ACS for keypunching of corrected data. Carrier codes can be valid numbers but applied to the wrong premium call. One of the other edits performed is to manually compare the name translated from the carrier code printout to the actual premium call. If the carrier code is not correct, NCCI will correct the number on the correction form sent to ACS for data entry.

MODIFICATIONS TO DATA:

No modifications are made by NCCI personnel. If modifications are necessary, the carrier will be requested to resubmit the premium call.

CALL FOR EXPERIENCE #1
CALL FOR NET DIRECT WRITTEN PREMIUM

Background and Purpose of the Report

The Call for Net Direct Written Premium is due at NCCI on or before March 1 of the year following the calendar year experience being collected. As an example, the 1990 Call For Net Direct Written Premium is due at NCCI on or before March 1, 1991.

For each Annual Call Year, the most recent calendar year data must be reported on a state basis. Calendar Year transactions are those that occur during a specific year. As a result, calendar year 1990 data will include policy activity transactions occurring during 1990 from 1-1-90 through 12-31-90.

This Call is used by NCCI to provide the premium information necessary for NCCI Assessments and Reinsurance Pool participation for the following:

- National Workers Compensation Reinsurance Pool
- Michigan Workers Compensation Reinsurance Pool
- New Mexico Workers Compensation Reinsurance Pool

The data contained on this also provides the basis for the market share calculations used with the performance evaluation Monetary Incentive Program and the Early Reporting Program. Data collected in the Call For Net Direct Written Premium includes net direct written premium as reported on the carrier's Annual Statement. This data is split between Workers Compensation, USL&HW, Excess Workers Compensation and National Defense. The Workers Compensation total excludes the other three types of coverage, but does include Coal Mine experience.

The data reported on this call should include the experience developed under all deductible policies. This experience should be reported on a net basis as reported on Page 14 of the Annual Statements.

Instructions for Completion of the Report

Column A—The required premiums are defined as Workers Compensation and Employers Liability Direct Premiums charged, including policy and membership fees, less return premiums and premiums on policies not taken which are returned to policyholders, excluding all Reinsurance Assumed and without deducting any Reinsurance Ceded and excluding premiums for Longshore and Harbor Workers' Act (USL&HW), Excess Workers Compensation, and National Defense Plans.

Note: Coal Mine premiums are included in this column.

Column B—Due to the variations in procedures in establishing the applicable premium writing's bases, special information is required. This column should be completed showing only those premiums written under the U.S. Longshore and Harbor Workers' Act (USL&HW) using the same basis as required for Column A.

Column C—As in Column B, special information is required and this column should be completed showing only those premiums written for Excess Workers Compensation using the same basis as required for Column A.

Excess insurance is insurance written over the retention of a qualified self-insurer. Excess premiums and losses are those required to be omitted in NCCI's Calls for financial data, and itemized in the Calendar Year Reconciliation Call.

Column D—As in Columns B and C, special information is required and this column should be completed showing only those premiums written under Special National Defense Comprehensive Rating or Special National Defense Premium Discount Plans using the same basis as required for Column A.

Column E—Provides for the balancing of the report. The totals of each line from Columns A, B, C, and D as entered in Column E will reconcile to the net direct written by state you are required to report on Page 14 of your Annual Statement.

Report premiums in all columns in whole dollars only.

Group Reporting—Group reporting of premiums by member companies will be permitted. The group report should indicate the group name that will then be used for all NCCI assessments and Reinsurance Pool participation. A listing of all companies included in a group report must be furnished with the report.

In submitting this report, all columns are to be completed. If your company did not write any workers compensation premiums, please indicate "NONE" on Line 49, as applicable. The completed report must be dated and signed by an authorized representative.

The Line 49 total in Column E must agree with Page 8, Part 2B, Column 1, Line 16 which indicates workers compensation direct premiums written and IT IS REQUIRED THAT A COPY OF PAGE 8 OF YOUR FILED ANNUAL STATEMENT BE SUBMITTED WITH THIS REPORT. If this is a Group report, your Page 8 Annual Statement submissions must agree with your Line 49, Column E report total.

IT IS ALSO REQUIRED THAT A COPY OF PAGE 14 OF YOUR FILED ANNUAL STATEMENT FOR EACH STATE IN WHICH THEY WERE FILED BE SUBMITTED WITH THIS REPORT. If this is a group report, your annual

statement's Page 14 must agree with Column E for each state.

The submission of this completed report will provide the premium information necessary for NCCI assessments and Reinsurance Pool participation for the following:

National Council on Compensation Insurance
National Workers Compensation Reinsurance Pool
Michigan Workers' Compensation Placement Facility
New Mexico Workers Compensation Reinsurance Pool

Two copies of the reporting form will be provided in the package of forms sent to carriers in October of each year. One copy is to be filed with NCCI and the other copy is for your records.

All questions on this Call should be directed to the Residual Market Accounting Department at (407) 997-4309.

Please note that the due date for reporting this data is on or before March 1 of each year.

Please mail this Call to:

National Council on Compensation Insurance

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

STATISTICAL CALL NAME:

Calendar Year Call For Compensation Experience By State (Call #2)

DESCRIPTION OF CALL:

This call contains dollar amounts for workers compensation Standard Earned Premium at NCCI DSR level, Standard Earned Premium at Company level, Net Earned Premium, and Total Incurred Losses for the specified calendar year. Each NCCI member carrier is required to submit this information for each state in which they operate. Some states require all carriers writing workers compensation policies to submit financial calls.

The Calendar Year Call for Compensation Experience is used to reconcile workers compensation experience data reported in the Policy Year Call and the Calendar-Accident Year Call to the carrier's annual statement.

FILES/DATABASES:

Calendar Year Call Production File:

This file serves as the central repository for Calendar Year Call data. This file contains all data received from the carriers as well as corrections applied to this data. Corrections to the file are made via ACS for data entry of revised reports with electronic transfer of the data to NCCI for incorporation into the production file.

Calendar Year Call SAS Dataset:

Actuarial analysis and reporting programs are executed using the data in this file.

There is one SAS dataset for each state for which the NCCI produces rates. The dataset contains data only for the specified state. This file is created through an extraction from the Calendar Year Call production file. Revised reports which are obtained after this extraction are entered into the SAS dataset and marked internally as revised records. When rate levels are completed for the state, these records are printed and sent to ACS for data entry and incorporation into the production file.

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

DESCRIPTION OF ERROR HANDLING:

Calendar Year data is validated in a two step process. An initial validation using automated reports is performed when the data is received from the carrier. A final validation of the data is performed as one of the steps in producing a state's rate level to ensure that no errors have been overlooked.

Carriers are sent written correspondence letters to resolve any errors identified during the initial validation. As revised reports are received, they are checked for accuracy. If correct, the revised reports are sent to ACS for processing or entered into the SAS dataset if the affected data is already being used for rate level production.

During the final validation, newly discovered and outstanding errors are handled in a slightly different manner. Carriers are contacted by phone for a response. Revised reports are submitted by facsimile transmission or some form of overnight delivery. NCCI may enter corrections based on the phone conversation and in anticipation of carrier submitted revisions.

MODIFICATIONS TO DATA:

Revised reports are processed as they are received. Any data containing errors which remain unresolved at the time of a state's rate level production will be removed from the dataset if resolution of the remaining errors is not possible within the framework of the rate level production schedule.

All revised data is requested to be submitted on revised reports or via written correspondence. When production deadlines require an immediate response, telephone responses are accepted with the stipulation that a written confirmation of the changes also be submitted.

CALL FOR EXPERIENCE #2
CALENDAR YEAR CALL

Background and Purpose of the Report

The Calendar Year Call is due at NCCI on or before March 15 of the year following the calendar year experience being collected. As an example, the Calendar Year 1990 Call is due at NCCI on or before March 15, 1991.

This Call is one of five standard annual calls for experience subject to the Performance Evaluation Monetary Incentive Program (PEMIP).

For each Annual Call Year, the most recent calendar year data must be reported on a state basis. Calendar year transactions, both premiums and losses, are those occurring during a specific year. Calendar Year 1990 will be comprised of all the transactions which occur during 1990, from 1/1/90 through 12/31/90. As a result, calendar year data will include policy activity, both premium and claim, originating in prior years. Any activity on these policies, such as endorsements and claim payments, would be reported to the Calendar Year during which the transaction occurred.

The Calendar Year Call formerly had a 50% weight in the Actuarial ratemaking formula; however, much of this emphasis has been replaced by the Calendar-Accident Year Call. Currently, the primary use of this call is as a validation to the Policy Year and Calendar-Accident Year Calls. It is also used internally to analyze countrywide results and trends. Results of the Calendar Year Call are distributed to NCCI Members and Subscribers.

Data collected in the Calendar Year Call includes earned premiums and incurred losses on a state basis. Calendar Year earned premiums are separated between Standard at NCCI DSR Level, Standard at Company Level and Net Earned. The incurred losses include indemnity and medical benefits, along with IBNR.

The data reported in this call should *exclude* experience developed under large deductible policies (deductible amount over \$100,000 per claim or per accident).

The Calendar Year Reconciliation Report (Call #8) has been revised to add lines to reconcile premium and losses to Page 14 of the Annual Statement due to the exclusion of the large deductible policies.

Filing Requirements

Calendar Year Call for Compensation Experience by State—Calendar Year Basis—due March 15 of the following year

In accordance with the approved statistical program, you are hereby requested to file with NCCI on or before March 15 of each year your compensation experience for the previous Calendar Year.

This Call is included in PEMIP (Performance Evaluation Monetary Incentive Program) and will be subject to assessments for late and/or inaccurate reporting. Details of PEMIP are updated annually in January of each year.

Questions regarding reporting requirements on completion of the Calls should be directed to Aggregate Ratemaking at (407) 997-4395.

A. GENERAL INSTRUCTIONS

1. Group Report

Carrier name and five-digit code must be shown on reporting forms. If this is a group reporting, each carrier writing compensation must be listed individually on the form. With respect to affiliated carriers, it will be appreciated if you will follow the same method of reporting for this Calendar Year Call (individual company basis or group basis) as was followed in compliance with our Semi-Annual Call for the first six months of the prior year issued. If this is not convenient, please advise us that you have changed procedure.

2. Standard Earned Premiums at NCCI Designated Statistical Reporting Level

Standard earned premiums shall be the entire earned premium for the state resulting from standard rating procedures after the application of:

1. Experience rating plan adjustments (NOTE: Except for Michigan experience, experience rating plan adjustments must reflect only NCCI published modification factors.)*
2. Expense Constants (These are the Expense Constants published by NCCI or an independent bureau. For Voluntary Business in pure premium states, expense constants at NCCI DSR level are 0.)
3. Loss Constants (These are the Loss Constants published by NCCI or an independent bureau. For Voluntary Business in pure premium states, loss constants at NCCI DSR level are 0.)

but prior to the application of:

1. Deviations from NCCI Designated Statistical Reporting rates or pure premiums**
2. Deviations from published NCCI experience rating plan modification factors (except Michigan)*
3. Retrospective rating plan adjustments
4. Other individual risk rating plan adjustments*** (e.g., Schedule Rating)
5. Premium discounts
6. Expense modification program adjustments
7. Payment of policyholder dividends
8. Premium credits for small deductible coverage *

* Carriers must report their Standard Earned Premium at NCCI's experience rating plan level for all states except Michigan. If carriers use their own experience rating plan in Michigan, they may report their Standard Earned Premium at their own experience rating plan level.

- ** Rates: Arkansas, Connecticut, Georgia, Illinois, Indiana, New Mexico, Rhode Island, Vermont
Pure Premiums: Kentucky, Louisiana (policies effective 4/1/89 and subsequent), Oregon, Michigan, Maryland
- *** Note that premium adjustments resulting from the application of individual risk rating plans other than experience rating must be excluded from both Standard Earned Premium at Company Level and Standard Earned Premium at NCCI Designated Statistical Reporting Level.

3. Standard Earned Premium at Company Level

The earned premium on all risks after the application of:

1. Deviations from NCCI Designated Statistical Reporting rates or pure premiums*
2. Experience rating plan adjustments (NOTE: Except for Michigan experience, experience rating plan adjustments must reflect only NCCI published modification factors.)**
3. Expense Constants (Carrier charged expense constants)
4. Loss Constants (Carrier charged loss constants) but prior to the application of:
 1. Deviations from published NCCI experience rating plan modification factors (Except Michigan)**
 2. Retrospective rating plan adjustments
 3. Other individual risk rating plan adjustments*** (e.g., Schedule Rating)
 4. Premium discounts
 5. Expense modification program adjustments
 6. Payment of policyholder dividends
7. Premium credits for small deductible coverage

For every state Standard Earned Premium at DSR Level is reported, Standard Earned Premium at Company Level must be reported as well.

- * Rates: Arkansas, Georgia, Illinois, Indiana, Rhode Island, Vermont
Pure Premiums: Connecticut (policies effective 1/1/90 and subsequent), Kentucky, Louisiana (policies effective 4/1/89 and subsequent), Maryland, Michigan, New Mexico (policies effective 1/1/90 and subsequent), Oregon
- ** Carriers must report their Standard Earned Premium at NCCI's experience rating plan level for all states except Michigan. If carriers use their own experience rating plan in Michigan, they may report their Standard Earned Premium at their own experience rating plan level.

- *** Note that premium adjustments resulting from the application of individual risk rating plans other than experience rating must be excluded from both Standard Earned Premium at Company Level and Standard Earned Premium at NCCI Designated Statistical Reporting Level.

4. Carriers Writing in Competitive Rating States

Arkansas, Connecticut, Georgia, Illinois, Indiana, Kentucky, Louisiana, Maryland, Michigan, New Mexico, Oregon, Rhode Island and Vermont. Carriers must enter the standard earned premium figures at NCCI Designated Statistical Reporting Level and at Company Level in the appropriate columns on the form. Please reference the enclosed circular titled "Annual Update on Designated Statistical Reporting Levels."

5. Carriers Writing at Deviations from NCCI Rates in Administered Pricing States

For State Funds and other carriers writing at deviations from Bureau Rates in non-competitive rating states, the standard earned premiums must be adjusted to Bureau rate level and must be reported in the column labeled "STD Earned Premium at NCCI Designated Stat. Reporting Level." The standard earned premiums at the carrier rate level must be reported in the column labeled "STD Earned Premium at Company Level."

Carriers that do not deviate from NCCI rates must enter their standard earned premium in the column labeled "STD Earned Premium at NCCI Designated Stat. Reporting Level" and must enter the same figure in the column labeled "STD Earned Premium at Company Level."

Also note that where premium credits have been granted in connection with the Transition Program of Payroll Limitation rules, both reported Standard Earned Premium figures shall be reduced by such credits.

6. Net Earned Premium

Net earned premiums shall be the actual earned premium on all risks prior to the payment of policyholder dividends; but after application of any retrospective rating premium adjustments, after the application of premium discounts in accordance with Manual Rules, after the expense modification program, after any deviations or "write-offs" from Bureau rates or pure premiums, and after the effect of any schedule rating premium adjustments.

7. Incurred Losses

Losses reported by state should include compensation and medical incurred during this calendar year period. For further details on the inclusion or exclusion of certain losses and/or reserves, please refer to the specific instructions below.

CALL FOR EXPERIENCE #2A
ASSIGNED RISK CALENDAR YEAR CALL

Background and Purpose of the Report

The Calendar Year Call for Assigned Risk Compensation Experience by State is due at NCCI on March 15 of the current year for the previous calendar year.

This call is one of the annual calls for experience subject to the Performance Evaluation Monetary Incentive Program (PEMIP).

For each Annual Year Call, the most recent calendar year assigned risk data must be reported on a state basis. Data collected on this Call includes earned premiums and incurred losses. The calendar year assigned risk premiums are separated into Standard premium at NCCI DSR Level and Net premium. As there are no company deviations or competitive ratings, assigned risk standard premium at company level is not applicable.

The net earned premium is used to reconcile the Call to page 14 of the company's Annual Statement. The calendar year incurred losses represent the sum of indemnity and medical benefits, including IBNR reserves.

The intent of this Call is to use the collected data in ratemaking to develop Assigned Risk experience separately and will also be used along with the Calendar Year Call to develop "voluntary business only" experience. Thus, it is essential that the methodology for determining the premium and losses reported in this Call be consistent with the procedures used for reporting the experience on page 14 of the annual statement. The data on this Call must also be consistent with the assigned risk data in the Calendar Year Call (Call #2).

The data reported in this call should *exclude* experience ★ developed under large deductible policies (deductible amount over \$100,000 per claim or per accident).

The Calendar Year Reconciliation Report (Call #8) has been ★ revised to add lines to reconcile premium and losses to Page 14 of the Annual Statement due to the exclusion of the large deductible policies.

Filing Requirements

Calendar Year Call for Assigned Risk Compensation Experience by State—Calendar Year Basis—Due March 15 of each year

In accordance with the approved statistical program, you are hereby requested to file with NCCI on or before March 15 of each year your Assigned Risk compensation experience for the preceding Calendar Year.

This Call is included in PEMIP (Performance Evaluation Monetary Incentive Program) and would normally be subject to assessments for late and/or inaccurate reporting. Details of PEMIP are updated annually in January of each year and when released in January 1990, will contain more details pertaining to the three Assigned Risk Only Calls.

Please note: the eventual intent of this Call is for use in ratemaking. This Call will be used on its own to develop Assigned Risk experience and also will be used along with the standard Calendar Year Call to develop "voluntary business only" experience. For this reason, it is essential that the premium and losses reported on this Call reconciles with the Assigned Risk data included on Page 14 of the annual statement. The data submitted on this Call should also be consistent with the Assigned Risk experience reported on the standard Calendar Year Call.

Questions regarding reporting requirements on completion of the Calls should be directed to Aggregate Ratemaking at (407) 997-4395.

A. GENERAL INSTRUCTIONS

1. Group Report

Carrier name and five-digit code must be shown on reporting forms. If this is a group reporting, each carrier writing compensation must be listed individually on the form. With respect to affiliated carriers, it will be appreciated if you will follow the same method of reporting for the Assigned Risk Calendar Year Call (individual company basis or group basis) as was followed in compliance with our Semi-Annual Call for the first six months of the current year issued in October. If this is not convenient, please advise us that you have changed procedure.

2. Standard Earned Premiums at NCCI Designated Statistical Reporting Level

Standard earned premiums shall be the entire earned premium for the state resulting from standard rating procedures after the application of:

1. Assigned Risk rating programs, surcharges, etc.
2. Experience rating plan adjustments (NOTE: Except for Michigan experience, experience rating plan adjustments must reflect only NCCI published modification factors.)*
3. Expense Constants (These are the Expense Constants published by NCCI or an independent bureau.)
4. Loss Constants (These are the Loss Constants published by NCCI or an independent bureau.)

but prior to the application of:

1. Deviations from published NCCI experience rating plan modification factors (except Michigan)*
2. Retrospective rating plan adjustments

3. Premium discounts
4. Expense modification program adjustments
5. Payment of policyholder dividends
- ★ 6. Premium credits for small deductible coverage

- Carriers must report their Standard Earned Premium at NCCI's experience rating plan level for all states except Michigan. If carriers use their own experience rating plan in Michigan, they may report their Standard Earned Premium at their own experience rating plan level.

3. Standard Earned Premium at Company Level

Not Applicable to Assigned Risk Calendar Year Call.

4. Carriers Writing in Competitive Rating States

Not Applicable to Assigned Risk Calendar Year Call.

5. Carriers Writing at Deviations from NCCI Rates in Administered Pricing States

Not Applicable to Assigned Risk Calendar Year Call.

6. Net Earned Premium

Net earned premiums shall be the actual earned premium on all risks prior to the payment of policyholder dividends; but after application of any retrospective rating premium adjustments, after the application of premium discounts in accordance with Manual Rules, after the expense modification program.

7. Incurred Losses

Losses reported by state should include compensation and medical incurred during this calendar year period. For further details on the inclusion or exclusion of certain losses and/or reserves please refer to the specific instructions below.

8. Rounding Procedure and Reporting of Credits

Please report amounts of premiums and losses in whole dollars only. Count fifty cents and over as an extra dollar, and reject the cents if less than fifty. Please show negative amounts enclosed within parentheses so that they may be handled properly in punching and tabulating operations.

9. Total Experience

Kindly show the totals of all amounts reported on the last line of sheet 2 captioned "All States."

10. Signature Requirement

The person responsible for the completion and accuracy of this Call should sign and date the reporting form.

11. Full Submission

Report should include ALL States where company has data to report. Resubmission or correction must also include all states, not just revised states.

B. SPECIFIC INSTRUCTIONS

1. "F" Classifications

Experience of the "F" Classifications for policies effective January 1, 1974, and thereafter, MUST BE EXCLUDED.

2. Coal Mine Experience

Underground Coal Mine experience MUST BE EXCLUDED in all states except Pennsylvania and Virginia. In Pennsylvania and Virginia ALL Coal Mine experience MUST BE EXCLUDED.

3. Excess Policies

Experience on excess policies MUST BE EXCLUDED.

4. National Defense Projects

Experience on National Defense Projects written under either the old Comprehensive Rating Plan or the new National Defense Projects Rating Plan MUST BE EXCLUDED. Experience incurred on a Defense Base should be included unless written under the National Defense Projects Rating Plan.

5. Reinsurance

No deductions shall be made from premiums and losses for or on account of reinsurance ceded. Premiums and losses arising from reinsurance received by the reporting company shall be excluded from the experience. Experience reported should be DIRECT BUSINESS ONLY.

6. Experience Incurred Under Occupational Disease Act

Experience incurred under any Occupational Disease Act which is separate and distinct from the Compensation Act for the state shall be combined with the traumatic experience under the State Compensation Act, and the total of such combined experience shall be reported.

7. IBNR

Losses reported by state should include an appropriate reserve for incurred but not reported cases.

8. Reopened Cases

Include an appropriate loss reserve for reopened cases.

8. Rounding Procedure and Reporting of Credits

Please report amounts of premiums and losses in whole dollars only. Count fifty cents and over as an extra dollar, and reject the cents if less than fifty. Please show negative amounts enclosed within parentheses so that they may be handled properly in punching and tabulating operations.

9. Total Experience

Kindly show the totals of all amounts reported on the last line of sheet 2 captioned "All States."

10. Signature Requirement

The person responsible for the completion and accuracy of this Call should sign and date the reporting form.

11. Full Submission

Report should include ALL states in which company has data to report. Resubmission or correction must also include all states, not just revised states.

B. SPECIFIC INSTRUCTIONS

1. "F" Classifications

Experience of the "F" Classifications for policies effective January 1, 1974, and thereafter, MUST BE EXCLUDED.

2. Coal Mine Experience

Underground coal mine experience MUST BE EXCLUDED in all states except Pennsylvania and Virginia. In Pennsylvania and Virginia ALL coal mine experience (surface and underground) MUST BE EXCLUDED.

3. Excess Policies

Experience on excess policies MUST BE EXCLUDED.

4. National Defense Projects

Experience on National Defense Projects written under either the old Comprehensive Rating Plan or the new National Defense Projects Rating Plan MUST BE EXCLUDED. Experience incurred on a Defense Base should be included unless written under the National Defense Projects Rating Plan.

5. Reinsurance

No deductions shall be made from premiums and losses for or on account of reinsurance ceded. Premiums and losses arising from reinsurance received by the reporting company shall be excluded from the experience. Experience reported should be DIRECT BUSINESS ONLY.

6. Assigned Risk

Experience for assigned risk policies must be INCLUDED. Assigned risk policies must be reported at the level of approved assigned risk rates.

7. Experience Incurred Under Occupational Disease Act

Experience incurred under any Occupational Disease Act that is separate and distinct from the Compensation Act for the state shall be combined with the traumatic experience under the State Compensation Act; and the total of such combined experience shall be reported.

8. IBNR

Losses reported by state should include an appropriate reserve for incurred but not reported cases.

9. Reopened Cases

Include an appropriate loss reserve for reopened cases.

10. Reserves for Specific Contingencies

Include medical and other loss reserves to meet specific contingencies.

11. Other Voluntary Reserves

Exclude voluntary reserves other than those mentioned above.

12. Expenses

Exclude all expenses, either allocated or unallocated, except allocated Coverage B loss adjustment expense.

13. Assessments and Special Compensation Funds

The inclusion of assessments and other compensation special funds as incurred losses in the Calendar Year data follow the same instructions that apply in reporting of experience under NCCI's Workers Compensation Unit Statistical Plan Manual. Specifically, where the compensation law states that, in connection with certain types of injury a specified amount shall be paid into special funds (e.g., a Second Injury Fund), and that such amounts are in addition to the compensation payable to the injured worker or his dependents, then the combined total amount shall be reported as incurred indemnity losses. Examples are: (1) payments in no-dependent death claims, and (2) a specified percentage of the permanent partial award. However, any special payments to the states

assessed on total premium writings, total losses paid or incurred, or total indemnity losses paid or incurred instead of on a per claim basis shall not be reported as losses to the rating bureau. In other words, special funds or assessments are reported as incurred losses only when the assessment is levied on certain types of injuries.

A list of specific assessments and other compensation special funds for each state and the proper treatment for including these assessments in calendar year submissions is attached.

★ 14. Small Deductible Programs

In states in which small deductible programs apply, losses are to be reported on a gross basis inclusive of the employer paid loss amount.

15. Pennsylvania Calendar Year Experience

The calendar year experience for the state of Pennsylvania should be reconcilable with Schedule W-Section II (a) of the Pennsylvania Annual Statement.

16. Taxes and Assessments in Kentucky

Taxes and assessments on premiums earned in Kentucky on or after January 1, 1977 MUST BE EXCLUDED.

17. Oregon Assessments

Assessments on premiums written or earned in Oregon on or after July 1, 1982 must be excluded. This is pursuant to the requirements of OAR 436-51-025 and 51-030(2) contained in WCD Administrative Order 8-1982.

Please note the date for reporting this data is on or before March 15 of the year following the valuation year. It is urged that every effort be made to comply with this reporting date as a delay in receiving this data will seriously hamper NCCI in its preparation of rate revisions. Please mail this Call to:

National Council on Compensation Insurance
750 Park of Commerce Drive
Boca Raton, Florida 33487

ATTENTION: FINANCIAL DATA

9. Reserves for Specific Contingencies

Include medical and other loss reserves to meet specific contingencies.

10. Other Voluntary Reserves

Exclude voluntary reserves other than those mentioned above.

11. Expenses

Exclude all expenses, either allocated or unallocated, except allocated Coverage B loss adjustment expense.

12. Assessments and Special Compensation Funds

The inclusion of assessments and other compensation special funds as incurred losses in the Calendar Year data follow the same instructions that apply in reporting of experience under the National Council Workers Compensation Unit Statistical Plan Manual. Specifically, where the compensation law states that, in connection with certain types of injury a specified amount shall be paid into special funds (e.g., a Second Injury Fund), and that such amounts are in addition to the compensation payable to the injured worker or his dependents, then the combined total amount shall be reported as incurred indemnity losses. Examples are: (1) payments in no-dependent death claims, and (2) a specified percentage of the permanent partial award.

However, any special payments to the states assessed on total premium writings, total losses paid or incurred, or total indemnity losses paid or incurred instead of on a per claim basis shall not be reported as losses to the rating bureau. In other words, special funds or assessments are reported as incurred losses only when the assessment is levied on certain types of injuries.

A list of specific assessments and other compensation special funds for each state and the proper treatment for including these assessments in calendar year submissions is attached.

13. Small Deductible Programs ★

In states in which small deductible programs apply, losses are to be reported on a gross basis inclusive of the employer paid loss amount.

Please note that the date for reporting this data is on or before March 15 of each year. It is urged that every effort be made to comply with this reporting date as a delay in receiving this data will seriously hamper the National Council in its preparation of rate revisions. Please mail this Call to:

National Council on Compensation Insurance
750 Park of Commerce Drive
Boca Raton, Florida 33487

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

STATISTICAL CALL NAME:

Calendar Year Call For Assigned Risk Compensation Experience (Call #2A)

DESCRIPTION OF CALL:

This call contains dollar amounts for workers compensation Standard Earned Premium at NCCI DSR level, Net Earned Premium, and Total Incurred Losses for the specified calendar year. Each NCCI member carrier is required to submit this information for each state in which they operate. Some states require all carriers writing workers compensation policies to submit financial calls.

The Calendar Year Call for Assigned Risk Compensation Experience is used to reconcile assigned risk workers compensation experience data reported in the Policy Year Assigned Risk Call to that reported in Calendar-Accident Year Assigned Risk Call.

NCCI first distributed the Calendar Year Assigned Risk Call in 1990. The data is validated, but not yet used to calculate rates. NCCI requires financial call data to be submitted for at least three years before it is used to calculate rates.

FILES/DATABASES:

Calendar Year Call Assigned Risk Production File:

This file serves as the central repository for Calendar Year Assigned Risk Call data. This file contains all data received from the carriers as well as corrections applied to this data. Corrections to the file are made via ACS for data entry of revised reports with electronic transfer of the data to NCCI for incorporation into the production file.

Calendar Year Call Assigned Risk SAS Dataset:

Actuarial analysis and reporting programs are executed using the data in this file.

There is one SAS dataset for each state for which the NCCI produces rates. The dataset contains data only for the specified state. This file is created through an extraction from the Calendar Year Call Assigned Risk production file. Revised reports which are obtained after this extraction are entered into the SAS dataset and marked internally as

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

revised records. When rate levels are completed for the state, these records are printed and sent to ACS for data entry and incorporation into the production file.

DESCRIPTION OF ERROR HANDLING:

Calendar Year Assigned Risk data is validated in a two step process. An initial validation using automated reports is performed when the data is received from the carrier. A final validation of the data is performed as one of the steps in producing a state's rate level to ensure that no errors have been overlooked.

Carriers are sent written correspondence letters to resolve any errors identified during the initial validation. As revised reports are received, they are checked for accuracy. If correct, the revised reports are sent to ACS for processing or entered into the SAS dataset if the affected data is already being used for rate level production.

During the final validation, newly discovered and outstanding errors are handled in a slightly different manner. Carriers are contacted by phone for a response. Revised reports are submitted by facsimile transmission or some form of overnight delivery. NCCI may enter corrections based on the phone conversation in anticipation of carrier submitted revisions.

MODIFICATIONS TO DATA:

Revised reports are processed as they are received. Any data containing errors which remain unresolved at the time of a state's rate level production will be removed from the dataset if resolution of the remaining errors is not possible within the framework of the rate level production schedule.

All revised data is requested to be submitted on revised reports or via written correspondence. When production deadlines require an immediate response, telephone responses are accepted with the stipulation that a written confirmation of the changes also be submitted.

CALL FOR EXPERIENCE #2A
ASSIGNED RISK CALENDAR YEAR CALL

Background and Purpose of the Report

The Calendar Year Call for Assigned Risk Compensation Experience by State is due at NCCI on March 15 of the current year for the previous calendar year.

This call is one of the annual calls for experience subject to the Performance Evaluation Monetary Incentive Program (PEMIP).

For each Annual Year Call, the most recent calendar year assigned risk data must be reported on a state basis. Data collected on this Call includes earned premiums and incurred losses. The calendar year assigned risk premiums are separated into Standard premium at NCCI DSR Level and Net premium. As there are no company deviations or competitive ratings, assigned risk standard premium at company level is not applicable.

The net earned premium is used to reconcile the Call to page 14 of the company's Annual Statement. The calendar year incurred losses represent the sum of indemnity and medical benefits, including IBNR reserves.

The intent of this Call is to use the collected data in ratemaking to develop Assigned Risk experience separately and will also be used along with the Calendar Year Call to develop "voluntary business only" experience. Thus, it is essential that the methodology for determining the premium and losses reported in this Call be consistent with the procedures used for reporting the experience on page 14 of the annual statement. The data on this Call must also be consistent with the assigned risk data in the Calendar Year Call (Call #2).

Filing Requirements

Calendar Year Call for Assigned Risk Compensation Experience by State—Calendar Year Basis—Due March 15 of each year

In accordance with the approved statistical program, you are hereby requested to file with NCCI on or before March 15 of each year your Assigned Risk compensation experience for the preceding Calendar Year.

This Call is included in PEMIP (Performance Evaluation Monetary Incentive Program) and would normally be subject to assessments for late and/or inaccurate reporting. Details of PEMIP are updated annually in January of each year and when released in January 1990, will contain more details pertaining to the three Assigned Risk Only Calls.

Please note: the eventual intent of this Call is for use in ratemaking. This Call will be used on its own to develop Assigned Risk experience and also will be used along with the standard Calendar Year Call to develop "voluntary business only" experience. For this reason, it is essential that the premium and losses reported on this Call reconciles with the Assigned Risk data included on Page 14 of the annual statement. The data submitted on this Call should also be consistent with the Assigned Risk experience reported on the standard Calendar Year Call.

Questions regarding reporting requirements on completion of the Calls should be directed to Aggregate Ratemaking at (407) 997-4395.

A. GENERAL INSTRUCTIONS

1. Group Report

Carrier name and five-digit code must be shown on reporting forms. If this is a group reporting, each carrier writing compensation must be listed individually on the form. With respect to affiliated carriers, it will be appreciated if you will follow the same method of reporting for the Assigned Risk Calendar Year Call (individual company basis or group basis) as was followed in compliance with our Semi-Annual Call for the first six months of the current year issued in October. If this is not convenient, please advise us that you have changed procedure.

2. Standard Earned Premiums at NCCI Designated Statistical Reporting Level

Standard earned premiums shall be the entire earned premium for the state resulting from standard rating procedures after the application of:

1. Assigned Risk rating programs, surcharges, etc.
2. Experience rating plan adjustments (NOTE: Except for Michigan experience, experience rating plan adjustments must reflect only NCCI published modification factors.)*
3. Expense Constants (These are the Expense Constants published by NCCI or an independent bureau.)
4. Loss Constants (These are the Loss Constants published by NCCI or an independent bureau.)

but prior to the application of:

1. Deviations from published NCCI experience rating plan modification factors (except Michigan)*
2. Retrospective rating plan adjustments

3. Premium discounts
4. Expense modification program adjustments
5. Maine small business premium discount
6. Payment of policyholder dividends
7. Premium credits for deductible coverage

• Carriers must report their Standard Earned Premium at NCCI's experience rating plan level for all states except Michigan. If carriers use their own experience rating plan in Michigan, they may report their Standard Earned Premium at their own experience rating plan level.

3. Standard Earned Premium at Company Level

Not Applicable to Assigned Risk Calendar Year Call.

4. Carriers Writing in Competitive Rating States

Not Applicable to Assigned Risk Calendar Year Call.

5. Carriers Writing at Deviations from NCCI Rates in Administered Pricing States

Not Applicable to Assigned Risk Calendar Year Call.

6. Net Earned Premium

Net earned premiums shall be the actual earned premium on all risks prior to the payment of policyholder dividends; but after application of any retrospective rating premium adjustments, after the application of premium discounts in accordance with Manual Rules, after the expense modification program.

7. Incurred Losses

Losses reported by state should include compensation and medical incurred during this calendar year period. For further details on the inclusion or exclusion of certain losses and/or reserves please refer to the specific instructions below.

8. Rounding Procedure and Reporting of Credits

Please report amounts of premiums and losses in whole dollars only. Count fifty cents and over as an extra dollar, and reject the cents if less than fifty. Please show negative amounts enclosed within parentheses so that they may be handled properly in punching and tabulating operations.

9. Total Experience

Kindly show the totals of all amounts reported on the last line of sheet 2 captioned "All States."

10. Signature Requirement

The person responsible for the completion and accuracy of this Call should sign and date the reporting form.

11. Full Submission

Report should include ALL States where company has data to report. Resubmission or correction must also include all states, not just revised states.

B. SPECIFIC INSTRUCTIONS

1. "F" Classifications

Experience of the "F" Classifications for policies effective January 1, 1974, and thereafter, MUST BE EXCLUDED.

2. Coal Mine Experience

Underground Coal Mine experience MUST BE EXCLUDED in all states except Pennsylvania and Virginia. In Pennsylvania and Virginia ALL Coal Mine experience MUST BE EXCLUDED.

3. Excess Policies

Experience on excess policies MUST BE EXCLUDED.

4. National Defense Projects

Experience on National Defense Projects written under either the old Comprehensive Rating Plan or the new National Defense Projects Rating Plan MUST BE EXCLUDED. Experience incurred on a Defense Base should be included unless written under the National Defense Projects Rating Plan.

5. Reinsurance

No deductions shall be made from premiums and losses for or on account of reinsurance ceded. Premiums and losses arising from reinsurance received by the reporting company shall be excluded from the experience. Experience reported should be DIRECT BUSINESS ONLY.

6. Experience Incurred Under Occupational Disease Act

Experience incurred under any Occupational Disease Act which is separate and distinct from the Compensation Act for the state shall be combined with the traumatic experience under the State Compensation Act, and the total of such combined experience shall be reported.

7. IBNR

Losses reported by state should include an appropriate reserve for incurred but not reported cases.

8. Reopened Cases

Include an appropriate loss reserve for reopened cases.

9. Reserves for Specific Contingencies

Include medical and other loss reserves to meet specific contingencies.

10. Other Voluntary Reserves

Exclude voluntary reserves other than those mentioned above.

11. Expenses

Exclude all expenses, either allocated or unallocated, except allocated Coverage B loss adjustment expense.

12. Assessments and Special Compensation Funds

The inclusion of assessments and other compensation special funds as incurred losses in the Calendar Year data follow the same instructions that apply in reporting of experience under the National Council Workers Compensation Unit Statistical Plan Manual. Specifically, where the compensation law states that, in connection with **certain types of injury** a specified amount shall be paid into special funds (e.g., a Second Injury Fund), and that such amounts are in addition to the compensation payable to the injured worker or his dependents, then the combined total amount shall be reported as incurred indemnity losses. Examples are: (1) payments in no-dependent death claims, and (2) a specified percentage of the permanent partial award.

However, any special payments to the states assessed on total premium writings, total losses paid or incurred, or total indemnity losses paid or incurred instead of on a per claim basis shall not be reported as losses to the rating bureau. In other words, special funds or assessments are reported as incurred losses only when the assessment is levied on certain types of injuries.

A list of specific assessments and other compensation special funds for each state and the proper treatment for including these assessments in calendar year submissions is attached.

13. Claims Deductible Programs

In states in which deductible programs apply, losses are to be reported on a gross basis inclusive of the employer paid loss amount.

Please note that the date for reporting this data is on or before March 15 of each year. It is urged that every effort be made to comply with this reporting date as a delay in receiving this data will seriously hamper the National Council in its preparation of rate revisions. Please mail this Call to:

National Council on Compensation Insurance
750 Park of Commerce Drive
Boca Raton, Florida 33487

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

STATISTICAL CALL NAME:

Policy Year Call For Compensation Experience (Call #3)

DESCRIPTION OF CALL:

This call contains dollar amounts for workers compensation Standard Earned Premium at NCCI DSR level, Standard Earned Premium at Company level, Net Earned Premium, and Total Incurred Losses by Policy Year for each state NCCI produces rate levels. The Total Incurred Losses are broken down to Paid, Outstanding excluding IBNR, and IBNR on page 1. Each of these components is further broken down into its indemnity and medical components and reported along with the Indemnity Claim Count on page 2. In addition, Indemnity and Medical Outstanding excluding IBNR are separated into case and bulk reserves on page 3. Each NCCI member carrier is required to submit this information for each state in which they operate. Some states require all carriers writing workers compensation policies to submit financial calls.

The Policy Year Call for Compensation Experience is used in conjunction with the Calendar-Accident Year Call to determine rate adequacy for the states in which the NCCI produces rate levels.

FILES/DATABASES:

Policy Year Call Production File:

This file serves as the central repository for Policy Year Call data. This file contains all data received from the carriers as well as corrections applied to this data. Corrections to the file are made via ACS for data entry of revised reports with electronic transfer of the data to NCCI for incorporation into the production file.

Policy Year Call SAS Dataset:

Actuarial analysis and reporting programs are executed using the data in this file.

There is one SAS dataset for each state for which the NCCI produces rates. The dataset contains data only for the specified state. This file is created through an extraction from the Policy Year Call production file. Revised reports which are obtained after this

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

extraction are entered into the SAS dataset and marked internally as revised records. When rate levels are completed for the state, these records are printed and sent to ACS for data entry and incorporation into the production file.

DESCRIPTION OF ERROR HANDLING:

Policy Year data is validated in a two step process. An initial validation using automated reports is performed when the data is received from the carrier. A final validation of the data is performed as one of the steps in producing a state's rate level to ensure that no errors have been overlooked.

Carriers are sent written correspondence letters to resolve any errors identified during the initial validation. As revised reports are received, they are checked for accuracy. If correct, the revised reports are sent to ACS for processing or entered into the SAS dataset if the affected data is already being used for rate level production.

During the final validation, newly discovered and outstanding errors are handled in a slightly different manner. Carriers are contacted by phone for a response. Revised reports are submitted by facsimile transmission or some form of overnight delivery. NCCI may enter corrections based on the phone conversation in anticipation of carrier submitted revisions.

MODIFICATIONS TO DATA:

Revised reports are processed as they are received. Any data containing errors which remain unresolved at the time of a state's rate level production will be removed from the dataset if resolution of the remaining errors is not possible within the framework of the rate level production schedule.

All revised data is requested to be submitted on revised reports or via written correspondence. When production deadlines require an immediate response, telephone responses are accepted with the stipulation that a written confirmation of the changes also be submitted.

CALL FOR EXPERIENCE #3
POLICY YEAR CALL

Background and Purpose of the Report

The Policy Year Call is due at NCCI on or before March 15 of the year following the most recent Policy Year. As an example, the Policy Year Call valued as of 12/31/90 is due at NCCI on or before March 15, 1991.

This call is one of five standard annual calls for experience subject to the Performance Evaluation Monetary Incentive Program (PEMIP).

In the past for each Annual Call Year, the most recent eight (8) full years of individual policy years had been reported separately by state. Prior to the eight most recent full years, the total of all "Prior to" Policy Years were grouped together. However, effective with Calls valued as of December 31, 1987, this call retained the oldest data year. As an example, the Policy Year Call valued as of 12/31/87 should be retained in the 1978 and prior to data as well as requesting data for 1987. This phase-in retention will result in the collection of 15 full underwriting years of data with calls reported in 1994. The definition of Policy Year refers to a way of organizing financial data based upon policy effective date. As an example, Policy Year 1990 is comprised of all policies with effective dates initiating in 1990 from 1/1/90 to 12/31/90. Additionally, all claims developed for these policies are reported back to the policy effective year, irrespective of the year the claim arose.

Policy Year data matches premiums and losses from an identified collection of policies that provide a very stable base on which to structure premium level analysis. As a result, this call is given a 50% weight in the ratemaking formula and is used to test reserve adequacy and reserve level changes. Changes in the ratemaking formula are made based upon these tests to obtain a more accurate indication of rate level needed. Results of the Policy Year Call are distributed to NCCI Members and Subscribers.

Data collected in the Policy Year Call includes earned premium and incurred losses on a state basis. Policy Year Earned Premiums are separated between Standard at NCCI DSR Level, Standard at Company Level and Net Earned. Standard at DSR Level is prior to the effect of any individual company competitive pricing activity and is, therefore, used for ratemaking. Standard at Company Level is used to confirm the accuracy of the ratemaking premium given our records of individual company deviation filings. Net earned premium is used to reconcile the company's annual statement (page 14) to the information reported on the call. Policy Year incurred losses, include incurred indemnity claim count and indemnity and medical total for paid losses, outstanding losses excluding IBNR, cases and bulk reserves in the outstanding losses excluding IBNR and total incurred losses.

The data reported in this call should *exclude* experience developed under large deductible policies (deductible amount over \$100,000 per claim or per accident).

The Calendar Year Reconciliation Report (Call #8) has been revised to add lines to reconcile premium and losses to Page 14 of the Annual Statement due to the exclusion of the large deductible policies.

Filing Requirements

Policy Year Call for Compensation Experience by State Valued as of December 31 of each year—due March 15 of the following year

In accordance with the approved statistical program, you are hereby requested to file with NCCI on or before March 15 of each year, your compensation experience by policy year valued as of December 31 of the prior year.

This Call is included in PEMIP (Performance Evaluation Monetary Incentive Program) and will be subject to assessments for late and/or inaccurate reporting. Details of PEMIP are updated annually in January of each year. Since future Compensation Rate Levels will depend upon these figures, it is essential that this Call be reported on or before the required due date.

This Call continues the phased-in expansion of the Policy Year Call to ultimately collect 15 full underwriting years of data. This Policy Year Call to be reported in 1990 retains the oldest data year (1978) and includes the current year 1989, thus requiring the collection of a total of 11 full underwriting years of data to be reported in 1990. This phased-in retention will continue until 15 full underwriting years of data are collected.

Two copies of the reporting form for the required information are provided in the package of forms sent to carriers in October of each year. Since a separate form is required for each state, carriers are asked to reproduce these forms within their organizations.

Questions regarding reporting requirements on completion of the Calls should be directed to Aggregate Ratemaking at (407) 997-4395.

A. GENERAL INSTRUCTIONS

1. Group Report

Carrier name and five-digit code must be shown on the reporting form. If this is a group reporting, each carrier writing compensation must be listed individually on the reporting form. List only the names or carrier codes of those carriers having direct business during at least one of the policy years for which data is required in a given state. Carriers are requested to submit the Policy Year Call on the same basis (i.e., group report or individual company report) as the Calendar Year Call. This will facilitate reconciliation of carrier data.

2. State

List both the name of the state and the state code number on each state's reporting form. Only one state per reporting sheet is allowed.

3. Accumulated Standard Earned Premium at NCCI Designated Statistical Reporting Level

As in last year's Call, you are required to report the Accumulated Standard Earned Premium for each of the indicated policy years. Specifically, for any given policy year, you are to report the entire Standard Earned Premium since policy inception through December 31 for those policies becoming effective during the policy year being reported.

For each policy year indicated, the Accumulated Standard Earned Premium at NCCI Designated Statistical Reporting Level shall be the accumulated earned premium for that particular policy year resulting from standard rating procedures after the application of:

1. Experience rating plan adjustments (NOTE: Except for Michigan experience, experience rating plan adjustments must reflect only NCCI-published modification factors.)*
2. Expense Constants (These are the Expense Constants published by NCCI or an independent bureau. For Voluntary Business in pure premium states, Expense Constants at the NCCI DSR level are 0.)
3. Loss Constants (These are the Loss Constants published by NCCI or an independent bureau. For Voluntary Business in pure premium states, Loss Constants at the NCCI DSR level are 0.)

but prior to the application of:

1. Deviations from NCCI Designated Statistical Reporting rates or pure premiums**
2. Deviations from published NCCI experience rating plan modification factors (Except Michigan)*
3. Retrospective rating plan adjustments
4. Other individual risk rating plan adjustments*** (e.g., Schedule Rating)
5. Premium discounts
6. Expense modification program adjustments
7. Payment of policyholder dividends
8. Premium credits for small deductible coverage

For every policy year Standard Earned Premium at DSR Level is reported, Standard Earned Premium at Company Level must be reported as well.

* Carriers must report their Standard Earned Premium at NCCI's experience rating plan level for all states except Michigan. If carriers use their own experience rating plan in Michigan, they may report their Standard Earned Premium at their own experience rating plan level.

** Rates: Arkansas, Georgia, Illinois, Indiana, Rhode Island, Vermont

Pure Premiums: Connecticut (policies effective 1/1/90 and subsequent), Kentucky, Louisiana (policies effective 4/1/89 and subsequent), Maryland, Michigan, New Mexico (policies effective 1/1/90 and subsequent), Oregon

*** Note that premium adjustments resulting from the application of individual risk rating plans other than experience rating must be excluded from both Standard Earned Premium at Company Level and Standard Earned Premium at NCCI Designated Statistical Reporting Level.

4. Standard Earned Premium at Company Level

The earned premium on all risks after the application of:

1. Deviations from NCCI Designated Statistical Reporting rates or pure premiums*
2. Experience rating plan adjustments (NOTE: Except for Michigan experience, experience rating plan adjustments must reflect only NCCI-published modification factors)**
3. Expense Constants (Carrier charged Expense Constants)
4. Loss Constants (Carrier charged Loss Constants)

but prior to the application of:

1. Deviations from published NCCI experience rating plan modification factors (except Michigan)**
2. Retrospective rating plan adjustments
3. Other individual risk rating plan adjustments*** (e.g., Schedule Rating)
4. Premium discounts
5. Expense modification program adjustments
6. Payment of policyholder dividends
7. Premium credits for small deductible coverage

For every state Standard Earned Premium at DSR Level is reported, Standard Earned Premium at Company Level must be reported as well.

* Rates: Arkansas, Connecticut, Georgia, Illinois, Indiana, New Mexico, Rhode Island, Vermont
Pure Premiums: Kentucky, Louisiana (policies effective 4/1/89 and subsequent), Maryland, Michigan, Oregon

** Carriers must report their Standard Earned Premium at NCCI's experience rating plan level for all states except Michigan. If carriers use their own experience rating plan in Michigan, they may report their Standard Earned Premium at their own experience rating plan level.

*** Note that premium adjustments resulting from the application of individual risk rating plans other than experience rating must be excluded from both Standard Earned Premium at Company Level and Standard Earned Premium at NCCI Designated Statistical Reporting Level.

5. Carriers Writing in Competitive Rating States

For Arkansas, Connecticut, Georgia, Illinois, Indiana, Kentucky, Louisiana, Maryland, Michigan, New Mexico, Oregon, Rhode Island, and Vermont, carriers must enter the Standard Earned Premium figures at NCCI Designated Statistical Reporting Level and at Company Level in the appropriate columns on the form. Both columns must be filled in for these states. The Designated Statistical Reporting Levels are often split during the policy year for these states. Please reference the enclosed circular titled "Annual Update on Designated Statistical Reporting Levels."

6. Carriers Writing at Deviations from NCCI Rates in Administered Pricing States

For State Funds and other carriers writing at deviations from Bureau rates in non-competitive rating states, the Standard Earned Premiums must be adjusted to Bureau rate level and reported in the column labeled "Standard Earned Premium at NCCI Designated Stat. Reporting Level." The Standard Earned Premium at the carrier rate level must be reported in the column labeled "Standard Earned Premium at Company Level."

Note: For Oklahoma the DSR level for policies effective between November 1, 1985 and July 1, 1988 is the March 1, 1985 rates. Companies writing policies on a "Consent to Rate" basis should report as if they had an upward deviation of the March 1, 1985 rates. For further information, refer to Statistical Circular 87-17, dated May 1, 1987.

Carriers that do not deviate from NCCI rates must enter their Standard Earned Premium in the column labeled "Standard Earned Premium at NCCI Designated Stat. Reporting Level" and must enter the same figure in the column labeled "Standard Earned Premium at Company Level."

Also note that where premium credits have been granted in connection with the Transition Program of payroll limitation rules, both reported Standard Earned Premium figures shall be reduced by such credits.

7. Accumulated Net Earned Premium

As in last year's Call, you are required to report the accumulated net earned premium for each of the indicated policy years. Specifically, for any given policy year you are to report the entire net earned premium since policy inception through December 31 of each year for those policies becoming effective during the policy year being reported.

For each policy year indicated, the accumulated net earned premium shall be the accumulated actual

earned premium on all risks prior to the payment of policyholder dividends; but after application of any retrospective rating premium adjustments, after the application of premium discounts in accordance with Manual rules, after the expense modification program, after any deviations or "write-offs" from Bureau rates or pure premiums and after the effects of any schedule rating premium adjustments.

8. Accumulated Incurred Losses

As in previous Policy Year Calls, you are required to report accumulated total incurred losses (i.e., from date of inception through December 31 of each year). The Call further requires that accumulated total incurred losses be split into the following components: accumulated indemnity losses (separately for paid, Outstanding Excluding IBNR—Case and Bulk, and IBNR) and accumulated medical losses (separately for paid, Outstanding Excluding IBNR—Case and Bulk, and IBNR). The reporting of these components of incurred losses is mandatory for all carriers. Please note that for line T only, under Outstanding Excluding IBNR and IBNR, the calendar year change should be reported rather than the accumulated total.

The Outstanding Excluding IBNR category is designed to capture case reserves and bulk reserves. For the purposes of this Call, the following working definitions may be used by carriers:

Case Reserves—Those outstanding reserves established for specific known cases reported in an aggregate amount to reflect the total case reserve for the company.

Bulk Reserves—Those outstanding reserves for general case reserve inadequacy, supplemental case reserves, cases that may reopen, or other reserves not associated to specific claims.

The goal of this reporting is to clearly isolate case reserves without impacting the carrier methodology of reporting IBNR. Carriers should not alter the mix of data historically allocated to IBNR, since doing so would adversely impact the NCCI development of IBNR data.

For this reason, carriers having reported bulk reserves in IBNR should continue to do so. On the Outstanding Excluding IBNR Page 3 Reporting Form, these carriers should respond "Yes" to the question in Note A. In addition, carriers having no bulk reserves should also respond "Yes" to the question in Note A.

Those carriers reporting bulk reserves in the Outstanding Excluding IBNR category should respond "No" to the question in Note A of the Outstanding Excluding IBNR Page 3 Reporting Form. These carriers should have data reported in both the case reserves and bulk reserves.

The Case and Bulk Reserve Reporting Form accommodates carriers allocating this data on an **ACTUAL** basis as well as **ESTIMATED** basis. The reporting form contains a coding box to indicate the actual versus estimated method of allocation.

9. Incurred Indemnity Claim Count

The incurred indemnity claim count (i.e., the accumulated number of claims for which an indemnity payment has been made and/or an outstanding reserve exists) must be reported on a mandatory basis for policy years 1981 and subsequent. (Those carriers that are in a position to do so are requested to report the incurred indemnity claim count for as many policy years prior to 1981 as possible.) The indemnity claim count should exclude claims that start out with an indemnity reserve, but were resolved as medical only claims or closed without payment. Also, indemnity claim count should include claims that start out as medical only but were resolved as indemnity at future valuations. If indemnity claims are reopened, they should not be added to the claim count.

10. No Experience

State reports should not be submitted for any state in which the carrier(s) has (have) never had experience. In instances where for one or more, but not all, of the 1978-1989 Policy Years the carrier(s) failed to have experience in a given state, indicate "NO EXPERIENCE" across the appropriate Policy Year line(s) on that state.

11. Questionnaire

The questionnaire on pages 4 and 5 of the reporting form must be completed. Submit only one questionnaire per submission. A separate questionnaire per state is no longer required.

12. Complete Submission

A complete call submission per state must include all three pages (and the Oklahoma Questionnaire as appropriate). Page 3 must be completed for each state in which the carrier reports experience.

13. Signature Requirement

The name of the person responsible for the completion and accuracy of this Call is only required on the first state's reporting form and does not have to be repeated on each state's form.

14. States for which the Reporting of Policy Year Experience is Required

State	Code#	State	Code#
Alabama	01		
Alaska	54	Michigan	21
Arizona	02	Mississippi	23
Arkansas	03	Missouri	24
Colorado	05	Montana	25
Connecticut	06	Nebraska	26
Dist. of Columbia	08	New Hampshire	28
Florida	09	New Mexico	30
Georgia	10	North Carolina	32
Hawaii	52	Oklahoma	35
Idaho	11	Oregon	36
Illinois	12	Rhode Island	38
Indiana	13	South Carolina	39
Iowa	14	South Dakota	40
Kansas	15	Tennessee	41
Kentucky	16	Texas	42
Louisiana	17	Utah	43
Maine	18	Vermont	44
Maryland	19	Virginia	45
		Wisconsin	48

15. Rounding Procedure and Reporting of Credits

Please report amounts of premiums and losses in whole dollars only. Count fifty cents and over as an extra dollar, and reject the cents if less than fifty. Please show negative amounts enclosed within parentheses so that they may be handled properly in punching and tabulating operations.

B. SPECIFIC INSTRUCTIONS

1. "F" Classifications

Experience of the "F" Classifications for policies effective January 1, 1974 and thereafter **MUST BE EXCLUDED**.

2. Coal Mine Experience

Underground Coal Mine experience **MUST BE EXCLUDED** in all states except Virginia. In Virginia **ALL** Coal Mine experience **MUST BE EXCLUDED**.

3. Excess Policies

Experience on excess policies **MUST BE EXCLUDED**.

4. National Defense Projects

Experience on National Defense Projects written under either the old Comprehensive Rating Plan or the new National Defense Projects Rating Plan **MUST BE**

EXCLUDED. Experience incurred on a Defense Base should be included unless written under the National Defense Projects Rating Plan.

5. Reinsurance

No deductions shall be made from premiums and losses for or on account of reinsurance ceded. Premiums and losses arising from reinsurance received by the reporting company shall be excluded from the experience. Experience reported should be **DIRECT BUSINESS ONLY.**

6. Assigned Risk

Experience for assigned risk policies must be **INCLUDED.** Assigned risk policies must be reported at the level of approved assigned risk rates.

7. Experience Incurred Under Occupational Disease Act

Experience incurred under any Occupational Disease Act separate and distinct from the Compensation Act for the state shall be combined with the traumatic experience under the State Compensation Act, and the total of such combined experience shall be reported.

8. IBNR

Losses reported by state should include an appropriate reserve for incurred but not reported cases. The IBNR reserve must be reported separately for indemnity and medical.

Commencing with the Policy Year Call valued as of December 31, 1986, the Outstanding Excluding IBNR category has been further refined to capture case reserves and bulk reserves.

This reporting clearly isolates case reserves without impacting the carrier methodology of reporting IBNR. Carriers should not alter the mix of data historically allocated to IBNR, since doing so would adversely impact the NCCI development of IBNR data.

For this reason, carriers having reported bulk reserves in IBNR should continue to do so. On the Outstanding Excluding IBNR Page 3 Reporting Form, these carriers should respond "Yes" to the question in Note A.

9. Reopened Cases

Include an appropriate loss reserve for reopened cases.

10. Reserves for Specific Contingencies

Include medical and other loss reserves to meet specific contingencies.

11. Other Voluntary Reserves

Exclude voluntary reserves other than those mentioned above.

12. Expenses

Exclude all expenses, allocated or unallocated, except allocated Coverage B loss adjustment expense.

13. Assessments and Special Compensation Funds

The inclusion of assessments and other compensation special funds as incurred losses in this Policy Year Call follow the same instructions that apply in reporting of experience under NCCI's Workers Compensation Unit Statistical Plan Manual. Specifically, when the compensation law states that, in connection with a certain type of injury, a specified amount shall be paid into special funds (e.g., a Second Injury Fund), and that such amounts are in addition to the compensation payable to the injured worker or his dependents, then the combined total amount shall be reported as incurred indemnity losses. Examples are: (1) payments in no-dependent death claims, and (2) a specified percentage of the permanent partial award. However, any special payments to the states assessed on total premium writings, total losses paid or incurred, or total indemnity losses paid or incurred instead of on a per-claim basis shall not be reported as losses to the rating bureau. In other words, special funds or assessments are reported as incurred losses only when the assessment is levied on certain types of injuries.

A list of specific assessments and other compensation special funds for each state and the proper treatment for including these assessments in this Call is attached.

14. Small Deductible Programs *

In states in which small deductible programs apply, losses are to be reported on a gross basis inclusive of the employer paid loss amount.

15. Taxes and Assessments in Kentucky

Taxes and Assessments on premiums earned in Kentucky on or after January 1, 1977 **MUST BE EXCLUDED.**

16. Oregon Assessments

Assessments on premiums written or earned in Oregon on or after July 1, 1982 must be excluded. This is pursuant to the requirements of OAR 436-51-025 and 51-030(2) contained in WCD Administrative Order 8-1982.

17. Oklahoma Statistical Reporting Requirements

To ensure the accurate calculation of Standard Earned Premium at NCCI Designated Statistical Reporting Level, the March 1, 1985 rates must be the DSR for policies effective between March 1, 1985 and July 1, 1988. For those policies written on a consent-to-rate basis, premium developed will have to be adjusted downward to attain the March 1, 1985 rate level.

Enclosed is the Oklahoma Questionnaire. The intent of this questionnaire will be to identify carriers writing on a consent-to-rate basis, and to what extent this basis was used. Also, questionnaire responses will assist us in verifying the inclusion of policyholder refunds and provide a ratemaking data quality check. For further information, refer to Statistical Circular 87-17 dated May 1, 1987.

Please note that the date for reporting this data is on or before March 15 of each year. It is urged that every effort be made to comply with this reporting date, as a delay in receiving this data will seriously hamper NCCI in its preparation of rate revisions. Please mail this Call to:

NOTE:

A. Does your company currently report all bulk reserves for indemnity and medical under the IBNR columns on page 2? Indicate by placing an "X" in the appropriate space below.

___ No ___ Yes

If "No," data should be reported in Columns 15 through 18. If "Yes," Columns 15 through 18 should be left blank.

B. If your company currently reports any bulk reserves for indemnity and medical under the outstanding excluding IBNR columns of page 2 then,

- Columns 15 + 16 on this page must equal Column 11 on page 2.
- Columns 17 + 18 on this page must equal Column 12 on page 2.

Please indicate if the amounts shown on this page are actual or estimated by placing an "x" in the appropriate space provided below.

___ Actual ___ Estimated

C. If you have provided estimated amounts, will your company be able to provide NCCI with actual amounts in subsequent reports?

___ No ___ Yes

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

STATISTICAL CALL NAME:

Policy Year Call For Assigned Risk Compensation Experience (Call #3A)

DESCRIPTION OF CALL:

This call contains dollar amounts for workers compensation Standard Earned Premium at NCCI DSR level, Standard Earned Premium at Company level, Net Earned Premium, and Total Incurred Losses by Policy Year for each state in which NCCI produces rate levels. The Total Incurred Losses are broken down into Paid, Outstanding excluding IBNR, and IBNR on page 1. Each of these components is further broken down into its indemnity and medical components and reported along with the Indemnity Claim Count on page 2. In addition, Indemnity and Medical Outstanding excluding IBNR are separated into case and bulk reserves on page 3. Each NCCI assigned risk servicing carrier is required to submit this information for each state in which they operate. Some states require all carriers writing workers compensation policies to submit financial calls.

The Assigned Risk Policy Year Call data is used in conjunction with the Assigned Risk Calendar-Accident Year Call data to determine assigned risk and/or voluntary business rate adequacy for the states in which NCCI produces rate levels. Voluntary business is derived by subtracting the assigned risk data from the statewide data.

NCCI first distributed the Policy Year Assigned Risk Call in 1990. The data is validated, but not yet used to calculate rates. NCCI requires financial call data to be submitted for at least three years before it is used to calculate rates.

FILES/DATABASES:

Policy Year Call Assigned Risk Production File:

This file serves as the central repository for Policy Year Call Assigned Risk data. This file contains all data received from the carriers as well as corrections applied to this data. Corrections to the file are made via ACS for data entry of revised reports with electronic transfer of the data to NCCI for incorporation into the production file.

Policy Year Call Assigned Risk SAS Dataset:

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

Actuarial analysis and reporting programs are executed using the data in this file.

There is one SAS dataset for each state for which NCCI produces rates and has assigned risk business. In some states, frequently those with state funds, there is no assigned risk business. In this case the state fund serves as the assigned risk insurer.

The dataset contains data only for the specified state. This file is created through an extraction from the Policy Year Call Assigned Risk production file. Revised reports which are obtained after this extraction are entered into the SAS dataset and marked internally as revised records. When rate levels are completed for the state, these records are printed and sent to ACS for data entry and incorporation into the production file.

DESCRIPTION OF ERROR HANDLING:

Policy Year Assigned Risk data is validated in a two step process. An initial validation using automated reports is performed when the data is received from the carrier. A final validation of the data is performed as one of the steps in producing a state's rate level to ensure that no errors have been overlooked.

Carriers are sent written correspondence letters to resolve any errors identified during the initial validation. As revised reports are received, they are checked for accuracy. If correct, the revised reports are sent to ACS for processing or entered into the SAS dataset if the affected data is already being used for rate level production.

During the final validation, newly discovered and outstanding errors are handled in a slightly different manner. Carriers are contacted by phone for a response. Revised reports are submitted by facsimile transmission or some form of overnight delivery. NCCI may enter corrections based on the phone conversation in anticipation of carrier submitted revisions.

MODIFICATIONS TO DATA:

Revised reports are processed as they are received. Any data containing errors which remain unresolved at the time of a state's rate level production will be removed from

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

the dataset if resolution of the remaining errors is not possible within the framework of the rate level production schedule.

All revised data is requested to be submitted on revised reports or via written correspondence. When production deadlines require an immediate response, telephone responses are accepted with the stipulation that a written confirmation of the changes also be submitted.

CALL FOR EXPERIENCE #3—A
POLICY YEAR CALL FOR ASSIGNED RISK POLICY YEAR CALL
BY STATE

Background and Purpose of the Report

The Policy Year Call for Assigned Risk Compensation Experience by state is due at NCCI on March 15 of the current year for the previous policy year.

This call is one of the annual calls for experience subject to the Performance Evaluation Monetary Incentive Program (PEMIP).

The intent of this call is for use in ratemaking to develop assigned risk experience separately and also will be used along with the standard Policy Year Call (Call #3) to develop "voluntary business only" experience. Therefore, it is essential that the methodology for determining the premium and losses reported in this call be consistent with the procedures used for reporting the experience on page 14 of the annual statement. The data submitted on this call should also be consistent with the assigned risk experience included in the Policy Year Call (Call #3).

Filing Requirements

Policy Year Call for Assigned Risk Compensation Experience by State Valued as of December 31 of each year—Due March 15 of the following year

In accordance with the approved statistical program you are hereby requested to file with NCCI on or before March 15 of each year your assigned risk compensation experience by policy year valued as of December 31 of the prior year.

This call is included in PEMIP (Performance Evaluation Monetary Incentive Program) and would normally be subject to assessments for late and/or inaccurate reporting. Details of PEMIP are updated annually in January of each year and when released in January 1990, will contain more details pertaining to the Assigned Risk Only Calls. Since 1990 compensation rate levels will depend upon these figures, it is essential that this call be reported on or before the required due date.

This Call follows the phased-in expansion of the Policy Year Call to ultimately collect 15 full underwriting years of data. This Assigned Risk Policy Year Call to be reported in 1990 retains the oldest data year (1978) and includes the current year 1989, thus requiring the collection of a total of 11 full underwriting years of data to be reported in 1990. This phased-in retention will continue until 15 full underwriting years of data are collected.

Please note: the eventual intent of this Call is for use in ratemaking. This Call will be used on its own to develop Assigned Risk experience and also will be used along with the standard Policy Year Call to develop "voluntary business only" experience. For this reason, it is essential that the premium and losses reported on this Call reconcile with the Assigned Risk data included on Page 14 of the annual statement. The data submitted on this Call should also be consistent with the Assigned Risk experience reported on the standard Policy Year Call.

Attached are two copies of the reporting form for the required information. Since a separate form is required for each state, carriers are asked to reproduce these forms within their organizations.

Questions regarding reporting requirements on completion of the Calls should be directed to Aggregate Ratemaking at 407-997-4395.

A. GENERAL INSTRUCTIONS

1. Group Report

Carrier name and five-digit code must be shown on the reporting form. If this is a group reporting, each carrier writing compensation must be listed individually on the reporting form. List only the names or carrier codes of those carriers having direct Assigned Risk business during at least one of the policy years for which data is required in a given state. Carriers are requested to submit the Assigned Risk Policy Year Call on the same basis (i.e., group report or individual company report) as the Assigned Risk Calendar Year Call. This will facilitate reconciliation of carrier data.

2. State

List both the name of the state and the state code number on each state's reporting form. Only one state per reporting sheet is allowed.

3. Accumulated Standard Earned Premium at NCCI Designated Statistical Reporting Level

You are asked to report the Accumulated Standard Earned Premium for each of the indicated policy years. Specifically, for any given policy year you are to report the entire Standard Earned Premium since policy inception through December 31, 1988 for those policies becoming effective during the policy year being reported.

For each policy year indicated, the Accumulated Standard Earned Premium at NCCI Designated Statistical Reporting Level shall be the accumulated earned premium for that particular policy year resulting from standard rating procedures after the application of:

1. Assigned Risk rating programs, surcharges etc.
2. Experience rating plan adjustments (NOTE: Except for Michigan experience, experience rating plan adjustments must reflect only NCCI-published modification factors.)*
3. Expense Constants (These are the Expense Constants published by NCCI or an independent bureau.)
4. Loss Constants (These are the Loss Constants published by NCCI or an independent bureau.)

but prior to the application of:

1. Deviations from published NCCI experience rating plan modification factors (except Michigan)*
2. Maine small business premium discount
3. Retrospective rating plan adjustments
4. Premium discounts
5. Expense modification program adjustments
6. Payment of policyholder dividends
7. Premium credits for deductible coverage

* Carriers must report their Standard Earned Premium at NCCI's experience rating plan level for all states except Michigan. If carriers use their own experience rating plan in Michigan, they may report their Standard Earned Premium at their own experience rating plan level.

4. **Standard Earned Premium at Company Level**
Not Applicable to Assigned Risk Policy Year Call.
5. **Carriers Writing in Competitive Rating States**
Not Applicable to Assigned Risk Policy Year Call.
6. **Carriers Writing at Deviations from NCCI Rates in Administered Pricing States**
Not Applicable to Assigned Risk Policy Year Call.
7. **Accumulated Net Earned Premium**

As in last year's Policy Year Call, you are required to report the accumulated net earned premium for each of the indicated policy years. Specifically, for any given policy year you are to report the entire net earned premium since policy inception through December 31, 1989 for those policies becoming effective during the policy year being reported.

For each policy year indicated, the accumulated net earned premium shall be the accumulated actual earned premium on all risks prior to the payment of policyholder dividends; but after application of any retrospective rating premium adjustments, after the application of premium discounts in accordance with Manual rules, after the expense modification program and after the effects of any schedule rating premium adjustments.

8. **Accumulated Incurred Losses**

As in previous Policy Year Calls, you are required to report accumulated total incurred losses (i.e., from date

of inception through December 31). The Call further requires that accumulated total incurred losses be split into the following components: accumulated indemnity losses (separately for Paid, Outstanding Excluding IBNR—Case and Bulk, and IBNR) and accumulated medical losses (separately for Paid, Outstanding Excluding IBNR—Case and Bulk, and IBNR). The reporting of these components of incurred losses is mandatory for all carriers. Please note that for line T only, under Outstanding Excluding IBNR and IBNR, the calendar year change should be reported rather than the accumulated total.

The Outstanding Excluding IBNR category is designed to capture case reserves and bulk reserves. For the purposes of this Call, the following working definitions may be used by carriers:

Case Reserves—Those outstanding reserves established for specific known cases reported in an aggregate amount to reflect the total case reserve for the company.

Bulk Reserves—Those outstanding reserves for general case reserve inadequacy, supplemental case reserves, cases that may reopen, or other reserves not associated to specific claims.

The goal of this reporting is to clearly isolate case reserves without impacting the carrier methodology of reporting IBNR. Carriers should not alter the mix of data historically allocated to IBNR, since doing so would adversely impact the NCCI development of IBNR data.

For this reason, carriers who have reported bulk reserves in IBNR should continue to do so. On the Outstanding Excluding IBNR Page 3 Reporting Form, these carriers should respond "Yes" to the question in Note A.

Those carriers reporting bulk reserves in the Outstanding Excluding IBNR category should respond "No" to the question in Note A of the Outstanding Excluding IBNR Page 3 Reporting Form. These carriers should have data reported in both the case reserves and bulk reserves.

The Case and Bulk Reserve Reporting Form accommodates carriers allocating this data on an ACTUAL basis as well as ESTIMATED basis. The reporting form contains a coding box to indicate the actual versus estimated method of allocation.

9. **Incurred Indemnity Claim Count**

The incurred indemnity claim count (i.e., the accumulated number of claims for which an indemnity payment has been made and/or an outstanding reserve exists) must be reported on a mandatory basis for policy years 1981 and subsequent. (Those carriers in a position to do so are requested to report the incurred

indemnity claim count for as many policy years prior to 1981 as possible.) The indemnity claim count should exclude claims that start out with an indemnity reserve, but are resolved as medical only claims or closed without payment. Also, indemnity claim count should include claims that start out as medical only but are resolved as indemnity at future evaluations. If indemnity claims are reopened, they should not be added to the claim counts.

10. No Experience

State reports should not be submitted for any state in which the carrier(s) has (have) never had experience. In instances in which for one or more, but not all, of the 1978-1989 policy years the carrier(s) failed to have experience in a given state, indicate "NO EXPERIENCE" across the appropriate Policy Year line(s) on that state.

11. Questionnaire

The questionnaire on pages 4 and 5 of the reporting form must be completed. Submit only one questionnaire per submission. A separate questionnaire per state is no longer required.

12. Complete Submission

A complete call submission per state must include all three pages (and the Oklahoma Questionnaire as appropriate). Page 3 must be completed for each state in which the carrier reports experience.

13. Signature Requirement

The name of the person responsible for the completion and accuracy of this Call is only required on the first state's reporting form and does not have to be repeated on each state's form.

14. States for Which the Reporting of Assigned Risk Policy Year Experience is Required

State	Code #	State	Code #	State	Code #
Alabama	01	Iowa	14	North Carolina	32
Alaska	54	Kansas	15	Oregon	36
Arizona	02	Kentucky	16	Rhode Island	38
Arkansas	03	Louisiana	17	South Carolina	39
Connecticut	06	Maine	18	South Dakota	40
Dist. of Columbia	06	Michigan	21	Tennessee	41
Florida	09	Mississippi	21	Texas	42
Georgia	10	Missouri	24	Vermont	44
Hawaii	52	Nebraska	26	Virginia	45
Illinois	12	New Hampshire	28	Wisconsin	48
Indiana	13	New Mexico	30		

15. Rounding Procedure and Reporting of Credits

Please report amounts of premiums and losses in whole dollars only. Count fifty cents and over as an extra dollar, and reject the cents if less than fifty. Please show negative amounts enclosed within parentheses so that they may be handled properly in punching and tabulating operations.

B. SPECIFIC INSTRUCTIONS

1. "F" Classifications

Experience of the "F" Classifications for policies effective January 1, 1974 and thereafter **MUST BE EXCLUDED**.

2. Coal Mine Experience

Underground Coal Mine experience **MUST BE EXCLUDED** in all states except Virginia. In Virginia **ALL** Coal Mine experience **MUST BE EXCLUDED**.

3. Excess Policies

Experience on excess policies **MUST BE EXCLUDED**.

4. National Defense Projects

Experience on National Defense Projects written under either the old Comprehensive Rating Plan or the new National Defense Projects Rating Plan **MUST BE EXCLUDED**. Experience incurred on a Defense Base should be included unless written under the National Defense Projects Rating Plan.

5. Reinsurance

No deductions shall be made from premiums and losses for or on account of reinsurance ceded. Premiums and losses arising from reinsurance received by the reporting company shall be excluded from the experience. Experience reported should be **DIRECT BUSINESS ONLY**.

6. Experience Incurred Under Occupational Disease Act

Experience incurred under any Occupational Disease Act which is separate and distinct from the Compensation Act for the state shall be combined with the traumatic experience under the State Compensation Act, and the total of such combined experience shall be reported.

7. IBNR

Losses reported by state should include an appropriate reserve for incurred but not reported cases. The IBNR reserve must be reported separately for indemnity and medical.

The Outstanding Excluding IBNR category is further refined to capture case reserves and bulk reserve

This reporting clearly isolates case reserves without impacting the carrier methodology of reporting IBNR.

Effective January 1, 1990

Carriers should not alter the mix of data historically allocated to IBNR, since doing so would adversely impact the NCCI development of IBNR data.

For this reason, carriers having reported bulk reserves in IBNR should continue to do so. On the Outstanding Excluding IBNR Page 3 Reporting Form, these carriers should respond "Yes" to the question in Note A.

8. Reopened Cases

Include an appropriate loss reserve for reopened cases.

9. Reserves for Specific Contingencies

Include medical and other loss reserves to meet specific contingencies.

10. Other Voluntary Reserves

Exclude voluntary reserves other than those mentioned above.

11. Expenses

Exclude all expenses, allocated or unallocated, except allocated Coverage B loss adjustment expense.

12. Assessments and Special Compensation Funds

The inclusion of assessments and other compensation special funds as incurred losses in this Policy Year Call follow the same instructions that apply in reporting of experience under NCCI's Workers Compensation Unit Statistical Plan Manual. Specifically, where the compensation law states that, in connection with a certain type of injury, a specified amount shall be paid into special funds (e.g., a Second Injury Fund),

and that such amounts are in addition to the compensation payable to the injured worker or his dependents, then the combined total amount shall be reported as incurred indemnity losses. Examples are: (1) payments in no-dependent death claims, and (2) a specified percentage of the permanent partial award. However, any special payments to the states assessed on total premium writings, total losses paid or incurred, or total indemnity losses paid or incurred instead of on a per-claim basis shall not be reported as losses to the rating bureau. In other words, special funds or assessments are reported as incurred losses only when the assessment is levied on certain types of injuries.

A list of specific assessments and other compensation special funds for each state and the proper treatment for including these assessments in this Call is attached.

13. Claims Deductible Programs

In states in which claim deductible programs apply, losses are to be reported on a gross basis inclusive of the employer paid loss amount.

Please note that the date for reporting this data is on or before March 15 of each year. It is urged that every effort be made to comply with this reporting date, as a delay in receiving this data will seriously hamper NCCI in its preparation of rate revisions. Please mail this Call to:

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

STATISTICAL CALL NAME:

Calendar-Accident Year Call For Compensation Experience (Call #5)

DESCRIPTION OF CALL:

This call contains dollar amounts for workers compensation Standard Earned Premium at NCCI DSR level, Standard Earned Premium at Company level, Net Earned Premium, and Total Incurred Losses by Calendar-Accident Year for each state in which NCCI produces rate levels. The Total Incurred Losses are broken down to Paid, Outstanding excluding IBNR, and IBNR on page 1. Each of these components is further broken down into its indemnity and medical components reported along with the Indemnity Claim Count on page 2. In addition, Indemnity and Medical Outstanding excluding IBNR are separated into case and bulk reserves on page 3. Each NCCI member carrier is required to submit this information for each state in which they operate. Some states require all carriers writing workers compensation policies to submit financial calls.

The Calendar-Accident Year Call for Compensation Experience is used in conjunction with the Policy Year Call to determine rate adequacy for the states in which NCCI produces rate levels.

FILES/DATABASES:

Calendar-Accident Year Call Production File:

This file serves as the central repository for Calendar-Accident Year Call data. This file contains all data received from the carriers as well as corrections applied to this data. Corrections to the file are made via ACS data entry of revised reports with electronic transfer of the data to NCCI for incorporation into the production file.

Calendar-Accident Year Call SAS Dataset:

Actuarial analysis and reporting programs are executed using the data in this file.

There is one SAS dataset for each state for which the NCCI produces rates. The dataset contains data only for the specified state. This file is created through an extraction from the Calendar-Accident Year Call production file. Revised reports which are obtained

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

after this extraction are entered into the SAS dataset and marked internally as revised records. When rate levels are completed for the state, these records are printed and sent to ACS for data entry and incorporation into the production file.

DESCRIPTION OF ERROR HANDLING:

Calendar-Accident Year data is validated in a two step process. An initial validation using automated reports is performed when the data is received from the carrier. A final validation of the data is performed as one of the steps in producing a state's rate level to ensure that no errors have been overlooked.

Carriers are sent written correspondence letters to resolve any errors identified during the initial validation. As revised reports are received, they are checked for accuracy. If correct, the revised reports are sent to ACS for processing or entered into the SAS dataset if the affected data is already being used for rate level production.

During the final validation, newly discovered and outstanding errors are handled in a slightly different manner. Carriers are contacted by phone for a response. Revised reports are submitted by facsimile transmission or some form of overnight delivery. NCCI may enter corrections based on the phone conversation in anticipation of carrier submitted revisions.

MODIFICATIONS TO DATA:

Revised reports are processed as they are received. Any data containing errors which remain unresolved at the time of a state's rate level production will be removed from the dataset. Data is removed only if resolution of the remaining errors is not possible within the framework of the rate level production schedule.

All revised data is requested to be submitted on revised reports or via written correspondence. When production deadlines require an immediate response, telephone responses are accepted with the stipulation that a written confirmation of the changes also be submitted.

CALL FOR EXPERIENCE #5 CALENDAR/ACCIDENT YEAR CALL

Background and Purpose of the Report

The Calendar/Accident Year Call is due at NCCI or before April 1 of the Year following the most recent Calendar/Accident Year being collected. As an example, Calendar/Accident Year experience valued as of 12-31-90 is due at NCCI on or before April 1, 1991.

This call is one of the five standard annual calls for experience subject to the Performance Evaluation Monetary Incentive Program (PEMIP).

In the past for each annual call year, the most recent eight (8) years of individual Calendar/Accident Years must be reported separately by state. Prior to the eight (8) most recent years, the total of all "prior to" Calendar/Accident Years are grouped together. However, effective with Calls valued as of December 31, 1987, the Call will retain the oldest data year. As an example, the Calendar Accident Call valued as of 12-31-87 will retain the 1979 and prior to data as well as requesting data for 1987. This phased-in retention will result in the collection of 15 full underwriting years of data being reported beginning in 1994. The definition of Calendar/Accident Year refers to the way the financial data reported on the call is organized. The term "Calendar" pertains to premium being reported according to specific transaction dates. The term "accident" pertains to losses being reported by the date the loss occurred. For example, Calendar/Accident Year 1990 includes premium transactions occurring in 1990 along with claims with accident days occurring in 1990.

Calendar/Accident Call results have recently been interrelated into the NCCI Actuarial Ratemaking Process, replacing the Calendar Year Call since it is just as responsive yet more stable. This call is currently given a 50% weight in the ratemaking formula and is used similarly to the Policy Year to test reserve adequacy and changes. Calendar/Accident Year data is also used to examine frequency patterns that assist in explaining changes in rate level needs. Industry Accident Year development data is provided to NCCI Members and Subscribers to assist in the preparation of Florida Form F (Excess Profits Test). Results of the Calendar/Accident Year Call are distributed to Members and Subscribers via circular each year.

The data collected in the Calendar/Accident Year Call includes earned premiums and incurred losses on a state basis. Calendar Year Earned Premiums are separated between Standard At NCCI DSR Level, Standard At Company Level and Net Earned. Accident Year incurred losses include incurred indemnity claim count and indemnity and medical totals for paid losses, outstanding losses excluding IBNR, case and bulk reserves in the outstanding losses excluding IBNR and total incurred losses.

The data reported in this call should *exclude* experience ★ developed under large deductible policies (deductible amount over \$100,000 per claim or per accident).

The Calendar Year Reconciliation Report (Call #8) has ★ been revised to add lines to reconcile premium and losses to Page 14 of the Annual Statement due to the exclusion of the large deductible policies.

Filing Requirements

Calendar-Accident Year Call for Compensation Experience by State Valued as of December 31 of each year—Due April 1 of the following year

In accordance with the approved statistical program you are hereby requested to file with the National Council on Compensation Insurance on or before April 1 of each year your calendar-accident year experience by state valued as of December 31 of the prior year.

This Call is included in PEMIP (Performance Evaluation Monetary Incentive Program) and will be subject to assessments for late and/or inaccurate reporting. Details of PEMIP are updated annually in January of each year.

Since current Compensation Rate Levels will depend upon these figures, it is essential that this Call be reported on or before the required due date.

This Call continues the phased-in expansion of the Calendar-Accident Year Call to ultimately collect 15 full underwriting years of data. This Calendar-Accident Year Call to be reported in 1990 retains the oldest data year (1979) and includes the current year 1989, thus requiring the collection of a total of 11 full underwriting years of individual data to be reported in 1990. This phased-in retention will continue until 15 full underwriting years are collected.

This Call continues the methodology of last year's Calendar-Accident Year Call in that it only requires the most recent five years of calendar year premium. Do not report Columns 1, 2, and 3 as shaded on the form for Lines A through G. As the older years of calendar year premium are not a critical part of the ratemaking process, the reporting of calendar year premium is limited to the most recent five years to simplify the reporting process.

To facilitate this reporting requirement, the totals on Lines Q, R and S for Columns 1, 2, and 3 are no longer required.

There is no change in the procedure for calculating the totals for the calendar-accident year losses (Columns 4 through 18).

Two copies of the reporting form are provided in the package of forms sent to carriers in October of each year. Since a separate form is required for each state, carriers are asked to reproduce these forms within their organizations.

Questions regarding reporting requirements on completion of the Calls should be directed to Aggregate Ratemaking at (407) 997-4395.

A. GENERAL INSTRUCTIONS

1. Group Report

Carrier name and five-digit code must be shown on each reporting form. If this is a group reporting, each carrier writing compensation must be listed individually on the reporting form. Carriers are requested to submit the Calendar-Accident Year Call on the same basis (i.e., group report or individual company report) as the Calendar Year Call. This will facilitate reconciliation of carrier data.

2. State

List both the name of the state and the state code number on each state's reporting form. Only one state per reporting sheet is allowed.

3. Calendar Year Standard Earned Premium at NCCI Designated Statistical Reporting Level

The Standard Earned Premium to be reported is the Calendar Year Standard Earned Premium as reported on the Calendar Year Call. This premium shall be the entire earned premium for the state resulting from standard rating procedures after the application of:

1. Experience rating plan adjustments (NOTE: Except for Michigan experience, experience rating plan adjustments must reflect only NCCI published modification factors.)*
2. Expense Constants (These are the Expense Constants published by NCCI or an independent bureau. For Voluntary Business in pure premium states, Expense Constants at the NCCI DSR level are 0.)
3. Loss Constants (These are the Loss Constants published by NCCI or an independent bureau. For Voluntary Business in pure premium states, Loss Constants at the NCCI DSR level are 0.)

but prior to the application of:

1. Deviations from NCCI Designated Statistical Reporting rates or pure premiums**
2. Deviations from published NCCI experience rating plan modification factors (except Michigan)*
3. Retrospective rating plan adjustments
4. Other individual risk rating plan adjustments*** (e.g., Schedule Rating)
5. Premium discounts
6. Expense modification program adjustments
7. Payment of policyholder dividends
8. Premium credits for small deductible coverage

* Carriers must report their Standard Earned Premium at NCCI's experience rating plan level for all states except Michigan. If carriers use their own experience rating plan in Michigan, they may report their Standard Earned Premium at their own experience rating plan level.

** Rates: Arkansas, Georgia, Illinois, Indiana, Rhode Island, Vermont
Pure Premiums: Connecticut (policies effective 1/1/90 and subsequent), Kentucky, Louisiana (policies

effective 4/1/89 and subsequent), Maryland, Michigan, New Mexico (policies effective 1/1/90 and subsequent), Oregon

*** Note that premium adjustments resulting from the application of individual risk rating plans other than experience rating must be excluded from both Standard Earned Premium at Company Level and Standard Earned Premium at NCCI DSR Level.

4. Standard Earned Premium At Company Level

The earned premium on all risks after the application of:

1. Deviations from NCCI Designated Statistical Reporting rates or pure premiums.*
2. Experience rating plan adjustments (NOTE: Except for Michigan experience, experience rating plan adjustments must reflect only NCCI published modification factors.)**
3. Expense Constants (Carrier charged Expense Constants)
4. Loss Constants (Carrier charged Loss Constants)

but prior to the application of:

1. Deviations from published NCCI experience rating plan modification factors (except Michigan)**
2. Retrospective rating plan adjustments
3. Other individual risk rating plan adjustments*** (e.g., Schedule Rating)
4. Premium discounts
5. Expense modification program adjustments
6. Payment of policyholder dividends
7. Premium credits for small deductible coverage

For every accident year Standard Earned Premium at DSR Level is reported, Standard Earned Premium at Company Level must be reported as well.

* Rates: Arkansas, Connecticut, Georgia, Illinois, Indiana, New Mexico, Rhode Island, Vermont
Pure Premiums: Kentucky, Louisiana (policies effective 4/1/89 and subsequent), Maryland, Michigan, Oregon

** Carriers must report their Standard Earned Premium at NCCI's experience rating plan level for all states except Michigan. If carriers use their own experience rating plan in Michigan, they may report their Standard Earned Premium at their own experience rating plan level.

*** Note that premium adjustments resulting from the application of individual risk rating plans other than experience rating must be excluded from both Standard Earned Premium at Company Level and Standard Earned Premium at NCCI Designated Statistical Reporting Level.

5. Carriers Writing in Competitive Rating States

For Arkansas, Connecticut, Georgia, Illinois, Indiana, Kentucky, Louisiana, Maryland, Michigan, New Mexico, Oregon, Rhode Island and Vermont, carriers must enter the Standard Earned Premium figures at NCCI

Designated Statistical Reporting Level and at Company Level in the appropriate columns on the form. Please reference the enclosed circular titled "Annual Update on Designated Statistical Reporting Levels."

5. Carriers Writing at Deviations from NCCI Rates in Administered Pricing States

For State Funds and other carriers writing at deviations from Bureau rates in non-competitive rating states, the Standard Earned Premiums must be adjusted to Bureau rate level and reported in the column labeled "Standard Earned Premium at NCCI Designated Stat. Reporting Level." The Standard Earned Premium at the carrier rate level must be reported in the column labeled "Standard Earned Premium at Company Level."

NOTE: For Oklahoma the DSR level for policies effective between November 1, 1985 and July 1, 1988 is the March 1, 1985 rates. Companies writing policies on a "Consent to Rate" basis should report as if they had an upward deviation of the March 1, 1985 rates. For further information, refer to Statistical Circular 87-17, dated May 1, 1987.

Carriers that do not deviate from NCCI rates must enter their Standard Earned Premium in the column labeled "Standard Earned Premium at NCCI Designated Stat. Reporting Level" and must enter the same figure in the column labeled "Standard Earned Premium at Company Level."

Also note that where premium credits have been granted in connection with the Transition Program of payroll limitation rules, both reported Standard Earned Premium figures shall be reduced by such credits.

7. Calendar Year Net Earned Premium

Net earned premiums shall be the actual earned premium on all risks prior to the payment of policyholder dividends; but after application of any retrospective rating premium adjustments, after the application of premium discounts in accordance with Manual Rules, after the expense modification program, after any deviations or "write-offs" from Bureau rates or pure premiums, and after the effect of any schedule rating premium adjustments.

8. Accident Year Accumulated Incurred Losses

As in previous Calendar-Accident Year Calls, you are required to report accumulated total incurred losses (i.e., from date of accident through December 31, of the current year) for each of the indicated accident years. If, for some reason, you are unable to report

accumulated paid and outstanding losses for one or more of the indicated accident years, no experience should be reported for that year. (For example, if paid losses have only been accumulated by accident year since January 1, 1990, while the amounts paid prior to this date cannot be separately identified by accident year, then no experience should be reported for 1989 and prior accident years. In this situation, the accumulated experience of all years prior to 1990 should be reported on Line A of the Call.)

Reconciliation of this Call to calendar year data will be possible if complete accident year data is being submitted on this year's Call and had been submitted on last year's Call. Line S (calendar year figures) will not reconcile unless losses for all accident years are included in both the "as-of" totals (Lines Q and R). If your company does not include directly the losses for all accident years shown on the Call, making use of the Policy Year Call will make it possible to report, on an aggregate basis, the losses for all accident years prior to those shown individually. Using the Policy Year Call for the corresponding year, use Line R to obtain the total for all accident years. Subtracting from this total the figures for the accident years shown individually will produce the "all prior accident year losses" to be included on the Accident Year Call. When this procedure is followed for this Call and for last year's Call, a restatement of figures from last year's Call will be necessary and the reconciliation will be possible. Carriers are urged to take every step to provide complete accident year information for as many accident years as possible. If it is not possible for your company to report the last nine accident years individually and your company uses the above procedure to calculate the "prior to" figures, then cross out the preprinted "prior to" year and write in the appropriate year.

For Line A, a continuing problem exists for any carrier unable to split its accumulated losses for any year into the six indemnity and medical components noted above. Since Line A is an accumulation of all prior years' experience, this line's components will not add correctly if even one year cannot be split. On this year's Call, Line A contains data for all years prior to the current year.

A carrier should take either of two steps to resolve this problem:

- a. Always use this method if you report Line A on the Policy Year Call and Lines B to L on the Calendar-Accident Year Call with the correct indemnity and medical split for all components. Line R on the Policy Year Call is your total experience valued as of the previous year. From this, subtract Lines B to L on the Calendar-Accident Year Call. The difference should be entered as Line A on the Calendar-Accident Year Call.

Effective January 1, 1990

- b. If you cannot use step 1 above, use either of the following methods:

Method 2a

Delete those years that cannot be split from your reported Line A experience. The remainder will be your base of experience. For example, if 1976 and earlier cannot be split, calculate the total experience for only years 1977 and 1978. Next, add to your base experience all the changes in indemnity, medical and total experience during 1990 for all accident years prior to 1979.

Method 2b

Keep all of the experience for years prior to 1979 on Line A and estimate the indemnity and medical components that add to your total components for Line A. For future reports the actual split experience should be added onto this base of experience.

Case and Bulk Reserve Reporting

This Call further requires that accumulated total incurred losses be split into the following components: accumulated indemnity losses (separately for paid, Outstanding Excluding IBNR—Case and Bulk, and IBNR) and accumulated medical losses (separately for paid, Outstanding Excluding IBNR—Case and Bulk, and IBNR).

The Outstanding Excluding IBNR category is designed to capture case reserves and bulk reserves. For the purposes of the Call, the following working definitions may be used by carriers:

Case Reserves—Those outstanding reserves established for specific known cases reported in an aggregate amount to reflect the total case reserve for the company.

Bulk Reserves—Those outstanding reserves for general case reserve inadequacy, supplemental case reserves, cases that may reopen, or other reserves not associated to specific claims.

The goal of this reporting is to clearly isolate case reserves without impacting the carrier methodology of reporting IBNR. Carriers should not alter the mix of data historically allocated to IBNR, since doing so would adversely impact the NCCI development of IBNR data.

For this reason, carriers reporting bulk reserves in IBNR should continue to do so. On the Outstanding Excluding IBNR Page 3 Reporting Form, these carriers should respond "Yes" to the question in Note A. In addition, carriers having no bulk reserves should also respond "Yes" to the question in Note A.

Those carriers reporting bulk reserves in the Outstanding Excluding IBNR should respond "No" to the question in Note A of the Outstanding Excluding IBNR Page 3 Report Form. These carriers should have data reported in both the case reserves and bulk reserves.

The Case and Bulk Reserve Reporting Form accommodates carriers allocating this data on an ACTUAL basis as well as ESTIMATED basis. The reporting form contains a coding box to indicate the actual vs. estimated method of allocation.

9. Incurred Indemnity Claim Count

The incurred indemnity claim count (i.e., the accumulated number of claims for which an indemnity payment has been made and/or an outstanding reserve exists) must be reported on a mandatory basis for accident years 1980 and subsequent. (Those carriers in a position to do so are requested to report the incurred indemnity claim count for as many accident years prior to 1980 as possible.) The indemnity claim count should exclude claims starting out with an indemnity reserve, but were resolved as medical only claims or closed without payment. Also, indemnity claim count should include claims starting out as medical only, but are resolved as indemnity at future evaluations. If indemnity claims are reopened, they should not be added to the claim counts.

10. Total Experience

Show the totals of all amounts reported on the line captioned "Total to current year."

11. No Experience

State reports should not be submitted for any state in which the carrier(s) has (have) never had experience. In instances in which one or more, but not all, of the 1979-1990 Accident Years the carrier(s) failed to have experience in a given state, indicate "NO EXPERIENCE" across the appropriate Accident Year line(s) on that state.

12. Signature Requirement

The name of the person responsible for the completion and accuracy of this Call is only required on the first state's reporting form and does not have to be repeated on each state's form.

13. States for Which the Reporting of Calendar-Accident Year Experience Is Required:

State	Code No.	State	Code No.
Alabama	01	Colorado	05
Alaska	54	Connecticut	06
Arizona	02	Dist. of Columbia	08
Arkansas	03	Florida	09

State	Code No.	State	Code No.
Georgia	10	Nebraska	26
Hawaii	52	New Hampshire	28
Idaho	11	New Mexico	30
Illinois	12	North Carolina	32
Indiana	13	Oklahoma	35
Iowa	14	Oregon	36
Kansas	15	Rhode Island	38
Kentucky	16	South Carolina	39
Louisiana	17	South Dakota	40
Maine	18	Tennessee	41
Maryland	19	Texas	42
Michigan	21	Utah	43
Mississippi	23	Vermont	44
Missouri	24	Virginia	45
Montana	25	Wisconsin	48

14. Rounding Procedure and Reporting of Credits

Please report amounts of premiums and losses in whole dollars only. Count fifty cents and over as an extra dollar, and reject the cents if less than fifty. Please show negative amounts enclosed within parentheses so that they may be handled properly in punching and tabulating operations.

15. Questionnaire

The questionnaire must be completed. Submit only one questionnaire per submission. A separate questionnaire per state is no longer required.

16. Complete Submission

A complete call submission per state must include all three pages. Page 3 must be completed for each state in which the carrier reports experience.

B. SPECIFIC INSTRUCTIONS

1. "F" Classifications

Experience of the "F" Classification for policies effective January 1, 1974 and thereafter, MUST BE EXCLUDED.

2. Coal Mine Experience

Underground Coal Mine experience MUST BE EXCLUDED in all states except Virginia. In Virginia ALL Coal Mine experience (surface and underground) MUST BE EXCLUDED.

3. Excess Policies

Experience on excess policies MUST BE EXCLUDED.

4. National Defense Projects

Experience on National Defense Projects written under either the old Comprehensive Rating Plan or the new National Defense Projects Rating Plan MUST BE EXCLUDED. Experience incurred on a Defense Base should be included unless written under the National Defense Projects Rating Plan.

5. Reinsurance

No deductions shall be made from premiums and losses for or on account of reinsurance ceded. Premiums and losses arising from reinsurance received by the reporting company shall be excluded from the experience. Experience reported should be DIRECT BUSINESS ONLY.

6. Assigned Risk

Experience for assigned risk policies must be INCLUDED. Assigned risk policies must be reported at the level of approved assigned risk rates.

7. Experience Incurred Under Occupational Disease Act

Experience incurred under any Occupational Disease Act separate and distinct from the Compensation Act for the state shall be combined with the traumatic experience under the State Compensation Act, and the total for such combined experience shall be reported.

8. IBNR

Losses reported by state should include an appropriate reserve for incurred but not reported cases. The IBNR reserve must be reported separately for indemnity and medical.

Commencing with Calendar-Accident Year Call valued as of December 31, 1986, the Outstanding Excluding IBNR category has been further refined to capture case reserves and bulk reserves.

This reporting isolates case reserves without impacting the carrier methodology of reporting IBNR. Carriers should not alter the mix of data historically allocated to IBNR, since doing so would adversely impact the NCCI development of IBNR data.

For this reason, carriers having reported bulk reserves in IBNR should continue to do so. On the Outstanding Excluding IBNR Page 3 Reporting Form, these carriers should respond "Yes" to the question in Note A.

9. Reopened Cases

Include an appropriate loss reserve for reopened cases.

10. Reserves for Specific Contingencies

Include medical and other loss reserves to meet specific contingencies.

11. Other Voluntary Reserves

Exclude voluntary reserves other than those mentioned above.

12. Expenses

Exclude all expenses, allocated or unallocated, except allocated Coverage B loss adjustment expense.

13. Assessments and Special Compensation Funds

The inclusion of assessments and other compensation special funds as incurred losses in this Calendar-Accident Year Call data follow the same instructions that apply in reporting of experience under NCCI's Workers Compensation Unit Statistical Plan Manual. Specifically, where the compensation law states that in connection with **certain types of injury** a specified amount shall be paid into special funds (e.g., a Second Injury Fund), and that such amounts are in addition to the compensation payable to the injured worker or his dependents, then the combined total amount shall be reported as incurred indemnity losses. Examples are: (1) payments in no-dependent death claims, and (2) a specified percentage of the permanent partial award. However, any special payments to the states that are assessed on total premium writings, total losses paid or incurred, or total indemnity losses paid or incurred instead of on a per-claim basis shall not be reported as losses to the rating bureau. In other words, special funds or assessments are reported as incurred losses only when the assessment is levied on certain types of injuries.

A list of specific assessments and other compensation special funds for each state and the proper treatment for including these assessments in this Call is attached.

★ 14. Small Deductible Programs

In states in which small deductible programs apply, losses are to be reported on a gross basis inclusive of the employer paid loss amount.

15. Taxes and Assessments in Kentucky

Taxes and Assessments on premiums earned in Kentucky on or after January 1, 1977 **MUST BE EXCLUDED.**

16. Oregon Assessments

Assessments on premiums written or earned in Oregon on or after July 1, 1982 must be excluded. This is pursuant to the requirements of OAR 436-51-025 and 51-030(2) contained in WCD Administrative Order 8-1982.

Please note that the date for reporting this data is on or before April 1 of each year. Please mail this Call to:

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

STATISTICAL CALL NAME:

Calendar-Accident Year Call For Assigned Risk Compensation Experience (Call #5A)

DESCRIPTION OF CALL:

This call contains dollar amounts for workers compensation Standard Earned Premium at NCCI DSR level, Net Earned Premium, and Total Incurred Losses by Calendar-Accident Year for each state in which NCCI produces rate levels. The Total Incurred Losses are broken down into Paid, Outstanding excluding IBNR, and IBNR on page 1. Each of these components is further broken down into its indemnity and medical components and reported along with the Indemnity Claim Count on page 2. In addition, Indemnity and Medical Outstanding excluding IBNR are separated into case and bulk reserves on page 3. Each NCCI assigned risk servicing carrier is required to submit this information in the states in which they operate and for which NCCI produces rate levels. Some states require all carriers writing workers compensation policies to submit financial calls.

The Assigned Risk Calendar-Accident Year Call data is used in conjunction with the Assigned Risk Policy Year Call data to determine assigned risk and/or voluntary business rate adequacy for the states in which NCCI produces rate levels. Voluntary business is derived by subtracting the assigned risk data from the statewide data.

NCCI first distributed the Calendar-Accident Year Assigned Risk Call in 1990. The data is validated, but not yet used to calculate rates. NCCI requires financial call data to be submitted for at least three years before it is used to calculate rates.

FILES/DATABASES:

Calendar-Accident Year Assigned Risk Call Production File:

This file serves as the central repository for Calendar-Accident Year Assigned Risk Call data. This file contains all data received from the carriers as well as corrections applied to this data. Corrections to the file are made via ACS for data entry of revised reports with electronic transfer of the data to NCCI for incorporation into the production file.

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

Calendar-Accident Year Assigned Risk Call SAS Dataset:

Actuarial analysis and reporting programs are executed using the data in this file.

There is one SAS dataset for each state for which the NCCI produces rates and has assigned risk business. In some states, frequently those with state funds, there is no assigned risk business. In these cases the state fund serves as the assigned risk insurer.

The SAS dataset contains data only for the specified state. This file is created through an extraction from the Calendar-Accident Year Assigned Risk Call production file. Revised reports which are obtained after this extraction are entered into the SAS dataset and marked internally as revised records. When rate levels are completed for the state, these records are printed and sent to ACS for data entry and incorporation into the production file.

DESCRIPTION OF ERROR HANDLING:

Calendar-Accident Year Assigned Risk data is validated in a two step process. An initial validation using automated reports is performed when the data is received from the carrier. A final validation of the data is performed as one of the steps in producing a state's rate level to ensure that no errors have been overlooked.

Carriers are sent written correspondence letters to resolve any errors identified during the initial validation. As revised reports are received, they are checked for accuracy. If correct, the revised reports are sent to ACS for processing or entered into the SAS dataset if the affected data is already being used for rate level production.

During the final validation, newly discovered and outstanding errors are handled in a slightly different manner. Carriers are contacted by phone for a response. Revised reports are submitted by facsimile transmission or some form of overnight delivery. NCCI may enter corrections based on the phone conversation in anticipation of carrier submitted revisions.

MODIFICATIONS TO DATA:

Revised reports are processed as they are received. Any data containing errors which remain unresolved at the time of a state's rate level production will be removed from the

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

dataset if resolution of the remaining errors is not possible within the framework of the rate level production schedule.

All revised data is requested to be submitted on revised reports or via written correspondence. When production deadlines require an immediate response, telephone responses are accepted with the stipulation that a written confirmation of the changes also be submitted.

CALL FOR EXPERIENCE #5—A
ASSIGNED RISK CALENDAR-ACCIDENT YEAR CALL

Background and Purpose of the Report

The Calendar-Accident Year Call for Assigned Risk Compensation Experience by State is due at NCCI on April 1 of the current year for assigned risk calendar-accident year experience for the previous year.

This call is one of the annual calls for experience subject to the Performance Evaluation Monetary Incentive Program (PEMIP).

This call follows the phased-in expansion of the Calendar-Accident Year Call to ultimately collect 15 full underwriting years of data. The Assigned Risk Calendar-Accident Year Call, to be reported in 1990, retains the oldest data year (1979) and includes the current year 1989. This requires the collection of 11 full underwriting years of individual data reportable in 1990. This phased-in retention will continue until 15 full underwriting years are collected. However, as this is the first year carriers will be required to report this data separately, carriers are asked to report as many prior years (back to 1979) as possible. Data validity is the key; therefore, only data for those years which can be collected accurately should be reported.

The intent of this call is for use in ratemaking to develop assigned risk experience and also will be used along with the standard Calendar-Accident Year Call (Call #5) to develop "voluntary business only" experience. Therefore, it is essential that the methodology for determining the premium and losses reported on this call be consistent with the procedures used for reporting the experience on page 14 of the annual statement. The data on this call should also be consistent with the assigned risk experience included in the standard Calendar-Accident Year Call (Call #5).

This call also follows the Calendar-Accident Year Call, as it only requires the most recent five years of calendar year premium. The reporting of calendar year premium is limited to the most recent five years to simplify reporting of this data. This includes discontinuation of the "totals" on lines Q, R, and S for columns 1, 2 and 3.

Filing Requirements

Calendar-Accident Year Call for Assigned Risk Compensation Experience by State Valued as of December 31 of each year—Due April 1 of the following year

In accordance with the approved statistical program you are hereby requested to file with NCCI on or before April 1 of each year your Assigned Risk calendar-accident year experience by state valued as of December 31 of the prior year.

This Call is included in PEMIP (Performance Evaluation Monetary Incentive Program) and would normally be subject to assessments for late and/or inaccurate reporting. Details of PEMIP are updated annually in January of each year and when released in January 1990, will contain more details pertaining to the Assigned Risk Only Calls.

Since 1990 Compensation Rate Levels will depend upon these figures, it is essential that this Call be reported on or before the required due date.

This Call follows the phased-in expansion of the Calendar-Accident Year Call to ultimately collect 15 full underwriting years of data. This Assigned Risk Calendar-Accident Year Call to be reported in 1990 retains the oldest data year (1979) and includes the current year 1989, thus requiring the collection of a total of 11 full underwriting years of individual data to be reported in 1990. This phased-in retention will continue until 15 full underwriting years are collected.

Please note: the eventual intent of this Call is for use in ratemaking. This Call will be used on its own to develop Assigned Risk experience and also will be used along with the standard Calendar-Accident Year Call to develop "voluntary business only" experience. For this reason, it is essential that the premium and losses reported on this Call reconcile with the Assigned Risk data included on Page 14 of the annual statement. The data submitted on this Call should also be consistent with the Assigned Risk experience reported on the standard Calendar-Accident Year Call.

This Call also follows the Calendar-Accident Year Call in that it only requires the most recent five years of calendar year premium. Do not report Columns 1, 2, and 3 as shaded on the form for Lines A through G. As the older years of calendar year premium are not a critical part of the ratemaking process, the reporting of calendar year premium is limited to the most recent five years to simplify the reporting process.

To facilitate this reporting requirement, the totals on Lines Q, R and S for Columns 1, 2, and 3 are no longer required.

Two copies of the reporting form are provided in the package of reporting forms sent to carriers in October of each year. Since a separate form is required for each state, carriers are asked to reproduce these forms within their organizations.

Questions regarding reporting requirements on completion of the Calls should be directed to Aggregate Ratemaking at 407-997-4395.

A. GENERAL INSTRUCTIONS

1. Group Report

Carrier name and five-digit code must be shown on each reporting form. If this is a group reporting, each carrier writing compensation must be listed individually on the reporting form. Carriers are requested to submit the Calendar-Accident Year Call on the same basis (i.e., group report or individual company report) as the Calendar Year Call. This will facilitate reconciliation of carrier data.

2. State

List both the name of the state and the state code number on each state's reporting form. Only one state per reporting sheet is allowed

3. Calendar Year Standard Earned Premium at NCCI Designated Statistical Reporting Level

The Standard Earned Premium to be reported is the Calendar Year Standard Earned Premium as reported on the Calendar Year Call. This premium shall be the entire earned premium for the state resulting from standard rating procedures after the application of:

1. Assigned Risk rating programs, surcharges, etc.
2. Experience rating plan adjustments (NOTE: Except for Michigan experience, experience rating plan adjustments must reflect only NCCI published modification factors.)*
3. Expense Constants (These are the Expense Constants published by the NCCI or an independent bureau.)
4. Loss Constants (These are the Loss Constants published by the NCCI or an independent bureau.)

but prior to the application of:

1. Deviations from published NCCI experience rating plan modification factors (except Michigan)*
2. Retrospective rating plan adjustments
3. Premium discounts
4. Expense modification program adjustments
5. Maine small business premium discount
6. Payment of policyholder dividends
7. Premium credits for deductible coverage

* Carriers must report their Standard Earned Premium at NCCI's experience rating plan level for all states except Michigan. If carriers use their own experience rating plan in Michigan, they may report their Standard Earned Premium at their own experience rating plan level.

4. Standard Earned Premium at Company Level

Not Applicable to Assigned Risk Calendar-Accident Year Call.

5. Carriers Writing in Competitive Rating States

Not Applicable to Assigned Risk Calendar-Accident Year Call.

6. Carriers Writing at Deviations from NCCI Rates in Administered Pricing States

Not Applicable to Assigned Risk Calendar-Accident Year Call.

7. Calendar Year Net Earned Premium

Net earned premiums shall be the actual earned premium on all risks prior to the payment of policyholder dividends, but after application of any retrospective rating premium adjustments, after the application of premium discounts in accordance with Manual Rules, after the expense modification program and after the effect of any schedule rating premium adjustments.

8. Accident Year Accumulated Incurred Losses

As in previous Calendar-Accident Year Calls, you are required to report accumulated total incurred losses (i.e., from date of accident through December 31, 1989) for each of the indicated accident years. If, for some reason, you are unable to report accumulated paid and outstanding losses for one or more of the indicated accident years, no experience should be reported for that year. (For example, if paid losses have only been accumulated by accident year since January 1, 1980 while the amounts paid prior to this date cannot be separately identified by accident year, then no experience should be reported for 1979 and prior accident years. In this situation, the accumulated experience of all years prior to 1980 should be reported on Line A of the Call.)

Reconciliation of this Call to calendar year data will be possible if complete accident year data is being submitted on this year's Call and had been submitted on last year's Call. Line S (calendar year figures) will not reconcile unless losses for all accident years are included in both the "as-of" totals (Lines Q and R). If your company does not include directly the losses for all accident years shown on the Call, making use of the Policy Year Call will make it possible to report, on an aggregate basis, the losses for all accident years prior to those shown individually. Using the Policy Year Call for the corresponding year, use Line R to obtain the total for all accident years. Subtracting from this total the figures for the accident years shown individually will produce the "all prior accident year losses" to be included on the Accident Year Call. When this procedure is followed for this Call and for last year's Call, a restatement of figures from last year's Call will be necessary and the reconciliation will be possible. Carriers are urged to take every step to provide complete accident year information for as many accident years as possible. If it is not possible for your company to report the last nine accident years individually and your company uses the above procedure to calculate the "prior to" figures, then cross out the preprinted "prior to" year and write in the appropriate year.

For Line A, a continuing problem exists for any carrier that for any year is unable to split its accumulated losses into the six indemnity and medical components noted above. Since Line A is an accumulation of all prior years' experience, this line's components will not add correctly if even one year cannot be split. On this year's Call, Line A contains data for all years prior to 1979.

A carrier should take either of two steps to resolve this problem:

- 1) Always use this method if you report Line A on the Assigned Risk Policy Year Call and Lines B to S on the Calendar-Accident Year Call with the correct indemnity and medical split for all components. Line R on the Policy Year Call is your total experience valued as of 12-31-89. From this, subtract Lines B to K on the Calendar-Accident Year Call. The difference should be entered as Line A on the Calendar-Accident Year Call.
- 2) If you cannot use step 1 above, use either of the following methods:

Method 2a

Delete those years that cannot be split from your reported Line A experience. The remainder will be your base of experience. For example, if 1976 and earlier cannot be split, calculate the total experience for only years 1977 and 1978. Next, add to your base experience all the changes in indemnity, medical and total experience during 1989 for all accident years prior to 1979.

Method 2b

Keep all of the experience for years prior to 1979 on Line A and estimate the indemnity and medical components that will add to your total components for Line A. For future reports the actual split experience should be added onto this base of experience.

Case and Bulk Reserve Reporting

This Call further requires that accumulated total incurred losses be split into the following components: accumulated indemnity losses (separately for Paid, Outstanding Excluding IBNR—Case and Bulk, and IBNR) and accumulated medical losses (separately for Paid, Outstanding Excluding IBNR—Case and Bulk, and IBNR).

The Outstanding Excluding IBNR category is designed to capture case reserves and bulk reserves. For the purposes of the Call, the following working definitions may be used by carriers:

Case Reserves—Those outstanding reserves established for specific known cases reported in an aggregate amount to reflect the total case reserve for the company.

Bulk Reserves—Those outstanding reserves for general case reserve inadequacy, supplemental case reserves, cases that may reopen, or other reserves not associated to specific claims.

The goal of this reporting is to clearly isolate case reserves without impacting the carrier methodology of reporting IBNR. Carriers should not alter the mix of data historically allocated to IBNR, since doing so would adversely impact the NCCI development of IBNR data.

For this reason, carriers who have reported bulk reserves in IBNR should continue to do so. On the Outstanding Excluding IBNR Page 3 Reporting Form, carriers should respond "Yes" to the question in Note A.

Those carriers reporting bulk reserves in the Outstanding Excluding IBNR should respond "No" to the question in Note A of the Outstanding Excluding IBNR Page 3 Report Form. These carriers should have data reported in both the case reserves and bulk reserves.

The Case and Bulk Reserve Reporting Form accommodates carriers allocating this data on an ACTUAL basis as well as ESTIMATED basis. The reporting form contains a coding box to indicate the actual vs. estimated method of allocation.

9. Incurred Indemnity Claim Count

The incurred indemnity claim count (i.e., the accumulated number of claims for which an indemnity payment has been made and/or an outstanding reserve exists) must be reported on a mandatory basis for accident years 1980 and subsequent. (Those carriers in a position to do so are requested to report the incurred indemnity claim count for as many accident years prior to 1980 as possible.) The indemnity claim count should exclude claims starting out with an indemnity reserve, but are resolved as medical only claims or closed without payment. Also, indemnity claim count should include claims that start out as medical only but are resolved as indemnity at future evaluations. If indemnity claims are reopened, they should not be added to the claim counts.

10. Total Experience

Show the totals of all amounts reported on the line captioned "Total to 12/31/89."

11. No Experience

State reports should not be submitted for any state in which the carrier(s) has (have) never had experience. In instances in which for one or more,

Effective January 1, 1990

but not all, of the 1979-1989 accident years the carrier(s) failed to have experience in a given state, indicate "NO EXPERIENCE" across the appropriate Accident Year line(s) on that state.

12. Signature Requirement

The name of the person responsible for the completion and accuracy of this Call is only required on the first state's reporting form and does not have to be repeated on each state's form.

13. States for Which the Reporting of Calendar-Accident Year Experience Is Required:

State	Code #	State	Code #	State	Code #
Alabama	01	Iowa	14	North Carolina	32
Alaska	54	Kansas	15	Oregon	36
Arizona	02	Kentucky	16	Rhode Island	38
Arkansas	03	Louisiana	17	South Carolina	39
Connecticut	06	Maine	18	South Dakota	40
Dist. of Columbia	08	Michigan	21	Tennessee	41
Florida	09	Mississippi	23	Texas	42
Georgia	10	Missouri	24	Vermont	44
Hawaii	52	Nebraska	26	Virginia	45
Illinois	12	New Hampshire	28	Wisconsin	48
Indiana	13	New Mexico	30		

14. Rounding Procedure and Reporting of Credits

Please report amounts of premiums and losses in whole dollars only. Count fifty cents and over as an extra dollar, and reject the cents if less than fifty. Please show negative amounts enclosed within parentheses so that they may be handled properly in punching and tabulating operations.

15. Questionnaire

The questionnaire must be completed. Submit only one questionnaire per submission. A separate questionnaire per state is no longer required.

16. Complete Submission

A complete call submission per state must include all three pages. Page 3 must be completed for each state in which the carrier reports experience.

B. SPECIFIC INSTRUCTIONS

1. "F" Classifications

Experience of the "F" Classification for policies effective January 1, 1974, and thereafter MUST BE EXCLUDED.

2. Coal Mine Experience

Underground Coal Mine experience MUST BE EXCLUDED in all states except Virginia. In Virginia ALL Coal Mine experience MUST BE EXCLUDED.

3. Excess Policies

Experience on excess policies MUST BE EXCLUDED.

4. National Defense Projects

Experience on National Defense Projects written under either the old Comprehensive Rating Plan or the new National Defense Projects Rating Plan MUST BE EXCLUDED. Experience incurred on a Defense Base should be included unless written under the National Defense Projects Rating Plan.

5. Reinsurance

No deductions shall be made from premiums and losses for or on account of reinsurance ceded. Premiums and losses arising from reinsurance received by the reporting company shall be excluded from the experience. Experience reported should be DIRECT BUSINESS ONLY.

6. Experience Incurred Under Occupational Disease Act

Experience incurred under any Occupational Disease Act separate and distinct from the Compensation Act for the state shall be combined with the traumatic experience under the State Compensation Act, and the total for such combined experience shall be reported.

7. IBNR

Losses reported by state should include an appropriate reserve for incurred but not reported cases. The IBNR reserve must be reported separately for indemnity and medical.

Commencing with Calendar-Accident Year Call valued as of December 31, 1986, the Outstanding Excluding IBNR category has been further refined to capture case reserves and bulk reserves.

This reporting isolates case reserves without impacting the carrier methodology of reporting IBNR. Carriers should not alter the mix of data historically allocated to IBNR, since doing so would adversely impact the NCCI development of IBNR data.

For this reason, carriers that have reported bulk reserves in IBNR should continue to do so. On the Outstanding Excluding IBNR Page 3 Reporting Form, these carriers should respond "Yes" to the question in Note A.

8. Reopened Cases

Include an appropriate loss reserve for reopened cases.

9. Reserves for Specific Contingencies

Include medical and other loss reserves to meet specific contingencies.

10. Other Voluntary Reserves

Exclude voluntary reserves other than those mentioned above.

11. Expenses

Exclude all expenses, allocated or unallocated, except allocated Coverage B loss adjustment expense.

12. Assessments and Special Compensation Funds

The inclusion of assessments and other compensation special funds as incurred losses in this Calendar-Accident Year Call data follow the same instructions that apply in reporting of experience under the National Council Workers Compensation Unit Statistical Plan Manual. Specifically, where the compensation law states that in connection with **certain types of injury** a specified amount shall be paid into special funds (e.g., a Second Injury Fund), and that such amounts are in addition to the compensation payable to the injured worker or his dependents, then the combined total amount shall be reported as incurred indemnity losses. Examples are: (1) payments in no-dependent death claims, and (2) a specified percentage of the permanent partial award. However, any special payments to the states that are assessed on total premium writings, total losses paid or incurred, or total indemnity losses paid or incurred instead of on a per-claim basis shall not be reported as losses to the

rating bureau. In other words, special funds or assessments are reported as incurred losses only when the assessment is levied on certain types of injuries.

A list of specific assessments and other compensation special funds for each state and the proper treatment for including these assessments in this Call is attached.

13. Claims Deductible Programs

In states in which claim deductible programs apply, losses are to be reported on a gross basis inclusive of the employer paid loss amount.

Please note that the date for reporting this data is on or before April 1, 1990. Please mail this Call to:

National Council on Compensation Insurance
750 Park of Commerce Drive
Boca Raton, Florida 33487

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

STATISTICAL CALL NAME:

Insurance Expense Exhibit (Call #6)

DESCRIPTION OF CALL:

This call contains dollar amounts in thousands for all lines of business for premium, losses and expenses. Part II, column 16, Part III and Part IV contain the data relating directly to workers compensation business. NCCI captures only data concerning workers compensation insurance.

The Insurance Expense Exhibit provides the data to which the Calendar Year Call, "F" Classification Calendar Year Call and Underground Coal Mine Call are reconciled. The call is summarized by type of company and also used in various studies on company expenses.

FILES/DATABASES:

Insurance Expense Exhibit Production File:

This file serves as the central repository for Calendar Year Financial Call data. This file contains all data received from the carriers as well as corrections applied to this data. Corrections to the file are made via ACS for data entry of revised reports with electronic transfer of the data to NCCI for incorporation into the production file.

DESCRIPTION OF ERROR HANDLING:

The Insurance Expense Exhibit is validated using automated reports when the data is received from the carrier. The summarized data is then subjected to an additional validation. In this validation, unusual expenses from Part II and III are investigated to determine if a carrier has incorrectly reported its expenses.

The call is validated to make sure it is internally consistent and checked against data from AM Best to verify state premiums and losses reported in Part IV. Carriers are sent written correspondence to resolve any errors identified during the validation. As revised

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

reports are received, they are checked for accuracy and then if correct are sent to ACS for processing.

MODIFICATIONS TO DATA:

Revised reports are processed as they are received. In extremely rare cases, carrier data may be removed due to errors.

All revised data is requested to be submitted on revised reports or via written correspondence. When production deadlines require an immediate response, telephone responses are excepted with the stipulation that a written confirmation of the changes also be submitted.

**CALL FOR EXPERIENCE #6
INSURANCE EXPENSE EXHIBIT**

Background and Purpose of the Report

The Insurance Expense Exhibit is due at NCCI on or before April 1 of the year following the most recent calendar year. As an example, the Insurance Expense Exhibit of 1990 captured calendar year 1990 data is due at NCCI on or before April 1, 1991.

This requirement has been established by the National Association of Insurance Commissioners (NAIC), and NCCI is responsible for compiling this Insurance Expense Exhibit (IEE) financial data.

Data from parts II and III are used in NCCI's annual review of expenses to establish the provisions for general expenses and loss adjustment expenses used in rate filings. Part IV of the IEE contains direct premiums and losses by state for workers compensation. This information is used in the reconciliation process to verify that NCCI's Policy Year, Calendar Year and Calendar/Accident Year data is consistent with the Annual Statement.

The data reported in this call should *include expenses* ★ related to large deductible policies (deductible amount over \$100,000 per claim or per accident).

NCCI compiles the individual company IEEs for workers compensation and distributes the results in its Annual Statistical Bulletin and in a separate booklet.

Filing Requirements

Insurance Expense Exhibit for Current Calendar Year Due April 1 of the following year

In accordance with the approved statistical program, you are hereby requested to file with NCCI on or before April 1 of each year a copy of your Insurance Expense Exhibit for the previous calendar year. This requirement has been established by the National Association of Insurance Commissioners.

NCCI is charged with the responsibility of compiling results for Workers Compensation Insurance for the NAIC. The aggregate results also are required to obtain the necessary expense information in order to determine the appropriate expense allowance to include in manual rates.

In order to facilitate reconciliation of carrier data, we request that the Insurance Expense Exhibit be submitted on an individual company basis rather than a carrier group basis.

Questions or request for additional information should be directed to Aggregate Ratemaking at (407) 997-4395. Please note that NCCI does not publish the blank forms for the Insurance Expense Exhibit. The Insurance Expense Exhibit can be obtained from Brandon Insurance Services at (615) 256-6291.

Please note that the due date for reporting this data is April 1 of each year. Please mail the Insurance Expense Exhibit to:

National Council on Compensation Insurance
750 Park of Commerce Drive
Boca Raton, Florida 33487

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

STATISTICAL CALL NAME:

Call For Premium By Size Of Policy (Call #7)

DESCRIPTION OF CALL:

This call contains dollar amounts for countrywide workers compensation Standard Earned Premium at Company level broken down into five policy size ranges (\$1 - 999), (\$1,000 - 4,999), (\$5,000 - 99,999), (\$100,000 - 499,999), and (\$500,000 and over) along with the number of policies in each range for the specified calendar year. Each NCCI member carrier is required to submit this information for the business they write. Some states require all carriers writing workers compensation policies to submit financial calls.

The Call For Premium by Size of Policy is used to determine premium discount and expense constant offsets.

FILES/DATABASES:

Call for Premium by Size of Policy Production File:

This file serves as the central repository for Premium by Size of Policy data. This file contains all data received from the carriers as well as corrections applied to this data. Corrections to the file are made via ACS keypunching of revised reports with electronic transfer of the data to NCCI for incorporation into the production file.

DESCRIPTION OF ERROR HANDLING:

Premium by Size of Policy data is validated using automated reports. Carriers are sent written correspondence to resolve any errors identified during the initial validation. As revised reports are received, they are checked for accuracy and then if correct are sent to ACS for data entry.

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

MODIFICATIONS TO DATA:

Revised reports are processed as they are received. Any data containing errors which remain unresolved at the end of the validation process are removed from the dataset. Due to the relative simplicity of the call, this happens only in rare instances.

All revised data is requested to be submitted on revised reports or via written correspondence. When production deadlines require an immediate response telephone responses are accepted with the stipulation that a written confirmation of the changes also be submitted.

**CALL FOR EXPERIENCE #7
PREMIUM BY SIZE OF POLICY**

Background and Purpose of the Report

The Premium by Size of Policy Call is due at the National Council on or before April 1 of the year following the most recent calendar year. As an example, the 1990 Premium by Size Policy Call data is due at NCCI on or before April 1, 1991.

The intent of this call is to establish a premium schedule according to Standard Earned Premium for one year period. The most recent call requested that this period be 7/1/86 through 6/30/87. Policies effective within this period must be sorted according to premium size, along with the total number of policies and Standard Earned Premium at NCCI DSR.

The distribution of premium by size of policy obtained from this call is used to determine average premium discounts by state in NCCI's annual review of expenses. This is necessary to produce a more accurate indication for general expense needs than is possible from a premium distribution based on Workers Compensation Statistical Plan data.

The data reported in this call should **exclude** experience ★ developed under large deductible policies (deductible amount over \$100,000 per claim or per accident).

The Calendar Year Reconciliation Report (Call #8) has ★ been revised to add lines to reconcile premium and losses to Page 14 of the Annual Statement due to the exclusion of the large deductible policies.

Filing Requirements

Call for Premium by Size of Policy—Due April 1 of each year

In accordance with the approved statistical program, you are hereby requested to file with the National Council on or before April 1, of each year your nationwide distribution of direct standard earned premium by size of policy.

Attached are two copies of the reporting form for the required information. One is to be filed with the National Council and the other is for your records.

Questions regarding reporting requirements on completion of the calls should be directed to Aggregate Ratemaking at (407) 997-4395.

Instructions

Establish a premium schedule according to standard earned premium per risk as indicated on the reporting form. Premium and risk counts for the various intervals should reflect final audited premium. The actual distribution should reflect

latest available audited or estimated audited premiums for policies issued over the one-year period ending June 30, 1989. If necessary, policies issued over the one-year period ending December 31, 1988 may otherwise be reported; if this period is used, please indicate such on the reporting form. **DO NOT REPORT ANY EXPERIENCE FOR POLICIES ISSUED PRIOR TO JANUARY 1, OF THE PREVIOUS YEAR UNDER ANY CIRCUMSTANCES.**

The standard earned premium at Company Level reported shall be the countrywide earned premiums resulting from standard rating procedures; prior to payment of policyholder dividends, prior to the application of premium discounts, prior to the expense modification program when applicable, prior to any retrospective rating premium adjustments, and prior to any schedule rating premium adjustments. Only direct standard earned premium, prior to reinsurance, shall be reported. Report all amounts in whole dollars only. It is only necessary to include the same states that are reported for the Policy Year and Calendar-Accident Year Calls.

This report should **INCLUDE** the experience of all classifications written on a direct basis ("F" Class, Coal Mine, Industrial Classes, Assigned Risk).

EXCLUDE risk counts and premiums associated with three-year fixed rate policies. **EXCLUDE** policies canceled flat (canceled on the effective date).

EXCLUDE risk counts and premiums under policies issued in conjunction with Homeowners and Comprehensive Personal Liability policies covering domestics (such as in California and New Hampshire).

This is the first year Type of Insurer is required on the Call for Premium by Size of Policy.

Please note that the date for reporting this data is April 1 of each year. Please mail this Call to:

National Council on Compensation Insurance
750 Park of Commerce Drive
Boca Raton, Florida 33487

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

STATISTICAL CALL NAME:

Calendar Year Reconciliation Report (Call #8)

DESCRIPTION OF CALL:

This call contains dollar amounts for workers compensation Net Direct Earned Premium and Direct Incurred Losses by state for the specified calendar year. Each NCCI member carrier is required to submit this information for each state in which they operate and NCCI produces rate levels. Some states require all carriers writing workers compensation policies to submit financial calls.

The Calendar Year Reconciliation Report is used to reconcile workers compensation experience data reported in the Calendar Year Call, "F" Classification Calendar Year Call, and the Underground Coal Mine Call to the carrier's annual statement.

FILES/DATABASES:

Calendar Year Reconciliation Report Production File:

This file serves as the central repository for Calendar Year Reconciliation Report data. This file contains all data received from the carriers as well as corrections applied to this data. Corrections to the file are made via ACS for data entry of revised reports with electronic transfer of the data to NCCI for incorporation into the production file.

DESCRIPTION OF ERROR HANDLING:

The Calendar Year Reconciliation data is validated using automated reports when the data is received from the carrier. The primary goal of this validation is to ensure the data reported to NCCI ties back to the individual carrier's annual statement. Particular attention is paid to the amounts reported in Line 10 as well as the explanation line to determine whether a company's data is suitable for ratemaking. The aggregate total by state for all carriers is reconciled to statewide figures provided by AM Best. This is to verify NCCI's database includes all significant data in each state where NCCI produces rate levels.

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

Carriers are sent written correspondence to resolve any errors identified during the validation. As revised reports are received, they are checked for accuracy and then if correct are sent to ACS for processing.

MODIFICATIONS TO DATA:

Revised reports are processed as they are received. Any data containing unresolved errors at the time of a state's rate level production will be removed from the dataset if remaining errors cannot be resolved within the rate level production schedule. Unresolved errors require removal of a carrier's Policy Year and Calendar-Accident Year data from rate level calculations if they are of sufficient magnitude.

All revised data is requested to be submitted on revised reports or via written correspondence. When production deadlines require an immediate response, telephone responses are accepted with the stipulation that a written confirmation of the changes also be submitted.

CALL FOR EXPERIENCE #8
RECONCILIATION REPORT

Background and Purpose of the Report

The Reconciliation Report is due at NCCI on or before April 15 of the year following the most recent Calendar Year. As an example, the Reconciliation Call of 1990 captured Calendar Year 1990 data, for submission to NCCI on or before April 15, 1991.

This Report is one of five standard annual calls for experience subject to the Performance Evaluation Monetary Incentive Program (PEMIP).

For each Annual Call Year, the most recent Calendar Year data must be reported on a state basis. Calendar Year Transactions are those occurring during a particular year, with Calendar Year 1990 being all those transactions occurring from 1/1/90 through 12/31/90. As a result, Calendar Year data will include policy activity, both premium and claim, originating from prior policy years.

The intent of the Reconciliation Report, as the name suggests, is to reconcile data reported on various NCCI requested Calls. Carriers are required to reconcile the Calendar Year Call, "F" Class Calendar Year Call, Coal Mine Calls, National Defense Projects and Excess Policy Data with the Insurance Expense Exhibit (Part IV). If reconciliation to the Insurance Expense Exhibit is not achieved, carriers are required to explain any differences.

Data collected in the Reconciliation Report includes both Net Earned Premium and Incurred Losses on a direct basis with regards to reinsurance.

Filing Requirements

Calendar Year Reconciliation Report by State of the Current Calendar Year Calls to the Current Insurance Expense Exhibit—due April 15, of the following year

In accordance with the approved statistical program, you are hereby requested to file with NCCI on or before April 15 of each year a reconciliation, by state, of data reported on the various Calendar Year Calls to the previous year's Insurance Expense Exhibit.

This Call is included in PEMIP (Performance Evaluation Monetary Incentive Program) and will be subject to assessments for late and/or inaccurate reporting. Details of PEMIP are updated annually in January of each year.

Two reporting forms for the required reconciliation information are provided in the package of forms sent to carriers in October of each year. Since a separate form is required for each state, carriers are asked to reproduce these forms within their organization.

Also included will be two copies of the form for reporting Incurred But Not Reported (IBNR) questionnaire information. One copy is to be filed with NCCI and the other copy is for your records.

Questions regarding reporting requirements on completion of the Calls should be directed to Aggregate Ratemaking at (407) 997-4395.

Reconciliation Instructions

This Call must reconcile data reported in Part IV of the Insurance Expense Exhibit with the data reported to the National Council in the following Calls: Calendar Year Call, "F" Classification Calendar Year Call and Underground Coal Mine Call. Additionally, calendar year experience for National Defense Projects and Excess Policies must be separately reported as reconciliation items since this experience is not included in any Call reported to NCCI. If these reconciliation items and the data reported on the above Calls do not equal that reported in Part IV of the Insurance Expense Exhibit, a detailed explanation for the difference is requested.

Note that since the experience from large deductible ★ policies (over \$100,000 per claim or accident) is being excluded from the Calendar Year Call an extra line is needed on the Reconciliation Report in order to reconcile to Part IV of the Insurance Expense Exhibit. Line (6) asks for the data on a net basis (i.e., the claim amount above the deductible) and is used to reconcile to the Insurance Expense Exhibit. Note that large deductible business is being written by a small minority of companies and that for most companies these lines should be left blank.

In order to facilitate reconciliation, the Insurance Expense Exhibit, Calendar Year Calls, and Reconciliation reports should be submitted on the same basis (group or individual company reports).

It is required to report this call for the same states that the Policy Year and Calendar-Accident Year calls have been submitted.

Amounts to be reported for earned premiums and incurred losses are to be on a direct basis with respect to reinsurance. Amounts reported must be in whole dollars. Please note that since amounts reported on the Insurance Expense Exhibit are in thousands, you are required to enter the low order zeros on Line (8) of the reporting form.

Additionally, please calculate the difference on Line (10) ★ exactly as indicated (Line 9 - Line 8). Indicate negative amounts in parentheses.

IBNR Questionnaire Instructions

The questions on this form are designed to provide further information as to the breakdown of total outstanding losses between the two components "Outstanding Excluding IBNR" and "IBNR" as reported on the Calls for Policy Year and Calendar-Accident Year, evaluated as of December 31.

Listed on the attached forms are several types of reserves, some of which your company may utilize as a portion of its total outstanding losses. For each type of reserve that your company carries, please specify whether that reserve is reported in the category "Outstanding Excluding IBNR" or in the category "IBNR", or some portion of both. In the latter case, please estimate the portion of that type of reserve which is reported in the "IBNR" category. If your company had no reserves for one or more of the types of reserves listed, please mark "X" in the appropriate category of response in most instances.

Additional IBNR Reporting Notes

"None" place an "X" in this column only when you have no portion of your total outstanding losses attributable to this type of loss reserve.

"Outstanding Excl. IBNR" place an "X" in this column for a particular type of loss reserve only when the entire loss reserve of this type is reported as "Outstanding Excluding IBNR," i.e., is included in the totals reported in Columns 11 and 12 of the Policy Year Call form.

"IBNR" place an "X" in this column for a particular type of loss reserve only when the entire loss reserve of this type is reported as "IBNR," i.e., is included in the totals reported in Columns 13 and 14 of the Policy Year Call form.

"Both" place an "X" in this column for a particular type of loss reserve when some portion of that type of reserve is included in "Outstanding Excluding IBNR" and some portion is included in "IBNR."

"% in IBNR" when "Both" is marked for a particular type of reserve, place in this column your best estimate of the approximate proportion of the reserves of the type that are reported as IBNR on the Call form.

Please note that the date for reporting both the Reconciliation and IBNR questionnaire data is on or before April 15 of each year.

Please mail this Call to:

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

STATISTICAL CALL NAME:

"F" Classification Calendar Year Call For Compensation Experience (Call #9)

DESCRIPTION OF CALL:

This call contains dollar amounts for workers compensation Standard Earned Premium at NCCI DSR level, Standard Earned Premium at Company level, Net Earned Premium, and Total Incurred Losses for the specified calendar year. Each NCCI member carrier is required to submit this information for each state in which they operate. Some states require all carriers writing workers compensation policies to submit financial calls.

The "F" Classification Calendar Year Call for Compensation Experience is used to reconcile workers compensation experience data reported in the "F" Classification Policy Year Call to the carrier's annual statement.

FILES/DATABASES:

"F" Classification Calendar Year Call Production File:

This file serves as the central repository for "F" Classification Calendar Year Call data. This file contains all data received from the carriers as well as corrections applied to this data. Corrections to the file are made via ACS for data entry of revised reports with electronic transfer of the data to NCCI for incorporation into the production file.

DESCRIPTION OF ERROR HANDLING:

"F" Classification Calendar Year data is not currently validated.

MODIFICATIONS TO DATA:

"F" Classification Calendar Year data is not currently modified.

CALL FOR EXPERIENCE #9
"F" CLASSIFICATION CALENDAR YEAR CALL

Background and Purpose of the Report

The "F" Classifications Calendar Year Call is due at NCCI on or before April 15 of the year following the most recent Calendar Year. As an example, the 1990 "F" Class Calendar Year Call is due at NCCI on or before April 15, 1991.

For each annual call year, the most recent calendar year data must be reported on a state basis. Calendar Year transactions are those occurring during a specific year. Calendar Year 1990 will be comprised of all premium and loss transactions occurring from 1/1/90 through 12/31/90.

The specific data to be reported in this Call are 27 "F" Classes, identified on the first page of the call for experience. The call indicates that if a carrier is not able to report "F" Class experience on a class-by-class basis, it is permissible to report the total experience on risks in which the "F" Class is the governing classification.

Data from this Call is currently used for "F" Class rate level in the state of Louisiana. Also, this data has the potential of being used in the ratemaking process for other states as well.

"F" Class data collected includes earned premiums and incurred losses on a state basis. Earned premiums are separated between Standard At NCCI DSR Level, Standard At Company Level and Net Earned. The incurred losses include indemnity and medical benefits, along with IBNR.

The data reported in this call should *exclude* experience ★ developed under large deductible policies (deductible amount over \$100,000 per claim or per accident).

The Calendar Year Reconciliation Report (Call #8) has ★ been revised to add lines to reconcile premium and losses to Page 14 of the Annual Statement due to the exclusion of the large deductible policies.

Filing Requirement

"F" Classification Calendar Year Call for Compensation Experience by State—Current Calendar Year—due April 15 of the following year

In accordance with the approved statistical program, you are hereby requested to file with NCCI on or before April 15 of each year your "F" Classification compensation experience for the previous calendar year. Experience included in this Call should be for policies effective January 1, 1974 and subsequent.

The specific "F" Classifications involved in this Call are: 6801F, 6803F, 6824F, 6825F, 6826F, 6827F, 6828F, 6829F, 6843F, 6845F, 6846F, 6869F, 6872F, 6873F, 6874F, 6875F, 7309F, 7313F, 7317F, 7323F, 7327F, 7350F, 7352F, 7366F, 8709F, 8726F, and 9077F.

If a carrier is not able to report "F" Classification experience on a classification-by-classification basis, it is permissible to report the total experience on risks in which the "F" Classification is a governing classification. If this procedure is used

when reporting data under this Call, both the premium and incurred losses must be reported on a risk total basis. The reporting of risk total premium and individual classification losses is not permitted.

Two copies of the reporting form for the required information are provided in the package of reporting forms sent to carriers in October of each year. One copy is to be filed with NCCI and the other copy is for your records. The states (or jurisdictions) for which requested data is to be filed are listed on the attached form.

Questions regarding reporting requirements on completion of the Calls should be directed to Aggregate Ratemaking at (407) 997-4395.

A. GENERAL INSTRUCTIONS

1. Group Report

Carrier name and five-digit code must be shown on both sheets. If this is a group reporting, each carrier writing compensation must be listed individually on the form. With respect to affiliated carriers, it will be appreciated if you will follow the same method of reporting for this Calendar Call for "F" Classification experience (individual company basis or group basis) as was followed in compliance with our Annual Call for Calendar Year Experience. If this is not convenient, kindly advise us when replying to this Call that you have changed procedure. Please note, however, that the experience of stock and non-stock carriers should not be combined in a report.

2. Standard Earned Premiums at NCCI Designated Statistical Reporting Level

Standard earned premiums shall be the entire "F" Classification earned premium for the state resulting from standard rating procedures after the application of:

1. Experience rating plan adjustments (NOTE: Except for Michigan experience, experience rating plan adjustments must reflect only NCCI published modification factors.)
2. Expense Constants (These are the Expense Constants published by NCCI or an independent bureau. For Voluntary Business in pure premium states, Expense Constants at the NCCI DSR level are 0.)
3. Loss Constants (These are the Loss Constants published by NCCI or an independent bureau. For Voluntary Business in pure premium states, Loss Constants at the NCCI DSR level are 0.)

but prior to the application of:

1. Deviations from NCCI Designated Statistical Reporting rates or pure premiums
2. Deviations from published NCCI experience rating plan modification factors (Except Michigan)
3. Retrospective rating plan adjustments

4. Other individual risk rating plan adjustments***
(e.g., Schedule Rating)
5. Premium discounts
6. Expense modification program adjustments
7. Payment of policyholder dividends
- * 8. Premium credits for small deductible coverage

* Carriers must report their Standard Earned Premium at NCCI's experience rating plan level for all states except Michigan. If carriers use their own experience rating plan in Michigan, they may report their Standard Earned Premium at their own experience rating plan level.

** Rates: Arkansas, Connecticut, Georgia, Illinois, Indiana, New Mexico, Rhode Island, Vermont
Pure Premiums: Kentucky, Louisiana (policies effective 4/1/89 and subsequent), Maryland, Michigan, Oregon

*** Note that premium adjustments resulting from the application of individual risk rating plans other than experience rating must be excluded from both Standard Earned Premium at Company Level and Standard Earned Premium at NCCI Designated Statistical Reporting Level.

3. Standard Earned Premium at Company Level

The earned premium on all risks after the application of:

1. Deviations from NCCI Designated Statistical Reporting rates or pure premiums*
2. Experience rating plan adjustments (NOTE: Except for Michigan experience, experience rating plan adjustments must reflect only NCCI published modification factors.)**
3. Expense Constants (Carrier-charged Expense Constants)
4. Loss Constants (Carrier-charged Loss Constants)

but prior to the application of:

1. Deviations from published NCCI experience rating plan modification factors (except Michigan)**
2. Retrospective rating plan adjustments
3. Other individual risk rating plan adjustments***
(e.g., Schedule Rating)
4. Premium discounts
5. Expense modification program adjustments
6. Payment of policyholder dividends
- * 7. Premium credits for small deductible coverage

For every state in which Standard Earned Premium at DSR Level is reported, Standard Earned Premium at Company Level must be reported as well.

* Rates: Arkansas, Connecticut, Georgia, Illinois, Indiana, New Mexico, Rhode Island, Vermont

Pure Premiums: Kentucky, Louisiana (policies effective 4/1/89 and subsequent), Maryland, Michigan, Oregon

** Carriers must report their Standard Earned Premium at NCCI's experience rating plan level for all states except Michigan. If carriers use their own experience rating plan in Michigan, they may report their Standard Earned Premium at their own experience rating plan level.

*** Note that premium adjustments resulting from the application of individual risk rating plans other than experience rating must be excluded from both Standard Earned Premium at Company Level and Standard Earned Premium at NCCI Designated Statistical Reporting Level.

4. Carriers Writing in Competitive Rating States

For Arkansas, Connecticut, Georgia, Illinois, Indiana, Kentucky, Louisiana, Maryland, Michigan, New Mexico, Oregon, Rhode Island and Vermont, carriers must enter the Standard Earned Premium at NCCI Designated Statistical Reporting Level and at Company Level in the appropriate columns on the form. Please reference the enclosed circular titled "Annual Update on Designated Statistical Reporting Levels."

5. Carriers Writing at Deviations from NCCI Rates in Administered Pricing States

For State Funds and other carriers writing at deviations from Bureau rates in non-competitive rating states, the Standard Earned Premium must be adjusted to Bureau rate level and reported in the column labeled "Standard Earned Premium at NCCI Designated Statistical Reporting Level." The Standard Earned Premium at the carrier rate level must be reported in the column labeled "Standard Earned Premium at Company Level."

Carriers that do not deviate from NCCI rates must enter their Standard Earned Premium in the column labeled "Standard Earned Premium at NCCI Designated Statistical Reporting Level" and must enter the same figure in the column labeled "Standard Earned Premium at Company Level."

Also note that when premium credits have been granted in connection with the transition program of payroll limitation rules, both reported Standard Earned Premium figures shall be reduced by such credits.

6. Net Earned Premium

Net earned premiums shall be the actual "F" Classification earned premium on all risks prior to the payment of policyholder dividends, but after application of any retrospective rating premium adjustments, after the application of premium discounts in accordance with Manual Rules, after the expense modification program, and after any deviation or "write-offs" from Bureau rates.

7. Incurred Losses

Losses reported by state should include compensation and medical incurred during this calendar year period. For further details on the inclusion or exclusion of certain losses and/or reserves, please refer to the specific instructions below.

8. Rounding Procedure and Reporting of Credits

Please report amounts of premiums and losses in whole dollars only. Count fifty cents and over as an extra dollar, and reject the cents if less than fifty. Please show negative amounts enclosed within parentheses so that they may be handled properly in punching and tabulating operations.

9. Total Experience

Kindly show the totals of all amounts reported on the last line of sheet 2 captioned "All States."

10. Signature Requirement

The person responsible for the completion and accuracy of this Call should sign and date the reporting form.

11. Full Submission

Report should include ALL States in which company has data to report. Resubmission or correction must also include all states, not just revised states.

B. SPECIFIC INSTRUCTIONS

1. "F" Classifications

This Call is exclusively for experience of the "F" Classifications for policies effective January 1, 1974 and thereafter.

2. Excess Policies

Experience on excess policies **MUST BE EXCLUDED.**

3. National Defense Projects

Experience on National Defense Projects written under the old Comprehensive Rating Plan or the new National Defense Projects Rating Plan **MUST BE EXCLUDED.** Experience incurred on a Defense Base should be included unless written under the National Defense Projects Rating Plan.

4. Reinsurance

No deductions shall be made from premiums and losses for or on account of reinsurance ceded. Premiums and losses arising from reinsurance received by the reporting company shall be excluded from the experience. Experience reported should be **DIRECT BUSINESS ONLY.**

5. Assigned Risk

Experience for assigned risk policies must be **INCLUDED.** Assigned risk policies must be reported at the level of approved assigned risk rates.

6. IBNR

Losses reported by state should include an appropriate reserve for incurred but not reported cases.

7. Reopened Cases

Include an appropriate loss reserve for reopened cases.

8. Reserves for Specific Contingencies

Include medical and other loss reserves to meet specific contingencies.

9. Other Voluntary Reserves

Exclude voluntary reserves other than those mentioned above.

10. Expenses

Exclude all expenses, either allocated or unallocated, except allocated Coverage B loss adjustment expense.

11. Assessments and Special Compensation Funds

The inclusion of assessments and other compensation special funds as incurred losses in the "F" Classification Calendar Year Call follows the same instructions that apply in reporting of experience under NCCI's Calendar Year Call for Compensation Experience.

12. Small Deductible Programs ★

In states in which small deductible programs apply, losses are to be reported on a gross basis inclusive of the employer paid loss amount.

13. Alternate Procedure for Reporting "F" Classification Experience

In a meeting of the Special Committee on Ratemaking held on May 1, 1974, it was agreed that when a company is not able to make a report on a classification by classification basis, an alternative procedure would be the reporting of experience on risks when an "F" Classification was a governing classification. Note that both total risk premium and total risk losses must be reported if this option is used.

14. Taxes and Assessments in Kentucky

Taxes and assessments on premiums earned in Kentucky on or after January 1, 1977 **MUST BE EXCLUDED.**

15. Oregon Assessments

Assessments on premiums written or earned in Oregon on or after July 15, 1982 must be excluded. This is pursuant to the requirements of OAR 436-51-025 and 51-030(2) contained in WCD Administrative Order 8-1982.

Please note that the date for reporting this data is on or before April 15 of each year. It is urged that every effort be made to comply with this reporting date as a delay in receiving this data will seriously hamper NCCI in its preparation of rate revisions. Please mail this Call to:

National Council on Compensation Insurance

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

STATISTICAL CALL NAME:

"F" Classification Policy Year Call For Compensation Experience (Call #11)

DESCRIPTION OF CALL:

This call contains dollar amounts for workers compensation Standard Earned Premium at NCCI DSR level, Standard Earned Premium at Company level, Net Earned Premium, and Total Incurred Losses by Policy Year for each state in which NCCI produces rate levels. The Total Incurred Losses are broken down to Paid, Outstanding excluding IBNR, and IBNR on page 1. Each of these components is further broken down into its indemnity and medical components and reported along with the Indemnity Claim Count on page 2. In addition, Indemnity and Medical Outstanding excluding IBNR are separated into case and bulk reserves on page 3. Each NCCI member carrier is required to submit this information for each state in which they operate and for which NCCI produces rate levels. Some states require all carriers writing workers compensation policies to submit financial calls.

The "F" Classification Policy Year Call for Compensation Experience is used to determine Industrial Classification market share for use in premium on-level calculations.

FILES/DATABASES:

"F" Classification Policy Year Call Production File:

This file serves as the central repository for "F" Classification Policy Year Call data. This file contains all data received from the carriers as well as corrections applied to this data. Corrections to the file are made via ACS for data entry of revised reports with electronic transfer of the data to NCCI for incorporation into the production file.

DESCRIPTION OF ERROR HANDLING:

"F" Classification Policy Year data is not currently validated.

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

MODIFICATIONS TO DATA:

"F" Classification Policy Year data is not currently modified.

2. State

List both the name of the state and the state code number on each state's data submission. Only one state per reporting sheet is allowed.

3. Accumulated Standard Earned Premium at NCCI Designated Statistical Reporting Level

As in last year's Call you are required to report the Accumulated Standard Earned Premium for each of the indicated policy years. Specifically, for any given policy year you are to report the entire "F" Classification Standard Earned Premium since policy inception through December 31 of the current year for those policies becoming effective during the policy year being reported.

For each policy year indicated, the Accumulated Standard Earned Premiums shall be the "F" Classification Accumulated Earned Premium for that particular policy year resulting from standard rating procedures after the application of:

1. Experience rating plan adjustments (NOTE: Except for Michigan experience, experience rating plan adjustments must reflect only NCCI published modification factors.)*
2. Expense Constants (These are the Expense Constants published by the NCCI or an independent bureau. For Voluntary Business in pure premium states, Expense Constants at NCCI DSR level are 0.)
3. Loss Constants (These are the Loss Constants published by NCCI or an independent bureau. For Voluntary Business in pure premium states, Loss Constants at NCCI DSR level are 0.)

but prior to the application of:

1. Deviations from NCCI Designated Statistical Reporting rates or pure premiums**
2. Deviations from published NCCI experience rating plan modification factors (Except Michigan)*
3. Retrospective rating plan adjustments
4. Other individual risk rating plan adjustments*** (e.g., Schedule Rating)
5. Premium discounts
6. Expense modification program adjustments
7. Payment of policyholder dividends
8. Premium credits for small deductible coverage

* Carriers must report their Standard Earned Premium at NCCI's experience rating plan level for all states except Michigan. If carriers use their own experience rating plan in Michigan, they may report their Standard Earned Premium at their own experience rating plan level.

** Rates: Arkansas, Connecticut, Georgia, Illinois, Indiana, New Mexico, Rhode Island, Vermont
Pure Premiums: Kentucky, Louisiana (policies effective 4/1/89 and subsequent), Maryland, Michigan, Oregon

*** Note that premium adjustments resulting from the application of individual risk rating plans other than experience rating must be excluded from both Standard Earned Premium at Company Rate Level and Standard Earned Premium at NCCI Designated Statistical Reporting Level.

4. Standard Earned Premium at Company Level

The earned premium on all risks after the application of:

1. Deviations from NCCI Designated Statistical Reporting rates or pure premium*
2. Experience rating plan adjustments (NOTE: Except for Michigan experience, experience rating plan adjustments must reflect only NCCI published modification factors)**
3. Expense Constants (Carrier-charged Expense Constants)
4. Loss Constants (Carrier-charged Loss Constants)

but prior to the application of:

1. Deviations from published NCCI experience rating plan modification factors (Except Michigan)**
2. Retrospective rating plan adjustments
3. Other individual risk rating plan adjustments*** (e.g., Schedule Rating)
4. Premium discounts
5. Expense modification program adjustments
6. Payment of policyholder dividends
7. Premium credits for small deductible coverage

For every policy year in which Standard Earned Premium at DSR Level is reported, Standard Earned Premium at Company Level must be reported as well.

* Rates: Arkansas, Connecticut, Georgia, Illinois, Indiana, New Mexico, Rhode Island, Vermont

Pure Premiums: Kentucky, Louisiana (policies effective 4/1/89 and subsequent), Maryland, Michigan, Oregon

** Carriers must report their Standard Earned Premium at NCCI's experience rating plan level for all states except Michigan. If carriers use their own experience rating plan in Michigan, they may report their Standard Earned Premium at their own experience rating plan level.

*** Note that premium adjustments resulting from the application of individual risk rating plans other than experience rating must be excluded from both Standard Earned Premium at Company Level and Standard Earned Premium at NCCI Level.

CALL FOR EXPERIENCE #11
"F" CLASSIFICATION POLICY YEAR CALL

Background and Purpose of the Report

The "F" Classification Policy Year Call is due at NCCI on or before April 15 of the year following the most recent policy year. As an example, the "F" Class Policy Year Call valued as of 12/31/90 is due at NCCI on or before April 15, 1991.

In the past, for each annual call year, the most recent eight (8) full years of individual policy years must be reported separately by state. Prior to the eight (8) most recent full years, the total of all "prior to" policy years are grouped together. However, effective with Calls valued as of December 31, 1987, this call will retain the oldest data year. As an example, the Policy Year Call valued as of 12/31/87 will retain the 1978 and prior to data as well as requesting data for 1987. This phased-in retention will result in the collection of 15 full underwriting years of data with calls reported in 1994. The definition of Policy Year refers to a way of organizing financial data based upon policy effective date. As an example, Policy Year 1990 is comprised of all policies with effective dates initiating in 1990 from 1/1/90 to 12/31/90. Additionally, all claims which develop for these policy years reported back to the policy effective year, irrespective of the year the claim arose.

The specific data to be reported in this Call are 27 "F" Classes, identified on the first page of the call for experience. The call indicates that if a carrier is not able to report "F" Class experience on a class-by-class basis, it is permissible to report the total experience on risks when the "F" Class is the governing classification.

Currently, this "F" Classification data is used for "F" Class rate level analysis in the state of Louisiana. This data also has the potential to be used in the ratemaking process for other states as well.

Data collected in the "F" Classification Policy Year Call includes earned premium and incurred losses on a state basis. Policy Year Earned premiums are separated between Standard At NCCI DSR Level, Standard At Company Level, and Net Earned. Policy Year incurred losses include incurred indemnity claim count and indemnity and medical total for paid losses, outstanding losses excluding IBNR, case and bulk reserves in the outstanding losses excluding IBNR, IBNR and total incurred losses.

The data reported in this call should *exclude* experience ★ developed under large deductible policies (deductible amount over \$100,000 per claim or per accident).

The Calendar Year Reconciliation Report (Call #8) has ★ been revised to add lines to reconcile premium and losses to Page 14 of the Annual Statement due to the exclusion of the large deductible policies.

Filing Requirements

"F" Classification Policy Year Call for Compensation Experience by State Valued as of December 31 of the Current Year—due April 15 of the following year

In accordance with the approved statistical program you are hereby requested to file with NCCI on or before April 15 of each year your "F" Classification experience by policy year valued as of December 31 of the prior year. Experience included in this Call should be for policies effective January 1, 1974 and subsequent.

This Call continues the phased-in expansion of the "F" Classification Policy Year Call to ultimately collect 15 full underwriting years of data. This "F" Classification Policy Year Call to be reported in 1990 retains the oldest data year (1978) and includes the current year, thus requiring the collection of a total of 11 full underwriting years of data to be reported in 1990. This phased-in retention will continue until 15 full underwriting years of data are collected.

The specific "F" Classifications involved in this Call are: 6801F, 6803F, 6824F, 6825F, 6826F, 6827F, 6828F, 6829F, 6843F, 6845F, 6846F, 6869F, 6872F, 6873F, 6874F, 6875F, 7309F, 7313F, 7317F, 7323F, 7327F, 7350F, 7352F, 7366F, 8709F, 8726F, and 9077F.

If a carrier is not able to report "F" Classification experience on a classification-by-classification basis, it is permissible to report the total experience on risks when the "F" Classification is a governing classification. If this procedure is used when reporting data under this Call, both the premium and incurred losses must be reported on a risk total basis. The reporting of risk total premium and individual classification losses is not permitted.

Two copies of the reporting form for the required information are provided in the package of reporting forms sent to carriers in October of each year. Since a separate form is required for each state, carriers are asked to reproduce these forms within their organizations.

Questions regarding reporting requirements on completion of the Calls should be directed to Aggregate Ratemaking at (407) 997-4395.

A. GENERAL INSTRUCTIONS

1. Group Report

Carrier name and five-digit code must be shown on each reporting form. If this is a group reporting, each carrier writing compensation must be listed individually on the reporting form. List the carrier names or carrier codes of those companies that have direct business during at least one of the policy years for which data is required in a given state. Carriers are requested to submit the "F" Classification Policy Year Call on the same basis (i.e., group report or individual company report) as the "F" Classification Calendar Year Call. This will facilitate reconciliation of carrier data.

5. Carriers Writing in Competitive Rating States

For Arkansas, Connecticut, Georgia, Illinois, Indiana, Kentucky, Louisiana, Maryland, Michigan, Oregon, Rhode Island and Vermont, carriers must enter the Standard Earned Premium figures at NCCI Designated Statistical Reporting Level and at Company Level in the appropriate columns on the form. Please reference the enclosed circular titled "Annual Update on Designated Statistical Reporting Levels."

6. Carriers Writing at Deviations from NCCI Rates in Administered Pricing States

For State Funds and other carriers writing at deviations from Bureau rates in non-competitive rating states, the Standard Earned Premium must be adjusted to Bureau rate level and reported in the column labeled "Standard Earned Premium at NCCI Designated Stat. Reporting Level." The Standard Earned Premium at the carrier rate level must be reported in the column labeled "Standard Earned Premium at Company Level."

Carriers that do not deviate from NCCI rates must enter their Standard Earned Premium in the column labeled "Standard Earned Premium at NCCI Designated Stat. Reporting Level" and must enter the same figure in the column labeled "Standard Earned Premium at Company Level."

Note that when premium credits have been granted in connection with the Transition Program of payroll limitation rules, both reported Standard Earned Premium figures shall be reduced by such credits.

7. Accumulated Net Earned Premium

As in last year's Call, you are required to report the accumulated net earned premium for each of the indicated policy years. Specifically, for any given policy year, you are to report the entire "F" Classification net earned premium since policy inception through December 31, 1988 for those policies becoming effective during the policy year being reported.

For each policy year indicated, the accumulated net earned premium shall be the "F" Classification accumulated actual earned premium on all risks prior to the payment of policyholder dividends; but after application of any retrospective rating premium adjustments, after the application of premium discounts in accordance with Manual rules, after the expense modification program, after any deviations or "write-offs" from Bureau rates or pure premiums and after the application of any schedule rating premium adjustments.

8. Accumulated Incurred Losses

As in previous "F" Classification Policy Year Calls, you are required to report "F" Classification accumulated total incurred losses (i.e., from date of inception through December 31 of each year). The Call further

requires that accumulated total incurred losses be split into the following components: accumulated indemnity losses (separately for paid, Outstanding Excluding IBNR—Case and Bulk, and IBNR) and accumulated medical losses (separately for paid, Outstanding Excluding IBNR Case and Bulk, and IBNR). It should be noted that all carriers are required to report incurred losses split between indemnity and medical on a mandatory basis.

The Outstanding Excluding IBNR category is designed to capture case reserves and bulk reserves. For the purposes of this Call, the following working definitions may be used by carriers:

Case Reserves—Those outstanding reserves established for specific known cases that would be reported in an aggregate amount to reflect the total case reserve for the company.

Bulk Reserves—Those outstanding reserves for general case reserve inadequacy, supplemental case reserves, cases that may reopen, or other reserves which are not associated to specific claims.

The goal of this reporting is to clearly isolate case reserves without impacting the carrier methodology of reporting IBNR. Carriers should not alter the mix of data that has historically been allocated to IBNR, since doing so would adversely impact the NCCI development of IBNR data.

For this reason, carriers reporting bulk reserves in IBNR should continue to do so. On the Outstanding Excluding IBNR Page 3 Reporting Form, these carriers should respond "Yes" to the question in Note A. In addition, carriers with no bulk reserves should also respond "Yes" to the question in Note A.

Those carriers reporting bulk reserves in the Outstanding Excluding IBNR category, should respond "No" to the question in Note A of the Outstanding Excluding IBNR Page 3 Reporting Form. These carriers should have data reported in both the case reserves and bulk reserves.

The Case and Bulk Reserve Reporting Form accommodates carriers allocating this data on an ACTUAL basis as well as ESTIMATED basis. The reporting form contains a coding box to indicate the actual versus estimated method of allocation.

9. Incurred Indemnity Claim Count

The incurred indemnity claim count (i.e., the accumulated number of claims for which an indemnity payment has been made and/or an outstanding reserve exists) must be reported on a mandatory basis for policy years 1981 and subsequent. (Those carriers that are in a position to do so are requested to report the incurred indemnity claim count for as many policy

years prior to 1981 as possible.) The indemnity claim counts should exclude claims that start out with an indemnity reserve, but were resolved as medical only claims or closed without payment. Also, indemnity claim count should include claims that start out as medical only but are resolved as indemnity at future evaluations. If indemnity claims are reopened, they should not be added to the claim count.

10. No Experience

State reports should not be submitted for any state in which the carrier(s) has (have) never had experience. In instances that for one or more, but not all, of the 1978-1989 Policy Years the carrier(s) failed to have experience in a given state, indicate "NO "F" CLASSIFICATION EXPERIENCE" across the appropriate Policy Year line(s) on that state.

11. Questionnaire

The questionnaire must be completed. Submit only one questionnaire per submission. A separate questionnaire per state is no longer required.

12. Signature Requirement

The person responsible for the completion and accuracy of this Call is only required on the first state's reporting form and does not have to be repeated on every state's form.

13. States for Which the Reporting of "F" Classification Experience is Required:

State	Code	State	Code
Alabama	01	Michigan	21
Alaska	54	Mississippi	23
Arizona	02	Missouri	24
Arkansas	03	Montana	25
Colorado	05	Nebraska	26
Connecticut	06	New Hampshire	28
Dist. of Columbia	08	New Mexico	30
Florida	09	North Carolina	32
Georgia	10	Oklahoma	35
Hawaii	52	Oregon	36
Idaho	11	Rhode Island	38
Illinois	12	South Carolina	39
Indiana	13	South Dakota	40
Iowa	14	Tennessee	41
Kansas	15	Texas	42
Kentucky	16	Utah	43
Louisiana	17	Vermont	44
Maine	18	Virginia	45
Maryland	19	Wisconsin	48

14. Rounding Procedure and Reporting of Credits

Please report amounts of premiums and losses in whole dollars only. Count fifty cents and over as an extra dollar, and reject the cents if less than fifty. Please show negative amounts enclosed within parentheses so that they may be handled properly in punching and tabulating operations.

15. Complete Submission

A complete call submission per state must include all three pages. Page 3 must be completed for each state in which the carrier reports experience.

B. SPECIFIC INSTRUCTIONS

1. "F" Classifications

This Call is exclusively for experience of the "F" Classifications for policies effective January 1, 1974 and thereafter.

2. Excess Policies

Experience on excess policies MUST BE EXCLUDED.

3. National Defense Projects

Experience on National Defense Projects written under the old Comprehensive Rating Plan or the new National Defense Projects Rating Plan MUST BE EXCLUDED. Experience incurred on a Defense Base should be included unless written under the National Defense Projects Rating Plan.

4. Reinsurance

No deductions shall be made from premiums and losses for or on account of reinsurance ceded. Premiums and losses arising from reinsurance received by the reporting company shall be excluded from the experience. Experience reported should be DIRECT BUSINESS ONLY.

5. Assigned Risk

Experience for assigned risk policies must be INCLUDED. Assigned risk policies must be reported at the level of approved assigned risk rates.

6. IBNR

Losses reported by state should include an appropriate reserve for incurred but not reported cases. The IBNR reserve must be reported separately for indemnity and medical.

Commencing with "F" Classification Policy Year Call valued as of December 31, 1986, the Outstanding Excluding IBNR category has been further refined to capture case reserves and bulk reserves.

This reporting clearly isolates case reserves without impacting the carrier methodology of reporting IBNR. Carriers should not alter the mix of data historically allocated to IBNR, since doing so would adversely impact the NCCI development of IBNR data.

For this reason, carriers who have reported bulk reserves in IBNR should continue to do so. On the Outstanding Excluding IBNR Page 3 Reporting Form, these carriers should respond "Yes" to the question in Note A.

7. Reopened Cases

Include an appropriate loss reserve for reopened cases.

8. Reserves for Specific Contingencies

Include medical and other loss reserves to meet specific contingencies.

9. Other Voluntary Reserves

Exclude voluntary reserves other than those mentioned above.

10. Expenses

Exclude all expenses, either allocated or unallocated, except allocated Coverage B loss adjustment expense.

11. Assessments and Special Compensation Funds

The inclusion of assessments and other compensation special funds as incurred losses in the "F" Classification Policy Year Call follow the same instructions that apply in reporting of experience under NCCI's Calendar Year Call for Compensation Experience.

12. Small Deductible Programs ★

In states in which small deductible programs apply, losses are to be reported on a gross basis inclusive of the employer paid loss amount.

13. Alternate Procedure for Reporting "F" Classification Experience

In a meeting of the Special Committee on Ratemaking held on May 1, 1974, it was agreed that when a company is not able to make a report on classification by classification basis, an alternative procedure would be the reporting of experience on risks in which an "F" Classification was a governing classification. Note that both total risk premium and total risk losses must be reported if this option is used.

14. Taxes and Assessments in Kentucky

Taxes and assessments on premiums earned in Kentucky on or after January 1, 1977 MUST BE EXCLUDED.

Please note that the date for reporting this data is April 15 of each year. It is urged that every effort be made to comply with this reporting date as a delay in receiving this data will seriously hamper NCCI in its preparation of rate revisions. Please mail this Call to:

National Council on Compensation Insurance
750 Park of Commerce Drive
Boca Raton, Florida 33487

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

STATISTICAL CALL NAME:

Calendar Year Expense Call (Call #14)

DESCRIPTION OF CALL:

This call contains dollar amounts for workers compensation premiums, losses and expenses. Each NCCI member carrier is required to submit this by state for all the states in which they operate. Some states require all carriers writing workers compensation policies to submit financial calls.

The Calendar Year Expense Call is used to determine target cost ratios and to help support expense allowances in rate filings.

FILES/DATABASES:

Calendar Year Expense Call Production File:

This file serves as the central repository for Calendar Year Expense Call data. This file contains all data received from the carriers as well as corrections applied to this data. Corrections to the file are made via ACS data entry of revised reports with electronic transfer of the data to NCCI for incorporation into the production file.

DESCRIPTION OF ERROR HANDLING:

Calendar Year Expense data is validated using automated reports when the data is received from the carrier.

Carriers are sent written correspondence to resolve any errors identified during validation. As revised reports are received, they are checked for accuracy and then if correct are sent to ACS for processing.

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

MODIFICATIONS TO DATA:

Revised reports are processed as they are received. Any data containing errors which can not be resolved in a timely manner are removed from the dataset.

All revised data is requested to be submitted on revised reports or via written correspondence. When production deadlines require an immediate response, telephone responses are accepted with the stipulation that a written confirmation of the changes also be submitted.

CALL FOR EXPERIENCE #14
CALENDAR YEAR EXPENSE DATA BY STATE

Background and Purpose of the Report

The Calendar Year Expense Data by State is due at NCCI on or before May 15 of the year following the most recent calendar year. As an example, the 1990 Call is due at NCCI on or before May 15, 1991.

For each annual call year, the most recent calendar year expense data must be reported on a state basis. Additionally, an addendum to this call requires the reporting of Maine expenses, for the purpose of capturing Safety Engineering and Loss Control expenses separately from other General expenses.

The purpose of collecting this data is to help support expense allowances in rate filings. In selected jurisdictions, data from this call is provided to regulators in conjunction with rate filings. Also, this expense data has been used in research such as studies of allocated Loss Adjustment Expense by state.

The data reported in this call should *include* expenses* related to large deductible policies (deductible amount over \$100,000 per claim or per accident).

**Call for Current Calendar Year Expense Data by State—
Due May 15 of the following year**

In accordance with the approved statistical program you are hereby requested to file with NCCI on or before May 15 of each year your Workers Compensation expense data by state for the previous calendar year. Additionally, addendums to this Call must be reported for:

1. The state of Maine pursuant to Maine House Bill 605
2. The state of Rhode Island pursuant to House Bill 6172

Attached are two sets of the reporting form for the required information. Since a separate form is required for each state, carriers are asked to reproduce these forms within their organization.

Questions regarding reporting requirements on completion of the calls should be directed to Aggregate Ratemaking at (407) 997-4395.

A. GENERAL INSTRUCTIONS

The Call for this data should be completed to include:

1. A copy for each state listed under item (14) of the instructions for those states in which your company writes workers compensation insurance.
2. A copy of ALL OTHER states combined (i.e., all jurisdictions not in 1), and
3. A copy of a total for all states combined (sum of 1 and 2). The latter should reconcile with your Countrywide Insurance Expense Exhibit.

B. SPECIFIC INSTRUCTIONS

1. **Direct Written Premiums**
To agree with Page 14 of the Annual Statement.
2. **Direct Net Earned Premiums**
To agree with Part IV of the Insurance Expense Exhibit.

3. Direct Standard Earned Premiums

This shall be the entire earned premiums for the state resulting from standard rating procedures prior to payment of policyholder dividends; prior to the application of premium discounts, prior to any applicable expense modification program, prior to application of any schedule rating modification, prior to any retrospective rating adjustments, and prior to the effects of any deviations or "write-offs" from Bureau rates or pure premiums.

In other words, report the Standard Earned Premium at NCCI Designated Statistical Reporting Level as described on the Calendar Year Call and the "F" Class Calendar Year Call for Compensation Experience by State.

4. Direct Acquisition, Field Supervision and Collection Expenses Incurred

A. Commission and Brokerage

Show amounts of Commission and Brokerage expenses incurred on the state's business, reflecting each state's Commission and Brokerage rates, subject to the Rules in Regulation 30. Indicate the basis of allocation using the allocation codes described in item (12) below.

B. All Other

(i) Branch Office—State's Share

Show actual expenses if you maintain an office within the state involved that processed only this state's business. Allocation by line of insurance must be made in accordance with Regulation 30. If you maintained a regional branch office in the state involved or any other state that processed this particular state's business along with business of other states, use the actual branch office expenses and determine the individual state's portion by appropriate allocation. In either case, indicate the basis of allocation using the allocation codes described in item (12) below.

(ii) Home Office—State's Share

Determine by appropriate allocation and indicate the basis of allocation using the allocation codes described in item (12) below.

5. Direct Losses

Both paid and incurred losses are actual amounts. Incurred should agree with Part IV of the Insurance Expense Exhibit.

6. Direct Unallocated Loss Adjustment Expense

Determine by appropriate allocation if the state's actual data is not available. In either case, please indicate

the basis of allocation using the allocation codes described in item (12) below.

7. Direct Allocated Loss Adjustment Expense

Determine by appropriate allocation if the state's actual data is not available. In either case, please indicate the basis of allocation for incurred allocated loss adjustment expenses using the allocation codes described in item (12) below. (Note: report actual amounts for paid allocated loss adjustment expense.)

8A. Direct Boards and Bureaus Expense

Determine all fees paid to Boards and Bureaus by appropriate allocation if the state's actual data is not available. In either case, please indicate the basis of allocation using the allocation codes described in item (12) below.

8B. Direct Audit, Inspection and Other General Expenses

This item includes all General Expenses other than Boards and Bureaus Expense. Determine by appropriate allocation if the state's actual data is not available. In either case, please indicate the basis of allocation using the allocation codes described in item (12) below.

9. Direct Taxes, Licenses and Fees

Show the actual state's data. This item includes the appropriate state's Premium Tax, Miscellaneous Taxes, Licenses and Fees.

10. Type of Insurer

Please identify carrier in accordance with the following table:

- N—Non-Participating Stock Companies
- P—Participating Stock Companies
- M—Mutual Companies
- R—Reciprocal Exchanges
- F—State Funds
- X—Miscellaneous Companies

Note: If this report is for a group with both participating and non-participating stock companies, please indicate the predominant type of insurer.

11. All amounts must be reported in whole dollars. Count fifty cents and over as an extra dollar, and reject cents if less than fifty.

12. Allocation Codes

Method of determining reported expense. Below is a table of allocation codes. For each item allocated, enter the code number of the basis that best describes the method used. When none of the listed bases are suitable, enter code number 7, and include an explanation of the method used on reverse side of each form. Exactly one code number should be entered in

the appropriate box for each of the items 4A, 4Bi, 4Bii, 6, 7, 8A and 8B.

Please use Actual expenses (code number 1) whenever possible

Allocation Code	Allocation Basis
1	Actual Expenses
2	Written Premium
3	Earned Premium
4	Losses
5	Salaries
6	Time Studies
7	Other, please explain on reverse side of each form.

13. Signature Requirement

The person responsible for the completion and accuracy of the Call should sign and date only the "All States Combined" page.

14. States for which Reporting on an Individual Basis is Required

State	Code No.	State	Code No.
Alabama	01	Mississippi	23
Alaska	54	Missouri	24
Arizona	02	Montana	25
Arkansas	03	Nebraska	26
Colorado	05	New Hampshire	28

Maryland	19	All Other	99*
Massachusetts	20	All States	00
Michigan	21		

* Include all jurisdictions not specifically listed (such as Minnesota, New York, New Jersey, etc.) under this code.

Please note that the due date for this Call is May 15 of each year. Please mail this Call to:

National Council on Compensation Insurance
750 Park of Commerce Drive
Boca Raton, Florida 33487

ATTENTION: FINANCIAL DATA

MAINE AND RHODE ISLAND ADDENDUM
CALENDAR YEAR EXPENSE DATA
REPORTING INSTRUCTIONS

I. CALENDAR YEAR EXPENSE DATA FORM

A. OVERVIEW

This form must be completed for the States of Maine and Rhode Island only, by all insurers writing Workers Compensation Insurance in Maine and Rhode Island, to comply with Maine House Bill 605 and Rhode Island House Bill 6172.

The requirements of this addendum are due **May 15 of each year**. Maine and Rhode Island data must be completed **separately**.

B. CALENDAR YEARS TO BE REPORTED

Separate Calendar Year Expense Data Forms must be completed for Calendar Year 1989 for Maine and Rhode Island.

C. REPORTING FORM DATA ELEMENTS

1. **Loss Control Services Expense**—Those expenses incurred in carrying out recommendations made to improve the quality of a risk as a result of safety engineering surveys or otherwise, including such programs as employee training seminars, equipment maintenance programs, safety incentive programs, etc.
2. **Safety Engineering Expense**—Those expenses incurred in thorough on-site inspections and review of an insured's operations in an effort to formulate a program to improve the quality of the risk.
3. **Remaining General Expenses**—That portion of General Expenses not allotted to Loss Control and Safety Engineering expense.
4. **Total General Expenses**—Those expenses incurred for fees paid to Boards and Bureaus plus Direct Audit, Inspection and all Other General Expenses. This item shows balance to Maine and Rhode Island experience reported on lines 8(A) plus (+) 8(B) on the Calendar Year Expense Data by State.
5. **Type of Insurer**—Please identify carrier in accordance with the following table:
N—Non-Participating Stock Companies
P—Participating Stock Companies
M—Mutual Companies
R—Reciprocal Exchanges
F—State Funds
X—Miscellaneous Companies

Note: If this report is for a group with both participating and non-participating stock companies, please indicate the predominant type of insurer.

D. REPORTING NOTES

1. Expense data reported should be in whole dollars only, **no cents reported**.

2. The sum of Loss Control Expenses (1), Safety Engineering Expenses (2), and Remaining General Expenses (3) should equal Total General Expenses (4).
3. Total General Expenses (4) should equal General Expenses as reported on lines (8A) and (8B) of the Call for Calendar Year Expense Data.
4. Report separate forms for the current calendar year.

II. LOSS CONTROL AND SAFETY ENGINEERING QUESTIONNAIRE

This questionnaire requests information on changes and improvements in loss control and safety engineering by each carrier writing in Maine and Rhode Island. Answer all questions, with **separate Maine and Rhode Island responses required for each calendar year**.

III. EXPLANATION OF LOSS RESERVING QUESTIONNAIRE

This questionnaire requires carriers to document the reserving policy used for Maine and Rhode Island Workers Compensation loss reserves. Also included are the interest rates accessed in determining present value to the reserves for which they apply. **Separate Maine and Rhode Island responses are required for loss reserves valued as of December 31 of each year.**

IV. RHODE ISLAND INTEREST AND PENALTIES QUESTIONNAIRE

This questionnaire requires carriers to provide information on the amount of money expended to pay back (accrued) interest to claimants and the amount of money expended to pay all penalties required by the Workers Compensation Act. The information reported should reflect all monies expended for interest and penalties during calendar year 1990.

This questionnaire is mandated for all carriers that had premium writings in Rhode Island in the year reported. If no interest or penalties were paid, complete the top of the questionnaire and indicate this by checking the no interest or penalties to report box.

If you do not write workers compensation insurance in Rhode Island and had no interest or penalties paid on previous policy years, please complete the carrier information on the top of the questionnaire and check the box that indicates no workers compensation premiums were written in Rhode Island in the year shown on the form.

V. REPORTING DUE DATE AND NCCI MAILING ADDRESS

The complete Maine and Rhode Island Calendar Year Expense Data Addendums and the Rhode Island Interest and Penalties Questionnaire for Calendar Year are due at NCCI no later than **May 15 of the following year**.

These addendums to the Calendar Year Expense Data Call should be mailed along with Call for Experience #14.

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

STATISTICAL CALL NAME:

Semiannual Call For Compensation Experience (Call #17)

DESCRIPTION OF CALL:

This call contains dollar amounts for workers compensation Standard Earned Premium at NCCI DSR level, Standard Earned Premium at Company level, Net Earned Premium, and Total Incurred Losses for the first half of the specified calendar year. Each NCCI member carrier is required to submit this information for each state in which they operate. Some states require all carriers writing workers compensation policies to submit financial calls.

The Semiannual Call for Compensation Experience is used to derive 1/1 through 6/30 Calendar Year data. This allows semiannual updates of exhibits utilizing Calendar Year data which would be limited to annual updates if the Semiannual Call for Compensation Experience were not collected.

FILES/DATABASES:

Semiannual Call Production File:

This file serves as the central repository for Semiannual Call data. This file contains all data received from the carriers as well as corrections applied to this data. Corrections to the file are made via ACS for data entry of revised reports with electronic transfer of the data to NCCI for incorporation into the production file.

Semiannual Call SAS Dataset:

This dataset serves as the work file for producing exhibits utilizing this data. Actuarial analysis and reporting programs are executed using the data in this file.

SAS datasets are created for only those states for which exhibits are produced. The SAS dataset only contains data for the specified state. This file is created through an extraction from the Calendar Year Call production file.

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

DESCRIPTION OF ERROR HANDLING:

Semiannual data is validated using automated reports as the data is received from the carrier.

Carriers are sent written correspondence to resolve any errors identified during validation. As revised reports are received, they are checked for accuracy and then if correct are sent to ACS for processing.

MODIFICATIONS TO DATA:

Revised reports are processed as they are received. Any data containing unresolved errors will be removed from the dataset if resolution of the remaining errors is not possible within the framework of the production schedule.

All revised data is requested to be submitted on revised reports or via written correspondence. When production deadlines require an immediate response, telephone responses are accepted with the stipulation that a written confirmation of the changes also be submitted.

CALL FOR EXPERIENCE #17
SEMI-ANNUAL CALENDAR YEAR CALL

Background and Purpose of the Report

The Semi-Annual Calendar Year Call is due at NCCI on or before August 15 of the same year as the experience being collected. As an example, the Semi-Annual Call for January 1, 1990 through June 30, 1990 Calendar Year Experience is due at NCCI on or before August 15, 1991.

This call is one of the five standard annual calls for experience subject to the Performance Evaluation Monetary Incentive Program (PEMIP).

For each Semi-Annual Call Year, the first six-months of data must be reported on a state basis. The Semi-Annual Call is reported only once every year, with the current Calendar Year January-June data the reportable experience. Semi-Annual Calendar Year Transactions include all premium and claims transactions that occurred in the first six-months of the current year. As a result, this six-months of Calendar Year data will include policy activity, both premium and claim which originated from prior policy years.

The Semi-Annual Call is no longer used by NCCI Actuarial for ratemaking as it has been replaced by the Calendar/Accident Year Call. However, this Call is used occasionally to support rate level filings, proving useful. Results for this call are still distributed to Members and Subscribers. It is also used internally to recognize and analyze state and industry trends.

Data collected in the Semi-Annual Calendar Year Call includes earned premium and incurred losses on a state basis. Earned Premiums are separated between Standard At NCCI DSR Level and Standard At Company Level. The incurred losses include indemnity and medical benefits, along with IBNR.

The data reported in this call should **exclude experience** * developed under large deductible policies (deductible amount over \$100,000 per claim or per accident).

The Calendar Year Reconciliation Report (Call #8) has * been revised to add lines to reconcile premium and losses to Page 14 of the Annual Statement due to the exclusion of the large deductible policies.

Filing Requirements

Semiannual Call for Compensation Experience by State—Calendar Period January 1 through June 30 of the Current Year—Due August 15 of the same year

In accordance with the approved statistical program, you are hereby requested to file with NCCI on or before August 15 of each year your compensation experience for the Calendar Year period from January 1 to June 30 of the same year.

This Call is included in PEMIP (Performance Evaluation Monetary Incentive Program) and will be subject to assessments for late and/or inaccurate reporting. Details of PEMIP are updated annually in January of each year.

Note that the data required on the Semiannual Calendar Year Call is now identical to that required on the annual

Calendar Year Call (Call #2). Net Earned Premium has been added to the Call and the Loss Ratio eliminated.

Two copies of the form for reporting the required information are provided in the package of calls sent to carriers in October of each year. One copy is to be filed with NCCI and the other copy is for your records. The states (or jurisdictions) for which the requested data is to be filed are listed on the attached forms.

Questions regarding reporting requirements on completion of the Calls should be directed to Aggregate Ratemaking at (407) 997-4395.

A. GENERAL INSTRUCTIONS

1. Group Report

Carrier name and five-digit code must be shown on reporting forms. If this is a group reporting, each carrier writing compensation must be listed individually on the form. With respect to affiliated carriers, it will be appreciated if you will follow the same method of reporting for this Call (individual company basis or group basis) as was followed in compliance with Call for Experience #2, the Calendar Year Call. If this is not convenient, please advise us that you have changed procedure.

2. Standard Earned Premiums at NCCI Designated Statistical Reporting Level

Standard earned premiums shall be the entire earned premium for the state resulting from standard rating procedures after the application of:

1. Experience rating plan adjustments (Note: Except for Michigan experience, experience rating plan adjustments must reflect only NCCI published modification factors.)*
2. Expense Constants (These are the Expense Constants published by NCCI or an independent bureau. For Voluntary Business in pure premium states, Expense Constants at NCCI DSR level are 0.)
3. Loss Constants (These are the Loss Constants published by NCCI or an independent bureau. For Voluntary Business in pure premium states, Loss Constants at NCCI DSR level are 0.)

but prior to the application of:

1. Deviations from NCCI designated Statistical Reporting rates or pure premiums**
2. Deviations from published NCCI experience rating plan modification factors (except Michigan)*
3. Retrospective rating plan adjustments
4. Other individual risk rating plan adjustments*** (e.g., Schedule Rating)

Effective January 1, 1990

5. Premium discounts
6. Expense modification program adjustments
7. Payment of policyholder dividends
8. Premium credits for small deductible coverage

* Carriers must report their Standard Earned Premium at NCCI's experience rating plan level for all states except Michigan. For Michigan, carriers may report their Standard Earned Premium at their own experience rating plan level if they use their own experience rating plan.

** Rates: Arkansas, Georgia, Illinois, Indiana, Rhode Island, and Vermont
Pure Premiums: Connecticut (for policies effective 1/1/90 and subsequent), Kentucky, Louisiana, Maryland, Michigan, New Mexico (for policies effective 1/1/90 and subsequent), Oregon

*** Note that premium adjustments resulting from the application of individual risk rating plans other than experience rating must be excluded from both Standard Earned Premium at Company Rate Level and Standard Earned Premium at NCCI Level.

3. Standard Earned Premium at Company Level

The earned premium on all risks after the application of:

1. Deviations from NCCI Designated Statistical Reporting rates or pure premiums*
2. Experience rating plan adjustments (Note: Except for Michigan experience, experience rating plan adjustments must reflect only NCCI published modification factors.)**
3. Expense Constants (Carrier charged Expense Constants)
4. Loss Constants (Carrier charged Loss Constants)

but prior to the application of:

1. Deviations from published NCCI experience rating plan modification factors (Except Michigan)**
2. Retrospective rating plan adjustments
3. Other individual risk rating plan adjustments*** (e.g., Schedule Rating)
4. Premium discounts
5. Expense modification program adjustments
6. Payment of policyholder dividends
7. Premium credits for small deductible coverage

* Rates: Arkansas, Georgia, Illinois, Indiana, Rhode Island, and Vermont
Pure Premiums: Connecticut (for policies effective 1/1/90 and subsequent), Kentucky, Louisiana, Maryland, Michigan, New Mexico (for policies effective 1/1/90 and subsequent), Oregon

** Carriers must report their Standard Earned Premium at NCCI's experience rating plan level for all states except Michigan. For Michigan, carriers may report their

Standard Earned Premium at their own experience rating plan level if they use their own experience rating plan

*** Note that premium adjustments resulting from the application of individual risk rating plans other than experience rating must be excluded from both Standard Earned Premium at Company Rate Level and Standard Earned Premium at NCCI Rate Level.

For every state in which Standard Earned Premium at DSR Level is reported, Standard Earned Premium at Company Level must be reported as well.

4. Carriers Writing at Deviations from NCCI Rates in Administered Pricing States

For State Funds and other carriers writing at deviations from Bureau Rates in non-competitive rating states, the Standard Earned Premiums must be adjusted to Bureau rate level and must be reported in the column labeled "STD NCCI Designated Stat. Reporting Level." The Standard Earned Premiums at the carrier rate level must be reported in the column labeled "Standard Earned Premium at Company Level."

Carriers that do not deviate from NCCI rates must enter their standard earned premium in the column labeled "STD NCCI Designated Stat. Reporting Level" and must enter the same figure in the column labeled "Standard Earned Premium at Company Level."

5. Competitive Rating States

For Arkansas, Connecticut, Georgia, Illinois, Indiana, Kentucky, Louisiana, Maryland, Michigan, New Mexico, Oregon, Rhode Island and Vermont, carriers must enter the standard earned premium figures at NCCI level and company level in the appropriate columns on the form.

6. Net Earned Premium

Net earned premium shall be the actual earned premium on all risks prior to the payment of policyholder dividends, but after application of any retrospective rating premium adjustments, after the application of premium discounts in accordance with Manual Rules, after the expense modification program, after any deviations or "write-offs" from Bureau rates or pure premiums, and after the effect of any schedule rating premium adjustments.

7. Incurred Losses

Losses reported by state should include compensation and medical incurred during this calendar year period. For further details on the inclusion or exclusion of certain losses and/or reserves, please refer to the specific instructions below.

8. Rounding Procedure and Reporting of Credits

Please report amounts of premiums and losses in whole dollars only. Count fifty cents and over as an extra dollar, and reject the cents if less than fifty. Please show negative amounts enclosed within parentheses so that they may be handled properly in data entry operations.

9. Total Experience

Kindly show the totals of all amounts reported on the last line captioned "Countrywide Total."

10. Signature Requirement

The person responsible for the completion and accuracy of this Call should sign and date the reporting form.

11. Full Submission

Report should include ALL States in which company has data to report. Resubmission or correction must also include all states, not just revised states.

B. SPECIFIC INSTRUCTIONS

1. "F" Classifications

Experience of the "F" Classifications for policies effective January 1, 1974, and thereafter, **MUST BE EXCLUDED.**

2. Coal Mine Experience

Underground Coal Mine experience **MUST BE EXCLUDED** in all states except Pennsylvania and Virginia. In Pennsylvania and Virginia **ALL Coal Mine Experience MUST BE EXCLUDED.**

3. Excess Policies

Experience on excess policies **MUST BE EXCLUDED.**

4. National Defense Projects

Experience on National Defense Projects written under the old Comprehensive Rating Plan or the new National Defense Projects Rating Plan **MUST BE EXCLUDED.** Experience incurred on a Defense Base should be included unless written under the National Defense Projects Rating Plan.

5. Reinsurance

No deductions shall be made from premiums and losses for or on account of reinsurance ceded. Premiums and losses arising from reinsurance received by the reporting company shall be excluded from the experience. Experience reported should be **DIRECT BUSINESS ONLY.**

6. Assigned Risk

Experience for assigned risk policies must be **INCLUDED.** Assigned risk policies must be reported at the level of approved assigned risk rates.

7. Experience Incurred Under Occupational Disease Act

Experience incurred under any Occupational Disease Act which is separate and distinct from the Compensation Act for the state shall be combined with the traumatic experience under the State Compensation Act, and the total of such combined experience shall be reported.

8. IBNR

Losses reported by state should include an appropriate reserve for incurred but not reported cases.

9. Reopened Cases

Include an appropriate loss reserve for reopened cases.

10. Reserves for Specific Contingencies

Include medical and other loss reserves to meet specific contingencies.

11. Other Voluntary Reserves

Exclude voluntary reserves other than those mentioned above.

12. Expenses

Exclude all expenses, either allocated or unallocated except allocated Coverage B loss adjustment expense.

13. Assessments and Special Compensation Funds

The inclusion of assessments and other compensation special funds as incurred losses in the Calendar Year data follows the same instructions that apply in reporting of experience under the NCCI Workers Compensation Unit Statistical Plan Manual. Specifically, when the compensation law states that, in connection with certain types of injury a specified amount shall be paid into special funds (e.g., a Second Injury Fund), and that such amounts are in addition to the compensation payable to the injured worker or his dependents, then the combined total amount shall be reported as incurred indemnity losses. Examples are: (1) payments in no-dependent death claims, and (2) a specified percentage of the permanent partial award. However, any special payments to the states that are assessed on total premium writings, total losses paid or incurred, or total indemnity losses paid or incurred instead of on a per claim basis, shall not be reported as losses to the rating bureau. Assessments on USL&HW Act cases as required by the U.S. Department of Labor should also be excluded. In other words, special funds or assessments are reported as incurred losses only when the assessment is levied on certain types of injuries.

A list of specific assessments and other compensation special funds for each state and the proper treatment for including these assessments in calendar year submissions is attached.

14. Small Deductible Programs *

In states in which small deductible programs apply, losses are to be reported on a gross basis inclusive of the employee paid loss amount.

15. Taxes and Assessments in Kentucky

Taxes and assessments on premiums earned in Kentucky on or after January 1, 1977 **MUST BE EXCLUDED.**

Please note that the date for reporting this data is on or before August 15 of each year. It is urged that every effort be made to comply with this reporting date, as a delay in receiving this data will seriously hamper NCCI in its preparation of rate revisions. Please mail this Call to:

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

STATISTICAL CALL NAME:

Loss Adjustment Expense Call On Countrywide Direct Workers Compensation Business
(Call #19)

DESCRIPTION OF CALL:

This call contains dollar amounts for workers compensation Incurred Losses , Allocated Loss Adjustment Expense, Unallocated Loss Adjustment Expense, and Total Loss Adjustment Expense separated into indemnity and medical components by Accident Year. Each NCCI member carrier is required to submit this in aggregate for all the states in which they operate. Some states require all carriers writing workers compensation policies to submit financial calls.

The Loss Adjustment Expense Call is used to determine Loss Adjustment Expense provisions included in NCCI manual rates and advisory rate filings.

FILES/DATABASES:

Loss Adjustment Expense Call Production File:

This file serves as the central repository for Loss Adjustment Expense Call data. This file contains all data received from the carriers as well as corrections applied to this data. Corrections to the file are made via ACS for data entry of revised reports with electronic transfer of the data to NCCI for incorporation into the production file.

DESCRIPTION OF ERROR HANDLING:

Loss Adjustment Expense data is validated using automated reports when the data is received from the carrier.

Carriers are sent written correspondence to resolve any errors identified during validation. As revised reports are received, they are checked for accuracy and then if correct are sent to ACS for keypunching.

DESCRIPTION OF DATA COLLECTION AND DATA HANDLING

Statistical Call Overview Document

MODIFICATIONS TO DATA:

Revised reports are processed as they are received. Any data containing errors which can not be resolved in a time for rate filing deadlines is removed from the dataset.

All revised data is requested to be submitted on revised reports or via written correspondence. When production deadlines require an immediate response telephone responses are accepted with the stipulation that a written confirmation of the changes also be submitted.

CALL FOR EXPERIENCE #19
CALL FOR LOSS ADJUSTMENT EXPENSE

Background and Purpose of the Report

The Call for Loss Adjustment Expense—Countrywide Direct Workers Compensation Business is due at NCCI on June 1 of the current year for loss adjustment expense data valued as of December 31 of the previous year.

At its October 12, 1988 meeting, the Actuarial Committee reviewed the latest available loss adjustment expense data. Currently, Staff has the following data available concerning loss adjustment expense:

1. Calendar year loss adjustment data on a direct basis.
2. Accident year allocated and unallocated loss adjustment expense data on a net basis.

The Committee wants to collect accident year loss adjustment expense information on a direct basis for the purpose of better analyzing loss adjustment expenses.

The data for completing Call #19 is similar to the data from Schedule 'P' Part 1D of the carrier's Annual Statement; except the data for this Call is on a direct basis.

The Call contains the same amount of accident years as Schedule 'P' of the Annual Statement. The carrier's definition of allocated loss adjustment expense is to be consistent with the definition adhered to in Schedule 'P'. The Call includes total paid and total outstanding loss adjustment expenses. Unallocated loss adjustment expenses are reported for all accident years.

The intent of this Call is to collect accident year loss adjustment expense information on a direct basis. This data is used for calculating the loss adjustment expense included in the NCCI manual rates.

Filing Requirements

Call for Loss Adjustment Expense—Countrywide Direct Workers Compensation Business as of December 31 of each year—Due June 1 of the following year

In accordance with the approved statistical program, you are hereby requested to file with NCCI on or before June 1 of each year, your loss adjustment expense—countrywide direct workers compensation business valued as of December 31 of the previous year.

Two copies of the reporting form for the required information are provided in the package of reporting forms sent to carriers in October of each year. One copy is to be filed with NCCI and the other copy is for your records.

Questions regarding reporting requirements on completion of the Call should be directed to Claims Cost Analysis at (407) 997-4347.

GENERAL INSTRUCTIONS

1. Group Report

Carrier name and five-digit code must be shown on the reporting form. If this is a group reporting, each carrier writing compensation must be listed individually on the reporting form. List only the names or carrier codes of those carriers that have direct business during at least one of the policy years for which data is required.

2. Accident Year Losses

- (1) Paid: Enter all Workers Compensation loss payments figures. This is similar to item #3 of Schedule 'P' Part 1D for the required years, except this Call requires direct business information.
- (2) Outstanding: Enter all Workers Compensation losses unpaid. This is similar to item #9 of Schedule 'P' Part 1D for the required years, except this Call requires direct business information.

LOSS ADJUSTMENT EXPENSE

3. Accident Year Allocated

- (3) Paid: Enter all Workers Compensation allocated loss expense payment figures. This is similar to column #4 of Schedule 'P' Part 1D for the required years, except this Call requires direct business information.
- (4) Outstanding: The method for calculating the figures to be reported in this column is to be consistent with the method used for splitting paid allocated and unallocated loss adjustment expense on Schedule 'P'.

4. Accident Year Unallocated

- (5) Paid: Enter all Workers Compensation unallocated loss expense payment figures. This is similar to column #5 of Schedule 'P' Part 1D for the required years, except this Call requires direct business information.
- (6) Outstanding: The method for calculating the figures to be reported in this column is to be consistent with the method used for splitting paid allocated and unallocated loss adjustment expense on Schedule 'P'.

5. Accident Year Total

- (7) Paid: Enter the sum of the figures reported in column #3 (paid allocated LAE) and column #5 (paid unallocated LAE) for the years required.

(8) Outstanding: Enter the sum of the figures reported in column #4 (allocated outstanding LAE) and column #6 (unallocated outstanding LAE) for the years required.

5a. Total (of A to L)

Enter the sum of lines a to l for each column (1 to 8).

6. Current Calendar Year

The last line of the call for Loss Adjustment Expenses asks for LAE data for the calendar year being reported. The required information is defined as follows:

COLUMN NUMBER	DATA DEFINITION
(1)	Enter the amount paid in Workers Compensation losses for the year being reported.
(2)	Enter the amount of change in Workers Compensation loss reserves for the year being reported.

(3) Enter the amount paid in allocated loss adjustment expense for the year being reported.

(4) Enter the amount of change in allocated loss adjustment expense reserves for the year being reported.

(5) Enter the amount paid in unallocated loss adjustment expense for the year being reported.

(6) Enter the amount of change in unallocated loss adjustment expense reserves for the year being reported.

(7) Enter the total paid Loss Adjustment Expense for the year being reported.

(8) Enter the change in Loss Adjustment Expense reserves for the year being reported.

Please note that the date for reporting this data is on or before June 1 of each year.

NAIC Examination of NCCI
Description of Data Collection and Data Quality
How to Use the Flowchart Documentation

Introduction:

The processing at NCCI has been documented using a graphic representation known as flowcharting. Flowcharts depict manual and automated procedures. They are read from the left to right, top to bottom unless otherwise noted by arrows.

The Section II Appendix includes flowcharts which detail the processing at NCCI. The flowcharts are divided into seven functional areas defined in the Description of Data Collection and Data Handling and depicted on the Overall Processing Flow (000).

The flowcharts for the seven functional areas are comprised of up to four levels of detail which are identified by numbers ranging in 100's, 200's, 300's, and 400's. The first is a high level depiction of the specified function. High level flows are exploded into more detail are indicated by the flowchart immediately above it.

Each flowchart is identified by a code located in the upper right hand corner of each flow diagram. The first character identifies the functional area. The second character defines the level of detail. The third, fourth and fifth characters specify the sequence of the flowcharts, much like page numbers.

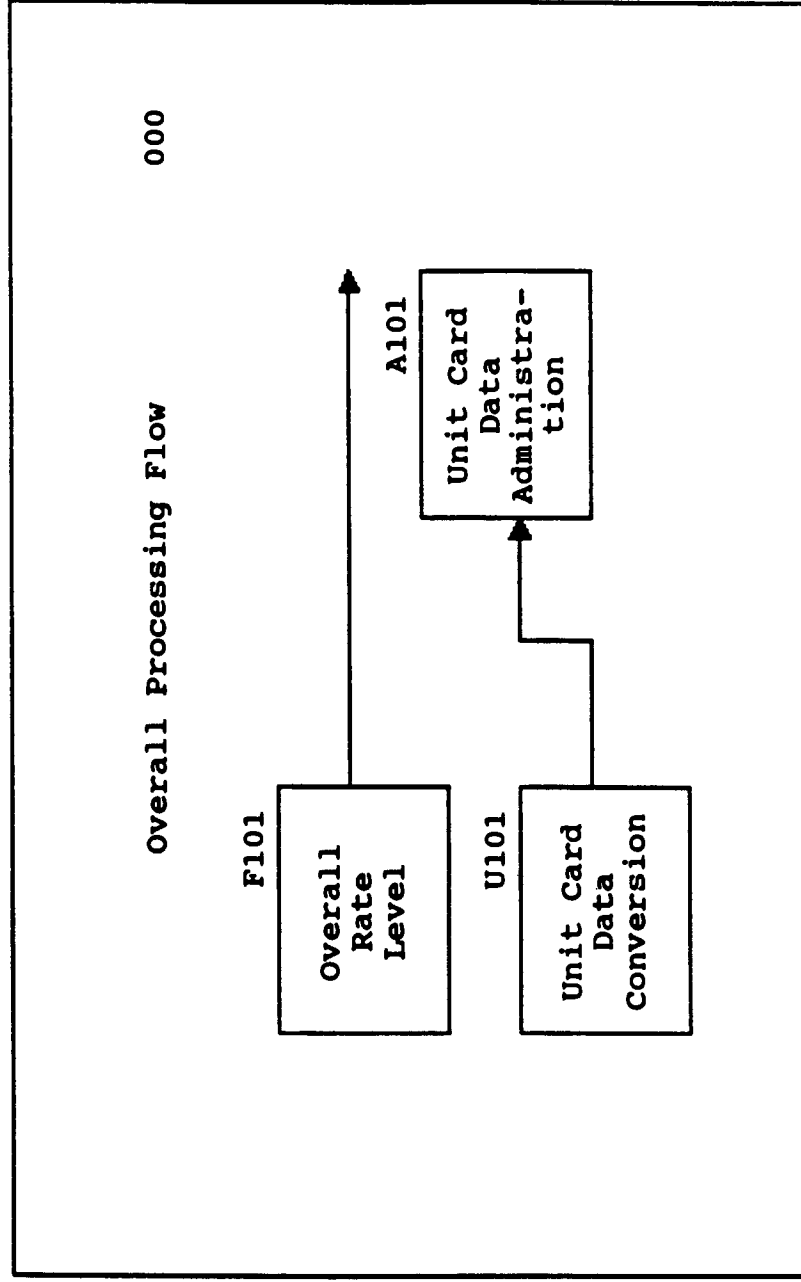

NAIC Examination of NCCI

Description of Data Collection and Data Quality

How to Use the Flowchart Documentation

Introduction:

The following example, taken from the Overall Processing Flow (000), references the Unit Card Data Conversion (U101), Overall Rate Level (F101) and Unit Card Data Administration (A101) areas.

NAIC Examination of NCCI

Description of Data Collection and Data Quality

How to Use the Flowchart Documentation

Introduction:

The Unit Card Data Conversion area is referenced on the Overall Processing Flow (000) on the previous page by the U101 indicator. The Unit Card Data Conversion 100 level flow identified by U101, references 200 level processes within the Unit Card Data Conversion area. Examples of the 200 level processes would be Preprocess Hard Copy Unit Cards (U201), Retrieve/Validate Risk ID (U203) and Disperse Unit Card Data (U204). The Preprocess Hard Copy Unit Cards (U201) diagram references more detailed, 300 level flows.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Volume III: Table of Contents

- A. Overall Rate Level
- B. Unit Card Data Conversion
- C. Unit Card Data Administration
- D. Class Ratemaking
- E. Experience Rating
- F. Detailed Claim Information
- G. Policy Issue Capture
- H. Appendix: Summary of Sample Test Results

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

A. Area Overview

The Overall Rate Level area collects aggregate premium, loss and expense data from each carrier on forms referred to as financial calls. NCCI receives approximately 95% of financial calls on hardcopy. The remaining calls are submitted by carriers on microcomputer diskette.

Aggregate premium, loss and expense data is combined with data from prior years to produce an overall rate level change recommendation for the industrial classes in each state. The proposed overall rate level change is delivered to Class Ratemaking for use in deriving rates by class and is included as part of the annual state rate filing.

For a more detailed description of the Overall Rate Level area, refer to Volume II, Section I, Description of Data Collection and Data Handling. Detailed flow diagrams for this area are included in the Volume II Appendix.

B. Area Evaluation

Key Strengths:

- o NCCI accurately processes the aggregate premium and loss amounts reported by carriers for use in the calculation of overall rate level indications.
- o NCCI consistently uses more than 98% of the premium written in a state to calculate the overall rate level.
- o NCCI's Quality Control department provides an independent check of critical validations and calculations used to determine the overall rate level.
- o NCCI performs extensive actuarial analysis of the financial call data as reported by the carriers.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

Key Weaknesses:

- o Current NCCI policy, procedures, and systems place too much of the burden of data verification and error correction on NCCI, and not enough on the carriers.
- o NCCI has limited controls over its end user systems. These systems account for the majority of overall rate level processing.
- o NCCI collects F-Class financial call data which is not used to determine rate level changes and is not currently validated.
- o The fines assessed through NCCI's current monetary incentive program do not provide significant financial incentive to improve carrier performance.

Key Recommendations:

- o NCCI should place more of the burden of the correction and validation of financial call data on the carriers.
- o NCCI should develop, establish, and strictly enforce standards for developing, executing, and maintaining end user applications.
- o NCCI should examine their current list of financial calls. Calls which are not validated or required should be eliminated.
- o Fines for late submissions and errors should be more significant and should also be assessed for failure to respond to NCCI inquiries about possible errors. This would encourage carriers to submit quality data on time and to respond promptly to NCCI requests for additional information.

C. Testing Objectives

- To evaluate the quality and adequacy of financial call data validation in Overall Rate Level.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

- To evaluate the controls over completeness of financial call data used to produce overall rate level indications.
- To verify that all corrections made to financial call data are documented and authorized by the appropriate carrier.
- To evaluate the accuracy of financial call data used to determine overall rate level indications as compared to the data reported by carriers.

D. Testing Methods

The evaluation of Overall Rate Level was accomplished through control procedures review, systems review and analysis, and statistical sampling. These techniques are described in the Evaluation Approach section of Volume I, Part C of this report.

E. General Observations & Recommendations

1) NCCI has limited controls over its end user systems in Overall Rate Level.

The Overall Rate Level area currently performs a great deal of its automated processing using systems controlled by actuarial personnel. These systems perform functions critical to NCCI's ratemaking function. They perform extensive financial call data validation, data correction and actuarial analysis and produce major components of rate filings. While these systems seem to operate adequately and the results are carefully checked by the Quality Control function, they do not have systems controls commensurate with their importance to NCCI's business objectives.

Key deficiencies include:

- o There are no processing control reports or audit trails which document the activity of extraction and update programs.
- o Documentation of existing applications is limited.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

- o There are no standards for testing new application programs or making changes to existing application programs.

Given the importance of end user computing to the Overall Rate Level process, NCCI is incurring significant risks due to their current lack of controls.

NCCI should implement more stringent controls over its end user computing environments. Standards for developing, executing, and maintaining end user applications should be established and strictly enforced.

We understand that NCCI is now developing an end user computing policy which is intended to address data processing controls.

- 2) Many of NCCI's end user systems in the Overall Rate Level area could be moved to a production environment.

The vast majority of validation of and correction to financial call data used to produce overall rate level indications is accomplished through the execution of end user controlled applications. Many of these applications are executed every year for each state.

Some of the validation processes performed through end user computing for each state are:

- o Policy Year and Accident Year Validation error reports which identify reporting errors that will have a net effect on the state rate level.
- o Deviation Analysis reports which compare the ratio of Standard Premium at NCCI Designated Statistical Reporting (DSR) Level to Standard Premium at Company Level on the Policy Year Call to NCCI's estimate of the ratio.
- o The Reconciliation Report which reconciles data used in the rate level calculations to the annual statement.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

- o Policy Year and Accident Year Check Reports which check to see that the allocation of losses to the Policy Year and Accident Year is consistent.

NCCI actuarial personnel currently maintain and execute these applications. Some of the types of modifications recently made to the validation and deviation analysis programs by end users are:

- o The validation programs were modified to allow validation of the new Assigned Risk Calls.
- o New edits were created to check for 8th-to-Ultimate development and separate indemnity and medical developments.
- o Enhancements were made which enabled more accurate validation of the Designated Statistical Reporting Level premium by utilizing the new Assigned Risk Financial Call.
- o The 8th-to-Ultimate development edit was changed to 10th-to-Ultimate, to reflect the collection of 10th-to-Ultimate data.

The "basic" and "general" edit functions do not change significantly from one year to the next and could be supported by NCCI's data processing department. Some functions, such as actuarial analysis, are better suited to an end user computing environment.

NCCI should move stable, regularly executed end user applications into a production environment where they can be maintained and executed by NCCI's data processing department. This will reduce the risk of processing errors by taking advantage of a more tightly controlled environment.

- 3) NCCI collects F-Class financial data which is not used to set rate levels and is not currently validated.

Each year, NCCI distributes twenty-two requests for financial data (financial calls) to member carriers. These financial calls provide NCCI with information necessary to determine overall rate level indications and to respond to state specific information requirements.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

The two "F-Class" calls collected by NCCI are not used to set rate levels or to respond to state insurance commission requests for information.

The F-Class Calendar Year Call and the F-Class Policy Year Call were originally distributed in 1974. In 1978 it was determined that most of the carriers had problems reporting F-Class financial data. NCCI decided to try to use statewide development factors or to use WCSP data to come up with a trending model. To NCCI it appears that trending using WCSP data is more accurate.

In 1986 an attempt was made to produce F-Class rate levels using the F-Class financial call data, but quality problems as well as the relatively low premium volume in most states led to results of questionable value. In the eight years between 1978 and 1986 no significant improvement was noted in F-Class data quality.

F-Class calls have never been consistently validated. Currently there are only two identified uses of the F-Class calls. The first use is to determine assigned risk market share. This figure is used as part of the calculation of on-level factors. An on-level factor is a factor that adjusts premiums (losses) to the current premium or law level. The second use is part of a reconciliation of financial call data to page 14 data in the insured's annual statement. During this process, the F-Class Calendar Year Net Direct Earned Premium and Direct Incurred Losses are used to verify the insured's reported data on the Calendar Year Reconciliation Report. F-Class calls will no longer be used when data from the newly implemented Assigned Risk calls is deemed mature.

NCCI should examine their current list of financial calls. Calls which are not required should be eliminated. Carriers should be required to submit quality data for any remaining calls. Likewise, NCCI should fully validate any financial data they continue to request from the carriers.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

- 4) The fines assessed through NCCI's current monetary incentive program are not large enough to provide an effective incentive to improve carrier reporting.

NCCI currently distributes twenty-two financial calls to over 400 carriers/carrier groups. NCCI procedures indicate that carriers are fined for:

- o Late financial call submissions.
- o Data submitted in error.
- o Late responses to NCCI requests for additional information.
- o Financial call submissions which are not reported in sequential page order.

We observed that NCCI assesses fines according to their procedures except for fines for late responses to requests for additional information. NCCI requests this information from carriers to explain unusual shifts in financial call data or to correct identified errors. NCCI procedures allow carriers two weeks to respond. Although carriers are often delinquent in responding, NCCI is not currently assessing any fines for late responses.

In a 1990 rate filing, a carrier's financial call data was not available at the time of preparation of the policy year and accident year rate filing calculations. This carrier wrote approximately 5% of the state's direct written premium. The carrier originally submitted its financial calls to NCCI, but additional information was requested before the data was to be used in the rate filing calculations. Unfortunately, the carrier did not respond to several requests by NCCI for additional information and its data was omitted from last year's rate filing.

Even the fines that NCCI does assess do not appear to be effective in encouraging timely, quality data submissions from carriers.

Fines assessed for errors in submitted data are based on three levels of editing:

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

- o General Edits - identify errors that will result in NCCI's inability to process the data (e.g. a missing state code).
- o Basic Edits - identify validation checks that identify conditions that can occur as the result of an error or omission and can be determined on a comparison of data elements on one or more calls. A major source of Basic edit errors is incorrect arithmetic or careless data entry (e.g. total line for IBNR losses does not equal the sum of the individual line items).
- o Actuarial Edits - identify those checks performed on a carrier's data designed to verify the accuracy and reasonableness of the data submitted (e.g. loss development for a policy year is unusual).

In addition to fining carriers for data errors and late submissions, NCCI charges carriers a \$50 reformatting fee for submissions which are not sorted in the standard NCCI sequence. Many carriers incur the \$50 charge rather than have their staff reformat the data.

In any given year, the total fines that can be assessed for a single carrier/carrier group is limited to 1/10 of 1% of the carrier/carrier group's prior calendar year net direct workers compensation premiums.

In 1990, 565 carriers were fined for late submissions and for failing "Basic" and "Actuarial" edits for their five PEMIP financial calls. There was a total fine assessment of \$72,800 for 449 "Basic" edit errors and \$77,380 for 203 "Actuarial" edit errors. Carriers were assessed \$214,122 in fines for submitting their PEMIP financial calls a total of 2,030 days late. The total fines assessed in 1990 were \$364,272, approximately 6/10 of 1% of NCCI's carrier contributed operating budget. NCCI will bill an estimated \$245,141 of this total. \$54,806 of the remaining \$119,131 is applicable to state funds. As a matter of policy, state funds do not pay fines. The remaining discrepancy is due to limitations of fines assessed against carriers.

NCCI should strongly encourage carriers to submit quality financial call information. The first step in this process is to establish precise quality and timeliness standards and to obtain carrier commitment to meet those standards. The second step is to measure and report results. Establishing consistent and regular carrier performance

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

reporting will help measure data quality and timeliness and communicate the results. Reports of carrier data quality and timeliness performance should be distributed to the carrier and to the industry as a whole. Peer reporting would assist NCCI in improving overall carrier performance. Financial incentive programs and/or fines should be more significant to encourage carrier compliance with the established quality and timeliness standards.

- 5) NCCI spends a significant amount of time performing basic and actuarial data edits which are intended to verify that carriers report data accurately and consistently. This reduces the time available to perform actuarial analysis.

Each year, NCCI receives financial calls from over 400 carriers/carrier groups. All financial call data is subjected to basic edits to ensure that all required fields are completed, detail amount fields add up to total amount fields, amounts are within acceptable limits, and data from one financial call is consistent with data reported on other financial calls. All of these edits must be performed before the actuarial analysis of the data begins.

When financial calls are received, NCCI clerks perform manual and automated processing to identify basic errors in financial data submitted by carriers. In addition, NCCI actuaries spend an average of two to three weeks per state identifying data that fails data edits.

NCCI has developed a PC edit package known as Financial Calls on Diskette (FCOD). This package provides carriers with the option of prevalidating their financial call data and submitting it on microcomputer diskette. The FCOD system package performs basic edits on financial call data, thus allowing carriers to correct the data before submitting it to NCCI. It also allows carriers to submit financial data on an electronic medium (diskettes), eliminating the need for manual entry of this data. The FCOD system does not provide a medium for carrier submitted corrections to financial call data. Only 34 of over 400 carriers/carrier groups currently submit financial call data through the FCOD system.

There are currently no carrier performance statistics available indicating the quality of the financial call data submitted on FCOD versus the data previously submitted on hard copy financial calls.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

NCCI should institute procedures to require carriers to validate and correct their own financial call data. While the current FCOD system is an excellent first step, more significant carrier participation and a mechanism for carrier submitted corrections are required to make it effective. The FCOD system should be enhanced and required. More significant fines should be assessed against carriers for all data submitted in error.

NCCI will still be required to validate carrier data, but by placing more of the burden of correction and validation of financial data on the carriers, NCCI actuaries will have more time to perform actuarial analysis.

6) NCCI eliminates financial call data from rate level calculations.

Each year NCCI eliminates ("zeros out") financial call data from rate level calculations. This is done to reduce distortion in rate level indications caused by unusual, inaccurate, or incomplete data. In our random sample three out of 180 Policy Year calls were "zeroed out", and eight out of 180 Calendar-Accident Year calls were "zeroed out".

NCCI personnel indicate there are several reasons why carrier submitted data may be excluded or "zeroed out". Among these are:

- o Policy year losses and/or premiums are reported as negative.
- o Losses are reported without corresponding premiums.
- o Reported losses do not accurately reflect the split between medical and indemnity components.
- o Reported data reflects significant, unreconcilable increases or decreases in reserves. An example of this would be unusual changes in outstanding losses.
- o Reported data is missing certain components because the acquiring company in a merger or buyout situation does not provide the carrier with premium information related to the acquired company.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

NCCI attempts to resolve problems with data before excluding it. In reviewing 38 NCCI state rate filings for 1990, 39 carriers in total had their data "zeroed out". This was the result of 100 exclusions of specific figures relating to policy year data from rate filings and 82 exclusions of specific figures relating to accident year data.

NCCI should continue to eliminate data if it is inaccurate and will significantly distort rate level calculations. Carriers should be strongly encouraged to submit quality data and to respond promptly to NCCI requests for additional information. A more effective fining procedure that includes more significant fines for data submitted in error would help in this regard.

- 7) NCCI's Quality Control department provides an independent and thorough check of critical calculations used to determine the overall rate level.

The Quality Control department (QC) is responsible for assuring the accuracy and reasonableness of the data that affects the overall rate level. QC provides an independent check intended to verify most overall ratemaking procedures. QC performs and independently recalculates the on-level factors using the input parameters and other supporting documentation provided by the Overall Ratemaking area. An on-level factor is a factor that adjusts premiums (losses) to the current premium or law level.

QC documents the data which they review with a red dot. This red dot signifies that the value reviewed reconciles to its supporting ("backup") documentation. The review mark is also placed by any recalculations that are performed by QC.

After QC has finished their review of the overall rate level data, a Rate Level Review Form is completed. Errors that QC has identified are designated with an asterisk on a draft of the rate level filing. The rate level filing is returned to Overall Ratemaking supervisors, who ensure that all identified errors are investigated and corrected.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

F. Specific Tests Performed

- 1) Evaluated the controls over receipt and data entry of hard copy financial calls.
 - Determined whether existing controls over carrier submission of financial calls are being executed.
 - Evaluated the adequacy of existing controls over carrier submission of financial calls.
 - Determined whether existing visual edits of financial calls are performed and that identified errors are cleared.
 - Evaluated the manual sorting process for hard copy financial calls.
 - Evaluated whether General edit errors are cleared properly and on a timely basis.

- 2) Evaluated procedures in place to validate and correct financial call data by carrier.
 - Determined whether corrections identified were applied to the Financial Call Production File.
 - Determined whether all corrections made to the financial call data had supporting documentation to explain any changes made.

- 3) Evaluated procedures in place to identify and clear errors using the Loss Analysis Report.
 - Evaluated whether those exceptions identified using the Loss Analysis Report were corrected and cleared on a timely basis.
 - Evaluated the procedures that ensure that carriers who reported total losses incurred which do not reconcile to their medical and indemnity amounts are identified and corrected.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

- Determined whether the proper level of management reviews this report.
- 4) Evaluated procedures in place to identify and clear errors using the Policy Year Validation, Accident Year Validation, and Deviation Analysis reports.
- Evaluated whether error messages are properly investigated and corrected on a timely basis.
 - Determined whether errors that were cleared or explained are supported with sufficient documentation.
 - Reviewed the documentation sign-off procedures to ensure that all errors have been addressed.
 - Evaluated whether sufficient documentation exists to explain discrepancies or changes in the rate level package.
- 5) Evaluated procedures to reconcile Policy Year and Accident Year information included in the final rate filing.
- Reconciled Policy and Accident year summaries to Policy and Accident year Early Warning reports.
 - Reconciled Policy and Accident year Early Warning reports to the Rate Level Including IBNR report.
- 6) Evaluated controls to ensure the accuracy of development factors used in determining overall rate levels.
- Determined whether the Development Checksheet Report identifies carriers that have contributed to any differences between this and last year's Policy Year Development Factors.
 - Determined whether development factors from the Policy Year Summary and Accident Year Summary Reports were used in last year's rate filings.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

- 7) Evaluated the effectiveness of the Quality Control Department in ensuring the accuracy of overall rate level indications:
- Determined whether Quality Control provides an independent check of the critical validations and calculations used to determine the aggregate ratemaking level.
 - Determined whether the input financial data used in the aggregate rate level calculations are correct.
 - Evaluated whether an adequate audit trail exists to determine what has been reviewed by Quality Control.
 - Determined whether the new on-level factor calculations are being computed properly.
 - Evaluated whether procedures exist to ensure that discrepancies identified by Quality Control are cleared on a timely basis.
- 8) Statistically sampled financial call data and compared it to originally submitted financial call forms and documented corrections.
- An attribute sampling approach was used. This approach measures frequency of errors rather than size of errors.
 - Five populations were defined. The Policy Year and Calendar-Accident Year populations consisted of all records submitted in 1987, 1988 and 1989. The Calendar Year, Insurance Expense Exhibit and Calendar Year Reconciliation Report By State populations consisted of all records submitted in 1989.
 - A confidence level of 95%, an expected error rate of 2% and a tolerable error of 5% were used to determine the sample sizes.
 - Samples were extracted from NCCI's computerized files used for overall ratemaking.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

- These samples were verified by comparing the original financial call to its corresponding file record. The specific fields tested for each call were:
 - o Calendar-Accident Year - State Code, Standard Premium, Company Premium, Net Premium, Total Losses Paid, Total Losses Outstanding excluding IBNR, Total IBNR, Total Incurred Losses including IBNR, Incurred Indemnity Claim Count, Paid Indemnity, Paid Medical, Outstanding excluding IBNR Indemnity, Outstanding excluding IBNR medical, IBNR Medical, and IBNR Indemnity.
 - o Policy Year - State Code, Standard Premium, Company Premium, Net Premium, Total Losses Paid, Total Losses Outstanding excluding IBNR, Total IBNR, Total Incurred Losses including IBNR, Incurred Indemnity Claim Count, Paid Indemnity, Paid Medical, Outstanding excluding IBNR Indemnity, Outstanding excluding IBNR medical, IBNR Medical, and IBNR Indemnity.
 - o Calendar Year - Net Direct Earned Premium, Direct Incurred Losses, State Code, Standard Premium and Company Premium.
 - o Calendar Year Reconciliation Report By State - Code, Net Direct Earned Premium and Direct Incurred Losses.
 - o Insurance Expense Exhibit - Net Premiums Written, Net Premiums Earned, Net Losses Incurred, Loss Adjustment Expenses, Acquisition Field Supervision and Collection Expenses, General Expenses, Taxes, Licenses and Fees, Net Investments and Total Expenses.
- All identified discrepancies were discussed and researched with NCCI personnel. Results were summarized and included in the Appendix of this volume.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

9) Judgmentally sampled carrier submitted financial calls and compared them to the Financial Call Production File.

- A judgmental sample of fifty carrier submitted financial calls was selected from the financial calls received in 1988, 1989 and 1990. Twenty-five Policy Year and Twenty-five Accident Year financial calls were selected from microfilm records.
- The financial calls selected were compared to data contained on the Financial Call Production File to determine whether the data existed on the file.
- All identified discrepancies were discussed and researched with NCCI personnel. Results were summarized and included in the Appendix of this volume.

G. Specific Findings & Recommendations:

1) Aggregate premium and loss amounts reported by carriers are accurately processed for use in the calculation of overall rate level indications.

NCCI's electronically stored financial call data was compared to carrier submitted source documents. This comparison was performed for five financial calls collected by NCCI. A summary of the results follows:

- o In a random statistical sample of 180 Calendar-Accident Year financial call records, one error which affected three premium fields was noted. This error was caused by receipt of a correction call after the overall rate levels had been produced. In addition, NCCI actuarial personnel zeroed out data for eight carriers. While eliminating data is warranted in many cases, these eliminations were considered to be errors for the purpose of quantifying the sample test results.
- o In a random statistical sample of 180 Policy Year financial call records, data for three carriers had been zeroed out.
- o In a random statistical sample of 176 Calendar Year financial call records, one error in a premium field was noted. This was caused by

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

receipt of a correction call after the overall rate levels had been produced. In addition, data for two carriers had been zeroed out.

- o In a random statistical sample of 177 Reconciliation Report records, no errors were noted.
- o In a random statistical sample of 181 Insurance Expense Exhibit records, one error was noted.

In all of these samples, errors were defined as discrepancies greater than \$5,000 between the originally submitted financial call and its corresponding data record used to calculate last year's aggregate rate level.

The results from these tests indicate that aggregate financial data is accurately processed for use in calculating overall rate levels.

Detail sampling results are included in the Appendix to this volume.

- 2) Limited testing indicates that financial call data files include all carrier submitted financial call data received by NCCI.

In a judgmental sample of fifty carrier submitted financial calls, no indication was found that data which should have been present on the Financial Call Production File was not.

In this sample, discrepancies were defined as differences between what was reported by carriers on financial calls and what was resident on the Financial Call Production File.

- 3) The current control mechanism to ensure that all member carriers submit financial call data is not based on an authoritative list of carriers.

Each year, NCCI receives financial call data from over 400 carriers or carrier groups. At the end of each year, NCCI sends out a financial call questionnaire to each member and subscribing carrier. On the questionnaire, carriers request that the financial call packages be sent during the coming year. NCCI uses this information as the basis to send out financial calls and acknowledgement letters.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

The log of expected financial calls is developed from the acknowledgement letters sent by the carriers and from a list of large carriers. Carriers who do not return the acknowledgement letter may not be included in this log.

For the 1990 financial calls, we observed that a subscribing carrier failed to indicate on the questionnaire those calls to be submitted, and consequently did not receive its package of financial calls in time to comply with the submission schedule. (The carrier apparently assumed that the calls would be sent automatically.) Subsequent follow-up, by the carrier, resulted in NCCI mailing the calls much later to the carrier. Without that carrier follow-up, the calls would not have been received. The carrier operates in only one state and did submit 1988 and 1989 financial calls.

If a carrier's financial calls are not received in time for the start of the overall ratemaking process, NCCI will, in theory, identify the problem during rate level processing. Year-to-year comparisons of data should reveal the possibility of an omission. If the data cannot be obtained within the rate filing schedule constraints, NCCI eliminates the data from development patterns and in calculating cost ratio calculations.

This situation highlights a control inadequacy. Any small or medium size carrier that does not return the questionnaire will not be expected to submit financial call data. This missing data may be identified later via reasonableness tests performed during a state's overall rate level processing, but will often result in eliminating related data rather than obtaining the missing data. Carriers that do not submit for several years in a row may not be missed.

NCCI should implement a front-end financial call tracking mechanism based on the assumption that all carriers writing workers compensation policies in a state will submit all financial calls required for that state. Carriers who do not submit a call should be required to submit an explanation letter. A carrier's submission requirements will not be fulfilled until all financial calls and/or explanation letters have been received. The tracking mechanism would also denote those carriers that are in liquidation or receivership, or no longer write workers compensation coverage. Such front-end monitoring at the

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

workers compensation coverage. Such front-end monitoring at the carrier submission level would reduce some of the basic edit validation effort performed by actuarial personnel during the state rate level processing.

This tracking system should be integrated with NCCI's policy database.

- 4) NCCI's current Carrier Correspondence files do not document all actions authorized by the carrier.

NCCI performs validation procedures to identify errors and unusual shifts in financial data. NCCI contacts carriers with requests for additional information when inconsistencies are identified in their financial data. Carriers are required to respond in writing to such requests within a two week period. These responses often result in modification to previously submitted financial call data. Frequently, NCCI personnel will elicit carrier responses over the telephone in order to expedite the production of overall rate levels.

Written correspondence is documented for each carrier in a Carrier Correspondence file. This documentation serves as an audit trail for carrier authorized modifications to financial call data.

Not all authorized changes are documented in the correspondence file. NCCI does not usually adequately document phone conversations made with the carrier which may result in modifications to financial data. There is no standard form or standard policy. Specific actions which the carrier agrees to take may not be followed up on or documented.

NCCI should document carrier authorization for all changes to financial call data. Phone conversations resulting in modifications to data should be documented on a standard form. Any follow up action agreed to by the carrier should be tracked to ensure its timely and successful completion. A log of written correspondences and detailed accounts of phone conversations should be stored on a centralized carrier correspondence database which could be accessed on-line.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

In the long term, carriers should be required to correct their own financial data through data resubmission. Carrier performance reports should be regularly distributed. More significant fines should be assessed against carriers for any data submitted in error.

5) NCCI rate filings do not indicate all exclusions of data from overall rate level calculations.

Each year NCCI eliminates some carrier submitted financial call data from rate level calculations. This action reduces the distortion caused by unusual, inaccurate, or incomplete data in actuarial analysis.

In state rate filings, NCCI identifies carriers with data excluded from cost ratio calculations if they write more than \$10,000 in premium in the state. The premium as a percent of market share is shown. Appendix A-VI from the thirty-seven state rate filings in 1990 indicated that between 0.0% and 5.2% of state premium volume was excluded depending on the state.

Rate filings do not indicate the dollar amounts of excluded losses and premiums or the percentage of total incurred loss data excluded. Data exclusions for carriers writing less than \$10,000 in premium are not noted.

NCCI should document all exclusions of data in state rate filings. This documentation should indicate all carriers excluded, the dollar amount of losses and premiums excluded, and the percentage of total losses and premiums. For those carriers writing less than \$10,000 in premium in a state, the amount of data eliminated should be shown in aggregate. Such documentation would then display both the market share proportion and magnitude of the excluded data.

NCCI should consider distributing a yearly carrier performance report to the NAIC indicating all carriers whose data has been zeroed out because of substandard reporting.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

- 6) NCCI rate filings do not explain differences in premium or loss amounts, valued as of the same point in time, in consecutive year's rate filings.

As part of state rate filings, NCCI includes development triangles. These development triangles include three evaluation years of data by accident year and policy year, and display changing valuations over time for reported losses. Loss development data contains cumulative payments, and may contain case reserves or case reserves plus IBNR depending upon the actuarial methodology being used. A sample of a development triangle is shown below.

Premium and Indemnity & Medical Paid Losses for Matching Companies As Per:

Policy Year	Valuation				Dev Factor
	1st Rpt	2nd Rpt	3rd Rpt	4th Rpt	
1983 Std Prem.	xxx	xxx	618,728,661	620,373,796	1.003
Ind.Pd.Losses	xxx	xxx	173,256,798	213,833,383	1.234
Med.Pd.Losses	xxx	xxx	197,519,536	210,036,314	1.063
1984 Std Prem.	xxx	xxx	776,498,413	776,258,920	1.000

1986 Std Prem.	1,052,479,864	1,104,574,907	xxx	xxx	1.049
Ind.Pd.Losses	124,868,768	228,163,337	xxx	xxx	1.827
Med.Pd.Losses	180,682,687	243,830,361	xxx	xxx	1.349

The reported loss amount as of a specific valuation year for a policy year or accident year is, in effect, a "snapshot" of losses and would be expected to remain constant over time. However, rate filings often list different values from one filing year to the next. This difference is due either to corrections received during the year or to data excluded one year that was not excluded in the previous year. The second cause can lead to an apparent anomaly where the total loss amount for a given policy year valued as of a third report, for example, will be different when used for

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

development from the second to third report than when used for the development from the third to fourth report in the same rate filing.

These differences are neither noted nor explained in the rate filing. The differences investigated during testing were legitimate. There were two reasons for the differences.

First, some data corrections were received after the corresponding rate filing had been completed; if the corrections had been received earlier, the corrections would have been part of the data in that rate filing. Instead, the corrections were part of the data in the next rate filing.

Second, carrier data was eliminated from a particular loss development calculation if there was a major change in reserving or settlement procedures that was judged to distort loss development patterns. An example is negative IBNR which cannot be reconciled. Thus, if there is a major change in the reserving practices between the third and fourth report of a policy year for a particular carrier, the amounts valued as of the third report will be included in the development factor calculation from the second to third report, but may be excluded from the third to the fourth report.

NCCI should explain any major differences in data used from one year to the next. A summary paragraph should be sufficient.

- 7) NCCI's method for applying corrections to financial call data requires redundant data entry.

At the beginning of the rate filing process for a state, all financial call data for the state is extracted from repositories of financial call data called "Production" files. Policy Year and Accident Year data extracted in this manner is stored in state specific SAS files called "Frozen" files. During the rate filing process, NCCI's actuarial staff correct errors in Policy Year and Accident Year data through a mechanism known as the "Corr" file. This file is merged with the Frozen files in order to apply the corrections.

Corrections are entered into two versions of the Corr file independently and the results are compared. Any differences in the two versions are resolved before the corrections are applied to the data. In this way, NCCI

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Overall Rate Level

staff are assured that no mistyped corrections are applied to the Frozen file financial call data.

At the end of the rate filing process, NCCI prints the contents of the Corr file. This printout is sent to ACS for data entry and the resulting correction file is merged with the original Production file.

NCCI should automate the application of Corr file corrections to the Production file.

8) NCCI's documentation of state rate filing production is inconsistent.

NCCI retains a "state folder" for each state in which it files workers compensation rates. These folders contain system generated reports, notes indicating special circumstances encountered, and documentation indicating modifications to carrier submitted data. Written procedures provide guidelines for producing and maintaining the documentation in these folders. These procedures are documented in a letter distributed to aggregate ratemaking personnel.

While NCCI procedures encourage consistent production notes, signatures, data notations, and documentation of data changes in state folders, the actual format and content of state folders vary from one supervisor to the next.

The same actuaries do not always validate a particular state's financial call data from one year to the next. A consistent state folder format would provide an informative documentation file of any problems or questions identified during the previous production year. Currently, actuaries processing a state for the first time must rely on the actuary who processed the state during the previous year to fully understand state specific issues. By providing consistent documentation, NCCI would encourage consistent rate filing procedures each year, regardless of the actuary performing the work.

NCCI should enforce their standards for documentation in state folders. This would ensure that any special knowledge required to validate a particular state's data is retained from one year to the next.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Conversion

A. Area Overview

The Unit Card Data Conversion area collects payroll, premium and loss data for each insured from insurance carriers on a standard form referred to as a unit report. This data is often referred to as Workers Compensation Statistical Plan (WCSP) data.

Carriers are required to submit unit reports for each workers compensation policy. First reports are valued as of eighteen months from the policy effective date and are due at NCCI at twenty months. Subsequent reports, valued at twelve month intervals after the first report, must be submitted for all policies which have open claims. Up to five unit reports (first and subsequents) may be submitted for a single policy.

Carriers may submit WCSP data on either hard copy unit cards or magnetic tape. Each year, NCCI receives about 1.2 million hard copy and 1.8 million magnetic tape unit reports. All unit report data received by the Data Conversion area is converted to electronic format, verified for completeness, and sent to the Unit Card Data Administration area for further validation in preparation for the development of insurance rates. In addition to being sent to the Data Administration area, unit report data for experience rated policies is sent to the Experience Rating area.

For a more detailed description of the Unit Card Data Conversion area, refer to Volume II, Section I, Description of Data Collection and Data Handling. Detailed flow diagrams for this area are included in the Volume II Appendix.

B. Area Evaluation

Key Strengths:

- o 60% percent of unit report data is received on magnetic tape. This reduces manual effort required to process WCSP data and increases data accuracy.
- o Statistical sampling of Data Administration and Experience Rating files suggests that NCCI accurately converts WCSP data reported by the carriers into NCCI computer files.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Conversion

- o Statistical sampling of Experience Rating files suggests that NCCI accurately associates unit report experience data with the correct insured.
- o Current NCCI system initiatives will address many of the current shortcomings of unit report processing.

Key Weaknesses:

- o There are currently no controls in place to ensure all unit reports are submitted by carriers.
- o NCCI's current systems do not thoroughly validate unit report data at the time it is received.
- o There is no centralized database of WCSP data. As a result, NCCI retains substantial amounts of hard copy, microfilm, and microfiche to document carrier submissions of WCSP data.
- o NCCI's Risk Identification Number (Risk ID), used to identify WCSP experience with a specific insured, is frequently reported inaccurately by carriers.

Ongoing system initiatives at NCCI are intended to resolve the first three of these weaknesses.

Key Recommendations:

- o NCCI should implement a system which tracks the due date and receipt of unit reports for each workers compensation policy.
- o NCCI should perform more extensive validation at the time of unit report receipt.
- o NCCI should develop a centralized unit report database.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Conversion

- o NCCI should consider using industry established risk identification information such as Federal Employer's ID Number (FEIN).

NCCI has development projects underway which, if successful, will satisfy the first three of these recommendations. These projects are described in Volume I, Part C of this report.

C. Testing Objectives

- To evaluate the controls over the timeliness and accuracy of receipt of information received from carriers.
- To evaluate the controls over the conversion of unit report data into an electronically stored format.
- To evaluate the process of associating policy experience reported on unit reports with the appropriate policy and insured. This is accomplished through the use of a Risk Identification Number (RiskID) for experience rated policies. Data for non-rated policies is not currently identified with a risk ID.
- To evaluate the quality of unit report data validation performed by the Data Conversion area.

D. Testing Methods

The evaluation of the Data Conversion area was accomplished through control procedure reviews and systems review and analysis. These techniques are described in the Evaluation Approach section of Volume I, Part C of this report.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Conversion

E. General Observations & Recommendations:

- 1) There are currently no controls in place to ensure unit reports for non-experience rated risks are submitted by carriers.

Carriers are required to submit unit reports to NCCI for every workers compensation policy they write. The first unit report for a policy is due twenty months after the policy effective date. This time allows six months of loss development from the policy expiration date (most policies are twelve months) and two months for carrier processing time. Subsequent reporting for the policy is due every twelve months after the first report. Carriers are required to submit up to four subsequent reports for each policy. If all claims for a policy have been closed, the carrier is not required to submit additional reports.

NCCI receives approximately 250,000 unit reports per month from carriers, but does not currently have a system in place to identify all of the unit reports which are due each month.

The Experience Rating system does track unit reports due by insured for those businesses that are experience rated. NCCI personnel estimate that experience rated policies represent approximately 25% of workers compensation policies written.

There is no process in the Class Ratemaking systems to track unit reports by risk. Instead, NCCI personnel perform reasonableness checks to identify significant omissions of data.

NCCI should implement a system which tracks the due date and receipt of unit reports for each workers compensation policy. Such a system would greatly improve NCCI's control over the timely and complete submission of Workers Compensation Statistical Plan (WCSP) data.

We understand that NCCI is currently implementing the Unit Report Control (URC) system which will initially track the due date and receipt of unit reports for experience rated and rated size policies only. Rated size policies are large enough (or within \$500) to be

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Conversion

experience rated, but were not experience rated in the previous two years.

NCCI plans to expand URC tracking to non-rated unit reports by the fourth quarter of 1992. The URC tracking mechanism is driven by policy information received from carriers. NCCI began retaining policy information for all non-rated policies in April of 1991. Unit reports for these policies will not be due until late in 1992.

- 2) NCCI's current systems do not thoroughly validate unit report data at the time it is received.

Data Conversion receives unit report data from carriers, converts it to electronic format, associates experience rated WCSP data with a risk identification number (risk ID), and then forwards the data to Experience Rating and/or Unit Card Data Administration. Limited data validation is performed in Data Conversion. The majority of WCSP data validation is performed independently by the Experience Rating and Data Administration areas. This current procedure results in significant delays in data verification in Data Administration and duplication of validation effort.

NCCI should perform more extensive validation at the time of unit report receipt. This validation should include field level edits (e.g. class codes are valid), field relationship edits (e.g. losses cannot be reported without corresponding payroll and premium), and risk validation (e.g. the class codes reported are consistent with the risk's policy specifications and inspection reports).

Carriers should be required to correct data submitted in error themselves through data resubmission.

NCCI should consider distributing a unit report edit software package to carriers. This would allow carriers to pre-validate their submissions of WCSP data. This should significantly reduce the number of WCSP errors requiring identification and correction by NCCI.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Conversion

We understand that NCCI has plans to implement the Unit Report Control (URC) and the Unit Report Quality (URQ) systems which are intended to perform extensive front-end WCSP data validation and provide a mechanism for carrier corrections. Field level validation is targeted for implementation in August of 1991. The implementation of additional, more complex validation has not been scheduled.

NCCI plans to distribute a unit report edit software package to carriers by the fourth quarter of 1992.

- 3) NCCI retains substantial amounts of hard copy, microfilm and microfiche to document carrier submissions of WCSP data.

NCCI currently receives WCSP data on unit reports and magnetic tape. Hard copy unit reports are microfilmed, keypunched and sent to the appropriate field office. Magnetic tapes are processed and the data is then printed and microfiched. Microfiche and microfilm copies of the unit report data are sent to each field office. The hard copy, microfilm and microfiche copies of unit reports are used for research and verification of input WCSP data.

NCCI should develop a centralized unit report database. Such a database would eliminate the need for hard copy, microfilmed and microfiched unit reports. It would also facilitate the validation, use and correction of WCSP data.

NCCI should also develop an electronic data transfer mechanism for transmitting WCSP data between the carriers and NCCI. NCCI should strongly encourage carriers to submit data through this mechanism by offering financial incentives for doing so. Such a data transfer would reduce the cost of manual handling and data entry of unit reports, eliminate data entry errors and speed the processing of WCSP data.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Conversion

We understand that NCCI has plans to implement the URS system which is intended to provide a centralized database for WCSP data. This database is scheduled for initial production in August 1991.

F. Specific Tests Performed

- 1) Evaluated the controls over receipt and processing of magnetic tapes received from carriers.
 - Examined and verified the Magnetic Tape Control Log which records all magnetic tapes received.
 - Compared carrier transmittal letters to the Magnetic Tape Control Log for agreement.
 - Examined and verified the Magtape Records Control Log for agreement with system generated record counts.
 - Examined the Record Count Exception Report and procedures in place to return faulty tapes to the carrier and track their resubmission.
 - Examined procedures intended to ensure that all unit report data due on magnetic tape is received on a timely basis.
 - Evaluated the control procedures intended to ensure that all unit report data received is processed into NCCI systems.
 - Evaluated the use of error reports generated by magnetic tape automated processing.

- 2) Evaluated controls over receipt, sorting, batching, and microfilming of hard copy unit cards received from carriers.
 - Examined procedures intended to ensure that all unit report data due on hard copy is received on a timely basis.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Conversion

- Evaluated control procedures intended to ensure hard copy unit cards are not lost during sorting and batching.
 - Evaluated the accuracy of the manual sorting process.
 - Evaluated the effectiveness of the Micrographics Daily Log as a control for unit card batches sent to an external microfilming service.
- 3) Evaluated effectiveness of visual edits for hard copy unit cards and controls over unit cards sent to the external data entry service.
- Determined whether the 11 documented visual edits for hard copy unit cards are properly performed.
 - Evaluated the effectiveness and completeness of the documented visual edits.
 - Determined whether the Transmittal Sheets accompanying the hard copy unit card batches sent to the data entry service are accurately completed.
 - Evaluated the effectiveness of the ACS Daily Log as a control for unit card batches sent out for data entry. Appalachian Computer Services (ACS) is the data entry service used by NCCI.
 - Evaluated the tracking and handling of unit cards which were sent to ACS, but could not be keypunched. These unit cards are removed from the batches for further follow-up.
- 4) Evaluated the unit report indexing process. This process associates policy experience reported on unit reports with the appropriate policy and insured. This is accomplished through the use of a Risk Identification Number (Risk ID) for experience rated policies. Data for non-rated policies is not currently identified with a risk ID.
- Observed clerks researching indexing error reports.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Conversion

- Evaluated the efficiency of the indexing process.
 - Determined whether corrections indicated on indexing error reports are successfully processed into the electronically stored unit report data.
 - Evaluated the review procedures in place for on-line indexing corrections.
- 5) Evaluated the process of combining unit report data received on hard copy with unit report data received on magnetic tape.
- Reviewed program logic and determined the criteria for combining and generating unit report records.
 - Evaluated the control procedures intended to ensure that data is not lost during the execution of this process.

G. Specific Findings & Recommendations:

- 1) The risk identification number (Risk ID) is frequently reported inaccurately by carriers submitting WCSP data.

The risk ID is assigned to each insured to identify the insured's WCSP experience. This relationship is critical for developing experience modification factors for each insured. This association could be very useful in identifying and researching missing unit reports for ratemaking purposes. If all unit reports were associated with a unique risk, it would be possible to identify those risks with incomplete WCSP data. Currently risk IDs are used only for WCSP data associated with experience rated risks.

The risk ID is an NCCI generated number. It is not widely used or recognized in the insurance industry. Because of this, carriers frequently do not include the risk ID with the WCSP data or they report it inaccurately. Based on a three month sample of NCCI indexing reports, 45% of unit reports requiring risk IDs are submitted with inaccurate or missing risk IDs or require research to verify the risk ID. Five full time

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Conversion

indexing clerks are currently employed to research and resolve risk ID problems. In 1990, these clerks reviewed over one million risk IDs.

NCCI should explore other possibilities for an insured's identification number. Federal Employer's ID Number (FEIN) is one possibility. This number is widely available to carriers, easily auditable, and would eliminate many of the inaccuracies and omissions in reporting the risk ID. Federal tax IDs could also be used to identify data associated with non-experience rated risks. This would facilitate tracking all unit reports due and would help to identify those risks with incomplete WCSP data.

We understand that differences between experience rating and Federal tax ownership rules may require grouping FEINs for the purposes of experience rating.

An alternative to associating WCSP data directly with a risk identifier is to focus on associating the data with the policy number which is submitted on all unit reports. Policy information is initially received by NCCI during the effective life of the policy. The policy should be accurately associated with the correct risk before the first unit report arrives, eight months after the policy expiration date. By associating the unit report to the policy and the policy to the insured, the necessary relationships will be established to control unit report receipt and to support experience rating.

- 2) There are no controls in place to ensure that all WCSP magnetic tapes sent by carriers are received by NCCI.

Carriers send WCSP magnetic tapes to NCCI via different delivery services. Confirmation notices are not sent to NCCI by the carrier indicating tapes have been mailed. If a tape is lost in transit, NCCI may not be aware of it.

NCCI should implement controls to ensure all WCSP tapes are received. A separate transmittal letter from the carrier may satisfy this requirement.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Conversion

- 3) NCCI does not follow-up with the carrier when magnetic tape record counts per the carrier do not agree with NCCI system generated record counts.

The WCSP Magtape Records Control Log lists WCSP tapes received from carriers. Clerks compare record counts per the transmittal letters received with the tapes to system generated record counts. In a review of the WCSP Magtape Records Control Log, the carriers' record counts for 10 of 35 WCSP tapes did not agree with system generated counts. In all cases, the carrier transmittal letter indicated more records than the NCCI system count. This is possible due to non-WCSP records on the tape which cannot be identified and processed by NCCI.

The WCSP data on these tapes is processed normally. All tapes are returned to the carrier with reports listing processed record counts. No follow-up is performed by NCCI for those tapes with record count discrepancies.

NCCI should implement follow-up procedures or a fining system which encourages carriers to submit only valid WCSP records and verify record counts. Carrier submitted tapes include trailer records which indicate the number of records on the tape. NCCI systems should reconcile valid NCCI records against the record counts indicated on the trailer record.

- 4) Magnetic tapes that cannot be processed are returned to carriers without NCCI follow-up.

In 1990, Data Conversion processed 758 WCSP magnetic tapes; 23 of these tapes were returned to carriers because they could not be processed. This situation occurs if a tape contains incomplete carrier information or is physically damaged.

Before an unprocessed tape is sent back to the carrier, procedures indicate that the carrier is to be contacted and advised of the problem. There are no follow-up procedures or additional measures taken by NCCI to ensure the magnetic tape is resubmitted.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Conversion

NCCI should track all unprocessed tapes returned to the carriers. A log indicating when the tape was returned along with follow-up procedures would ensure that the carriers resubmit the data on a timely basis. This control mechanism should be integrated with NCCI's Unit Report Control (URC) system currently being implemented.

Carrier performance reporting and fining procedure for returned tapes would encourage carriers to submit only quality tapes and data.

- 5) Unnecessary processing occurs in the automated procedure which loads WCSP magnetic tapes into NCCI files.

NCCI inputs carrier submitted magnetic tapes to an automated procedure which loads the data into NCCI files. This procedure performs steps which are obsolete. Specifically, the procedure separates WCSP data into header data, detail data, and errors. Header and detail data are then recombined and input to magnetic tape format and print processing.

The split of header and detail data was intended to facilitate reporting and the application of ACS keyed corrections. Neither function is used at this time and there is no apparent reason for separating header and detail data only to recombine them in the next processing step.

The procedure described is IMGR01PA. The program which separates the data is IMG0100 and is executed as step PS10 of the procedure.

This process should be examined and redesigned to eliminate processing and storage inefficiencies.

- 6) The report entitled "Risks Not Identified As Interstate Or Intrastate With Manual Premium Greater Than \$2,000" is produced but not reviewed.

As indicated, this report lists errors, however it is not reviewed by NCCI personnel or carriers.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Conversion

The report ID number is IMG0110-1 and is produced by procedure IMGR01PA, step PS20, program IMG0110P.

NCCI should determine the purpose of this report. If it provides useful information it should be reviewed regularly. If it does not, it should be eliminated from the system.

- 7) There are no controls to ensure that all hard copy unit card batches sent by carriers are received by NCCI.

Carriers mail hard copy unit cards to NCCI. Confirmation notices are not sent to NCCI by the carrier indicating hard copy unit cards have been mailed. If unit cards are lost in transit, NCCI may not be aware of it. **NCCI should implement controls to ensure all hard copy unit cards are received. A separate transmittal letter from the carrier may satisfy this requirement.**

In the long term, NCCI should provide software and incentives to encourage carriers to transmit data electronically or by magnetic tape.

- 8) Hard copy unit cards are not adequately controlled before the assignment of sequential administration numbers.

NCCI receives, on average, 4000 to 5000 hard copy unit cards each day. These cards are sorted, batched, and left in an unrestricted area overnight. The following day, sequential administration numbers are manually stamped on individual cards to track them and the unit cards are sent to ACS for data entry. The unit cards are not adequately controlled prior to the assignment of the administration numbers.

NCCI should implement procedures to track and control unit cards immediately upon receipt. Prior to the assignment of administration numbers and data entry, unit cards should be stored in a secure area.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Conversion

In the long term, NCCI should provide software and incentives to encourage carriers to transmit data electronically or by magnetic tape.

- 9) Of eleven visual unit card edits required by NCCI's written procedures, eight are actually performed.

Data Conversion procedures specify that clerks perform eleven visual edits to ensure that hard copy unit cards are properly completed prior to data entry. Three of these edits are not actually performed. The three edits not performed are:

- o Verify that the condition code is entered on the unit card
- o Verify that the risk ID is entered on the unit card, as applicable
- o Verify that the experience modification factor is entered on the unit card, as applicable

Of 119 unit cards reviewed, 101 were missing at least one of the above three data elements.

NCCI should reevaluate its procedures. If the three omitted edits are unnecessary, NCCI should revise the written procedures. If the edits are necessary, they should be performed.

In the long term, NCCI should perform WCSP data edits in an automated fashion at the time of unit report receipt.

We understand that NCCI has plans to implement the Unit Report Control (URC) and the UnitReport Quality (URQ) systems which are intended to perform extensive automated front-end WCSP data validation and provide a platform for carrier corrections. Field level validation is targeted for implementation in August of 1991. The implementation of additional, more complex validation has not been scheduled.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Conversion

- 10) The current procedure for correcting unit report data which has not been associated with the proper insured involves unnecessary paper flow and manual intervention.

The Unidentified Interstate Risks and Unidentified Intrastate Risks reports list WCSP data for experience rated policies that could not be associated with its insured through the use of a risk ID. These reports are received by Data Conversion clerks located in Boca Raton. These hardcopy reports are batched, logged and sent to the appropriate field offices where field office clerks review them. The purpose of the review is to identify unit report data that is not properly associated with an insured. Clerks research the errors and mark corrections on the reports. The reports are sent back to Boca Raton where they are checked in and forwarded to the indexing department. Indexing clerks key the corrections as indicated on the hardcopy reports into the on-line correction system. Approximately 40% of unit reports requiring risk IDs or risk ID verification or approximately 400,000 unit reports per year appear on this report. Field office clerks correct about 5% of these unit reports.

Fifteen corrections noted by field office clerks were compared to the corresponding correction entered on-line by indexing clerks. Two of the fifteen were entered incorrectly. The errors were caused by misunderstanding the indicated correction on the report.

Nine reports with corrections indicated by field office clerks were examined for appropriate sign off of the individual at the field office who recommended the indicated correction. None of the nine reports were initialed or signed off.

At a minimum, standards should be established for documenting required corrections on the hardcopy reports. Field office clerks should sign and date corrections to provide an audit trail.

These reports should be printed at the various field offices. Field office clerks should make indexing corrections through the on-line Indexing System known as IDV. The field offices have on-site printers and computer terminals to facilitate this change.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Conversion

An automated audit trail based on a clerk's user ID should be implemented for all on-line corrections.

In the long term, the process of associating WCSP experience with an insured should be almost completely automated. A risk identifier which is more readily available to carriers should be used. (see Finding #1 in this section)

- 11) Data Conversion personnel undermine system security by sharing on-line user IDs.

On-line user IDs and passwords are widely shared between clerks and supervisors. This represents a violation of established system security policy and a risk to data integrity.

NCCI employees should not share on-line user IDs and should keep passwords confidential. Management should establish strict security policies and enforcement measures.

- 12) No audit trail exists for WCSP records which are discarded by the application program which combines magnetic tape data and keypunched hard copy data.

The automated process (IDV0100P) which combines WCSP data submitted on magnetic tape with WCSP data submitted on hard copy discards records. This program also combines records and generates records. This process results in a change in record counts. In a review of one control report generated by this program, 75,655 total records were input, 104 additional records were generated, and 2,281 records were bypassed or combined.

A record is discarded by this program if it cannot be processed because it is an address record, non-WCSP data or an invalid record type. Records are combined if they report payroll for the same class code, risk or firm. Records are generated when unit report detail records span more than one page when printed. In this case, additional unit report header records are created and each page of the unit report is treated as a separate card.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Conversion

There is currently no audit trail documenting the detail records discarded or generated by this program. If a problem or question arises as a result of this processing, there is no medium for research. The program does provide for an audit trail, but this function has been inactivated.

NCCI should print an error report from this program listing the records discarded, bypassed, and combined. This report should be distributed to the appropriate carriers and a fining procedure established to encourage carriers to supply only valid records.

This process should be integrated with NCCI's current systems initiatives Unit Report Control (URC) and Unit Report Quality (URQ) and should be implemented under a pervasive policy of carrier performance reporting and financial incentives.

- 13) The Carrier Performance Statistics process is not widely accepted and therefore not effective.

The Carrier Performance Statistics process was designed to provide feedback to carriers on their performance with regard to accurate and timely submission of WCSP data. While over 400 of the 700 carriers who submit WCSP data to NCCI subscribe to this report, some of the largest carriers do not.

NCCI should determine the carriers' concerns regarding the Carrier Performance Statistics process. The process should then be redesigned or replaced. NCCI should consider distributing carrier performance information to State insurance departments.

We understand from our discussions with NCCI management that Unit Report Control (URC) and Unit Report Quality (URQ) may provide better mechanisms for reporting carrier performance than are currently available.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

A. Area Overview

The Unit Card Data Administration area receives WCSP data by state from Unit Card Data Conversion. A series of automated and manual edits is performed on this data. This validation includes: payroll comparisons by class code from one year to the next, loss development reasonableness checks, duplicate data identification, and various other edits. Identified errors are corrected either on-line or through NCCI's data entry service (ACS). Validated data is summarized by class code and passed to Class Ratemaking.

For a more detailed description of the Data Administration area, refer to Volume II of this report.

B. Area Evaluation

Key Strengths:

- o NCCI is committed to improving the integrity of data used in ratemaking.
- o On the whole, data provided for use in ratemaking accurately reflects data submitted by carriers.

Key Weaknesses:

- o NCCI validation of WCSP data involves manually intensive procedures.
- o NCCI does not validate ratemaking data at the time of receipt. A year or more may pass before this validation occurs.
- o NCCI performs separate validation of the same WCSP data in Experience Rating and in Data Administration.
- o Current NCCI policy, procedures, and systems place too much of the burden of data verification and error correction on NCCI, and not enough on the carriers.
- o NCCI procedures allow changes to WCSP data without direct carrier approval.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

- o Many Data Administration application programs are old, poorly structured and undocumented.

Key Recommendations:

- o NCCI should validate WCSP data at the time of unit report receipt.
- o NCCI should place the burden of WCSP data correction on the carriers.
- o NCCI should implement a centralized WCSP data repository. All applications requiring WCSP data for processing should access this database.
- o NCCI should use modern software engineering techniques and follow strict structured programming techniques and documentation standards when rebuilding Data Administration applications.

C. Testing Objectives

- To evaluate the quality and adequacy of WCSP data validation in Data Administration.
- To evaluate the controls over completeness of WCSP data delivered to Class Ratemaking.
- To verify that all corrections made to WCSP data are authorized by the appropriate carrier.

D. Testing Methods

The evaluation of Unit Card Data Administration was accomplished through control procedures review, systems review and analysis, and statistical sampling. These techniques are described in the Evaluation Approach section of Volume I, Part C of this report.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

E. General Observations & Recommendations

- 1) NCCI expends extensive time and effort in validating WCSP data used to produce Class Rates.

NCCI spends a considerable amount of time and effort validating and correcting WCSP data used for Class Ratemaking. Approximately 3 million unit reports are received by NCCI each year. An average of 7.5 WCSP data records result from each unit report received. This amounts to 22.5 million new WCSP data records which must be validated by NCCI each year.

NCCI currently validates WCSP data for 37 states and acts as the ratemaking bureau for 33 of these states. NCCI requires two to three months to validate WCSP data for a small state, four to five months for a medium size state, and five to six months to validate data for a large state.

A great deal of the WCSP validation process is performed manually by Data Administration clerks. The State Validation Procedure provides an example of the extensive manual effort required to execute the current validation procedures.

The State Validation Report is one of the primary tools for identifying WCSP errors in Data Administration. This report is run twice for each state served by NCCI. Data Administration clerks manually review every page of this report in order to make corrections.

This year the first State Validation Report for Missouri is 5,420 pages or about three boxes of computer paper. The Florida report is about six boxes of paper or approximately 10,000 pages.

Many of the potential errors listed on the State Validation Report do not actually require corrections. However, all potential errors must be reviewed.

NCCI should further automate its WCSP validation and correction procedures. Many decisions currently made by clerks could be made by application programs.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

NCCI should place the burden of data correction on the carriers. WCSP data should be validated at the time of unit report receipt. NCCI should require carriers to resubmit data found to be in error.

We understand that NCCI has plans to implement the Unit Report Control (URC) and Unit Report Quality (URQ) systems. These systems, described in Volume I, are intended to perform front-end WCSP data validation and provide procedures for carrier corrections.

The URC system is currently being tested with selected carriers; industry-wide phased implementation is scheduled to be completed by July of 1992. The URQ system is scheduled for a phased implementation to be completed in October of 1992.

2) NCCI performs separate validation and correction of the same WCSP data in Experience Rating and Data Administration.

NCCI receives WCSP data in Data Conversion. Limited validation is performed at this time. This data is routed separately to Experience Rating and Data Administration/Class Ratemaking. The majority of WCSP data validation is performed in these areas. Experience Rating and Data Administration validate, correct, and use their versions of the data independently from one another with potentially inconsistent results. NCCI does not attempt to reconcile Experience Rating and Data Administration WCSP data or corrections.

NCCI should implement a centralized WCSP data repository. WCSP data should be validated immediately upon receipt and included in this database. Applications requiring WCSP data for processing should access this database.

We understand that NCCI plans to implement the URQ system which is intended to validate WCSP data upon receipt. We also understand that NCCI plans to implement the URS database which is intended to serve as a centralized repository of validated WCSP data. The URQ system is scheduled for a phased implementation to be completed in

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

October of 1992. The URS database will begin capturing new unit reports in September of 1991.

3) NCCI data collection systems and procedures give rise to duplicates in WCSP data.

NCCI receives WCSP data from carriers in the form of hard copy unit reports and on magnetic tape. All carrier submissions are processed through Data Conversion and stored on magnetic tape by month of receipt.

NCCI performs a rate revision every 12 to 24 months for each of the 33 states for which it serves as the ratemaking bureau. At the start of each state rate revision, Data Administration extracts unit reports for the state from Data Conversion files. The extract includes any unit reports received since the prior rate revision's extract was performed. The extracted data is combined with data in the previous revision's Data Administration file. This combination forms the current revision's Data Administration file. Unit reports received for the state after this extraction/combination process require special handling in order to be included in the current revision's Data Administration file.

Late unit reports sometimes arrive in Data Conversion after the extraction has been performed. If identified as missing by Data Administration, these late arriving unit reports are incorporated into Data Administration files through a special process known as "Unit Add". The Unit Add process copies WCSP data from Data Conversion files into Data Administration files. The same data then exists in both Data Conversion and Data Administration. This allows late arriving data to be included in the current revision's Data Administration file after the extract has taken place.

During the state's next rate revision, Data Administration will extract unit report data from Data Conversion and combine it with the previous revision's Data Administration file. Any unit reports that were processed through Unit Add will be present in both the extract and the previous revision's Data Administration file. Combining the extract with this file will result in duplicates.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

In a population of 20,218,299 Data Administration payroll and loss records with policy effective dates of 1986 and 1987, 39,538 records, or 0.2% of the records, were identified as records that entered the system late by way of the Unit Add process. These records result in duplicates which NCCI's processing is designed to identify and remove.

Duplicates can also result from Data Administration corrections. Data Administration clerks enter corrections to the Data Administration file using either an on-line facility or a data entry service. Carriers submit corrections known as "C" reports through Data Conversion. If a correction is entered by Data Administration clerks and is submitted by a carrier through Data Conversion, a duplicate will result.

In both duplicate data examples described above, the problem is caused by dual points of WCSP data entry into NCCI's systems.

In a population of 20,218,299 Data Administration payroll and loss records with policy effective dates of 1986 and 1987, 26,687 records, or 0.1% of the records, were identified as duplicates during validation of Data Administration files.

Duplicate data is also produced when carriers submit the same WCSP data to NCCI more than once. Each time NCCI performs a rate revision for a state, Data Administration extracts data for that state from Data Conversion files. Before the extracted data is combined with prior year data to create the current revision's Data Administration file, the extract is checked for duplicates. The first step in the validation process identifies and removes carrier submitted duplicate records. This application program produces a control report which lists the number of duplicates removed from the extracted data.

In a judgmental sample of 34 control reports, representing 34 states processed during the 1990 rate revision, 3% of records were identified and removed as duplicates by this program. Because this program may have missed some duplicates, 3% is a conservative estimate of the percentage of duplicates actually contained in carrier submitted WCSP data.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

NCCI should implement a centralized WCSP data repository. WCSP data should be validated immediately upon receipt and included in this database through a single point of entry. Duplicate data should be identified and eliminated at this time. Applications requiring WCSP data for processing should access the database.

We understand that NCCI plans to implement the URQ system which is intended to validate WCSP data upon receipt. We also understand that NCCI plans to implement the URS database which is intended to serve as a centralized repository of validated WCSP data. The URQ system is scheduled for a phased implementation to be completed in October of 1992. The URS database will begin capturing new unit reports in September of 1991.

- 4) Duplicate unit report submissions are identified at the time of unit report receipt, but no action is taken at that time.

A unit report is uniquely identified by Carrier Number, Policy Number, Policy Effective Date, and Unit Report Number (e.g. 1st, 2nd, 3rd report). At the time of unit report receipt, this identifying information is logged into the Unit Card Tracking System, also known as "ICT". Duplicate unit reports are identified in this system by adding a suffix to the report number. An original 1st report would have a report number of "1". A duplicate 1st report would have a report number of "1D1". If a second duplicate 1st report was received it would be denoted "1D2".

Although the ICT system clearly identifies duplicate unit reports at the time of receipt, no action is taken to remove or segregate duplicate data at that point. Instead, data is forwarded to Data Administration where extensive efforts are undertaken to identify and remove duplicate data.

In the short term, NCCI should use the ICT system to help identify duplicates during Data Administration processing. A simple report program should be developed to list all instances of duplicates identified in ICT. This report should be used by Data Administration during the duplicate removal process.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

In the long term, NCCI should identify and eliminate duplicate unit reports at the time of unit report receipt.

We understand that NCCI has plans to implement the Unit Report Control (URC) system which is intended to identify duplicate unit report submissions at the time of receipt. The URC system is currently being tested with selected carriers; industry-wide phased implementation is scheduled to be completed by July of 1992.

- 5) WCSP data used for Class Ratemaking may be validated a year or more after unit report receipt.

Unit reports are received throughout the year in Data Conversion. Limited validation is performed by Data Conversion. For each state rate revision, WCSP data is extracted for validation and correction in Data Administration and eventual use in Class Ratemaking. While data received shortly after the extraction process is used almost immediately for experience rating, it remains unused and unvalidated for ratemaking purposes until the following year. The next year, Data Administration performs an extraction of WCSP data. Extensive validation is performed at that time.

NCCI should fully validate WCSP data at the time of unit report receipt. Carriers should be contacted immediately for resolution of any identified errors.

We understand that NCCI has plans to implement the Unit Report Control (URC) and Unit Report Quality (URQ) systems. These systems, described in Volume I, are intended to perform front-end WCSP validation and provide procedures for timely carrier corrections. The URC system is currently being tested with selected carriers; industry-wide phased implementation is scheduled to be completed by July of 1992. The URQ system is scheduled for a phased implementation to be completed in October of 1992.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

6) Data Administration WCSP validation procedures include many "rules of thumb".

NCCI receives approximately 3 million unit reports each year. This translates to approximately 22.5 million new WCSP data records each year. To facilitate validation of this large volume of data, Data Administration has implemented many "rules of thumb" in WCSP data validation procedures. The need for time saving "rules of thumb" does not mean that such rules are acceptable and instead highlights flaws in the overall design of the validation and correction process. A few examples of these rules are:

- o Eliminate losses with no related payroll information without further research if there are five or fewer occurrences of such losses for a single carrier.
- o If two exposure records are identical except for the experience mod, keep the record with the higher mod and delete the other record. If the higher experience mod is 1.000, delete the record with the higher experience mod and keep the other record.
- o Identical exposure records should not be treated as duplicates if the payroll amount is divisible by 100.
- o For temporary total and temporary partial disability claims, 80% of unreasonable fluctuations in loss development within an injury type must be explained. For permanent partial disability claims, 75% must be explained, and for medical only claims, 70% must be explained.

Most of these rules evolved in an effort to reduce the monumental task of validating WCSP data.

At a minimum, NCCI should reevaluate these rules.

In the long term, rules such as these should be eliminated. If the burden of data correction is placed on the carrier, NCCI will no longer be in the position of modifying data based on potentially inaccurate assumptions or incomplete evaluations.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

7) NCCI does not perform risk level validation of WCSP data used in Class Ratemaking.

Data Administration validates WCSP data by performing field edits, checking relationships within unit reports, and checking aggregate data for reasonableness. These efforts are designed to ensure that items such as the following hold true for WCSP data used in Class Ratemaking:

- o The case count field on a loss record is not equal to zero. This is a field edit.
- o The case count field on a loss record does not contain a value greater than the indemnity or medical amount reported on that record. This is a verification of relationships within a data record.
- o Loss records on a unit report are accompanied by associated payroll records. This is a verification of relationships within a unit report.
- o Total payroll for a class code this year is reasonable compared to total payroll for that class code last year. This is a verification of aggregate data reasonableness.
- o Total losses for an injury type valued as of this year are reasonable compared to those losses valued as of last year. This is a verification of aggregate data reasonableness.

Validation does not currently exist to ensure that data for a specific risk is reported consistently with policy specifications, risk inspections, or previously submitted data for that risk.

NCCI should implement risk specific WCSP data validation. WCSP data for a risk should, at a minimum, be compared to policy specifications, risk inspections, and previously submitted data for that risk. Comparisons should include: reported class codes, payroll, standard premium, experience modification, and loss development. Verification and correction of WCSP data at the risk level will eliminate most of the effort required to verify and correct data in aggregate.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

- 8) Many Data Administration application programs are old, poorly structured and undocumented.

Applications should be documented and programs should contain comments in order to provide systems personnel and end users with easily understood explanations of program functions and logic. When little documentation exists and programs contain few comments, systems personnel must decipher computer code in order to understand programs.

Much of the current Data Administration system was developed during the mid 1970s. NCCI has almost no documentation for Data Administration applications developed during that time. The source code for these programs is generally unstructured and contains few comments. These conditions make the programs very difficult to maintain, especially since most of the systems personnel who created these programs are no longer employed by NCCI.

Because programs are difficult to maintain, known program deficiencies are circumvented through manual intervention rather than addressed through proper program maintenance.

For example, the Administration Number, a unique identifier for unit reports, is truncated in the Payroll/Loss (P/L) Detail file forcing Data Administration personnel to perform additional steps when retrieving unit reports. This problem has existed at least since July of 1987, the last time major changes were made to the format and content of the P/L Detail file.

NCCI should use modern software engineering techniques and follow strict structured programming techniques and documentation standards when rebuilding Data Administration applications.

NCCI should document existing applications using the standards which are to be applied to new development.

We understand that the new DCI system was recently developed using modern software engineering techniques and that strict structured programming techniques and documentation standards were followed. We also understand that a current management

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

objective for the Applications Support Department is to document existing application programs by the end of 1991.

9) Data Administration procedures allow changes to WCSP data without direct carrier approval.

Data Administration correction procedures instruct clerks to modify WCSP data believed to be in error. In many cases, these procedures do not require any contact with the carrier. Examples of cases where carrier contact is not required before changing data include:

- o Removal of duplicate payroll records.
- o Removal of duplicate loss records.
- o Elimination of loss data without corresponding payroll information.
- o Replacement of invalid case count information.

Some of these corrections do not warrant contact with the carrier, e.g. NCCI can reliably confirm that a duplicate exists by tracing suspect data back to hard copy unit reports. When a duplicate is identified the appropriate correction is always to remove the duplicate and carrier comment or approval is unnecessary.

In a population of over 20 million Data Administration payroll and loss records with policy effective dates of 1986 and 1987, 1.1% of the records were correction records created by NCCI. The serial number on these correction records indicates the type of correction. Based on the serial numbers observed, it appears that approximately 45% of the corrections in this population could have been reliably made without contacting the carrier. Examples of these corrections include removal of verifiable duplicates and correction of keypunch errors.

NCCI's Data Administration department made approximately 513,000 corrections to unit report data last year. Although sample results suggest that 55% of corrections should involve carrier contact, NCCI contacted carriers to resolve only about 1,000 errors last year. While one error may lead to multiple corrections on NCCI's systems, it is clear that NCCI

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

contacted carriers for only a very small percentage of corrections made to unit report data last year.

NCCI should place the burden of WCSP data correction on the carriers. WCSP data should be validated at the time of unit report receipt. NCCI should require carriers to resubmit data found to be in error.

We understand that NCCI has plans to implement the Unit Report Control (URC) and Unit Report Quality (URQ) systems. These systems, described in Volume I, are intended to perform front-end WCSP validation and provide procedures for timely carrier corrections.

- 10) NCCI data files are unnecessarily complex and voluminous due to the use of a credit offset method for updating and correcting WCSP data.

NCCI receives WCSP data from carriers and stores this data in computer files. Data for a new policy is stored in the form of debit records. Debit records reflect WCSP data using positive values for information such as payroll, losses, and number of cases.

Over time, carriers submit more current WCSP data to update policy information. NCCI requires that carriers identify the existing data and specify how the revised data should appear after the update. NCCI offsets the existing data by creating a negative, or credit entry. A new debit record is then created to reflect the revised information. Similarly, any corrections made to WCSP data by NCCI are recorded by offsetting the data in error with a credit record, and creating a new debit record to reflect the correct information.

Updates and corrections require a minimum of two records: a credit record offsetting the original data, and a debit record containing the revised data. Data that has been modified once will therefore be represented by three records:

- o The original debit record.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

- o The offsetting credit record.
- o The current debit record.

To determine correct data values, the current debit record must be identified from among these other records.

While use of this credit offset method provides NCCI with an audit trail for tracing changes made to WCSP data, it hinders processing by increasing data volume and making interpretation more difficult.

NCCI should implement a centralized WCSP database. When updating information, instead of adding credit records to the database to offset non-current data records, a status field within each data record should be used to differentiate current from non-current data. This would decrease the volume of data records while maintaining historical data to provide for analysis of trend and development. Corrections should be made by changing records in the database. A separate history of these changes should be maintained to provide an audit trail.

We understand that NCCI plans to implement the URS database which is intended to serve as a centralized repository of validated WCSP data. We also understand that the credit offset method will not be used to update or correct information in this database. NCCI plans to capture new unit reports in the URS database in September of 1991.

F. Specific Tests Performed

- 1) Evaluated the effectiveness of the State Validation process. The State Validation process consists of computerized identification and manual correction of WCSP data errors.

- Observed procedures used for clearing errors on the State Validation report.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

- Determined whether actions taken by clerks to correct errors were supported by documented procedures.
 - Reviewed documented procedures for clearing errors to assess the reasonableness of the procedures.
 - Determined whether documentation accompanying corrections sufficiently supported the corrective action taken.
 - Reviewed procedures used to research WCSP data.
- 2) Evaluated the effectiveness of efforts to identify and remove duplicate WCSP data.
- Observed procedures used for identifying and clearing duplicate data.
 - Determined whether actions taken by clerks to identify and remove duplicate data were supported by documented procedures.
 - Reviewed documented procedures for clearing duplicates to assess the reasonableness of the procedures.
 - Reviewed program logic and control reports and interviewed data processing personnel to determine the effectiveness of duplicate removal programs. (RP10100P, RP10102P, RP10103P).
 - Reviewed statistically sampled data to identify duplicates missed by both automated and manual duplicate removal processes.
- 3) Evaluated the controls in place to ensure that corrections sent to ACS are accurately keypunched and incorporated into the P/L Detail file.
- Determined whether intended corrections as listed on the Payroll/Loss Detail Correction forms were present on the RCDUPDATE listing of corrections applied to the P/L Detail file.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

- 4) Evaluated the controls in place to ensure that corrections made on-line are accurately incorporated into the P/L Detail file.
 - Determined whether intended corrections as noted on the State Validation report were present on the RCDUPDATE listing of corrections applied to the P/L Detail file.

- 5) Evaluated the effectiveness of the Reasonableness Test. The Reasonableness Test identifies unreasonable fluctuations in reported losses from one valuation point to the next.
 - Observed procedures used to research and explain unreasonable fluctuations in loss development.
 - Reviewed documented procedures to assess their reasonableness.
 - Determined whether sufficient documentation existed to support the explanations provided.
 - Observed the quality control review of the reasonableness test to assess its adequacy.

- 6) Evaluated the effectiveness of the Class Payroll Fluctuation Investigation. This investigation is used to identify unreasonable fluctuations in payroll by class between policy periods.
 - Reviewed documented procedures to assess their reasonableness.
 - Determined whether actions taken to explain unreasonable fluctuations were supported by documented procedures.
 - Determined whether the explanations provided for fluctuations in payroll were reasonable.
 - Determined whether sufficient documentation existed to support the explanations provided.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

7) Statistically sampled Data Administration payroll and loss records and compared them to the originally submitted unit reports and documented corrections.

- Two populations were defined. The first was all payroll records in the Payroll/Loss Detail file having a policy effective date of 1986 or 1987. The second population was all loss records in the Payroll/Loss Detail file having a policy effective date of 1986 or 1987.
- Data for policies with effective dates after 1987 had not yet been incorporated into the Payroll/Loss Detail file at the time of this sample. This is because data for a policy is not due at NCCI until 20 months after the effective date. Once received, this data does not enter Data Administration for validation until a year or more has passed. Then depending on the volume of data being validated, two to six months can pass before validation is complete and the data is included in the final Payroll/Loss Detail file.
- An attribute sampling approach was used. This approach measures frequency of errors rather than size of errors.
- A confidence level of 95%, expected error rate of 2%, and tolerable error of 5% were used to determine the sample sizes.
- The payroll and loss records selected were compared to carrier submitted unit reports and any documented corrections. The specific fields tested were: State Code, Class Code, Payroll Amount, Premium Amount, Injury Code, Indemnity Amount, and Medical Amount.
- All identified discrepancies were discussed and researched with NCCI personnel. Results were summarized and included in the Appendix of this volume.

8) Judgmentally sampled carrier submitted unit reports and compared them to Data Administration payroll and loss records.

- A judgmental sample of fifty carrier submitted unit reports was selected from unit reports received in 1990 and 1991. Twenty-five unit reports submitted on hard copy were selected from microfilm

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

records. Twenty five unit reports submitted on magnetic tape were selected from microfiche records.

- The unit report data selected was compared to data contained in payroll and loss records extracted from the Data Administration P/L file. The specific fields tested were: State Code, Class Code, Payroll Amount, Premium Amount, Indemnity Amount, Medical Amount, Policy Number, Policy Effective Date, Carrier Code, and Claim number.
- All identified discrepancies were discussed and researched with NCCI personnel. Results were summarized and included in the Appendix of this volume.

9) Evaluated the accuracy of the process used to summarize unit report data by class code.

- Developed a program to summarize payroll and loss detail data by class code.
- Determined the accuracy of NCCI's summarization process. This was accomplished by comparing output from our test program with output from NCCI's summarization process.

10) Verified that the loss limitation programs limit losses according to documented procedures.

- Developed a program to identify loss records to be considered for loss limitation.
- Compared output from this program to output from NCCI's loss limitation programs.
- Determined whether loss limitation techniques applied were supported by documented procedures.
- Reviewed procedures for loss limitation to assess their reasonableness.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

G. Specific Findings & Recommendations:

- 1) WCSP exposure and loss amounts reported by carriers are accurately processed for use in calculation of Class Rates.

NCCI's electronically stored WCSP data used for calculating class rates was compared to carrier submitted source documents. A summary of the results follows:

- o In a random sample of 181 payroll records, one error in payroll amount was noted. This was caused by a duplicate record in the P/L detail file. In addition, four hard copy unit reports could not be located. Data for which supporting documentation could not be located was considered an error for the purposes of quantifying the sample test results.
- o In a random sample of 181 loss records, four errors in medical loss amount were noted. These were caused by a data entry transposition error, a duplicate record and two records on the P/L detail file which could not be supported by unit report data provided by state funds. In addition, three hard copy unit reports could not be located.

In these samples, exceptions were defined as differences between what was reported by carriers on unit reports and what was resident in detail payroll and loss data files that are summarized for use by Class Ratemaking. Errors were defined as those exceptions which could not be attributed to acceptable WCSP data processing practices.

The results from this test indicate that WCSP exposure and loss amounts reported by carriers are accurately processed for use in calculating class rates.

Detail sampling results are included in the Appendix to this volume.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

- 2) Testing indicates that WCSP data files include all carrier submitted WCSP data received by NCCI.

In a judgmental sample of fifty carrier submitted unit reports, no indication was found that data which should have been present in Data Administration files was missing.

In this sample, discrepancies were defined as differences between what was reported by carriers on unit reports and what was resident in Data Administration files.

- 3) Carriers periodically fail to submit WCSP data on a timely basis, fail to submit particular units of data, and fail to reply to NCCI's requests for missing data or data clarification.

Data Administration compares aggregate WCSP data with data from previous reporting periods and previous policy periods. When unreasonable fluctuations in the aggregate data are observed, Data Administration investigates the underlying detail. Detailed investigations sometimes reveal that WCSP data for a particular risk is missing or incomplete.

When Data Administration finds that WCSP data for a risk is missing or incomplete, an analyst sends a research letter to the carrier who wrote the policy. The research letter specifies the risk name, policy number, effective date, class code, and a statement of the problem.

The Data Administration Analyst allows approximately fifteen days for carrier response before issuing a follow-up letter or phone call.

The effect of missing and incomplete WCSP data on ratemaking is difficult to quantify. The dollar amount of missing WCSP data is significant only in terms of its relative effect on the experience available for making rates in a given class.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

In a recent rate revision, one class for one state showed a decrease of \$8.7 million in reported payroll between policy periods. Data Administration suspected that the decrease was due to missing WCSP data for a single risk. Although efforts were made, contact with the carrier failed to resolve the problem.

The missing data caused at least an 18% decrease in the state experience available for making rates for that particular class. This exclusion of data resulted in more credibility being given to nationwide experience than would have been warranted if all state experience had been available. It is difficult to quantify the effect of this missing data on class rates.

NCCI is sometimes forced to remove WCSP data because it is obviously incomplete. In a recent rate revision, \$16.5 million was reported as payroll for a risk, but there were no losses reported for that risk. Research letters and follow-up efforts brought no response from the carrier. NCCI removed the payroll data to avoid potentially distorting the database. The effect on rates in this instance is difficult to quantify.

Carriers should be held to strict reporting standards. They should be made aware of their performance with regard to these standards, and fined for any deviations from them.

We understand that NCCI has plans to implement the Unit Report Control (URC) system which will help ensure the timeliness and completeness of data. The URC system is currently being tested with selected carriers; industry-wide phased implementation is scheduled to be completed by July of 1992.

- 4) WCSP data reflecting losses without payroll for an insured is eliminated without contacting the carrier.

The State Validation Report identifies errors in WCSP data, including WCSP data reflecting losses reported for a class code with no corresponding payroll. Data Administration procedures dictate that data meeting the criteria for losses without payroll should be removed from the ratemaking files without further research unless there are more than five occurrences for a single carrier. If there are more than five occurrences of

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

this error for a single carrier, an investigation will occur before eliminating the data. This investigation may include contacting the carrier.

In practice, an investigation may also occur if the loss is considered large. However, this practice is not reflected in documented procedures.

In a population of 6,726,062 loss records having policy effective dates of 1986 and 1987, 36,252 loss records, or .5% of the loss records, were removed because corresponding payroll information did not exist.

NCCI procedures should require investigation into all loss without payroll errors. Carrier approval should be required on all resulting modifications.

In the long term, the loss without payroll and other data edits should be performed at the time of unit report receipt. NCCI should require carriers to correct any identified errors through data resubmission.

We understand that NCCI has plans to implement the Unit Report Control (URC) and Unit Report Quality (URQ) systems. These systems, described in Volume I, are intended to perform front-end WCSP validation and provide procedures for timely carrier corrections. The URC system is currently being tested with selected carriers; industry-wide phased implementation is scheduled to be completed by July of 1992. The URQ system is scheduled for a phased implementation to be completed in October of 1992.

5) Duplicate WCSP data exists in the data used to produce Class Rates.

The detailed WCSP data processed in Data Administration is comprised of exposure records and loss records. Each exposure record indicates payroll and premium in a payroll classification for a specific risk. Each loss record indicates indemnity and medical loss amounts for a specific loss or for aggregated small losses. Data Administration summarizes the detailed WCSP data and forwards it to Class Ratemaking where it is used to produce rates.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

Two random samples were taken from detailed WCSP data. The samples included 181 payroll records and 181 loss records. In these samples, two instances of duplicate WCSP data were identified. These duplicate records were used in Class Ratemaking to produce rates. In both instances, the duplicates detected were insignificant and had no impact on ratemaking.

At a minimum, NCCI should reevaluate procedures used to identify and remove duplicate WCSP data.

In the long term, NCCI should implement a centralized WCSP data repository. WCSP data should be validated immediately upon receipt and included in this database through a single point of entry. Duplicate data should be identified at this time. Applications requiring WCSP data for processing should access the database. NCCI should also strictly enforce the timeliness of data submission. This measure would decrease the incidence of duplicate data.

We understand that NCCI plans to implement the URS database, which is intended to serve as a centralized repository of validated WCSP data. NCCI plans to capture new unit reports in the URS database in September of 1991.

We understand that NCCI has plans to implement the Unit Report Control (URC) and Unit Report Quality (URQ) systems. These systems, described in Volume I, are intended to perform front-end WCSP validation and provide procedures for timely carrier corrections. The URC system is currently being tested with selected carriers; industry-wide phased implementation is scheduled to be completed by July of 1992. The URQ system is scheduled for a phased implementation to be completed in October of 1992.

- 6) State Validation procedures do not adequately document the steps necessary to clear certain types of errors.

The Data Administration State Validation Procedures outline, in detail, the steps necessary to correct errors appearing on the State Validation Report. However, procedures for clearing certain errors (e.g. error code

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

E: Average Indemnity Not Within Specified Ranges, and error code F: Average Medical Not Within Specified Ranges) are not adequately documented. In the specified examples, the procedures refer the user to a supervisor for resolving the error.

NCCI should update the State Validation Procedures to include sufficient detail to clear all State Validation errors.

- 7) Duplicate Removal Procedures dictate that exposure records identified as duplicates should not be removed if payroll amounts are divisible by 100. This allows some identified duplicates to remain in the data.

Under the Workers Compensation Statistical Plan (WCSP), exposure should be reported in aggregate for each class code. It is not unusual for carriers to report multiple line items of exposure for one class code. The net sum of these line items is the aggregate exposure for the class code. In identifying duplicate data, Data Administration clerks look for multiple line items that indicate the same risk id, class code, and exposure. Potential duplicates are researched and, if appropriate, removed from the WCSP data.

Duplicate Removal Procedures indicate that identical line items should not be treated as duplicates if the exposure amount is divisible by 100. Such exposure amounts are referred to as "Common Payroll".

In practice, common payroll may be investigated if the payroll amount is considered large. However, this practice is not reflected in documented procedures.

In a random sample of 181 payroll records, one duplicate was identified. This duplicate amounted to a net overstatement in payroll of \$31,000. It was not removed, presumably because it met the "Common Payroll" criterion (i.e. 31,000 is divisible by 100). In comparing this data to carrier submitted unit reports, it was identified as a true duplicate.

At a minimum, NCCI should research all potential duplicates, including those with payroll amounts divisible by 100. Written procedures should be updated to reflect this policy.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

In the long term, NCCI should identify and eliminate duplicate unit reports at the time of unit report receipt.

We understand that NCCI has plans to implement the Unit Report Control (URC) system which is intended to identify and eliminate duplicate unit report submissions. The URC system is currently being tested with selected carriers; industry-wide phased implementation is scheduled to be completed by July of 1992.

8) Data Administration loss investigation reports do not list Claim Number.

Loss investigation reports provide detail listings of specified subsets of WCSP data. These reports are used to investigate unusual loss development trends and other anomalies in WCSP loss data.

Current loss investigation reports do not include Claim Number as part of the detail. Claim Number is required to positively identify duplicate loss records. Data Administration clerks retrieve hard copy unit reports or order custom data extracts to obtain this information.

NCCI should include Claim Number on loss investigation reports.

9) The Administration Number, a unique NCCI identifier for unit reports, is not accurately recorded in WCSP data files, and is not used on Data Administration reports.

A unique Administration Number is assigned to each unit report received by NCCI either on hard copy or on magnetic tape. This information is stored in most WCSP data files at NCCI.

Microfilm and microfiche copies of original documents are stored in Administration Number order. Knowledge of the Administration Number is necessary to locate a carrier submitted unit report.

Data Administration reports list Carrier Number, Policy Number, Policy Effective Date, Report Number, State Code, and/or Risk Id. Clerks use

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

this information to "look up" the Administration Number in the Unit Card Tracking System (ICT). Once the Administration Number is determined, the original unit report can be located on microfilm or microfiche.

If the Administration Number were included on Data Administration reports, unit reports could be located immediately. The interim step of using ICT could be eliminated. This would reduce error research time. However, Administration Numbers are not readily accessible because they are truncated in WCSP data files.

NCCI should resolve processing errors which cause Administration Numbers to be truncated in WCSP data files. In addition, the Administration Number should be added to many current Data Administration error reports.

We understand that NCCI is currently addressing truncation problems which affect the Administration Number. These problems are being addressed through NCCI's normal change order process for system maintenance.

10) The procedure to obtain unit report source documents is time consuming.

In researching WCSP data errors, Data Administration personnel often retrieve original unit report data. Currently this procedure requires:

- 1) Determining the Unit Report Administration Number through the ICT system by using the Policy Number or Risk ID.
- 2) Obtaining the appropriate microfilm or microfiche based on the Administration Number.
- 3) Viewing and printing the unit report image using microfilm and microfiche machines.

Sometimes the PICS database and the Risk Directory are also accessed during this process.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Unit Card Data Administration

Given the large number of errors requiring research by Data Administration, this process represents a significant time commitment.

NCCI should print Administration Number on Data Administration error reports. This would eliminate the need to access ICT, the PICS database, and the Risk Directory.

In the long term, NCCI should provide on-line access to detail unit report data. This could be accomplished through the development of a centralized WCSP database.

We understand that NCCI plans to implement the URS database which is intended to serve as a centralized repository of validated WCSP data. NCCI plans to capture new unit reports in the URS database in September of 1991.

11) The State Validation on-line correction system formats the Policy Effective Date incorrectly.

WCSP errors identified on the State Validation Report are corrected by Data Administration clerks through an on-line correction system. This system formats credit and/or debit records to offset the erroneous data and, if appropriate, replace it.

The on-line correction system formats the Policy Effective Date as part of each record it creates. This date is formatted without the decade, e.g. January 5, 1988 would be formatted as 01/05/08.

In a population of 20,218,299 exposure and loss records, 13,965 records had incorrectly formatted Policy Effective Dates.

While this deficiency does not impact processing, it should be corrected to provide data consistency.

NCCI should modify the State Validation on-line correction system so that the Policy Effective Date is formatted correctly.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Class Ratemaking

A. Area Overview

The Class Ratemaking area uses overall rate level change indications from the Overall Rate Level area and summarized payroll and loss data from Unit Card Data Administration. This information is used to produce workers compensation rates by payroll classification code for each state.

Class Ratemaking also produces Expected Loss Rate Factors (ELR Factors) and D-Ratios used by Experience Rating to produce Experience Modification Factors (experience mods). (ELRs indicate the expected losses for a classification per unit of exposure; D-ratios indicate the portion of those losses below a specified dollar threshold.)

For a more detailed description of the Class Ratemaking area, refer to Volume II, Section I, Description of Data Collection and Data Handling. Detailed flow diagrams for this area are included in the Volume II Appendix.

B. Area Evaluation

Key Strengths:

- o NCCI adheres to its stated methodologies during the ratemaking process.
- o NCCI's Quality Control Department provides an independent review of data and calculations used in ratemaking.
- o NCCI is committed to improving integrity and accuracy in the ratemaking process.

Key Weaknesses:

- o Critical class ratemaking applications are developed, maintained, and controlled by actuarial personnel. These end user systems do not have the degree of automated application control required of most production systems.
- o Class Ratemaking application programs are in need of maintenance to correct long standing deficiencies and to provide needed enhancements.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Class Ratemaking

Key Recommendations:

- o NCCI should implement more stringent controls over its end user computing environments. Standards for developing, executing, and maintaining end user applications should be established and strictly enforced.
- o NCCI should address maintenance and enhancement requirements of Class Ratemaking application programs.

C. Testing Objectives

- To evaluate the accuracy of processing used to produce Expected Loss Rates (ELRs) and D-ratios.
- To evaluate the accuracy of processing used to produce class rates.

D. Testing Methods

The evaluation of Class Ratemaking was accomplished through control procedures review and systems review and analysis. These techniques are described in the Evaluation Approach section of Volume I, Part C of this report.

E. General Observations & Recommendations

- 1) NCCI's Quality Control department performs an independent and thorough check of data and calculations used to determine class rates.

Quality Control (QC) is responsible for providing an independent review to ensure the accuracy and reasonableness of data affecting class ratemaking. QC's review of Class Ratemaking begins at the point where summarized WCSP data is received from Data Administration, and continues through the calculation of class rates and final assembly of the bound rate filing.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Class Ratemaking

QC actions include independent checking of input to sources, review of formula calculations, review of state specific items, and independent derivation of certain factors (e.g. state law amendment factors).

QC places a red dot next to data that has been reviewed. The red dot indicates that the data reviewed has been successfully recalculated or reconciled to sources.

- 2) NCCI's end user systems do not have the degree of automated application control required of most production systems.

Class Ratemaking currently performs portions of its automated processing using systems developed, maintained and controlled by actuarial personnel. These systems perform functions critical to NCCI's ratemaking function. They perform WCSP data validation, calculate critical rate adjustment and rate calculation factors, and produce major components of rate filings.

While these systems operate adequately, and their output is carefully checked by the Quality Control Department, they do not have systems controls commensurate with their importance to NCCI's business objectives.

Critical deficiencies include the following:

- o There are no processing control reports or automated audit trails which document application program activity.
- o There are no documented procedures to control program changes. (It should be noted, however, that in some areas efforts have been made to provide control over program changes by assigning program maintenance responsibility to one individual.)
- o Documentation of existing applications is sparse and poorly integrated.
- o There are no formal backup procedures. Although most applications and data sets are backed up, most backups are not stored off site and a documented retention schedule does not exist.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Class Ratemaking

- o Access to microcomputer applications is not restricted through use of passwords or other security measures.
- o Microcomputer applications reside on unsecured personal computers (PCs).
- o There are no documented standards for testing new end user application programs or for testing changes to existing end user application programs.

Given the importance of end user computing to the class ratemaking process, NCCI is incurring significant risk due to their current lack of controls.

NCCI should implement more stringent controls over its end user computing environments. Standards for developing, executing, and maintaining end user applications should be established and strictly enforced.

NCCI should move more stable, regularly executed end user applications into a production environment where they can be maintained and executed by NCCI's data processing department. This will reduce the risk of processing errors by taking advantage of a more tightly controlled environment.

We understand that NCCI is developing an end user computing policy which is intended to address data processing controls. NCCI has not set a date for implementation of this policy.

- 3) Ratemaking procedures allow WCSP data to be eliminated without direct carrier approval.

WCSP data used for class ratemaking is primarily validated and corrected in Data Administration. Identified errors are sometimes resolved through contact with the carrier. NCCI investigates approximately 1000 errors a year by requesting information from carriers. Approximately 10-15% of these requests go unanswered.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Class Ratemaking

When a carrier does not respond to a request for information, Data Administration supervisors contact Class Ratemaking actuarial supervisors for advice. If the actuarial supervisor determines that the data in error is insignificant or may substantially distort class rate levels, the data is eliminated.

This situation occurs approximately one or two times for every three states processed.

NCCI should continue to eliminate data if it is inaccurate and might adversely affect the integrity of class rate levels. Carriers should be strongly encouraged to submit quality data and to respond promptly to NCCI requests for additional information.

In the long term, NCCI should place the burden of WCSP data correction on the carriers. WCSP data should be validated at the time of unit card receipt. NCCI should require carriers to resubmit data found to be in error.

We understand that NCCI plans to implement the Unit Report Control (URC) and Unit Report Quality (URQ) systems, which are intended to perform front-end WCSP data validation and provide a platform for carrier corrections. Both systems are scheduled to be fully operational by the end of 1992.

- 4) NCCI's process for creating Unit Statistical Plan (USP) rate filing exhibits is complex due to the implementation of makeshift controls in an end user environment.

During the production of each rate filing, NCCI produces various reports listing summarized Workers Compensation Statistical Plan (WCSP) data and factors derived from this data. These reports, referred to as USP exhibits, provide information for analysis, factors used in class rate calculations, and exhibits for rate filings.

Currently, all USP exhibits are produced utilizing an end user controlled PC spreadsheet application (LOTUS 123). Each year, Class Ratemaking copies portions of the previous year's USP Exhibit diskette onto two new

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Class Ratemaking

diskettes. The new diskettes are numbered "1" and "2" and serve as the starting point for USP Exhibits for the current year. In order to complete the necessary input to these diskettes, Class Ratemaking performs the following steps:

- o Data is downloaded from mainframe computer files to Diskette 2. To verify the results of the download process, key values from hard copy reports are manually entered onto Diskette 1 for later comparison:
 - Limited and summarized WCSP data for five policy years, known as NC235 data, is downloaded from the mainframe computer to Diskette 2.
 - Limited and summarized WCSP data for the second most recent policy year valued as of the 1st report is known as 1&9 Limited Summary data. The 1&9 Limited Summary includes 1st reports received the previous year, late 1st reports received during the current year, and any carrier submitted corrections. This data is downloaded from the mainframe to Diskette 2.
 - Total amounts from the report of NC235 Limited Summary data are manually entered onto Diskette 1.
 - Total amounts from the report of 1&9 Limited data are manually entered onto Diskette 1.
- o Data from hard copy source documents is manually entered onto Diskette 1. To verify the results of the data entry process, a second person enters the same data onto Diskette 2 for later comparison.
 - Total amounts from a report of 4th and 5th Limited Summary data are manually entered onto both Diskette 1 and Diskette 2. The 4th and 5th Limited data includes limited experience for the 4th and 5th oldest policy years included in the NC235 data. Data is entered onto the two diskettes by two different people.
 - Factors intended to adjust data based on the effects of state legislation are manually entered from the Amendment Factors Page onto both Diskette 1 and Diskette 2. Data is entered onto the two diskettes by two different people.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Class Ratemaking

- Cost ratios, trend factors, statewide average weekly wages and other factors are manually entered from the Form R Input Page onto both Diskette 1 and Diskette 2. Data is entered onto the two diskettes by two different people.
- o Diskette 1 is compared to Diskette 2 by an automated microcomputer program. Any differences are researched and resolved.
- o Diskette 1 is used to produce USP exhibits.

This process is complex because two diskettes are updated independently with the objective of ultimately making them identical. The independent diskettes are compared after all updates. This double entry verification serves as a control mechanism to ensure data accuracy.

If standard data processing controls were in place, it would not be necessary to produce two independent diskettes. Input data could be verified through on-line entry validation and batch total verification.

NCCI should streamline the process used to create USP Exhibit diskettes. Implementing tighter data processing controls over its end user systems in general will eliminate the need for double entry verification strategies.

We understand that NCCI is developing an end user computing policy which is intended to address data processing controls. NCCI has not set a date for implementation of this policy.

In the long term, NCCI should implement most of this process as a standard production application.

F. Specific Tests Performed

- 1) Evaluated the use and effectiveness of the Preparation Checksheet.

The Preparation Checksheet is used to ensure that specific data integrity checks have been completed before class rates are calculated.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Class Ratemaking

- Determined whether maximum aggregate amounts were identified and researched.
- Determined whether new class codes were identified and researched for experience prior to their effective dates.

2) Verified the accuracy of data on the Form R Input Sheet.

The Form R Input Sheet is used to record information for use as input to USP exhibits. The information on the Form R Input Page includes: cost ratios, trend factors, statewide average weekly wages, etc.

- Verified the accuracy of the data by tracing it back to its sources.

3) Verified the accuracy of data on the Amendment Factors Page.

The Amendment Factors Page is used to record information for use as input to USP exhibits. The information on the Amendment Factors Page includes: amendment factors, adjustment factors, and assessment factors.

- Verified the accuracy of the data by tracing it back to its sources.

4) Evaluated the adequacy of Class Ratemaking's assessment of data reasonableness.

Class Ratemaking's assessment of data reasonableness includes the review of reasonableness checks performed by Data Administration, as well as the performance of additional reasonableness checks as needed by actuarial personnel.

- Determined whether reviews of Data Administration reasonableness checks were performed.
- Evaluated the adequacy of the tests performed by Data Administration and the tests available for performance by Class Ratemaking.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Class Ratemaking

- Reviewed documentation and audit trails for changes.
- Investigated follow-up procedures to ensure that changes were properly made.

5) Verified the accuracy of data contained in the Lotus Input Spreadsheet.

The Lotus Input Spreadsheet contains the input data used to create the USP Exhibits. The USP Exhibits provide information for analysis, factors used in class rate calculations, and exhibits for rate filings.

- Evaluated the process used to enter and download data to the input spreadsheet.
- Verified the accuracy of the data by tracing it back to its sources.

6) Verified the accuracy of data contained in the USP Exhibits.

The USP Exhibits provide information for analysis and inclusion in the rate filing, factors used in class rate calculations, and exhibits for rate filings.

- Evaluated Quality Control's review of data in the USP Exhibits.
- Verified the accuracy of the data through recalculation and by tracing the data back to its sources.

7) Reviewed the accuracy of data entered on A-sheet control cards.

Data entered on A-Sheet control cards is used as input to the A-sheet calculation program.

- Verified the accuracy of the data by tracing it back to its sources.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Class Ratemaking

8) Identified the reasons for data truncation in Class Ratemaking application programs. Evaluated the controls in place to ensure these truncation errors do not affect the calculation of class rates.

- Identified truncation errors in Class Ratemaking data.
- Interviewed Class Ratemaking personnel to determine how truncation errors are resolved.

9) Verified that the automated A-sheet calculation program produces A-sheets according to documented procedures.

- Developed a parallel A-Sheet program to test NCCI's A-Sheet process.
- Verified the accuracy of NCCI's A-Sheet process by comparing NCCI A-Sheets to A-Sheets produced by the A-Sheet test program.

10) Verified the accuracy of data used to calculate Expected Loss Rate Factors (ELR Factors).

Expected Loss Rate Factors are used in the Revised Experience Rating Plan to calculate expected losses.

- Verified the accuracy of input data by tracing it back to its sources.
- Verified the accuracy of worksheet calculations by recalculating values.

11) Verified the accuracy of data used to calculate D-Ratios.

D-Ratios are used under the Revised Experience Rating Plan to calculate expected primary losses. A primary loss is the portion of a single loss, including medical and indemnity, up to a dollar threshold. This threshold varies from between \$2000 to \$10,000.

- Verified the accuracy of input data by tracing it back to its sources.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Class Ratemaking

- Verified the accuracy of worksheet calculations by recalculating values.
- 12) Verified the accuracy of data on Rate Factor Card Worksheets.
- Rate Factor Card Worksheets are used to record information in order to facilitate construction of rate factor cards. Rate Factor Cards are used as input to the automated class rates calculation program (IDRATE).
- Verified the accuracy of the data by tracing it back to its sources.
- 13) Verified the accuracy of data on Rate Factor Cards.
- Rate Factor Cards are used as input to the automated class rates calculation program (IDRATE).
- Verified the accuracy of the data by tracing it back to its sources.
- 14) Verified that Rate Factor Card data is accurately input to the automated class rates calculation program (IDRATE).
- Verified the accuracy of the data by tracing it back to its sources.
- 15) Verified that the automated class rates calculation program (IDRATE) calculates rates according to documented procedures.
- Verified the accuracy of the rate calculation program by performing rate calculations manually.
- 16) Evaluated the controls in place to ensure that calculated class rates achieve the proposed overall rate level change calculated by Overall Rate Level.
- Calculated achieved overall rate level by calculating rate levels using an independent program.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Class Ratemaking

- Verified that intended rate levels were achieved by comparing intended rate levels to rate levels calculated by the independent program.
 - Reviewed program logic to determine whether adequate controls exist to ensure that the intended rate level is achieved.
- 17) Evaluated the effectiveness of the Quality Control Department to ensure the accuracy of class ratemaking indications.
- Interviewed Quality Control Department personnel to gain an understanding of quality control procedures.
 - Reviewed Class Ratemaking documentation for evidence of Quality Control review.
 - Verified the accuracy of Quality Control's review by spot checking data reviewed by Quality Control.
- 18) Reviewed F-class ratemaking processing steps to gain an overall understanding of similarities and differences between F-class and industrial class ratemaking.
- Interviewed actuarial personnel to understand responsibilities and identify key processing steps.
 - Reviewed Quality Control's involvement in reviewing and evaluating F-class ratemaking calculations and rates produced.

G. Specific Findings & Recommendations:

1) Class Ratemaking application programs truncate dollar amounts.

Class Ratemaking mainframe application programs do not correctly process payroll amounts of \$10 billion or more or pure premium amounts greater than \$100. Both payroll and pure premium sometimes exceed these amounts.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Class Ratemaking

Pure premium is usually defined as the dollar amount of losses per \$100 of payroll. In some cases pure premium is defined using an exposure base other than payroll. When an exposure base other than payroll is used (e.g. number of employees), it is not uncommon to encounter pure premium amounts greater than \$100.

The application programs that produce A-sheets truncate payroll amounts greater than \$10 billion. For example, a payroll amount of \$26,000,000,000 processed by this program is erroneously transformed to \$6,000,000,000. Pure premium amounts greater than \$100 are also truncated. For example, a pure premium amount of \$112.012 is truncated to \$12.012.

The application program which calculates class rates (IDRATE) also truncates dollar amounts. This program truncates pure premium amounts greater than \$100.

Class Ratemaking personnel currently overcome these truncation problems by manually correcting the output from these programs. Although a system generated report is available to help identify some truncation problems, a manual review of the data is often necessary.

In some cases, once problems are identified, only hard copy output or print files are corrected and magnetically stored data remains truncated. Each time the magnetically stored data is used, Class Ratemaking personnel must recorrect the truncated data. During our limited review of this process, manual processing and quality control procedures identified and addressed these problems. However, identifying and correcting these errors is time consuming and NCCI unnecessarily assumes the risk of missing errors and grossly misstating amounts.

NCCI should correct truncation problems in the A-sheet process and the IDRATE process.

We understand that truncation problems were corrected in test programs modified for this examination. These problems should similarly be addressed in NCCI's production environment. NCCI estimates that correcting these problems in the A-Sheet process will

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Class Ratemaking

involve modifications to 22 application programs. NCCI has made plans to correct these problems through its normal change order process for system maintenance.

- 2) F-class ratemaking is performed within an environment that is separate from the environment used for industrial class ratemaking.

F-class financial call data is not used for overall rate level change indications since NCCI has determined that the F-class financial data is unreliable. Therefore F-class ratemaking is based solely upon WCSP data. The validation and processing of F-class WCSP data is completely separate from validation and processing used for industrial class ratemaking. F-class processing utilizes its own programs which were independently created in 1988. These programs are maintained by actuarial personnel.

Beginning in 1991, NCCI intends to perform F-Class ratemaking annually. Between 1985 and 1990, there were only two F-class rate filings: in 1988 and 1990. The infrequency of filings was attributed to the need to train new employees after the move to NCCI's Boca Raton facilities and the higher priority given to industrial classes during that transition. Now, with sufficiently trained staff, NCCI is reviewing processing procedures, processing responsibilities, and methodology to support annual F-class filings.

We understand that NCCI is reviewing the feasibility of transferring validation of F-class WCSP data to the Data Administration production systems. It is important to note that F-class validation is somewhat more complicated than industrial class validation. Personnel performing F-class validation must be familiar with the applicable Federal and state laws governing the determination of rates.

NCCI is also reviewing issues which may affect methodology and thus the design of application programs. Two outstanding issues include the provision for loss development after the fifth report and the inclusion of a provision for trending losses.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Class Ratemaking

NCCI should consider the recommendations provided in this report regarding end user systems, industrial class ratemaking, and WCSP validation and processing to ensure consistency in the development of F-class ratemaking.

3) Class Ratemaking verifies the achievement of the proposed overall rate level change before class rates have been finalized.

The application program that determines class rate levels (IDRATE) verifies that the proposed overall rate level change is actually achieved by the changes in individual class rates. This is accomplished as follows:

- o Proposed class rates are multiplied by current exposure to calculate the proposed manual premium.
- o Current class rates are multiplied by current exposure to calculate the current manual premium.
- o Proposed manual premium is divided by the current manual premium to calculate the achieved overall rate change.
- o The achieved overall rate level change is compared to the change proposed by the Overall Rate Level area.
- o If the two values do not match within a specified tolerance, class rates are appropriately adjusted.

This process is repeated until the achieved overall rate level change matches the proposed overall rate level change.

The IDRATE program performs the verification of overall rate level before class rates have been finalized. Two types of changes to the rates occur after this verification is completed. The IDRATE program makes changes to class rates based on individual state specific requirements, and NCCI Class Ratemaking personnel manually change class rates based on class specific requirements. No formal verification process exists to ensure the final class rates achieve the proposed overall rate level change.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Class Ratemaking

NCCI has developed an on-request end user program which determines the achieved overall rate level change. This program could be used to verify that final class rates achieve the proposed overall rate level change.

NCCI should procedurally verify that final class rates achieve the proposed overall rate level change. The existing end user program mentioned could be used to achieve this objective.

- 4) The number of significant digits applied to a key rate adjustment factor is inconsistent.

Class Ratemaking calculates class rates using an application process known as IDRATE. IDRATE calculates class rates based on the proposed overall rate level change, class experience, various trend factors, class swing limits, and loss limitations. Class swing limits restrict the amount a class rate can change from one year to the next.

Because of swing limits, IDRATE typically does not achieve the proposed overall rate change in its first calculation of class rates. The calculation must be iteratively performed, adjusting class rates to satisfy the overall rate level as well as swing limits by class.

The overall rate level is achieved using a multiplier called the test correction factor. The test correction factor is adjusted with each iteration to reduce the difference between the targeted overall rate level change and the overall rate level change resulting from the newly calculated class rates. When the final test correction factor has been determined the next step calculates final class rates.

The test correction factor used to calculate final class rates is different from the final test correction factor resulting from the iterative process.

The test correction factor calculated and verified during the iterative process has five significant digits after the decimal point, e.g. 1.12345. The test correction factor used to calculate class rates has three significant digits after the decimal point, e.g. 1.123. The potential impact of this difference on any class rates is less than .01% per class rate.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Class Ratemaking

While this deficiency has no material impact on class rates, it should be corrected to provide consistency.

NCCI should use the same test correction factor to verify the achieved overall rate level and to calculate the actual class rates.

5) Tasks on the Preparation Checksheet are not consistently checked off to denote completion.

Class Ratemaking personnel use the Preparation Checksheet to ensure that certain tasks have been completed prior to the class rate production process. Examples of tasks that must be completed include the following:

- o Review state memos to identify any state specific information which might be helpful during ratemaking.
- o Review data from the previous rate revision to identify state specific information that might be helpful during ratemaking.
- o Research maximum limits for losses in the state. If limits exist, data should be reviewed to determine whether any limits have been exceeded.
- o Research the effective dates for any new class codes in the state. Data should be reviewed to determine whether data for new classes was reported prior to effective dates for those classes.
- o Research the state requirements for any special wording for appendices included in the rate filing.

Class Ratemaking personnel do not always complete the checklist. In some cases, they perform the checks but do not indicate this action on the form. In a judgmental sample of three Preparation Checksheets, two checksheets were not adequately completed.

Class Ratemaking personnel should complete the Preparation Checksheet and sign off on items as they are completed. In addition,

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Class Ratemaking

a supervisor should review the checksheet to verify that the form is complete.

- 6) Documented procedures for Class Ratemaking's review, execution and follow-up of data reasonableness checks are incomplete.

Data Administration executes various reasonableness checks on WCSP data. These checks include analysis of loss data, payroll data, and changes occurring in the data between policy periods and valuation points. For example, Data Administration reviews loss development by injury type. When "unreasonable" data or unusual patterns are identified, investigations are performed to research the underlying causes. Investigations may reveal missing or inaccurate data. Data Administration analysts attempt to resolve errors through carrier contact.

Class Ratemaking analysts review the results of reasonableness checks performed by Data Administration. If needed, Class Ratemaking analysts may perform additional reasonableness checks on the data, especially for fluctuation of payroll by class. Class Ratemaking's review and execution of reasonableness checks may result in requests for follow-up investigation of the data. Such requests are made verbally to Data Administration supervisors and are accompanied by a photocopy of the data in question.

Documented procedures for Class Ratemaking's review and execution of reasonableness checks are sometimes vague.

There is no formal procedure requiring sign off on data reviewed or checked.

There are no documented procedures for tracking follow-up investigation requests or questions to monitor their resolution.

NCCI should implement formal procedures for Class Ratemaking's review and execution of reasonableness checks of the data. NCCI should adopt a policy of signing off on data reviewed or checked. A tracking mechanism for investigative follow up should also be implemented.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Class Ratemaking

We understand that informed actuarial judgment is necessary when reviewing and performing reasonableness checks of the data. We further understand that standard written procedures can not anticipate all applications of such judgment. However, we believe that most of the reasonableness checks can be formally specified by actuaries, documented, and signed off on when completed.

7) NCCI Class Ratemaking reports contain inconsistent names and labels for some identical types of information.

NCCI produces various reports during the class ratemaking process. Many of these reports list some of the same information. In some cases, the same information is labeled differently on different reports. Examples follow:

- o The "Effect of Changes By Parts" factor on the Rate Calculation Form contains the same information as the "Law Amendment" factor on the Rate Factor with Swing Limits report.
- o The "Final Exhibit I Loss Ratio" on the Rate Factor Card contains the same information as the "Average Cost Ratio" on Exhibit I of the Rate Level Worksheet.

These inconsistent names make it difficult to trace data from one report to another. Training of new personnel is generally more difficult under these circumstances.

NCCI should enforce consistent naming standards on ratemaking reports.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Experience Rating

A. Area Overview

The Experience Rating area uses up to three years of payroll and loss experience data received from Data Conversion and Expected Loss Rate Factors (ELRs) and D-Ratios received from Class Ratemaking to produce Experience Modification Factors (experience mods). (ELRs indicate the expected losses for a classification per unit of exposure; D-ratios indicate the portion of those losses below a specified dollar threshold.)

An Experience Mod for a risk is printed along with the risk's experience on Experience Rating Sheets. Rating Sheets are sent to carriers who use them to adjust an insured's total premium. An experience modification factor is a number less than one for risks with fewer actual losses than expected and greater than one for risks with more actual losses than expected.

For a more detailed description of the Experience Rating area, refer to Volume II of this report.

B. Area Evaluation

Key Strengths:

- o Statistical sampling of Experience Rating files indicates that NCCI accurately converts WCSP data reported by the carriers to NCCI computer files used to produce experience mods.
- o The Experience Rating Profile System serves as a control to ensure all required WCSP data has been received prior to producing experience mods. This system appears to be working effectively.
- o Current NCCI initiatives will address some of the current shortcomings of the experience rating processing.

Key Weaknesses:

- o NCCI performs separate validation of the same WCSP data in Experience Rating and Data Administration.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Experience Rating

- o NCCI's validation of rating sheets is heavily reliant on manual procedures.
- o NCCI's Risk Identification Number (Risk ID), used to identify WCSP experience with a specific insured, is frequently reported inaccurately by carriers. Risk ID verification and correction requires extensive NCCI effort.

Ongoing system initiatives at NCCI are intended to resolve the first two of these weaknesses. These initiatives are discussed in Volume I of this report.

Key Recommendations:

- o NCCI should develop a centralized unit report database.
- o NCCI should perform automated validation of WCSP data used to produce rating sheets. Most of this validation should occur at the time of unit report receipt.
- o NCCI should consider using an industry established risk identifier, such as Federal Employer's ID Number (FEIN).

NCCI has development projects underway which, if successful, will satisfy the first two of these recommendations. These projects are described in Volume I, Part C of this report.

C. Testing Objectives

- To evaluate the controls in place to ensure the completeness of payroll and loss data used to produce experience modification factors.
- To evaluate the procedures in place to ensure the accuracy of payroll and loss data used to produce experience modification factors.
- To evaluate the controls in place to ensure the completeness and accuracy of ELR Factors and D-Ratios used to produce experience modification factors.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Experience Rating

- To evaluate the controls in place to ensure timely production and distribution of experience modification factors.
- To evaluate the accuracy of payroll and loss data used to produce experience modification factors as compared to the data reported by carriers.

D. Testing Methods

The evaluation of Experience Rating was accomplished through control procedures review, systems review and analysis, and statistical sampling. These techniques are described in the Evaluation Approach section of Volume I, Part C of this report.

E. General Observations & Recommendations

- 1) NCCI performs separate validation of the same WCSP data in Experience Rating and Data Administration.

NCCI receives WCSP data in Data Conversion. Limited validation is performed at this time. This data is routed separately to Experience Rating and Data Administration/Class Ratemaking. The majority of WCSP data validation is performed in these areas. Experience Rating and Data Administration validate, correct and use their versions of the data independently from one another with potentially inconsistent results. NCCI does not attempt to reconcile Experience Rating and Data Administration WCSP data or corrections.

NCCI should implement a centralized WCSP data repository. This database should contain validated WCSP data for use by all applications requiring this data for processing.

We understand that NCCI plans to implement the Unit Report Quality (URQ) system which is intended to validate WCSP data upon receipt. We also understand that NCCI plans to implement the URS database which is intended to serve as a centralized repository of validated WCSP data. The URQ system is scheduled for a phased

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Experience Rating

implementation to be completed in October of 1992. The URS database will begin capturing new unit reports in September of 1991.

- 2) Experience Rating personnel perform substantial manual edits that could be performed in automated application programs.

NCCI manually reviews all rating sheets it produces. These manual audits include risk specific reasonableness checks (e.g. no unusual class code changes since last year, premium this year compared to last year, etc.), comparison to original unit reports, and contacting the carrier or insured if necessary. NCCI manually reviews over 600,000 rating sheets per year.

At a minimum, NCCI should perform most of the current manual rating sheet edits as part of Experience Rating automated validation processing.

In the long term, NCCI should perform these edits, in an automated fashion, at the time of unit report receipt.

We understand that NCCI has plans to implement the Automated Auditing system which is intended to automate many of the current manual rating sheet edits. We also understand that NCCI has plans to implement the Unit Report Quality (URQ) system which is intended to perform extensive front-end unit report validation, eventually including risk specific validation. The Automated Auditing system is scheduled for production in the fourth quarter of 1991. The URQ system is scheduled for a phased implementation to be completed in October of 1992.

- 3) Experience Rating validation programs identify basic errors in unit report data that could be identified and corrected at the time of unit report receipt.

Two major application programs in the Experience Rating system (EXP0205P and EXP0210P) validate payroll and loss data. The edits performed by these programs are field level and include verifications such as:

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Experience Rating

- o Indemnity Amount is numeric
- o Loss Injury Code is greater than 1 and less than 7
- o Effective Date is a valid date.
- o Exposure Amount is numeric
- o State Code is an existing state code.
- o Class Code exists for the specified state
- o Loss Status Code must be 0, 1, or *

Most of the edits performed in these application programs could easily be performed at the time of receipt of the unit report.

Rating Support Services estimate that 60% of the data rejected by these programs is rejected because of invalid Class Codes. Another 10% of the rejections are due to invalid Status Codes and Injury Types.

NCCI should perform field level edits at the time of receipt of the unit report. This will improve the timeliness of error identification and correction.

We understand that NCCI has plans to implement the Unit Report Control (URC) and Unit Report Quality (URQ) systems which are intended to perform field level validation at the time of unit report receipt. An industry-wide phased implementation of the Unit Report Control system is scheduled to be completed by July of 1992. The Unit Report Quality system is scheduled for a phased implementation, to be completed in October of 1992.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Experience Rating

F. Specific Tests Performed

- 1) Evaluated the procedures in place to verify and correct the completeness of experience rating data through the use of the Experience Rating Profile System known as EPU. This system indicates which unit reports are required for a risk's rating to be produced and which have been received. The EPU system allows modification to the list of required unit reports.
 - Evaluated the procedure for clearing entries on the Ratings Not Produced Report. This report indicates all experience ratings due in the next three months that have not yet been produced because of missing unit reports.
 - Determined whether entries appearing on the Ratings Not Produced Report are cleared using the EPU system where appropriate.
 - Determined whether on-line activity through the EPU System is reflected on the Employee Activity Log. This log is a system generated audit trail of EPU activity.
 - Evaluated the adequacy of the Employee Activity Log as an audit trail for Profile System on-line activity.
 - Evaluated the procedure in place for supervisors to review on-line EPU activity made by experience rating clerks.
 - Evaluated controls in place to limit access to the EPU on-line system.

- 2) Evaluated the controls in place to ensure that corrections to WCSP data initiated by NCCI field offices are received and processed by the centralized rating support group.
 - Determined whether correction checking slips are adequately completed with all significant information. Checking slips accompany corrections sent to NCCI's main office by the field office. They include information of the number and type of corrections sent.
 - Determined whether correction checking slips accurately reflect contents of correction batches.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Experience Rating

- Evaluated the procedures to follow up on discrepancies between the contents of correction batches and the information indicated on checking slips.
- 3) Evaluated the controls in place to ensure WCSP data is not lost during processing and that processing problems are resolved in a timely manner.
- Verified the "Grid Log" record count balancing procedure through an independent reconciliation. The Grid Log is a manual procedure for verifying record counts through the Experience Rating System.
 - Reviewed the Rating Support Services Problem Log. This log indicates processing problems identified by Rating Support Services.
- 4) Evaluated the automated programs which validate payroll and loss data used to produce experience modification factors.
- Reviewed program logic and error reports, and interviewed data processing personnel to determine the specific validation procedures for loss data performed by the primary experience rating loss validation program (EXP0205P).
 - Reviewed program logic and error reports and interviewed data processing personnel to determine the specific validation of payroll data performed by the primary experience rating payroll validation program (EXP0210P).
 - Reviewed program logic and interviewed data processing personnel to determine the reasons for bypassing, combining, and deleting records.
 - Reconciled input and output record counts from validation program control reports.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Experience Rating

- 5) Evaluated controls in place to ensure that errors identified on the Reclaimables Rejection Report are cleared. This report identifies basic errors in unit report data such as invalid class codes, invalid injury types, etc.
- Observed procedures for clearing errors appearing on the Reclaimables Rejection Report.
 - Determined whether ratings identified on the Reclaimables Rejection Report appeared on the "B" listing as well as the Ratings Produced Report after corrections were applied. The "B" listing is a report of ACS keyed corrections.
 - Interviewed NCCI personnel to determine the type and relative frequency of errors which cause ratings to be rejected.
- 6) Evaluated the final rating sheet review and correction procedures.
- Determined whether approved rating sheets satisfied documented reasonableness tests.
 - Determined whether corrections noted on the Employee Activity Log were initiated by an error noted on the rating sheets.
 - Determined whether corrections noted on the rating sheet appeared on the Employee Activity Log and were included in the final rating sheets.
 - Determined whether corrections processed through ACS were included in the final rating sheets.
- 7) Statistically sampled Experience Rating payroll and loss records and compared them to the originally submitted unit reports and documented corrections.
- Two populations were defined. The first was all payroll records appearing on rating sheets produced in 1990. The second population was all loss records appearing on rating sheets produced in 1990.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Experience Rating

These rating sheets include WCSP data from policy years 1986, 1987, and 1988.

- The population was verified by comparing the number of risks in the sampled file to NCCI's risk directory. The risk directory is an electronically stored list of all experience rated risks. It includes such information as risk ID, risk name and the current experience mod.
- An attribute sampling approach was used. This approach measures frequency of errors rather than size of errors.
- A confidence level of 95%, expected error rate of 2%, and tolerable error of 5% were used to determine the sample sizes.
- The payroll and loss records selected were compared to carrier submitted unit reports and any documented corrections. The specific fields tested were: Insured Name, Risk Id, Rating Effective Date, Class Code, Payroll Amount, and Loss Amount.
- All identified discrepancies were discussed and researched with NCCI personnel. Results were summarized and included in the Appendix of this volume.

G. Specific Findings & Recommendations:

- 1) WCSP exposure and loss amounts reported by carriers are accurately processed for use in calculation of experience modification factors.

NCCI's electronically stored WCSP data used for calculating experience ratings was compared to carrier submitted source documents. A summary of the results follows:

- o In a random statistical sample of 181 payroll records, two errors in payroll amount were noted. In one case, a correction unit report was omitted from an experience rating. In addition, the supporting documentation for one record could not be located. Data for which supporting documentation could not be located was considered an error for the purposes of quantifying the sample test results.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Experience Rating

- o In a random statistical sample of 181 loss records, one error in loss amount was noted. This was due to the omission of a correction unit report from an experience rating.

In these samples, discrepancies were defined as differences between what was reported by carriers and what was used to calculate experience modification factors.

The results from this test indicate that WCSP exposure and loss amounts reported by carriers are accurately processed for use in calculating experience ratings.

Detailed sampling results are included in the Appendix to this volume.

2) Carriers frequently report incorrect risk IDs and risk names when submitting WCSP data.

NCCI uses the risk ID and risk name to associate WCSP experience with a specific insured. This relationship is critical for developing experience modification factors for the insured.

In a random sample of 181 WCSP payroll records and 181 WCSP loss records representing 362 Experience Rating Sheets, 47 risk IDs and 13 risk names were changed by NCCI from what was reported on the original unit reports. NCCI has a specific function defined to verify and correct risk IDs and risk names reported on unit reports. Carriers make significant errors in reporting risk IDs and risk names, as these sample results illustrate.

NCCI should explore other possibilities for an insured's identification number. Federal Employer's ID Number (FEIN) is one possibility. This number is widely available to carriers and would eliminate many of the inaccuracies and omissions in reporting the risk ID.

Regardless of the identification number used, it should be required input on all unit reports. NCCI should institute policies which will encourage carriers to report correct risk IDs and names. Financial

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Experience Rating

incentives and forcing carriers to correct their own data will help in this regard.

We understand that differences between experience rating and federal tax ownership rules may require grouping FEINs for the purposes of experience rating.

- 3) Checking slips, which indicate the number of unit report corrections sent to Rating Support Services from the field offices, do not always agree with the actual number of corrections received.

Field office clerks send corrections to the Rating Support department with checking slips which indicate the number of corrections sent. Rating Support procedures require the receiving clerk to count the corrections and compare them to the checking slip counts. If there are differences, the clerk sends the corrected checking slip to the field. There are no follow up procedures in place to verify that all corrections are received.

Four checking slips were compared to physical counts of corrections. Two of these checking slips did not indicate the correct physical counts. The impact of these discrepancies was minimal.

NCCI should verify checking slip counts and actively follow up on any discrepancies with the field offices.

We understand that Rating Support Services does follow up large differences between correction counts on the checking slip and actual corrections. It is unclear what signifies a large discrepancy in this context.

- 4) Checking slips are numbered manually, sometimes resulting in batch sequence gaps.

Checking slips which accompany corrections sent to Rating Support by the field offices are numbered manually by field office clerks. The receiving clerk sometimes notices gaps in checking slip numbers. These

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Experience Rating

gaps could indicate incorrectly numbered checking slips or missing correction batches.

NCCI should use preprinted, prenumbered checking slips.

5) Two out of ten rating sheet audit procedures are not being followed consistently.

Experience Rating procedures specify ten basic reasonableness edits to be performed after a rating sheet is produced. If a rating sheet fails any of these edits, procedures dictate that related unit reports are pulled and a full verification of information is performed.

Thirty-five rating sheets were reviewed for compliance with the reasonableness edits. Twenty-eight rating sheets failed at least one edit. In these cases, further investigation of the rating sheet data should be performed by Experience Rating clerks.

An Experience Rating clerk indicated that two of the ten edits are not actually performed. These two edits are:

- o Experience Modification increases or decreases are within 25% of last year's rating
- o In comparing the last two years, payroll increases or decreases are within 50%.

In the sample of thirty-five rating sheets, two failed the first edit and eight failed the second. Further follow up indicated the omission of these edits may have been due to inadequate training of the clerk.

NCCI should consistently perform the two identified edits. NCCI should implement a mechanism for ensuring all edits are actually performed. One possibility is a checklist and required clerk sign off. NCCI training should be enough to ensure clerks are aware of all procedures and the reasons behind them. In the long term, edits of this type should be performed in an automated fashion.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Experience Rating

We understand that NCCI is currently implementing the Automated Auditing System which is intended to perform rating sheet edits in an automated fashion. The Automated Auditing system is scheduled for production in the fourth quarter of 1991.

- 6) Experience Rating application programs produce non-standard processing control reports.

Control reports produced by several consecutively executed application programs are inconsistent. Some of these reports list record counts, some list risk counts and some list both. This inconsistency makes it difficult to verify data output from one program and input to the next.

An integrated set of control reports was reconciled as part of the testing of Experience Rating. These reports represented consecutive processing steps of the same WCSP data. Any changes in the number of data records should have been attributable to a specific program and reason.

We were unable to balance all control reports during this test since not all necessary information was readily available.

NCCI should make control reports consistent between programs. This will facilitate reconciliation of inputs and outputs.

We understand that NCCI currently maintains the "Grid Log" which is a manual system intended to verify the number of records processed through the Experience Rating system. The system, although cumbersome, appears to be effective.

- 7) Experience Rating's current control mechanism over record counts is manual but uses input from automated procedures and could be automated.

The "Grid Log" is a mechanism by which Rating Support tracks data through the Experience Rating system. Rating Support personnel use record and risk counts from automated procedures and post these numbers to a manual reconciliation sheet. Reconciliation of these numbers is performed manually.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Experience Rating

NCCI should automate this reconciliation procedure. Since all inputs to the Grid Log are from automated sources, an automated reconciliation procedure could be implemented. Alternatively, NCCI could include trailer records in all files. Trailer records would indicate expected detail record counts. Programs would verify that records processed match records indicated on the trailer record for input. Consistent control reports would provide a suitable mechanism for review.

- 8) Rating Support Services does not directly verify that ACS keyed corrections were entered correctly.

Rating Support Services sends corrections to ACS via the Rejected Risks Report (Rpt No EXP0215P-2). These corrections are keypunched by ACS and returned to NCCI along with a listing of the entered data called the "B" Listing.

Rating Support personnel compare the "B" Listing to the on-line experience rating system. This comparison verifies that the ACS correction file was successfully transmitted to NCCI. There is no direct verification that all corrections on the Rejected Risks Report were successfully entered.

Rating Support Services should compare ACS corrections listed on the "B" Listing to the Rejected Risks Report. This comparison process may be a candidate for automation using standard file compare software or custom developed applications.

In the long term, NCCI should require carriers to correct any identified WCSP data errors through data resubmission.

- 9) Experience Rating supervisors do not review on-line corrections made by clerks.

Experience Rating clerks make on-line corrections to WCSP data through the ERC system and to the Experience Rating Profile through the EPU

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Experience Rating

system. The Profile indicates which unit reports are required before a rating can be produced for a risk.

Supervisors do not review the corrections made by clerks. Current automated on-line activity audit trails do not provide sufficient detail to verify or backout changes made to data. Hard copy rating sheets are retained, however, and might be usable for reversing erroneous changes.

NCCI should implement complete system generated audit trails for these on-line functions. Experience Rating supervisors should review these audit trails on a regular basis.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Detailed Claim Information

A. Area Overview

The Detailed Claim Information (DCI) system is used to provide more in depth information on claims and to analyze trends in workers compensation claims. The DCI data consists of random samples of indemnity claims from thirteen states. The samples are designed to capture 1,000 valid permanent partial disability cases per state annually. The DCI system provides additional information concerning claimant data, indemnity benefits, medical benefits and claim administration details. Claims are reported for nine years, until they are closed or until they no longer include indemnity benefits. Quarterly, all valid DCI data is loaded into a database and is available for batch reporting.

For a more detailed description of the DCI system, refer to Volume II of this report.

B. Area Evaluation

Key Strengths:

- o The DCI system performs extensive validations on data at the time of receipt.
- o Data which fails any edits is immediately returned to the carrier for correction.
- o The system generates calls for corrected and subsequent information.
- o DCI data is stored in a centralized database.
- o The new DCI system being developed will address many of the weak points in the existing system.

Key Weaknesses:

- o DCI data is not integrated with policy and claim data residing in other NCCI systems.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Detailed Claim Information

- o There is no mechanism in place to encourage carriers to comply with DCI reporting requirements or to penalize them for failing to do so.

Key Recommendations:

- o DCI claim data should be compared to WCSP data to verify its consistency.
- o The PICS carrier master should be used in all applications requiring carrier data.
- o Procedures for measuring and reporting carrier reporting performance should be implemented. Enforcement measures such as fines or financial incentives should also be implemented.

C. Testing Objectives

- To evaluate the controls in place to ensure the completeness of detailed claim information received at NCCI.
- To evaluate the controls in place to ensure the accuracy of detailed claim information received at NCCI.
- To evaluate the controls in place to ensure the timely receipt of detailed claim information.
- To evaluate the accuracy of the processing of DCI data received by NCCI.

D. Testing Methods

The evaluation of controls in the Detailed Claim Information system was accomplished through systems and procedures review and analysis. The evaluation of the accuracy of data processing was accomplished through statistical sampling. These techniques are described in Volume I, Part C of this report.

EVALUTION OF DATA COLLECTION AND DATA QUALITY

Detailed Claim Information

E. General Observations & Recommendations

1) NCCI does not verify the consistency of DCI data with unit report data.

NCCI does not verify that total incurred claim costs are consistently reported on unit reports and DCI calls for the same individual claims. This would provide some evidence that DCI data is being reported reliably by carriers. It would also provide a limited completeness validation of WCSP data which is part of the DCI sample. NCCI has compared average costs per claim from WCSP data for all states to average cost per claim from DCI data for policy years 1983 - 1987. The analysis shows that the DCI sample is representative of the WCSP population.

We recommend that a comparison of DCI and unit report loss data be performed periodically. This requires a unique claim identifier to associate claims in the two systems. This can be done using data currently existing in the two systems, such as policy, carrier and claim numbers, or by capturing a unique risk identifier in both systems.

We understand that claim data is valued at different points in time, however the data should be reasonably consistent for open claims and should match exactly for closed claims. As of December 31, 1989, 88% of all valid claims in the DCI database were closed.

2) NCCI does not effectively enforce DCI reporting requirements.

Carrier reporting of DCI data is mandatory for all member carriers in each DCI state where they write more than 0.1% of statewide premiums. NCCI analysis indicates an upward trend in carrier compliance with DCI reporting requirements since 1987. The compliance rate has increased from approximately 55% in 1987 to approximately 75% in 1990. A large increase in compliance is evident beginning in the first quarter of 1989, which coincides with a system upgrade which resulted in automatic generation of requests for missing subsequent calls and correction calls.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Detailed Claim Information

Carrier reporting compliance is not considered in determining the sampling rate for each state. Poor compliance causes the DCI database to capture fewer permanent partial claims than intended.

We recommend that carriers be strongly encouraged to submit all required DCI data. Carrier performance reporting should be implemented to provide carriers with data on their individual compliance. These reports should be distributed to carrier management and should be made available to regulatory agencies. Performance reporting should be combined with either a fining or incentive program.

We understand that a monetary incentive program is included in the design of the new DCI system and that decisions about implementing the programs are being made by the Workers Compensation Data Management (WCDM) group. We recommend that NCCI evaluate trends in carrier compliance on an ongoing basis to ensure the effectiveness of the program.

- 3) There are no procedures to ensure that the DCI system is capturing the targeted number of permanent partial disability cases for each state.

NCCI targets the capture of 1,000 valid permanent partial disability cases in each DCI state annually. Carriers are required to take a random sample of all claims in DCI states. A sampling rate is determined by DCI actuarial personnel who determine the sampling rate by evaluating the ratio of permanent partial claims to total claims for all carriers in the state. The rate does not take into account the possibility that some carriers may not submit the requested number of claims. The risk exists that the DCI database will not contain the desired amount of data. NCCI does not periodically evaluate the DCI database to determine whether the target has been achieved.

NCCI statistics indicate that carrier reporting compliance for 1990 was between 75-80%. An analysis of the DCI database for accident years 1985 through 1989 for the 13 current DCI states indicates that, of the 63 samples represented, only 19 captured the targeted number of claims. In

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Detailed Claim Information

1990, the target was achieved in 7 of 13 states. Additional samples are not requested when the target is not met.

We recommend that the DCI data be analyzed periodically to determine whether the targeted number of permanent partial claims is being captured. If the target is not being met, then NCCI should analyze the causes of the failure to obtain the desired number of permanent partial claims. Based on the results of the analysis, either the sampling rate should be adjusted or carrier compliance with DCI reporting requirements should be more strictly enforced.

- 4) The DCI carrier master file is not reconciled to carrier master files in the overall rate level and PICS systems.

The DCI carrier master file lists all carriers subject to DCI reporting requirements. The file is updated by analyzing the amount of premium written by carrier in each DCI state using financial call data. Carrier master files also exist in the Overall Rate Level and PICS systems.

We recommend that, in the short term, the DCI carrier master file should be reconciled to the PICS carrier master file. In the long term, NCCI should maintain only one carrier master file.

We understand that a new DCI system is being developed which will use the PICS carrier master file. DCI actuarial personnel will continue to periodically determine the states for which each carrier must submit a DCI sample. However, this information will be entered into the PICS carrier master file instead of an independent carrier master file.

- 5) There are no procedures in place to contact carriers who fail to submit DCI Calls for Corrected Detailed Claim Information and Calls for Subsequent Detailed Claim Information after four system generated calls have been mailed.

If a Call for Detailed Claim Information passes the fatal error edits, but fails any of the other logical edits, it is processed into a suspense file. The

EVALUTION OF DATA COLLECTION AND DATA QUALITY

Detailed Claim Information

system will automatically generate Calls for Corrected Detailed Claim Information every two months. Once a call is established, the system generates a Call for Subsequent Detailed Claim Information one to two months prior to the due date for annual subsequent submissions. If no response is received, up to three additional calls will be generated.

If four calls for either corrections or subsequent information are mailed but not returned by the carrier, the system stops generating requests. NCCI does not have formal procedures to contact the carrier when this occurs. The claim data will remain on the suspense file. As of May 1, 1991 there were 25,490 claims on the suspense file compared to 631,732 total claims in the system. This indicates that not all required reports have been processed for approximately 4% of claims in the DCI system.

We recommend that carriers be encouraged to submit all DCI data required by NCCI. Complete data for all DCI claims will enhance the credibility and integrity of the data used in DCI analyses. Carrier performance in submitting all required claims should be monitored and reported. Performance reporting should be combined with a fining or incentive program to further encourage complete and timely submission of DCI data.

We understand that a monetary incentive program is included in the design of the new DCI system and that decisions about implementing the programs are being made by the Workers Compensation Data Management (WCDM) group. We recommend that NCCI evaluate trends in carrier compliance on an ongoing basis to ensure the effectiveness of the program.

- 6) There are no procedures in place to track DCI calls which create fatal errors and are not processed into the database.

If a call fails certain edits of critical information, such as invalid carrier code or policy number, it is rejected from the system as a "fatal error" and is returned to the carrier. The data must be resubmitted to NCCI on the same form.

EVALUTION OF DATA COLLECTION AND DATA QUALITY

Detailed Claim Information

There are no procedures to track calls which fail these edits. NCCI cannot determine whether specific calls which generate fatal errors are ever resubmitted and established in the system. According to NCCI statistics, 8,780 fatal errors occurred in 1990 out of 106,949 submissions.

We recommend that procedures be developed to specifically identify and track DCI reports which create fatal errors before they are returned to carriers. Follow up procedures with the carriers for specific claims should be implemented. Carriers should be encouraged to resubmit these claims. Information regarding carrier resubmission rates should be incorporated into a comprehensive performance monitoring plan.

We understand that the new DCI system will address the tracking of individual fatal errors and provide a method to follow up on these errors.

7) DCI data received from carriers is accurately processed into the DCI system.

We randomly sampled DCI data from a population of all DCI calls received from August 1, 1990 to March 31, 1990. The sampling unit was defined to be an individual DCI call. We extracted the population from the DCI file of valid claims and selected a random sample of 200 calls.

The sample was tested by comparing information in the DCI system to the hard copy calls received from the carriers. An attribute sampling method was used to focus on the occurrence rate of errors. Each field on the call was defined to be a separate attribute. The sampling parameters used were a confidence level of 95%, an upper error limit of 5% and an expected error rate of 2%.

We noted three minor discrepancies in different data fields on three calls which we discussed with NCCI personnel.

Detailed results of the sampling can be found in the Appendix to this volume of the report.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Policy Issue Capture

A. Area Overview

The Policy Issue Capture area collects workers compensation policy information from carriers in the form of policy declaration pages. Carriers may submit this information on either hard copy documents or magnetic tape. Carriers send hard copy documents to NCCI field offices. Magnetic tapes are sent directly to NCCI's headquarters for processing. Approximately 66% of policies sent to NCCI are submitted on magnetic tape.

NCCI validates policy information through a series of automated processes. Policy information is checked for correct field values, completeness, and consistency. Valid policy data is loaded into the Policy Issue Capture System (PICS) database.

The PICS database is used internally by NCCI for research and by subscribers to NCCI's Proof of Coverage (POC) service. PICS serves as the basis for the new Unit Report Control (URC) system (operational 5/1/91). This system is intended to control the receipt of WCSP data based on the assumption that carriers must submit a unit report for every state on every workers compensation policy written. In addition, policy information contained in PICS will be used by the Unit Report Quality (URQ) system to verify data submitted on unit reports.

For a more detailed description of the Policy Issue Capture System (PICS), refer to Volume II of this report.

B. Area Evaluation

Key Strengths:

- o NCCI stores policy information in an integrated database providing a single, centralized source of data.
- o NCCI requires carriers to correct NCCI identified errors in submitted policy information through resubmission of data. This moves the burden of error correction to the carrier.
- o As of May, 1991, NCCI is capturing all policies, including all non-experience rated policies. This should ultimately build an authoritative repository of policy information.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Policy Issue Capture

Key Weaknesses:

- o NCCI does not currently verify that all policies written have been submitted by carriers.
- o NCCI does not currently capture all relevant policy information submitted by carriers in the PICS database. This information is currently stored on microfilm.
- o There is no clear, consistent agreement with carriers regarding the timely submission of individual policy information.
- o There is no current mechanism (i.e. performance reporting, fining) to encourage carriers to submit quality policy data on a timely basis.

The current automated policy review and PICS 3.0 projects are intended to address the first and second of these weaknesses respectively. These initiatives are described in Volume I of this report.

Key Recommendations:

- o NCCI should establish and enforce clear standards for quality and timeliness of carrier submitted policy information.
- o NCCI should institute controls to ensure carriers submit all workers compensation policies written in NCCI states.
- o NCCI should capture all pertinent policy information submitted by carriers.

NCCI has development projects underway or planned which, if successful, will partially satisfy the last two of these recommendations. These projects are described in Volume I, Part C of this report.

C. Testing Objectives

- To evaluate the controls in place to ensure the completeness of policy information received by NCCI.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Policy Issue Capture

- To evaluate the procedures in place to ensure the accuracy of policy information received by NCCI.
- To evaluate the controls in place to ensure the timely receipt of policy information.

D. Testing Methods

The evaluation of Policy Issue Capture was accomplished through systems and procedures review and analysis. This technique is described in the Evaluation Approach section of Volume I, Part C of this report.

E. General Observations & Recommendations

- 1) There is no effective procedure to ensure all policy information for all member states is submitted to NCCI.

NCCI requires carriers to submit information for all workers compensation policies written in NCCI member states. Currently, NCCI has this information for over 6,000,000 policies dating back to 1984. This population is growing at a rate of approximately 125,000 policies each month.

In two states subscribing to NCCI's Proof of Coverage (POC) service, strict fines are assessed against carriers for claims filed against a policy which does not exist in the Policy Issue Capture System (PICS) database. This provides significant incentive for carriers to submit policy information for these states. However, this procedure provides only limited control over policy receipt. There is no control mechanism to ensure that all policy information is submitted.

Complete policy information is critical to the successful implementation of NCCI's current system initiatives. The Unit Report Control System (URC) identifies unit cards required from carriers based on policy information contained in the PICS database. Without complete policy information, the URC system will not be an effective control over unit card receipt.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Policy Issue Capture

NCCI should implement controls to ensure all policy data is submitted by carriers. All expiring policies in PICS should require either a renewal from the same carrier, a policy from a new carrier, or a legitimate explanation of why the risk will not require coverage. This explanation would have to be elicited from the insured and could require significant follow up effort on NCCI's part.

NCCI should establish procedures for the member carriers to certify that they have submitted all policies written to NCCI.

Other authoritative sources of workers compensation policy information should be sought out and used for control and validation purposes if possible. One suggestion is to require carriers to include the number of policies written by state in the Call for Net Direct Written Premium. The number of policies captured in the PICS system for a carrier and state can be compared to this number.

We understand that NCCI has plans to implement the Automated Policy Review System. One objective of this system is to identify non-renewed policies. The Automated Policy Review System will be implemented in October of 1992. This system is discussed further in Volume I of this report.

- 2) NCCI does not have a clear, consistent agreement with carriers as to when policy information is due.

NCCI currently receives policy information from over 700 carriers in 33 member states as well as additional non-member states. This policy information is for both assigned risk and voluntary market policies.

All states require policy information to be submitted either to the state or a service bureau. This requirement is only effectively enforced for those states subscribing to NCCI's Proof of Coverage service.

There is no specific state regulation for timely submission of voluntary market policies written in non-POC states.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Policy Issue Capture

Currently, the only operational requirement that policy information be received in a timely fashion is to verify claims through the Proof of Coverage (POC) system. Experience rating and ratemaking personnel sometimes use policy information to investigate unit report data questions. This use begins when the first unit report is received for the policy, 18 to 20 months after the effective date.

With the advent of the Unit Report Control System (URC), policy information will be needed fifteen months after the policy effective date in order to support URC reporting.

Workers compensation policies form the basis for NCCI's ratemaking and experience rating services. It is reasonable to expect that as systems integration efforts and increased data capture make policy information more accessible and complete, other uses for this information will be identified. Future uses of policy information may have different requirements as to the timeliness of receipt of policy information.

NCCI should establish clear and consistent standards regarding due dates for policy information. Carriers should be encouraged to adhere to these standards through regular performance reporting and financial incentives for late and incomplete submissions.

3) NCCI does not fine carriers for policy data submitted in error.

NCCI receives policy information on magnetic tape and on hard copy documents. In 1990, NCCI performed an audit of policy information submitted on magnetic tape for 40 carriers. Data on 429 tapes was inspected. There were over 32,000 errors identified on these tapes. The most frequent error was invalid risk identification number accounting for 40% of the identified errors across 34 carriers.

While carriers are requested to resubmit data in error, NCCI does not currently have a process to fine carriers for policy data submitted with errors.

NCCI should strongly encourage carriers to submit quality policy information. Instituting clear, precise quality standards and

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Policy Issue Capture

obtaining carrier commitment to meet those standards is the first step in this process. The second step is to measure and report results. Establishing consistent and regular carrier performance reporting will help to measure data quality and communicate the results. Financial incentive programs and/or fines should be implemented, as required, to encourage carrier compliance to the established quality standards.

- 4) NCCI does not currently capture all pertinent policy information in their policy database.

NCCI receives policy information on both magnetic tape and on hardcopy policy declaration pages. Both types of submissions contain data which is not currently captured in the PICS database. Two significant fields which are not captured are the experience modification factor (experience mod) and payroll classification codes other than the governing class code. The governing class code is the class code, other than clerical codes, with the most payroll on a policy.

Both class codes and experience mods are very important to NCCI's future systems initiatives. NCCI can use this information to verify the accuracy of submitted unit report (WCSP) data.

NCCI should capture the experience modification factor and all class codes from carrier submitted policy information. Other information should be evaluated for capture as well.

We understand that NCCI has plans to upgrade the Policy Issue Capture System (PICS). One of the major modifications planned is to capture more of the available policy information. The PICS 3.0 enhancements are scheduled to be implemented by January of 1992.

- 5) NCCI does not validate all captured policy information received from carriers.

NCCI performs extensive edits through the Policy Issue Capture System (PICS) and manual review of policy declaration pages to ensure all

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Policy Issue Capture

required policy information has been entered and that the data meets basic criteria (e.g. estimated premium must be numeric). Not all policy information is validated to ensure its accuracy.

One field that is not validated for accuracy is the estimated premium. This information indicates the total standard policy premium the carrier expects for the policy. This information could be checked for reasonableness by comparing it to previously submitted policy information.

NCCI could eventually use this and other data fields to verify the accuracy of unit report (WCSP) data submitted by carriers.

NCCI should implement procedures to check the reasonableness of this and other data fields. This is of particular importance given NCCI's plans to use policy information to verify WCSP data accuracy.

We understand that NCCI has ongoing plans to upgrade their Policy Issue Capture System procedures. One of the major modifications planned is to perform more validation of policy information using alternate information sources such as risk inspections. The PICS 3.0 enhancements are scheduled to be implemented by January of 1992.

6) Carriers submit hardcopy policy declaration pages on various formats.

NCCI receives approximately 34% of carrier submitted policy information on hardcopy policy declaration pages. This represents an estimated 40,000 policies a month. NCCI field office clerks verify this information visually and either enter it on-line themselves or forward it to ACS, NCCI's external keypunching service.

Currently, there is no standard form for submitting policy information on hardcopy. NCCI published guidelines have resulted in general format consistencies between submissions for these formats, but, the declaration pages received still differ widely.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Policy Issue Capture

Because of the different formats, it is difficult to establish standard data entry rules. Therefore, NCCI and ACS data entry personnel must be very well trained to handle the inevitable exceptions.

NCCI should establish a standard form for carrier submitted policy information. Carriers should be encouraged to use this form. A monetary incentive program would help in this regard.

NCCI should continue to encourage carriers to submit policy information on magnetic tape. Magnetic tape or electronic transfer are the preferred long term media for data submissions.

7) NCCI's primary access to policy information is by risk name.

NCCI stores policy information in the Policy Issue Capture System (PICS) database. Currently, there are over 6,000,000 policies resident in the PICS database. This number is currently growing at an average rate of about 125,000 policies each month.

NCCI personnel currently access policy information through policy number, risk name, or risk ID. Risk name is the primary access method because it is easily identifiable by carriers, risks, and NCCI personnel.

In order for risk name to be effective in accessing policy information, it must be entered consistently each time a policy for a specific risk is captured. NCCI has developed standard name formatting rules for accomplishing this. Without this standardization, risk name would not be effective in accessing policy information.

While risk name seems to be working effectively as an access point for policy information, NCCI expends a great deal of effort to standardize it. For policies submitted on hard copy, this standardization occurs at the time of data entry. NCCI field office clerks and ACS data entry clerks standardize risk name as they enter the policy information. This requires that data entry clerks be well trained in order to properly handle all possible variations in the reporting of a name.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Policy Issue Capture

Magnetic tape submitted policies are stored in a temporary database after processing. NCCI personnel reformat names on these policies to make them standard. Currently, 11 full time clerks are employed to perform name and address standardization for magnetic tape submissions.

NCCI should explore other identifying information that could be used to access policy information without reformatting. One readily available possibility is the Federal Employers Identification Number (FEIN). This number is already captured by PICS and is readily available to carriers, risks, and NCCI.

Accessing policy information by name can be enhanced by using available packaged software designed to match similar names of different spellings or word orders (e.g. Christin vs. Kristin or The Company Name vs. Company Name, The).

We understand that NCCI has ongoing plans to upgrade their Policy Issue Capture System (PICS) and procedures. One modification planned is to allow access to policy data using the FEIN. The PICS 3.0 enhancements are scheduled to be implemented by January of 1992.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Appendix: Summary of Sample Testing Results

A. Appendix Overview

This appendix summarizes the results of our sample testing. We tested ten statistical samples to evaluate the accuracy of NCCI's processing of the data which it receives from carriers. We examined two judgmental samples to test the completeness of critical computer files. This was tested by ensuring that judgmentally selected data from microfilm and microfiche media resided in critical computer files. Also, two judgmental samples were used to test the consistency of data between systems.

This appendix first presents the quantification and specific findings of our statistical samples and then presents the findings of our judgmental samples. The statistical samples are organized by functional area and are in the same order as the area reports in this volume.

B. Testing Overview

We tested the data used to calculate overall rate level indications, class rates and experience modifications. We also tested the detailed claim information data used in analyzing workers compensation loss costs.

An attribute sampling approach was employed to test the occurrence rate of errors in the population. The sampling units tested were randomly extracted from NCCI computer files. Errors were defined as discrepancies between the computer files and the source documents received from carriers, including originally submitted data and corrections. The occurrence of an error indicates that the data in the computer files does not agree with the carriers' submissions. Our testing did not include verifying the accuracy of the data submitted by the carriers. The inferences made from the sample results were statements about the rate of errors, as defined above, which are likely to occur in NCCI data for the specific populations tested.

The judgmental samples were selected from hard copy input received from the carriers. The data from the carriers was compared to the information in the computer files. While the samples were not random, an attempt was made to draw unbiased samples.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Appendix: Summary of Sample Testing Results

C. Definitions

The following terms are used in the statistical sample summaries:

- o Confidence Level: The probability that the true error in the population does not exceed a stated value (i.e., the achieved upper error limit).
- o Achieved Upper Error Limit: This represents the maximum potential error rate that is likely to be found in the population at the specified confidence level.
- o Tolerable Error: This defines the judgmental assessment of the maximum error in the population which can be tolerated and still satisfy the objectives of the testing.
- o Expected Error: This is a preliminary assessment of the anticipated error rate in the population and is used in determining sample size.
- o Sample Error Rate: This is the actual error rate observed in the sample.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Appendix: Summary of Sample Testing Results

Sample Name: Calendar-Accident Year Financial Call

Description of Errors

Description of Errors	Number of Errors
Call data for seven carriers in the sample was found to have been partially or completely deleted, or "zeroed out", by NCCI. The deletions were done deliberately to avoid distortion of overall rate level indications. Inclusion of these deletions in our error statistics increased the error count for each attribute by five to seven errors. For error statistics net of this effect, see the following page. For a more detailed discussion of zeroing out of data, see General Observation #6 and Specific Finding # 5 in the Overall Rate Level Area Report in Volume III.	88
One correction call was received from a carrier after overall rate levels had been produced. This call caused a difference in three premium fields between the amounts on the correction and the data in the overall rate level system.	3
The indemnity claim counts did not agree between the system and the financial call. The difference was less than 15 claims.	1
	<hr/> 92

Note 1) One data entry error was noted which was below the \$5,000 tolerance level.

Note 2) The achieved upper error limit for all attributes in this sample exceeds our tolerable error of 5%. This is primarily due to NCCI's procedure of zeroing out data, which for our sample purposes is considered to be an error. Zeroing out of data is further discussed in General Observation #6 and Specific Finding # 5 in the Overall Rate Level Area Report in Volume III.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Appendix: Summary of Sample Testing Results

Sample Name:	Calendar Year Financial Call
Population:	Calendar Year Libraries for Data Used in 1990 Overall Rate Level Calculations
Population Size:	6,339 Records
Confidence Level:	95%
Tolerable Error:	5%
Expected Error:	2%
Sample Size:	176
Tolerance Level:	\$5,000

Quantification of Errors

Attribute	Number of Errors	Sample Error Rate	Achieved Upper Error Limit
Net Earned Premium	2	1.1%	3.5%
Standard Earned Premium at Company Level	1	0.6%	2.7%
Standard Earned Premium at Designated Statistical Reporting Level	2	1.1%	3.5%
Incurred Losses	1	0.6%	2.7%
State Code	1	0.6%	2.7%
	7		

Description of Errors

Description of Errors	Number of Errors
Call data for two carriers in the sample was found to have been partially or completely deleted, or "zeroed out", by NCCI. The deletions were done deliberately to avoid distortion of overall rate level indications. Inclusion of these deletions in our error statistics increased the error count for each attribute by either one or two errors. For error statistics net of this effect, see the following page. For a more detailed discussion of zeroing out of data, see General Observation #6 and Specific Finding # 5 in the Overall Rate Level Area Report in Volume III.	6
One correction call was received from a carrier after overall rate levels had been produced. This call caused a difference in the designated statistical reporting premium field between the amount on the correction call and the data in the Overall Rate Level system.	1

	8		

Description of Errors

Description of Errors	Number of Errors
One unit report and rating sheet in the sample could not be located. Inclusion of the unlocated unit report and rating sheet in our error statistics increased the error count for each attribute by one error. For error statistics net of this effect, see the following page.	5
The company name on one rating sheet was very similar to the name on a unit report which was used in the experience modification calculations. The entities were not related and the rating sheet improperly included the unit report experience.	1
A class code on one rating sheet did not agree to the unit report.	1

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Appendix: Summary of Sample Testing Results

Sample Name: Unit Report Payroll Data Used in Experience Rating

One rating sheet did not include the data from a correction unit report, causing payroll to be misstated. 1

8

Note 1) The risk ID on 26 rating sheets did not agree to the unit reports (e.g. risk ID not reported on unit report, risk had changed interstate/intrastate status since unit was submitted, etc.). The rating sheets correctly included the unit report data.

Note 2) The name on 10 rating sheets did not agree to the unit report. The company identified on the rating sheet was related to the company on the unit report. Data handling by NCCI was deemed to be appropriate.

Quantification of Errors Net of Unlocated Documentation

Attribute	Number of Errors	Sample Error Rate	Achieved Upper Error Limit
Name	1	0.6%	2.6%
Risk ID	0	0.0%	1.6%
Policy Effective Date	0	0.0%	1.6%
Class Code	1	0.6%	2.6%
Payroll Amount	1	0.6%	2.6%
	3		

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Appendix: Summary of Sample Testing Results

Sample Name: Unit Report Loss Data Used in Experience Rating
Population: Compress File Loss Records for 1990 Ratings (1986, 1987 & 1988 Unit Reports)
Population Size: 1,997,261 Records
Confidence Level: 95%
Tolerable Error: 5%
Expected Error: 2%
Sample Size: 181

Quantification of Error

Attribute	Number of Errors	Sample Error Rate	Achieved Upper Error Limit
Name	0	0.0%	1.6%
Risk ID	0	0.0%	1.6%
Policy Effective Date	0	0.0%	1.6%
Class Code	0	0.0%	1.6%
Loss Amount	1	0.6%	2.6%
	1		

Description of Error

Description of Error	Number of Errors
One rating sheet did not include the data from a correction unit report, causing the loss amount to be misstated.	1

Note 1) The risk ID on 21 rating sheets did not agree to the unit report (e.g. risk ID not reported on unit report, risk had changed interstate/intrastate status since unit was submitted, etc.). The rating sheets correctly included the unit report data.

Note 2) The name on 3 rating sheets did not agree to the unit report. The company identified on the rating sheet was related to the company on the unit report. Data handling by NCCI was deemed to be appropriate.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Appendix: Summary of Sample Testing Results

Sample Name:	Detailed Claim Information
Population:	All DCI Calls Processed into the Valid File between 8/1/90 and 3/30/9
Population Size:	41,001 Records
Confidence Level:	95%
Tolerable Error:	5%
Expected Error:	2%
Sample Size:	200

Quantification of Errors

Attribute	Number of Errors	Sample Error Rate	Achieved Upper Error Limit
Field #23 - Claim Reopened Indicator	1	0.5%	2.3%
Field #37 - Paid to Date Hospital Costs	1	0.5%	2.3%
Field #40 - Number of Days Confined in Hospital to Date	1	0.5%	2.3%
All Other Fields on DCI Call	0	0.0%	1.5%
	3		

Description of Errors

Description of Errors	Number of Errors
One error was due to a change made to the data by an NCCI clerk which differed from the carrier's submission, including the carrier's correction submission. The correction call had failed one of the system field edits, therefore NCCI changed the field to a presumed valid number.	1
Two errors noted were due to data entry input errors.	2
	3

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Appendix: Summary of Sample Testing Results

Results of Judgemental Samples

Sample Name: Overall Rate Level - Calendar-Accident Year and Policy Year Calls
Sample Size: 25 Policy Year Calls
25 Calendar-Accident Year Calls

<u>Test Performed/Purpose</u>	<u>Test Result</u>
Comparison of judgmentally selected financial calls to state level data files to ensure that financial calls received are processed into the Overall Rate Level system.	No errors were noted.

Sample Name: Unit Reports - Data Administration Area
Sample Size: 50 Unit Reports

<u>Test Performed/Purpose</u>	<u>Test Result</u>
Comparison of judgmentally selected unit reports to Data Administration P/L Detail File, Month Pools and Futures File to ensure that unit reports received are processed into the Class Ratemaking system.	No errors were noted.

EVALUATION OF DATA COLLECTION AND DATA QUALITY

Appendix: Summary of Sample Testing Results

Results of Judgemental Samples

Sample Name: Unit Reports - Data Administration and Experience Rating Area
Sample Size: 29 Unit Reports with Experience Rated or Rated Size Premium

Test Performed/Purpose

Comparison of unit report data to experience rating sheets to ensure that data used in experience rating calculations and class rate calculations is consistent.

Test Result

One unit report was omitted from an experience rating sheet because it was received after the rating production date. However, it was received prior to the rating effective date and should have been included in the rating calculation.

Sample Name: Unit Report - Experience Rating
Sample Size: 29 Rating Sheets.

Test Performed/Purpose

Comparison of Expected Loss Rates (ELRs) and D-Ratios produced by Class Ratemaking to ensure they are being accurately transferred from Class Ratemaking to Experience Rating.

Test Result

No errors were noted.

Review of DCI Development Project

Introduction:

This report presents the approach, findings and recommendations of the review of the Detailed Claim Information (DCI) system development project at the National Council on Compensation Insurance (NCCI) performed by Arthur Andersen & Co. It contains the written deliverables of this review.

Background

Milliman & Robertson, Inc. and Arthur Andersen & Co., performed an examination of the structure and operations of NCCI under the examination authorities of the Florida Department of Insurance, the Maine Bureau of Insurance, the Nebraska Department of Insurance and the Utah Department of Insurance. The National Association of Insurance Commissioners (NAIC) coordinated the activities of the four departments in administering the examination.

The overall purpose of this examination was to evaluate the data collection and data handling activities of NCCI, certain aspects of its ratemaking activities and practical considerations involved in implementing a loss cost system.

The NAIC retained Arthur Andersen & Co. to review NCCI's DCI development project through an amendment to the examination contract.

Objectives

Detailed Claim Information (DCI) is used by NCCI to provide a basis for understanding the components of changing Workers' Compensation loss costs. NCCI's stated objectives of the new DCI system are to: (1) establish an online DCI data base; (2) capture additional data elements to meet the requirements of the NAIC model data reporting regulation; (3) provide carriers with an edit package to ensure data accuracy prior to submission to NCCI; and (4) ensure data quality through the implementation of a Workers' Compensation Data Monitoring (WCMDM) program.

Review of DCI Development Project

The objective of our review of the DCI project was to assist the NAIC in assessing NCCI's progress in achieving these objectives and the broader objective of providing flexible and timely access to accurate detailed claim information.

Scope

The scope of this review included NCCI's DCI system development project, carrier edit package development project, and WCDM program development project. We have provided comments on the objectives and progress of these projects but could not assess the final products because they were not complete at the time of this review.

Approach

1. Review DCI System Definition:

We began by reviewing the NAIC model regulation and NCCI's user requirements and system definition documentation. We met with NCCI's project leaders to confirm our understanding of project objectives.

The issue of whether the data elements included in the expanded DCI design meet the data requirements of NAIC model data reporting regulation was beyond the scope of our DCI project review.

2. Review DCI Design:

In our next work segment, we reviewed NCCI's design of the new DCI system. Our design review included the project data model, application architecture, user view of the system, including screen and report designs, and key interfaces to other systems. We reviewed the detailed design specifications for selected application programs within the new system.

Review of DCI Development Project

3. Review DCI Project Development and Implementation

In the third segment of our work, we reviewed the ongoing programming and testing phase of the DCI project. We began this phase of work by reviewing NCCI's project work plan and status for the development and implementation phases of the project. We met with project team leaders and programming supervisors to review the programming and unit testing approach and results. We reviewed the system test approach and the conversion plan. As part of the review, we conducted detailed reviews of selected application programs, unit test results and system test results.

4. Review Procedures to Ensure Timeliness and Accuracy

In the fourth segment of our work, we reviewed NCCI's proposed procedures to ensure timeliness and accuracy of the data. Our approach built on our knowledge of existing DCI timeliness and accuracy standards and the changes NCCI contemplates making in those standards.

Lists of the interviews we conducted and documents we reviewed are included in the appendix to this report.

Review of DCI Development Project

DCI Reporting Overview:*

The Call for Detailed Claim Information (DCI) is a data collection program by the National Council on Compensation Insurance (NCCI) whereby insurance companies furnish specific information on workers compensation indemnity claims. An indemnity claim is one which is made by an employee who has lost time from work because of a work-related injury. Claims involving medical costs only are not included in the Call.

The purpose of the DCI is to provide insight into the underlying elements inherent in the aggregate costs of Workers Compensation Insurance. DCI is an invaluable tool for a more refined analysis of workers compensation.

The original DCI data collection program was initiated for claims with report dates of April 1, 1979 and subsequent. In 1991, this DCI system was replaced with an expanded system that carriers could report on a voluntary basis. The new DCI system contains 85 data elements compared to the original 54 data elements. It consists of a continuous random sampling of workers compensation indemnity claims. Insurance companies participating in the Call update claims six months after they are filed by an injured worker and submit them to NCCI two months later. Follow-up reports are then submitted on a yearly basis until the claim is closed, no longer includes indemnity or reaches the 9th report level.

The expanded format is mandatory with new claims reported to the carrier January 1, 1992 and subsequent. The January 1, 1992 reported claims are valued in July 1992. Also, any subsequent reports valued as of July 1992 will be printed in the expanded format for submission to NCCI. Prior implementations may be made by carriers on a voluntary basis.

*Source: NCCI's Call for Detailed Claim Information Instruction Manual

Review of DCI Development Project

DCI System Overview:

- 1) Carriers will have the option of submitting DCI data on hardcopy or magnetic tape.
 - Hardcopy submissions will be received by NCCI clerks and sent to ACS for data entry.
 - Carriers submitting data on magnetic tape will have the additional option of prevalidating their submissions through the carrier edit package.
- 2) Magnetic tape and hardcopy submissions will be validated through DCI's main edit program. This program will produce error reports and calls for correction for all data found to be in error.
- 3) Valid data will be loaded into the DCI database. Data with minor errors will also be loaded, but will be held in suspense until corrected. Data with fatal errors will not be loaded into the database.
- 4) NCCI clerical personnel will use the DCI online system to investigate errors, maintain data edit parameters, maintain carrier contact information, and to expedite entry of carrier submitted corrections and revisions.

(continued on next page)

DCI System Overview

Review of DCI Development Project

- 5) The DCI system will automatically track required input and generate carrier performance reports.
- Calls for subsequent reports for existing DCI claims will be produced and sent to carriers.
 - Sample control forms will be produced and sent to carriers for completion. Completed sample control forms will indicate the number of claims carriers are required to submit.
 - The system will monitor and report carrier performance and calculate monetary incentives. For each valid submission of an original report, carriers will be credited \$10; for each valid correction or subsequent report, carriers will be credited \$5.
- 6) Quarterly, current DCI claim data will be extracted from the DCI database and combined with previously extracted data to produce the archive file which contains 10 years of DCI claim data. The file will be used for actuarial reporting, inquiry and analysis of DCI claim data.

NOTE: NCCI will convert historical DCI data. However, the new archive file will not contain 10 complete years of expanded DCI data until the year 2002.

DCI System Overview

Review of DCI Development Project

WCDDM Overview:

The Workers' Compensation Data Monitoring (WCDDM) program is a set of standards and procedures designed to monitor carrier compliance with DCI reporting requirements and audit the quality of reported DCI data.

- 1) During the first year of the WCDDM program, companies must document their DCI systems and procedural controls. This documentation must be updated as necessary.
- 2) Annually, company personnel not directly associated with the production or use of DCI data will conduct a review of DCI systems, procedures, and data. The objective of this review will be to verify that all requirements of the WCDDM have been satisfied.
 - The annual review will be based primarily on a random sample of DCI data. A random sample consisting of 10% of the DCI reports submitted to NCCI will be compared to data in claim adjusters' files. Data will not be traced back to the insured risk.
 - If a carrier's random sampling results indicate an error rate greater than 3%, the carrier will be required to produce detailed documentation of its controls and plans to improve them.
- 3) Each data error identified in the random sample will be traced to its source. Companies will be expected to correct all systems or controls deficiencies identified if feasible.
- 4) Annually, companies will submit results to NCCI. At this time, companies will certify, in writing, their compliance with WCDDM.
- 5) NCCI will review and summarize company certification reports. NCCI will report the results to regulators.

WCDM Overview

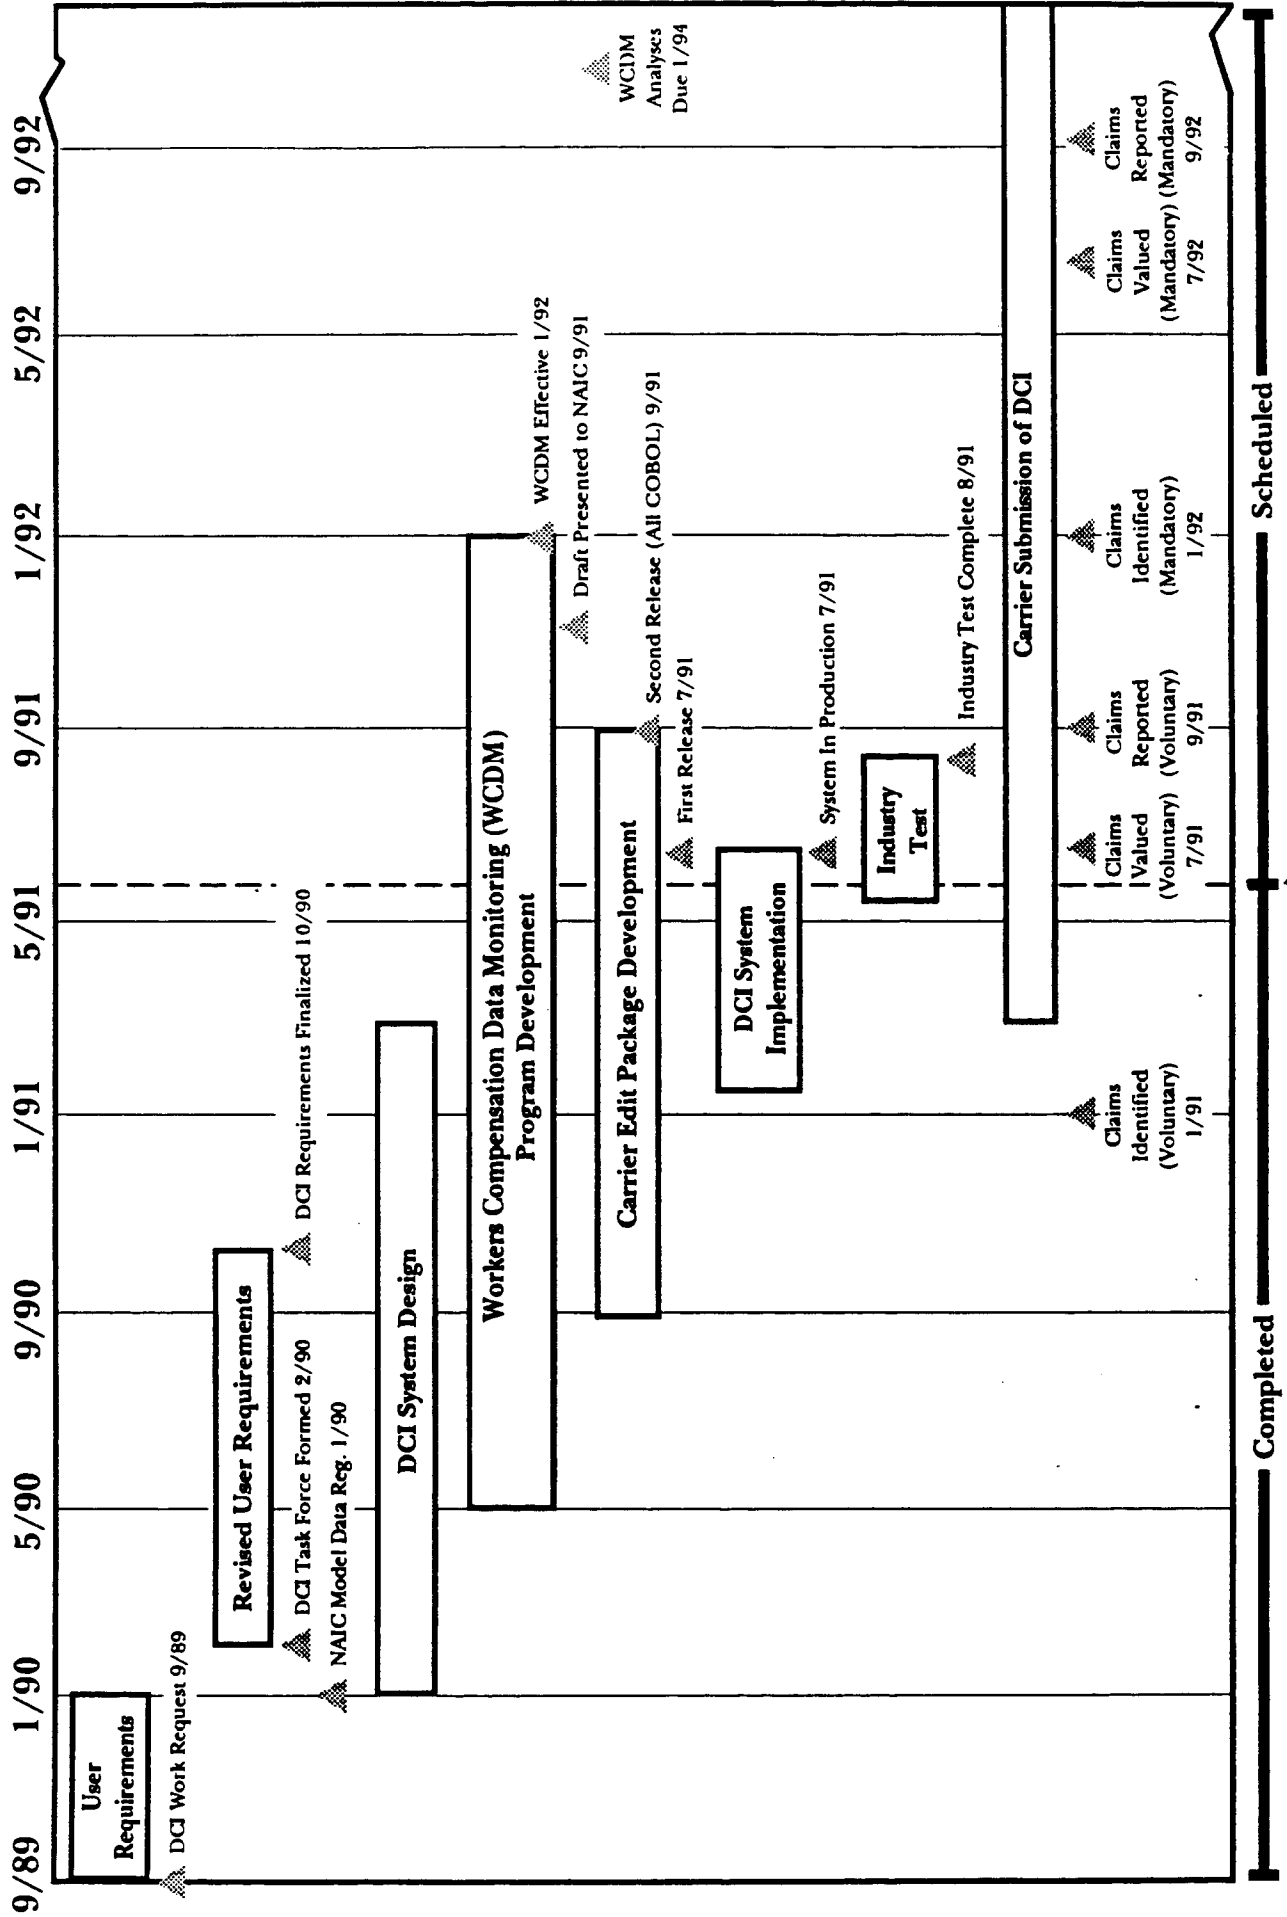

Review of DCI Development Project

Summary of DCI Project Schedule:

The DCI project has been in process since September 1989. Listed below are key historical events and dates. On the following page, future milestones and their target dates are listed.

Completed Milestones	Date
• Work request submitted to develop an online DCI data base	9/89
• User requirements defined and approved	12/89
• NAIC model data reporting regulation published	1/90
• DCI industry task force formed	2/90
• Revised user requirements approved (including NAIC model data reporting regulation requirements)	10/90
• Carriers began identifying claims for the new DCI reporting format on a voluntary basis	1/91

DCI Project Timeline

Review of DCI Development Project

Summary of DCI Project Schedule:

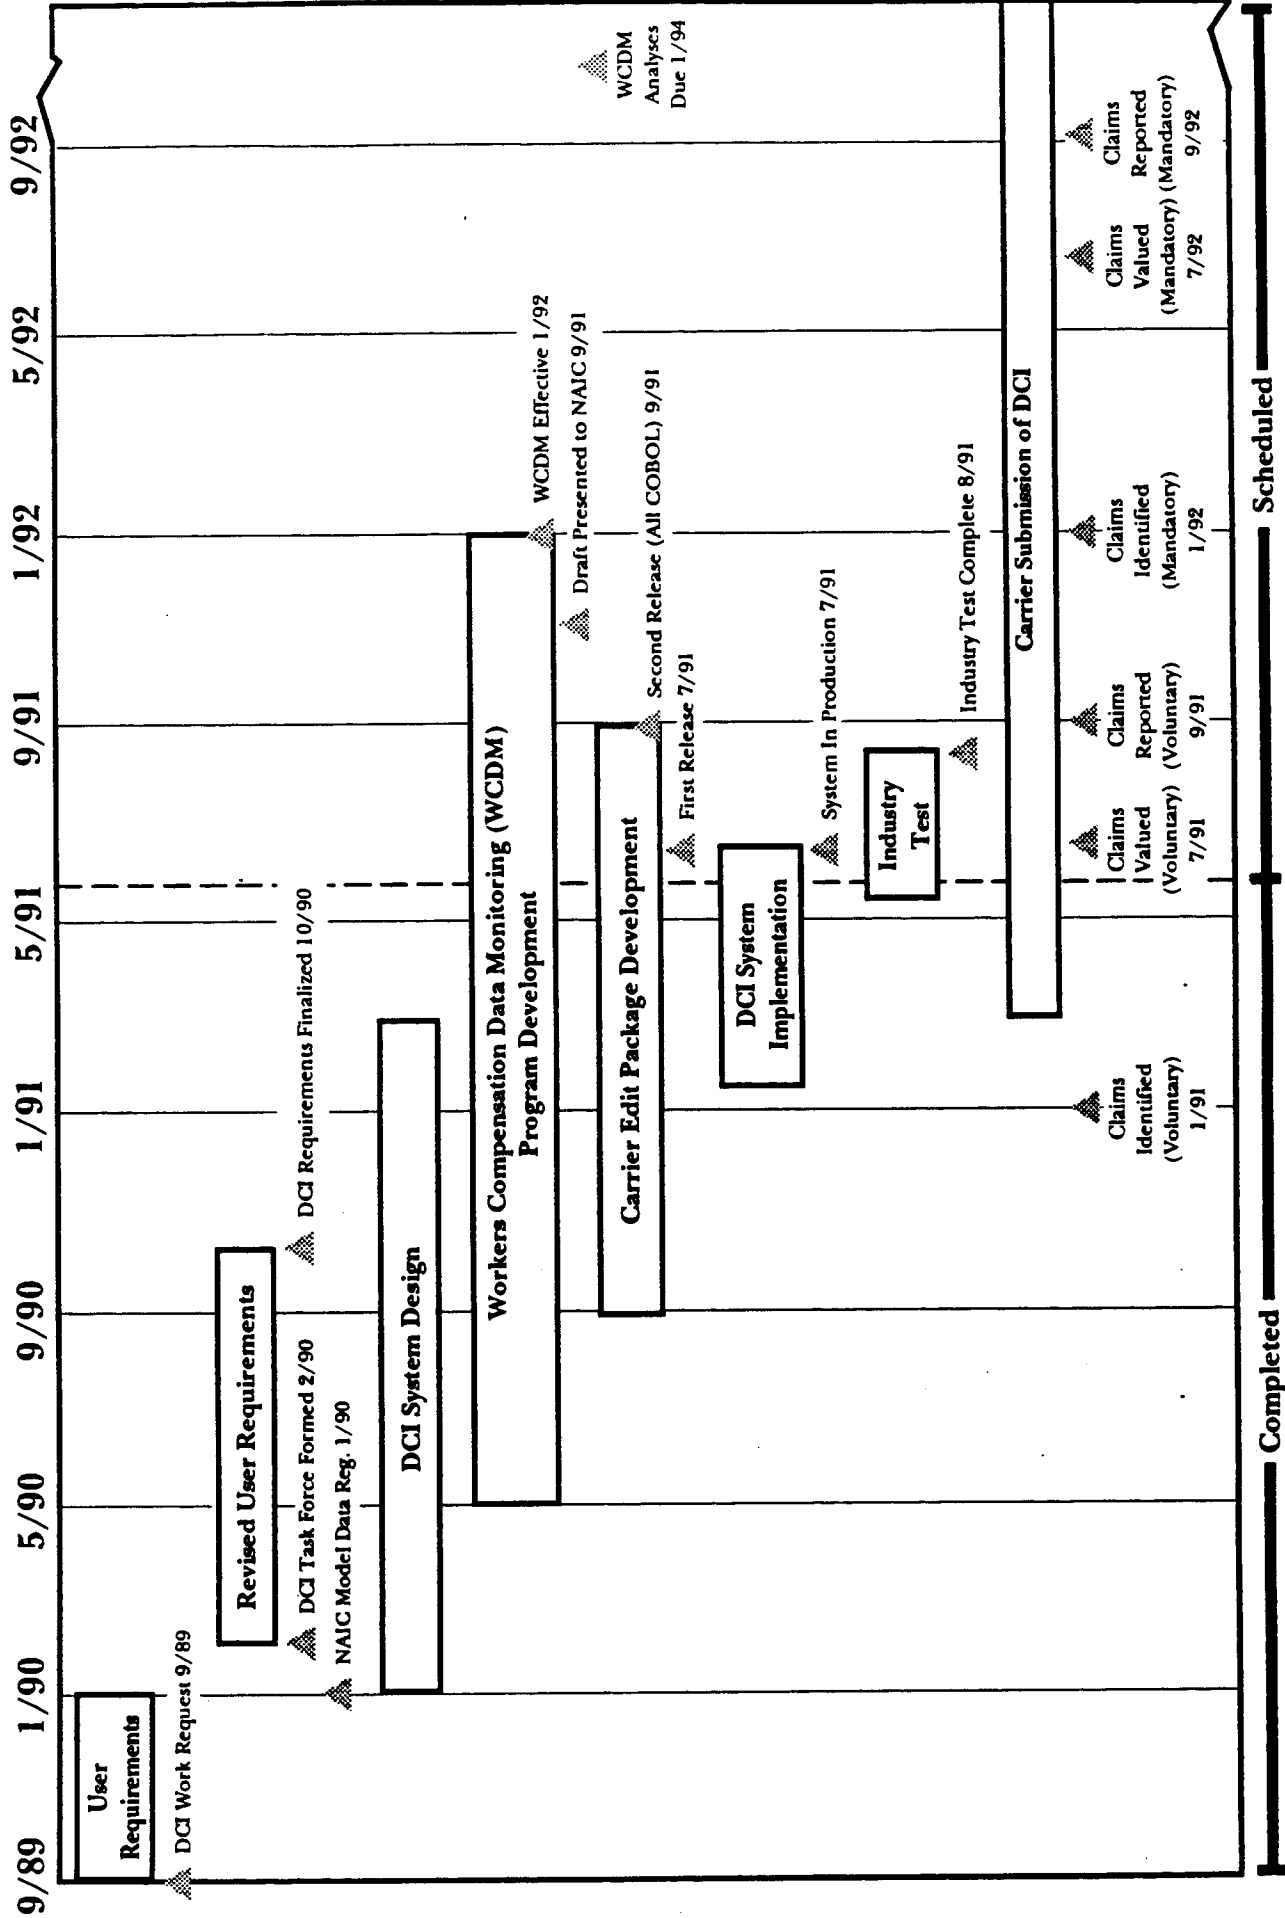

<u>Scheduled Milestones</u>	<u>Date</u>
• New DCI system in production	7/91
• Carrier edit package available	7/91
• Industry testing complete	8/91
• First voluntary DCI claims in the new reporting format are due at NCCI	9/91
• Revised carrier edit package (all COBOL version) available	9/91
• Final draft of WCDM presented to the NAIC	9/91
• All carriers begin sampling claims for the new DCI reporting format	1/92
• WCDM program becomes effective for DCI submissions due at NCCI starting 9/92	1/92
• All carriers submit expanded DCI claims	9/92
• First set of WCDM analyses due at NCCI	1/94

Review of DCI Development Project

NCCI's Stated Project Objectives:

- 1) Establish an online DCI data base.
- 2) Capture additional data elements to meet the requirements of the NAIC model data reporting regulation.
- 3) Provide carriers with an edit package to ensure data accuracy prior to submission to NCCI.
- 4) Ensure data quality through the implementation of a Workers' Compensation Data Monitoring (WCDM) program.

DCI Project Timeline

Completed

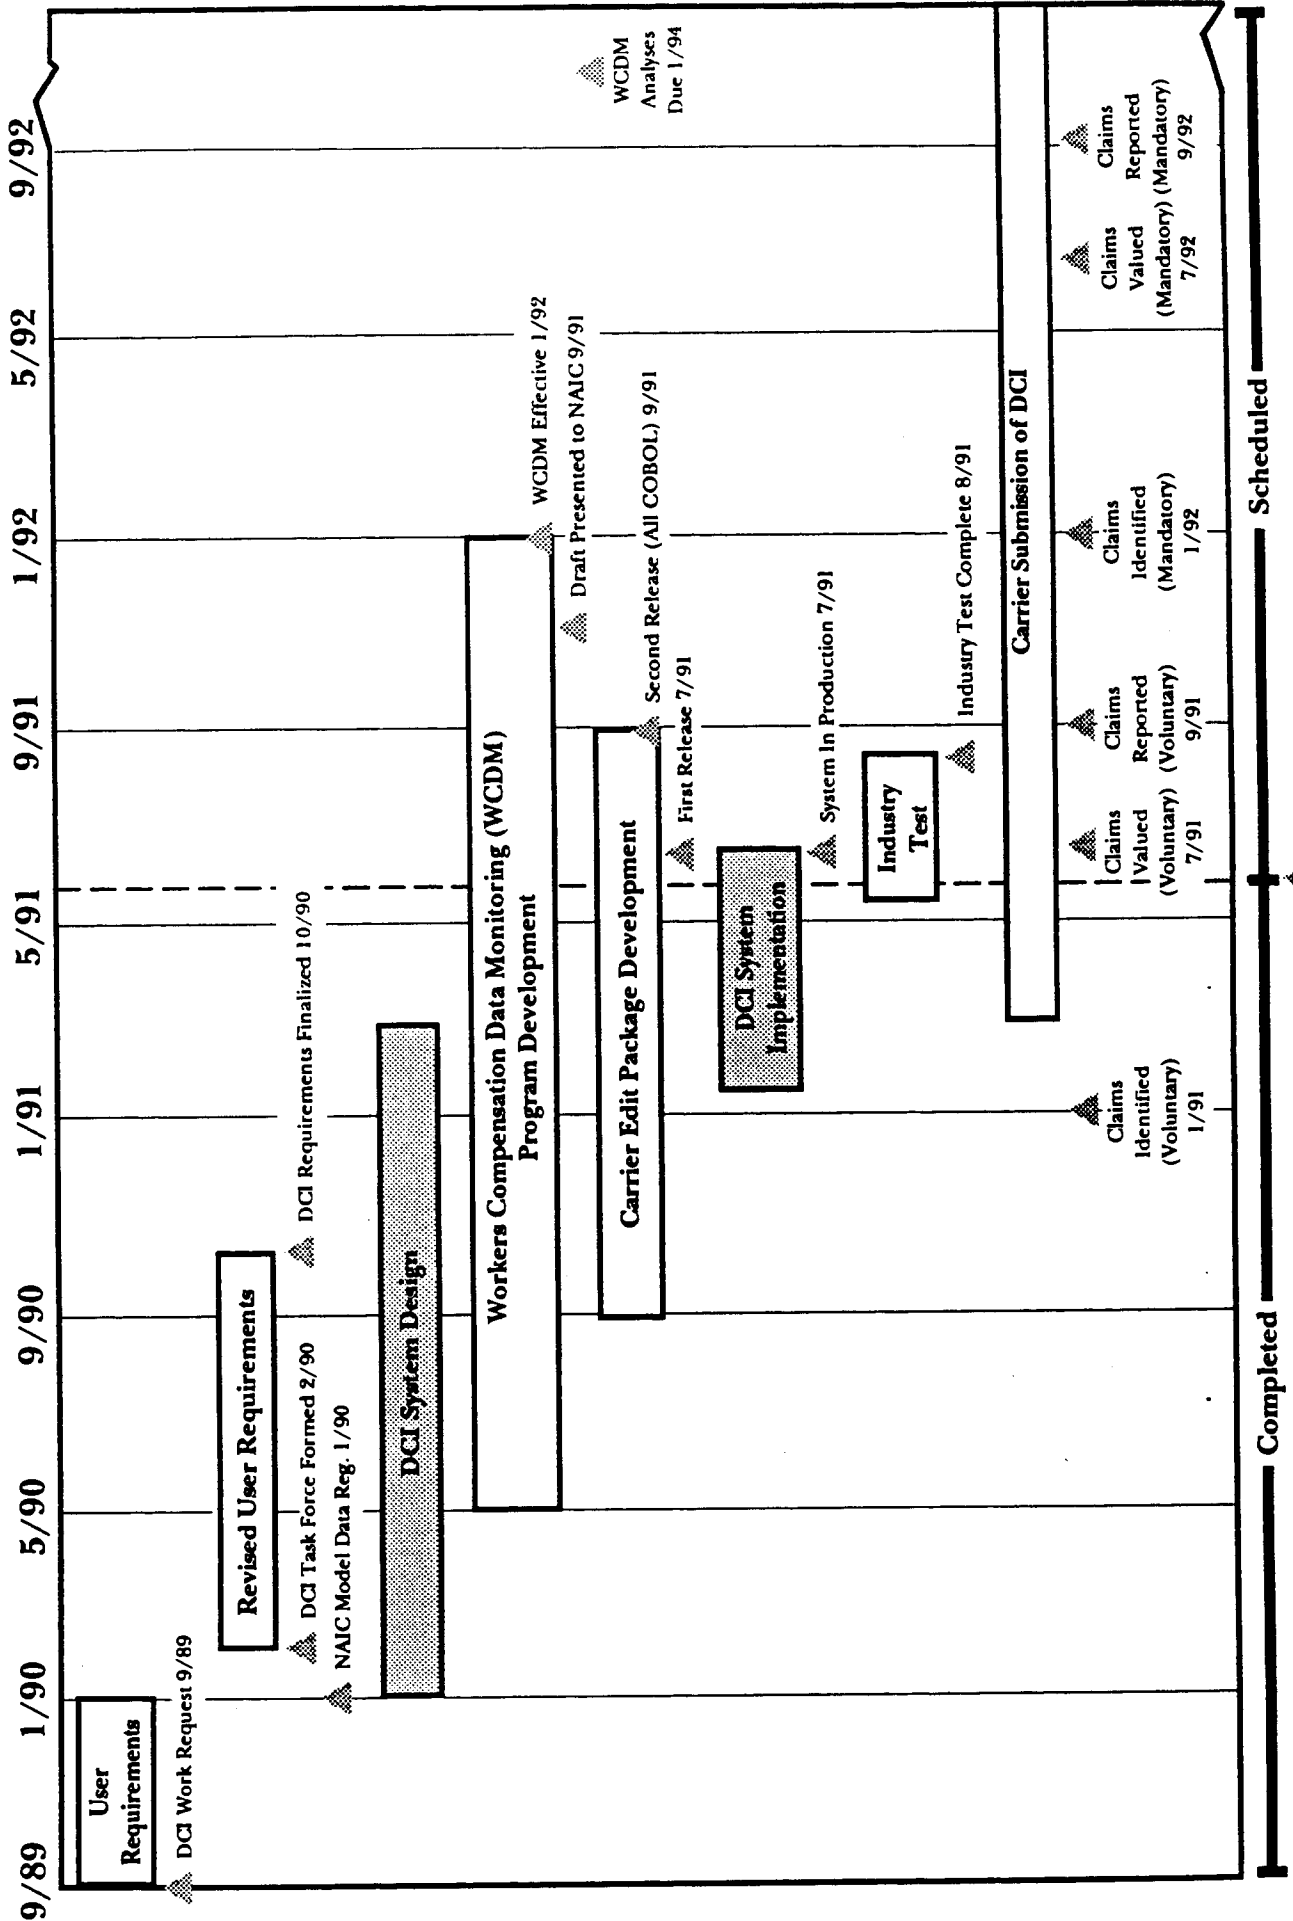

Scheduled

Review of DCI Development Project

NCCI's Progress Against Stated Objectives:

- 1) Establish an online DCI data base.
 - NCCI has designed and implemented a DCI database which will contain DCI sample control data, DCI claim data, carrier information, and edit tables.
 - NCCI has designed, programmed, and tested an online system which allows users to query, add, update, and delete data on the DCI database.
 - NCCI has designed, programmed, and tested a conversion system to load the DCI database with historical DCI data.
 - NCCI has designed, programmed, and tested a batch system to receive new DCI data from carriers on magnetic tape or hardcopy and load this information into the DCI database.

DCI Project Timeline

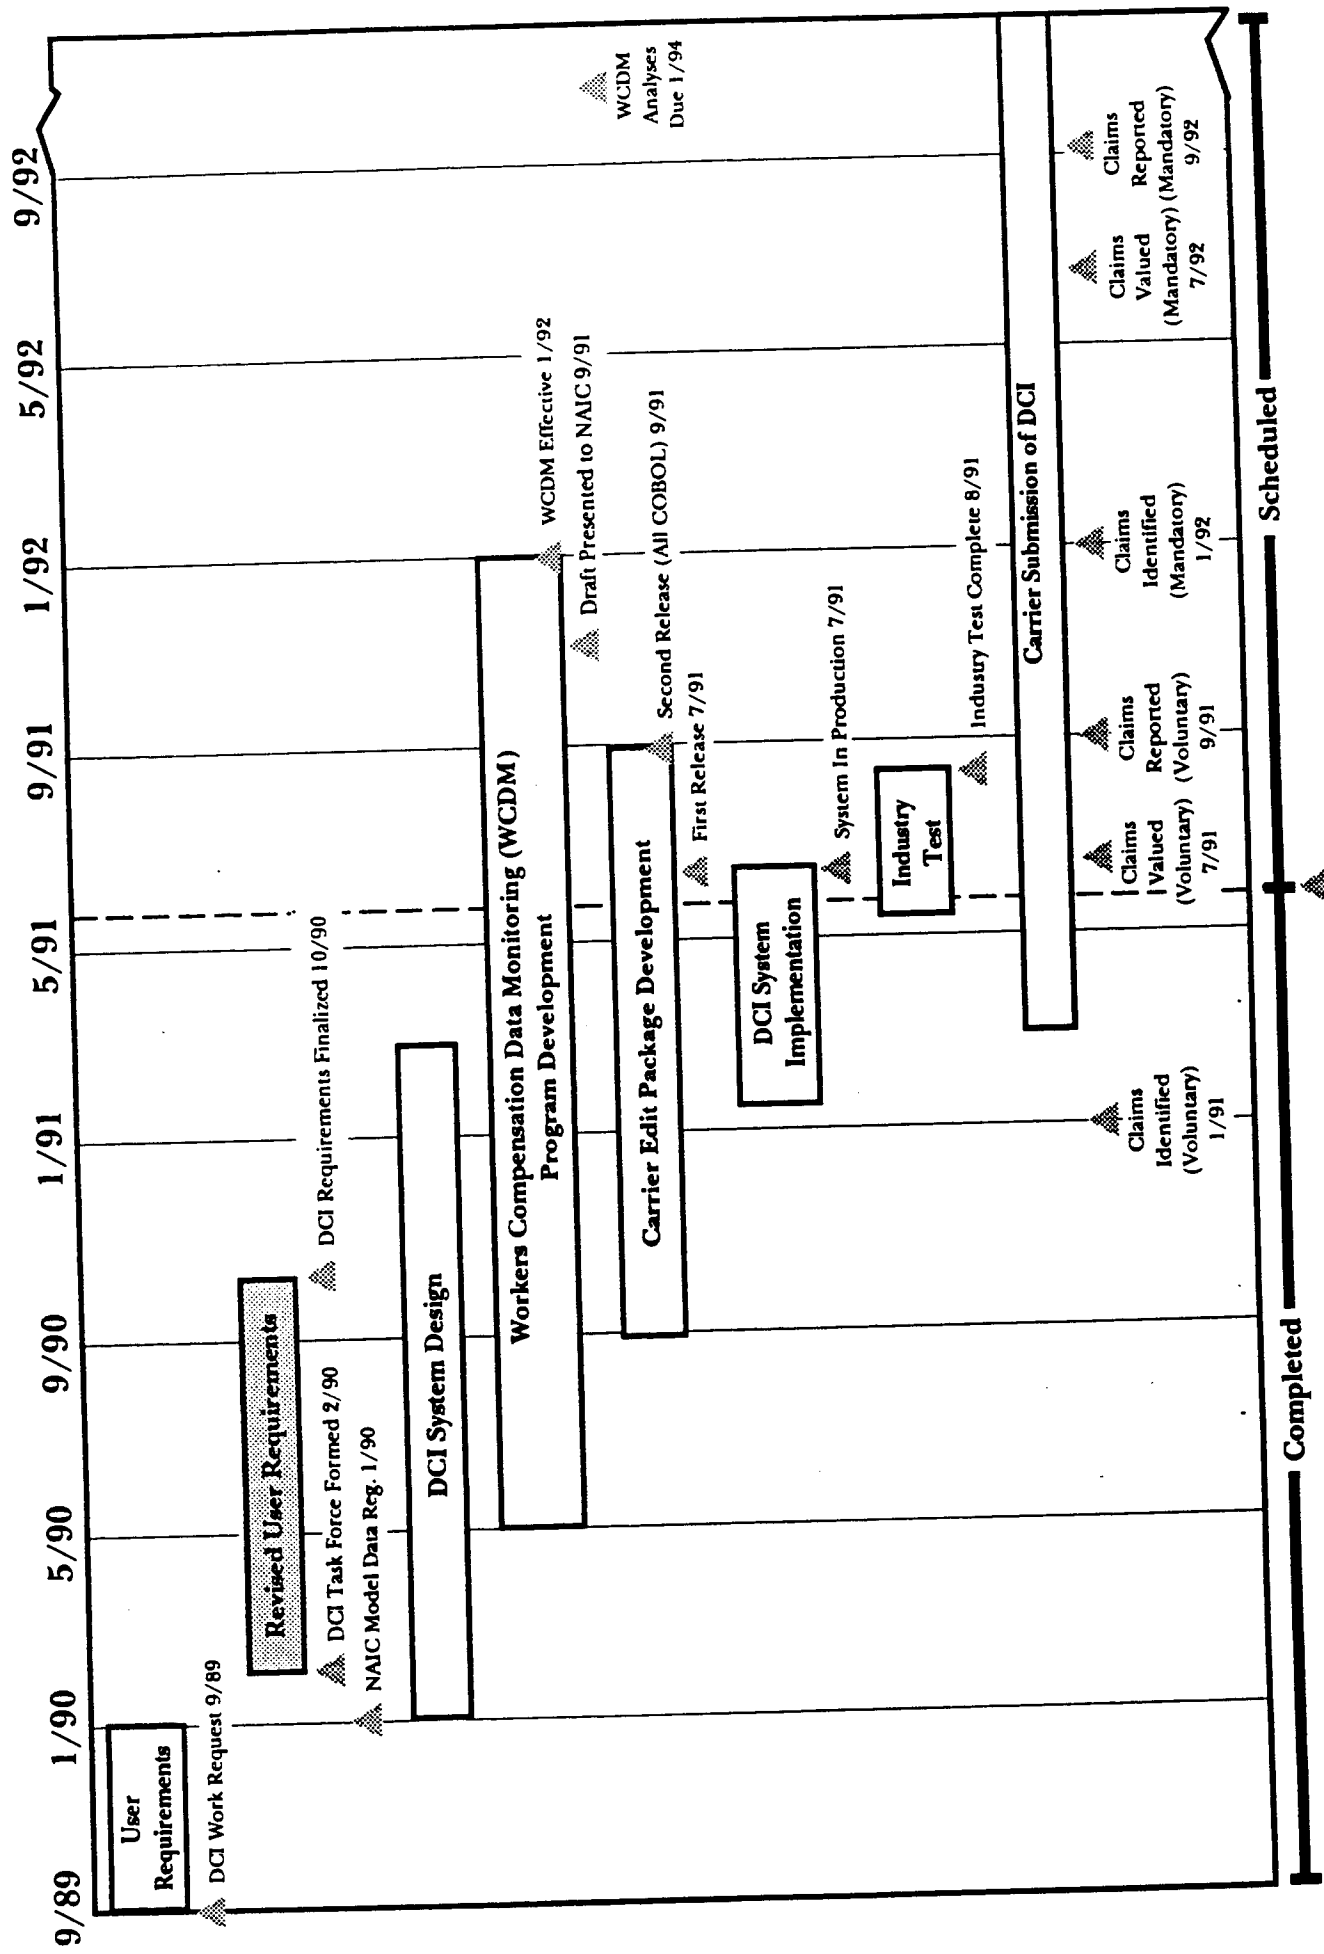

Review of DCI Development Project

NCCI's Progress Against Stated Objectives:

- 2) Capture additional data elements to meet the requirements of the NAIC model data reporting regulation.
 - NCCI has designed a new DCI submission form to capture 85 DCI elements and implemented a database to store this information.
 - NCCI has reconciled its 85 DCI data elements to the NAIC model data reporting regulation. Omissions were noted and agreement reached with the NAIC data collection task force. Agreement was also reached on the specific definition of each data element included in DCI.
 - NCCI has involved the NAIC data collection task force in defining DCI data requirements through monthly meetings and negotiations.

DCI Project Timeline

Review of DCI 6/91

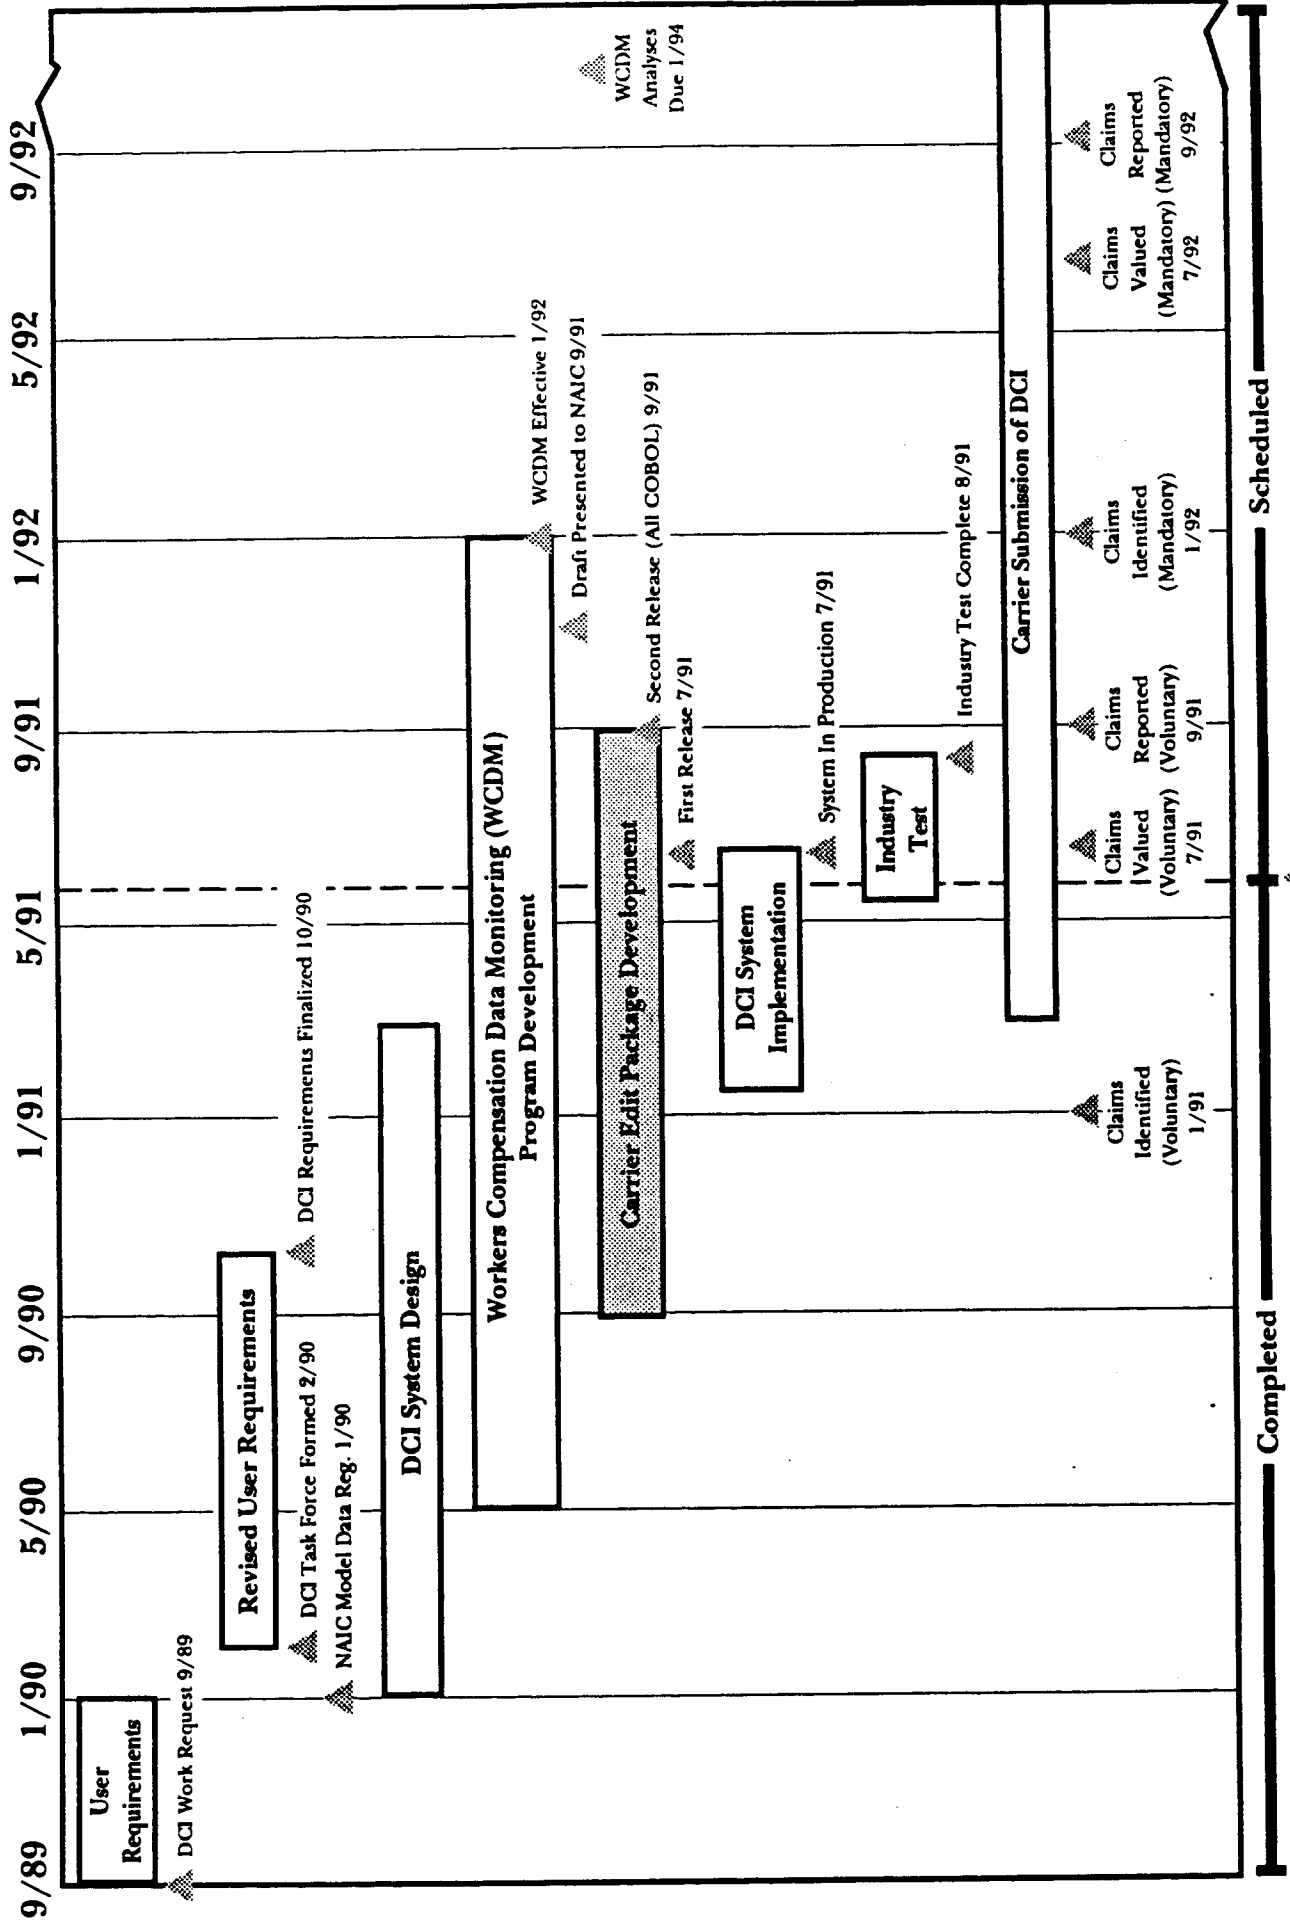

MILESTONE

Review of DCI Development Project

NCCI's Progress Against Stated Objectives:

- 3) Provide carriers with an edit package to ensure data accuracy prior to submission to NCCI.
 - NCCI has designed, programmed, and tested a carrier edit package which can be executed in an IBM main-frame environment. This package takes DCI data as input and produces error reports based on edits included in NCCI's DCI system.
 - Two carriers are in the process of testing the edit package.
 - NCCI is in the process of developing a procedures manual for the carrier edit package.
 - NCCI has developed a strategy to maintain consistency between the carrier edit package and the DCI system validation programs.
 - NCCI has developed a strategy for distributing modifications and enhancements to the carrier edit package.

DCI Project Timeline

Completed

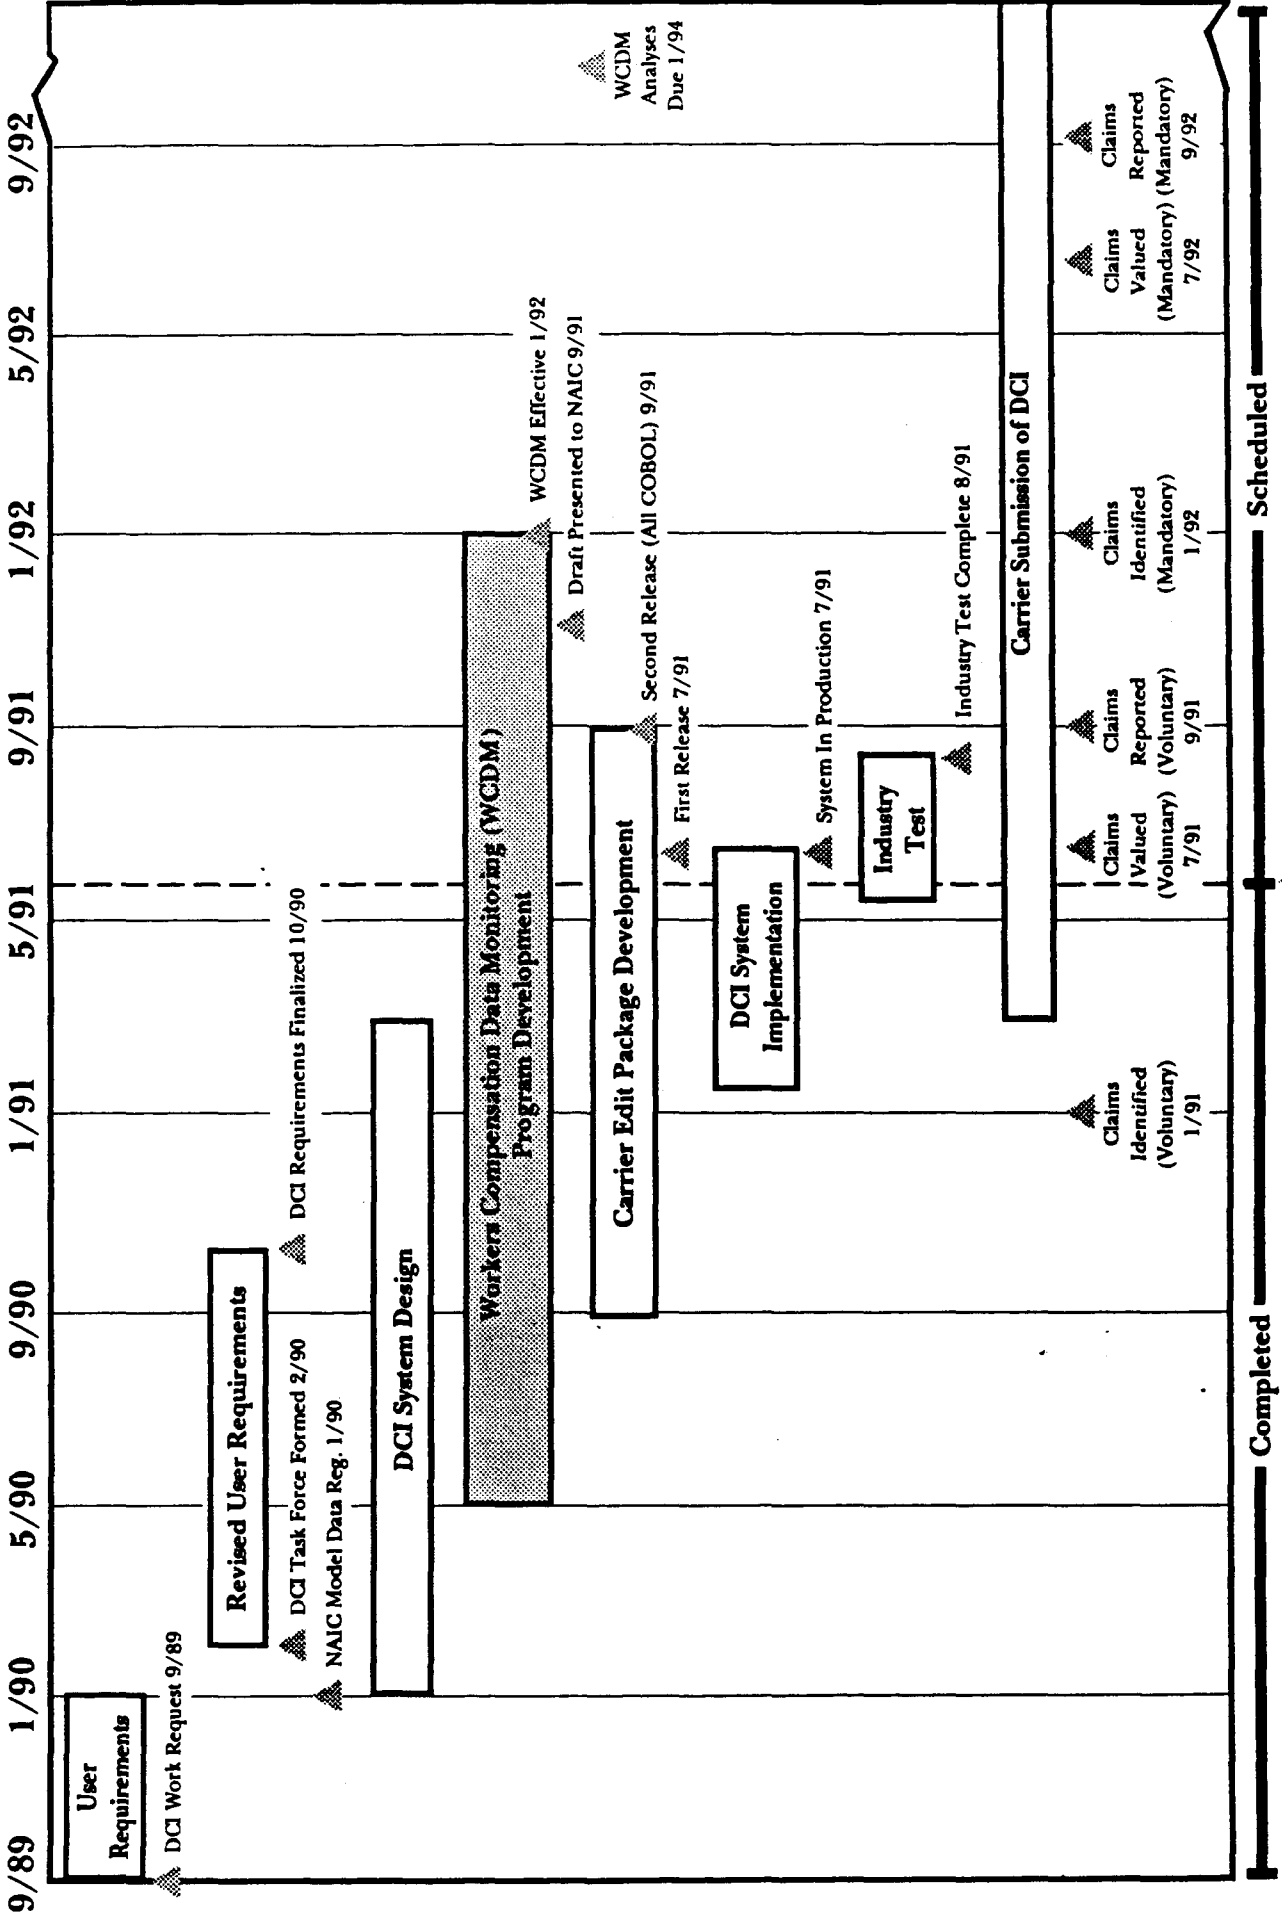

Scheduled

Review of DCI Development Project

NCCI's Progress Against Stated Objectives:

- 4) Ensure data quality through the implementation of a Workers' Compensation Data Monitoring (WCDM) program.
 - NCCI is continuing to work with carriers and regulators to develop the WCDM program.
 - NCCI has drafted the first section of the WCDM manual which outlines general responsibilities of carriers, regulators, and the NCCI and specific procedures that carriers must follow.
 - Section I of the WCDM manual describes:
 - Carriers' responsibility to comply with the requirements of the WCDM program.
 - Carriers' responsibility to document its data quality control procedures.
 - Carriers' responsibility to statistically test, document and report on the accuracy of the data it submits to NCCI.
 - NCCI is in the process of drafting Section II of the WCDM manual which will describe NCCI's responsibilities including enforcement of WCDM.

DCI Project Timeline

Review of DCI Development Project

Summary Evaluation of DCI Design:

Strengths:

- Regulators, industry representatives and NCCI actuarial and clerical personnel were very involved in the design of the DCI system. This high degree of user involvement increases the likelihood that the DCI system will meet the needs of its users.
- The DCI design supports the tracking and control of receipt of DCI data.
- The DCI design supports measurement of carrier performance regarding the timely and accurate submission of DCI data.
- The DCI design supports an efficient error turnaround process. Data found to be in error is returned to the carrier with descriptions of the errors. Carriers are required to correct and resubmit this data.
- The design includes a carrier edit package. This package will allow carriers to validate DCI data prior to submission to NCCI. This should improve the quality of DCI data submitted to NCCI by carriers using the package.
- The DCI data design adequately supports the current systems functions and provides for future addition of new data elements.
- Online application designs were subjected to project team and Quality Review Board (made up of NCCI management) review to ensure adequate functionality and compliance to standards. The database management team reviewed the design for performance considerations.

Review of DCI Development Project

- Batch application designs were subjected to project team and Quality Review Board review to ensure adequate functionality and compliance to standards.
- Database access logic was designed to be executed from a single module. This enhances application maintainability.

Review of DCI Development Project

Summary Evaluation of DCI Design:

Weaknesses:

- State regulators have not formally signed off on the DCI design. There is some risk that they will not accept DCI in its current form. Regulators may request additional information or alternative data selection methods.
- The DCI design specifies IDMS as the application's database management system (DBMS). This choice was necessary to ensure the timely completion of the system, but IDMS does not support the degree of flexibility of data access provided by relational DBMS's.
- The carrier edit package is designed to be executed on only one hardware/software platform (IBM/MVS/COBOL). NCCI does not plan to support other platforms. The one platform strategy may limit carrier acceptance of the software.
- The DCI design supports submission of data from carriers on hardcopy or magnetic tape, but specifies that data in error will be returned to carriers on hardcopy only. Additionally, the design does not support submission of data on alternate media such as electronic transfer or microcomputer diskette.
- NCCI has not clearly defined its position on providing and charging for external access to DCI data. They are now drafting a position statement addressing this issue.
- The DCI design does not specify mechanisms for providing external access to DCI data (e.g., magnetic tape, online access, electronic transfer, etc.).

Review of DCI Development Project

Summary Evaluation of DCI Development & Implementation:

Strengths:

- The development of the DCI system followed a structured methodology. This helped to ensure the quality of the final product.
- The DCI development effort and system are well documented. This will help to ensure that the system is maintainable.
- During the DCI development effort, there was a high degree of user involvement. This helped to ensure that the system meets the business objectives of the design.
- The DCI development effort was carried out by a very competent team of users and systems personnel. This team provided necessary business and systems skills to help ensure the successful implementation of the system.
- The conversion plan was developed jointly by NCCI users and systems personnel and approved by industry and regulators. This wide involvement helped ensure that all users of the system are aware of and able to prepare for conversion to the new system and procedures.
- Application programs were developed from detailed specifications and subjected to review by project team members and the Quality Review Board to ensure proper function and compliance to standards. Online programs were further reviewed by the database management group for performance considerations. This approach helped to ensure the quality of the system.

Review of DCI Development Project

- NCCI's primary DCI user conducted a thorough test of the business functions of the new system and demonstrated that the system supports NCCI user requirements.
- An industry test is being conducted to ensure the new system meets the requirements of the insurance carriers who will submit DCI data.
- NCCI is publishing a clear and complete manual explaining expanded DCI forms, edit rules and magnetic tape specifications.
- NCCI is publishing a manual for the DCI carrier edit software package which explains installation and use.

Review of DCI Development Project

Summary Evaluation of DCI Development & Implementation:

Weaknesses:

- Only carriers with DCI systems capable of supporting NCCI's magnetic tape input specifications can use the carrier edit package. Currently, only six carriers submit on magnetic tape.
- NCCI has not completely defined its strategy for providing technical support for the carrier edit package.
- There are no formal plans or guidelines for training industry DCI personnel in completing the expanded DCI forms. Each insurance company is responsible for developing its own training program.
- DCI data used for analysis is stored in VSAM files and accessed by user developed SAS and EASYTRIEVE programs. Relational database technology and user inquiry tools would provide more flexible access to DCI data.
- Program and subsystem integration testing did not include test conditions for every logic path. Also, since input test data was not saved, tests which identified problems could not be easily repeated to verify program corrections. There is some risk that system bugs have remained undetected.
- NCCI's program change control procedures dictate that batch programs are promoted to production by one group and online programs by another. The lack of centralized change management to control changes to the production system could result in coordination problems during production support.

Review of DCI Development Project

Summary Evaluation of DCI Timeliness & Accuracy Standards & Controls:

Strengths:

- The DCI system includes a sample control mechanism which indicates the number of claims a carrier is required to submit.
- The DCI system includes front-end data edits which should help to ensure the quality of data in the DCI database.
- The DCI system automatically requests DCI subsequent and correction reports and monitors their receipt.
- The DCI system produces reports which measure carriers' quality and timeliness performance.
- The WCDM manual will define specific data quality standards and monitoring procedures. If followed, the WCDM program should help ensure the quality of DCI data.

Review of DCI Development Project

Summary Evaluation of DCI Timeliness and Accuracy Standards & Controls:

Weaknesses:

- NCCI's authority to enforce DCI and WCDM quality and timeliness standards is not clearly defined.
- The regulators' role in enforcing DCI and WCDM compliance is not clearly defined.

Review of DCI Development Project

Major Recommendations:

- The NAIC, carriers and NCCI should clearly define NCCI's authority to enforce DCI and WCDM quality and timeliness standards.
- The NAIC, carriers and NCCI should define the regulators' role in enforcing DCI and WCDM compliance.
- The NAIC, through the appropriate task force, should develop a model Workers' Compensation data quality regulation which includes standards for DCI.
- NCCI should solicit formal acceptance of DCI from each state insurance department.
- NCCI should develop a strategy for responding to state regulator requests for detailed claim information not included in the new DCI system.
- NCCI should develop a plan and timetable to require carriers to submit DCI data on electronic media such as electronic transfer, microcomputer diskette or magnetic tape.
- NCCI should explore alternatives to make the carrier edit package usable by more carriers. Such alternatives might include other technical platforms, such as microcomputers, and providing an online entry function with the package. A reasonable goal would be to have 85% of all DCI input pre-validated by carriers using the edit package.
- NCCI should clearly define its strategy for providing technical support for the carrier edit package.

Review of DCI Development Project

- NCCI should assess its DCI database and end user access strategies within the context of its long-term strategic objectives.
- NCCI should develop and publish a standard training program which could be employed by carriers and other users to train their DCI staff.
- NCCI should develop a standard training and support program for insurance regulators who intend to use DCI data.
- NCCI should clearly define its position on providing and charging for external access to DCI data.
- NCCI should determine what mechanisms will be used to provide external access to DCI data.

VOLUME I - SECTION II EXECUTIVE SUMMARY

I. OVERVIEW OF CONCLUSIONS AND RECOMMENDATIONS

A. Introduction

Project Background

The National Council on Compensation Insurance (NCCI) is the major industry-sponsored ratemaking and statistical bureau for workers compensation coverage in the United States. NCCI operates as a rate maker and/or statistical agent in 38 jurisdictions. In some jurisdictions, NCCI only provides advisory pure premiums while in other jurisdictions, it provides the complete manual rates. NCCI promulgates experience rating modifications and manages the operations of the residual market pools for workers compensation in most states where it operates as a statistical agent. As such, NCCI plays a major role in determining the pure premiums and manual rates to be charged for workers compensation insurance coverages throughout the United States as well as in determining the types of ratemaking and statistical information that will be utilized and maintained by the industry.

Milliman & Robertson, Inc. (M&R) was retained by the Florida Department of Insurance to assist with an examination of the data collection and ratemaking operations of NCCI. Joining the Florida Department in conducting the examination were the Maine Bureau of Insurance, the Nebraska Department of Insurance, and the Utah Department of Insurance. The National Association of Insurance Commissioners (NAIC) coordinated the activities of the participating insurance departments in administering the examination and established an Examination Oversight Group (EOG), consisting of regulators from various insurance departments to oversee the examination process.

The overall purpose of the NCCI examination was to evaluate the data collection and data handling activities of NCCI, certain aspects of its ratemaking activities and practical considerations involved in implementing a loss cost system.

VOLUME I - SECTION II EXECUTIVE SUMMARY

The examination was conducted in three major sections:

- I. Data Collection and Data Quality;
- II. Ratemaking Procedures; and
- III. Loss Cost Implementation.

Arthur Andersen & Co (AA&CO), working as a subcontractor to M&R, had primary responsibility for Section I, the Data Collection and Data Quality phase of the examination. Actuarial consultants from M&R were primarily responsible for the Section II and III phases of the study.

A list of the regulators and consultants who participated in the examination is included in Section III, Examination Personnel, of this document. The specific requirements and conditions of the examination are specified in the Request for Proposal (RFP) for this project which is attached as Appendix A.

This Executive Summary provides an overview of Section II of the examination and outlines the approach, conclusions, and recommendations of the examination of ratemaking procedures at NCCI. This Executive Summary is supported by nine separate reports which examine various ratemaking issues specified in the RFP. These reports are identified as Section II, Volumes II through X. The reports provide additional detail and insight into the examination process and should be reviewed for a thorough understanding of the conclusions and recommendations highlighted in this document.

Similar executive summaries are available, from the NAIC Central Office, for Section I - Data Collection and Data Quality, and Section III - Loss Cost Implementation of the examination.

VOLUME I - SECTION II EXECUTIVE SUMMARY

Project Objectives

The primary objectives of Section II of the examination were to (1) describe the current ratemaking process of NCCI and (2) perform thorough evaluations of specific areas of that process.

Report Structure

Our report for Section II of the examination is organized in ten volumes:

- I. Section II - Executive Summary
- II. Section IIA - Part 1 - Description of Ratemaking Procedures
- III. Section IIB - Part 1 - Premium and Loss Development Factors
- IV. Section IIB - Part 2 - Expenses
- V. Section IIB - Part 3 - Trend
- VI. Section IIB - Part 4 - Classification Ratemaking
- VII. Section IIB - Part 5 - Law Amendments
- VIII. Section IIB - Part 6 - Alternative Exposure Bases
- IX. Section IIB - Part 7 - Experience Rating Plan
- X. Section IIB - Part 8 - Miscellaneous

The nine underlying ratemaking reports (Volume II through X) should be reviewed in conjunction with the Section I report on Data Collection and Data Quality and the Section III report on Loss Cost Implementation to gain a thorough understanding of

VOLUME I - SECTION II EXECUTIVE SUMMARY

the examination process. All of the examination reports are available through the NAIC Central Office.

B. Examination Approach

In conducting this part of the examination, we proceeded as follows:

1. Initial Project Meeting - On October 9-10, 1990, the initial project meeting was held in Boca Raton, Florida. All parties to the examination process met to discuss the importance of the examination and the need for confidentiality during the course of the examination. In addition, we reviewed the scope of the examination and emphasized the need for open and timely communications.
2. Identification of Key Contact Personnel - To facilitate the flow of information and data among parties, we identified key contact personnel working on various parts of the examination. This gave the examination team direct access to NCCI staff responsible for the areas under examination.
3. Schedule for EOG Status Reports - In addition to regularly scheduled conference calls with NCCI and/or the EOG, M&R presented status reports to the EOG/NAIC at meetings in Louisville, New York, Charleston, Indianapolis, Salt Lake City, Pittsburgh, and Houston.
4. Informational Meetings and Interviews - Informational meetings were held at NCCI where key members of the NCCI staff could be interviewed. Although meetings were primarily at the Boca Raton headquarters of NCCI, meetings were also held in New York (Law Amendments) and Hartford (Experience Rating).
5. Data and Information Gathering - To accomplish the objectives of the study, we requested a great deal of data and information in paper or electronic format from NCCI. We also gathered other data and information from various independent rating bureaus around the country. Examples of the kinds of data and information gathered by our consultants include:

VOLUME I - SECTION II EXECUTIVE SUMMARY

- a. NCCI and other independent rating bureau rate filings for the last 2 or 3 rate filing cycles.
 - b. Minutes from various NCCI actuarial or governing committee meetings.
 - c. Premium and loss development data for 11 states for policy years 1973 through 1987.
 - d. Trend data and information for 8 states for policy years 1981 through 1988.
 - e. Historical classification loss experience for the period 1987 through 1990 for twelve states.
 - f. Benefit filings from 6 states for the latest 2 years as well as injury and wage distribution tables underlying benefit formula calculations.
 - g. Experience rating files on computer tapes including individual risk data from 4 states.
6. NCCI Research and Analysis - We utilized the staff at NCCI in researching and analyzing certain topics. Examples include:
- a. Past classification rates were recalculated by NCCI utilizing alternative ratemaking techniques.
 - b. Calendar/accident year loss ratios vs. policy year loss ratios for all NCCI states were analyzed by NCCI for policy years 1986 through 1988 and calendar/accident years 1987 through 1989.
 - c. Trend calculations comparing exponential and linear methods for 37 states and 2 states funds.

VOLUME I - SECTION II EXECUTIVE SUMMARY

7. M&R Research and Analysis - Based on the data and information gathered, we conducted independent research and analysis into the areas outlined in the RFP. In some cases, as a result of our analysis, we identified areas where additional data and information were required of NCCI or where additional research was beyond the scope of the RFP. With EOG approval, we requested the additional data and/or conducted the additional research.

8. M&R Peer Review Process - Prior to releasing any draft reports to the EOG for discussion purposes, M&R actuaries, other than the authors of the report, were utilized for peer review purposes.

9. EOG Report Review Process - After the M&R peer review process, each draft report was distributed to a team of actuaries who were members of the EOG. The regulatory actuaries serving on the EOG conducted a thorough review of the M&R draft reports. Conference calls were held, and regulatory feedback was received on each report.

10. NCCI Report Review Process - The next step was the issuance of a confidential draft report to NCCI for internal review purposes only. Conference calls were scheduled with M&R and the EOG, and the NCCI staff was given the opportunity to discuss and air issues of concern with the examination team.

11. Final Report Issuance - Based on the review process noted above, M&R issued a final report to the NAIC Central Office for distribution purposes.

During the course of the examination, we received the full cooperation of the staff at NCCI. We recognize that the examination process placed a tremendous burden on NCCI to produce documents and to fulfill data requests and support research activities. NCCI should be commended for their prompt and professional manner in responding to the requests of the examination team.

The contributions of the individual members of the EOG were an essential part of this examination. Although all EOG members contributed significantly, we especially note

VOLUME I - SECTION II EXECUTIVE SUMMARY

the efforts of Jim Watford of the Florida Insurance Department and Alan Wickman of the Nebraska Department of Insurance.

C. Conclusions and Recommendations

NCCI has fashioned an extraordinarily complex ratemaking system. Many of our recommendations will complicate it further. It is an actuarial fact of life that greater accuracy can rarely be accomplished without further complication. The NCCI ratemaking system strives to be as accurate as reasonably possible and must therefore be complicated. Unfortunately, this results in a process that even actuaries find time-consuming to understand in detail.

Broadly speaking, for the elements studied, our conclusion is that NCCI ratemaking system is not as good as it could be, but that it is a sophisticated system that can ordinarily be expected to produce reasonably accurate results. Many of our recommendations relate to aspects of the current NCCI ratemaking system that we believe are basically reasonable but which can be improved. Only a small number of aspects of the current system were found to generally result in underestimation or in overestimation of the overall rate level.

The major ratemaking elements that we did not study were retrospective rating, target profitability, investment income, and the like. These were identified by the RFP as being outside the scope of the examination.

The more significant conclusions and recommendations are discussed in the remainder of this section. Additional conclusions and recommendations can be found in each underlying report. We stress that it would be unwise to take action on the basis of the Executive Summary alone. The summary statements contained here often cannot convey the complexity of the underlying subject matter. In addition, many of these findings will require significant additional research for confirmation and/or implementation.

VOLUME I - SECTION II EXECUTIVE SUMMARY

In section II of the Executive Summary, beginning on page 19, we provide a brief explanation of each of the underlying ratemaking reports for those readers unfamiliar with the RFP. Appendix A is a copy of the RFP while Appendix B provides copies of the Tables of Contents from the various reports.

Volume II - Section IIA - Part 1 - Description of Ratemaking Procedures

* Volume II contains a detailed explanation of current NCCI ratemaking procedures. In this volume, several suggestions are made for improvements in the clarity of presentation and the explanatory material included with rate filings. In contrast to the other volumes comprising Part II of the examination, this volume does not contain an analysis of NCCI ratemaking techniques.

Volume III - Section IIB - Part 1 - Premium and Loss Development Factors

* The premium and loss development analysis process cannot be reduced to a single best methodology. No one approach for analyzing development patterns or choosing among several alternative projection methods will be most appropriate in all circumstances.

* We recommend that an average of the ultimate losses resulting from paid and paid plus outstanding (excluding IBNR and bulk reserves) projection methods be used as the primary basis for the rate indications. Deviations from the primary methodology (such as using only the paid method, the paid plus outstanding method, or the incurred method) should be made when appropriate, based on diagnostic tests and consideration of the underlying forces influencing the development patterns.

* Our tests of predictive accuracy indicate that projections of ultimate losses from first report are subject to significant estimation error. This suggests that consideration should be given to using data from more than one policy and/or accident year rather than one policy year and one accident year, as in the current NCCI methodology. We recommend that future NCCI filings develop projections of ultimate, trended loss

VOLUME I - SECTION II EXECUTIVE SUMMARY

ratios based on the latest two or three policy years or the latest two or three policy and accident years. Judgment will need to be exercised in selecting standard weights (or a variable weighting system), although tests of predictive accuracy may be helpful in making this judgment.

* We recommend that NCCI expand the diagnostic tests to enhance their ability to analyze loss development patterns. To assist in the evaluation of changes in loss development patterns, several such tests are identified in this report, some of which can be calculated with currently available data.

* Development factors based on all three types of data studied (paid, paid plus outstanding, and incurred losses) tended to underestimate the ultimate losses by approximately equal amounts, on average, for the time period studied in this report. This resulted from an upward trend in loss development factors at early stages of development and does not, in our opinion, indicate an inherent flaw in loss development methods.

* We recommend the collection of additional claim count data (number of claims closed with indemnity payments), for use in diagnostic tests of loss development.

Volume IV - Section IIB - Part 2 - Expenses

* NCCI expense provisions have overstated the actual amount of expenses incurred by the companies. This observation is apparent in both general and production expenses. NCCI expense analysis procedures should be improved so that expense provisions more closely relate to actual expenses. To the extent that verifiable trends are apparent, NCCI should reflect them. The effect of this overstatement on final policyholders costs depends on many factors including the adequacy of loss cost estimates and the effect of individual state regulatory actions.

* NCCI compares general expenses to net earned premium. We recommend that NCCI compare general expenses to direct earned premium. NCCI should also

VOLUME I - SECTION II EXECUTIVE SUMMARY

combine the expense experience of stock and mutual companies in establishing general expense indications. Based on recent experience, this is not expected to have a material impact on the selected expense provision.

* NCCI does not collect data useful to the analysis of the NCCI production expense provision of 15% for the first \$5,000 of standard premium. We recommend that NCCI review production expenses annually, as it does for other expenses, in establishing production expense provisions. NCCI should establish a production expense element based on actual experience rather than the budgetary approach by comparing direct production expenses to direct written premium.

* Historically, NCCI has based their Loss Adjustment Expense (LAE) provision on a review of net and direct calendar year experience. In order to enhance their ability to analyze LAE, NCCI issued a special call to collect accident year direct paid and outstanding losses, Allocated Loss Adjustment Expenses (ALAE), and Unallocated Loss Adjustment Expenses (ULAE). We recommend that NCCI rely on the special call data (direct experience) by accident year in establishing the LAE provision. Based on reviewing the latest special call data, an LAE provision between 12.0% and 12.5% of losses is indicated.

* We recommend that NCCI collect ALAE experience by claim and that ALAE be treated like losses for ratemaking purposes. We worked with NCCI to design a survey to sample small, medium, and large companies to determine the cost of collecting ALAE by claim. The cost estimate, .05% of workers compensation premium for insurers and \$1.4 million for NCCI, is sufficiently low in relation to the benefit that we recommend ALAE be collected by claim effective January 1, 1993. However, a transition program may be appropriate for companies which will incur a high relative cost.

* The RFP asked M&R to review the appropriateness of tempering the NCCI expense provision when large rate increases are indicated. We concluded that expense provisions should generally not be tempered.

VOLUME I - SECTION II EXECUTIVE SUMMARY

* NCCI data suggests that there are expense variations from state to state, and we recommend that additional research be performed to determine the appropriateness of varying expense levels by state. To the extent that verifiable differences exist by state, NCCI should reflect state expense levels in the ratemaking process.

* The data from the 1982 Expense Study does not indicate that there are any significant biases by size of risk. However, we recommend that (1) the expense study by size of risk be updated more often than every nine years, and (2) the expense study by size of risk should incorporate all production expenses (i.e., commission, brokerage and other acquisition expenses), rather than just other acquisition expenses.

Volume V - Section IIB - Part 3 - Trend

* In the past, NCCI utilized linear trending procedures, which tend to yield lower trend indications than exponential trending procedures. Within the last year, NCCI has begun to use exponential trending as a standard procedure. Our tests, based on projection accuracy in recent years, support this change with regard to medical losses. For indemnity losses, our test results are not conclusive, but tend to favor the exponential procedures over the linear procedures. We recommend that NCCI perform tests similar to those contained in this report on a periodic basis (e.g., every two years) to reflect the then more current conditions.

* We recommend that NCCI move toward the adoption of a Bayesian credibility approach for weighting state and countrywide trend indications, unless subsequent investigation reveals an unanticipated problem.

* We recommend that NCCI perform extensive analysis of econometric models to better evaluate and reflect the impact of economic changes on losses.

* We recommend changes to the NCCI approach for recognizing benefit changes in ratemaking. The proposed alternative approach will facilitate econometric analysis, but is likely to increase projection accuracy to only a small degree. Because its impact

VOLUME I - SECTION II EXECUTIVE SUMMARY

on rate accuracy would be slight, we do not consider this a high priority recommendation.

Volume VI - Section IIB - Part 4 - Classification

- * We found that lengthening the experience period used for classification ratemaking from three to five years tended to improve the accuracy and consistency of the methodology in identifying relative loss cost differences among classes.
- * We recommend that NCCI increase the number of years of experience used from three to five unless additional tests by NCCI, using methodology we developed for this examination, are not consistent with the results we obtained. We have not tested the impact of the use of more than five years and thus have formulated no opinion regarding the use of more than five years of data.
- * There is an inconsistency in the loss limitations inherent in the three partial pure premiums currently used in calculating the pure premiums derived by formula. We recommend that NCCI modify its methodology to overcome this inconsistency.
- * We examined losses in excess of the current loss limitation and found, based on the limited data available, that different classes may have different expected losses above the loss limitation than the remaining classes in their industry group. We recommend that NCCI further test this with additional data and, if the results continue to hold, address the effect this has on classification ratemaking methodology.
- * We reviewed the composition of the "All Other" industry group. We recommend that NCCI further investigate subdividing this industry group into smaller, more homogeneous industry groups. Given the size of the "All Other" group, we believe that the resulting sub-groups could result in industry groups large enough to have full statistical credibility.

VOLUME I - SECTION II EXECUTIVE SUMMARY

Volume VII - Section IIB - Part 5 - Law Amendments

- * For "formula" benefit changes, NCCI's pricing methodology seems to be working satisfactorily ("formula" benefit changes are those for which NCCI applies standard benefit tables and distributions in its cost evaluation).
- * In some non-formula situations, NCCI appears to apply formula techniques when those techniques are not appropriate. In other more recent cases, NCCI has applied new data sources and new estimation techniques. NCCI should improve the method of identifying law changes significant enough to require the use of "non-formula" techniques.
- * NCCI should increase the utilization of state specific information regarding the workers compensation benefit system being analyzed.
- * NCCI should improve the explanatory material included with a benefit pricing report.

Volume VIII - Section IIB - Part 6 - Alternative Exposure Bases

- * No single exposure base for workers compensation (or any other line of insurance) is ideal for all circumstances. Unlimited payroll appears to provide the most reasonable compromise between theoretical and practical considerations for most insureds.
- * The introduction of the Revised Experience Rating Plan (RERP) will mitigate the premium basis inequities inherent in the current rating system for many insureds.
- * A further analysis of insured characteristics indicates that, despite the combined application of unlimited payroll and RERP, theoretical inequities in the rating system can remain. For purposes of this report, we refer to any unidentifiable premium disparity remaining after application of all aspects of the rating structure, including experience rating, as residual inequity. By testing the impact of the rating system in

VOLUME I - SECTION II EXECUTIVE SUMMARY

various hypothetical situations, we conclude that this residual inequity is most likely to exist for insureds with the following joint characteristics:

They are concentrated in classes with a wide range of verifiable average hourly wages.

The wage variation has no logical relationship to occupational hazard specific to a given type and locale of activity.

The insureds are either too small to qualify for, or have low credibility under RERP.

* The residual inequity can be further mitigated through a wage rate recognition plan limited to those classes with a demonstrated problem and with hours worked data readily available and verifiable.

We do not conclude that recognition of wage rates within the rating structure for all classes of insureds would ultimately improve the equity of the system. It is impossible to identify all who benefit (and all who do not) from such a universal change. However, it is clear that such a universal change would provoke a largely unnecessary disturbance in the workers compensation system with regard to rates and procedures.

* We believe that the costs associated with universal collection of hours worked or average hourly wage could be as much as 0.4% to 0.7% of collected premium. Even at that cost, there is no guarantee that the data collected will be accurate and usable. Furthermore, these additional expenses could be concentrated in those employments least likely to realize an equity enhancement through wage rate recognition.

* We recommend judicious use of wage rate recognition plans only for those states and classes of employment identified as having residual inequities after application of RERP to the unlimited payroll exposure base. The intent of this recommendation is to introduce wage rate differentials as a refinement of the classification system without creating new inequities or extraordinary expenses.

VOLUME I - SECTION II EXECUTIVE SUMMARY

Volume IX - Section IIB - Part 7 - Experience Rating Plan

* We have evaluated the accuracy of the Revised Experience Rating Plan (RERP), and find it performs better than the prior experience rating plan which it replaces. We conclude that the NCCI's method of introducing the RERP does not tend to result in a premium increase or decrease.

* We investigated an alternate experience rating modification formula which is a combination of both a formula used by the Insurance Services Office and the current NCCI approach. The alternate formula would adjust expected excess losses by an experience modification factor based on primary losses, whereas the current NCCI expected excess losses are not affected by the actual primary losses. We believe that the alternate formula can be expected to produce more accurate results than the RERP (or a version of the RERP in which the parameters have been optimized as in the alternate formula). However, the degree of improvement is not clear. We recommend that further testing be done by NCCI using more states and more time periods to evaluate the degree of improvement produced by the alternate formula. If the degree of improvement is found to be substantial, then we would recommend implementing the alternate formula as soon as is practical. If the improvement is found to be minor, then the practical difficulties involved in implementing a change in the formula make it appropriate to postpone implementation until such time as other significant changes are being implemented, or possibly to forego implementation altogether. This will be a matter of professional judgment.

* Our testing, using the alternate formula and an optimized version of the RERP, suggests that the accuracy of the experience rating plan would be improved by expanding the experience period to five years from the current three years. However, inclusion of the fourth and fifth years of experience would entail significant implementation costs as well as substantial ongoing costs. In addition to the impacts on accuracy and cost, extension of the experience period to five years could affect the perception of the plan's reasonableness by policyholders. Some policyholders already

VOLUME I - SECTION II EXECUTIVE SUMMARY

consider it inappropriate to use data as old as the oldest year currently used in experience rating; the addition of two older years would exacerbate this perception.

* We recommend several changes in the calculation of the Expected Loss Rates and D-ratios used in experience rating in order to make them more accurate.

* Standard NCCI methodology does not address changes in experience rating off-balances, although adjustments have been made by NCCI in some cases. We recommend that standard NCCI methodology identify off-balance levels and movements during the experience periods used for trending and rate level indications. An attempt should be made to determine the cause of significant off-balance changes whenever they are seen. Proper action in response to significant off-balance changes would be a function of the cause identified. We would recommend that adjustments not be made when changes are attributed to a change in the mix of risks insured. We would expect adjustments to be appropriate when changes in off-balance are attributed to changes in the experience rating plan itself (e.g. rules, such as eligibility requirements, or formulas such as those for calculating ELR's), or delays in updating ELR's and D-ratios, due to prior delays in the approval of rate changes. The adjustments could result in either an increase or a decrease in the indicated rate change, depending on the circumstances.

Volume X - Section IIB - Part 8 - Miscellaneous

* Minimum premium risks appear to have consistently worse loss ratios than all other risks. Due to the relatively small premium contribution from minimum premium risks and the size of the loss ratio differential, their effect on overall loss ratios is small. It is not clear what loss ratios will ultimately result from NCCI's current program of minimum premium multipliers. NCCI should continue to study the loss ratio experience of small risks.

* If premium levels for minimum premium risks were increased, either through increasing the minimum premium multipliers or adding a loss constant, insurers might be more willing to provide voluntary coverage to these risks. On the other hand,

VOLUME I - SECTION II EXECUTIVE SUMMARY

there are a significant number of minimum premium risks and there is likely to be some dissatisfaction after a price increase targeted at minimum premium risks. Due to the low impact of minimum premium risks on the overall loss ratio, we believe that the policy of whether or not to change the pricing of minimum premium risks should be governed by its practical effects, rather than its actuarial significance.

* In general, we believe that the standard NCCI procedures to reflect additional revenue from residual market policies are reasonable. However, we have a number of concerns regarding some related issues. These include the need to improve explanatory material in the rate filing and the need to reflect net premium programs in all states as a standard methodology. In addition, we note that experience rating of assigned risks has the potential to double-count adverse experience in states that charged a surcharge that was high enough to eliminate residual market shortfalls.

* In general, the policy year and accident year loss ratios used in recent filings appear to be consistent with each other. We recommend that NCCI continue to investigate the reasons for the premium differences in those states where they are most pronounced. We also recommend that NCCI strengthen the process for editing carriers' future calendar and policy year premium reports for consistency.

**VOLUME I - SECTION II
EXECUTIVE SUMMARY**

VOLUME I - SECTION II EXECUTIVE SUMMARY

II. SECTIONAL OVERVIEWS

For readers unfamiliar with the details of the RFP, we present below an overview of each of the sections of our report. These overviews briefly describe the analysis undertaken and do not contain any conclusions or recommendations. Appendix B provides the Table of Contents for each of the underlying reports in order to give further insight into the issues examined.

A. Volume II - Section IIA - Part 1 - Description of Ratemaking Procedures

There are three general situations in which NCCI performs ratemaking functions:

1. Administered Pricing System
2. Advisory Rate System
3. Loss Cost System

This section of the examination provides a general description of how ratemaking operates at the NCCI in other than a loss cost system. Our report describes NCCI's current annual ratemaking procedures, including standard methodologies and alternative approaches used in particular circumstances. A discussion of the assumptions underlying the NCCI's procedures and the methods used by NCCI to test these assumptions is also included.

Since this section deals with the documentation of current procedures, there are no conclusions and recommendations contained therein.

B. Volume III - Section IIB - Part 1 - Premium and Loss Development Factors

The determination of an overall rate level requirement is generally based on an estimate of the ultimate loss ratio for the period during which the rates will be in

VOLUME I - SECTION II EXECUTIVE SUMMARY

effect. This estimate is often derived from the ultimate loss levels of prior periods, which are also estimated.

One of the fundamental concepts underlying most actuarial projections of ultimate losses is that of loss development. Losses are aggregated by accident year or policy year and evaluated at different valuation dates. The ratios of the losses at each successive valuation are known as development factors.

When experience is analyzed on a policy year basis, a similar development technique is used in estimating the total premiums on policies insuring the claims.

In this part of the examination, we had two primary objectives:

- 1a. Evaluate the NCCI's premium and loss development techniques.
- 1b. Evaluate the NCCI's procedures for reconciling differences that occur between different development techniques and evaluate the effectiveness and likely accuracy of the criteria they use to choose one technique over another.

We reviewed NCCI's process for determining and selecting development factors. Performance tests of current methodology, measured against various alternatives, were conducted for a variety of states. We analyzed issues such as the number of years entering the development factor calculation, the use of multiple state data, as well as the selection of tail factors.

C. Volume IV - Section IIB - Part 2 - Expenses

A critical consideration in the development of a final rate is the expense factor. This component of M&R's examination of the ratemaking procedure used by NCCI discusses the methodology NCCI uses to incorporate expenses in the ratemaking process, evaluates the appropriateness of that methodology, and suggests improvements. As the RFP makes clear, NCCI's treatment of expenses is complicated by many factors. Is it appropriate to use an average, a budgeted amount, or a factor

VOLUME I - SECTION II EXECUTIVE SUMMARY

that reflects individual company experience? These factors are all, in a sense, interrelated in how they impact the final workers compensation premiums paid by insureds.

In this part of the examination, we had six primary objectives:

- 2a. Evaluate NCCI's expense methodology
- 2b. Costs and benefits of collecting ALAE by claim
- 2c. State specific expense issues
- 2d. Budgeted approach to acquisition expenses
- 2e. Justification for dual expense discounts
- 2f. Equity of premium discount programs and expense constants

In responding to the above objectives, we analyzed the current NCCI expense methodologies by reviewing the expense data utilized and testing alternative methods for their effectiveness and cost.

D. Volume V - Section IIB - Part 3 - Trend

In ratemaking, historical experience is used to project the loss ratios expected for the period during which rates will be in effect (the rate effective period). Due to the time necessary to compile the historical experience, prepare rate filings and, where necessary, gain regulatory approval, two or three years can elapse between the historical experience period and the rate effective period. During that time, many factors can influence loss ratios, including differences between medical and wage inflation, changes in the utilization of medical services, changes in claim frequency, and shifts in frequency between types of injuries. The purpose of trend is to measure

VOLUME I - SECTION II EXECUTIVE SUMMARY

these changes and to include a provision in the rate level for anticipated changes between the experience period and the rate effective period.

Trend factors are used to reflect the impact of a complex array of forces, including economic and social changes, on losses and wages. A variety of approaches are possible for estimating trends, varying from mathematically simple to mathematically complex methods, and varying from use of a curve fit for extrapolation of a series of past points to in-depth analysis of the forces influencing past points and the projection of the future course of such forces.

In recent years, loss trends have generally exceeded wage trends, particularly for the medical component of losses. Simple extrapolation of this relationship into the future is not appropriate without examining the underlying forces and evaluating the likelihood of their continuation.

In this part of the examination, we had six primary objectives:

- 3a. Evaluate NCCI's trend procedures
- 3b. Evaluate changes to NCCI's trend procedures
- 3c. Evaluate the impact on NCCI's trend procedures of significant legal or economic changes
- 3d. Evaluate an alternate method of adjusting for benefit changes
- 3e. Evaluate possible distortions in premium on level factors
- 3f. Evaluate possible distortions in benefit on level factors

We reviewed NCCI's general trending procedures and analyzed alternative trending methods for comparison purposes. We reviewed issues such as the trend period, the data underlying the calculations, the statistical approach utilized and the use of multiple state data, as well as the application of credibility concepts.

**VOLUME I - SECTION II
EXECUTIVE SUMMARY**

E. Volume VI - Section IIB - Part 4 - Classification Ratemaking

An integral aspect of NCCI's ratemaking efforts is the allocation of the overall rate level change to individual classifications. This step is important in determining the relative equity of the premiums to be charged members of each rating class. The process involves analyzing data by classification as produced by the Workers Compensation Statistical Plan (WCSP) and converting this information into a final classification rate indication.

In this section, the examination was to concentrate on the following three objectives:

- 4a. Study and recommend alternatives to NCCI's current approach to credibility, their practice of using three years of data for classification ratemaking, and loss limitations used in those calculations.
- 4b. Evaluate whether procedures for determining industry group relativities could be enhanced by using more years of experience.
- 4c. Evaluate the application of trend factors in classification ratemaking.

We addressed these objectives theoretically and empirically. We first reviewed the theory underlying the current methodology to identify the procedures used and to understand their impact on NCCI rates. We then identified specific alternative procedures to be tested.

On the empirical level, we designed tests of the accuracy and consistency of the methodology in identifying relative loss cost differences among the classes. These tests can be used by NCCI to evaluate other alternatives.

VOLUME I - SECTION II EXECUTIVE SUMMARY

F. Volume VII - Section IIB - Part 5 - Law Amendments

NCCI is frequently called upon to estimate the impact of statutory revisions that affect benefit levels to determine their impact on loss levels. As states focus on workers compensation cost containment, it is important that the methodologies used by NCCI to price benefit changes be as accurate as possible.

According to NCCI, a benefit change (statutory revision) can be categorized as a "formula" or "non-formula" type change. However, this identification is not always clear cut. NCCI considers a formula change to be any change that can be priced through use of the existing databases and distribution tables, and a non-formula change to be a change that requires additional data and information.

In this section of the report, we address the following four issues:

- 5a. NCCI's procedures for determining the expected loss changes due to revisions in weekly benefits, waiting periods, escalation provisions, and medical fee schedules (formula benefit changes).
- 5b. The appropriateness of the 1973 Standard Wage Distribution Table.
- 5c. NCCI's performance in analyzing non-formula benefit changes.
- 5d. Whether different wage distribution tables should be used for different class groups.

For use in this report, a formula change was taken to be any benefit revision that involved changes in one or more of the following items: maximum weekly benefit, benefit level as a percentage of gross wages, waiting periods, retroactive periods, escalation rates, or medical fee schedules. All other benefit changes were considered non-formula.

VOLUME I - SECTION II EXECUTIVE SUMMARY

In our review of formula type changes, we discussed basic pricing parameters and assumptions, the data and distribution tables used by NCCI as well as NCCI's formula pricing methodology.

As respects NCCI's non-formula techniques, we reviewed the effectiveness of NCCI when presented with non-formula type benefit changes. To accomplish this goal, we reviewed the alternative data sources and techniques used by NCCI to price non-formula type changes in states where changes have been implemented.

In addition to studying NCCI's current approach to pricing benefit changes, we have analyzed, where necessary, alternative methods for pricing benefit changes.

G. Volume VIII - Section IIB - Part 6 - Alternative Exposure Bases

The exposure base is the fundamental measurement of an insured's exposure to loss. The exposure base is multiplied by the rate specified by the rating manual to derive the manual premium for the insured. The total premium collected during the policy term is the manual premium adjusted for experience rating modifications, premium discount, expense constant and minimum premium considerations, and other rating variables (e.g., schedule and retrospective rating) that may apply. In most jurisdictions and for most classifications, the current exposure base used by NCCI is unlimited payroll. This base has been used for at least 10 years in most states. However, at various times, limited payroll, hours worked, number of employees and several combinations thereof have been espoused as preferred alternatives to unlimited payroll.

Currently, the discussion on exposure bases centers on whether or not equity in rating can be enhanced by recognizing wage rate differences among insureds within the same classification.

As part of its examination of NCCI ratemaking procedures, M&R was directed to respond to the following two questions:

VOLUME I - SECTION II EXECUTIVE SUMMARY

6a. What improvement in rate equity could be expected from a system recognizing wage rates (if available) in addition to unlimited payroll?

6b. What additional expenses would be expected from administration of a system using wage rates?

The scope of the assignment did not involve collection and compilation of original data. Instead, M&R was to rely on data compiled from past studies of alternative exposure bases.

We compiled and reviewed existing studies on alternate exposure bases and the expense associated with each alternative.

H. Volume IX - Section IIB - Part 7 - Experience Rating Plan

The Experience Rating Plan (ERP) is intended to increase the accuracy of the premium calculation system by incorporating the recent experience of an insured as an enhancement to the classification process. The NCCI ERP is a prospective rating plan; i.e., it is used to determine the rate for a policy period prior to the availability of actual claim experience for that period. The ERP provides a refinement to the class rates which are determined by the type of business, in an effort to assess the appropriate premium rate for a particular insured.

The ERP results in an experience modification factor which is applied to the manual rate in order to determine the rate for a particular insured.

The fundamental technique in experience rating is to compare the historical experience of the insured with the expected experience (based on the insured's class) in order to adjust the price of the insurance provided. Currently, the process calls for three years of experience and smaller risks are not eligible for experience rating. The data used for experience rating is based on the WCSP.

VOLUME I - SECTION II EXECUTIVE SUMMARY

The objectives for this phase of the examination called for an evaluation of the following issues:

- 7a. NCCI's procedures and formulas.
- 7b. The number of years used in experience rating.
- 7c. Extension of the plan to small risks.
- 7d. The current formulas for ELR's and D-Ratios.
- 7e. The premium impact of implementing the Revised Experience Rating Plan (RERP).
- 7f. The impact of the experience rating plan off-balance on ratemaking methodology.

We analyzed the accuracy and equity of NCCI's RERP and have suggested improvements. We also studied the benefit and cost of using more than three years of data for experience rating.

I. Volume X Section IIB - Part 8 - Miscellaneous

In this part, we discuss the various ancillary issues that impact the ratemaking process.

The four objectives evaluated in this part included:

- 8a. Loss and expense ratios of minimum premium insureds.
- 8b. Additional premiums due to residual market surcharges.
- 8c. Experience rating plan off-balance (This objective was transferred to Section IIB - Part 7f).

**VOLUME I - SECTION II
EXECUTIVE SUMMARY**

8d. Calendar/accident year vs. policy year loss ratios (This objective was added by the EOG during the course of the examination).

**VOLUME I - SECTION II
EXECUTIVE SUMMARY**

III. EXAMINATION PERSONNEL

A. Examination Oversight Group

The following regulators were members of the Examination Oversight Group:

Commissioners:

William McCartney	Director, Nebraska Department of Insurance
Harold C. Yancey	Commissioner, Utah Department of Insurance
Tom Gallagher	Commissioner, Florida Insurance Department
Joseph Edwards	Superintendent, Maine Bureau of Insurance
Jeri Brown	Acting Superintendent, Maine Bureau of Insurance

Examination Coordinators:

James D. Watford	Actuary, Florida Insurance Department
Alan E. Wickman	Actuary, Nebraska Department of Insurance
Robert Klein, Ph.D.	NAIC Central Office

Other members of the review team:

Kevin J. Conley	Actuary, Iowa Insurance Division
Michael R. Lamb	Actuary, Oregon Department of Insurance and Finance
Richard Johnson	Actuary, Maine Bureau of Insurance
Martin M. Simons	Actuary, South Carolina Insurance Department
Robert A. Bailey	Deputy Commissioner, Michigan Insurance Department
Eric Nordman	NAIC Central Office
James Rose	NAIC Central Office

VOLUME I - SECTION II EXECUTIVE SUMMARY

B. Examination Consultants

The following consultants were responsible for Section II - Ratemaking

Overall Project Administration	James R. Berquist, FCAS E. Frederick Fossa, FCAS
Peer Reviewers	Allan M. Kaufman, FCAS Michael A. McMurray, FCAS
Section IIA - Part 1 - Description of Ratemaking Procedures	Daniel J. Flaherty, FCAS Janet G. Lockwood, FCAS
Section IIB - Part 1 - Premium and Loss Development Factors	Patrick J. Grannan, FCAS Gary R. Josephson, FCAS
Section IIB - Part 2 - Expenses	Allan M. Kaufman, FCAS Brian Z. Brown, FCAS
Section IIB - Part 3 - Trend	Patrick J. Grannan, FCAS Spencer M. Gluck, FCAS Susan E. Witcraft, FCAS
Section IIB - Part 4 - Classification Ratemaking	Roger M. Hayne, FCAS Michael A. McMurray, FCAS
Section IIB - Part 5 - Law Amendments	Allan M. Kaufman, FCAS John Herzfeld, FCAS
Section IIB - Part 6 - Alternative Exposure Bases	Michael A. McMurray, FCAS Richard S. Biondi, FCAS Robert J. Finger, FCAS Brett E. Miller, ACAS (AA&CO)
Section IIB - Part 7 - Experience Rating Plan	Patrick J. Grannan, FCAS Richard S. Biondi, FCAS Mark W. Mulvaney, FCAS Marvin Pestcoe, ACAS
Section IIB - Part 8 - Miscellaneous	John Herzfeld, FCAS Gary R. Josephson, FCAS Patrick J. Grannan, FCAS

**VOLUME I - SECTION II
EXECUTIVE SUMMARY**

C. NCCI Key Personnel

The following were important contact personnel at NCCI:

Overall Project Administration	W. Hager, Esq. R. Hilton R. Retterath, FCAS
Review Coordinators	M. Dolan, FCAS R. Blanco, ACAS J. Mallon
Section IIA - Part 1 - Description of Ratemaking Procedures	R. Yenke P. Langdon
Section IIB - Part 1 - Premium and Loss Development	P. Langdon B. Spidell, FCAS
Section IIB - Part 2 - Expenses	J. Gillam, FCAS F. Leederman
Section IIB - Part 3 - Trend	P. Langdon J. Gillam, FCAS
Section IIB - Part 4 - Classification Ratemaking	R. Yenke S. Fandrey
Section IIB - Part 5 - Law Amendments	B. Llewellyn, ACAS G. Phillips, FCAS
Section IIB - Part 6 - Alternative Exposure Bases	J. Mallon B. Llewellyn, ACAS

EXECUTIVE SUMMARY**

APPENDIX A: NAIC REQUEST FOR PROPOSAL

**VOLUME I - SECTION II
EXECUTIVE SUMMARY**

REQUEST FOR PROPOSAL

PART I GENERAL INFORMATION

1-1 Purpose

The purpose of this request for proposal (RFP) is to provide information and guidelines for the submission of proposals to the Florida Department of Insurance (hereafter referred to as "the Department") by consulting firms for an examination of the structure and operations of the National Council on Compensation Insurance (NCCI).

This examination will be conducted under the examination authorities of the Florida Department of Insurance, the Maine Bureau of Insurance, the Nebraska Department of Insurance, and the Utah Department of Insurance. The examination is intended to address areas of concern to these states as well as other states with respect to the structure and operations of the NCCI. The National Association of Insurance Commissioners (NAIC) will be coordinating the activities of the four departments in administering the examination but is not a party to the contract with the consultants.

1-2 Issuing Office

The issuing office is the Florida Department of Insurance, Purchasing Section, Division of Administration, Room G-59, Larson Building, Tallahassee, Florida 32399-0300, 904/488-4984.

1-3 Contract Consideration

Due to the nature of the work to be performed, consideration will only be given to consultants with sufficiently qualified people in the areas of actuarial science, computer auditing, statistical analysis, financial and management consulting to undertake a detailed and comprehensive examination of a workers' compensation rating organization.

1-4 Acceptance

The Department reserves the right to accept or reject any or all proposals and to award the ensuing contract in the best interest of the State of Florida and the other participating states, as named above. Any material conflict of interest arising out of current or past work performed for the NCCI could cause the rejection of a proposal.

1-5 Developmental Costs

Neither the Department, nor the other participating departments, or the NAIC or any other state or agency of any other state is liable for any of the costs incurred by the respondent in preparing a proposal in response to this RFP.

1-6 Questions

Only questions in writing concerning this RFP will be received before July 13, 1990 by Robert Klein, Director of Research, NAIC, 120 West 12th

Street, Suite 1100, Kansas City, Missouri. A list of the questions received and written answers to those questions will then be distributed by First Class U.S. Mail to all recipients of this RFP by July 20, 1990. Questions received after July 13, 1990 will not be answered.

1-7 Agenda

Any significant change made in the RFP will be brought to the attention of those who have demonstrated interest in responding to the RFP and adequate time will be allowed for response.

1-8 Schedule

The following schedule will be strictly adhered to in all actions relative to this procurement.

- A. June 29, 1990: RFP issued.
- B. From June 29, 1990 to July 13, 1990, written questions will be received.
- C. All proposals are due by 3:00 p.m. on July 27, 1990 in the issuing office (see Part 1-15).
- D. From July 27, 1990, proposal evaluation will begin.
- E. A site visit at the offices of the NCCI on July 10, 1990 (see Part 1-17). The purpose of the site visit is to allow bidders to obtain information on the data systems and procedures of the NCCI.
- F. Oral presentation if required will be scheduled during the period August 21 to August 23. Since this will require coordination of evaluation committee members from four states and the NAIC, respondents should be prepared to attend on relatively short notice.
- G. Notice of the Department decision will be posted on August 24, 1990 in the issuing office (see Part 1-15).
- H. Following the evaluation negotiations and necessary concurrences between the Department and successful respondent, a contract award will occur.

1-9 Proposal Content and Signature

To facilitate an objective review, eleven (11) copies of the proposal will be required with a separately sealed cost proposal. All copies must be signed by a company official with power to bind the firm to its proposal for a sixty (60) day period. To be considered, all proposals must be completely responsive to the RFP.

1-10 Proposal Preparation

All respondents will provide a straightforward and concise description of their ability to meet RFP requirements (see Part IV). The

proposal must specify the approach to the development (i.e., computer programs, tables, reports, etc.) of the final product.

1-11 Prime Responsibilities

The selected respondent will be expected to assume responsibility for all services offered in his proposal. The selected respondent will be the sole point of contractual matters including payment of any and all charges resulting from the contract.

1-12 Project Control

Control of the project shall remain the total responsibility of the Department and the other participating departments.

1-13 Rules for Proposal

The signer of the proposal must declare that the only person, persons, company or parties interested in the proposals as principals, are named therein, that the proposal is made without collusion with any other person, persons, company or parties submitting a proposal, that it is in all respects fair and in good faith without collusion or fraud, and that the signer of the proposal has full authority to bind the principal.

1-14 Regulations

The selected firm or individual will be required to comply with all applicable State of Florida regulations and contract provisions. The ensuing contract shall contain such contractual provisions or conditions necessary to define a sound and complete agreement and to satisfy state regulations and statutory requirements of the Department.

1-15 Proposal Submission

The proposal must be submitted (per schedule in Section 1-8) to Ina Boykin, Purchasing Director, G-59 Larson Building, Tallahassee, Florida 32399-0300 telephone (904) 488-4984.

1-16 Proposal Timetable

The final report for the project may be completed on a section by section basis. The final report for Section III Practical Considerations in Implementing a Loss Cost System shall be submitted by November 15, 1990. The final reports for Sections I and II shall be submitted no later than May 15, 1991. If the respondent can complete reports sooner, then this should be noted in the proposal.

1-17 NCCI Site Visit

A site visit at the offices of the NCCI at 750 Park of Commerce Drive, Boca Raton, Florida, is scheduled for July 10, 1990, beginning at 9:00 a.m. The purpose of the site visit is to allow bidders to obtain information on the data systems and procedures of the NCCI. NCCI personnel will be available to answer questions at this meeting. Any other questions concerning the RFP should be submitted to Bob Klein in accordance with Part 1-6.

PART II INFORMATION REQUIRED FROM RESPONDENTS

Proposals must be submitted in the format below:

2-1 Organization and Credentials

Provide a listing showing all persons who will work on the project along with their experience and qualifications. Any work for the NCCI by any person who will be involved in this project over the past 5 years should be clearly noted and explained. Any potential conflict of interest arising out of current or past work performed for the NCCI by the respondent or any subcontractor should be clearly noted and explained. Also, provide an estimate of the number of hours per week that each person would be available. A separate listing should show those persons who would participate on a peer review basis as opposed to being active in the research or drafting of the reports. A separate section should show the computer hardware and systems capabilities that will be used in the project.

2-2 Respondent's Understanding of the Project and Workplan

Provide a precise rendering of the respondent's understanding of the project.

2-3 Subcontractors

Identification of any contemplated subcontractor(s) is required, with identification of personnel to be assigned, their qualifications, and experiences and specific details of how the subcontractor(s) will be used, the work products the subcontractor(s) will produce and the costs for these services.

2-4 Services of the Department, Other Participating Departments, the NAIC and the NCCI.

Respondents should indicate any data they might require from the NCCI or other sources as well as assistance anticipated from Department, other participating departments or the NAIC in acquiring such data.

2-5 Cost Proposals

A Cost Proposal attached to the eleven (11) copies of the proposal must be separately sealed and submitted to the Department utilizing the standard form attached to this RFP and in accordance with the provisions outlined in Part I of this RFP. A separate cost form should be submitted for each of the following parts of the project: Section I.A.; Section I.B.; Section II.A.; Section III; and under Section II.B. each of the following: 1a, 1b, 2a, 2b, 2c, 2d, 2e, 2f, 3a, 3b, 3c, 3d, 3e, 3f, 4a, 4b, 4c, 5a, 5b, 5c, 5d, 6a, 6b, 7a, 7b, 7c, 7d, 8a, 8b, and 8c. A separate cost form should show a consolidation for the entire project. Costs should be based on the hourly fees of required personnel clearly stated and the anticipated hourly involvement of such personnel.

2-6 Additional Information and Comments

Comments under this heading are encouraged and left to the discretion of the respondent. Material should be pertinent to the proposal but not otherwise required in the RFP.

PART III PROPOSAL REVIEW/CRITERIA FOR SELECTION

3-1 Submission

Proposals will be submitted initially on the most favorable terms from both technical and cost standpoints. The date and time of submission (see Part I, 1-8) will be strictly adhered to.

3-2 Proposals for Specific Parts of the Examination

The overwhelming preference is to award the contract to one entity for the entire project. The reason for this preference is the interrelationship between the various sections of the examination. Information or insight gained in one part of the examination could prove to be crucial to other areas of the examination. However, proposals to perform specific part(s) of the project will be accepted. The burden will be on the respondent to explain why and how the project can be performed by several providers and integrated into one final project.

3-3 Proposal Review

The proposals will be reviewed and necessary negotiations conducted by the Department, other participating departments and NAIC personnel. Oral presentations may be required to assist in the final selection of proposals.

3-4 Evaluation

Proposals will be evaluated and the respondent selected on the following criteria with a maximum possible total points of 100.

Weighting Factors for Evaluation of Proposals:

<u>Points</u>	<u>Weighting Criteria:</u>
15	A. The quality of the proposal submitted and the demonstrated understanding of the nature of the analysis and report required.
10	B. Time frames for completion of research and delivery of final reports.
20	C. Cost factors.
	D. The quality and adequacy of the team assembled, including computer hardware and system capabilities, to perform the underlying research and draft of the report(s). This involves consideration of the factors shown under D.(1), D.(2), and D(3). The total points

allowed for D. is 55 which is composed of 20 points for D.(1), 20 points for D.(2) and 15 points for D.(3).

- | | |
|----|--|
| 20 | (1) The experience and qualifications of the team to undertake the examination specified. The number of highly qualified persons who will be active in the research and drafting of the portions of the report relating to ratemaking and experience rating formula, as opposed to merely reading later drafts as a form of peer review. Any material conflict of interest arising out of current or past work performed for the NCCI. |
| 20 | (2) The number of hours per week that will be available from highly qualified persons, as well as from necessary support staff, and the computer hardware and system capabilities. |
| 15 | (3) The adequacy of peer review procedures. Any material conflict of interest arising out of current or past work performed for the NCCI. |

100 Total Points

PART IV WORK PRODUCT REQUIRED

This examination stems from a recommendation by the NAIC's Workers' Compensation Advisory Organization Activities Working Group. The working group studied the issue of implementing a "loss cost" system in workers' compensation similar to the system being implemented in the other property-casualty lines. Under a loss cost system, advisory/rating organizations are prohibited from filing final rates but they are allowed to file "prospective lost costs" which include adjustments for development and trend.

In December of 1989, the NAIC adopted that working group's resolution which said that its present belief was that workers' compensation should not be treated differently from the other property-casualty lines with respect to permissible activities of advisory/rating organizations. However, some group members expressed concerns about the impact of a loss cost system on the marketplace as well as concerns about the performance of advisory/rating organizations within workers' compensation which would not be resolved by implementation of a loss cost system. Consequently, the group deferred recommendations on the specific details of the system to be implemented until the completion of two studies: 1) a staff economic analysis of the likely impact of a loss cost system on state workers' compensation markets; and 2) a comprehensive examination of the structure and operations of the National Council on Compensation Insurance (NCCI) conducted under the examination authority of the four states.

The purpose of this examination is to thoroughly evaluate the data collection and processing activities of the NCCI as well as certain aspects of its ratemaking activities. The examination also is intended to review the practical considerations with respect to the NCCI's operations involved in implementing a loss cost system. While the examination will be conducted under the authority of four states, it is intended to address issues of general concern to all state insurance regulators.

The examiners will be expected to fully document current NCCI procedures, evaluate the adequacy or appropriateness of those procedures, and where possible, present possible alternative approaches and the practical effects of those approaches. The examiners also will be expected to use the results of previous NCCI examination reports where possible to the extent that the results of those examinations can be verified.

The final product of the examination should be a comprehensive and detailed report that will provide insurance regulators with a good understanding of NCCI procedures as well as ideas on how those procedures might be improved. In addition, the report should identify the practical questions that would be associated with the NCCI's transition to loss costs and discuss how those areas might be handled. The report should enable insurance regulators, individually and collectively, to make specific recommendations on the features of the system that would be implemented as well as other improvements to the data collection and analysis services provided by the NCCI.

Section I. Data Collection and Data Quality

A. Description of NCCI's Data Collection and Data Handling Procedures

The consultant will be expected to fully document the NCCI's data systems by either verifying information produced by NCCI or creating documentation where necessary. The final work product will completely document the NCCI data systems from input documents to final data bases. As a general introduction to data collection, the consultant should include responses to the following:

- . What types of data does the NCCI collect?
- . What is the purpose for collecting each type of data?
- . How are the data obtained from insurers and processed into a data base?

For each statistical call, the following should be shown:

- . The fields that are entered on computer systems from the source document;
- . The edits performed on each field;
- . How errors are handled and how corrected fields are integrated into the data base.
- . Any modifications to the data from the source document;
- . A list of all data bases and fields within the data base that come from the statistical call.

Also, for each data base there should be provided a list of all fields, the source of each field, an indication of how long the data are maintained and a discussion of how the data base are used.

B. Evaluation of Data Collection and Data Quality

The consultant will be expected to evaluate NCCI data collection, data handling procedures and the quality of the NCCI data. The consultant should make suggestions for improvements in any of these areas. Part of this analysis should be accomplished by sampling actual transactions and testing computer programs within the NCCI. Answers to each of the following questions should be included in the final work product:

- (1) How accurate is the data base? Are adequate quality control procedures in place to ensure the accuracy of the data as they are reported by insurers and processed by the NCCI? How could these procedures be improved?
- (2) Does the NCCI reconcile data collected for ratemaking purposes with the data reported in insurers' annual statements? If so, how are these data reconciled and what is done when these data do not match? Are there additional reconciliation measures that could be beneficial?
- (3) Does the NCCI have adequate procedures to ensure that classification data are complete and accurate? Are additional checks of the data performed when unusual classification indications appear? Does the NCCI check to be sure that insurers report reimbursements by second injury funds, subrogation and funds associated with cases determined to be noncompensable?
- (4) What quality controls are used to ensure the accuracy of data collected under a detailed claim information call?
- (5) Are the data collected and maintained in such a way that the experience from a specific policy can always be traced? If not, how could this be accomplished? Are the data for risks in the residual markets maintained in such a way that the experience can be compiled separately for the residual market versus the voluntary market?
- (6) Is sufficient information collected and maintained to test and implement reasonable alternative ratemaking methodologies? If not, what enhancements could be made to support alternative methodologies and identify the underlying causes of rate increases?
- (7) Do the NCCI's data gathering procedures ensure that the data base is not distorted by schedule rating?
- (8) What kinds of data on insurer expenses are collected and how are they processed and maintained? What controls are in place to ensure that insurers' reporting of expenses is reasonable and accurate? Are there ways in which the reporting of expense data could be improved to make it more suitable for ratemaking? Is separate information on the cost of loss prevention services collected, and if not, could it be collected?

Section II. Ratemaking Procedures

A. Description of NCCI's Current Ratemaking Procedures

The work product must include a thorough and technically complete description of the procedures and formulas currently used by the NCCI in

producing manual rates and experience rating values. When more than one procedure is sometimes used (i.e., where the NCCI may base its rate change upon policy year incurred losses, with or without incurred but not reported losses (IBNR), or upon paid losses; or where they may average differing numbers of years, etc.), describe the different procedures and describe how the NCCI chooses among them. In areas, if any, where the NCCI will often deviate from their "normal" procedures, note whether these deviations are usually reasonable responses to unusual situations where "normal" procedures would be likely to produce inaccurate results. Describe the assumptions made by the NCCI in their procedures and describe the means used by the NCCI to verify these assumptions.

B. Evaluation of Ratemaking Methodologies

Note: Within the ratemaking methodology section, priorities of "A", "B", "C" or "D" are assigned to each question. The grading corresponds to the depth to which a topic is to be covered, with "A" topics being most important. Answers to "A" priority questions should be detailed and of such quality that they may be used to advance the "state of the art". Answers to "D" priority questions should be the highest quality answers that can be obtained at a moderate cost. As such, limitations to the responses to "D" priority questions are acceptable due to the time and cost that would be necessary to cover every possible issue in the topic area. Questions with "B" and "C" priorities should receive intermediate treatment.

Comments have also been made with regard to the extent of original research which is expected to be most appropriate. These comments are presented as an attempt to be helpful, but should be interpreted as guidelines only.

1. Premium and Loss Development Factors

While the selection of link ratios and the calculation of development factors is often considered a purely mechanical process, differences of 5-10 percent in the estimated ultimate losses for a recent policy or accident year are common between different loss development methods. In addition, differences of opinion in the selection of link ratios can occur within the same development format. Past experience has clearly shown that misestimations in this regard are only compounded by trending, because indicated trends are heavily influenced by the most recent point or two, which are those points most heavily distorted by excessive or inadequate loss development. In this context:

- (a) Evaluate the NCCI's premium and loss development techniques. Would the use of more years of data or of multistate data, with appropriate adjustments, produce superior results? Are there other techniques or improvements to current techniques that would be appropriate?

(Priority: "A". Past experience in this regard should be tabulated and reviewed. An attempt should be made to discern what differences might be appropriate for larger vs. smaller states.)

- (b) The NCCI uses different formats for loss development from state to state and from year to year. Paid losses through the 8th report may be used one time as a basis, the next time incurred losses excluding IBNR may be used, etc. The use of multiple techniques is common and considered good practice in many types of reserving applications. The results of different techniques, which normally differ, can be studied to gain insights relating to the underlying assumptions used with each technique. Evaluate the NCCI's procedures for reconciling the differences which occur between different development techniques and evaluate the effectiveness and likely accuracy of the criteria which they use to choose one format over another.

(Priority: "B". The nature and quality of NCCI analytical techniques and whether they are reasonably followed should be examined here. Original research should largely be confined to that which is relevant to answer question 1(a). It is not the intent of this question to focus on whether any sort of bias from state to state occurs, although it should be covered if an overt tendency becomes apparent.)

2. Expenses

There is some question as to whether the expense loadings filed by the NCCI are consistent with the actual experience of their member insurers. Several factors complicate this analysis including premium discounts, the interplay of stock versus non-stock discounts, the consideration of stock only expenses in some instances and not in others, plus the impact of expense constants and minimum premiums.

- (a) Does the current NCCI expense methodology tend to load more or less expenses in the overall rate level than are actually expended by insurers using stock discounts in NCCI states? If there are biases or inaccuracies, what is their source and their effect?

(Priority: "A". A detailed analysis of the NCCI's expense methodology for insurers using stock discounts should be performed.)

- (b) What would be the incremental cost of collecting allocated loss adjustment expense (ALAE) on a unit basis. Discuss the pro's and con's of having this level of detail available versus what is now available. Also, discuss whether it would be more cost efficient to collect this on a more limited survey basis, or only specific areas where problems may exist such as retrospectively rated risks and residual markets. (In these two situations, there is little economic motivation for an insurer to defend claims.)

(Priority: "A". We are aware that the NCCI has been presented with this question in the past, so it is likely that some degree of documentation may exist for the consultant to start with. Consider the costs to insurers as well as to the NCCI with this question.)

- (c) When a state's premiums and rates grow at approximately the same rate as is occurring on a national basis, it is reasonable to expect a proportional increase in the expense loading for the individual state. However, when a state's proposed rate increase considerably exceeds the national average, is it reasonable to assume that expenses increase proportionally for the state? Should large state rate increases be tempered because of less than proportional increases in expenses?

(Priority: "C". No individual research is required here. The response to this question should be well reasoned and offer, if possible, suggested changes to current methodologies.)

- (d) Discuss the advantages and disadvantages of using a budgeted approach to acquisition expenses versus basing these factors on actual expense experience.

(Priority: "C". No individual research is required here. The response to this question should be well reasoned and offer, if possible, suggested changes to current methodologies.)

- (e) Traditionally, mutual insurers utilized a non-stock discount and collected a higher premium than stock insurers. In return, however, mutual insurers following this plan would also return generous dividends which resulted in net premiums that were lower than for stock insurers. The workers compensation market has since evolved into a much more complex mechanism and the consultant should examine whether the original assumptions which supported the existence of dual expense discounts still exist. Are the higher rates collected by insurers utilizing non-stock discounts fully returned in the form of higher dividends than are paid by insurers utilizing stock discount tables? In addition, are lower expenses, if any, experienced by insurers utilizing non-stock discounts also returned in the form of higher dividends? (The analysis should be restricted to NCCI states as it relates to dividends, as a high portion of countrywide compensation dividends are paid in California, which is a non-NCCI state.)

(Priority: "B". It is presumed that the NCCI can provide expense data compilations sufficient to address this question. A degree of imprecision due to the effects of company groups would be acceptable. Basically, this question presumes that the consultant will design requests for compilations to be performed by the NCCI and that the consultant will report on the indications resulting from these compilations.)

- (f) Review premium discounts (stock and non-stock) and expense constants to determine whether the relative expense loadings are equitable for all sizes of risk. (Consideration of minimum premium size risks may be excluded here as they are the subject of a broader question under the "Miscellaneous" heading.)

(Priority: "D". The NCCI has studied these factors from time to time. Review this material and report on it.)

3. Trend

In most jurisdictions, losses have increased more quickly than wages and it is necessary to apply trend factors to losses in order to generate adequate rate level indications. Because these trend indications have often been quite large, there is some question of the NCCI trend factors even when past results on a national basis would seem to indicate that trend factors have not been excessive. In addition, the NCCI also appears to project past trends into the future without offset for any legislation attempting to mitigate the increase in workers compensation claims.

- (a) Are there any expected biases or errors present in the NCCI's general trending procedures? If so, discuss their impact.

(Priority: "A". This should be an in-depth and refined analysis of the procedure and techniques.)

- (b) Would more accurate trending be likely with a different model or with revisions to the current model?

(Priority: "B". This is an extension of question 3(a).)

- (c) Are adequate adjustments made to projections by the NCCI's trend model when significant legal or economic changes occur on a state or national level?

(Priority: "C". Traditional actuarial trending procedures presume that future loss trends will continue to be similar to past loss trends. This presumption loses validity, however, when recent legal or economic developments intervene. In response to this question, examine the extent to which the NCCI brings such events into consideration and whether this appears to be adequate.)

- (d) Contrast the current model, which puts all losses to a current benefit level, to a model which puts all past losses to the same "relative" value of prospective benefits. (In other words, if the prospective min/max benefit level and state AWW were \$100/\$300 and \$320, respectively, then no adjustment would be made to past losses if the past values were \$80/\$240 and \$256. This method would apply a steeper trend line to a lower historic loss level.)

(Priority: "D". Examine the two approaches from a theoretical point of view. No original research is expected.)

- (e) The NCCI determines the overall impact of all classification rate changes combined based on the three years of payroll used in the filing at that time. If the mix of business in a state changes over the years, this estimation of the effect of a past rate filing as it would relate to the current mix of classifications may be distorted. Estimate the likely magnitude of these distortions and discuss whether an improved procedure would be warranted.

(Priority: "D". It is presumed that the NCCI can produce data runs for a sampling of states and years so that the likely magnitude of any distortions can be examined. It would be expected that the consultant would provide the specifications for the NCCI to produce such data and that the consultant would review and comment on the results.)

- (f) The NCCI brings past losses to a current benefit level by multiplying the various law change factors estimated at about the time the law changes went into effect. Is this an accurate method?

(Priority: "D". Examine this from a theoretical point of view.)

4. Classification Ratemaking

There is a significant concern that current classification ratemaking procedures may be significantly less accurate than would be possible using more years of data and an improved methodology. There are often significant swings in class rate relativities from year to year when there is no reason to expect that underlying loss expectancies are changing so rapidly. An optimum ratemaking procedure should give the weight to state class experience that would be most likely to produce accurate estimates of future losses.

- (a) Study the NCCI's current scheme of credibilities and their practice of using three years of data as a sole indicator for most national pure premium indications and as a basic unit for determining pure premiums at the state level. (We recognize the implicit weight given to older years of state data where credibilities of less than 100% are used.) For different types of loss and different expected loss volumes, determine whether class rating accuracy could be improved through the use of more years of data, different credibilities, or both. In addition, determine whether superior results would be expected using maximum loss size limitations that vary as a function of the total expected losses by class, by state, with adjustments made to recognize the effects of these differing limitations.

(Priority: "A". While the NCCI would be expected to do the data compilation necessary to address this question, a thorough response will require a significant level of original research to be performed by the consultant. It is expected that the response to this question may involve more effort than that required to respond to any other ratemaking question.)

- (b) Could the NCCI's procedure for determining industry group relativities be enhanced by utilizing more years of data (with appropriate recognition of apparent trends)? How would this vary between large states and small states?

(Priority: "C". The NCCI would be expected to do the data compilation necessary to perform this analysis.)

- (c) In their classification ratemaking, the NCCI applies loss

development and benefit level adjustments to individual years of data, but applies a single trend factor to all three years of experience combined. Should the NCCI adjust losses to a current (or common) level by trending individual years separately rather than by applying an aggregate trend factor to all years combined?

(Priority: "D". It would be expected that this question would be approached from a theoretical point of view. If it was felt that a change would produce superior results, then the likely degree of improvement, plus any practical considerations, should be discussed.)

5. Determination of Rate Changes Due to Statutory Revisions

- (a) Review NCCI's procedures for determining expected loss changes due to changes in weekly benefits, waiting periods, escalation provisions and medical fee schedules to see if they would be expected to yield fair estimations.

(Priority: "A". A technically complete analysis of this question should be provided.)

- (b) Should the 1973 Standard Wage Distribution Table be updated?

(Priority: "C". The consultant should structure a test of indemnity losses to see if they are reasonably consistent with expectations from the 1973 table. If the NCCI has undertaken studies of this question, use them to the fullest extent possible.)

- (c) Discuss the manner and anticipated or observed effectiveness of the NCCI when presented with non-formula type law changes. Could NCCI's performance in this area be practicably improved?

(Priority: "C". Examine a sampling of recent situations where this has occurred and evaluate the NCCI's performance.)

- (d) Should different wage distribution tables be determined for major classification groupings, instead of for all occupational groups, so that differences in the job mix from state to state may be recognized?

(Priority: "D". The differences in average wages from state to state will be attributable in part to different mixes of industry as well as different overall wage levels. Without significant research, except to examine any studies which the NCCI may already have available, attempt to determine whether this is an area which warrants the extensive work which it would require to have multiple wage distribution tables.)

6. Alternate Exposure Bases

There has been significant discussion and controversy over total payroll as an exposure base for workers compensation. The controversy involving man-hours as an exposure base has largely

subsidized, but plans involving recognition of the wage rate(s) at which total payrolls are earned appear to offer the hope of more equitable rating. The consultant should largely restrict themselves to a study using data culled from previous studies, thereby avoiding the need to collect original data.

- (a) What degree of improvement could be expected from a rating system that recognized the wage rate (if available) in addition to total payroll?

(Priority: "A". The consultant should conduct a thorough review of the research which already exists relating to this question.)

- (b) Discuss the additional expenses that would be expected to result from the administration of a system utilizing this additional information.

(Priority: "B". A rating system that utilized both wage rates and total remuneration might require additional recordkeeping by employers, more time for insurer audits, and additional data elements for the NCCI and its member insurers. Estimate the magnitude of these additional costs.)

7. Experience Rating Formulas

The work product must include a thorough and technically complete description of the formulas currently used by the NCCI in their production of experience rating modifications. This should include a description of interstate and intrastate experience rating as well as a description of experience rating formulas both before and after NCCI's revised experience rating plan (RERP) filing. LRAP, schedule rating and miscellaneous state exceptions should be omitted.

- (a) Is the NCCI's RERP experience rating actuarially sound? Specifically, are there significant tendencies for the formulas to produce debits or credits such that it could reasonably be predicted that groupings of risk by any combination of classification, risk size or modification range would be likely to have excessive or inadequate rates? What changes could be made to lessen these deficiencies?

(Priority: "A". A thorough analysis of the study done by NCCI to develop RERP should be completed. Additional data should be requested, if necessary, to verify the action of RERP.)

- (b) To what extent, if any, would experience rating be expected to be more accurate if more than three years of data were used for experience rating? Specifically consider whether five years would be superior, as insurers report unit data through fifth report. Discuss additional costs, if any, that might be applicable from the use of five years of data versus three.

(Priority: "B". Data provided by the NCCI should be tested to determine if the addition of two more years of data would tend

to produce more accurate experience rating. If it would, it would be necessary to examine what additional costs would be incurred by the NCCI to use five years instead of three.)

- (c) What credits would be indicated for loss free risks that were less than the minimum size to be eligible for experience rating? To what extent would it be indicated and practicable to debit small risks for higher than expected losses?

(Priority: "B". The consultant should analyze experience runs produced by the NCCI according to specifications provided by the consultant. The consultant should evaluate whether it would be feasible to provide some degree of credits for small risks that had no losses or very low loss ratios if it could be done without endangering rate adequacy.)

- (d) Are the formulas used to calculate ELR's and "D" ratios sound? Does the NCCI method of introducing RERP tend to result in a revenue increase?

(Priority: "C". Examine current techniques to see if they are appropriate.)

8. Miscellaneous

- (a) Compare the expected loss and expense ratios of minimum premium insureds to those for all classes of insureds combined.

(Priority: "B". It would be expected that the NCCI would be able to generate the data that would be necessary to address this question. The consultant should analyze data runs produced by the NCCI according to the consultant's specifications.)

- (b) What recognition does NCCI give to additional premiums expected to be collected from surcharges imposed on policyholders in residual markets? As these markets increase or decrease, is this expected change in revenue recognized?

(Priority: "C". Examine recent filings made by the NCCI to answer this question. Examine filings where surcharge plans are introduced as well as filings where surcharges are in place to determine whether NCCI filing procedures adequately recognize this additional income.)

- (c) Does the NCCI ratemaking formula accurately account for any off-balance due to the experience rating plan? Does the NCCI adequately adjust expected loss ratios (ELR) and "D" ratios to maintain the off-balance at a reasonable level? What improvements could be made in the NCCI's procedures regarding the off-balance in the experience rating plan?

(Priority: "C". Examine NCCI procedures carefully to check for their apparent balance.)

Section III. Practical Considerations in Implementing a Loss Cost System

Under the system adopted by the NAIC for the other property-casualty lines, advisory organizations are allowed to do much of what they had done previously, short of filing final rates. Advisory organizations are allowed to collect historical loss information from insurers, adjust these data for development and trend, and distribute or file this "prospective" loss cost information with the commissioner. Advisory organizations also are allowed to develop and file supplementary rating information, rating manuals (excluding final rate pages) and policy forms and endorsements. Insurers are required to determine individually, their own expense and profit factors and file their final rates. Insurers' rate filings can reference, if necessary, the prospective loss cost and supplementary rating information filed by the advisory organization. This approach seeks to promote competition and maximize benefits to consumers by preserving efficiencies gained through the joint collection and analysis of loss information, while enforcing independence in the areas of expenses and profits which should be based on each insurer's specific methods of operation.

The examination should address the practical considerations involved in implementing a loss cost system on a national scale in workers compensation insurance. In other words, how should the NCCI's activities be modified to accommodate a loss cost system similar to that which is being implemented for the other lines? This question also encompasses how member insurers would be allowed to use NCCI information in making their own rate filings. To the extent possible, the consultant should use the system being developed for the other lines as a model but also should consider areas where workers' compensation may require different treatment. In this analysis, the consultant also will be expected to review how the NCCI and member insurers operate in states that currently have a loss cost system for workers' compensation.

The consultant's analysis should consider, but not be limited to, the following areas:

- . minimum premiums
- . rating plans
- . premium discount plans
- . schedule rating plans
- . expense constants
- . experience rating systems
- . policyholder dividend plans and practices
- . retrospective rating plans
- . anniversary date rating rules
- . other rate-related rules
- . distribution of expense data to insurers

In addition to these areas, the consultant should evaluate whether any changes

should be made to Part III of the Insurance Expense Exhibit and the approval of rate changes for policies already in effect or rate filings with retroactive effective dates in a loss cost environment.

The examination report should analyze the relevant issues with respect to these areas, as well as any other significant areas, and outline the different options that might be taken and their likely consequences. It should be assumed that the NCCI would continue to administer and make rates for the residual market.

GLOSSARY 117

NCCI RATEMAKING PROCEDURES CHAPTER 1 - OVERVIEW

Our description of NCCI's Annual Ratemaking procedures is subdivided into three chapters:

1. Overview of Ratemaking at NCCI
2. Standard NCCI Ratemaking Methodology
3. Alternative Ratemaking Methodologies

Chapter 1 presents an overview of the NCCI's ratemaking process. In this chapter we provide a non-technical description of the data, methodology and assumptions utilized by NCCI in estimating future premium needs for workers compensation insurers.

Chapter 2 provides a detailed description of the standard ratemaking process used by NCCI in the two most recent rating cycles (1989-90). The rate calculations are subdivided into three sections. The determination of the overall state rate level change is described first. Calculations underlying classification rates are discussed next. Finally, factors affecting the final premium to be charged each insured are documented. To facilitate our explanation of the NCCI procedures, a sample NCCI filing is included as a Technical Supplement and is bound separately for ease of reference.

Chapter 3 discusses alternative methodologies which have been used by NCCI in the two most recent rating cycles (1989-90). Alternative methodologies usually are brought into play in response to unique actuarial considerations, judgments about business or political issues, or to comply with legislative or regulatory requirements in particular states.

In addition to our descriptive report and Technical Supplement, we have prepared a glossary of key terms for reference purposes. The glossary can be found at the end of Chapter 3.

NCCI RATEMAKING PROCEDURES CHAPTER 1 - OVERVIEW

CHAPTER 1 - OVERVIEW OF RATEMAKING AT NCCI

There are three general types of situations in which NCCI performs ratemaking functions:

1. Administered Pricing System
2. Advisory Rate System
3. Loss Cost System

With an administered pricing system, NCCI, in effect, is developing a set of manual rates and rating values to be used by all insurers operating in the state. However, provision may be made for individual insurers to seek approval of deviations from NCCI rates.

In an advisory system, NCCI develops a set of recommended manual rates. Each insurer must decide whether those advisory manual rates are appropriate for its business.

In the first two systems mentioned above, NCCI produces manual rates which contemplate future expected costs for losses, expenses, and profit and contingencies. In a loss cost system, the expected costs estimated by NCCI are for either losses only or for losses and loss adjustment expenses. In a loss cost state, each insurer must include its estimate of its required expense and profit provisions.

In the section that follows, we provide a general description of how ratemaking operates at NCCI in other than a loss cost system.

NCCI RATEMAKING PROCEDURES CHAPTER 1 - OVERVIEW

I. DETERMINING AN EMPLOYER'S PREMIUM - A PRIMER

The end result of the NCCI's ratemaking process is a set of manual rates and rating values that determine the premiums to be paid by each insured employer. This section provides an example of how an individual employer's premium is determined.

Most casualty insurance rating programs involve grouping insureds with similar propensity to loss into sub-groups referred to as classifications or "classes". In workers compensation this grouping process is built on the concept of similar types of employers' operations. In the NCCI classification plan, there are hundreds of classes. Any one employer may have exposure in one class or many, depending upon the diversity of the employer's operations.

Size differences between employers within the same class are measured by the amount of payroll to be paid to the workers in that class. The usual exposure base for rating workers compensation policies is the amount of annual payroll paid to the workers assigned to each distinct NCCI class.

To determine the premium for an employer in the NCCI rating system generally involves four steps:

1. Calculate the "Manual Premium".
2. If eligible, apply the Experience Rating Modification (ERM) to the manual premium to determine the standard premium.
3. If large enough, in terms of total standard premium, apply the premium discount rules to determine the insured's discounted premium.
4. Add the Expense Constant Per Policy. This results in the insured's net premium.

A simple example follows to illustrate this process. This example assumes the standard NCCI practices apply. Exceptions to this process may occur for a particular state. The example does not include the application of any schedule rating

NCCI RATEMAKING PROCEDURES CHAPTER 1 - OVERVIEW

adjustments or policyholder dividend plans. The procedures for determining these adjustments are determined by the individual insurers and not by NCCI.

Assume that our hypothetical risk is composed of operations that fall into three classes all within one state as follows:

<u>Class</u>	<u>Description</u>	<u>Estimated Payroll</u>
2014	Grain Milling	\$150,000
8742	Outside Salesmen	60,000
8810	Clerical Office	30,000

The insurer would proceed as follows:

1. Calculate Manual Premium

From the appropriate state rate manual, the rate per hundred dollars of payroll would be extracted. The manual premium would then be the sum of the products for each class of the estimated payroll in hundreds of dollars and the manual rate. Assuming the following effective manual rates, we can determine the manual premium as follows:

<u>Class</u>	<u>Estimated Payroll in Hundreds</u>	<u>Manual Rate</u>	<u>Manual Premium</u>
2014	1,500	\$6.28	\$9,420
8742	600	0.76	456
8810	<u>300</u>	<u>0.35</u>	<u>105</u>
	2,400	xx	\$9,981

The separate calculation of manual premium based upon three different classifications is appropriate only because 8742 and 8810 are standard exception classes which do not require the operation to be grouped with the one classification that best describes the business of the employer.

NCCI RATEMAKING PROCEDURES CHAPTER 1 - OVERVIEW

2. Apply the Experience Rating Plan

For employers who meet the eligibility requirements, the experience rating plan is applied. The purpose of this plan is to adjust the individual employer's manual premium up or down depending upon how that employer's recent past experience compares to other similar employers. The application of the plan produces a factor referred to as the ERM (experience rating modification).

By measuring the frequency and severity of the insured's past experience relative to the "average insured" as represented by the manual rate, a credit or debit is determined. For example, if the comparison resulted in an ERM of 0.90, the risk receives a 10% credit from the manual premium. A risk with an ERM of 0.90 is anticipated to have expected losses 10% below that contemplated in the manual rate. If the ERM is 1.20 that means the risk is expected to have losses 20% higher than the average contemplated in the manual rate. In this case, the risk would receive a 20% debit.

Assuming our hypothetical insured generates an ERM of 0.95, a 5% credit from the manual premium determined in step (1) above, we have an ERM modified premium of \$9,482 ($\$9,981 \times .95$).

The product of the insured's manual premium times the ERM is often referred to as standard premium in the NCCI statistical system. Standard premiums represent premiums after the application of the ERM but prior to the application of the mandatory premium discount rules.

3. Apply Premium Discount Rule

An integral part of the NCCI process for determining an insured's premium is calculating the effect of any premium discount.

The expense provision in the manual rate is intended to only apply to the first \$5,000 of standard premium per insured. NCCI has studied how acquisition and general expenses decline as a percentage of premium as the total amount of standard premium increases. To reflect this reduction in expense needs as a percentage of standard premium, NCCI has rules which provide premium discounts as the insured's

NCCI RATEMAKING PROCEDURES

CHAPTER 1 - OVERVIEW

standard premium increases. There are two different premium discount tables, one labelled "stock companies" and the other "non-stock companies". Each insurer elects which table to use. That is, stock insurers may elect to use the non-stock table and non-stock insurers may elect to use the stock table.

To maintain the simplified example, assuming the insurer in our example had elected to use stock insurers' premium discount rules, the standard table is:

	<u>Standard Premium</u>	<u>Premium Discount Percentage</u>
First	\$ 5,000	-
Next	\$ 95,000	10.9%
Next	\$400,000	12.6%
Over	\$500,000	14.4%

Since our hypothetical risk has standard premium of \$9,482, we would develop the total amount of discount as follows:

$$\text{Premium discount} = .109 \times (\$9,482 - \$5,000) = \$489$$

Or the net premium before the application of the expense constant is \$8,993 (\$9,482 - \$489).

4. Add Expense Constant

The NCCI's system anticipates collecting premium to cover insurer operating or underwriting expenses partly by levying an expense constant per policy and partly by a percentage loading in the manual rate. An expense constant is added to the premium determined above. A typical expense constant at present is \$140 per policy. The final premium is then \$9,133 (\$8,993 + \$140).

We have determined the estimated net premium owed by the employer at the beginning of the policy year.

NCCI RATEMAKING PROCEDURES CHAPTER 1 - OVERVIEW

It is worthy of note that the NCCI's use of the phrase "net premium" should not be confused with the more usual use of the phrase net premium in accounting terms. In financial reporting, "net premium" is premium after the application of the effect of assumed and ceded reinsurance premium transactions on the direct premiums paid by insureds.

One final point about the NCCI process for rating policies should be noted. Remember that the exposure base, in general, is payroll in hundreds of dollars. At the beginning of the policy the deposit premium is based on the amount of estimated payrolls by class. The final premium the insured owes is determined precisely after the policy has expired and an audit of actual payrolls is completed.

NCCI RATEMAKING PROCEDURES CHAPTER 1 - OVERVIEW

II. OBJECTIVES OF RATEMAKING

The Casualty Actuarial Society has developed a statement of principles regarding property and casualty insurance ratemaking. The purpose of the statement is to identify and describe principles applicable to the determination of insurance rates. The principles were developed to apply to most lines of insurance, including workers compensation.

The statement of principles consists of four parts: definitions, principles, considerations and conclusions.

Ratemaking is defined as the process of establishing premium rates used in insurance or other risk transfer mechanisms. Ratemaking is prospective because in property and casualty insurance the rate must be developed prior to the transfer of risk. Because it is prospective, estimates of future conditions must be made.

Four principles of ratemaking are stated:

- Principle 1: A rate is an estimate of the expected value of future costs.
- Principle 2: A rate provides for all costs associated with the transfer of risk.
- Principle 3: A rate provides for the costs associated with an individual risk transfer.
- Principle 4: A rate is reasonable and not excessive, inadequate, or unfairly discriminatory if it is an actuarially sound estimate of the expected value of all future costs associated with an individual risk transfer.

For workers compensation, some of the more important items listed in the section of the statement of principles as considerations are:

- Exposure Unit
- Data
- Organization of Data

NCCI RATEMAKING PROCEDURES CHAPTER 1 - OVERVIEW

Credibility
Loss Development
Trends
Catastrophes
Other Influences (i.e., external)
Classification Plans
Individual Risk Rating

These considerations largely determine the scope of the actuarial examination being conducted by the NAIC.

Finally, the statement of principles concludes with acknowledging that other business considerations are also a part of ratemaking.

NCCI RATEMAKING PROCEDURES CHAPTER 1 - OVERVIEW

III. NCCI RATEMAKING

The ratemaking process generally involves estimating the overall rate level change required in the state for "Industrial Classes". These classes include all classes except for "F" classes, which are discussed later, and other exception classes which may vary by state. This statewide change is then distributed to the classes and finally, to individual insureds. Further adjustments to the manual rate may be based on the individual insured's experience. This approach conforms to the generally accepted actuarial practice of focusing first on overall financial needs and then secondarily on how to distribute that need amongst insureds in an equitable fashion.

The NCCI calculation of workers compensation rate levels has been divided into three levels of detail for our discussion purposes:

1. Overall Premium Level Change
2. Classification Rates
3. Individual Risk Rates

NCCI RATEMAKING PROCEDURES CHAPTER 1 - OVERVIEW

IV. NCCI OVERALL PREMIUM LEVEL CHANGE

The NCCI's calculation of the overall premium level change depends upon comparing the projected cost ratio expected in the future with the target or permissible cost ratio.

The projected cost ratio is derived by first adjusting historical premium and loss data to their estimated ultimate levels. They are also adjusted for known changes in benefit levels and rate levels.

The target cost ratio is the percentage of premium available to pay loss and loss adjustment expenses after including a provision for expenses and profit. The NCCI methodology for incorporating loss adjustment expense assumes that these expenses vary directly with the level of losses. The NCCI's target cost ratio is analogous to what other rate filers may refer to as the permissible loss and loss adjustment ratio.

A. Data Utilized

The calculation of the statewide premium level change is based upon the premium and loss experience reported to NCCI by insurers in the state. This experience data is referred to as financial call data. The financial calls produce two data sets for premium and losses by state which are used in ratemaking:

policy year data

and

calendar-accident year data.

Two different calculations are generally performed to determine the indicated statewide premium level requirement with the proposed change being the unweighted average of the two indications. The calculations are identical in actuarial concepts, except that one uses the experience reported on a policy year basis and the other uses calendar year earned premiums and accident year incurred losses.

NCCI RATEMAKING PROCEDURES CHAPTER 1 - OVERVIEW

Policy year data assigns both premiums and losses to the year in which the policy was effective.

Calendar-accident year experience reflects the calendar year in which the premium was reported as earned by the insurer. The losses assumed to be related to these premiums are those with accident dates in the same year, regardless of when these losses are reported or in what year the policies were written.

For example, the sample filing of NCCI used in our report to discuss the detailed actuarial calculations relied on policy year 1988 and calendar-accident year 1989. In both data sets, the experience was evaluated as of December 31, 1989. The data was reported to NCCI in the spring of 1990.

B. Adjustments to Reported Premium and Loss Data

1. Premium and Loss Development Adjustments

Policy year 1988 reflects the experience on all policies with effective dates between January 1, 1988 and December 31, 1988. As mentioned earlier, workers compensation policies are usually written at inception on the basis of estimated payrolls for the coming year. As of December 31, 1989, not all policies written in 1988 would have had their final premium audits done. Adjustments will be booked by the insurers in 1990 or even later years to reflect differences between the initial payroll estimates and the final audits.

To use policy year 1988 evaluated as of December 31, 1989, NCCI must incorporate an estimate of what the ultimate premiums will eventually be on all policies written in 1988. An estimate must be made in order to include the effect of expected future premium audits. To do this, NCCI examines how initial estimated premiums for earlier policy years gradually reach their ultimate values. This actuarial process is referred to as analyzing premium development patterns.

Just as ultimate premiums must be estimated if recent experience is to be used in ratemaking, so too must losses. The nature of workers compensation claims is for a considerable time period to elapse between the occurrence of the claim, the reporting

NCCI RATEMAKING PROCEDURES CHAPTER 1 - OVERVIEW

of the claim to the insurer and the final settlement of the claim. It is also fairly common that the injured worker has the right to re-open the claim years after the claim may have been thought closed. Both indemnity and medical claims are usually paid through periodic payments which involve an element of uncertainty as to their duration. It can be many years before the actual losses from a block of policies will be known with certainty. In fact, while the actuarial methods for premium and loss development are similar in concept, the process of estimating ultimate losses requires many more years of prior loss development patterns to be examined.

NCCI performs a separate analysis of developments for medical and indemnity losses. The development patterns of reported losses for these two loss components differ substantially.

Additionally, the development patterns of past losses are often examined at more refined levels of detail. Losses can be categorized and analyzed at the level of losses paid, incurred losses, incurred losses excluding incurred but not reported (IBNR) and incurred losses excluding bulk. Incurred losses include payments, case reserves on known claims, IBNR reserves and bulk reserves. Incurred excluding IBNR includes all of these components except IBNR reserves. Incurred excluding bulk includes only payments plus case reserves.

Policy year losses involve accidents occurring over two successive years. For example, policy year 1988 is providing insurance coverage on claims that can occur in either 1988 or 1989. Considerably more time must elapse before the ultimate cost of these claims will be known with reasonable certainty.

Accident year 1989 encompasses all claims arising from accidents that occurred in 1989. Policy year 1988 includes some of the claims that occurred in 1989 and these losses are common to both sets of data. However, accident year 1989 is more current in that it also includes claims on accidents occurring in 1989 which are covered by policies written in 1989. By the same token, calendar year 1989 earned premium would include the portion of policy year 1989 premiums earned by December 31, 1989.

NCCI RATEMAKING PROCEDURES CHAPTER 1 - OVERVIEW

2. Premium and Loss On-Level Adjustments

Historical premiums reflect rate levels in effect when the policies were written. As a result, the reported developed premiums must be adjusted to the level of rates currently in effect. In adjusting the premiums to current rates, a special adjustment is introduced by NCCI. NCCI removes the effect of trend in the current rates in bringing premiums to current level. Accordingly, they do not multiply their adjusted and developed losses by a trend factor. Although a new trend factor is calculated with each revision, only the effect of the change in the trend is applied to current rates. Most other bureau rate filings (i.e., Insurance Services Office) incorporate a trend factor that is applied to past ultimate losses to estimate their level in the future.

It is also necessary to adjust past indemnity and medical claim costs to current benefit levels. This process depends on NCCI's estimates of the effects of benefit changes enacted since the beginning of the period when the losses used to calculate rate level indications were being incurred.

C. Determination of Indicated Changes by Components

Projected cost ratios for policy year and calendar-accident year data are calculated by dividing the adjusted and developed indemnity and medical losses by estimated premiums that would have been earned if rates equal to the current rates with the provision for trend removed had been in effect. An unweighted average of the policy year and calendar-accident year indications is calculated.

The indicated overall change in premiums is obtained by comparing the average projected cost ratio to the target cost ratio underlying current rates. The target cost ratio represents the proportion of the premium which was projected to be available to pay losses and loss adjustment expenses after expenses and profit and contingencies have been taken into account.

The determination of the expenses and profit and contingencies to be reflected in the manual rate is the end result of a process that considers:

NCCI RATEMAKING PROCEDURES CHAPTER 1 - OVERVIEW

1. Actual average expenses of stock insurers in recent years;
2. Assumptions about certain expenses that are only analyzed periodically;
3. Budgeted expenses and profit and contingencies that have been included in the rates based on either judgment or historical usage; and
4. Past regulatory pronouncement e.g. loss adjustment expenses may be loaded onto losses or to expenses depending on state law.

The NCCI ratemaking system is designed to isolate the effect of various specific factors affecting rate levels. This objective requires introducing some complications in the manner of their presentation in order to achieve this separation of effect. NCCI isolates such things as:

1. the amount of change in the trend factor to be incorporated in the current rates,
2. any change in expense provisions,
3. changes in benefits not already reflected in the current rates,
4. any change in assessments levied for such state mandated operations as guaranty or second injury funds.

Separate rate level change indications may be calculated for the voluntary market and the residual market. In this case, separate analyses of assigned risk and voluntary experience will be performed. Alternatively the assigned risk rates may reflect a percentage differential applied to the voluntary rates.

The indicated changes by industry group are also presented as a part of the overall rate level change indication. Further discussion of the allocation of changes to industry groups is provided in the subsection which discusses standard ratemaking procedures.

NCCI RATEMAKING PROCEDURES

CHAPTER 1 - OVERVIEW

V. CLASSIFICATION RATES

The second level of rate level analyses involves allocating the overall indicated change by industry group and by classification. These calculations reflect experience by class in the state and in some cases, in part, on nationwide pure premium relativities by class. The class indications determine whether the risks that have exposures in that particular class receive a larger or smaller adjustment than the overall rate level change for the industry group.

A. Data Utilized

Detailed data by state and employer is also collected from each insurer under the Workers Compensation Statistical Plan ("WCSP"). This data may also be referred to as Unit Statistical Plan data ("USP"). This detailed information, which includes premiums, payroll, incurred losses by injury type, classification and employer, is required for the analysis of the experience indications by classification and type of loss. Because of its extremely detailed level, the compilation of this data requires a considerable amount of processing time. Since this data is less up to date than the financial call, it is used to determine rate relativities by class and industry groups rather than overall rate levels. This same data is also used to calculate the experience rating modifications for individual employers.

For the reader interested in the data utilized by NCCI, both financial call and WCSP, we would refer the reader to the report on Section I (Data Collection and Data Quality) of the NCCI examination.

B. Proposed Rates

The first step in the determination of rates or loss costs by class is the distribution of the overall premium level change into three major industry groups:

1. Manufacturing
2. Contracting

NCCI RATEMAKING PROCEDURES CHAPTER 1 - OVERVIEW

3. All other industries

The indications by industry group are used to reflect relative costs by types of employment. The industry group indications supplement the experience for classes in which the available state and national experience may not be of sufficient volume to be given full credibility.

Industry group differentials and the resulting rate level changes by industry group are calculated from the latest three years of WCSP data. The claim data is adjusted to reflect:

1. Expected development to ultimate cost levels.
2. The projected impact of benefit level changes by injury type.
3. The off-balance produced by the experience rating plan.

Rates or loss costs by class are calculated by weighting the indications based on the class experience for the state with the industry group change applied to the class' current rate and national pure premiums which have been adjusted to reflect differences in cost levels by state. Limitations are imposed on the amount of rate change permitted by class in any one rate revision. Currently, NCCI limits the class rate change to $\pm 25\%$ over the amount of rate change determined for the industry group. The effect of these limitations is measured and a correction factor is applied uniformly to each class not subject to a limitation in the industry group to assure that the indicated overall rate level change is achieved.

NCCI RATEMAKING PROCEDURES CHAPTER 1 - OVERVIEW

VI. INDIVIDUAL RISK RATES

The analyses of the overall rate level requirement and the experience by industry group and individual class yields the NCCI's proposed manual rates. Coincident with each rate revision, NCCI calculates new factors to update that state's experience rating plan. These factors are explained in Chapter 2.

Expense constants are utilized to assure that the insurer collects sufficient premium to cover the estimated policy writing costs and other expenses which apply on a per policy basis.

Expense constant indications are developed each year by NCCI as part of the annual review of expense requirements. The premium discount tables are revised less frequently. The current expense constants and premium discount tables were based on data from a 1982 study of expenses by size of risk. A study of 1991 data will provide updated indications for general expenses, expense constants and premium discounts.

In the next chapter of this report, we provide a more detailed description of the ratemaking process currently in use at NCCI. Chapter 3 provides further explanation of significant variations in NCCI's methodology.

In Section IIB of our report on the actuarial examination, the results of our evaluation of NCCI's ratemaking methodologies is provided.

**NCCI RATEMAKING PROCEDURES
CHAPTER 2 - STANDARD
METHODOLOGY**

CHAPTER 2 - STANDARD NCCI RATEMAKING METHODOLOGY

This chapter provides a detailed description of the standard ratemaking procedures of NCCI. The description is designed for a reader who has been exposed to workers compensation rate filings in the past. The structure of this chapter follows the steps in the sequence in which they are presented in a typical NCCI rate filing.

To provide a concrete example, the Illinois filing effective January 1, 1991 is included as a Technical Supplement for ease of reference. This filing uses the standard NCCI approach in most aspects.

Our discussion of the standard NCCI approach is in four sections as follows:

- I. Overview of NCCI Filing
- II. Calculation of Overall Premium Level Change
- III. Classification Ratemaking for Industrial Classes
- IV. Determination of Factors to Adjust Individual Premiums

Chapter 2 ends with a discussion of "F" classes, which are classes applicable to occupational activities covered by the United States Longshoremen's and Harbor Workers' Act.

NCCI RATEMAKING PROCEDURES

CHAPTER 2 -STANDARD

METHODOLOGY

I. OVERVIEW OF AN NCCI FILING

The NCCI rate filing is a lengthy technical document. Each filing begins with a cover letter which presents the proposed rate level change and specifies the proposed effective date.

Following the cover letter is a two page summary of rate level indications for industrial classes which are developed in the filing. The proposed changes are shown two ways; first by what NCCI refers to as component and then by industry group.

The components of the overall proposal are:

	Sample State Filing ¹ Illinois 1/1/91 <u>Premium Level Changes</u>
• Experience	+ 7.2%
• Trend Change	+ 0.5
• Expense change	- 0.1
• Benefit change	+ 0.4
• <u>Tax change</u>	<u>+ 0.5</u>
• Overall	+ 8.5

The overall premium level changes for the three industry groups: manufacturing, contracting, and all other are then summarized.

1 The reader is encouraged to refer to the Illinois sample state filing which is included in the Technical Supplement.

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

- Manufacturing + 9.6%
- Contracting + 6.2
- All Others + 9.3
- Overall + 8.5

An NCCI filing, such as the Illinois filing provided in the Technical Supplement, is divided into two major parts.

Part I is comprised of:

Exhibit I - Determination of Indicated Change in Statewide Premium Level. (This exhibit is a presentation of how the overall premium level change was developed).

Exhibit II - Workers Compensation Expense Program. (This exhibit provides support for the expense provisions and target cost ratios used in the filing).

Exhibit III - Proposed Advisory Rates and Rating Values.

Part II of the NCCI filing contains the supporting appendices. Specifically, they are:

Appendix A - Factors Underlying Rate Revision

Appendix B - Computation of Advisory Rates

Appendix C - Law, Assessment and Tax Memoranda

Later in this chapter we will provide a complete description of each of the NCCI's documents.

**NCCI RATEMAKING PROCEDURES
CHAPTER 2 -STANDARD
METHODOLOGY**

We have found it necessary to add Appendix D. This is not part of the NCCI filing. Rather it contains NCCI workpapers to document or clarify the methodology.

Appendix D - Additional Workpapers

**NCCI RATEMAKING PROCEDURES
CHAPTER 2 - STANDARD
METHODOLOGY**

II. CALCULATION OF OVERALL PREMIUM LEVEL CHANGE

As mentioned, the NCCI filing develops the statewide indicated premium level change by component: Experience, Trend Change, Expense Change, Benefit Change and Tax Change. For illustrative purposes, we have grouped the components as follows:

- Experience
- Benefit Change
- Other: Trend, Expense and Tax

The Experience component is based on past premium and benefit cost data as reflected in the financial call data. The Benefit Change component is the result of the estimated impact of legislated changes in benefit level. What we have elected to call the Other Component reflects the changes in the other miscellaneous factors: trend, expenses, taxes and assessments. These components are shown in Figure 1 shown below. References to Exhibits are those in the NCCI Illinois filing (Technical Supplement) used as our sample. The final premium level change is the product of the changes due to Experience, Benefits, and Other.

Figure 1 also shows the distinction between "Overall Premium Level Change" and "Overall Manual Rate Level Change". The "Overall Premium Level Change" is offset for the "Effect of the New Expense Program" to develop the "Overall Manual Rate Level Change." Changes in such items as expense constants can affect the insurers' premium income without necessarily being the result of a change in manual rates.

**NCCI RATEMAKING PROCEDURES
CHAPTER 2 -STANDARD
METHODOLOGY**

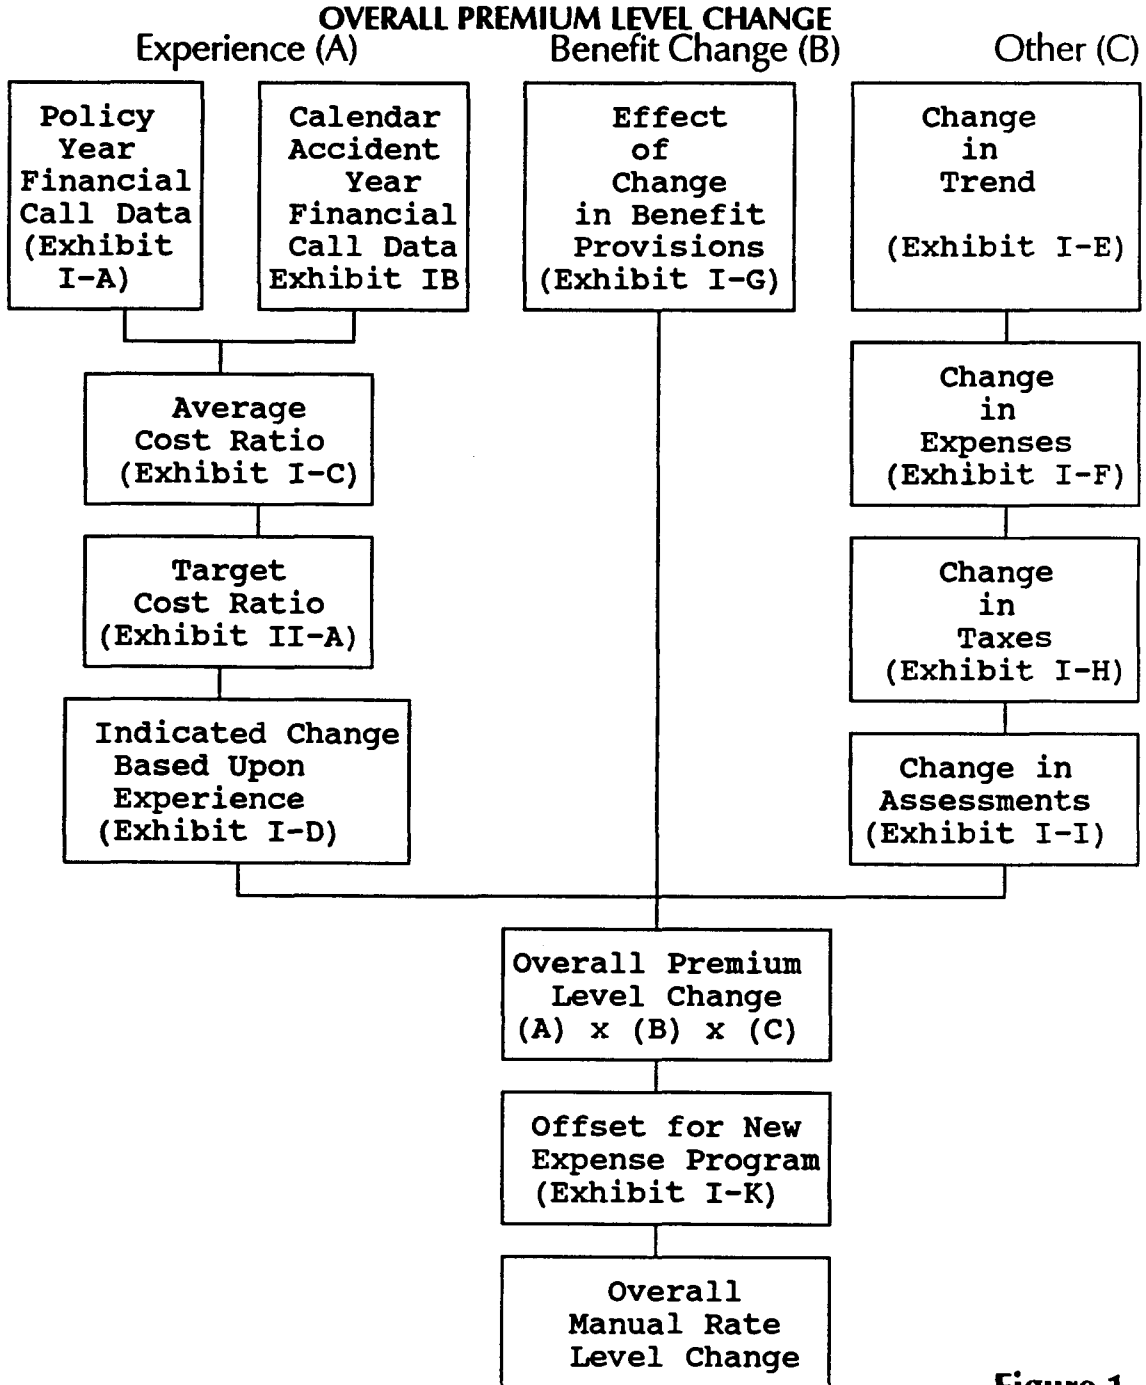

Figure 1

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

NCCI's Exhibit I includes one additional step that is beyond the determination of overall statewide requirements. In Exhibit I-J, NCCI distributes the overall premium level change to the three industry groups (See Figure 2). As will be discussed later in this chapter, this distribution process depends on a different body of premium and loss data. The industry groups differentials are derived from the WCSP data rather than the financial call data relied on for the overall state premium level. The distribution to industry groups might be considered to be the link between the overall state requirements and those for the individual NCCI classes.

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

A. Premium and Loss Data Used

Workers compensation premium levels are calculated using two major types of premium and loss data. Financial call data is reported on a summary basis and is used to develop statewide premium levels. WCSP data provides detailed experience by employer, by class and by type of injury and is used for industry group and classification ratemaking.

1. Financial Call Data

The premium and loss data used to determine overall statewide premium level indications are compiled from NCCI's Financial Calls for data. All insurers in states where NCCI is the statistical agent are required to file policy year data reports by March 15 and accident year data reports by April 1 of each year. Reports are required which show experience on a policy year basis and separate reports show experience on a calendar-accident year basis. These reports include statewide premiums and losses for each policy year and accident year evaluated as of the end of the calendar year. These reports are referred to as financial data since they are reconciled to the financial statements which the companies prepare.

A small number of insurers may have their data excluded from statewide totals if their data is not provided on time or is thought to contain errors. NCCI will exclude individual company data only if they believe its exclusion would have no significant effect on the proposed rates. On average, less than 5% of premium and losses will be omitted. For example, a list of companies excluded and their respective shares of premium volume are contained in Appendix A-VI of the sample rate filing. For the Illinois sample state filing, 1.9% was omitted for the 1988 policy year and 0.6% for the 1989 calendar-accident year.

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

The data collected in these calls is:

- Standard Earned Premium²
- Net Earned Premium
- Paid Losses³
- Outstanding Losses Excluding IBNR³
- IBNR Losses³
- Incurred Losses Including IBNR³
- Incurred Indemnity Claim Count
- Case Outstanding Losses⁴
- Bulk Outstanding Losses⁴

"Bulk" outstanding losses as defined by NCCI are "reserves for general case reserve inadequacy, supplemental case reserves, cases that may reopen, or other [non-IBNR] reserves which are not associated with specific claims." "Outstanding losses" include bulk reserves for some companies, while other companies include bulk reserves in IBNR.

The loss data is reported separately for medical and indemnity claims. The type of data contained on financial data reports permits the actuaries at NCCI to track the changes of indemnity and medical losses over time and to base projections on the data they expect will most likely estimate the emergence of ultimate losses.

Historically, the summary loss data collected by NCCI on both a policy year and a calendar-accident year basis contained results reported by year through eight years of development with a summary category for all prior years. The reporting forms began requiring one additional year of separate reporting per year beginning with the December 31, 1987 evaluation. The expansion in the number of years reported is scheduled to extend until fifteen evaluations will be available for the oldest year.

-
- 2 Standard Earned Premium is required to be presented at two rate levels: the NCCI Designated Statistical Reporting Level and the Company Level.
 - 3 Medical, Indemnity and Total.
 - 4 These items are required of companies that include Bulk Outstanding Losses in the "Outstanding Excluding IBNR."
-

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

a. Policy Year Data

Policy year data classifies experience based on the year in which the policy was written. Policy year 1988, for example would include the experience of all policies effective between January 1, 1988 and December 31, 1988. Policy year data takes twenty four months to become complete, since the last policy could be written twelve months after the beginning of the policy year and will expire 24 months after the beginning of the policy year. The last accident may occur twenty-four months after the beginning of the policy year. For policy year 1988, the last policy could have been effective December 31, 1988 and that policy could cover a loss occurring on December 31, 1989. For the report made at the end of 1989, policy year 1989 is referred to as an incomplete policy year. This incomplete policy year is not used in workers compensation ratemaking. However, it is needed for balancing policy year totals to other financial reports.

In the Illinois sample filing, the 1988 policy year data at the first report reflects data for policies written between January 1, 1988 and December 31, 1988 evaluated as of December 31, 1989. This experience would have been reported to NCCI in March of 1990 by each individual insurer and aggregated by NCCI for all insurers.

The policy year used in a rate filing may be two or three years prior to the proposed effective date of the filing. For filings with effective dates early in the year, such as the sample filing with a January 1, 1991 effective date, the latest available policy year would be three calendar years prior to the effective date; i.e., policy year 1988.

b. Calendar-Accident Year Data

Calendar-accident year data assigns premiums to the calendar year in which they are reported as earned. Losses are assigned to the year in which the accident occurs. The first report on an accident year basis is available to NCCI fifteen months after the start of the period and includes losses evaluated as of

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

twelve months. Consequently the calendar-accident year used in rate filings is only one to two years before the proposed effective year depending on the proposed effective date of the filing. The Illinois sample filing uses calendar-accident year 1989 data valued as of December 31, 1989.

Calendar-accident year data was introduced into the ratemaking procedures in 1984 to increase the responsiveness to current conditions.⁵ The average loss date in the 1989 calendar-accident data is July 1, 1989. The comparable average loss date in the 1988 policy year data is January 1, 1989. The experience contained in calendar-accident year data used in this filing is on average six months more recent than the policy year experience.

B. Cost Ratio Based on Policy Year Experience

The first step in calculating the overall rate level change indication is to estimate the expected cost ratio derived from the policy year experience. This calculation is summarized in Exhibit I-A in the sample filing. The details supporting the calculations are contained primarily in Appendix A.

Figure 3 displays the process that is used by NCCI for policy year experience; a similar methodology is used with the calendar-accident year data.

5 Undated NCCI Memorandum on Accident Year Ratemaking.

**NCCI RATEMAKING PROCEDURES
CHAPTER 2 - STANDARD
METHODOLOGY**

POLICY YEAR COST RATIO CALCULATION
Benefit Cost

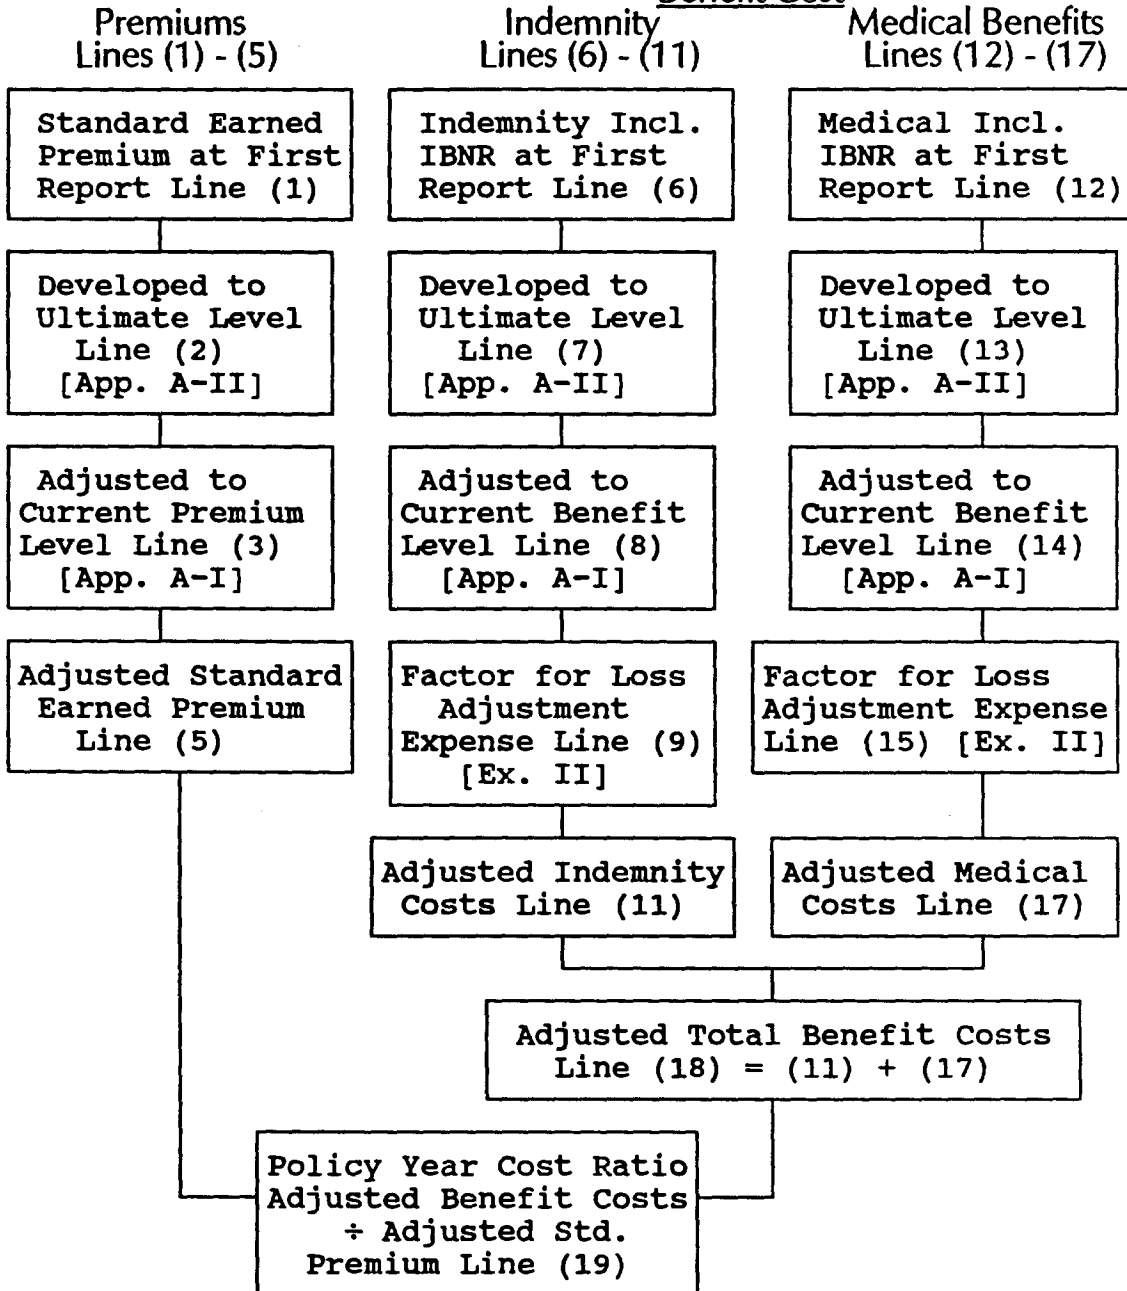

Figure 3

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

To estimate the policy year cost ratio, we proceed as outlined below:

1. Premiums

Standard Earned Premiums at First Report compiled from the financial calls is the starting point in the calculation of the Policy Year Cost Ratio. Each company reports premium at the Designated Statistical Reporting (DSR) level.

a. Policy Year Premium Development Factors

Standard Earned Premiums at First Report are developed to an ultimate basis using the premium development factor in line (2) Exhibit I-A. The premium development factor is intended to reflect expected future changes in policy year premiums from the first report to the fifth report. The implicit assumptions are that future premium growth from the first to fifth report will be similar to older policy years when they were at similar maturities and that premiums will not change after the fifth report.

The calculations used to derive the premium development factor are described in Appendix A-II of the sample filing.

Development factors are calculated by dividing reported premiums at the later evaluation point by the premiums reported for the same companies twelve months previously. Companies which had not reported valid data are excluded from both totals used in any development factor calculation. This is to ensure that a true indication based on matched companies is achieved. Due to the adjustments required for matching companies, the development factor exhibits are likely to contain two different totals for a particular policy period at each evaluation point. One total will exclude the companies that do not have valid data at that report and those that do not have valid data at the prior evaluation. The other total excludes the companies without valid data at that report and companies without valid data at the subsequent report.

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

Age to age development factors to adjust from one evaluation point to the next for each set of maturities are generally calculated using data for the three most recent years at each maturity. Three years of data are used to calculate two development factors for each maturity.

In the Illinois sample filing, Appendix A-II two first to second report development factors are calculated. One divides the premiums for policy year 1986 at second report by the premiums for policy year 1986 at first report. The second factor comes from dividing policy year 1987 premiums at second report by policy year 1987 premiums at first report. The simple unweighted average of these two factors is used to estimate the premium development factor from first report to second report. The selection of an unweighted average reflects an assumption that the most recent year's development pattern and the prior year's pattern are equally predictive of future development for policy year 1988 premiums.

Cumulative development factors are then derived by multiplying all of the selected age to age development factors. That is, the first to fifth development factor used in Exhibit I-A of the NCCI filing reflects the expected development from first to second report, from second to third report, from third to fourth report and from fourth to fifth report. These factors are obtained from Sections A and B of Appendix A-II of the sample filing and are used on line (2) of Exhibit I-A.

b. Factor to Adjust Premium to Current Level

The purpose of the current level factor used on line (3) of Exhibit I-A is to adjust premiums to reflect rate level changes which have occurred since the policies were written. During this process, NCCI also removes premium due to expense constants and the impact of the trend factor contained in the current rates.

The calculation of the policy year on level factors in the sample filing is presented on the first page of Appendix A-I. The Illinois sample filing contains

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

calculations related to rate level changes for assigned risks (Section A), and the voluntary market (Section B), which are then combined in Section C of Appendix A-I. Our discussion will focus on the general approach to calculating factors to adjust premiums to current levels. The concept is the same, however, whether talking about the voluntary or assigned risk premiums.

First, an index is set up for each period in which there have been different rate levels. The earliest period is set as the base with an index of 1.0. Each succeeding change is measured relative to the level that previously existed and a cumulative index is created. Next, the proportion of the year's earned premium written at each rate level is determined. Then an average is calculated by multiplying each relevant index by its proportionate weight. Finally, the cumulative index at the most recent rate level change is divided by the weighted average index to produce the adjustment factor to apply to developed reported premium.

To estimate the weights at which past premiums were earned, an assumed distribution of premium by month is used. This distribution is based on NCCI studies of premiums by anniversary date. The use of the same distribution in most states reflects the observation that the distribution of policy effective dates does not usually vary significantly by state.

If rate level changes apply to new and renewal policies, all premiums assumed to be written before the proposed effective date are modified. In certain cases benefit level changes are applicable to all outstanding policies. In this case all premiums earned after the effective date are assumed to be at the revised rate level.

NCCI makes an estimate of the amount of premium collected from the expense constant. In most states this is a relatively small amount. For the sample filing it amounts to 0.9% of standard premium. (See Column 6 of Section A of Appendix A-I).

Each fall, NCCI produces its proposed expense provisions for the coming year's rate filings. NCCI uses the latest available policy counts and reported standard earned

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

premiums to estimate the percentage of future premiums to be received from the expense constant. See our report, Section II-B, Subsection 2, for more details.

The expense offset of .991 used in the current level factor calculations in Appendix A-I in the Illinois sample filing reflects the expected impacted of a \$60 expense constant. The calculation utilizes data from the 1982 expense study by size of loss which includes 2,040,675 policies with \$11,191,930,042 of premium. An inflationary adjustment is required since flat charges per policy do not increase with inflation but overall premiums do. The inflation factor underlying this calculation, which is based on differences between 1982 average wage levels and 1988 average wage levels, is 1.264. The calculation is documented below.

$$[.991 = 1 - (60 \times 2,040,675 / 11,191,930,042 (1.264))]$$

The premium adjustment factor is also modified by dividing it by the trend factor in the current rates. This is different than the treatment provided trend in many other ratemaking systems. (These differences will be discussed further, below). In the Illinois sample filing, the adjustment for trend is introduced in line (9) of Section C of Appendix A-I.

The factor to adjust premium to current level used in line (3) of Exhibit I-A is actually the combined effect of these factors: past premium level changes, the removal of the expense constant premium and the exclusion of the trend factor in the current rates.

In more commonly used ratemaking systems, the adjusted and developed losses would be multiplied by a trend factor to represent the cost level expected to exist while the new rates are in effect. These projected losses would then be divided by the full premium expected to be earned at current rates.

NCCI has chosen not to directly multiply the adjusted and developed losses by the trend factor and instead removes the provision for trend from the current rate. Algebraically, the result is the same.

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

$$\text{Trended Loss Ratio} = \frac{\text{Standard Non-NCCI Method}}{\text{Premiums}} = \frac{\text{NCCI Method}}{\text{Premiums} \div \text{Trend Factor}}$$

Losses x Trend Factor Losses

As a later step in the ratemaking process, NCCI will introduce an adjustment to reflect the effect of a change in trend. Since the current rates reflect the provision for trend included in the previous filing and the NCCI ratemaking methodology has adjusted for this trend, it will only be necessary to incorporate a change in trend.

2. Benefit Costs (Losses)

As with premiums, policy year losses at first report are the starting point in the development of the cost ratios on Exhibit I-A. Indemnity losses (line (6)) are developed separately from medical losses (line (12)) and then the developed losses added together (line (18)). The methodology to develop losses to their ultimate values is comparable to the process used to estimate ultimate standard premiums.

a. Policy Year Loss Development Factors

When a rate filing is prepared, the NCCI actuaries consider which of five types of loss data to use as a basis for their ultimate loss projections. Projections based on any of the following types of data are considered part of the standard methodology by NCCI:

- Incurred losses including IBNR
- Incurred losses excluding IBNR
- Incurred losses excluding all bulk reserves
- Paid losses to the fourth report with incurred losses including IBNR thereafter
- Paid losses to the eighth report with incurred losses including IBNR thereafter.

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

An assumption in the use of loss development factors is that historical patterns are predictive of future development. Therefore, data which exhibits consistent and stable development patterns generally is preferable.

NCCI selects the data expected to best predict future claim costs. The decision is based on a review of the projections produced by each type of data. Patterns of changes in age to age development factors are also considered. In addition, tests are performed by NCCI of historical accuracy of the various methods by state.

NCCI also consider ratios which are useful for identifying situations where changes in reserving adequacy might cause the use of incurred loss data to produce distorted results. These ratios are designed to identify situations where loss reserving levels are changing. NCCI reports that they also consider the expected impact of benefit changes, legal decisions and economic conditions on the validity of projections using each type of data. Ultimately, the NCCI decision of which data to use is based on their judgment. The selection of the type of data to use for medical and indemnity losses could differ within a filing.

The filing does not contain the documentation of the tests NCCI may have made before selecting the data used for making ultimate loss estimates. If a method other than incurred including IBNR is chosen, the filing discusses the reasons for using the selected method. For further information on the uses of loss development factors by NCCI, see the M&R Report on Section II-B, Part 1.

In the sample filing, NCCI selected incurred losses including IBNR. The selected indemnity and medical first to ultimate factors are used on lines (7) and (13) of Exhibit I-A and come from Section D of Appendix A-II. However in the following two sections, we will briefly discuss the methodology used by NCCI to calculate incurred and paid loss development factors.

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

(1) Incurred Data

Age to age loss development factors through the eighth report are calculated using methodologies similar to those described in the premium development section. These calculations are documented in Appendix A-II, Section A and B of the sample filing. The product of the seven age to age factors represents the projected development from the first report used in the rate filing to the eighth report.

(2) Tail Projection - Development Beyond the Eighth Report

In Appendix A-II, Section C of the sample filing, two sets of eighth to ultimate factors are calculated. These factors are referred to as tail factors. The selected factor used in the loss projections is the unweighted average of the indications from each set. NCCI has tested various periods to use in determining eighth to ultimate factors.⁶ The use of an unweighted average assumes the two most recent years are equally predictive of the future development.

The derivation of the tail factor is a two step process:

First, convert projected losses at eighth report to an incurred (including IBNR) basis. The general methodology uses a two year average of:

$$\frac{\text{Incurred (Including IBNR) at eighth report}}{\text{Reported at eighth report}}$$

Reported at eighth report reflects the loss type being developed, i.e., paid, incurred excluding IBNR, etc. In the sample filing which uses incurred losses including IBNR, this factor is not reported since its value would be 1.0.

Second, calculate the eighth to ultimate tail (incurred including IBNR) as follows:

6 Minutes of Actuarial Committee Meeting of June 23, 1987.

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

Calendar Year (Incurred) Loss Development for all
maturities beyond eighth report
Average of most recent three years' incurred
losses at eighth report

The denominator (three year average) reflects a fairly recent modification to the NCCI's tail factor calculation. It is a reflection of the fact that the previous approach, which used only the most recent year's incurred losses at eighth report, understates the tail when the loss base is growing over time as has been the case in most states.

(3) Paid Loss Data

When the loss development factors are calculated using paid losses either four or eight years of payment data may be used. NCCI decides whether paid losses developed to four or eight years are expected to provide more reasonable estimates. NCCI will use only four years of paid loss development unless reserve level distortions after the fourth report are observed. This reflects an NCCI assumption that projections based on incurred development are generally more reliable than those based on paid development.

If four years of paid losses are used, the paid losses developed to a fourth report are adjusted to an estimated incurred at the fourth report. This is done by applying an assumed ratio of Incurred to Paid Losses at a fourth report. To calculate this assumed ratio, data for the most recent two years which are currently at a fourth report are used. The unweighted average is generally used unless a different selection is recommended by NCCI. This incurred to paid factor incorporates the expected reserves at the fourth report level and assumes that the ratios for these two years are predictive of the ratio which will occur in the future. Incurred loss development factors are then used to adjust losses from the fourth report to the eighth report.

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

If eight years of payment data are used, seven age to age paid development factors are calculated. An incurred to paid factor is then calculated to adjust paid losses at the eighth report to incurred losses at the eight report. This is based upon the average ratio of paid plus IBNR at eighth report to losses paid at eighth report . This ratio introduces a provision for the expected eighth report reserves and assumes the ratios for the two most recent years are equally valid for predicting these reserves. For this approach, the factor to develop losses beyond the eighth report is identical to the tail factor used for the incurred loss projection.

b. Current Benefit Level Factors

Exhibit I-A, line (8) (indemnity) and line (14) (medical) show the factors to adjust losses to current benefit levels. These factors are documented on page 2 of Appendix A-I, Sections D and E of the sample rate filing. Separate calculations are made for medical and indemnity losses since benefit level changes generally have a different impact on these two components of benefit costs. The process is similar in concept to that used for bringing premiums to current level.

First, the calculation of the adjustment factors involves assigning the oldest benefit level in effect a base value of 1.0 and introducing a factor which measures the impact of each benefit change relative to what previously had been in effect. Cumulative indices are calculated for all benefit levels by multiplying all prior indices since the base period.

Next, the proportion of incurred losses which were incurred at each benefit level is estimated. The distribution of losses by period reflects the assumed policy anniversary distribution for policies written in each policy year. For any one policy, losses are assumed to occur evenly over the year.

Finally, the cumulative index for the current benefit level is divided by the weighted average index for benefits incurred during the policy period to produce the required adjustment factor. The purpose of this adjustment factor

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

is to bring the past losses to the cost level expected based on the benefit level contemplated by the current rates.

c. Claim Adjustment Expense Provision

On Exhibit I-A, lines (9) and (15), a provision is introduced to include claim adjustment expenses as a percentage of losses. The standard NCCI procedure is to apply the claim adjustment expense factor underlying current rates here and then in Exhibit I-F, (change in expenses) to include the change in the loss adjustment expense factor along with the change in other expenses. However, in the sample filing the current loss adjustment expense factor of 1.12 is the same as the proposed factor. The determination of the loss adjustment expense provision is presented in Exhibit II-C of the filing. The proposed factor of 1.12 is the average of three years of incurred loss and loss adjustment expense ratios. Provisions for claim adjustment expenses are currently based on countrywide data. Both stock and mutual company experience is utilized in the calculations. In recent years, NCCI has also used the results of a special call to obtain loss adjustment expenses and losses paid on a direct basis by accident year. This is to avoid the problem that can occur in using net of reinsurance data where the effect of reinsurance can be different for losses and loss adjustment expense.

The use of a multiplicative factor applied to losses assumes that claim adjustment expenses will change proportionally as loss levels change.

3. Policy Year Cost Ratio

Adjusted policy year premiums (Exhibit I-A line (5)) are calculated by multiplying reported premiums by premium development factors and current level factors. These premiums represent the expected ultimate premium if policies had been written at current rate levels excluding the trend provision and the effect of the expense constants.

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

The adjusted indemnity benefit cost (line (11)) is calculated by multiplying the policy year reported indemnity cost by the indemnity development factor, the indemnity current benefit level factor and the claim adjustment expense factor. These benefit costs are the projected ultimate indemnity amounts for all losses under the current benefit provisions and with the current claim adjustment provision included.

Similarly, the adjusted medical benefit cost (line (17)) is calculated by multiplying the reported policy year medical amount by the medical development factor, the medical current benefit level factor and the current claim adjustment expense ratio. The adjusted total benefit cost (line 18) is the sum of the adjusted indemnity and medical costs.

The Policy Year Cost Ratio (line (19)) is calculated by dividing adjusted total benefit costs (line (18)) by adjusted policy year standard premiums (line (5)). This ratio reflects the proportion of standard premiums at the current premium level, excluding trend and expense constant premiums, which would be available to cover projected losses and claim adjustment expense at the current benefit levels.

C. Cost Ratio Based on Calendar-Accident Year Experience

The methodology used to calculate cost ratios based on calendar-accident year experience shown in Exhibit I-B is very similar to the methodology used for policy year experience. This report will not repeat the explanation of the factors common to both.

1. Premium

NCCI assumes that calendar-accident year standard earned premiums require no development adjustment. Calendar year 1989 will reflect premiums from 1988 and 1989 policies as well as possible adjustments on 1987 and prior policies. NCCI assumes the calendar year premium will produce a reasonably accurate match with the accident year exposures. The validity of the assumption that calendar-accident

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

year premium does not need to be developed will be commented on more fully in Section II-B, Part 1 of M&R's report to the NAIC.

Line (2) of Exhibit I-B shows the factor to adjust calendar-accident year premiums to current levels. This factor is calculated in Section A, B and C of Appendix A-III in the sample filing. The methodology and underlying actuarial assumptions are analogous to the policy year calculations.

2. Benefit Cost (Losses)

Accident year development factors are calculated in Appendix A-IV of the sample rate filing. The first to ultimate development factors for accident year losses for indemnity and medical are derived in Section D of Appendix A-IV and are used on lines (5) and (11) of Exhibit I-B.

The calculations and underlying actuarial assumptions are comparable to those used for policy year data. For the Illinois sample filing, both sets of calculations use incurred loss including IBNR data. In some NCCI rate filings, the data which is selected as most appropriate for policy year data may not be selected for accident year data.

Appendix A-III, Sections D and E shows the calculation of factors to bring indemnity and medical accident year losses to the present benefit level. These factors are used on lines (6) and (12) of Exhibit I-B. Again, the methodology is comparable to that used in adjusting the policy year benefit data.

3. Calendar-Accident Year Cost Ratio

The calendar-accident cost ratio is calculated in Exhibit I-B on line (17) by dividing the sum of accident year adjusted indemnity and medical losses (line (16)) by the calendar year's adjusted standard earned premium (line (3)). This cost ratio represents the proportion of calendar year 1989 premium at the current premium level, excluding trend and expense constant premiums, which would be available to cover projected accident-year 1989 claim costs, assuming the current benefit levels.

**NCCI RATEMAKING PROCEDURES
CHAPTER 2 -STANDARD
METHODOLOGY**

D. Average Cost Ratio and Indicated Change Based on Experience

1. Average Cost Ratio

Exhibit I-C calculates the average of the policy year and calendar-accident year cost ratios. The average cost ratio gives equal weight to the cost ratio based on policy year experience and the cost ratio based on calendar-accident year experience.

The use of one policy year and one accident-year of experience reflects an NCCI assumption that the most recent year is a better predictor than an average of a number of years and, furthermore, that policy year experience and accident-year experience are equally good predictors.

2. Target Cost Ratio

The current target cost ratio represents the proportion of premium expected to remain after the provision for expenses other than claim adjustment expenses and the provision for profit and contingencies have been removed. An average cost ratio exactly equal to the target cost ratio would indicate that the current premium excluding trend provisions was exactly at a level to cover projected losses, claim adjustment expenses, general expenses and profits. The derivation of the target cost ratio is documented in Exhibit II-A.

The expense provisions (Exhibit II-B) underlying the target cost ratios are selected to be indicative of the expense requirements for the first \$5,000 of standard premium excluding estimated premiums from the application of expense constants.

The target cost ratio considers provisions for production costs, general expenses, taxes, licenses and fees other than federal income taxes and profit and contingencies. These provisions are obtained from Exhibit II of the prior rate filing. Proposed adjustments in any of these provisions filing are introduced in later sections of the rate level calculation.

**NCCI RATEMAKING PROCEDURES
CHAPTER 2 - STANDARD
METHODOLOGY**

3. Indicated Change Based On Experience

The indicated change based on experience is calculated in Exhibit I-D by dividing the average cost ratio by the current target cost ratio contemplated by the current rates.

E. Impact of Changes in Trend

NCCI's indicated change based on experience is calculated using untrended losses and assuming the trend factor in current rates will continue at its current level. A trend factor of 1.122 is contained in the current rates for the Illinois sample filing. When NCCI updates the trend indication from this year's rate revision, only the change in the indicated trend factor needs to be introduced.

The calculation of indicated rate levels should include an adjustment of indemnity and medical losses to reflect expected changes in the trend factor. This is shown in Exhibit I-E. Trend factors reflect estimated changes in benefit cost levels between the experience period and the period the proposed rates are expected to be in effect. In workers compensation, since the exposure is based on payroll, trends actually reflect the expected increase of medical and indemnity losses relative to the expected payroll growth.

The calculation of the policy year trend factor is documented in Appendix A-V of the sample rate filing. The trending procedures of NCCI are documented in a memorandum on trend procedures.⁷

1. Data Utilized in Trend Calculations

The calculation of the trend factors generally utilizes five years of policy year data from the financial calls. The most recent year corresponds to the year used to calculate the indicated change based on experience. The selection of a five year period assumes that this period will be predictive and medical trends have been used

⁷ NCCI Memorandum on New Trend Procedures

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

since 1983 to respond to the differing influence of outside factors on medical and indemnity losses. The calculation considers countrywide experience as well as individual state data.

2. Trend Data Adjustments

Premiums for each policy year are developed to current levels using the same procedures which were discussed in the policy year premium section of this chapter. The on-level premium for the most recent year is identical to the value used in the calculation of the policy year cost ratio. The derivation of the factors for the other years is not contained in the current rate filing but is available from NCCI if requested.

For indemnity losses, reported amounts are developed to ultimate levels and adjusted to current benefit levels. The development factors used in this calculation are calculated in Appendix A-II of the sample filing.

Indemnity and medical losses are adjusted to current benefit levels using factors which reflect changes since the earliest year in the five year policy period. It is essential to have all losses on the same benefit level so that benefit changes do not distort the measurement of any trend. The methodology and assumptions of these calculations are identical to those discussed above in the current benefit level factors section. Only the factors applied to the most recent policy period are documented in the sample filing. Again, NCCI can provide the complete documentation if requested.

For indemnity and medical losses, the values for the most recent year used in trend calculations do not agree with the value contained in the average cost ratio projection since the provision for claim adjustment expenses is not included in the trend calculation.

In addition to state data, the selected trend factor may rely, in part, on countrywide trend indications. The weighting of state and countrywide trend indications assumes that in states where trends are not considered fully credible countrywide data is a good indicator of the expected trend in the state.

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

Two trends are calculated from countrywide medical data. One trend is based on experience from states that have either no medical fee schedule or a medical fee schedule which NCCI considers ineffective. The second countrywide medical trend is based on data from states that NCCI considers to have effective medical fee schedules. The use of separate trends reflects the expectation that medical costs may show different trend patterns if an effective medical fee schedule is in use.

3. Calculation of Trend Factors

Loss ratios at current rate and benefit levels for each of the five most recent policy years are calculated by dividing adjusted indemnity or medical losses by adjusted premiums. This is documented in Sections D and E of Appendix A-V. The use of loss ratios for trend indications measures the difference between claim cost growth and payroll growth.

Linear least squares regression techniques are used to fit a line through the adjusted loss ratios for the five policy years. A linear least squares regression fits a line which minimizes the sum of the square distances between the actual adjusted loss ratios and the loss ratios on the fitted line. This fitted line is used to project costs to the midpoint of the period that the rates are assumed to be effective. Generally, each set of proposed rates is assumed to be effective for one year.

Trends projected using linear regression assume that loss ratios are changing by a uniform amount each year.

4. Credibility of Trend Indications

The credibility which is assigned to trend indications based on state data depends on how closely the data fits the straight line projection fitted by the linear regression. More credibility is assigned when the actual data is close to the projected trend line. The assignment of partial credibilities is based on standards selected by the Actuarial Committee of NCCI and is designed to give full credibility if there is a 90% chance

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

that loss ratios will be within 5% of the fitted loss ratios at the midpoint of the experience period.

A detailed discussion of the methodologies and concepts underlying the determination of trend factors and credibility for trend calculations is included in Section II-B, Part 4 of our report to the NAIC on NCCI ratemaking.

5. Change in Trend

The indicated overall trend factor is derived by weighting the medical and indemnity trends by the respective policy year medical and indemnity losses used in the filing. This overall factor is divided by the trend factor underlying the current rates to produce the change in trend factor introduced in Exhibit I-E of the rate filing.

As explained above, the projected cost ratios have had the provision for trend included in existing rates removed. That is, the projected premiums are not at the level traditionally used for "premiums at current rates" in other lines of insurance. Rather, they are the premiums that would be collected if the current rates were charged but without the provision for trend contained in the current rates.

In the sample filing, the indicated trend from the midpoint of the experience period to the midpoint of the policy effective period is 1.128. The trend factor in the prior filing was 1.122. The effect of the change in trend is 1.005, or an increase of 0.5%. which is calculated by dividing the new trend factor by the old trend factor.

F. Effect of Changes in Expenses

The NCCI method of presenting rate level changes isolates the effects of each change in expense provisions. In the sample filing, changes in general expenses are introduced in Exhibit I-F. Provisions for changes in taxes are introduced in Exhibit I-H. Finally, the proposed change in the expense constant is introduced in Exhibit I-K. The change in expense constant is intended to have an effect on the changes in the proposed manual rates but not the proposed premium level.

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

The sample filing does not have any changes in production expenses, claim adjustment expenses, assessments or the provisions for profits and contingencies. If there had been any, changes in production expenses or claim adjustment expenses would have been included in Exhibit I-F. Changes in assessments would have been introduced in Exhibit I-I.

1. Illustrative Example of Expense Changes

The discussion of the expense changes in the Illinois sample filing shown below does not follow the NCCI presentation in Exhibit II-B. Rather it is designed to clarify the links between the three expense changes in the sample filing.

The sample filing is really changing three components for expenses:

- a. A reduction in the general expense provisions in the current rates from 6.7% to 6.6% assuming no change in the expense constant of \$60. (See columns A and B of Exhibit II-B and line 9 of that Exhibit.)
- b. A change in the provision for taxes that NCCI believes is necessitated by assessments for the Illinois Guaranty Fund. (See line 3, column C of Exhibit II-B of the sample filing).
- c. A change in the expense program triggered by changing the expense constant from \$60 to \$75 per policy. Since more premiums will be collected by levying the higher expense constant, a smaller percentage loading is required for general expenses. Specifically, coincident with the increase in the expense constant from \$60 to \$75 policy, the general expense premium can be reduced from 6.60% to 6.40% per premium.

2. Data Utilized in the Analysis

NCCI reviews expense provisions annually. The review process has the NCCI staff compiling the data and making recommendations to the Actuarial Committee. This

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

Committee then discusses and votes on what to include as expense and profit provisions in the coming year's filings. Countrywide data compiled from the Insurance Expense Exhibits is used in this review in most states. The Insurance Expense Exhibit data is adjusted for expense constant revenue, premium discounts, schedule rating, and carrier deviation. A further adjustment is made to remove the effect of servicing carrier allowances in order to put expenses on a direct basis with respect to pool reinsurance.

NCCI assumes that countrywide data is more appropriate than state data because the allocation of expenses by state is not practical due to the relatively large proportion of the total premium for interstate policies. In a few states, including Illinois, state data is used at the regulators' request.

Separate tabulations are made of expense data for participating stock companies, non-participating stock companies, mutual companies and reciprocal insurers. The expense provisions used in NCCI rate level calculations are those estimated to be appropriate for stock companies. NCCI indicates that stock companies generally write the smaller policies and historically their experience has been the basis for determining the expense provisions in the rate structure.

3. Provision for Production Expense

The provision for production expenses including commissions, other acquisition, field supervision and collection expense is not calculated directly from actual production expenses being incurred by insurers but is included as a budgetary provision. This provision, which is generally 15% of the first five thousand dollars of standard premium, has existed for many years. NCCI indicates that the combined production expense experience of a group of carriers would not be meaningful since commission levels are based on competitive factors and the result of a wide variety of individually negotiated contracts. NCCI does, however, believe that stock company data supports the reasonableness of the current provision for production expenses.

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

4. Provision for General Expenses

About 60% of the income generated by the expense constant is designated to be used to pay general expenses. This reduces the otherwise required general expense provision which must be collected as a percentage of premium.

In the filing, a reduction in the general expense provision in the current rates from 6.70% to 6.60% is being proposed while maintaining the present expense constant of \$60. This change has the -0.1% effect on premium level derived on line (9) of Exhibit II-B. This expense adjustment, which is carried over to Exhibit I-F of the sample filing, does not include the additional reduction of the general expense provision from 6.60% to 6.40% of standard premium which could result from the increase in the expense constant from \$60 to \$75. The documentation showing how the general expense provision could be reduced by increasing the expense constant to \$75 is contained in Exhibit II-D. The effect of this change on rate level is introduced in Section I-K of the sample filing.

5. Provisions for Profit and Contingencies

A provision for profit and contingencies is included in the target expense level used to calculate rate level change indications. Historically, the provision for profit and contingencies used in calculating workers' compensation rates has been 2.5%. The objective of NCCI in filing this provision is to produce an underwriting profit of 2.5% of premium before federal income taxes. This provision is not derived in the rate filing but NCCI routinely supplies documentation to support the 2.5% provision.

The issue of what constitutes a reasonable provision for profit and contingencies has been a subject that has been receiving increased scrutiny over the past several years. Any discussion of profit and contingency provisions is outside the scope of this review.

**NCCI RATEMAKING PROCEDURES
CHAPTER 2 -STANDARD
METHODOLOGY**

G. Adjustments for Changes in Benefits

Up to this point in the sample filing, NCCI has estimated future benefit costs based on the level of benefits that became effective on July 15, 1989. It is common for NCCI to encounter situations where because of the logistics of preparing a rate filing, revisions in statutory benefits become effective subsequent to initiating the work on a filing. In these cases, NCCI will perform its analysis based on the statutory benefits in effect prior to the revision. Subsequent benefit revisions will have their impact reflected separately from the experience review. As will be seen later, these revisions are also incorporated in a final step prior to computing proposed rates. Three sets of benefit changes became effective in 1990 that are not yet reflected in the January 1, 1991 rate level indication. These three benefit changes and their estimated impact on benefit costs are:

January 15, 1990	+0.03%
July 1, 1990	+0.40%
July 15, 1990	+0.03%

The changes are the result of increases in the minimum and maximum weekly benefits. These minimums and maximums are tied to semi-annual changes in the state's average weekly wages as posted and published by the Illinois Industrial Commission. The combined effect of these three changes is estimated by NCCI to be an increase of 0.4%. This is the effect incorporated in Exhibit I-G of the Illinois sample filing.

NCCI provides documentation of its estimate of these changes in three separate "Illinois Law Memos"; Appendices C-I, C-II, and C-III, respectively of the filing. Because of their similarities, we have only included Appendix C-1 in the sample filing included as part of this report. The documentation of the effect of the January 15, 1990 benefit revision by type of injury is shown in Exhibit II-A of the NCCI's Appendix C-1.

A discussion of the technical concepts underlying the evaluation of changes in claim costs due to benefit revisions is beyond the scope of this part of our report. These

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

aspects of benefit level evaluation as well as a discussion of other types of benefit evaluations are covered in Section II-B, Part 5 of M&R's overall report on the examination of NCCI ratemaking.

H. Changes in Taxes and Assessments

Tax and Assessment changes are introduced in Exhibit I-H and Exhibit I-I of the NCCI ratemaking calculations. These adjustments are developed in Exhibit II of the filing.

1. Effect of Change in Taxes

The NCCI rate level filing incorporates a provision for changes in premium taxes, licenses, and fees. The provisions for these three components in the current rates and underlying the proposed rates are presented in Exhibit II-A of the sample filing.

The provision for premium taxes is generally based on the statutory rate for foreign insurance companies. Other tax considerations such as those imposed by retaliatory tax provisions are not reflected. No recognition is made to reflect if domestic insurance companies have premium tax exemptions.

Miscellaneous taxes are assumed to be 0.8% of premiums. This provision for miscellaneous taxes is adjusted periodically based on a review of experience reported in the Insurance Expense Exhibits. No change in miscellaneous taxes is proposed in the sample filing.

NCCI generally introduces guaranty fund fees, or indeed any assessment calculated as a percent of premium, as a tax. The sample filing includes a change in insurance guaranty fund taxes. The provision underlying current rates of .15% is shown on line 3(b) of Exhibit II-A. The .52% provision underlying proposed rates is also presented on line 3(b). The effect of this change is calculated on line (12) of Exhibit II-B and then carried over to be displayed on line (2) of Exhibit I-H.

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

Premium-based assessment provisions are generally calculated from the most recent actual assessment levied by the governing body controlling the funds. When the guaranty fund assessment can be credited against the premium taxes incurred, no provision for such assessment is made in the rate level calculation.

2. Effect of Changes in Assessments

Assessments payable as a percent of indemnity payments or total paid or incurred losses are introduced through the benefit adjustment factors. The provisions for assessments on losses are presented on line (8) of Exhibit II-A. In the sample filing the Second Injury and Compensation Rate Adjustment Funds are .125% and .50% of losses respectively. Since no change was introduced, the values in all columns of line (8) are identical and no provisions for changes in assessments are applied in Exhibit I-I.

Many jurisdictions have assessments on individual injury types such as fatal claims. Such assessments are included in reported losses.

I. Distribution of Premium Change to Industry Groups

In most states there are three industry groups. Each class is assigned to either the manufacturing, contracting or all other industry group. The use of these categories assumes that the factors affecting premiums and benefit costs may be operating differently between these three industry groups.

The distribution of the overall premium level change to industry groups is shown in Exhibit I-J of the sample filing. This distribution is done through industry group differentials that are calculated in Appendix A-VII in the NCCI sample filing.

Because the industry group differentials rely on WCSP data, a considerable number of adjustments must be made to that data to be consistent with the financial call data used to determine overall premium levels. Consequently, we will explain these adjustments in a subsequent section of this chapter discussing classification rates.

**NCCI RATEMAKING PROCEDURES
CHAPTER 2 - STANDARD
METHODOLOGY**

J. Effect of New Expense Program

The final adjustment is in Exhibit I-K of the rate filing; that is the introduction of the factor to reflect the new expense program. This factor is calculated in Exhibit II-B of the filing and reflects the effect of increasing the expense constant. This adjustment is applied uniformly to the indicated premium level changes by industry group to produce the indicated rate level change by industry group.

The effect on premium level for the new expense program is calculated by comparing columns C and D in Exhibit II-B in the sample filing. The general expense provision is reduced to adjust for the additional income from the increased expense constant. In the sample filing the increase in the expense constant from \$60 to \$75 reduces the general expense provision from 6.6% to 6.4%. This, in turn, permits a 0.3% reduction in overall manual rate level without affecting the overall premium level.

Additional information on issues relating to the expense program is contained in Section II-B, Part 2 of the M&R report on NCCI ratemaking.

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

III. CLASSIFICATION RATEMAKING FOR INDUSTRIAL CLASSES

As we have seen, the NCCI's standard methodology bases the overall proposed statewide premium level change on its analyses of financial call data for premium, and losses. Premiums and losses are state specific while expenses more frequently are analyzed on a countrywide basis.

The key to understanding the NCCI's methodology at the classification level is keeping in mind two factors:

1. the data utilized for industry group and class ratemaking differs from the data used to calculate the overall premium level change; and
2. the class and industry group ratemaking emphasizes distributing the overall statewide change rather than developing rates directly from the class data.

In the Illinois sample filing, the proposed overall premium level was derived from the experience of policy year 1988 and calendar-accident year 1989 with both sets of data being evaluated as of December 31, 1989.

The data used for industry group differentials and classification ratemaking comes from the WCSP. This body of data differs from the financial call data in a number of significant ways.

1. It is at a greater level of detail. It provides payroll, premium and loss data by class for each insured employer; with the losses being reported by type of injury;
2. It is older. The sample filing uses WCSP data for policies effective between April 1, 1985 and March 31, 1988 with valuation dates being from October 1, 1988 through September 30, 1989; and

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

3. The WCSP data is used not only for classification ratemaking but is the same data base NCCI uses in deriving experience rating modifications for each eligible insured.

For additional information on the differences and inter-relationship in the data between the financial calls and WCSP, please see our report in Section I of this examination.

It is clear though that the greater level of detail provided by WCSP and its more extensive use for such things as experience rating suggests a longer and more complex task to capture and to be able to use this data. Because of this, it is important to also remember that the financial call and WCSP data may not be compiled for ratemaking at the same time by NCCI.

As mentioned in the preceding section of this chapter, NCCI's presentation calls for calculating industry group differentials as one of the last steps in presenting the overall statewide premium level change. This is only for presentation purposes. Algebraically, it could just as easily be presented as the first step in developing the classification rates without having an effect on the overall premium level proposed.

Stated another way, the calculation of industry group differentials may be viewed as the process for bridging the indications from the financial call data and the indications that would be developed solely from the WCSP data. Achieving the proposed statewide premium level change is of primary importance in the NCCI's methodology.

In the next section of this chapter, we will focus first on the methodology and assumptions used by NCCI to develop the industry group differentials. We will then proceed to discuss the development of the class rates.

One final note, we have previously mentioned that NCCI has supporting workpapers for calculations not completely documented in the filing. Some of these workpapers are critical to understanding how the WCSP data is used. Consequently, we have created Appendix D to the sample filing. Appendix D incorporates some of the more

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

important NCCI workpapers and will be referred to specifically in the discussion that follows.

A. Industry Group Differentials

The industry group differentials derived by NCCI in Appendix A-VII of the sample filing depend upon comparing the level of expected, or permissible, losses in the current premium structure with the indicated losses derived from the WCSP data.

1. Expected Losses

NCCI derives the expected losses by multiplying the premiums at current manual rates shown in column (1) of Appendix A-VII by the ratio of earned to manual premiums and target cost ratio.

The premiums at current manual rates are before the effect of the experience rating plan. NCCI's objective is to estimate the required change in standard premium levels; that is manual premium after the effect of the experience rating plan. NCCI uses the ratio of earned to manual premium to make this adjustment.

a. Ratio of Earned to Manual

The calculation of these factors by industry group are shown in the supporting NCCI workpapers. Appendix D-I shows the calculation for the sample filing. The derived ratios from line 4 are:

Manufacturing	0.987
Contracting	0.989
All Other	<u>0.993</u>
Total	0.991

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

The ratio is the three year average of the reported standard earned premium to the premium at manual rates for each industry group. The premiums used in the calculation are the actual reported amounts for manual and standard earned premium from the WCSP system. In the WCSP, there is no adjustment of the reported manual or standard earned premiums to reflect current rate levels in the calculation of the ratio of earned to manual. In the sample filing, a special loss ratio adjustment program applicable only to the Contracting Group was in existence. A modification to the standard procedure is incorporated for this special plan before developing the final earned to manual ratio for the Contracting Group.

NCCI believes that the introduction of the earned to manual ratio is necessary to reflect the off-balance that results from the application of the experience rating plan. The ratio of "earned to manual" is usually less than 1.00 reflecting the general tendency for the experience rating plan to provide more credits than debits. In estimating overall premium level changes, NCCI begins with policy year data from the financial calls that is already at the standard premium level.

b. Target Cost Ratio

The percentage of the current level standard premiums available to pay loss and loss adjustment expenses is 72.85%. This value is from the first column of Exhibit II and reflects the expense level of the prior rate filing.

c. Expected Losses

As an example, the expected losses for the Manufacturing Group shown in Appendix A-VII are calculated as follows:

Premiums at 9/1/90 level	\$1,461,651,768
Ratio of earned to manual	0.987
Target Cost Ratio	72.85%
Expected Losses (1)x(2)x(3)	1,050,870,740

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

This value is shown in column (2) of the second page of Appendix A-VII.

2. Indicated Losses

The NCCI procedure for developing the indicated losses in column (3) of Appendix A-VII involves adjusting WCSP losses in four steps:

- a. Adjust the losses to current benefit level,
- b. Develop the losses to ultimate,
- c. Adjust the losses to Level of 1987 policy year aggregate and calendar-accident year 1988 exposure as of December 31, 1988.
- d. Wage Trend Differential Adjustment.

Each of these steps is described below.

a. Adjust Losses to Current Benefit Level

The losses shown in Appendix A-VII have been brought to the same benefit level, July 15, 1989, as that used in Exhibit I of the sample filing to estimate overall premium levels. The process for calculating these on-level factors is the same as that described earlier in this chapter. However, at the class and industry group level, the process is applied by type of injury. This is because the WCSP system provides loss data by type of injury (fatal, permanent total, etc.). NCCI evaluates the impact of benefit changes by type of injury. The factors used in Exhibit I for each benefit level change are only the weighted average of the effects estimated by type of injury by NCCI. Since each class may have a different distribution of losses by type of injury, NCCI's methodology for class and industry group ratemaking uses benefit level

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

adjustments by type of injury for each class. The factors actually used in the sample filing are shown on the first page for Appendix B-1, Section B.(a).

b. Develop the Losses to Ultimate

As with the benefit level adjustments, in concept, the methodology to develop losses to ultimate is comparable to that explained in connection with overall premium level determination. Again though, the development factors are applied to the WCSP losses at a more refined level.

Separate loss development factors are calculated to be applied to the following categories of WCSP losses by class.

<u>INDEMNITY</u>		<u>MEDICAL</u>	
<u>SERIOUS</u>	<u>NON-SERIOUS</u>	<u>SERIOUS</u>	<u>NON-SERIOUS</u>

Under WCSP, serious losses are from fatal, permanent total and major permanent partial injuries and non-serious losses are from minor permanent partial, temporary total, and medical only. WCSP requires the losses by type of injury be reported separately for indemnity and medical.

Development factors for first to fifth reports are derived directly from WCSP data. In going from the fifth to ultimate, NCCI uses the average indemnity and medical development factors that it derives for use in the overall rate level.

In going from the fifth report to ultimate, NCCI assumes that any development of incurred losses occurs only on serious losses. If the total fifth to ultimate indemnity loss development was 1.05 and serious losses made up 80% of the indemnity losses in the WCSP data, then the fifth to ultimate factor of 1.063 for serious indemnity losses would be calculated as follows:

$$80\% \text{ of } x + 20\% \text{ of } 1.00 = 1.05$$

$$x = 1.063$$

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

A similar calculation is made for serious medical losses.

The development factors applied to each policy year of WCSP data are shown in Appendix B-I, Section B.(b). However, someone tracing NCCI's calculations would find the need to incorporate another factor into the loss developments in order to derive the factors shown in Section B.(b) of Appendix B-I. That is, the factor described in the next sub-section of this report.

- c. Adjust the losses to Level of 1987 policy year aggregate and calendar-accident year 1988 exposure as of December 31, 1988.

The manual rates currently in effect, which are the basis for deriving the expected losses by industry group, were the result of a prior experience review. In the sample filing, that would have been the rates projected based on experience from policy year 1987 and calendar-accident year 1988, both valued at December 31, 1988.

The current rates, therefore, specifically include a provision for trend factors for indemnity and medical losses as well as the effect of introducing calendar-accident year data into the overall rate level. These factors are not yet reflected in the WCSP data. To bring the WCSP data to the same level of costs reflected in the current rates, NCCI returns to the last overall experience review and takes the policy year adjusted cost ratio that it developed last year and adjusts it to reflect any subsequent premium and benefit revisions. For example, in the sample filing, using the prior experience review, and bringing it to the same rate and benefit level used in this year's overall premium indication based on experience, NCCI workpapers show a policy year 1988 adjusted cost ratio of 0.7050.

**NCCI RATEMAKING PROCEDURES
CHAPTER 2 - STANDARD
METHODOLOGY**

i. Policy Year Adjustment Factor

The January 1, 1990 rates also contemplated an overall trend factor of 1.122, comprised of 1.100 for indemnity and 1.169 for medical. These were documented in Appendix A-V, Section F of the prior filing and, as we shall see, in Appendix B-I, Section B, (e).

The WCSP adjusted cost ratio is calculated from the premium and loss data shown in Appendix A-VII after adjusting for the ratio of earned to manual.

(1)	Loss Ratio from Appendix A-VII (3,265.6 ÷ 5,746.8)	.568
(2)	Ratio of Earned to Manual (See Section A.1.a)	.991
(3)	Loss Ratio on Standard Premium Basis (1) ÷ (2)	.5734

These three factors are then combined to develop the policy year adjustment factor as follows:

(1)	Policy Year 1988 Adjusted Cost Ratio	.7050
(2)	Current Overall Trend Factor	1.1220
(3)	WCSP Adjusted Cost Ratio	0.5734
(4)	Adjustment Factor [(1) ÷ (2)] ÷ (3)	1.096

The policy year adjustment factor of 1.096 is then used to bring the WCSP loss ratio to the same level as that contemplated by last year's financial call data. It is incorporated into NCCI's methodology by

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

applying it uniformly to all the loss development factors that would otherwise be used to develop WCSP losses.

ii. Calendar-Accident Year Adjustment Factor

In a similar fashion, the effect that calendar-accident year 1988 had on premium levels from the last experience review must be included. The overall premium level change is a 50-50 weighting of separate policy year and calendar-accident year indications.

From the prior experience review, the average cost ratio adjusted to the same rate and benefit level contemplated in this year's analysis is 0.7185. The affect of incorporating the calendar-accident year into last year's review is 1.019 (.7185+.7050).

The 1.019 factor is presented in Appendix B-I Section B. Subsection (b). NCCI does not also disclose the policy year aggregate adjustment factor of 1.096. We believe they should.

d. Wage Trend Differential Adjustment

The goal of using industry group differentials is to adjust for differences in loss ratios between the three industry groups. The statewide rate level change indications assume the same rate of change of indemnity and medical costs relative to wage costs for all segments of the business.

Specific adjustments have been introduced recently to adjust for differences in average wage growth rates for the three industry groups. The development of the current methodology is based on analysis and testing by the NCCI Actuarial Committee during 1988 and 1989. Several memoranda document the

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

discussions and testing which were performed before this change was introduced.⁸

The Illinois sample filing does not include any documentation of the calculation of industry group trends. Sample pages provided by NCCI which support the trend factor adjustments are included in Appendix D-II, which is bound with the sample rate filing. The average wage data and trend indications are presented on Appendix D-II Page 1.

The calculation of the factor to adjust the industry group differential for differences in wage growth involves trending average weekly wages for each industry group. The average weekly wage values by industry group are compiled by NCCI from state Bureau of Labor Statistics data by occupation. The industry group trends are calculated to measure the difference between the midpoint of the experience period and the midpoint of the most recent year. Industry group wage trends are calculated by fitting a linear least squares regression to five years of data on average weekly earnings by industry group. The linear trend assumes that the dollar amount of change per year is uniform. Industrywide wage trends are calculated by weighting the industry group trends using the expected losses from Appendix A-VII as weights.

For each industry group, the wage trend differential is calculated by dividing the average trend by the industry group trend. This calculation is shown on page 2 of Appendix D-II. In the sample filing, the manufacturing and contracting trends are slightly lower than the overall trend and the all other trend is higher than the average.

An adjustment factor is then calculated for each industry group to modify indicated losses to reflect the differences in wage trends. To calculate this factor, indicated medical losses multiplied by the wage trend differential are added to indicated indemnity losses. This wage trend differential increases the medical losses used in the industry group differentials for groups with lower

8 Minutes to Actuarial Committee meetings dated December 1 and 2 1988, February 6 and 7, 1989, and October 10, 1989.

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

than average wage growth rates. The sum of modified medical losses and unmodified indemnity losses is divided by unmodified medical and indemnity losses to produce the adjustment factor. This method of calculating the adjustment reflects the assumption that indemnity costs will follow wage costs, but that medical costs are not directly related to wage costs.

Adjustment factors are then normalized to assure that the overall ratio is 1.000 so that the adjustment has no overall rate impact. These normalized adjustment factors are multiplied by total indicated losses to produce adjusted indicated losses by industry group.

3. Calculation of Industry Group Differentials

The industry group differentials are calculated by dividing the adjusted indicated losses by expected losses. Generally, NCCI expects the industry group differentials to be between .9 and 1.1. In the sample filing the ratios range from .98 to 1.01. Any situation where industry group differentials fall outside the expected range is examined by NCCI to determine whether there is a reason to permit such deviation. If no reason is found for a change outside the range, indicated differentials are adjusted to the upper or lower bound. When the industry group differential for one group is limited, the other industry group differentials are adjusted in the opposite direction to produce changes by industry group that balance to 1.0.

B. Derivation of Rates or Loss Costs by Class

Rates or loss costs by class are calculated by distributing the industry group rate level change in a manner which reflects differences in experience by class within the industry group. The revised class rates are based upon the recent experience in the class, the indicated changes by industry group and the relative experience by class based on national experience. The credibility or weight assigned to each indication depends upon the expected losses of the class.

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

Our discussion follows the order of presentation contained in Appendices B-I, B-II and B-III of the sample filing which document the calculation of the final advisory rates or loss costs. Calculations are illustrated using class 2014 which is the example used in Appendix B-IV of the Illinois sample filing.

APPENDIX B-I, SECTION A: THE DATA

The primary data used to calculate class rates is the exposure and loss data reported under the WCSP. NCCI prepares NC-235 reports which summarize WCSP experience for each policy year used in the rate filing by class. These reports are the underlying information used in the class ratemaking process. A sample of the NC-235 reports for class 2014 is presented in Appendix D-III. Both limited and unlimited reports are produced if any claims are subject to the per claim limitation. NCCI calculates pure premiums for each class from the NC-235 reports for the state.

For class ratemaking, individual large losses and total losses for accidents involving multiple claimants are limited to reduce distortions in individual class rate indications. For classification ratemaking, it is common actuarial practice to place claim limitations on the losses used.

Individual losses are limited to five times the average serious case in the state. Claims with multiple claimants are limited to twice the individual claim limitation. The average serious claim for the state is calculated based on three years of experience plus one year of three year fixed rate policy data. As will be seen later in this section, the effect of the loss limitation by industry group is built into the final rates by a test correction factor. This factor ensures that the overall premium level by industry group and state is achieved.

APPENDIX B-I, SECTION B: ADJUSTMENTS TO DATA

1. Benefit Level

Reported losses for each class are adjusted to the benefit level used in the current rate filing for the experience portion of overall premium level. The factors to adjust losses

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

to the July 15, 1989 benefit level are presented in Section B subsection (a) of Appendix B-I of the sample filing.

Adjustments to reflect the costs of later benefit level changes that need to be introduced are incorporated separately in the final rate calculations.

2. Loss Development

Adjustments are also made for projected development to reflect the ultimate expected cost for data from each policy period. The factors are shown in Section B Subsection (b) of Appendix B-I of the sample filing. The process for deriving these development factors was described in the preceding section on industry group differentials.

In the Illinois sample filing, the development factors also include the policy year adjustment factor of 1.096, which represents the difference between the financial data policy year cost ratio in the prior filing and the cost ratio developed based on WCSP data for this filing. The derivation of that factor was shown above when discussing the industry group differentials.

3. Combined Conversion Factors

Additional adjustments are included in Appendix B-I, Section B in lines (c) through (f) leading to the composite factors shown on line (g). They are: the current assessments that are calculated as a percent of losses; an adjustment for differences between the policy year loss ratio used in last year's experience review and the average of policy year and accident year data (the calendar-accident year adjustment); the medical and indemnity trends in current rates; and the provision for loss adjustment expenses. The end result of applying all these adjustments to WCSP reported losses is to have them at the same level as the experience indications developed from the financial call data in Exhibit I of last year's filing.

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

APPENDIX B-I, SECTION C: FORMULA PURE PREMIUMS

As we shall see, there are five pure premiums calculated in Appendix B-II.

1. Indicated pure premiums
2. Underlying present rates
3. Present on rate level
4. Indicated by national relativities
5. Derived by Formula

Derived by formula pure premiums are the credibility weighted averages of three of these pure premiums: the indicated; indicated by national relativities; and the present on rate level.

Separate sections below address the calculation of each of the pure premiums and the determination of credibility values used as weights. The derivation of formula pure premiums are shown on the classification pure premium exhibits, also referred to as A-sheets, which are included as Appendix B-II in the rate filing. We have provided only the A-sheet page containing class code 2014 in the sample filing.

When proposed manual rates are calculated, additional adjustments are made to the formula pure premiums to introduce the changes based on experience, trend, expenses and the latest benefit levels from this year's review.

1. Indicated Pure Premiums

Indicated pure premiums are derived from the state experience for the class. They are calculated from payrolls and adjusted and developed losses. The payrolls and modified losses and loss adjustment expenses by component are shown at the top of each A-sheet report in Appendix B-II. On the A-sheets, the indicated pure premium

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

is shown on the total line. The A-sheet does not label this value as the indicated pure premium.

Reported payrolls are summed without adjustment for any expected additional payroll development. This assumes that there are no significant differences in premium development by classification.

An explanation of the how the A-sheet values for class 2014 are developed from NC-235 reports follows. The NC-235 reports for class 2014 are included as Appendix D-III of the supplementary material. The A-sheet for class 2014 is in Appendix B-II of the sample filing. A table of injury types follows to clarify the allocation of experience to serious and non-serious categories and the references to experience by injury type in the calculations:

<u>Injury Code</u>	<u>Injury Type</u>	<u>Classification</u>
11	Death	Serious
12	Permanent Total Disability	Serious
13	Major Permanent Partial Disability	Serious
14	Minor Permanent Partial Disability	Non-serious
15	Temporary Total Disability	Non-serious
16	Medical Only	Non-serious
17	Contract Medical	Non-serious

For the WCSP policy year beginning April 1987, the payroll on the class 2014 A-sheet equals the NC-235 value of \$46,896,281.

The number of serious indemnity claims is 8 for major permanent partial claims, since no other serious claims were reported. The count of 76 for non-serious indemnity is the sum of the 26 minor permanent partial claims and the 50 temporary total claims.

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

The serious indemnity amount of \$826,023 is the reported limited serious permanent partial value of \$362,768 times the major permanent partial combined conversion factor of 2.277 from Appendix B-I Section B, Subsection (2). For non-serious indemnity, the \$421,640 value is the minor permanent partial value of \$221,814 times the combined conversion factor of 1.394 plus the \$81,002 of temporary total loss times the factor of 1.388. The medical amount of \$875,473 is the limited serious medical amount of \$285,105 times 1.544 plus the non-serious permanent partial, temporary total and medical only amounts of \$116,156, \$84,222 and \$69,809, respectively, times 1.611.

Similar calculations are performed for the other policy periods used for class ratemaking calculations. The partial pure premiums are calculated from these totals.

The class 2014 total modified serious amount of \$3,109,172 from Appendix B-II is divided by the total payroll (\$161,193,339) in hundreds of dollars to produce the total serious pure premium of \$1.929. The other indicated pure premiums are calculated by dividing the total modified losses for non-serious and medical losses by the same total payroll in hundreds of dollars.

2. Pure Premiums Underlying Present Rate

We have reversed the sequence that NCCI uses to present these pure premiums in Appendix B-II. We did this because the pure premium underlying the present rate is needed before the pure premium present on rate level can be derived.

The pure premiums underlying present rates can be calculated in a straight forward manner from the partial pure premiums developed in connection with the previous rate filing. Each of the three partial pure premiums from the previous rate filing is multiplied by adjustment factors which reflect the factors which are introduced after pure premiums are derived in developing rates. These factors include law amendments enacted after the rate analysis, any change in loss adjustment expense ratios, the change in the ratio of manual to earned premium, and the removal of the normalized adjustment applied to industry group differentials in the previous rate level.

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

The derivation of the class 2014 serious pure premium underlying present rates of \$2.204 is described below. The serious pure premium of \$2.171 from last year's filing is multiplied by the manufacturing group manual to earned premium change ratio of 1.017 which introduces the current experience rating plan off balance. The 1.017 factor to adjust for changes in the manual to earned premium level is calculated as follows. Class 2014 is a manufacturing class. The current manual to earned premium ratio for manufacturing classes, developed in Appendix D-I, is 1.013. The factor in the previous filing was 1.030. The adjustment factor of 1.017 is the ratio of the prior ratio and the current ratio ($1.017 = 1.030/1.013$). The 1.017 factor is multiplied by the serious pure premium of \$2.171 resulting in a product of \$2.208.

The result (\$2.208) is divided by the normalizing adjustment of 1.002 for the manufacturing group which is developed in Appendix D-II. Removal of this adjustment allows pure premiums to be at the level they would have been without wage growth differential changes. There were no late benefit adjustments or loss adjustment expense changes in the sample filing. ($2.204 = \$2.208 / 1.002$)

3. Pure Premiums Present on Rate Level

The pure premiums on rate level refer to the rate level that is now indicated by using the experience from the last review. It will be shown later in this sub-section that the effects of this year's overall experience review is reflected not in the pure premium exhibits but rather as a final step in calculating this year's manual rates.

The indicated pure premiums had the WCSP losses brought to a level such that those adjusted and developed losses would equal 71.85% of the current manual rates (See Section A.2.c.ii, above).

The pure premiums underlying the current manual rates were designed to produce a loss ratio of 72.85%. (See Exhibit II). To bring the pure premiums underlying the current rates to a level consistent with the apparent indicated change from last year's

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

experience review, a reduction of 1.4% is required $\{[(.7185 \div .7285) - 1.0] \times 100\%$. This is the calculation that produces the indicated premium level change factor of 0.986.

However, a second adjustment is needed to reflect the result of this year's WCSP review by industry group. These industry group differentials were derived in Appendix A-VII and represent the current relative need for rate correction by industry group. These two factors make up the Present on Rate Level Factors documented by NCCI in Appendix B-I, Section C, sub-section (c). For a manufacturing class, the present on rate level factor is 0.996 (0.986 x 1.010).

In the above example, for class 2014, the \$2.195 serious pure premium present on rate level is calculated by multiplying the underlying present rate serious pure premium of \$2.204 by .996 since class 2014 is a manufacturing class.

4. Pure Premiums Indicated by National Relativities

Pure premiums indicated by national relativities reflect countrywide experience adjusted to the approximate level expected for the state under review. This process is done separately for each partial pure premium: serious, non-serious, and medical.

In March of each year, a national database is produced using payroll and losses for all states where NCCI compiles workers compensation data. Individual state losses and exposures which are entered into the database are those obtained from the most recently filed rate filing available at the time. This data continues to be used for all state filings during the next twelve month period, and is not adjusted during the year to include updated experience. The sample filing which was effective on January 1, 1991 used indicated pure premiums from state filings which had effective dates between November 1988 and July 1990. The objective of NCCI's use of national relativities is to obtain an alternate estimate of the state's pure premium by class based on data from all other NCCI states. Use of this alternate estimate assumes that other state's experience by class can be adjusted to the level expected for the state.

In the sample filing for Illinois, NCCI calculates the indicated pure premium for each class with Illinois exposure. The indicated pure premiums by class are also calculated

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

for every other state. For each of these other states, a theoretical statewide average pure premium is derived. This average pure premium is the result of weighting each individual class pure premium in the state by the Illinois payroll distribution by class.

The ratio of the statewide average pure premium for Illinois is then taken to each and every other state's average pure premium. This ratio is then assumed to represent the average loss cost differential between Illinois and the other states. In other words, for each NCCI state, the NCCI data base now contains a factor that represents the average loss cost differential between Illinois and that state.

This factor, representing the average difference in loss costs between Illinois and each state, is then used as a multiplier to bring the pure premium for each class in the state to the approximate Illinois cost levels.

Then for each class, a countrywide average pure premium, adjusted to Illinois loss cost levels, is calculated. The countrywide average pure premium at Illinois cost levels for each class is the weighted average of each state's pure premium adjusted to Illinois cost levels with the weights being the payroll by state for that class.

This countrywide average excludes the state for which this filing is being prepared; in this case Illinois. The countrywide pure premium adjusted to Illinois cost levels is the pure premium indicated by national relativity.

NCCI recently became aware of a problem with this procedure, especially involving state special classifications. The problem arises in calculating the average loss cost differential for the state under review compared to each and every other NCCI state. If the class under review has payroll in a particular state but the other states do not, the pure premium for that class has been assumed to be zero but was weighted by that class' payroll in the state under review in calculating the statewide average pure premium.

To eliminate this problem, starting in 1991, NCCI will eliminate payroll from state special classifications in the calculation of national pure premium. In addition, the

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

calculation will balance the national pure premiums to the state's pure premium for each industry group in the state under review.

More detailed information on this process can be obtained from our report on Section II-B, Subsection 4 to the NAIC.

5. Pure Premium Derived by Formula

The derived by formula pure premium is calculated as a credibility weighted average of each of three partial pure premiums: the indicated, the present on rate level and the pure premium indicated by national relativity.

Credibility is an actuarial concept used to determine how much weight to assign to a particular body of data. Credibility factors are designed to assign weights in proportion to how well the data is expected to project future experience.

The usual first step in determining credibility values is to set a level at which the experience is assumed to be fully credible. In workers compensation classification ratemaking, NCCI sets separate standards for serious, non-serious and medical experience. The actual process of establishing 100% credibility standards is a two step operation.

First, for the serious pure premium calculation, the full credibility standard is set at twenty-five times the average serious loss. For non-serious pure premium calculations, the credibility standard is 300 times the average non-serious case. For medical pure premium calculations, the standard is a dollar amount equal to 80% of the non-serious full credibility standard. The calculation of the average serious and non-serious case is one of the early steps in rate level calculations. The documentation of this calculation is not in the rate filing but is contained in Form J of the workpapers provided by NCCI. Form J is presented in Appendix D-IV page 1. The claim counts and losses and loss adjustment expenses used in the average claim calculations are included as pages 2 to 5 of Appendix D-IV.

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

NCCI applies a second adjustment before setting the standard for 100% credibility. This adjustment is made in recognition that the credibility assigned to a class' partial pure premium will depend on its level of expected losses. The expected losses for a class equals the class payroll times the partial pure premium underlying the present rate.

The average costs per claim by component are derived directly from the WCSP data. As we have already seen, these losses are not at the same level that went into determining the overall rate level. Thus, an adjustment factor is calculated in column (10) of Form J to bring the average claim cost indications to the same level of costs contemplated by the expected losses by class.

Once full credibility standards are established, expected losses corresponding to other credibility levels are calculated. The expected losses required for a class which has lower expected losses than the full credibility standard is calculated for each credibility value by multiplying the expected losses for the full credibility standard by the square root of the cube of the credibility value. For example, in the Illinois sample filing, the standard for full credibility of serious losses is \$2,466,410. For a serious credibility value of .50, a class would need \$872,008 of expected serious losses. [$872,008 = (.5)^{3/2} \times 2,466,410$]. If the credibility for a particular expected loss amount is calculated, the formula uses the two thirds power of expected losses divided by the credibility standard [$.5 = (872,008/2,466,410)^{2/3}$]. Credibilities are calculated to two decimals and are truncated rather than rounded.

If the statewide experience for a class is not assigned full credibility, a credibility for national experience is also calculated. This calculation also involves two steps. The first step determines the indicated credibility based on the national experience. This initial national credibility depends upon the number of claims for the class included in the national experience. Specifically, the full credibility standards are:

- 25 serious cases for serious;
- 300 non-serious cases for non-serious; and
- 300 serious and non-serious cases for medical.

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

Partial credibilities for national experience by class are based on the same formula used for state partial credibilities by class.

The second step in the determination of credibility for national relativities is to limit the national credibility to no more than one-half the complement of the credibility assigned to state experience. NCCI imposed this limit on the maximum credibility assigned to national data to ensure that rates depend predominantly on data for the state for which the proposed rates are being calculated. Finally, the present on rate level pure premium is assigned a credibility equal to 1.00 minus the credibility for indicated pure premium and the credibility for the pure premium based on national relativities.

Credibilities by class are shown on the A-sheets in Appendix B-II. For class 2014 the state credibility for both serious and medical pure premiums is equal to 1.00. The derived by formula pure premium for these components is equal to the indicated pure premium. For non-serious, the state credibility is 99%, the national credibility is 0%, and the credibility for pure premiums underlying current rates is 1%. The pure premium of \$.736 derived by formula is calculated as .99 times \$.735 plus .01 times \$.795.

Class 2016 in Appendix B-II demonstrates the limitation on the credibility given to national relativities. For serious pure premiums, the state credibility is 32%. One half the remaining credibility or 34% is assigned to national experience (.68 x .5). If the national experience had supported a credibility lower than 34%, then the lower value would have been used. For class 2016, the serious pure premium underlying present rates is assigned the remaining weight of 34% (.34 = 1.00 - .32 - .34). The derived by formula serious pure premium of \$0.519 is calculated by weighting the pure premiums using these credibilities ($0.519 = .32 \times .345 + .34 \times .687 + .34 \times .514$).

Classes assigned zero credibilities for all three components based on both state and national data are referred to as non-reviewed classes. The ratemaking methodology for non-reviewed classes is discussed in the final sub-section of this discussion of class ratemaking.

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

APPENDIX B-III: COMPUTATION OF FINAL RATE OR LOSS COST

1. Reviewed Classes

Additional adjustments are applied to the derived by formula pure premiums to produce proposed loss costs or rates. The derivation of these adjustments is documented in Appendix B-III of the filing.

The first adjustments lead to composite factors which combine the financial data adjustment factor, the offset for changes in the minimum premium multiplier, and a test correction factor.

a. Financial Data Adjustment Factor

The financial data adjustment factor is calculated by dividing the average cost ratio derived in Exhibit I of the current filing by the average cost ratio from the financial call data developed in the previous filing. It was previously explained that the classification experience is adjusted to the premium levels implicit in the rates from the last experience review. It is now time to bring the classification experience to the indications from this year's experience review. The derivation of the 0.7185 on line (b) of the first section of Appendix B-III was explained on Page 64 of this chapter.

b. Minimum Premium Offset

A factor to offset the increase in premium that will result from a proposed change in minimum premium multipliers is introduced. The sample filing does not provide the documentation that shows how rates can be reduced by 0.04% while maintaining no change in premium levels. More information about minimum premium rules can be obtained from our report in Section II-B, Part 8.

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

c. Rates - Test Correction Factor

The Test Correction Factor is applied to the formula pure premium and is intended to ensure that the overall change in manual premium level calculated in Exhibit I has been achieved. Two major factors contribute to the need for a Test Correction Factor by industry group.

First, in developing the classification experience, limitations were placed on the amount of losses from any one claim or from any one accident with multiple claimants. The Test Correction Factor in effect spreads the impact of the loss limitation uniformly over each class within each industry group.

Second, as will be seen below, there are swing limits that apply to the amount of change that can occur from one revision to the next.

d. Other Factors

Parts (4)-(9) of Appendix B-III identify a number of other factors that need to be considered in calculating manual rates. Some of the more important actuarial considerations follow.

Separate factors are calculated for medical and indemnity trends by dividing the current trend provisions by the provisions in the previous filing. This year's indicated medical and indemnity trends are displayed in the sample filing in Section F of Appendix A-V. The medical and indemnity trend values in the current rates and incorporated in the classification experience are shown in Appendix B-I, Section B, line (e). The effects of changing the trends then, are:

**NCCI RATEMAKING PROCEDURES
CHAPTER 2 -STANDARD
METHODOLOGY**

	(1) <u>Current Rates</u>	(2) <u>Proposed Rates</u>	(3) Effect <u>(2) ÷ (1)</u>
Serious (Indemnity)	1.100	1.097	.997
Non-Serious (Indemnity)	1.100	1.097	.997
Medical	1.169	1.193	1.021

There have been a number of benefit changes that have been enacted since the last rate filing which also were not incorporated in this year's experience review. They are shown on part 5 of Appendix B-III.

Part 6 of Appendix B-III is necessary since the classification experience excludes the effect of the experience rating plan. The required overall premium level change derived in Exhibit I of the filing was in terms of the change in standard premium; that is, manual premiums after the application of the experience rating modification factors.

The assumption is that the future rates will have an average modification equal to the latest ratio of earned to manual. For the Illinois Manufacturing group that would be an earned to manual ratio of 0.987. Thus, if the proposed pure premium is multiplied by 1.013 when calculating the manual rates, then when those manual premiums are brought to a standard premium level by applying the average experience rating modification of 0.987, the manual rates will produce the desired standard premium level.

Pure premiums are converted to rates by dividing by the proposed target cost ratio. This target loss ratio was developed in Exhibit II of the sample filing and

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

reflects the proportion of future premiums expected to be available to cover losses and loss adjustment expenses.

NCCI limits changes in rates from one filing to the next to avoid extreme fluctuations for individual classes. In most states, the limitation equals the industry group change plus or minus 25%. If necessary, the rates of all classes with changes within the limitations are adjusted to produce the overall premium level change.

This sample filing produces both advisory rates and advisory loss costs. The loss costs do not include any provisions for expenses or profits and contingencies.

The advisory loss cost is calculated by removing from the advisory rates the provisions for underwriting expenses and profit, loss adjustment expense, and assessments. In other states, the components which may be included in loss costs may differ. If only loss costs are developed, the expense adjustments will not be introduced. A discussion of the provisions included in loss cost filings is included in a separate section of our report.⁹

2. Non-Reviewed Classes

Classes for which neither state experience nor national experience is given any credibility are referred to as non-reviewed. The calculation of the rate for a non-reviewed class rate is similar in concept to the reviewed class calculations with full credibility assigned to the pure premiums underlying the last approved rate. The revised pure premiums or rates are based on the last approved pure premiums. Industry group change factors are applied. An adjustment is introduced to reflect changes in manual to earned premium ratios and other adjustments since the pure premiums were calculated.

9 Implementation of Loss Costs, Section III of NCCI Examination, February 22, 1991.

**NCCI RATEMAKING PROCEDURES
CHAPTER 2 -STANDARD
METHODOLOGY**

Only a very small number of classes are currently non-reviewed since an assignment of credibility to any of the three pure premium components in the national data base would result in the classification being a reviewed class. NCCI periodically evaluates non-reviewed classes for discontinuance or merger into other classes.

**NCCI RATEMAKING PROCEDURES
CHAPTER 2 - STANDARD
METHODOLOGY**

IV. DETERMINATION OF FACTORS TO ADJUST INDIVIDUAL PREMIUMS

The final premiums paid by individual insureds depend on certain characteristics of the individual insured as well as rating rules that apply to all risks. An overview of these additional considerations are as follows:

- Expense Constants - All risks are subject to expense constants designed to cover expenses which are incurred on a per policy basis.
- Minimum Premiums - Small risks are subject to minimum premiums to reflect the exposure of the insurer for even the smallest insured.
- Premium Discount Factors - The expense provision is reduced for larger insureds by using premium discount factors which reflect differences in expenses by size of risk.
- Experience Rating Plan - The experience rating plan modifies premiums based on the employer's loss record.
- Ex-Medical Ratios
- Retrospective Rating Plan - The premium may further be adjusted through optional retrospective rating plans.

As previously mentioned, Schedule Rating Plans and Dividend Plans will not be discussed in this report.

Each of these items is discussed below.

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

A. Expense Constants

The expense constant is a provision for expenses which are not expected to vary by policy size. Fixed expenses associated with policy issue and recording are the primary components of the expense constant. The use of an expense constant is expected to make the allocation of expenses between insureds more equitable and to make insurers more willing to write small policies.

Countrywide expense constant indications are determined by NCCI using data from a 1982 study of expenses by size of risk. The indications are updated annually to recognize the impact of inflation on these expenses using trend factors based on consumer price index data. A more detailed discussion of expense constants is included in our report on Section II-B, Part 2.

B. Minimum Premiums

The minimum premium for each class is contained on Exhibit III of the Illinois sample filing. This minimum premium is calculated by multiplying the advisory rate by the minimum premium multiplier, adding the expense constant and checking that the value does not exceed the maximum minimum premium. The minimum premium multiplier in the sample filing is 105. The minimum premium for class 2014 of \$734 is calculated by multiplying the rate of \$6.28 by 105 and adding the \$75 expense constant.

The maximum minimum premium is a dollar amount which limits the impact of the minimum premium multiplier for classes with high rates per \$100 of payroll. The minimum premium for class 2014 is not limited since the calculation produces a value less than the maximum minimum premium of \$750 in the sample filing.

NCCI has indicated that its goal is to have the minimum premium multiplier produce a premium equal to the cost of insuring one employee for one year who earned the state average wage. To achieve this, the minimum premium multiplier would need to

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

be equal to the average annual wage divided by \$100. Current multipliers are substantially below this level in most states. For example, in the sample filing, the January 15, 1990 average weekly wage used to calculate benefit level adjustments is \$458.23 which translates to an annual wage of \$23,828, and a minimum premium multiplier of 238. The actual minimum premium multiplier is 105, or less than half the indicated amount.

C. Premium Discount Factors

Premium discount factors reflect the reduction of expected expenses on a percentage basis as the size of the premium increases. They are applied for any risk with a total annual standard premium in all NCCI states in excess of \$5,000.

Two schedules of premium discount factors are presented in the Miscellaneous Values section of Exhibit III of the sample filing. The first set is designed to be used by stock companies. The second set, which contains smaller discounts, is designed for non-stock companies. All insurers have the option of using either schedule. The lower discounts for non-stock companies reflect an expectation that policyholders of non-stock insurers will also receive dividends after the policies have expired.

A more detailed technical discussion of expense issues including premium discount factors is included in Section II-B, Part 2 of our report to the NAIC.

D. Experience Rating Plan

The state specific values used in the NCCI experience rating plan are revised in connection with each rate level analyses. A detailed explanation of the derivation of the experience rating plan factors is contained in an article prepared by NCCI.¹⁰ The key values derived are:

10 "Calculation of Experience Rating Values and Plan Parameters" by William R. Gillam dated February 28, 1990.

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

1. State Reference Point
2. Expected Loss Rates
3. D-Ratios
4. Ballast & Weighting factors

These state specific values are shown in Exhibit III of an NCCI filing. The Expected Loss Rates and D-Ratios vary by class and are shown on the rate pages. The state reference point is documented in the Table of Weighting Values also contained in Exhibit III.

1. State Reference Point

The experience rating modification factor for individual risks is calculated based on three years of WCSP detail data. The insured's losses used in experience rating are limited based on the state reference point (SRP). Individual losses are limited to 10% of the SRP and multiple claim accidents are limited to 20% of the SRP. The SRP is two hundred fifty times the state average cost per case rounded to the nearest \$5,000.

Statewide average claim costs used in calculating loss limitations are based on the three most recent years of WCSP data and utilize all types of claims. No development factors are applied in calculating the SRP since the loss limitation is compared to reported experience by insured which also has not been developed. A trend factor is introduced to adjust for differences between the experience period used in determining rating values and the period used in calculating the experience rating modification. The trend period generally varies between one and two years depending on the length of time between the rate level calculations and the proposed effective date of the filing. The trend is based on the countrywide average cost per case using combined medical and indemnity data.

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

To limit volatility and reflect the expectation that claim costs generally increase with inflation, the calculated values of SRP may be judgmentally modified. The SRP is not allowed to decrease between filings unless there has been a significant benefit reduction. Changes in excess of 20% are investigated to determine whether changes of this magnitude are reasonable.

2. Calculation of Expected Loss Rates

Expected Loss Rates (ELR's) by class are used to determine total expected losses in the experience rating plan. The ELR's that are shown in Exhibit III are the result of applying factors to the proposed manual rates. For example, the ELR for class 2014 shown in Exhibit III is \$2.31. This was calculated by multiplying the advisory rate of \$6.28 by a factor of .368. For an employer with \$1,000,000 of class 2014 payroll in the three years used in experience rating, that employer's expected losses would be \$23,100 ($\$23,100 = 2.31 \times 1,000,000/100$).

The factors used to derive the ELR's vary by hazard group. There are four hazard groups. The hazard groups are the NCCI's attempt to identify classes with different propensities to generate severe losses. The hazard group concept has been used for years in the NCCI's retrospective rating plans.

The experience rating modification is based on comparing the insured's actual reported losses during the three year experience period with the losses that the average insured could be expected to have reported. The NCCI ELR is intended to provide the estimate of the average insured's expected losses during the experience period.

To do this, NCCI begins with the proposed manual rate which is intended to provide funds for the losses and expenses to be incurred in the future. Thus the proposed manual rates are based on losses that are fully developed, brought to the latest known benefit levels, and trended to a date one year after the effective date of the rates.

The individual insured's losses that are used in calculating the insured's experience rating modification (ERM) are the reported losses under the WCSP Plan. The

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

proposed rates were assumed to be effective January 1, 1991 and to be effective for one year. ERM's calculated in 1991 will use the latest three policy years of experience evaluated and reported to NCCI prior to the 1991 renewal date.

For example, a risk renewing on July 1, 1991 would have the following WCSP data used in its ERM calculation:

<u>Policy Period</u>	<u>Evaluation Date</u>	<u>Report</u>
July 1, 1987-88	December 31, 1990	Third
July 1, 1988-89	December 31, 1990	Second
July 1, 1989-90	December 31, 1990	First

The losses for each policy year would be at the benefit level that existed at the time the claim was incurred.

NCCI's procedure for calculating the ELR's then is based on unwinding from the proposed manual rates the average amount of loss development, benefit level adjustments and trends originally applied to the WCSP data to construct the manual rates.

Some other considerations must be included in the process. The expenses and profit contemplated in the rates must be removed from the rate when calculating the ELR. The ERM calculation is based only on losses and not loss adjustment expense. Therefore, the loss adjustment expense provision is also removed.

NCCI also has a provision in the process for calculating ELR's that relates to the off-balance of the experience rating plan. It was previously noted in this report that the average overall effect of the experience rating plan is to generate more credits than debits. The NCCI procedure for calculating ELR's includes a factor of 1.01 as an off-balance adjustment factor. Studies by the NCCI Actuarial Committee indicate that an experience rating plan correct in aggregate will still result in an average modification below 1.00. The 1.01 factor serves to bring the off-balance closer to 1.00.

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

Finally, NCCI's procedure attempts to measure the percentage of losses that will not be incorporated in experience rating because of the per claim limitations. To do this, they use a similar procedure to that used to calculate excess loss premium factors for the optional retrospective rating plans. Therefore, this adjustment reflects the Hazard Group assignment of each class.

To sum up this discussion, the expected loss rate of \$2.31 per hundred dollars of payroll for class 2014 found in the sample filing is the NCCI's estimate of the average amount of WCSP losses expected to be reported for policies incepting in 1987-1989 at a third, second, and first report evaluation. These expected losses reflect a per claim limitation of \$88,000 and do not include any provision for loss adjustment expenses.

3. Calculation of D-Ratios by Class

The experience rating plan splits losses into a "primary" piece and an "excess" piece. The experience rating formulas handle aggregate primary and aggregate excess losses separately.

Discount Ratio Factors (D-Ratios) are ratios of expected primary losses to expected total losses for each class. Class D-Ratios multiplied by expected losses equal the expected primary losses used in experience rating plan calculations. The class D-Ratios are calculated by weighting serious, non-serious and medical D-Ratio factors. An exhibit documenting the derivation of the partial D-Ratio factors is included as Appendix D-V.

To calculate D-Ratios, statewide losses are separated between primary and excess using the experience rating plan definitions. Under the current experience rating plan, also referred to as the revised experience rating plan, (RERP), all losses under \$5,000 are primary as are the first \$5,000 of all other losses. Excess losses can be calculated as the difference between total reported losses and primary amounts for these losses.

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

In determining the primary and excess portion of losses, medical and indemnity components of a loss are summed. The first \$5,000 of the combined loss is considered primary. Estimated primary amounts for indemnity are calculated by multiplying \$5,000 by the ratio of indemnity to total loss for the claim. The primary medical loss is equal to \$5,000 times the medical proportion of the total loss. In this calculation, NCCI assumes the overall medical/indemnity split does not differ for primary and excess losses.

Average D-Ratio factors are calculated from the most recent policy year of WCSP data. This data is at the first report level. Use of data at a first report, where the full severity of serious cases is less likely to be known, may understate the excess proportion of losses and thus distort D-Ratio calculations. No per claim limitations are applied which are expected to increase the D-Ratio factor. NCCI indicates that the use of unlimited losses tends to overstate the excess component of losses. These two factors will tend to balance each other. An exact evaluation of the relative impact of the two factors was not provided by NCCI.

For class 2014 in the sample filing, the D-Ratio is .29. This value is calculated by multiplying the serious, non-serious and medical D-Ratio factors calculated in connection with the sample filing by the adjusted pure premiums in Appendix B-IV of the sample filing and dividing by the total pure premium (.29 = [.053 x 2.122 + .609 x .805 + .449 x 1.583] / 4.51).

Average D-Ratios are examined for reasonableness. Inflation is expected to cause D-Ratios to decrease if the dollar value used to separate primary and excess losses remains fixed. Increases or decreases of over 10% are investigated since these ratios are expected to remain relatively stable. Under the revised experience rating plan, the minimum D-Ratio is .25 and the maximum D-Ratio is .90 based on the assumption that no class is expected to have more than 75% of total losses or less than 10% of total losses in the excess layer.

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

4. Calculation of the Factors Used in the Experience Rating Plan

In Exhibit III of the rate filing, tables of ballast factors (B) and weighting factors (W) which are used in experience rating plan modification calculations are shown.

The W factor determines the weight assigned to the excess loss experience in the experience modification formula. The B factor provides stability and ensures that no risk has full credibility assigned to its excess losses. In the current experience rating plan formula, the B factor increases with expected losses but at a slower rate. Consequently, as a percentage of expected losses, the B factor decreases with size. The weighting and ballast factors are calculated based on the state reference point previously discussed.

A more technical discussion of the actuarial concepts in the NCCI's experience rating is contained in Section II-B, Part 7 of the M&R report on NCCI ratemaking.

E. Ex-Medical Ratios

Ex-medical ratios are used when a workers compensation policy is written which does not provide medical coverage. Most of the ex-medical policies, which represent a very small proportion of total premium, are for hospitals which are in the position to provide medical care to their own injured employees.

The ex-medical premium is calculated by multiplying the total class pure premium by 1.0 minus the ex-medical ratio. For class 2014 in the sample filing, which has an ex-medical ratio of .25, an ex-medical policy would cost \$4.71 per \$100 of payroll ($4.71 = 6.28 \times (1-.25)$).

The ex-medical ratio is developed by multiplying the medical pure premium for the class by 0.7 and dividing by the total class pure premium. Only 70% of the medical losses are assumed to be eliminated with an ex-medical policy to recognize the possibility that a small amount of residual medical exposure may remain with the insurance company in the event that the insured cannot pay the statutory benefits.

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

From Appendix B-IV, the adjusted medical pure premium for Class 2014 is \$1.583 and the total pure premium is \$4.51. This results in an ex-medical ratio of .25 as shown below:

$$\frac{.70 \times 1.583}{4.51} = .25$$

F. Retrospective Rating Plans

NCCI maintains retrospective rating plans. These plans are reserved for the optional use of those larger insureds who meet the premium size eligibility requirements.

In essence under a retrospectively rated policy, the insured agrees to pay a final premium that is a direct and linear function of his claims experience under the policy. This experienced based indicated retrospective premium is subject to a pre-specified minimum and maximum. The minimum and maximum are specified as percentages of standard premium.

NCCI's retrospective rating plans include tables of insurance charges and savings that vary by the size of premium of insured. The tables are intended to reflect the percentage of total losses expected to be incurred by insureds exceeding the maximum ("charge") and the percentage of total losses expected to be incurred by insureds having losses below the specified minimum ("saving").

Since the lowest possible maximum premium is the standard premium, the insured is, in effect, risking the amount of premium discount he would have received under a guaranteed cost program.

In addition to pre-specified minimum and maximum premiums another optional insurance feature is the advance election of a maximum single chargeable loss from any one occurrence. If the insured elects to have a loss limitation provision apply to

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

the policy, then a separate charge for this is made, referred to as "excess loss premium".

The optional use of retrospective rating is not expected to have any impact on NCCI's ratemaking procedures. The full losses of any retrospectively rated risks are reported to NCCI in the same manner as guaranteed cost insureds. While the final retrospective premium is reported to NCCI, the premium that is used in the ratemaking system is standard premium. That is, the premium under the policy prior to any deviations, premium discounts, schedule rating, or retrospectively rated provisions which may affect the final premium paid by the insured.

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

V. "F" CLASS RATEMAKING METHODOLOGIES

"F" classifications are those which include exposure under the U.S. Longshoremen's and Harborworkers' Compensation Act (USL&HW Compensation Act). The USL&HW Compensation Act provides for payment of compensation and other benefits to employees such as longshoremen, harbor workers, and ship repairmen while working on navigable waters in the United States. Injured individuals in "F" classifications often have the choice of receiving coverage under either federal or state laws. The state component of losses are referred to as state act losses. According to NCCI, approximately 70% of loss amounts for "F" class business are under the USL&HW Compensation Act. The "F" classification rate calculations in the sample filing are documented in Appendix B-V.

A-Sheets containing "F" class pure premium indications are produced at the same time of year for all states, since the evaluation involves the use of data for all states. The completion of "F" class rates for a particular state occurs at the same time as ratemaking for the industrial classes in that state and is included in the same rate filing package. State experience used in "F" class rate calculations may be based on a different experience period and may be developed to reflect different trend and benefit levels than were used in calculating rates for industrial classes.

Unlike the industrial classifications, no target rate level change based on financial data is used for "F" classifications. The "F" class rate level change is determined after the preliminary individual rates have been calculated. The rate level indication is derived by extending the payroll by the preliminary individual rates and the current rates and comparing the resulting premiums. Subsequent modification to the preliminary rates are made due to swing limits.

The pure premiums for "F" classes are calculated following procedures similar to those used for industrial class rates which have previously been described. Areas where changes are made to the methodology are discussed below.

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

In calculating indicated pure premiums, state act losses are brought to the current state benefit level and state assessment level, and federal act losses are brought to the most recent federal benefit level and federal assessment level.

A. Data Utilized

"F" class rate level indications are based on WCSP data. Because of historical data problems with the results of the special calls, no aggregate "F" class data from financial calls is used. Statewide experience is used to calculate "F" class rates. In states with separate voluntary and assigned risk rates for industrial classes, the same factors are applied to "F" class rates.

B. Adjustment to Reported Premium and Loss Data

Separate development factors and loss limits for ratemaking and experience rating are calculated for "F" classes. The development factors are based on countrywide "F" class data excluding Louisiana. Louisiana has the largest volume of "F" class data in the country. Since Louisiana experience varies substantially from countrywide data, NCCI indicated that Louisiana would distort indications for other states if it was included.

For development factor calculations, data through fifth reports is based on WCSP reports. Later development factors are based on a weighted average of state industrial class financial call data and District of Columbia financial call data. For the years under consideration, the District of Columbia used Federal benefit levels.

Trend adjustments are not incorporated in current "F" class calculations. A major benefit and coverage change was introduced in 1984 which distorts the data which was previously used to calculate separate "F" class trends. Five years of data will soon be available which would allow trend calculations to be performed again. Since the data used in "F" class filings is WCSP data, the lag between data and premium effective period is even longer than for overall ratemaking or class ratemaking.

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

Introduction of appropriate trends would be expected to produce more valid "F" class rate levels.

The reported insured experience for large insureds which are now self-insured may be removed from the rate level calculations, if it is expected to cause distortions.

C. Determination of Indicated Change

Indications derived from national experience pure premiums are based on the sum of losses for each state adjusted to a specific federal benefit level with a specified loss adjustment expense ratio. The national pure premium for each state is calculated by adjusting national pure premiums to state conditions. This adjustment reflects the percentage of state act losses, payroll limitations, loss adjustment expenses and state specific loss assessments. For states with only limited credibility, the countrywide federal-state split is used. A state currently is classified as a small credibility state if the three year total projected ultimate losses are less than one million dollars.

A derived by formula pure premium is calculated as a credibility weighted average of the pure premiums indicated by state experience (both federal and state benefits), the pure premiums indicated by national experience, and the underlying pure premium. State credibility is applied to the state experience, national credibility is applied to the national experience, and the residual credibility is applied to the underlying pure premium.

The derived by formula pure premium is adjusted to assure that the rates for these classifications reflect national experience. Adjustments are made if the derived by formula pure premium differs by more than 25% from the national experience pure premium in either direction. If the underlying pure premium is inside the range and the derived by formula pure premium is outside the range, or if the underlying pure premium and the derived by formula pure premium are both outside the range, but on opposite sides, then the boundary closest to the derived by formula pure premium is selected. If the underlying pure premium and the derived by formula pure

NCCI RATEMAKING PROCEDURES CHAPTER 2 - STANDARD METHODOLOGY

premium both exceed the limitation on the same side, then the one closest to the limitation is selected. If there is no national experience for a particular classification (e.g. a state special classification), then the derived by formula pure premium is used without adjustment.

D. Computation of Final Rate

1. Effects of Change in Indemnity Assessment

A U.S. Department of Labor loss assessment applies to claims made under the USL&HW Act. In some states, claims made under the state act require payment of a state loss assessment. The U.S. Department of Labor Assessment also applies to the Non-Appropriated Instrumentalities Act classification (9077F).

Loss assessments and benefit level factors are applied separately to federal and state losses where available. Weighted changes in loss assessments and benefit changes are applied to pure premiums where necessary since they reflect combined federal and state experience.

2. Manual to Earned Premium Adjustments

Separate ratios of manual to earned premiums are calculated for shipbuilding and repairs, stevedoring, and non-appropriated fund instrumentalities to reflect differences in the experience rating offset for these groups. These ratios are based on countrywide data excluding Louisiana to provide sufficient volume for credible indications.

3. Expense Allowance

In states where the rules of application for taxes on premium differ for federal classes, the target cost ratio for "F" classes differs from the ratio used for industrial classes.

NCCI RATEMAKING PROCEDURES CHAPTER 2 -STANDARD METHODOLOGY

4. Aggregate Update Factor

An aggregate update factor is introduced which reflects the ratio of unlimited to limited losses and development from fifth to ultimate reports. An adjustment for loss limitations is required since the final results are not balanced to a financial data indication based on unlimited losses. The factor used reflects a weighting of state fifth to ultimate factors and countrywide fifth to ultimate factors using losses as weights. The countrywide factor uses standard fifth to ultimate development factors developed based on data from the District of Columbia.

5. Test Correction Factor

Once all the appropriate factors have been applied to the derived by formula pure premiums, the payrolls are extended by the rates presently in effect and by the indicated rates. This determines the proposed rate level change. Swing limits of plus or minus 25% of the proposed rate level are then applied. An iterative process is initiated which continuously tests the indicated rates including the test correction factor until the required change in manual premium is obtained.

6. Federal-State Comparisons

A comparison is made between "F" classifications and the corresponding state act code. Since federal benefits are higher than most state benefits, it is assumed that the federal pure premiums should exceed the state pure premiums. If the total pure premium for an "F" classification is lower than its associated industrial classification, and federal benefits are higher than state benefits, an average pure premium is calculated by weighting the state and federal pure premiums using payroll as the weighting factor. This average pure premium is used to calculate the "F" class rate and its associated industrial class rate. A slight reduction in industrial class premium results with a corresponding premium increase for "F" classification. Percentagewise the impact on industrial classes is less than the impact on "F" classes due to relative premium volumes.

**NCCI RATEMAKING PROCEDURES
CHAPTER 2 - STANDARD
METHODOLOGY**

E. USL&H Factors

The USL&H factor is applied to the rate of insureds in non-"F" class businesses to reflect the portion of their exposure to the USL&H act benefits. The factor is intended to reflect the average benefit difference between the state act and the USL&H act benefits. The model used to estimate the impact of benefit level changes determines the factor as the ratio of the federal benefit cost divided by the state benefit cost. Interim updates are done by multiplying the existing factor by any federal benefit changes and dividing by any state benefit changes.

The USL&H factor is applied to the rate of insureds in non-"F" class businesses to reflect the portion of their exposure to the USL&H act benefits. The factor is intended to reflect the average benefit difference between the state act and the USL&H act benefits. The model used to estimate the impact of benefit level changes determines the factor as the ratio of the federal benefit cost divided by the state benefit cost. **NCCI RATEMAKING PROCEDURES
CHAPTER 3 - ALTERNATIVE
METHODOLOGIES**

**NCCI RATEMAKING PROCEDURES
CHAPTER 3 - ALTERNATIVE
METHODOLOGIES**

CHAPTER 3 - ALTERNATIVE NCCI RATEMAKING METHODOLOGIES

In the majority of states, the determination of the overall rate level change and class rates follows the standard methodologies. The type of data utilized and the factors selected may differ.

This chapter of the report discusses alternative methodologies, factors and data used in recent NCCI rate filings. The reasons behind the selection of the alternative methodologies and the implications of these changes are also discussed.

Alternate methodologies are often introduced when the standard methodology is expected to produce distorted results in a state. The choice of methods is based upon the judgment of NCCI. In addition, the selection of methods may reflect input from the state Classification and Rates Committee or a review of projections using alternative approaches.

Other changes in methodology, data or factors are often dictated by the Insurance Department or the insurance regulations of the state. This report only discusses the changes introduced by regulators which are expected to have the most impact on the NCCI ratemaking process.

State exceptions such as differences in minimum premiums, expense constants, provisions for expenses or differences in rules are not considered to be differences in methodologies or assumptions and hence are not discussed in this section.

NCCI RATEMAKING PROCEDURES CHAPTER 3 - ALTERNATIVE METHODOLOGIES

I. OVERALL RATE LEVEL INDICATIONS

A. Premiums and Loss Data Used

The standard filing uses one year of policy year and one calendar-accident year of experience to determine overall rate level change indications based on experience. The cost ratios based on these two types of data are given equal weight.

Some filings include two years of policy year experience in addition to one calendar-accident year of experience. Results based on the two policy years are averaged. The policy year average ratio is then given the same weight as the calendar-accident year ratio. This is generally done in small states on the recommendation of NCCI. The additional year of experience is expected to lend stability to the indications.

The average date of loss of the experience used in determining rate level change indications is earlier if two policy years of data are used than with the standard data. In the sample filing, the average date of loss for policy year 1988 was January 1, 1989. The average date of loss for calendar-accident year 1989 was July 1, 1989. Experience underlying the overall average rate level change had an average date of loss of April 1, 1989 (the average of January 1, 1989 and July 1, 1989). If policy years 1987 and 1988 had been used, the average date for policy years 1987 and 1988 would have been July 1, 1988. The overall average would have been January 1, 1989 (the average of July 1, 1988 and July 1, 1989) which is three months earlier than the average date with only one policy year of data.

B. Separate Treatment of State Fund Experience

For states with a competitive state fund which writes a large portion of the business, a separate analysis of state fund data is often performed. The areas where separate treatment is utilized reflect areas in which the state funds operate substantially differently from the private carriers.

NCCI RATEMAKING PROCEDURES CHAPTER 3 - ALTERNATIVE METHODOLOGIES

This separation is actuarially indicated since state fund distributions of policies by anniversary date are often substantially different from those occurring in commercial carrier experience. Adjustments to reflect these differences are addressed in the subsection on current level factors.

In some states, premium and loss development patterns and trend indications based on state fund data differ substantially from those experienced by private carriers in the state. The subsections on development factors and trend discuss the methods used to separately analyze and then combine the state fund and private carrier indications.

C. Separate Treatment of Assigned Risk Experience

In some states, the rates used to calculate assigned risk premiums are identical to those used for the voluntary market. In a number of states, a flat percentage differential is applied to the voluntary rates to obtain the assigned risk rates. Rate level increases have a similar effect on a percentage basis for both segments of the business in either of these cases unless the differentials are changed at the time of the filing. Other states modify assigned risk and voluntary rates separately based on the separate experience of these two segments of the business.

The sample filing illustrates an approach taken for a state which has had separate rate level changes for assigned risk business since 1983. The current level factor adjusts all premiums to the current voluntary rate level. This requires the calculation of separate current level factors for assigned risk and voluntary earned premiums. An additional adjustment is required to remove the cumulative assigned risk differential which has resulted due to differences in rate level changes since 1983. The current combined voluntary and assigned risk level factor in the sample Illinois filing is the weighted average of the voluntary and assigned risk current level factors with an additional adjustment to bring assigned risk premiums to the current voluntary rate levels.

This adjusts all premiums to the current voluntary rate level and market share. A more detailed description of assigned risk rating is contained in Section II-B subsection 8 of our analysis of NCCI ratemaking.

NCCI RATEMAKING PROCEDURES CHAPTER 3 - ALTERNATIVE METHODOLOGIES

D. Premium and Loss Development Factors

Selected age to age development factors are generally calculated by taking the average of the two factors which reflect experience in the two most recent experience periods at the appropriate maturity. After examining the two year indications, NCCI may decide to use more years of experience, eliminate the development factors for a particular year, or otherwise apply judgment in selecting factors.

In the 1990 filing cycle, rate levels based on a three year average were selected for one state even though the standard two year average had been used in the prior filing. The three years of data provided greater stability. The additional factors would have limited the impact of development patterns in the two most recent years if they contained distortions. The selection of the number of years of factors to use should be based on an actuarial review of the experience and the underlying forces influencing claim costs in the state.

In one of the filings in the most recent cycle the selected factors for first to second report medical development used only the most recent year's development factor. The development factor for the prior period was considered unreliable since it showed an unusual degree of loss development due to major reserving changes. The excluded factor was more than 20% higher than the selected factor. Use of a straight two year average would have increased the indicated calendar-accident year medical claim costs by 10%.

In some cases, development patterns may change so dramatically that none of the calculated development factors are expected to be appropriate. In these cases, NCCI makes judgmental selections. Such judgements might be required when a benefit change was expected to have a significant impact on claim payout and reserving levels. When development factor indications show a definite trend over time, and there were reasons to expect such trends to continue, judgmentally selected factors may reflect these trends.

**NCCI RATEMAKING PROCEDURES
CHAPTER 3 - ALTERNATIVE
METHODOLOGIES**

E. Treatment of Trend in Factors to Adjust Premiums to Current Levels

In most filings, the on-level factor includes an adjustment which removes the provision for trend contained in the prior rate level filing. Some filings use current level factors that do not remove trend.

The overall indicated rate level change does not depend upon which method is selected. When the current level factor does not remove trend, the trend factor introduces the full trend impact rather than the change in trend.

Filings with downward trend indications are most likely to exclude the trend factor removal from the current level calculation. NCCI indicated that negative trend adjustments are likely to cause confusion if they are presented in the standard manner. Their alternate method of presentation may also be confusing, since the standard wording such as, "indicated change based on experience" includes different components than in a filing following standard methodology.

The example below illustrates the differences which would result in the presentation if the downward trend was introduced in the standard manner and the equivalency of the results. In this example, the prior year trend from the average experience date to the average effective date is .90 and the current year trend for this period is .95 which produces an indicated change in trend of 1.056.

**NCCI RATEMAKING PROCEDURES
CHAPTER 3 - ALTERNATIVE
METHODOLOGIES**

	<u>Standard Presentation</u>	<u>NCCI Presentation</u>
A. Policy Year Adjusted Earned Premium	315,000	350,000
B. Policy Year Adjusted Incurred Losses	330,000	330,000
C. Policy Year Cost Ratio (B)/(A)	1.048	.943
D. Calendar Accident Year Adjusted Earned Premium	340,000	377,778
E. Calendar-Accident Year Adjusted Incurred Loss	350,000	350,000
F. Calendar-Accident Year Cost Ratio (E)/(D)	1.029	.926
G. Average Cost Ratio $1/2[(C)+(F)]$	1.0385	.9345
H. Target Cost Ratio	.700	.700
I. Indicated Change	1.484	1.335
J. Trend Adjustment	.950	1.056
K. Indicated Change Modified to Reflect Change in Trend (G)x(H)	1.410	1.410

F. Distribution of Policies Underlying Current Level Factors

Most NCCI rate filings use the countrywide distribution of policies by anniversaries to calculate current level factors.

NCCI RATEMAKING PROCEDURES CHAPTER 3 - ALTERNATIVE METHODOLOGIES

NCCI has tested for differences in policy effective dates by state.¹¹ Except for states where the state fund writes a large proportion of the business with common anniversary dates, they found no significant differences.

Many state funds write all policies or a large proportion of policies with a common expiration date. This changes the impact of rate level and benefit changes substantially. For example, if all policies expire on a particular date, the experience for a policy year beginning one year prior will be fully earned at that date rather than requiring the traditional twenty four months to be earned. Separate state fund current level factors are calculated for states where the state fund has a large market share and the state fund anniversary distribution differs from the overall distribution.

A few states require the use of distributions based on experience for that state only. According to NCCI, unless the differences from the statewide distribution are significant, use of state data will have little impact on overall rate level indications.

G. Calculation of Indicated Change Based on Experience

In states where state fund experience is analyzed separately, the private carrier and state fund average ratios are weighted based on their respective shares of calendar year standard earned premiums during the experience period. The combined rate level is proposed for both state fund and private carrier experience.

A simplified example of such a situation follows. In this example, the state fund writes half of the premium and has an average cost ratio 10% higher than the overall experience.

11 Memorandum on Effect of Distribution of Policy Effective Dates on On-Level Factors

**NCCI RATEMAKING PROCEDURES
CHAPTER 3 - ALTERNATIVE
METHODOLOGIES**

	<u>State Fund</u>	<u>Private Carriers</u>	<u>Total</u>
Earned Premium	\$1,000,000	\$1,000,000	\$2,000,000
Projected Average Cost Ratio	.990	.810	.900
Target Cost Ratio	.750	.750	.750
Indicated Change	1.320	1.080	1.200
Implemented Change	1.200	1.200	1.200
Expected Loss Ratio	.825	.675	.750

If the indicated 20% increase is implemented for all carriers, the State Fund is expected to have a loss ratio of 82.5% and the private carriers are expected to have a loss ratio of 67.5%. These ratios may or may not be appropriate for private carriers or the state fund depending upon their expense and profitability needs which may differ.

H. Calculation of Trend Indications

Trend factors are generally based on five years of policy year data. A larger number of years of data may be used in some state filings at the request of NCCI or the regulator.

Accident year data rather than policy year data is used for trend calculations in some states in response to requests by regulators. NCCI indicated that policy year data is more reliable.

NCCI RATEMAKING PROCEDURES CHAPTER 3 - ALTERNATIVE METHODOLOGIES

In some filings, separate trend factors are calculated based on state fund and private industry data. A weighted average trend is used in the rate level change calculations. If the trends differ widely, the combination may lead to rate levels which are adequate in the aggregate but do not reflect the expected costs for either segment of the business. If different trend factors were applied to each segment, the magnitude of the expected differences in experience between groups would be more clear.

The determination of the appropriate trend factor for a state which has recently introduced a medical fee schedule requires the modification of standard methodologies. Medical trends are lower in states which have an effective medical fee schedule than in states without a medical fee schedule. A "bent-line" trend factor is calculated which uses two separate trend factors with the change in trend occurring at the date of the implementation of the medical fee schedule. The trend based on state experience with no medical fee schedule is used for periods prior to the implementation of the fee schedule. The trend factor for periods after implementation of a medical fee schedule is based on the countrywide trend for states with an effective fee schedule modified to reflect the ratio of the state trend prior to the fee schedule to the countrywide trend for states with no fee schedule.

To illustrate the "bent-line" trend, we will assume that the state being evaluated had a medical fee schedule adopted on January 1, 1990. The state medical experience supports a medical trend of 12% which was 20% higher than the 10% countrywide trend for states with no fee schedule. In this example the countrywide trend factor for states with effective medical fee schedules is 5%. The state trend used for the period after the fee schedule is implemented will be 6%. ($5\% \times 12\%/10\% = 6\%$). In calculating rate level indications, experience will be projected to January 1, 1990 levels using the 12% trend and then projected to the average effective date for proposed rates using the 6% trend factor.

In certain states which have had downward trend indications, regulators do not permit credibility weighting of state trend indications with the countrywide trends. In these cases, NCCI uses a trend of unity which assumes that losses grow at exactly the same rate as payrolls.

NCCI RATEMAKING PROCEDURES CHAPTER 3 - ALTERNATIVE METHODOLOGIES

In certain circumstances, such as significant legal or economic changes in the state, the trend factors may be judgmentally modified. Actuarial judgment must be introduced when the historical indications cannot be adjusted to reflect changes in conditions.

I. Evaluation of Provisions for Profit and Contingencies

For many years, the standard provision for profit and contingencies in an NCCI rate filing has been 2.5% of premium. Today many states do not permit the use of the standard profit and contingencies margin of 2.5%. Some states specify the formulas to be used in calculating the indicated provisions. Others specify a percentage provision for profit and contingencies in the filing approval order.

NCCI has developed an internal rate of return model for testing the profit and contingency provisions in rate level proposals. This model is designed to project all cash flows associated with a group of policies written uniformly during the policy effective year with \$1 million of net earned premium.

NCCI has also developed a cost of capital model which examines a number of financial ratios for selected commercial casualty companies and uses their experience to evaluate target rates of return.

The material supporting the internal rate of return and target rate of return projections are included with some filings and are provided on request in other states. Regulators in some states have not accepted the NCCI's methodologies and have required that other approaches be used.

Except for the relatively brief reference on this page, which was included for the sake of completeness, the M&R examination of NCCI did not analyze the NCCI's methodology for determining profit and contingency loadings. M&R and the states conducting this examination agree that this topic is important in workers compensation ratemaking.

**NCCI RATEMAKING PROCEDURES
CHAPTER 3 - ALTERNATIVE
METHODOLOGIES**

This agreed-upon importance notwithstanding, the states conducting this examination chose not to include this topic within the scope of the work to be performed by contractors engaged in the NCCI examination. The states made this decision based on their perception of potential costs and also based on their perception that any such study would be likely to only add to the literature in the area, rather than provide definite direction to regulators and to NCCI.

**NCCI RATEMAKING PROCEDURES
CHAPTER 3 - ALTERNATIVE
METHODOLOGIES**

II. CLASSIFICATION RATEMAKING

A. Calculation of Industry Group Differentials

Certain states do not use industry group differentials. For a state that does not have a credible amount of experience in one or more of the industry groups, the use of industry group differentials may not improve rate equity.

A few states specify that selected classes be reclassified to a different industry group than the one generally assigned by NCCI in order to reflect the type of business performed for insureds in these classes in the state. An additional industry group was developed in Alaska for the oil and gas industry. In Alaska, these classes represent a credible subset of the state experience which is subject to substantially different economic forces. In most states, these classes would probably not have enough experience to produce credible indications.

B. Calculation of Class Rates

The credibility standards for assigning full credibility to national experience generally require 25 serious cases and 300 non-serious cases. In Alaska, NCCI uses 50 serious and 600 non-serious cases for full credibility of national experience. The standard for full medical credibility in Alaska is a total of 600 actual serious and non-serious cases. A special study performed for the Alaska Division of Insurance indicated that a specified number of claims from the state would be expected to better predict state losses than an equal number of adjusted countrywide claims.

**NCCI RATEMAKING PROCEDURES
CHAPTER 3 - ALTERNATIVE
METHODOLOGIES**

C. Modification of Swing Limits

Lower swing limits than the standard 25% are used in several states at the request of the insurance department. In the 1990 rating cycle, a number of states required lower swing limits.

The limitation of class rate level changes using swing limits does not change the overall premium income. Whenever classes have their rate changes limited, the remaining classes will have their existing rate indications adjusted through the application of the test correction factor.

A simple example may clarify the impact of varying the level of swing limits.

	<u>Class A</u>	<u>Class B</u>	<u>Total</u>
Premium	\$200,000	\$800,000	\$1,000,000
Indicated Change	1.430	1.0175	1.100
Modified for 25% swing limit	1.350	1.0375	1.100
Modified for 10% swing limit	1.200	1.0750	1.100

If a 25% limitation is applied, class A will have a rate level increase of 35% since the total (industry group) increase is 10%. Class B will have a rate increase of 3.75%. This is the amount required to produce the overall 10% increase. The adjustment required to produce the indicated overall change is relatively small.

If a 10% limitation were applied, class A would have an increase of 20% and class B would have a 7.5% increase.

**NCCI RATEMAKING PROCEDURES
CHAPTER 3 - ALTERNATIVE
METHODOLOGIES**

Some loss cost states do not permit the imposition of swing limits. It is then the responsibility of the individual insurers to introduce limitations and adjust premiums for all classes to produce the selected overall rate level.

**NCCI RATEMAKING PROCEDURES
CHAPTER 3 - ALTERNATIVE
METHODOLOGIES**

III. INDIVIDUAL RISK MODIFICATIONS

A. Assigned Risk Premium Modifications

In recent years, a number of programs have been developed to more equitably allocate costs between voluntary business and assigned risks.

Some states use lower premium discount factors or no premium discount factors for insureds written through the assigned risk plan. This creates the situation where larger insureds in an assigned risk pool will end up paying a relatively greater penalty. Reasons for this treatment sometimes include:

- a. Many regulators feel that smaller insureds have fewer alternatives available to them in terms of how their insurance is placed; hence it is "fairer" that larger insureds, which ostensibly have more control, are assessed a larger assigned risk penalty.
- b. Many regulators feel that smaller insureds are often placed in assigned risk plans without a thorough underwriting review, where large insureds are much more likely to have been closely reviewed prior to declination. If one accepts these presumptions, then it would appear that larger insureds in an assigned risk plan might tend to be of relatively poorer quality than smaller insureds.

We did not undertake to confirm these or similar presumptions, or attempt any study of indicated differentials by size of risk. We are aware that the entire assigned risk area, including consideration of questions like these, is the recipient of ongoing scrutiny by both NCCI and the regulatory community.

Other states include premium discount factors for those in the assigned risk plan only if they qualify based on the size of their experience rating modification factor. Under such a plan, a risk with a .80 experience rating modification would receive

NCCI RATEMAKING PROCEDURES CHAPTER 3 - ALTERNATIVE METHODOLOGIES

premium discounts, but a risk with a 1.20 modification would not. The large risks with favorable experience are given the benefit of premium discounts.

Several states have adopted an additional experience rating plan for the assigned risk program. This program, known as the Assigned Risk Adjustment Program (ARAP), introduces an additional debit on risks whose actual losses were higher than expected losses which have already been modified by the experience rating plan. Surcharges are limited based on the size of the risk. For risks with expected losses of \$2,500 the maximum additional charge is 9%. A maximum surcharge of 49% is imposed for risks with over \$40,000 of expected losses.

A second program, the Assigned Risk Rating Plan (ARRP) has also been accepted in some states. This program develops premium surcharges for assigned risks over \$50,000 that have poor loss experience. For more details on how residual markets affect ratemaking, please see our report in Section II-B, Subsection 8.

a-RATES ("GUIDE" a-RATES)

Classifications whose diversification of experience cannot warrant normal manual rating are 'a'-rated. Estimated rates are obtained from NCCI or another licensed rating organization until an inspection of the insured's activities can be made.

A-SHEET CONVERSION FACTORS

These factors are calculated by injury type for the latest three report policy periods and one three-year fixed rate policy period. They are applied to the corresponding NC-235 losses for each class code to obtain A-Sheet losses. They contain amendment factors, loss development to an ultimate report, loss assessments (if applicable), policy and calendar-accident year adjustment, trend(s) (if applicable), and loss adjustment expense (when applicable).

A-SHEETS (PURE PREMIUM EXHIBITS)

This exhibit contains, for each classification, payrolls, losses on current level (see A-Sheet Conversion Factors), credibilities for state and national partial pure premiums, as well as the following pure premiums (see Pure Premiums) by serious indemnity, non-serious indemnity and medical parts:

1. Indicated by Experience
2. Present on Rate Level
3. Underlying Present Rates
4. Indicated by National Relativity
5. Derived by Formula

ACCIDENT YEAR

A loss accounting definition whereby experience is summarized by the calendar year in which an accident occurred.

NCCI RATEMAKING PROCEDURES GLOSSARY

ACCIDENT YEAR CALL

A request for premium and loss experience reported by accident year. (Reference: Financial Call).

BASIC MANUAL ON WORKERS COMPENSATION INSURANCE AND EMPLOYERS LIABILITY

This manual contains the rules in use in Workers Compensation and Occupational Disease and a description of each rule. It also contains the following:

- Administrative Bureau Rules and Procedures
- Premium Discount Tables
- Cancellation Tables
- Classifications
- Underwriting Guide
- Interpretation Section: Classifications, Auditing, Basis of Premium, Manual Rules, Miscellaneous, Overtime, Payroll Limitation, Premium Discounts, Experience Rating, Retrospective Rating
- Manual Supplement - Treatment of Disease Coverage
- Rates and Rating Values Including Special Classifications

BULK RESERVES

Those outstanding reserves for general case reserve inadequacy, supplemental case reserves, cases that may reopen, or other (non IBNR) reserves which are not associated to specific claims. (Reference: Financial Call).

NCCI RATEMAKING PROCEDURES GLOSSARY

CALENDAR YEAR CALL

A request for companies to submit aggregate data for the specified calendar year. (Reference: Financial Call).

CASE RESERVES

Those outstanding reserves established for specific known cases.

CONTRACT MEDICAL OR HOSPITAL ALLOWANCE

A payment made by an insurance company to cover medical costs provided to the injured worker by the employer. Injury code #17 on the WCSP NC-235's.

"CORR" FILE

A temporary correction file used to store financial call data corrections when determination of a state's rate level is in progress.

CREDIBILITY

A weight, ranging from 0 to 1, assigned to a certain body of data. NCCI applies credibility in its trend methodology, its classification ratemaking methodology, and its experience rating methodology.

CREDIBILITY COMPLEMENT

Unity less credibility.

NCCI RATEMAKING PROCEDURES GLOSSARY

CRITICAL VALUE

The amount of indemnity losses determining whether a permanent partial claim is classified as major or minor. If the indemnity portion is greater than or equal to the critical value, then the injury type is major permanent partial. If the indemnity portion is less than the critical value, then the injury type is minor permanent partial.

"D" RATIO

Represents the ratio of expected primary losses to total expected losses for a given classification.

"D" RATIO FACTORS

Used in the "D" ratio formula, these factors are calculated for application to serious, non-serious, and medical pure premiums. (Reference: "D" Ratio Formula).

"D" RATIO FORMULA

As follows:

$$\begin{aligned} & [(\text{Serious "D" ratio factor} \times \text{Serious pure premium}) \\ & + (\text{Non-serious "D" ratio factor} \times \text{Non-serious pure premium}) \\ & + (\text{Medical "D" ratio factor} \times \text{Medical pure premium})] \\ & \div \text{Total Pure Premium.} \end{aligned}$$

"D" ratios are limited to plus or minus .1 from the last approved rate's "D" ratio. In most states, "D" ratios cannot be less than .25; nor can they exceed .90.

NCCI RATEMAKING PROCEDURES GLOSSARY

DATA REQUEST FORM

Describes the workers compensation statistical plan policy periods to be used in the upcoming state experience filing. Also denotes critical values, current A sheet Loss Limitation (to limit NC-235 losses), current master and the Phase I Volume Checks.

DETAILED CLAIM INFORMATION

Information on an individual claim basis which provides detail on the components of the loss. This is obtained through a separate call on a sample basis.

DEVELOPMENT FACTOR

Ratio of losses (premium) at a given age divided by losses (premium) at a prior age.

EX-MEDICAL RATE

Policies may be endorsed to exclude medical coverage (e.g. hospitals). The carrier does not provide medical payment for this coverage, and a manual rate is calculated.

Formula: $(1 - \text{Ex-Medical Ratio}) \times \text{Rate}$

EX-MEDICAL RATIO

Ratio used to calculate Ex-Medical Rate.

Formula: $.7 \times \text{Proposed Medical Pure Premium} / \text{Proposed Total Pure Premium}$

(Note: The .7 assumes the carrier is still liable for some portion of the medical on an ex-medical policy. It also assumes that the loss adjustment expense and the general expense will be the same for an ex-medical policy as for a full coverage policy, but production, taxes and profit will be lower for an ex-medical policy).

NCCI RATEMAKING PROCEDURES GLOSSARY

EXCESS LOSS FACTORS (ELF)

Excess Loss Factors are percentages of standard premium paid by the policyholder in lieu of being charged for losses above a selected limit per accident. The charges vary by hazard group to reflect the differences in expected frequency and size of claim. Excess Loss Factors are only used in the Retrospective Rating Plan.

EXPECTED ANNUAL TREND

Estimated annual amount of increase in loss ratio. It is used to the extent that the indemnity and/or medical trend indications based on an individual state's experience is not credible. It is based on the sum of the data for states where the NCCI calculates trend factors.

EXPECTED LOSS RATES (ELR)

ELR's are used in the experience rating calculation. An ELR estimates average loss levels (losses per \$100 of payroll) of a classification for the experience rating plan experience period. The ELR factor is calculated for each hazard group and is applied to the manual rate to obtain the expected loss rate.

EXPECTED LOSSES

1. In classification ratemaking: the class payroll in hundreds multiplied by the partial pure premium underlying the current rate (not the A-Sheet pure premiums). Used to calculate state credibility.
2. In experience rating: the payroll in hundreds multiplied by the expected loss rate.

NCCI RATEMAKING PROCEDURES GLOSSARY

EXPERIENCE MODIFICATION (MOD)

A factor calculated from actual case loss experience (unit cards) used to adjust an insured's manual premiums (up or down) based on the insured's loss experience relative to the average underlying the manual premiums.

EXPERIENCE PERIOD FOR RATEMAKING

The time interval from which the loss and premium data was extracted.

EXPERIENCE PERIOD FOR TREND

The time interval from which the indemnity (medical) loss ratio data was extracted.

EXPERIENCE RATING

A mandatory form of individual risk rating which takes into consideration the loss experience of the particular insured (or "risk") relative to the industry average. (Applies only to insureds meeting Premium Eligibility Requirements).

EXPERIENCE RATING ELIGIBILITY REQUIREMENTS

In states where Item E-1215 is effective the minimum premium required for experience rating eligibility is approximately equal to the standard earned premium generated from ten average workers. The state average earned rate and the state average wage are used in determination of the eligibility requirements.

NCCI RATEMAKING PROCEDURES GLOSSARY

EXPERIENCE RATING PLAN MANUAL FOR WORKERS COMPENSATION AND EMPLOYERS LIABILITY

Contains the rules that govern the Experience Rating plan in connection with Workers Compensation and Employers Liability insurance.

EXPOSURE

For most classifications, the total dollar amount of covered payroll in units of \$100. Number of employee years is used instead of payroll for "per capita" classifications.

EXTENDED TERM

A policy that extends past 12 months and 15 days in length. Unit statistical cards are required separately for the first 12 month period and each subsequent period of 12 months or less.

FINANCIAL CALL

A request for financial information from the carrier. Financial calls are required for each state. This information is used to generate aggregate rate level indicators, reconcile reported data for expense analysis and for certain state specific calculations and regulatory reports. There are three primary financial calls - Accident year, Calendar year and Policy year.

FINANCIAL DATA

Policy year, accident year, and calendar year data are collected on an overall basis and are referred to as financial data because they can be reconciled to a company's annual statement.

NCCI RATEMAKING PROCEDURES GLOSSARY

FINANCIAL DATA ADJUSTMENT FACTOR

The factor to adjust the financial data loss ratio used in the A-Sheets to the final loss ratio. The factor is used in the calculation of the Rate Level Adjustment Factor.

FIRST REPORT (FINANCIAL CALL)

For the accident year financial call, the first report is as of the end of the accident year (i.e. 12 months). For the policy year financial call, the first report is as of 24 months after the start of the policy year.

FIRST REPORT (WCSP)

For the first Workers Compensation Statistical Plan unit report filing; the first report contains policy year payroll, premiums and claims valued as of the 18th month after the policy became effective.

FORM H

Displays by classification the payroll, premium at current manual rate, expected losses and credibilities by parts.

FORM J

Determines the amount of expected serious, non-serious and medical losses necessary for full state credibility. This exhibit is included in the Workers Compensation Statistical Plan data request.

NCCI RATEMAKING PROCEDURES GLOSSARY

FORM R

Totals by industry group and policy period, showing payroll and premium at current manual rates. Part of the Workers Compensation Statistical Plan data request.

FREE FLOW

Unit card data which can be processed without manual intervention through the experience rating system.

FREQUENCY

Number of claims divided by exposures in a given period.

INCURRED BUT NOT REPORTED (IBNR)

IBNR refers to losses estimated for events that will result in claims but have not yet been reported to insurers. It also may include "bulk" reserves for estimated future development of case reserves. Carriers are required to report IBNR on the financial calls.

INDEXING

The process of assigning a risk ID to a unit card.

INJURY TYPE

NCCI classifies injuries as one of the following:

1. death
2. permanent total

NCCI RATEMAKING PROCEDURES GLOSSARY

3. major permanent partial
4. minor permanent partial
5. temporary total
6. medical only.
7. contract medical

INTERSTATE RISK

Policyholder with payroll (exposure) in more than one state where interstate rating has been adopted.

INVESTMENT INCOME

That part of a company's income that stems from the interest and dividends earned on the stocks and bonds it owns or the return on any other investment in which it has put its funds.

LAW AMENDMENT FACTOR

Factor that adjusts losses for any changes in the law.

LOSS ADJUSTMENT EXPENSE (LAE)

Includes the cost of investigating cases, representing the employer before claims adjudicating bodies, defending law suits and so forth. The allowance for loss adjustment expense includes both allocated and unallocated expense since workers compensation reported losses exclude all loss adjustment expense (except Coverage B employers liability claims).

NCCI RATEMAKING PROCEDURES GLOSSARY

LOSS COST

The portion of workers compensation rates consisting of projected losses. Expenses and profits are not included in loss cost.

LOSS RATIO

Losses divided by premium in a given period.

LOSS RATIO ADJUSTMENT PROGRAM (LRAP)

A plan that increases the Experience Rating Plan's responsiveness to an individual construction employer's actual claim experience through the application of additional premium credits or surcharges. LRAP was applicable in Illinois, Maryland, Nebraska, and Oregon but has since been discontinued.

MANUAL PREMIUM

Payroll, in hundreds of dollars, multiplied by the manual rate.

MANUAL RATE

The unit cost which is multiplied by the employer's payroll to determine manual premium.

MASTER-FINAL PASS RATES

The final computer printout listing class codes, run and effective date of rates, approved updated pure premiums by serious, non-serious, medical and total, approved rates, disease elements and "D" ratios. This printout of classification code

NCCI RATEMAKING PROCEDURES GLOSSARY

rates and rating values is used as the base upon which the next proposed rate change is run.

MERIT RATING

State mandated program to provide a factor for premium adjustment based on past loss experience of a risk. Merit rating differs from experience rating in that merit ratings are determined for policies with premiums below the Experience Rating threshold.

MIDTERM CANCELLATION

One party cancels the insurance contract after the effective date but before the expiration date.

MINIMUM PREMIUM

The minimum price for writing a workers compensation policy based upon the following formula:

Rate (including disease loading) x Minimum Premium Multiplier + Expense Constant.

(Note: This formula does not apply to per capita classes).

MINIMUM PREMIUM MULTIPLIER

The minimum premium multiplier is a component of the minimum premium formula. It was originally calculated to reflect the state average annual worker's wage ((average weekly earnings x 52 weeks)/100), but limited to a maximum annual increase of 10 units.

NCCI RATEMAKING PROCEDURES GLOSSARY

For example, the minimum premium multiplier in Alabama should be the average annual workers wage in hundreds rounded to the nearest 5 $((294.79 \times 52)/100 = 150)$. The Alabama minimum premium multiplier is, however, subject to the maximum increase of 10. Since the May 1, 1986 minimum premium multiplier is 105, the June 1, 1987 minimum premium multiplier cannot increase to 150. It is limited to 115.

MIP

Monetary Incentive Program or fining program used by NCCI to encourage timely and accurate submission of experience by carriers. Also known as PEMIP.

MONOPOLISTIC STATE

State where workers compensation coverage is written by a state fund with no competition from commercial carriers.

NATIONAL DATA BASE

A compilation of the latest approved indicated A-Sheet experience for every state. It is used to derive the pure premiums indicated by the National Relativity.

NC-235's

Compilations of Workers Compensation Statistical Plan data which show payroll, earned and manual premiums, number of cases and indemnity and medical losses by injury type. For individual class NC-235's, losses from individual claims are limited to 20% of the self-rating point, and for multiple claims are limited to 40% of the self-rating point. (Under SERA the A-sheet limitation point will no longer be called the self-rating point).

NCCI RATEMAKING PROCEDURES GLOSSARY

NCCI

National Council on Compensation Insurance.

NET PREMIUM

Premium resulting from the application of premium discounts and retrospective adjustments to standard premium.

NEW BUSINESS

Policies newly written by an insurance carrier.

NON-FREE FLOW

Unit card data which requires manual intervention to continue processing through the experience rating system.

NON-RATED RISK

An insured risk which is not subject to experience modification of policy premium.

ON-LEVEL FACTOR

Factor that adjusts premium (losses) to the current premium or law level.

ON-LEVEL LOSSES

Losses from a prior period multiplied by the on-level factor to arrive at losses on the same base as those in the current period.

NCCI RATEMAKING PROCEDURES GLOSSARY

ON-LEVEL PREMIUM

Premium from a prior period multiplied by the on-level factor to arrive at premium on the same base as those in the current period.

OUTSTANDING (EXCLUDING IBNR) LOSSES

In the financial calls, this definition is intended to capture case reserves and bulk reserves (see separate definitions of these two reserve components). For some carriers, this item will include case reserves only. (Reference: Financial Call).

PAYROLL/LOSS DETAIL (P/L DETAIL)

The individual class records, taken from unit cards, for a particular state and policy period. The class records are separated into exposure (usually payroll) and loss records.

PEMIP

Performance Evaluation Monetary Incentive Program or fining program used by NCCI to encourage timely and accurate submission of experience by carriers. Also known as MIP.

PER CAPITA CLASSIFICATION

A classification which uses the number of worker years rather than payroll as the exposure base. Private residence workers (servants, drivers) fall into this category. Per capita classification rates are rounded to a whole number, and the minimum premium is usually the rate plus the expense constant.

NCCI RATEMAKING PROCEDURES GLOSSARY

PERMISSIBLE LOSS RATIO

The target cost ratio excluding loss adjustment expense.

PICS

NCCI database of carrier policy information (Policy Issue Capture System).

POC STATE

Proof of Coverage State. States that use NCCI database to verify workers compensation coverage.

POLICY EFFECTIVE DATE

Effective date of coverage for a policy; starts WCSP unit reporting cycle.

POLICY REGISTER

A record of key data (number, effective date, coverage states, etc.) for all policies maintained in a carrier database.

POLICY YEAR

A premium and loss accounting definition whereby experience is summarized for all policies with effective dates in a given calendar year period.

NCCI RATEMAKING PROCEDURES GLOSSARY

POLICY YEAR CALL

A request for premium and loss experience reported by policy year. (Reference: Financial Call).

POLICY YEAR DATA

The premium and loss associated with policies with effective dates in a given calendar year period.

PREMIUM THRESHOLD

Annual or two-year average premium payment level that qualifies a risk for experience modification. Each state sets its own threshold.

PRIMARY LOSS

Used in experience rating. Under the revised experience rating plan, it is the portion of a loss up to \$5,000. The prior experience rating plan contained a formula to produce primary losses. The effective date for the new \$5,000 threshold varies by state. Primary losses are used to avoid unreasonable effects of very large losses on an insured's experience modification factor in the experience rating plan.

PROFILE SYSTEM

NCCI system containing the last calculated experience rating and unit reports received since the last rating.

NCCI RATEMAKING PROCEDURES GLOSSARY

PROOF OF COVERAGE CARD

Document sent to the state notifying it of a company's workers compensation coverage.

PROOF OF COVERAGE STATE

States that use the NCCI database to verify workers compensation coverage.

PURE PREMIUM DEPARTMENT

The actuarial department within NCCI that calculates development factors, industry group differentials and cost ratios and produces certain exhibits for class ratemaking. The Pure Premium Department produces the A-Sheets (using calculated loss development factors, industry group differentials and other factors) and certain exhibits for class ratemaking.

PURE PREMIUMS (A-SHEETS)

1. Indicated by Experience - Workers Compensation Statistical Plan experience from class NC-235's adjusted to current level of benefits, and to reflect loss adjustment expense, trend and financial data, developed to an ultimate and divided by payroll in units of one hundred dollars.
2. Underlying Present Rates - On A-Sheets, the pure premiums from the last rate revision, adjusted for the most recent off-balance of the Experience Rating Plan and any subsequent law changes since the last rate revision.
3. Present on Rate Level - The A-Sheet underlying pure premiums adjusted to the level of the current financial data.

NCCI RATEMAKING PROCEDURES GLOSSARY

4. Indicated by National Relativity - See Frank Harwayne's paper, "Use of National Experience Indications in Workers Compensation Classification Ratemaking." (PCAS, Vol. LXIV, 1977, p. 74). Pure premiums reflect the countrywide experience as indicated by the latest available individual classification experience for all states for which the National Council compiles data.
5. Derived by Formula - Weighted combination of indicated present on rate level and indicated by national relativity pure premiums.

(state credibility x indicated pure premium) + (national credibility x pure premium indicated by national relativity) + [(1 - state credibility - national credibility) x pure premium on present rate level]

PURE PREMIUMS UNDERLYING RATES

1. Present: These are the serious, non-serious and medical pure premiums underlying the rates currently in effect. They are obtained from the master, and are used to obtain pure premiums on the next set of A-sheets.
2. Proposed: These are the serious, non-serious and medical pure premiums underlying the proposed rates, obtained by rate calculations. (Note: Not to be confused with A-Sheet Pure Premiums.)

RATE FILING

The annual request for workers compensation rate changes filed with a state.

NCCI RATEMAKING PROCEDURES GLOSSARY

RATE LEVEL ADJUSTMENT FACTOR (RLAF)

Allows for any factors to be applied to a reviewed classification rate calculation (RLAF x Test Correction Factor = Composite Factor) that are not applied elsewhere in a rate filing, as well as an adjustment of financial data.

RATE PROJECTION PERIOD

This is the time period from the average accident date in the experience period for ratemaking to the average accident date for the policy year starting on the effective date stated in the rate filing.

RATED RISK

An insured risk that is subject to experience rating modification of policy premium.

RATED SIZE POLICY

A policy which has enough premium to meet state threshold amounts for experience modification. Policies with premium within \$500 of this threshold are also included in this group.

RATEMAKING

The actuarial process of establishing premium rates to be charged to policyholders. Ratemaking is performed annually on a state-by-state basis.

NCCI RATEMAKING PROCEDURES GLOSSARY

RATIO OF MANUAL TO EARNED PREMIUM

1. The present ratio of manual premium to earned premium divided by the proposed ratio of manual premium to earned premium is applied in A-Sheets to obtain pure premiums underlying manual rates.
2. The new (proposed) ratio of manual premium to earned premium (after any adjustments - e.g., revised eligibility) is applied in the rate calculation.

REPORT, CARRIER FORMS

Summarizes each carrier's overall timeliness with unit reports.

REPORT, DUPLICATE

A facsimile of all unit reports that are rejected due to identical key information to records already on PICS.

REPORT, REJECTION

A facsimile of unit reports that fail edit criteria.

REPORTED DATA

Carrier data that has been reported to a bureau on a unit report.

RETROSPECTIVE RATING

A voluntary rating system setting forth conditions whereby the premium actually paid by an insured depends upon the loss experience generated by the insured during the

NCCI RATEMAKING PROCEDURES GLOSSARY

time the policy is in force, subject to maximum and minimum limits. The Retrospective Rating Plan offers five Rating Options.

RETROSPECTIVE RATING ELIGIBILITY REQUIREMENTS

A risk is eligible for Retrospective Rating if it satisfies the following standard premium requirements:

1. One-Year Plan - A risk is eligible for a one-year plan if the estimated standard premium is at least \$25,000.
2. Three-Year Plan - A risk is eligible for a three-year plan if the estimated standard premium for 3 years is at least \$50,000. Exception: Eligibility for Rating Option V is at least \$75,000.

RETROSPECTIVE RATING PLAN MANUAL FOR WORKERS COMPENSATION AND EMPLOYERS LIABILITY

Contains the rules that govern the Retrospective Rating Plan in connection with Workers Compensation and Employers Liability policies.

REVISED EXPERIENCE RATING PLAN (RERP)

A modification to the experience rating plan introduced in 1989 using updated parameters to more accurately predict the loss experience of an eligible employer.

RISK ID

A unique number used by NCCI to identify a rated risk.

NCCI RATEMAKING PROCEDURES GLOSSARY

RISK STUDY

A printout of risk, payroll, earned and manual premium and indemnity and medical losses by premium size for stock and non-stock companies by industry group on a first report basis. Also contains list of risks with premium greater than \$99,999 by carrier and class code.

SAWW

Statewide Average Weekly Wage.

SCHEDULE Z

A compilation of unadjusted Workers Compensation Statistical Plan experience by policy period and by class, which underlies the A-sheets. Losses are not limited in any way. The same data on NC-235's is available on Schedule Z.

SECOND REPORT, THIRD REPORT, ETC. (FINANCIAL CALLS)

Premium and loss data evaluated 12 months, 24 months, etc. after the first report.

SECONDS, THIRDS, FOURTHS, FIFTHS (WCSP)

Subsequent WCSP reports occurring 12, 24, 36 and 48 months after the first report for a policy.

SELF-RATING POINT

In experience rating, the self-rating point is the amount of expected losses necessary for a risk's own experience to solely determine its experience modification. (Under SERA, however, the concept of self-rating will no longer exist.) It is also used to limit

NCCI RATEMAKING PROCEDURES GLOSSARY

the losses considered in experience rating to 10% and 20% of the self-rating point for single and multiple claims respectively. (Under SERA, losses for experience rating will be limited using the State Reference Point).

The self-rating point is 25 times the serious average cost per case averaged with the previous self-rating point.

In the Pure Premium Exhibits (the A-sheets), losses are limited to 20% and 40% of the self-rating point for single and multiple claims, respectively.

SEVERITY

Volume of losses divided by claims in a given period.

SL2 PROCESS

Current NCCI process of requesting late records that should be replaced by the Unit Report Control turnaround process.

STANDARD EXCLUSIONS

Any classification code whose experience is not found on the A-Sheets (e.g., Federal classifications, Maritime classifications, "a"-rated classifications, Explosive classifications, Non-Ratable Element Codes). These codes are listed on the master as industry group "7".

STANDARD PREMIUM

Premium resulting from the application of experience rating and expense constants to manual premium.

NCCI RATEMAKING PROCEDURES GLOSSARY

STATE REFERENCE POINT

This number will be used in the new SERA plan and is equal to 250 times the state average cost per case. The State Reference Point will be used to determine loss limitations for experience rating.

STATISTICAL PLAN

The rules that govern how workers compensation statistics must be reported to NCCI.

STEVEDORING CLASSIFICATIONS

Stevedoring classes are those involving the loading and unloading of cargo from ships in port, and are Federal classifications.

NC-235 Grand Totals Excluding or Including Stevedoring classifications refer to totals with or without all Federal Classifications (Shipbuilding, Stevedoring and United States Armed Services Risks - Class Code 9077F), not only Stevedoring Classifications.

SUBSEQUENT REPORTS

All Workers Compensation Statistical Plan unit cards after the First Report.

SWING LIMITS

Swing limits are used to control the change in rates by classification. For example, a swing limit of 25% implies that Maximum Deviation = Effect of the final change in rate level by industry group plus or minus 25% rounded to the nearest 1%.

NCCI RATEMAKING PROCEDURES GLOSSARY

TARGET COST RATIO (TCR)

Represents the percentage of each dollar of standard premium available for payment of benefits including loss adjustment expense.

TEST CORRECTION FACTOR (TCF)

Used to determine if the required change in manual premium level has been achieved. An iterative process continually tests the proposed rates including tentative TCF's until the required change is obtained. This process also adjusts for the effect of classes limited by the upper and lower swing limits.

THREE-YEAR FIXED RATE POLICY

Established to permit the underwriting of small size insureds at less cost. An insured whose estimated premium is not over \$700 per year may be written for a period of three years at the manual rate, provided the risk is not eligible for the Experience Rating Plan on the effective date of the policy. This rate will not change unless there is an adjustment of outstanding policies in excess of 10% as a result of a law amendment.

TREND

Factor applied to indemnity (medical) loss ratio to adjust for future inflation in loss ratios.

TURNAROUND DOCUMENT

A Listing or Report sent from the bureau to the carrier and then returned to the bureau with the appropriate Carrier Response Codes.

NCCI RATEMAKING PROCEDURES GLOSSARY

ULTIMATE COST

The total paid losses to date plus an estimate of all future costs required to close the claim.

UNIT CARDS

Standard reporting forms completed by insurance companies for each insured supplying information about payroll and premium by classification, and losses for individual claims above a minimum size. Small claims are reported on an aggregate basis. Unit cards are received by the National Council and compiled for each state under the Workers Compensation Statistical Plan.

UNIT RECORD CARD

Report of premiums and/or claims to the state workers compensation body or rating bureau.

UNIT REPORT CONTROL (URC)

Production system that will trigger requests for unit reports for experience rated sized policies, provide information necessary to assess fines against carriers for late unit card reporting and provide information on overall performance in delivering unit reports on time.

UNIT REPORT SYSTEM (URS)

Future system which will provide an on-line database to store all unit reports and to serve as a foundation for improvements to data validation, Experience Rating, and Class Ratemaking.

NCCI RATEMAKING PROCEDURES GLOSSARY

UNITED STATES LONGSHOREMEN'S AND HARBOR WORKERS' COMPENSATION ACT (USL&HW COMP. ACT)

Provides for payment of compensation and other benefits to employees such as longshoremen, harbor workers, ship repairmen, etc. Applicable to employees while working on navigable waters of the United States.

UNITED STATES LONGSHOREMEN'S AND HARBOR WORKERS' PERCENTAGE (USL&HW %)

Ratio comparison of federal to state indemnity benefit provisions expressed as an overall percentage. The USL&HW % is applied to the rates for classifications that do not normally reflect coverage under the USL&HW Act. Such increased rates apply only to payroll of employers engaged in operations subject to the USL&HW Act (i.e., non-"F" Classifications).

UNREPORTED DATA

Carrier data that has not been reported to a bureau on a unit report.

VALUATION DATE

The point at which the costs of claims to date are estimated. (Reference: First Report, Second Report, etc.).

WORKERS COMPENSATION STATISTICAL PLAN (WCSP)

The reporting method by which the National Council compiles its payroll, premium and loss information through unit card summarization. The WCSP used to be referred to as the Unit Statistical Plan (USP).

(As part of an NAIC examination of NCCI, Milliman & Robertson, Inc. has prepared a report which describes the workers compensation ratemaking procedures utilized by NCCI. The purpose of this technical supplement is to provide reference material supporting this report).

SECTION IIA NCCI RATEMAKING PROCEDURES TECHNICAL SUPPLEMENT

As part of an NAIC examination of NCCI, Milliman & Robertson, Inc. has prepared a description of the workers compensation ratemaking procedures utilized by NCCI.

The purpose of this Technical Supplement is to provide reference material including selected sections of a sample rate filing and additional support for classification ratemaking.

I. SAMPLE NCCI RATE FILING

The sample rate filing was prepared by the National Council on Compensation Insurance for the state of Illinois to be effective January 1, 1991.

The sample filing is subdivided into three main section as follows:

- Introductory Material
- Part I - Primary Exhibits
- Part II - Supporting Appendices

A brief outline of each of these areas follows.

A. Introductory Material

The introductory material includes:

1. Cover Letter

The filing begins with a cover letter which presents the proposed rate level change, the proposed effective data and other pertinent background information.

**SECTION IIA
NCCI RATEMAKING PROCEDURES
TECHNICAL SUPPLEMENT**

2. Summary of Indicated Change by Component

The filing contains a two page summary of rate level indications for industrial classes which are developed in the filing. The proposed changes are shown in two ways; first by what NCCI refers to as by component and then by industry groups.

3. Table of Contents

The filing includes a Table of Contents indicating where pertinent materials in support of the filing can be found.

B. Part I - Primary Exhibits

The Part I Primary Exhibits includes:

- Exhibit I - Determination of indicated change in Statewide premium level
- Exhibit II - Workers Compensation Expense Program
- Exhibit III - Proposed Advisory Rates and Rating Values

C. Part II - Supporting Appendices

The Part II Supporting Appendices includes:

- Appendix A - Factors Underlying Rate Revisions
- Appendix B - Computation of Advisory Rates
- Appendix C - Law, Assessment and Tax Memoranda

**SECTION IIA
NCCI RATEMAKING PROCEDURES
TECHNICAL SUPPLEMENT**

II. APPENDIX D - NCCI SUPPORTING MATERIAL

In our report on the ratemaking procedures utilized by NCCI, we describe each of the above sections. We have found it necessary to add an Appendix D. This is not part of the NCCI filing. Rather, it contains NCCI workpapers to document or clarify their methodology.

**SECTION IIA

Larry E. Hochstetler
Director

October 3, 1990

The Honorable Zack Stamp
Director of Insurance
State of Illinois
Insurance Department
320 West Washington Street
Springfield, IL 62767

Re: Workers Compensation Advisory Rates and Rating Values - Advisory Loss
Costs - Effective January 1, 1991
Illinois Voluntary Market

Dear Director Stamp:

In accordance with Section 457(2) of the Illinois Insurance Code, I am filing on behalf of the National Council on Compensation Insurance (NCCI) advisory rates, advisory loss costs, and certain advisory rating values which are being distributed to the NCCI members and subscribers writing workers compensation insurance for the voluntary market in Illinois. NCCI members and subscribers will not be required to adhere to these advisory rates or loss costs.

I am also filing on behalf of NCCI and its members and subscribers, certain rating values that are part of the NCCI rating plan to which NCCI members and subscribers are required to adhere.

The loss costs were determined by removing all allowances for expenses from the rates and rating values proposed to become effective January 1, 1991. Specifically, these values exclude allowances for the following expenses: Acquisition and Field Supervision; General Expense; Taxes, Licenses and Fees other than Federal Income Tax; Profit and Contingencies and Loss Adjustment Expense. Additionally, there are no provisions in these loss costs for any Illinois assessments such as the Second Injury Fund, the Compensation Rate Adjustment Fund, and the Insurance Guaranty Fund Tax.

We are including both the advisory rates and advisory loss costs (i.e., pure premium rates). Carriers may wish to adopt either the advisory rates which are based on the NCCI's compilations of expense data or the advisory loss costs and apply their own expense provisions to calculate rates.

This advisory filing represents an average overall increase in premium level of +8.5% for industrial classifications in the voluntary market from the current advisory premium level (i.e., based on the advisory rate filing effective January 1, 1990). The breakdown of the components of this filing is shown on the Summary Page.

The attached advisory rates and rating values and pure premium rates are proposed for use as of January 1, 1991.

A circular will be sent to all NCCI members and subscribers notifying them that these advisory rates and rating values and pure premium rates have been filed.

The Honorable Zack Stamp
October 3, 1990
Page 2

In addition, the circular will advise NCCI members and subscribers to be cognizant of the possible impact of Senate Bill 1200 regarding the use of the advisory rates and rating values.

Advisory rate and loss cost information filed, to which adherence is not required, includes the following enclosed information and material:

1. Advisory Rates and Loss Costs, Including Disease
2. Minimum Premiums
3. Expense Constants
4. Ex-Medical Ratios
5. Premium Discount Percentages included in Miscellaneous Values tables
6. United States Longshore and Harbor Workers' Compensation Coverage Percentage included in Miscellaneous Values table
7. Tables of Retrospective Rating Values, Expected Loss Ratios and Tax Multipliers used in connection with the various retrospective rating plans
8. Excess Loss Premium and Pure Premium Factors (both state and federal)
9. Retrospective Rating Development Factors
10. Table of Specific Disease Loadings

The following material and information require adherence by NCCI members and subscribers authorized by Section 457(2) of the Illinois Insurance Code:

1. Expected Loss Rates
2. D Ratios
3. Basis of Premium applicable in accordance with the footnote instructions for Code 7370 contained in the Miscellaneous Values table
4. Maximum Remuneration applicable in accordance with Basic Manual Rule IX-A-4-b, etc., contained in the Miscellaneous Values table
5. Minimum Remuneration applicable in accordance with Basic Manual Rule IX-A-4-a contained in the Miscellaneous Values table
6. Table III - W and B Values of the Experience Rating Plan Manual

This filing is being made to satisfy the requirements for NCCI as a rating organization as outlined in Illinois Senate Bill 1496.

If you have any questions or if you need additional information, please call us.

Very truly Yours,

NATIONAL COUNCIL ON COMPENSATION INSURANCE

Larry Hochstetler, Director
Government, Consumer & Industry Affairs

ILLINOIS

EXHIBIT II

Exhibit II-A - Determination of Target Cost Ratio

Overhead expense provisions are itemized below. These figures are expressed as percentages of standard premium (excluding expense constants) and are indicative of the expenses of the first \$5,000 of policy premium. Taken together, these allowances represent that portion of the standard premium dollar necessary to operate the benefit system. The complementary portion, therefore, corresponds to the portion of the premium dollar available to finance benefits and claims adjustment expense. This percentage is referred to as the "target cost ratio".

	Provisions Underlying Current Rates	Provisions Underlying Proposed Rates	
		Current Expense Program	Proposed Expense Program
1) Production Cost	15.00%	15.00%	15.00%
2) General Expense	6.70%	6.60%	6.40%
3) Taxes, Licenses and Fees other than Federal Income Tax			
(a) Privilege Tax	2.00%	2.00%	2.00%
(b) Insurance Guaranty Fund	0.15%	0.52%	0.52%
(c) Miscellaneous Tax	0.80%	0.80%	0.80%
4) Profit and Contingencies	2.50%	2.50%	2.50%
5) Total Overhead Provisions (1)+(2)+(3)+(4)	27.15%	27.42%	27.22%
6) Target Cost Ratio (100% - (5))	72.85%	72.58%	72.78%
Other Important Expense Values:			
7) Claim Adjustment Expense as a percentage of Incurred Benefit Costs	12.0%	12.0%	12.0%
8) Assessments on Losses			
Second Injury Fund on indemnity incurred losses	0.125%	0.125%	0.125%
Comp. Rate Adj. Fund on indemnity incurred losses	0.50%	0.50%	0.50%
9) Expense Constant	\$60	\$60	\$75

Next \$95,000	39.98%	2.60%
Next \$400,000	16.99%	2.80%
Over \$500,000	18.97%	4.40%
Total or Average	100.00%	2.35%

(a) Countrywide distribution based on Policy Period 1986-1987

ILLINOIS

EXHIBIT II

Exhibit II-E - Table of Premium Discounts

<u>Division of Standard Premium</u>		<u>Stock Cos Discounts</u>	<u>Non-Stock Cos Discounts</u>
First	\$5,000	---	---
Next	\$95,000	10.9%	3.5%
Next	\$400,000	12.6%	5.0%
Over	\$500,000	14.4%	7.0%

Application of the appropriate discount schedule to the standard premium produces a dollar discount that is subtracted from the standard premium.

Exhibit II-F Expense Provisions After Application of Premium Discounts

Reproduced below are the graduated expense provisions and the schedule of stock discounts. Also displayed is a countrywide distribution of standard premium earned by carriers according to size of policy premiums. Based upon that distribution an overall premium discount for this state is found as well as average provisions for production and general expenses as percentages of standard premium.

<u>Gradation of Standard Premium Based on Policy Period 1986-87</u>		<u>Gradation of Expense Provisions</u>		
<u>Division of Premium</u>	<u>Percentage of Premium</u>	<u>Production</u>	<u>General</u>	<u>Discount</u>
First \$5,000	24.06%	15.00%	6.40%	---
Next \$95,000	39.98%	7.50%	3.80%	10.9%
Next \$400,000	16.99%	6.00%	3.60%	12.6%
Over \$500,000	18.97%	6.00%	2.00%	14.4%
	100.00%			
Average weighted by premium:		8.77%	4.05%	9.11%

The above average provisions for production and general expense are based upon standard, pre-discount premium. One may use the the average premium discount just determined for this state to calculated the expense provision as percentages of premium after the application of premium discounts.

ILLINOIS

EXHIBIT II

Exhibit II-F - Illinois Expense Provisions including the effect of Premium Discounts and Expense Constants

The exhibit below illustrates the allocation of the final premium dollar after the application of Premium Discounts and Expense Constants based on Illinois expense provisions.

Conclusion:

The system is efficient in that 79.1% of the final premium income in Illinois is utilized for benefit and claims adjustment costs.

ILLINOIS

EXHIBIT II

Exhibit II-G - Relative Growth of Premium and Overhead Cost Since 1978

The following chart displays percentage changes since 1978 of both earned premiums and overhead costs (excluding profit and contingencies).

The underlying data for this exhibit is taken from Insurance Expense Exhibits. The premium has been adjusted to exclude the average effect of schedule rating and carrier deviations. It is important to observe that, despite tremendous increases in benefit levels and wages over the period covered (1978-1988), growth in overhead expenses has consistently tracked that for premiums.

This justifies the technique of providing for overhead expense in the rate structure as a percentage of premium excluding expense constants.

* Note the use of a nonuniform vertical scale. It is customary when displaying a picture of relative growth to employ such a scale (termed semi-log") designed so that the vertical change corresponding to the doubling from 100% to 200% is seen equal to that for the doubling from 200% to 400%.

FOR EXPECTED LOSSES GREATER THAN \$1,671,250, THE BALLAST VALUE CAN BE CALCULATED USING THE FOLLOWING FORMULA (ROUNDED TO THE NEAREST 1):

$$\text{BALLAST} = (.10)(\text{EXPECTED LOSSES}) + (2500)(\text{EXPECTED LOSSES})(3.50) \\ \text{(EXPECTED LOSSES} + 700(3.50))$$

TABLE OF CONTENTS

APPENDIX A

**SECTION IIA
NCCI RATEMAKING PROCEDURES
TECHNICAL SUPPLEMENT**

A - FACTORS UNDERLYING RATE REVISION

**A-I - Factors Adjusting 1988 Policy Year Premiums and Losses
to Current Levels**

- Section A - Assigned Risk Premium - 1988
- Section B - Voluntary Premium - 1988
- Section C - Assigned Risk and Voluntary Premium - 1988
- Section D - Indemnity Losses - 1988
- Section E - Medical Losses - 1988

A-II - Calculation of Policy Year Development Factors

- Section A - 1st to 4th Report Development Factors
- Section B - 4th to 8th Report Development Factors
- Section C - 8th to Ultimate Report Development Factors
- Section D - Summary of Policy Year Development Factors

**A-III - Factors Adjusting 1989 Calendar-Accident Year Premiums
and Losses to Current Levels**

- Section A - Calendar Year Assigned Risk Premium
- Section B - Calendar Year Voluntary Premium
- Section C - Calendar Year Assigned Risk and Voluntary
Program
- Section D - Accident Year Indemnity Losses
- Section E - Accident Year Medical Losses

**A-IV - Calculation of Calendar-Accident Year Development
Factors**

- Section A - 1st to 4th Report Development Factors
- Section B - 4th to 8th Report Development Factors
- Section C - 8th to Ultimate Report Development Factors
- Section D - Summary of Calendar-Accident Year Development
Factors

A-V - Calculation of Policy Year Trend Factor

- Section A - Standard Earned Premium
- Section B - Indemnity Losses
- Section C - Medical Losses
- Section D - Data for Indemnity Trend
- Section E - Data for Medical Trend
- Section F - Determination of Overall Trend Factor
- Section G - Derivation of Effect of Trend Factor

CALCULATION OF 1988 POLICY YEAR ON LEVEL FACTORS

SECTION A - Factor Adjusting 1988 Policy Year Assigned Risk Premium to Present
Assigned Risk Premium Level

Date	(1) Std. Premium Level Change	(2) Cumulative Index	(3) Weight	(4) Product (2)X(3)	(5) Adj.Fac: Present Index/Sum Col. (4)	(6) Adj.For Expense Constant Removal@	(7) Premium Adjustment Factor (5)x(6)
1/1/88	Base	1.000	1.000	<u>1.000</u>	1.325	.991	1.313
NR 7/1/89	1.204	1.204		1.000			
NR 1/1/90	1.087	1.309					
NR 9/1/90	1.012	1.325					

SECTION B - Factor Adjusting 1988 Policy Year Voluntary Premium to Present Voluntary
Premium Level

Date	(1) Std. Premium Level Change	(2) Cumulative Index	(3) Weight	(4) Product (2)X(3)	(5) Adj.Fac: Present Index/Sum Col (4)	(6) Adj.For Expense Constant Removal@	(7) Premium Adjustment Factor (5)x(6)
1/1/88	Base	1.000	1.000	<u>1.000</u>	1.147	.991	1.137
NR 1/1/89	1.030	1.030		1.000			
NR 1/1/90	1.100	1.133					
NR 9/1/90	1.012	1.147					

SECTION C - Factor Adjusting 1988 Policy Year Assigned Risk Premium
and Voluntary Premium to Present Level

(1)	Assigned Risk Market Share FY 1988	.151
(2)	Voluntary Market Share FY 1988	.849
(3)	Assigned Risk Std. Premium Adjustment Factor (Sec.A)	1.313
(4)	Voluntary Premium Adjustment Factor (Sec.B)	1.137
(5)	Cumulative Assigned Risk Premium Level Change since 1/1/83	1.962
(6)	Cumulative Voluntary Premium Level Change since 1/1/83	1.635
(7)	Differential in Voluntary Premium Level Change and Assigned Risk Premium Level Change since 1/1/83 = ((5)/(6))	1.200
(8)	Premium Adjustment Factor = (2)x(4)+(1)x((3)/(7))	1.130
(9)	Premium Adjustment Factor excluding trend*	1.007

R - New and renewal business

@ - Eliminates premium derived from expense constants

* - Trend factor in current voluntary rates (effective 1/1/90) is 1.122 (1.007 - 1.130 / 1.122)

CALCULATION OF POLICY YEAR ON LEVEL FACTORS

SECTION C - CALCULATION OF POLICY YEAR DEVELOPMENT FACTORS (8th TO ULTIMATE REPORT)

	INDEMNITY -----	MEDICAL -----
(1) Losses for policy year 1977 valued as of 12-31-85	315,885,287	93,887,878
(2) Losses for policy year 1978 valued as of 12-31-86	362,414,469	113,502,508
(3) Losses for policy year 1979 valued as of 12-31-87	380,491,484	126,293,983
(4) Average ((1)+(2)+(3))/3	352,930,413	111,228,123
(5) Ratio (4)/(3)	.928	.881
(6) Losses for policy year 1979 valued as of 12-31-87	387,276,934	128,611,616
(7) Losses for all policy years prior to 1979 valued as of 12-31-87	2,287,065,291	797,826,878
(8) Losses for all policy years prior to 1980 valued as of 12-31-88	2,662,973,360	929,353,799
(9) Loss development factor from 8th to ultimate report for all years prior to 1980 (1 + ((8)-(7)-(6))/((6)x(5)))	.968	1.026

(1), (2) and (3) include only data for matching companies for 12/31/85, 12/31/86 and 12/31/87 valuations.

(6), (7) and (8) include only data for matching companies for 12/31/87 and 12/31/88 valuations.

SECTION C - CALCULATION OF POLICY YEAR DEVELOPMENT FACTORS (8th TO ULTIMATE REPORT) - CONTD.

	INDEMNITY -----	MEDICAL -----
(10) Losses for policy year 1978 valued as of 12-31-86	389,698,249	119,418,741
(11) Losses for policy year 1979 valued as of 12-31-87	405,615,746	134,390,288
(12) Losses for policy year 1980 valued as of 12-31-88	367,842,396	136,435,966
(13) Average ((10)+(11)+(12))/3	387,718,797	130,081,665
(14) Ratio (13)/(12)	1.054	.953
(15) Losses for policy year 1980 valued as of 12-31-88	335,293,976	127,609,628
(16) Losses for all policy years prior to 1980 valued as of 12-31-88	2,545,026,907	890,773,230
(17) Losses for all policy years prior to 1981 valued as of 12-31-89	2,880,177,591	1,015,147,618
(18) Loss development factor from 8th to ultimate report for all years prior to 1981 (1 + ((17)-(16)-(15))/((15)x(14)))	1.000	.973
(19) Unweighted average 8th to ultimate loss development factor ((9)+(18))/2	.984	1.000

(10), (11) and (12) include only data for matching companies for 12/31/86, 12/31/87 and 12/31/88 valuations.

(15), (16) and (17) include only data for matching companies for 12/31/88 and 12/31/89 valuations.

APPENDIX A-V

CALCULATION OF POLICY YEAR TREND FACTOR (CONTD.)

SECTION F - DETERMINATION OF OVERALL TREND FACTOR

(1) Adjusted Indemnity Losses for Policy Year 1988 valued as of 12-31-89 (See Appendix A-V - Section B)	825,028,333
(2) Adjusted Medical Losses for Policy Year 1988 valued as of 12-31-89 (See Appendix A-V - Section C)	395,062,097
(3) Indemnity Trend Factor	1.097
(4) Medical Trend Factor	1.193
(5) Indicated Overall Trend Factor ((1)x(3)) + ((2)x(4)) ----- (1) + (2)	1.128

SECTION G - DERIVATION OF EFFECT OF TREND FACTOR

Policy year 1988 with an average accident date of January 1, 1989 (Exhibit I-A) and calendar-accident year 1989 with an average accident date of July 1, 1989 (Exhibit I-B) are used in the determination of the indicated change based upon experience (Exhibit I-D). This experience reflects, on average, conditions as of April 1, 1989. The midpoint of the time period for which the revised rates are being proposed is January 1, 1992. The premium level must therefore reflect experience levels which will exist 33 months later than the midpoint of the experience on which the current indication has been derived. The indicated trend factor is 1.128 which represents a trend factor of approximately 4.7% on an annual basis. Since the present rates include a factor of 1.122, the appropriate factor to incorporate the effect of trend into the overall change in premium level is the ratio of these two trend factors: 1.005 (1.005 = 1.128 / 1.122).

ILLINOIS

APPENDIX A-VI

The National Council conducts extensive programs to insure both the completeness and accuracy of experience reported. Occasionally a particular carrier's report is not available at the time of preparation of the rate filing. The data is excluded only if its omission would have no significant effect on the proposed rates. The carriers for which data is not included in this filing are listed below. The listing is separated between policy year and calendar-accident year aggregate data.

SECTION A

CARRIERS NOT INCLUDED IN 1988 POLICY YEAR EXPERIENCE VALUED AS OF 12-31-89

Name of Carrier -----	Percent of Premium Volume -----
Argonaut-Midwest Insurance Company	1.4%
Petroleum Casualty Company	0.3
Allianz Insurance Company	0.1
Intercontinental Insurance Company	<u>0.1</u>
Total	1.9%

Total volume present in policy year experience valued as of 12-31-89 is 98.1% (98.1% - 100.0% - 1.9%).

ILLINOIS

APPENDIX A-VI (CONTD.)

SECTION B

CARRIERS NOT INCLUDED IN 1989 CALENDAR-ACCIDENT YEAR
EXPERIENCE AS OF 12-31-89

Name of Carrier -----	Percent of Premium Volume -----
Petroleum Casualty Company	0.3%
Allianz Insurance Company	0.1
Intercontinental Insurance Company	0.1
National American Insurance Company	<u>0.1</u>
 Total	 0.6%

Total volume present in 1989 calendar-accident year experience as of 12-31-89 is 99.4% (99.4% = 100.0% - 0.6%).

APPENDIX A-VII (CONTD.)

In order to obtain the premium level by industry group, the overall premium level change must be distributed by industry group using policy year differentials.

The expected losses, column (2), are calculated by multiplying the premium at current manual rates by the ratio of earned premium to manual premium to recognize the effect of the Experience Rating Plan and by the target cost ratio. The indicated losses, column (3), are the losses and loss adjustment expense on the current law level derived from the Workers Compensation Statistical Plan, and include an adjustment to the level of the 1987 policy year aggregates valued as of December 31, 1988 and calendar-accident year experience for the twelve months ending December 31, 1988. In addition, an adjustment has been made to the indicated losses to account for the change in industry group wages relative to the change in medical losses.

APPENDIX B-I

Distribution of Change in Manual Premium Level
To Occupational Classification

After determining the required changes in manual premium level (see Exhibit I) the next step in the ratemaking procedure is to distribute these changes among the various occupational classifications.

Section A - The Data

The attached exhibit (Appendix B-II) of classification statistics shows, in detail, the experience for each classification in this state. The data shown in these exhibits are from third reports under the Workers Compensation Statistical Plan for the earliest policy period, second reports under the Workers Compensation Statistical Plan for the middle policy period, and first reports for the latest policy period; the experience of the three-year fixed-rate policies is equivalent to a third report for the first twelve months of experience, a second report for the second twelve months of experience, and a first report for the latest twelve months of experience. Individual claim amounts are subject to a maximum limit based on five times the historical average serious cost per case. The limit utilized in this filing is \$306,000. The actual incurred losses for each multiple claim accident are limited such that the total loss for the accident does not exceed two times the individual claim loss limitation. This limit is \$612,000.

Section B - Adjustment of Data

The losses are adjusted to the July 15, 1989 benefit level and include development and loss adjustment expense. The losses are further modified to reflect calendar-accident year experience for twelve months ending December 31, 1988. These factors are shown below. The development factors are based on Workers Compensation Statistical Plan data and include an adjustment to the level of the 1987 policy year aggregates valued as of December 31, 1988.

(a) Factors to Adjust Losses to Benefit Level
Effective July 15, 1989

* (a) x (((((b) x (c)) x (d)) x (e)) x (f))
 + Three-Year Fixed-Rate Policies.

The effects of subsequent changes determined after the compilation of the pure premiums have been excluded entirely from these exhibits of classification experience. Appropriate factors reflecting these changes will be introduced in Appendix B-III.

Section C - Calculation of the Derived by Formula Pure Premiums

The pure premiums shown at the right on these classification exhibits are as follows:

- (a) Indicated: The line of figures for each classification captioned "Total" shows the pure premium indicated by the combined experience for this state for the policy periods as indicated above.

ILLINOIS

APPENDIX B-I (CONTD.)

- (b) Underlying Present Rates: These are the partial pure premiums underlying the current manual rates. The pure premiums are updated to reflect the current off-balance in the Experience Rating Plan. The partial pure premiums "Underlying Present Rates" are shown in the attached Appendix B-II.
- (c) Present on Rate Level: These are the pure premiums underlying present rates (see paragraph "b" above) brought to the proposed premium level by the application to the partial pure premiums of the factors representing the combined effect of the experience of policy year 1987 valued as of December 31, 1988 and calendar-accident year experience for the twelve months ending December 31, 1988. The derivation of the present on rate level factors is as follows:

	(1) Indicated Premium <u>Level Change</u>	(2) Industry Group <u>Differentials</u>	(3) Present on Rate Level Factors <u>(1)x(2)</u>
Manufacturing	.986	1.010	.996
Contracting	.986	.979	.965
All Other	.986	1.007	.993

- (d) Indicated by National Relativity: These pure premiums reflect the countrywide experience for each classification as indicated by the latest available individual classification experience for all states for which the National Council compiles workers compensation data.

Countrywide data is adjusted to Illinois conditions in three steps. First, statewide indicated pure premiums are determined for Illinois. Second, using Illinois payrolls as weights, corresponding statewide average pure premiums are computed for each remaining state. Third, the ratios of Illinois statewide pure premiums to those for other states are used as adjustment factors to convert losses for other states to a basis concomitant with the Illinois indicated pure premiums. The quotient of the countrywide total of such adjusted losses divided by the total countrywide payroll for the classification is the pure premium indicated by national relativity. Serious, non-serious and medical pure premiums are computed separately.

ILLINOIS

APPENDIX B-I (CONTD.)

- (e) Derived by Formula: As for the preceding pure premiums, separate computations are performed for each partial pure premium: serious, non-serious and medical. Each partial formula pure premium is derived by the weighting of the indicated partial pure premium, the present on rate level partial pure premium, and the partial pure premium indicated by national relativity. The weight assigned to the policy year indicated pure premium varies in one percent intervals from zero percent to one hundred percent, depending upon the volume of expected losses (i.e., the product of the underlying pure premiums and the payroll in hundreds). To achieve full state credibility, a classification must have expected losses of at least:

\$ 2,466,410 for serious;
1,263,710 for non-serious; and
1,010,968 for medical.

Partial credibilities are determined by a three-halves formula; that is, the product of the square root of the cube of any given credibility value and the full credibility standard determines the minimum volume of expected losses necessary to achieve the given credibility value. For the pure premiums indicated by national relativity, credibility is determined from the number of cases. Full credibility standards are:

25 serious cases	- serious;
300 non-serious cases	- non-serious; and
300 serious and non-serious cases	- medical.

Partial credibilities are assigned in accordance with the same three-halves formula. In no case is the national credibility permitted to exceed 50% of the complement of the state credibility. The residual credibility (100% less the sum of the state and national credibilities) is assigned to the present on rate level pure premium.

For example, if the state credibility is 40%, the pure premium indicated by national relativity is assigned a credibility of 30% $((100 - 40) / 2)$; the remaining 30% is assigned to the present on rate level pure premium.

The total pure premium shown on the attached Appendix B-II is obtained by adding the partial pure premiums obtained above and rounding the sum to two decimal places.

NCCINational
Council on
Compensation
InsuranceILLINOISAPPENDIX B-I (CONTD.)

For purposes of rate calculation, classifications are separated into reviewed and non-reviewed categories. The reviewed classifications are those whose experience is of sufficient volume to merit some degree of credibility. The recognition of reviewed classification experience requires that test correction factors be applied in the rate computation to ensure that the required changes in premium level developed in Exhibit I are actually realized. Non-reviewed classifications (those with neither state nor national credibility) are calculated directly from present rates and do not require application of test correction factors.

ILLINOIS

APPENDIX B-III

COMPUTATION OF FINAL ADVISORY RATE

The following items are combined with the derived by formula pure premium to obtain the indicated advisory rate:

(1) Financial Data Adjustment Factor

The derived by formula pure premiums do not recognize the effect of policy year 1988 experience for twelve months ending December 31, 1989 and have been calculated prior to the availability of experience for calendar-accident year 1989 valued as of December 31, 1989. An adjustment factor is derived below and must be applied to the derived by formula pure premiums.

(a) Unweighted average of policy year and calendar-accident year cost ratios (See Exhibit I-C)	.781
(b) Unweighted average of policy year and calendar-accident year cost ratios used in pure premium exhibits	.7185
(c) Financial data adjustment factor (a)+(b)	1.087

(2) Offset for the New Minimum Premium Multiplier

A factor of .9996 must be applied to offset the increase in premium collected as a result of the change in the minimum premium formula from the present 95 to 105 times the class advisory rate plus any applicable expense constant.

(3) Rates - Test Correction Factor

The payrolls are now extended by the advisory rates presently in effect and by the indicated proposed advisory rates to determine if the required change in manual premium level as calculated in Exhibit I has been achieved. Since at first this calculation may not yield the required results, an iterative process is initiated which continuously tests the proposed advisory rates including tentative test correction factors until the required change in manual premium level is obtained. The test correction factor is applied to the derived by formula pure premiums.

ILLINOIS

APPENDIX B-III (CONTD.)

The factors referred to in (1), (2) and (3) are set out as follows:

	(1) Fin. Data Adj. Factor	(2) Offset for the New Min. Prem. Mult.	(3) Product (1)x(2)	(4) Test Corr. Factor	(5) Composite Factor (3)x(4)
Manufacturing	1.087	.9996	1.087	1.005	1.092
Contracting	1.087	.9996	1.087	1.050	1.141
All Other	1.087	.9996	1.087	1.027	1.116

(4) Change In Trend Factors

See Appendix A-V for an explanation of these factors. The classification experience shown in Appendix B-II has been compiled excluding the change in trend factors. It is necessary to bring in these factors before translating the derived by formula pure premiums to advisory rates.

(5) Effect of the January 15, 1990, July 1, 1990 and the July 15, 1990 benefit changes

The partial pure premiums are multiplied by the effects of the January 15, 1990, July 1, 1990 and the July 15, 1990 benefit changes.

The factors referred to in (4) and (5) are set out as follows:

	(1) Change in Trend Factors	(2) Effect of the January 15, 1990 Benefit Change	(3) Effect of the July 1, 1990 Benefit Change	(4) Effect of the July 15, 1990 Benefit Change	(5) Product (((1)x(2)) x(3))x(4)
Serious	.997	1.001	1.007	1.001	1.006
Non-Serious	.997	1.0002	1.004	1.0002	1.001
Medical	1.021	1.000	1.000	1.000	1.021

ILLINOIS

APPENDIX B-III (CONTD.)

(6) Ratios of Manual to Earned Premiums

The ratios of manual to earned premiums by industry group have also been excluded from the classification experience, and it is necessary to apply these factors to the derived by formula pure premiums.

<u>Industry Group</u>	<u>Ratio of Manual to Earned Premiums</u>
Manufacturing	1.013
Contracting	1.011
All Other	1.007

(7) Expense Allowance

The expense allowance is introduced into the advisory rate by dividing the product of the proposed pure premium and the appropriate factors above by the proposed target cost ratio of .7278. (See Exhibit II-A for derivation of this factor.) This operation produces the proposed advisory rate prior to the addition of a disease loading, if any.

(8) Disease Loadings

The proposed advisory rates shown in this filing include specific disease loadings for those classifications where they apply. The proposed specific disease loadings are shown in the Table of Specific Disease Loadings.

(9) Swing Limits

As a further step a test is made to make certain that the proposed advisory rates fall within the following departures from the present advisory rates:

Manufacturing	from 34% above to 16% below
Contracting	from 31% above to 19% below
All Other	from 34% above to 16% below

These limits have been calculated in accordance with the following formula:

Max. Deviation = Effect of the final change in rate level by industry group plus or minus 25% rounded to the nearest 1%

The classifications which have been so limited are listed at the end of this exhibit.

ILLINOIS

APPENDIX B-III (CONTD.)

An illustrative example showing the calculation of the proposed advisory rate for Code 2014 is attached as Appendix B-IV. This example demonstrates the manner in which the partial pure premiums are combined to produce a total pure premium, and shows the steps in the calculation at which rounding takes place. Revised advisory rates for other classifications are calculated in the same manner.

ILLINOIS

APPENDIX B-V

"F" CLASSIFICATIONS

This filing represents an average decrease of 0.9% in the overall level of "F" classification advisory premium presently in force. Since "F" classification premium comprises 0.3% of the overall premium volume in this state, there will be no change in the statewide overall premium level (.000 = .003 x -.009). The -0.9% reflects the following considerations:

1. The latest available workers compensation experience indicates the need for a 3.5% decrease in premium level.

2. The change in general expense from 6.7% to 6.6% will decrease the premium level by 0.1%.

3. The federal benefit change, effective October 1, 1990, is estimated to increase compensation costs by 0.2% on the average for Longshore and Harbor Workers. The state benefit changes, effective January 15, 1990, July 1, 1990, and July 15, 1990 are estimated to increase compensation costs for state losses 0.5% on the average for Longshore and Harbor Workers. As state losses are 47.0% of total losses, the weighted effect of these changes is an overall increase of 0.3%.

4. The change in taxes from 2.95% to 3.32% will increase the premium level by 0.5%.

5. The United States Longshore and Harbor Workers' Compensation Act Special Fund assessment on federal losses has been increased from 20.1% to 24.2% on total losses. The weighted effect of this change is an increase of 2.0% in compensation costs for "F" classifications.

The combined effect of these changes is a decrease in advisory premium level of 0.9% (.991 = (((.965 x .999) x 1.003) x 1.005) x 1.020)).

The rate impact of the change in expense constant from \$60 to \$75 is .997.

The effect of this change is a decrease in advisory rate level of 1.2% (.988 = .991 x .997).

While the average change in "F" classification advisory rates is a decrease of 1.2%, changes in individual classification advisory rates will vary from the average depending upon the volume and character of the particular classification experience.

The advisory rates are proposed effective January 1, 1991. These advisory rates are applicable to new and renewal policies only.

Details of the calculations of the proposed advisory rates are outlined in the following exhibits:

- Appendix B-V-I - Calculation of Proposed Pure Premiums
- Appendix B-V-II - Individual Classification Experience
- Appendix B-V-III - Calculation of Proposed Advisory Rates
- Appendix B-V-IV - Sample Calculation of Proposed Advisory Rate - Code 7309F - Stevedoring
- Appendix B-V-V - Applied Effects of the Federal and State Benefit Changes

ILLINOIS

APPENDIX B-V-I

CALCULATION OF PROPOSED PURE PREMIUMS

The attached exhibits (Appendix B-V-II) show in detail the experience for each classification. The state losses are at the July 15, 1988 state benefit level while federal losses are at the October 1, 1988 federal benefit level. All losses include development factors based on countrywide "F" classification experience and the loss adjustment expense provision. The state losses reflect the effect of the Second Injury Fund and Compensation Rate Adjustment assessments, namely 0.625% based upon indemnity losses. The federal losses reflect the effect of the United States Longshore and Harbor Workers' Compensation Act Special Fund assessment, namely 25.7% based upon indemnity losses only.

The pure premiums shown at the right on these classification exhibits are as follows:

A. Indicated: These pure premiums have been adjusted to the law level and assessment level shown above. The losses are developed to a fifth report using countrywide "F" classification Workers Compensation Statistical Plan data. Losses are limited to five times the average serious cost per case for single claim accidents. The limit utilized in this filing is \$314,000. For multiple claim accidents, the losses are limited to ten times the average serious cost per case. This limit is \$628,000. The line of figures for each classification captioned "Total" shows the pure premium indicated by the policies becoming effective during the period from February 1, 1982 through January 31, 1985. The three-year indicated pure premium is obtained by dividing the total serious, non-serious, and medical losses by the total payroll in hundreds.

B. Underlying Present Rates: These are the pure premiums underlying the "F" classification advisory rates currently in force. These pure premiums have been adjusted to the law level and assessment level shown above.

C. Indicated by National Relativity: The losses used to determine the national pure premiums are the sum of the losses for each state adjusted to an October 1, 1988 federal benefit level. The payrolls for each state are converted to a total payroll rule basis and then summed to determine the national payroll. A national pure premium for Illinois is calculated by adjusting the countrywide national pure premiums to state conditions. Illinois' national pure premiums reflect the same benefit level and loss assessments as the indicated and underlying present rate pure premiums.

APPENDIX B-V-I (CONTD.)

D. Derived by Formula: As for the preceding pure premiums, separate computations are performed for each partial pure premium: serious, non-serious and medical. Each partial formula pure premium is derived by the weighting of the indicated partial pure premium, underlying partial pure premium, and the partial pure premium indicated by national relativity. The weight assigned to the policy year indicated pure premium varies in one percent intervals from zero to one hundred percent, depending upon the volume of expected losses (i.e., the product of the underlying pure premiums and the payroll in hundreds). To achieve full state credibility, a classification must have expected losses of at least:

\$2,028,908 for serious;
679,392 for non-serious; and
543,514 for medical.

Partial credibilities are determined by a three-halves formula; that is, the product of the square root of the cube of any given credibility value and the full credibility standard determines the minimum volume of expected losses necessary to achieve the given credibility value. For the pure premiums indicated by national relativity, credibility is determined from the number of cases. Full credibility standards are:

25 serious cases	- serious;
300 non-serious cases	- non-serious; and
300 serious and non-serious cases	- medical.

Partial credibilities are assigned in accordance with the same three-halves formula. In no case is the national credibility permitted to exceed 50% of the complement of the state credibility. The residual credibility (100% less the sum of the state and national credibilities) is assigned to the underlying pure premium.

For example, if the state credibility is 40%, the pure premium indicated by national relativity is assigned a credibility of 30% $((100 - 40) / 2)$; the remaining 30% is assigned to the underlying pure premium.

The total pure premium shown on the attached Appendix B-V-II is obtained by adding the partial pure premiums obtained above and rounding the sum to two decimal places.

ILLINOIS

APPENDIX B-V-I (CONTD.)

E. Adjustment of Derived by Formula Pure Premium
Based on National Experience:

For each individual classification a range is established by using 25% below and 25% above the total pure premium indicated by national relativity. The following rules (1) through (6) are applied to determine if any adjustment for the derived by formula pure premium is necessary:

1. If the underlying pure premium and the derived by formula pure premium both fall within the range, the derived by formula pure premium is proposed without further adjustment.
2. If the underlying pure premium falls inside the range and the derived by formula pure premium falls outside the range, the proposed pure premium will be limited to the pure premium establishing the boundary of the range.
3. If the underlying pure premium is outside the range and the derived by formula pure premium falls inside the range, the derived by formula pure premium is used without further adjustment.
4. If both the underlying and the derived by formula pure premium fall outside the range (on the same side), the underlying pure premium is retained if the derived by formula pure premium is further away from the range; if the derived by formula pure premium is closer to the range, then the proposed pure premium is the derived by formula pure premium without adjustment.
5. If both the underlying and the derived by formula pure premium fall outside the range (on opposite sides) then the range boundary (nearest the derived by formula pure premium) is the proposed pure premium.
6. If the pure premium indicated by the national relativity is zero, the derived by formula pure premium is used without further adjustment.

When the selected pure premium is other than the derived by formula pure premium, the distribution of partial pure premiums underlying the derived by formula pure premium is used in determining the adjusted serious, non-serious, and medical pure premiums.

The derived by formula pure premiums have been adjusted for the following classification:

7309F

CLASS: 6801F BOAT BUILDING WOOD NOC

APPENDIX B-V-III

CALCULATION OF PROPOSED ADVISORY RATES

The following items are combined with the proposed pure premiums (derived by formula) to obtain the final advisory rates.

A. Effects of the State and Federal Benefit Changes

The proposed partial pure premiums (derived by formula) as shown on Appendix B-V-II are multiplied by the weighted effects of the October 1, 1989 and October 1, 1990 federal benefit changes and the January 15, 1989 through July 15, 1990 state benefit changes.

The weighted effects of these factors are:

Serious: 1.011
 Non-Serious: 1.007
 Medical: 1.000

except for Code 9077F.

The federal benefits for Code 9077F are administered under the Non-Appropriated Fund Instrumentality Employees Longshore and Harbor Workers' Compensation Act. The separate effects are, by parts, serious 1.003, non-serious 1.005, and medical 1.000.

B. Effects of Change in Indemnity Assessment

The proposed partial pure premiums are multiplied by the weighted effects of the change in the United States Longshore and Harbor Workers' Compensation Act Special Fund assessment from 25.7% to 31.2% on indemnity losses only.

The weighted effects of this factor are:

Serious: 1.026
 Non-Serious: 1.026
 Medical: 1.000

except for Code 9077F.

The federal assessment for Code 9077F is administered under the Non-Appropriated Fund Instrumentality Employees Longshore and Harbor Workers' Compensation Act. The separate effects are, by parts, serious 1.044, non-serious 1.044, and medical 1.000.

The factors referred to in A and B are set out as follows:

	(1) Effect of State and Federal <u>Benefit Changes</u>	(2) Effect of Change in <u>Indemnity Assess.</u>	(3) Product <u>(1)x(2)</u>
Serious	1.011	1.026	1.037
Non-Serious	1.007	1.026	1.033
Medical	1.000	1.000	1.000

C. Ratio of Manual to Earned Premiums

The ratio of manual to earned premium is based upon a comparison of policy year manual premiums for "F" classifications with standard earned premiums (manual premiums modified to include the effects of experience rating).

Ratios of manual to earned premiums have been calculated on a national basis separately for three groups of "F" classifications. The three groups are "Shipbuilding and Repair" (includes Codes 6801F, 6803F, 6824F, 6825F, 6826F, 6827F, 6828F, 6829F, 6843F, 6845F, 6846F, 6869F, 6872F, 6873F, 6874F), "Stevedoring" (includes Codes 7309F, 7313F, 7317F, 7323F, 7327F, 7350F, 8709F, and 8726F) and "Non-Appropriated Fund Instrumentalities" (Code 9077F). The ratios, which are applied to the modified pure premiums, are:

Shipbuilding & Repair	1.017
Stevedoring	1.020
Non-App. Fund Inst.	.999

D. Expense Allowance

The expense allowance is introduced into the advisory rate by dividing the product of the derived by formula pure premium and the appropriate factors above by the proposed target cost ratio of .7278. This operation produces the indicated advisory rate.

E. Aggregate Update Factor

Loss development beyond a fifth report and excess losses above the accident limitations must be included at this time in the advisory rate calculation. The effect of the losses above the accident limitation is 1.049. The factor to reflect loss development beyond a fifth report is 1.061. The combined effect of the factors produces an Aggregate Update Factor of 1.113 ($1.113 = 1.049 \times 1.061$).

F. Test Correction Factor

The payrolls are now extended by the advisory rates presently in effect and by the indicated advisory rates. This determines the proposed advisory rate level change. Swing limits are then applied (Section G). The resulting advisory rates may not yield the proposed advisory rate level change. An iterative process is initiated which continuously tests the indicated advisory rates including test correction factors until the required change in manual premium is obtained. The test correction factor is 1.008.

APPENDIX B-V-III (CONTD.)

G. Swing Limits

As a further step a test is made to make certain that each proposed advisory rate falls within a Maximum Deviation from the present advisory rate of not more than 24% above and not less than 26% below. These limits have been calculated in accordance with the following formula:

$$\text{Maximum Deviation} = \text{Effect of final change in advisory rate level plus or minus 25\% rounded to the nearest 1\%}.$$

The classifications which have been so limited are listed at the end of this exhibit.

H. Federal-State Comparison

As a final step, a comparison is made between certain "F" classes and their corresponding state act codes. The comparison criteria is that the federal total pure premium should be greater than or equal to the corresponding state total pure premium, since federal benefits are higher than state benefits. If a class code fails to meet the above criteria, a payroll weighted combination of the federal and state total pure premium is computed. This produces no significant change in the overall statewide premium level. The following class codes were adjusted due to the Federal-State Comparison.

<u>Federal</u>		<u>State</u>

Minimum Weekly Benefit++		Varies with dependency
Maximum Weekly Benefit	133 1/3% SAWW*	133 1/3% SAWW**
Waiting Period/Retro. After		3 days/13 days
PERMANENT PARTIAL DISABILITY		
<u>SCHEDULE</u>		
Rate of Compensation		60%
Duration		As per schedule
Minimum Weekly Benefit++		Varies with dependency
Maximum Weekly Benefit	133 1/3% SAWW* for amputation or enucleation,	133 1/3% SAWW** for amputation or enucleation,

ILLINOIS LAW MEMO

EXHIBIT I (CONTD.)

Summary of the Principal Benefit Provisions Due to the Increase in the Maximum and Minimum Weekly Benefits, Effective 01/15/1990

	Effective 07/15/1989	Effective 01/15/1990
PERMANENT PARTIAL DISABILITY (CONTD.)		
NON-SCHEDULE		
% Rate of Compensation		60%
Minimum Weekly Benefit++		Varies with dependency
Maximum Weekly Benefit		Same as for Schedule
Duration+ (exclusive of Healing Period)		2/3 of disability x 500 weeks
Healing Period Benefit		Same as Temporary Total

NOTES:

* Actual State Average Weekly Wage (SAWW) as of 07/15/1989 = \$453.55
 50% of \$453.55 = \$226.78
 133 1/3% of \$453.55 = \$604.73

** Actual SAWW as of 01/15/1990 = \$458.23
 50% of \$458.23 = \$229.12
 133 1/3% of \$458.23 = \$610.97

SAWW changes each January 15 and July 15; posted and published by Industrial Commission.

+ An injured worker may choose wage loss benefits, which are 66.6667% of his wage loss for the duration of his wage loss.

++ If the employee wage is less than the minimum, the employee receives his wage.

** On July 1 of each year, beginning in 1987, the maximum weekly compensation rate shall be determined as follows: If during the preceding twelve-month period there shall have been an increase in the State's average weekly wage in covered industries under 'The Unemployment Insurance Act,' the weekly compensation rate shall be proportionately increased by the same percentage as the percentage of increase in the State's average weekly wage in covered industries under 'The Unemployment Insurance Act' during such period.

*** (01/15/1989 SAWW)/(01/15/1988 SAWW) = 1.048 = \$435.67/\$415.70
 \$333.26 = \$318.00 x 1.048

EXHIBIT II

Impact by Type of Injury Due to the Increase in the Maximum and Minimum Weekly Benefits, Effective 01/15/1990

Type of Injury	Percentage of Losses*	Effect(%)
Fatal	3.0%	+ 0.2
Permanent Total	3.7%	+ 0.5
Major Permanent Partial	39.6%	+ 0.01
Minor Permanent Partial	11.0%	+ 0.01
Temporary Total	9.9%	+ 0.03
Indemnity	67.2%	+ 0.05**
Medical	32.8%	+ 0.0
Total	100.0%	+ 0.03**

* Losses for policies becoming effective during the 24-month period ending 03/31/1987 on the 07/15/1989 law level and developed to an ultimate basis by type of injury.

** Weighted Average.

EXHIBIT II-A

Overall Effect Due to the
Increase in the Maximum and Minimum Weekly Benefits, Effective 01/15/1990

Type of Injury	(1) Losses*	(2) Effect	(3) Modified Losses (1)x(2)
Fatal	60,809,118	1.002	60,930,736
Permanent Total	73,867,038	1.005	74,236,373
Major Permanent Partial (Serious)	799,186,946 (933,863,102)	1.0001 (1.001)	799,266,865 (934,433,974)
Minor Permanent Partial	220,877,755	1.0001	220,899,843
Temporary Total (Non-Serious)	198,661,642 (419,539,397)	1.0003 (1.0002)	198,721,240 (419,621,083)
Medical	659,520,211	1.000	659,520,211
Total/Effect	2,012,922,710	1.0003	2,013,575,268

* Losses for policies becoming effective during the 24-month period ending 03/31/1987 on the 07/15/1989 law level and developed to an ultimate basis by type of injury.

EXHIBIT III

Determination of the Monetary Cost and Effect of Amendments on Fatal Benefits

	<u>07/15/1989</u>	<u>01/15/1990</u>

EXHIBIT I

Summary of the Principal Benefit Changes Due to the Increase in
the Minimum and Maximum Weekly Benefits, Effective 10-1-90

	<u>Effective 10-1-89</u>	<u>Effective 10-1-90</u>
<u>FATAL</u>		
% Rate of Compensation		
Widow Alone		50%
Widow and Children		66 2/3%
One Orphan		50%
Two or more Orphans		66 2/3%
Parent(s)		25% (each)
Brother(s)/Sister(s)/Others		20% (each)
Max. % Rate of Compensation		66 2/3%
Wage for Min. Weekly Benefit*	\$332.39	\$343.84
Maximum Weekly Benefit**	\$664.78	\$687.68
Duration:		Life or remarriage; Until age 18 for a child, or 23 if a student
Remarriage Award		2 year lump sum
Burial Allowance		\$3,000
Special Fund (Non-Dependency Cases)		\$5,000
Escalation****		Annual Percentage Increase in the NAWW limited to 5%
<u>PERMANENT TOTAL DISABILITY</u>		
% Rate of Compensation		66 2/3%
Min.***/Max. Weekly Benefit**	\$166.20 or AWW, whichever is less/\$664.78	\$171.92 or AWW, whichever is less/\$687.68
Duration		Length of Disability
Escalation****		Annual Percentage Increase in the NAWW limited to 5%
<u>TEMPORARY TOTAL DISABILITY</u>		
% Rate of Compensation		66 2/3%
Min.***/Max. Weekly Benefit **	\$166.20 or AWW, whichever is less/\$664.78	\$171.92 or AWW, whichever is less/\$687.68
Duration		Length of Disability
Waiting Period/Retro. after		3 days/14 days
<u>PERMANENT PARTIAL DISABILITY</u>		
<u>Schedule Injuries:</u>		
% Rate of Compensation		66 2/3%
Maximum Weekly Benefit**	\$664.78	\$687.68
Duration		As per Schedule
<u>Non-Schedule Injuries:</u>		
% Rate of Compensation		66 2/3% LOEC+
Maximum Weekly Benefit**	\$664.78	\$687.68
Duration		Length of Disability

Note: NAWW is the National Average Weekly Wage.
NAWW effective 10-1-90 = \$343.84 (Estimate).
NAWW effective 10-1-89 = \$332.39 (Estimate).
AWW is the Average Weekly Wage of the worker.

- * 100% of the NAWW.
- ** 200% of the NAWW.
- *** 50% of the NAWW.
- **** Annual Increase in the NAWW is Assumed to be 6.0%.
- + LOEC - Loss of Earning Capacity (Assumed LOEC = Wage Loss).

LONGSHORE AND HARBOR WORKERS' COMPENSATION ACT LAW MEMO

EXHIBIT II

Impact by Type of Injury Due to the Increase in the Minimum
and Maximum Weekly Benefits, Effective 10-1-90

<u>Type of Injury</u>	<u>Percentage of Losses*</u>	<u>Effect(%)</u>
Fatal	5.3%	+ 1.1
Permanent Total	8.3%	+ 0.4
Major Permanent Partial	54.0%	+ 0.1
Minor Permanent Partial	2.6%	+ 0.1
Temporary Total	7.5%	+ 0.4
Indemnity	77.7%	+ 0.2 **
Medical	22.3%	0.0
Total	100.0%	+ 0.2 **

* Nationwide+ losses under Longshore and Harbor Workers' Act, excluding Non-Appropriated Fund Instrumentality losses, for the two-year policy period ending 1-31-86 on the 10-1-89 law level and developed to an ultimate report by serious, non-serious and medical categories.

** Weighted Average

+ Excluding California, Delaware, Massachusetts, New Jersey, New York, Pennsylvania and Texas.

LONGSHORE AND HARBOR WORKERS' COMPENSATION ACT LAW MEMO

EXHIBIT II-A

Overall Effect Due to the Increase in the Minimum
and Maximum Weekly Benefits, Effective 10-1-90

<u>Type of Injury</u>	(1) <u>Losses*</u>	(2) <u>Effect</u>	(3) <u>Modified Losses</u> <u>(1)x(2)</u>
Fatal	7,412,991	1.011	7,494,534
Permanent Total	11,638,134	1.004	11,684,687

JUL 3 1990

File Number:

**NOTICE TO INSURANCE CARRIERS AND SELF-INSURED EMPLOYERS
(LONGSHORE AND HARBOR WORKERS' COMPENSATION ACT AND
EXTENSIONS**

**SUBJECT: 1990 ASSESSMENT FOR THE SPECIAL FUND, SECTION 44
OF THE LONGSHORE AND HARBOR WORKERS' COMPENSATION
ACT**

On January 5, 1990, pursuant to section 44 of the Longshore and Harbor Workers' Compensation Act, a Notice was sent to insurance carriers and self-insured employers authorized under the Act and its extensions (including the District of Columbia Compensation Act), requesting a report of the amount of all compensation and medical payments made during calendar year 1989. Form LS-513, Report of Payments, was attached to the Notice.

All payments made during calendar year 1989 by insurance carriers and self-insured employers have now been reported. A total of \$294,738,046.95 in compensation payments has been reported under the Longshore Act and three extensions, the Defense Base Act, the Outer Continental Shelf Lands Act, and the Nonappropriated Funds Instrumentalities Act. A total of \$11,765,605.77 has been reported under the District of Columbia Compensation Act for compensation and medical payments in cases that arose prior to July 26, 1982.

This Office has determined that for calendar year 1990 a total of \$91,969,924 is needed for the Special Fund under the Longshore Act and extensions excluding the District of Columbia Compensation Act, and a total of \$11,297,124 is needed for the Special Fund under the District of Columbia Compensation Act. Proceeds from the Special Fund assessment are used for one-half the adjusted payments made under the original provisions of section 10(h)(1), for payments under section 8(f), and for other payments from the Fund listed in section 44 of the Act.

This Notice transmits the total amount of your 1990 assessment.

The attached billing form shows the calculation on which your assessment is based. Under the Longshore Act and extensions, except for the District of Columbia Compensation Act, the assessment is based on (1) the ratio of the amount each carrier or self-insurer paid during the prior calendar year for compensation benefits in relation to the amount all such carriers and self-insurers paid during that period, and

(2), the ratio of the amount of payments made by the Special Fund attributable to each carrier or self-insurer for all cases being paid under the provisions of section 8(f) of the Act during the preceding calendar year, in relation to the total of such payments. The resulting sum of the percentages is divided by two and multiplied by the estimated expenses of the Fund. The amount paid for the advance assessment is credited against the total assessment and the amount now due is shown last.

Under the District of Columbia Compensation Act the ratio of the amount each carrier or self-insurer paid during the prior calendar year for compensation and medical benefits in relation to the amount all such carriers and self-insurers paid during that period is multiplied by the estimated expenses of the Fund.

PLEASE MAKE YOUR CHECK PAYABLE TO THE U.S. DEPARTMENT OF LABOR, OFFICE OF WORKERS' COMPENSATION PROGRAMS, AND MAIL IT TO:

Department of Labor - Longshore
P O Box 371088M
Pittsburgh, PA 15251

Payment should be mailed to reach this address no later than 30 days from the date of this Notice. Please attach the original copy of the billing form to the check. Any payments received after the due date are subject to interest charges.

Please direct any inquiries concerning your assessment to Frank Fiorini or Carl Abildso at 202-523-8721.

JOSEPH F. OLIMPIO
Director, Division of Longshore
and Harbor Workers' Compensation

(A) Total losses on 7/15/89 law level * policy year and calendar-accident year adjustment factor for differentials.

(B1) - (B3)
Indicated indemnity, medical, and total losses by industry group from Exhibit I-B.

(C) Calculated using linear regression on the most recent five years of average weekly wages by industry group.

(C1) Total trend- weighted average of wage trends, with expected losses (from Appendix A-VII) used as weights.

(D) (Total wage trend)/(Industry Group wage trend).

(E) Adjustments- [(B1)*1.000 + (B2)*(D)]/(B3)

(E1) Total adjustment- weighted average of adjustments by industry group, with expected losses (from Appendix A-VII) used as weights.

(F) Normalized adjustment - adjustments/total adjustment.

(G) Adjusted indicated losses = indicated losses (A) * normalized adjustment.

PREMIUM AND LOSS DEVELOPMENT FACTORS

I. INTRODUCTION

The determination of an overall rate level requirement is generally based on an estimate of the ultimate loss ratio for the period during which the rates will be in effect. This estimate is often derived from the ultimate loss levels of prior periods, which are also estimated.

One of the fundamental concepts underlying most actuarial projections of ultimate losses is that of loss development. In the Casualty Actuarial Society textbook "Foundations of Casualty Actuarial Science", development is defined as:

"... the difference, on successive evaluation dates, between observed values of certain fundamental quantities that may be used in the (loss) estimation process."

One of the basic actuarial projection methods is to aggregate claims by accident year or policy year, and to measure development as the ratio of the aggregate values of these claims at successive valuation dates. By examining these ratios, or development factors as they are called, for successive years at common maturities, patterns of development can be observed. These patterns are then used to project the future development for years that have not yet reached their full maturity.

When experience is analyzed on a policy year basis, development techniques are also commonly used in estimating the total premiums on policies insuring the claims. As a result of premium audits and late payroll reports, adjustments to policy year premium earnings may occur for some time after the relevant policies have expired.

In this chapter, we have two primary objectives:

- 1a. Evaluate the NCCI's premium and loss development techniques.
- 1b. Evaluate the NCCI's procedures for reconciling differences that occur between different development techniques and evaluate the effectiveness and likely accuracy of the criteria they use to choose one technique over another.

**PREMIUM AND LOSS
DEVELOPMENT FACTORS**

PREMIUM AND LOSS DEVELOPMENT FACTORS

II. CONCLUSIONS AND RECOMMENDATIONS

The following is a summary of our conclusions and recommendations. For ease of reference, where recommendations can be found in a specific section of this report, we have identified the section.

General Methodology

- The premium and loss development analysis process cannot be reduced to a single best methodology. No one approach for analyzing development patterns or choosing among several alternative projection methods will be most appropriate in all circumstances.

Informed judgment is required at many junctures of the ratemaking process. This judgment should be based on a review of various loss statistics as well as knowledge of the workers compensation environment for a given state. (Section V.A., Page 24).

- Our tests of predictive accuracy indicate that projections of ultimate losses from first report are subject to significant estimation error. The accuracy of projections based on data at second and third reports is naturally better, although far from perfect. This suggests that consideration should be given to using data from more than one policy and/or accident year rather than one policy year and one accident year, as in the current NCCI methodology. In using older years, there is a tradeoff between the increased accuracy of the estimated ultimate past loss ratios and the decrease in accuracy due to the lengthening of the trend period. We recommend that future NCCI filings develop projections of ultimate, trended loss ratios based on the latest two or three policy years or the latest two or three policy and accident years. Judgment will need to be exercised in selecting standard weights (or a variable weighting system), although tests of predictive accuracy may be helpful in making this judgment. (Section V.E., Pages 37-38).

PREMIUM AND LOSS DEVELOPMENT FACTORS

Loss Development

- Loss development factors have been increasing at early ages of development for many states, as well as on a regional basis. This appears to be occurring without a corresponding decrease in development at later maturities. In general, the upward trend for paid losses appears to continue through the latest development year (calendar year 1989) included in this study, while the trends for paid plus outstanding and for incurred (including IBNR) losses appear to have ceased, at least temporarily, in about calendar year 1988 or 1989. (Section V.A., Pages 22-24).
- Because of the trends in development factors over the period studied in this report, for many of the states, use of a trended development factor method would have produced more accurate results than any average of prior years' development factors. We believe that it is important to investigate the underlying causes of trend to evaluate whether an observed trend is likely to continue. Where a trended development factor method is employed, it is also important to consider how causes of the trend in development factors at a given maturity will affect factors at other maturities. While a trended development factor method may be appropriate in some instances, it will generally be the least accurate method (compared to an average of prior factors) when a reversal of the trend occurs. (Section V.A., Pages 23-24).
- In cases where there is not a trend in loss development factors, an average of three or four years (rather than two) appears to produce a small improvement in accuracy. (This statement applies for all loss types). (Section V.A., Page 24).
- Development factors based on all three types of loss data studied (paid, paid plus outstanding, and incurred losses) tended to underestimate the ultimate losses by approximately equal amounts, on average, for the time period studied in this report. That is, there was no appreciable difference among the estimation biases in the period studied. The observed underestimation resulted from the upward trend noted previously and does not, in our opinion, indicate an inherent flaw in loss development methods. (Section V.D., Page 35).

PREMIUM AND LOSS DEVELOPMENT FACTORS

- Development factors based on paid losses and paid plus outstanding losses have tended to produce more stable estimates, from one evaluation to the next, than have development factors based on incurred losses (including IBNR). As noted in the previous conclusion, this is accomplished without a reduction in average accuracy. We hypothesize that the greater instability of the incurred loss development method may be due to inaccuracies in the allocation procedures used by companies to calculate IBNR by state. We recommend that an average of the ultimate losses resulting from paid and paid plus outstanding projection methods be used as the primary basis for the rate indications. Deviations from the primary methodology (such as using only the paid method, the paid plus outstanding method, or the incurred method) should be made when appropriate, based on diagnostic tests and consideration of the underlying forces influencing the development patterns. The supporting information provided with the NCCI rate filing should provide documentation and explain the rationale for deviations from the primary methodology. (Section V.D., Page 36).
- We consider it likely that development factors based on the sum of paid losses and case reserves will be found to be a more reliable basis for projection than paid plus outstanding losses, for most states. However, the collection of "pure" case reserve data by NCCI began only with the December 31, 1987 data calls. Thus, there is not enough historical data to thoroughly test this judgment. (Section V.D., Pages 36-37).
- We recommend that NCCI expand the diagnostic tests to enhance their ability to analyze loss development patterns. To assist in the evaluation of changes in loss development patterns, several such tests are identified in this report, some of which can be calculated with currently available data. (Section VI.D., Page 50).
- We recommend the collection of additional claim count data (number of claims closed with indemnity payments), for use in diagnostic tests of loss development. There are data quality implications to this recommendation which will be discussed later in this report. (It is likely to be some time before an adequate history of claim count data is available, from all carriers, to utilize claim counts in the diagnostic tests). (Section VI.D., Pages 50-51).

PREMIUM AND LOSS DEVELOPMENT FACTORS

- The methodology employed by NCCI to estimate "tail" factors makes best use of available incurred loss data. However, we recommend that NCCI also utilize tail factors based on paid losses and paid plus outstanding losses. (Section V.C., Page 28).
- We agree with the NCCI's planned expansion of the data calls to allow development factors to be evaluated beyond eighth report (thereby reducing the magnitude of the tail). Eventually, the data base will include development to fifteenth report. In the interim, we recommend that data be collected from a sample of companies, to possibly allow acceleration of the schedule for expanded loss development. (Section V.C., Page 28).
- The use of multiple state data appears unlikely to contribute significantly toward stabilizing the loss development factor estimation process. (Section V.B., Page 25).

Premium Development

- No one premium development factor estimation method was consistently more successful than the others. However, there is some evidence that a longer term average will perform better than the NCCI's current two year average. We recommend that the NCCI review at least four years of premium development factors, and that a three year average be used as the standard procedure from which deviations can be made where appropriate. (Section V.A., Page 22).
- The adjustment of calendar year earned premium to current rate level does not take into account the contributions to calendar year premium arising from audit adjustments to older policy years. It also does not reflect differences in exposure volume between the two policy years contributing to the accident year. A more theoretically correct calculation would be based on policy year contributions to accident year exposures. In periods of increasing premium volume, the current NCCI approach results in an understatement of calendar year premiums at current rates. The more theoretically correct calculation

PREMIUM AND LOSS DEVELOPMENT FACTORS

appears likely, for most states, to reduce the indicated rate level by less than one percent. (Section V.F., Pages 38-41).

**PREMIUM AND LOSS
DEVELOPMENT FACTORS**

PREMIUM AND LOSS DEVELOPMENT FACTORS

III. PREMIUM AND LOSS DEVELOPMENT METHODOLOGIES

A. NCCI Standard Approach

The following is a description of how premium and loss development are used in the ratemaking process employed by NCCI.

1. Source of Data

The data underlying the premium and loss development sections of the rate filing is compiled from the NCCI's Financial Calls for data. The two specific calls relevant to our analysis request premium and loss data, by policy year and accident year, at each year end. The data collected in these calls is:

- Standard Earned Premium¹
- Net Earned Premium
- Paid Losses²
- Outstanding Losses Excluding IBNR²
- IBNR Losses²
- Incurred Losses Including IBNR²
- Incurred Indemnity Claim Count
- Case Outstanding Losses³
- Bulk Outstanding Losses³

"Bulk" reserves as defined by NCCI are "reserves for general case reserve inadequacy, supplemental case reserves, cases that may reopen, or other [non-IBNR] reserves which are not associated with specific claims." "Outstanding losses" include bulk reserves for some companies, while other companies include bulk reserves in IBNR.

The development triangles are then compiled from successive year end evaluations.

-
- 1 Standard Earned Premium is required to be presented at two rate levels: the NCCI Designated Statistical Reporting Level and the Company level.
 - 2 Medical, Indemnity and Total.
 - 3 These items are required of companies that include Bulk reserves in the "Outstanding Excluding IBNR".
-

PREMIUM AND LOSS DEVELOPMENT FACTORS

Development factors are defined by reporting period, i.e., first to second report, second to third report etc. By definition, first report for accident year 19xx is December 31, 19xx; first report for policy year 19xx is December 31, 19xx+1.

A complication arises from the fact that, as a result of the NCCI's editing process and the timing of some state rate filings, not all companies' data will be included in the compilation of policy year and accident year aggregates. NCCI uses a "matching company" process for deriving development factors. In this process, development factors for, say, first to second report, are derived only from companies that provide useable data for each of these reports. The same is true for second to third report, and so on. On average, less than 5% of premiums and losses are omitted due to the matching process.

2. Premium and Loss Development Factors

Policy year standard earned premium at a first report is developed to a fifth report. Premium development factors are selected separately for first report to second report, second report to third report, third report to fourth report and fourth report to fifth report. The development factors are based on historical policy year premium development in the state. The standard methodology uses the arithmetic average of the two most recent years' development factors. The fifth report is considered final, that is, no premium development is assumed to take place beyond the fifth report.

Policy year indemnity and medical losses are separately developed to ultimate. Loss development factors are selected for each successive development interval, i.e., first to second through seventh to eighth. As with premium development, the standard methodology uses the arithmetic average of the two most recent years.

Accident year losses are developed in a similar manner. Premium development is not utilized in the accident year loss ratio indication.

Using the development process described above, loss projections based on the following methodologies are reviewed for each state. (Methodology refers to the type of data being used. In general, the calculation of development factors is similar for the various methodologies.)

PREMIUM AND LOSS DEVELOPMENT FACTORS

Incurred Losses including IBNR
Incurred Losses excluding IBNR (i.e paid plus outstanding including reported
bulk reserves)
Paid plus Case Outstanding Losses
Paid Losses
Paid Losses to fourth report; Incurred including IBNR from fourth report to
ultimate

In each of the above methodologies, development beyond eighth report is based on incurred including IBNR, using the tail factor calculation described below.

3. Tail Factor Calculation

A "tail" factor is a loss development factor that reflects the expected development beyond the period for which individual loss development factors are available.

For data calls conducted through December 31, 1986, the policy year and accident year aggregate data included loss experience for individual years only to the eighth report. All years at a valuation date beyond eighth report were aggregated. As a consequence, the loss development factors by development year were available only through eighth report.

Experience shows that development beyond eighth report can be significant, and the tail factor is intended to estimate this development.

The derivation of the tail factor is a two step process:

- a. Calculate a factor to convert losses projected to an eighth report to an incurred (including IBNR) basis at eighth report. The general methodology uses a two year average of the following ratio:

$$\frac{\text{Incurred (including IBNR) at eighth report}}{\text{Reported at eighth report}}$$

Reported at eighth report reflects the loss type being developed, (e.g. paid).

PREMIUM AND LOSS DEVELOPMENT FACTORS

- b. Calculate the eighth to ultimate tail (incurred including IBNR) as follows:

Calendar Year (Incurred) Loss Development
for all maturities beyond eighth report
Average of most recent three years'
incurred losses at eighth report

The denominator (three year average) reflects a fairly recent modification to the NCCI's tail factor calculation. It is a reflection of the fact that the previous approach, which used only the most recent year's incurred losses at eighth report, understates the tail factor when the loss base is growing over time (as has been the case for most states.)

Beginning with the December 31, 1987 report, the aggregate calls for data have been modified to allow the collection of individual years' development beyond eighth report. Ultimately, the expanded calls will provide loss development to fifteenth report.

As NCCI compiles more data from its expanded policy year and accident year calls, the actual development factors will be extended to reflect the available data, and the development interval projected by the tail will be adjusted accordingly.

The current NCCI methodology requires two values for each development factor and tail factor. Several alternative tail methodologies are possible. For example, the December 31, 1990 reports will include one development factor for (policy year) eleventh to twelfth report, and would allow one calculation of a tail factor for eleventh report to ultimate. The current methodology would be to use development to tenth report, with a tail factor reflecting development from tenth report to ultimate, since two values of the latter are available. An alternative would be to use development to eleventh report, along with the single eleventh to ultimate tail factor.

The NCCI staff analyzed several alternative methodologies in early 1989. This analysis tested each of the methodologies' accuracy in predicting the "true" tail, for each of 38 states and in total. The test was designed to evaluate the predictive accuracy of the

PREMIUM AND LOSS DEVELOPMENT FACTORS

various methodologies, under several alternative scenarios of loss development factors that replicate the most recent eighth to ultimate factor. In addition to the most recent eighth to ultimate factor for each state, the test incorporated average annual (loss) growth rates exhibited by each state. Based on the results of this analysis, NCCI established the following schedule:

<u>Filing Year</u>	<u>Tail Methodology</u>
1991	10th to Ultimate (no growth adjustment)
1992	11th to Ultimate (no growth adjustment)
1993	12th to Ultimate (no growth adjustment)
1994	13th to Ultimate (no growth adjustment)
1995	14th to Ultimate (no growth adjustment)
1996	15th to Ultimate (no growth adjustment)
1997	15th to Ultimate (two year average denominator)
1998	15th to Ultimate (three year average denominator)

The planned methodology has subsequently been modified to reflect a growth adjustment in the factors for the 1991-1996 filing years. We understand that the NCCI staff monitors the actual tail development, each year, relative to the test results.

4. Selection Among Various Methodologies

As discussed above, ultimate loss projections are prepared using a number of loss measures, including:

- Incurred Losses including IBNR
- Incurred Losses excluding IBNR
- Paid plus Case Outstanding losses
- Paid Losses
- Paid Losses to fourth report; Incurred including IBNR from fourth report to ultimate

Currently, rate level analyses utilizing all five of the data types are prepared for internal review by NCCI, along with the results of the NCCI's "Early Warning System"

PREMIUM AND LOSS DEVELOPMENT FACTORS

which was developed to assist in choosing among the various methodologies. The two main tests included in the Early Warning System are:

- Change in the product of the first to fifth incurred (including IBNR) loss development factors (based on two year averages). A change of more than five percentage points is considered evidence of a possible change in reserve adequacy, leading to consideration of methodologies other than incurred losses.
- Change in ratio of paid to incurred (including IBNR) losses at first report. If the ratios for successive years differ by more than three percentage points, this is taken as evidence of changing reserving patterns or payment patterns.

In addition to the early warning tests, NCCI may evaluate other diagnostic tests and may also take into consideration information received from company managements, particularly claim departments, as to changes in the claim process which may be affecting development patterns.

B. Independent Bureau Methodologies

We have reviewed the filings of the following independent rating bureaus (selected as a sample):

<u>State</u>	<u>Effective Dates</u>
California	1/1/90; 1/1/91
Massachusetts	1/1/90; 1/1/91
Minnesota (pure premium filing)	1/1/90; 1/1/91
New York	7/1/89; 7/1/90

The following is a summary of the premium and loss development methodologies used by these bureaus:

PREMIUM AND LOSS DEVELOPMENT FACTORS

1. Premium and Loss Data

California ultimate loss ratio projections are based on accident year loss data (together with calendar year earned premium data) only. Indemnity and medical losses are developed separately using incurred losses excluding IBNR. (As with NCCI data, these losses may include companies' estimates of bulk reserves for case reserve development.)

Massachusetts ultimate loss ratio projections are based on averages of policy year and accident year data. While several alternatives are provided in the filing, the indicated change in rate level is based on paid plus case loss development for medical and indemnity losses combined. This represents a change from previous filings, for which the indications were based on incurred losses including IBNR.

Minnesota ultimate loss ratio projections are based on averages of policy year and accident year data. While several alternatives are provided in the filing, the ultimate loss projection is based on incurred losses excluding IBNR (with medical and indemnity evaluated separately).

New York ultimate loss ratio projections are based on averages of policy year and calendar year data. The indicated change in rate level in the most recent filing (effective 7/1/90) is based on development of paid plus case for medical and indemnity losses combined. This represents a change from previous filings, in which the indications were based on incurred losses including IBNR.

2. Premium and Loss Development Factors

California "standard" loss development factor selection is the average of the three most recent years. Where the three years show evidence of a trend in the factors, a trending method (double exponential smoothing) is used to project the next factor, which is given consideration in the final selection. Loss development data is compiled and projected separately for the state fund and for the private carriers. Premium development is not considered because calendar year earned premiums are used.

Massachusetts premium and loss development factors are based on the most recent two year average. In the most recent filing (effective 1/1/91) loss development data is

PREMIUM AND LOSS DEVELOPMENT FACTORS

compiled (and projected) separately for the ten largest carriers (individually), and for the rest of the industry.

Minnesota premium and loss development factors are chosen from among several diagnostic averages, including the following: average of all (five) factors; average of the two most recent factors; and average of (three) factors excluding the highest and lowest.

New York premium and loss development factors are based on the most recent two year averages.

3. Tail Factor

California accident year loss development is available to 234 months (19.5 years). The tail factor (234 months to ultimate) is based on the ratio of incurred including IBNR to incurred excluding IBNR.

Massachusetts policy year and accident year loss development is available to tenth report. The tail (tenth report to ultimate) is based on the ratio of incurred including IBNR to incurred excluding IBNR.

Minnesota pure premiums reflect development only to eighth report. Beyond that, carriers are required to apply their own development tail. The Minnesota filing provides several alternative tail factor calculations for carriers to consider. Each of these alternatives is a variation of the approach used by NCCI and discussed above.

New York policy year development is available to seventh report. Beyond that, the tail factor is derived using the NCCI methodology described above, but without the adjustment for growth in the denominator.

4. General Observations

In general, these four independent bureaus tend to be moving away from the use of incurred loss including IBNR.

**PREMIUM AND LOSS
DEVELOPMENT FACTORS**

Three of the four bureaus rely solely on the last two or three development factors. The fourth bureau (Minnesota) evaluates the factors over a longer time period.

**PREMIUM AND LOSS
DEVELOPMENT FACTORS**

PREMIUM AND LOSS DEVELOPMENT FACTORS

IV. DATA UNDERLYING OUR ANALYSIS

The following states were chosen for our analysis, to represent a mixture of states of various size, geography and workers compensation laws:

- Connecticut
- Florida
- Illinois
- Louisiana
- Maine
- Michigan
- Nebraska
- North Carolina
- Oregon
- Utah
- Wisconsin

The following policy year data was obtained from NCCI:

- Standard Earned Premiums (at NCCI Designated Reporting Level)
- Paid Medical Losses
- Paid Indemnity Losses
- Outstanding (excluding IBNR) Medical Losses
- Outstanding (excluding IBNR) Indemnity Losses
- Bulk Medical Losses
- Bulk Indemnity Losses
- Incurred (including IBNR) Medical Losses
- Incurred (including IBNR) Indemnity Losses
- Reported Indemnity Claim Counts

Matching company data was provided for each development period for policy years 1973 through 1987.

In addition to the eleven states identified above, similar data was obtained for each of the three NCCI regions (North, South, West). We also received the premium and loss

PREMIUM AND LOSS DEVELOPMENT FACTORS

development sections from each of the most recent three rate filings for the states above.

We obtained a copy of the "Early Warning System" exhibits prepared by NCCI with each rate review.

We received copies of internal NCCI correspondence relative to modifications to the tail factor procedure to reflect the additional development data as it becomes available.

We chose to perform our analysis using policy year data only. For the issues we are studying, conclusions based on policy year data are equally applicable to accident year data.

PREMIUM AND LOSS DEVELOPMENT FACTORS

V. OBJECTIVE 1a -- EVALUATION OF THE NCCI'S PREMIUM AND LOSS DEVELOPMENT TECHNIQUES

A. Number of Years Entering the Development Triangle

The purpose of this section of our analysis was to evaluate alternatives to the two year arithmetic average which is the norm for the development factors used by NCCI in its projections of ultimate losses and premiums. We evaluated the following alternatives:

- Three Year Average
- Four Year Average
- Two Year Weighted Average
- Three Year Weighted Average
- Four Year Weighted Average

The weights utilized in the weighted averages were exponential weights based on a weighting factor of 0.9, as follows:

Most recent factor	1.000
Next most recent factor	0.900
Next most recent factor (if used)	0.810
Next most recent factor (if used)	0.729

We designed a test which compares, for each of the alternative averages, the projected factor to the actual factor. This was done for each of five successive development years - December 31, 1984 through December 31, 1989. For example, as a test of the first to second development factor, the factors from policy years 1981-1983 were used to project the factor for 1984, the factors for 1982-1984 were used to project the factor for 1985, and so on.

For each alternative, and for each development interval, we calculated the square of the difference between the projected development factor based on the development technique and the actual development factor.

The best performing alternative at each development interval was then defined as the one for which the sum of the squared differences was the lowest.

PREMIUM AND LOSS DEVELOPMENT FACTORS

(Note: This test evaluates the ability to predict the next calendar year's loss development, rather than the latest policy year's loss development. For purposes of comparing the accuracy of the alternative weighting methods, we consider it preferable to test against the next calendar year's loss development, because this allows use of the latest available development factors. However, later in this study, our comparison of predictive accuracy of alternative data types (paid vs. paid plus outstanding vs. incurred) will test the ability to predict a policy year's loss development).

Exhibits 1 through 7 summarize the results. (More detailed summaries for each state are provided in the technical appendix.) Two summaries are provided for each exhibit. The top half of each exhibit identifies the method producing the lowest average deviation, summed across all development intervals, i.e., the average deviation for the first report to second report factors plus the average deviation for the second report to third report factors, and so on. The bottom half of each exhibit identifies the method that produces the lowest average deviation for the greatest number of development intervals.

For premium development, no single averaging method was consistently more successful than the others. There is some evidence that longer term averages will perform better than the standard two year average utilized by NCCI. Based on the tests, we recommend that NCCI compile at least four years of premium development factors, and that a three year average be used as the standard procedure from which deviations can be made where appropriate.

For losses, the frequent success of the two year exponential average can be explained by the fact that, for many states, the development factors at a given age exhibit a trend. In particular, loss development factors have generally been increasing over the time period studied. The two year exponential average is weighted more heavily toward recent experience than the other alternatives we evaluated.

The increase in loss development factors at the early maturities appears to be occurring without a corresponding decrease at the later maturities. In general, the upward trend for paid losses appears to continue through the latest development year included in the study, while the trends for paid plus outstanding and for incurred

PREMIUM AND LOSS DEVELOPMENT FACTORS

(including IBNR) losses appear to have ceased, at least temporarily, in about calendar year 1988 or 1989.

We chose not to include trended development factors in our tests (that is, development factors resulting from the assumption of a continuation of a "down the column" trend). While an appropriately chosen trending method would have performed better than the other averages in predicting the development factors in many instances, a trending method will generally be the least accurate in a situation where a reversal of the trend occurs. For example, the following is a summary of the paid indemnity loss development factors for Louisiana, from first report to second report:

<u>Policy Year</u>	<u>Development Factor</u>
1979	1.622
1980	1.704
1981	1.748
1982	1.691
1983	1.767
1984	1.758
1985	1.797
1986	1.850
1987	1.736

Clearly, an upward trend exists in the factors through policy year 1986.

With the benefit of hindsight, we can see that a development factor approach which assumed a continuation of the trend in the development factors would have more accurately predicted the factors for policy years 1985 and 1986 than would any average of the prior years development factors.

Conversely, again with hindsight, we can observe that a development factor approach which assumed a continuation of the trend would have overstated the factor for policy year 1987.

PREMIUM AND LOSS DEVELOPMENT FACTORS

The point of the above is to illustrate that no one approach for analyzing development factors is most appropriate in all circumstances.

As noted above, for most states the upward trend in paid development factors appears to continue through the latest development year included in the study (Calendar Year 1989). We believe that it is unlikely that a reversal of the trends will occur in all states at any point in time. However, we believe that it is equally unlikely that the trends will continue indefinitely in all states. An investigation into the causes of the trend, and the likelihood that it will continue, can assist in the development factor selection process for a given state.

The tests for each state suggests that, for those states and development intervals for which there is no apparent trend in development factors (trends appear to be more prevalent at the early development intervals), no one average consistently outperforms the others. However, there is some evidence that the longer term averages (three and four year) perform better when there is no apparent trend.

We conclude, from the above tests, that in the absence of a trend in development factors, an average of three or four years (rather than two) may produce a small improvement in accuracy. However, where a trend is present, we do not believe that it is appropriate to assume that the trend will continue, without an investigation of the underlying cause of the trend. If the results of the investigation give a reason to expect a continuation of the trend, then a trended development method may be appropriate. It will be important, however, to also consider how the trend in development factors at a given maturity will affect factors at other maturities.

Where a trend has existed in the past development factors, and where it is not clear whether the trend is more likely to continue or to reverse in the future, the most appropriate development factor may be the most recent factor, rather than an average of several recent factors.

In conclusion, no one approach for analyzing development patterns will be most appropriate in all circumstances. Informed judgment, based on knowledge of workers compensation environment for a given state, is required in the development analysis.

PREMIUM AND LOSS DEVELOPMENT FACTORS

B. Use of Multiple State Data

The development factors selected by NCCI for a given state are based solely on the loss development data from that state. We have designed a test to evaluate whether the use of multiple state data would improve the development factor selections for the smaller states.

The premise underlying the concept of using multiple state data is that the factors for a given state exhibit too much variability to allow full reliance upon them as a basis for estimating future development. This would be more likely to occur for small (low volume) states than for the larger states. Thus, if the premise is correct, we would expect that the smaller states would exhibit more variability in the development factors than would the larger states.

To test for this, we have calculated the variances of the loss development factors for each of the eleven states, as well as for the regional data. If the above premise is true, we would expect the variances to decrease as the size of the state increases. A comparison of the variances for each of the six loss types (paid medical, paid indemnity, paid plus outstanding medical, paid plus outstanding indemnity, incurred medical, incurred indemnity) is attached as Exhibits 8 through 13. On the exhibits, states are arranged in increasing order based on policy year 1987 earned premium. At the early maturities, there does not appear to be any clear relationship between size (premium volume) and variance of development factors. At the later maturities, the regional variances are lower than the state variances. However, there are a number of anomalies in the variances of the state data (i.e., large states with relatively high variances and small states with relatively low variances) which indicate that elements other than volume have significant impact on development stability. In addition, there are a number of instances where the average loss development factors for one state are consistently higher than the corresponding regional average, while those for another state in the region are consistently lower than the regional average. Thus, grouping states to increase the volume of data would not appear to improve the development factor estimation process.

PREMIUM AND LOSS DEVELOPMENT FACTORS

C. Selection of Tail Factor

As discussed above, the NCCI tail factor is based on the following ratio:

$$\frac{\text{Calendar Year Incurred Loss Development} \\ \text{for all maturities beyond eighth report}}{\text{Average of most recent three years'} \\ \text{incurred losses at eighth report}}$$

Our first observation is that the adjustment which was made to the tail calculation, whereby the denominator was adjusted for growth, was a valid measure to counteract the bias in the previous procedure. The prior approach was to use the ratio of:

$$\frac{\text{Calendar Year Incurred Loss Development} \\ \text{for all maturities beyond eighth report}}{\text{Most recent year at eighth report}}$$

Exhibit 14 attached provides a hypothetical example which demonstrates that, in a period of growth, the prior approach will understate the true tail. From the example, the following are the key values:

"True" Tail	1.163
Unadjusted Tail	1.147
Adjusted Tail	1.161

A second observation is that, despite the improvement in the process, there still exists a fair amount of volatility in the eighth to ultimate factors from one year to the next. A two year average of tail factors, calculated from successive calendar years, is used to reduce variability from one rate filing to the next. This is illustrated below with tail factors from Connecticut rate filings.

**PREMIUM AND LOSS
DEVELOPMENT FACTORS**

<u>Filing Effective</u>	<u>Indemnity Eighth to Ultimate</u>		
	<u>Tail Factor #1</u>	<u>Tail Factor #2</u>	<u>Average</u>
10/01/87	1.132	1.187	1.160
01/01/89	1.158	1.127	1.143
01/01/90	1.125	1.160	1.143

As the data becomes available for development beyond eighth report, the tail will be one year shorter, with each evaluation, up to the point when development is available to fifteenth report. Thus, the magnitude of the tail will diminish as this data becomes available. To illustrate, as discussed earlier, the California data provides accident year development factors to 234 months. Based on the California filing effective January 1, 1991, the following is a comparison of the (incurred excluding IBNR) tail factors from 102 months (which is approximately equivalent to a policy year at eighth report), 186 months (which is approximately equivalent to a policy year at fifteenth report) and 234 months (which is approximately equivalent to a policy year at nineteenth report):

<u>Accident Year Maturity</u>	<u>California Tail Factors</u>	
	<u>Medical</u>	<u>Indemnity</u>
102	1.1233	1.0445
186	1.0692	1.0296
234	1.0350	1.0174

The NCCI plan for integrating the additional loss development data, with corresponding adjustments to the tail, as this data becomes available, was discussed in Section III-A 3. The plan requires that two data points (loss development factor or tail factor) be available before a specific methodology is used. We believe that this constraint is appropriate. While other methods exist for deriving a tail, such as curve fitting or modeling methods, we do not believe that these generally provide more accurate estimates of the tail than the NCCI's current procedure. Curve fitting, for example, requires an assumption regarding the underlying "shape" of the development curve. Families of plausible curves, with equally good measures of fit to the loss development data to eighth report, can produce significantly different tail factors.

PREMIUM AND LOSS DEVELOPMENT FACTORS

We agree with the NCCI's plan, which will result in data for one additional loss development interval, each year (with the tail factor therefore reflecting one less development interval), until December 31, 1996 when the tail will reflect development from fifteenth report to ultimate. We recommend that, in the interim, NCCI collect loss development data on a sampling basis, from carriers having development data by policy year (and accident year) for maturities beyond those required in the calls. Analysis of this data may allow acceleration of the schedule for expanded loss development.

We also recommend that NCCI utilize tail factors based on paid losses and paid plus outstanding losses. For reasons to be discussed in more detail in a later section, we believe the incurred including IBNR is a less reliable predictor of ultimate incurred losses than paid losses or paid plus outstanding losses.

In conclusion, we believe that the approach used by NCCI makes best use of available data in deriving the tail. We agree with the plan to extend the development history to fifteenth report, as the data becomes available. We recommend that tail calculations, based on paid losses and on paid plus outstanding losses, be used as alternatives to the tail based on incurred losses. We also recommend that additional tail data be collected, on a sampling basis, to possibly allow acceleration of the tail modification schedule.

D. Performance Tests of Loss Development Methods

As discussed earlier, several methodologies (i.e., loss types) are considered by NCCI in projecting ultimate loss ratios. In a later section, we will discuss the NCCI's procedure for choosing the methodology to be used in the rate filing. We will also discuss other diagnostic tests which may assist in this selection process.

First, however, we will evaluate the historical performance of the three main methodologies:

PREMIUM AND LOSS DEVELOPMENT FACTORS

Paid Losses

Incurred Losses excluding IBNR (referred to herein as Paid plus Outstanding Losses)

Incurred Losses including IBNR (referred to herein as Incurred Losses)

A fourth methodology, Paid plus Case Outstanding Losses, is also considered by NCCI. However, case reserves have only been reported separately (from bulk reserves) since December 31, 1986. This is not a sufficient history to incorporate this method in our evaluation.

The purpose of the tests, which will be described below, is to compare the three methods with respect to:

- variability in the estimates of ultimate incurred losses;
- accuracy in the estimates of ultimate incurred losses from the early policy year maturities.

The premise underlying the use of both of these measures in evaluating the methods is that, while predictive accuracy is the most important feature of the methodology, if two (or three) methods are approximately equal in their predictive ability, then the methods exhibiting the least variability will be preferred because of the greater potential to detect and adjust for any bias.

1. Tests of Variability

Our first test of performance compares the variability in the estimates produced by each of the three data types as a policy year matures. The estimates are based on the NCCI's current projection methodology (that is, using a two year average development factor) and are developed to eighth report.

This test measures the variability in two ways. The first is the percentage variation in the projected value at eighth report based on data at successive development points.

PREMIUM AND LOSS DEVELOPMENT FACTORS

That is, if the available projections are from:

Fourth Report	P4
Fifth Report	P5
Sixth Report	P6
Seventh Report	P7
Eighth Report	P8

The first measure of variability is:

$$\frac{\left| \frac{P5}{P4} - 1 \right| + \left| \frac{P6}{P5} - 1 \right| + \left| \frac{P7}{P6} - 1 \right| + \left| \frac{P8}{P7} - 1 \right|}{4}$$

Exhibits 15 and 16 summarize the average variations in the projections for each state and policy year.

The second measure of variability is the percentage variation between the estimates from each valuation relative to the most recent available estimate:

$$\frac{\left| \frac{P4}{P8} - 1 \right| + \left| \frac{P5}{P8} - 1 \right| + \left| \frac{P6}{P8} - 1 \right| + \left| \frac{P7}{P8} - 1 \right|}{4}$$

Exhibits 17 and 18 summarize the average variations measured in this way.

On the exhibits (15 through 18) we have identified the method with the least variability (as defined above) for each state and policy year. For each test, we have seventy-seven measures of variability (eleven states and seven policy years). The following is a summary of the number of times each method produced the least variability:

**PREMIUM AND LOSS
DEVELOPMENT FACTORS**

<u>Exhibit Number</u>	<u>Loss Type</u>	<u>Deviation From</u>	<u>Projection Based on Paid Plus</u>		
			<u>Paid Losses</u>	<u>Outstanding Losses</u>	<u>Incurred Losses</u>
15	Indemnity	Prior Projection	46	23	8
16	Medical	Prior Projection	75	1	1
17	Indemnity	Latest Projection	47	22	8
18	Medical	Latest Projection	62	6	9

The results clearly indicate that for a majority of states tested the paid loss development projection exhibits less variability, to eighth report, than the incurred and the paid plus outstanding development projections.

The tests above measure variability within each of the projection methods only. They do not reflect variability resulting from the conversion to an incurred basis. That is, if all else were equal, we would expect more variability in development from paid losses at eighth report than we would in incurred losses at eighth report. We have reflected this component of the variability by converting the projections from each of the first two methods (paid; paid plus outstanding) to an incurred basis. This conversion uses the most recent two year average of:

$$\frac{\text{Paid Losses}}{\text{Incurred Losses}}$$

or

$$\frac{\text{Paid Plus Outstanding Losses}}{\text{Incurred Losses}}$$

This is the approach used by NCCI in converting to an incurred basis, before applying the tail factor.

Exhibits 19-22 display the results of these projections. The interpretation of these exhibits is the same as that for Exhibits 15-18. The following table is a summary.

PREMIUM AND LOSS DEVELOPMENT FACTORS

<u>Exhibit Number</u>	<u>Loss Type</u>	<u>Deviation From</u>	<u>Projection Based on</u>		
			<u>Paid Losses</u>	<u>Paid Plus Outstanding Losses</u>	<u>Incurred Losses</u>
19	Indemnity	Prior Projection	37	31	9
20	Medical	Prior Projection	41	25	11
21	Indemnity	Latest Projection	29	26	22
22	Medical	Latest Projection	31	28	18

These tests indicate that, even after making an adjustment to an incurred basis, the paid development method exhibits the least variability in the projection of incurred at eighth report in more states than either of the other two methods. Paid plus outstanding is the next least variable.

These results are opposite to those one might expect. That is, if the IBNR (and bulk reserve) estimates were to reflect companies' actuarial estimates of these values for each state, one would expect the least variability in the incurred projection, followed by the paid plus outstanding, and the most variability in the paid projection. In fact, however, the opposite is the case.

It is our understanding that the IBNR and bulk reserves which are reported on many companies' responses to the calls for aggregate data by state do not reflect detailed actuarial analyses of the required values for the individual states. Rather, the values often result from an allocation method applied to the results of a countrywide analysis. The estimates of total IBNR are also subject to variations in adequacy from year to year. Consequently, a change in the value of incurred losses from one valuation to the next may not be a reflection of changing IBNR (or bulk) requirements for that state, but rather a reflection either of changes in the company's countrywide estimate of IBNR for workers compensation or of changes in the allocation formulae.

This would appear to explain the results of the above tests, and suggests that the incurred method is influenced by imprecise estimates of IBNR, thereby producing more variability in the estimates from one evaluation to the next.

PREMIUM AND LOSS DEVELOPMENT FACTORS

Another observation can be made from the above tests. After converting to an incurred basis, the paid plus outstanding method produces the least variability almost as often as the paid method. Paid plus outstanding is affected by variability in the bulk reserve in the same way as the incurred projection is affected by variability in the IBNR reserve. However, not all companies calculate a bulk reserve, (some include it with IBNR). The impact of bulk reserves on the paid plus outstanding method should be less than the impact of bulk and IBNR reserves on the incurred methods.

The above tests suggest that the paid and paid plus outstanding methods are the most stable. If paid plus case data were available for the development history reflected in the tests, we would expect it to demonstrate variability less than or equal to the variability of the paid plus outstanding method. (While not shown on the exhibits, the paid plus case development factors, in the three years for which they are available, exhibit about the same degree of variability as the paid plus outstanding factor for these same years.)

2. Tests of Predictive Ability

The focus of the previous test was the variability across all development intervals. Given that the NCCI's current methodology is based on a projection of the most recent (policy and accident) year at first report, we need to also focus on the relative predictive ability of the three methods using data as of first report.

To accomplish this, Exhibits 23 through 28 display the projections, converted to incurred at eighth report, from each of the first three reports for policy years 1981 through 1984. The exhibits also display the projection from the most recent report for each of the four policy years. We received data through December 31, 1989. Thus the most recent reports are:

Policy Year 1981	Eighth Report
Policy Year 1982	Seventh Report
Policy Year 1983	Sixth Report
Policy Year 1984	Fifth Report

**PREMIUM AND LOSS
DEVELOPMENT FACTORS**

On the bottom of each exhibit, we have shown the following values:

- Average deviation
- Average absolute deviation
- Average of the variances of state deviations

Positive values on the exhibits indicate projections that are lower than the latest estimate. The following is a summary:

	<u>Average Percentage Deviation From</u>		
	<u>1st Report</u>	<u>2nd Report</u>	<u>3rd Report</u>
<u>Indemnity</u>			
Paid	10.61%	8.23%	5.63%
Paid Plus Outstanding	10.52	7.27	3.87
Incurred	11.68	8.19	4.31

<u>Medical</u>			
Paid	4.24	2.50	1.62
Paid Plus Outstanding	3.79	1.30	0.20
Incurred	3.56	1.44	(0.15)

	<u>Average Percentage Absolute Deviation From</u>		
	<u>1st Report</u>	<u>2nd Report</u>	<u>3rd Report</u>
<u>Indemnity</u>			
Paid	11.74%	9.70%	7.34%
Paid Plus Outstanding	11.46	8.50	5.55
Incurred	12.35	8.76	5.22

<u>Medical</u>			
Paid	6.39	4.94	4.43
Paid Plus Outstanding	5.63	6.01	4.18
Incurred	8.24	6.34	4.12

PREMIUM AND LOSS DEVELOPMENT FACTORS

From the above and the Exhibits 23 through 28, we observe:

- a. There is no appreciable difference in the predictive accuracy from first report among the three methods.
- b. The predictive accuracy for all methods improved at second and third reports. The improvements in accuracy from first to second and third reports suggest the possibility of using the later reports in projecting loss ratios in rate filings. This will be discussed in a later section.
- c. The results vary considerably from state to state.

As a final note, none of the methods described above was as successful in predicting ultimate losses from the early maturities as we would have liked. Each demonstrated a tendency for the projections to understate the ultimate losses for policy years 1981 through 1984. We do not consider the observed understatement to indicate a chronic fault of the projection methods. As noted in the loss development factor section of this chapter, loss development factors have exhibited an upward trend over this time period. Had a continuation of the trend been anticipated at the time, and had development factors been chosen in accordance with this expectation, it is possible that each of the methods would have demonstrated more accurate results. The trends in the development factors are less pronounced for the incurred losses than for paid and paid plus outstanding. However, as we discussed earlier, estimates based on incurred losses will be subject to variability due to the adequacy of the carriers' estimates of IBNR. With the benefit of hindsight, the insurance industry's reserves for workers compensation during this period of time have proven to have been inadequate. This is a contributing cause to the understatement of the ultimate losses from the projections based on incurred losses.

Had the tests been performed for a different time period, it is possible that the results would differ. Nevertheless, the exhibits above indicate no appreciable difference in the accuracy of the three methods for the four policy years studied.

PREMIUM AND LOSS DEVELOPMENT FACTORS

3. Conclusions

The tests above have suggested that all three methods have demonstrated a tendency to understate the ultimate losses, based on projections from early maturities for the years studied. This bias is not appreciably different for any of the three methods.

The tests above have also suggested that, in most of the states studied, the paid and paid plus outstanding methods exhibit less variability in the projections than does the incurred method.

While the evidence is not conclusive, we believe that the tests support a "primary" methodology which gives precedence to the paid and paid plus outstanding methods. The incurred method is subject to external factors which increase the variability of the projections. These include changes in the adequacy of companies' estimates of IBNR, inaccuracies in the allocation of IBNR to individual states, and similarly, inaccuracies in the allocation of IBNR to policy years.

These "external" influences and the observed variability in the incurred method lead us to believe that the paid and paid plus outstanding (and eventually paid plus case) methods are more susceptible to identification and correction of any projection biases than is the incurred method. These corrections, which may be either by adjustments to the data or elimination of the method, can follow from the evaluation of diagnostic tests and statistics discussed in a later section, and from an evaluation of the underlying causes of patterns in the development factors.

We recommend that an average of the ultimate losses resulting from the paid loss development and paid plus outstanding loss development projections be used as the primary basis for the rate indications. Deviations from this primary approach (such as using solely the paid method, the paid plus outstanding method, or the incurred method) should be made when appropriate, based on diagnostic tests and consideration of the underlying forces influencing the development patterns. The supporting information provided with the NCCI rate filing should explain the rationale for deviations from the primary methodology and include documentation.

As noted previously, NCCI has not been collecting "true" case outstanding losses for a long enough time to draw any conclusions about the paid plus case projection

PREMIUM AND LOSS DEVELOPMENT FACTORS

method. We believe that case reserves should be less subject to distortions (due to allocation) than are bulk and IBNR reserves. Some very simple tests of the development factors suggest that the paid plus case development has similar variability to the paid plus outstanding. We consider it likely that further testing by NCCI, as additional data becomes available, will show that paid plus case losses should replace paid plus outstanding losses.

Finally, we emphasize the need for additional diagnostics to allow evaluation of the reliability of various methodologies for a specific situation. This will be discussed in a later section.

E. Number of Years Used in the Projection

The current ratemaking methodology uses the most recent policy year and accident year, at first report, in projecting ultimate loss ratios, for the rate level indication.

The tests described earlier demonstrated the tendency for the projection from first report to understate the ultimate losses for policy years 1981 through 1984. This was due, in part, to the trend in development factors discussed earlier. That is, if development factors are increasing, with no corresponding reduction in the tail, the use of past factors will understate the future development. (As discussed earlier, we do not consider the observed understatement to indicate a chronic fault of the projection methods).

The tests indicated that the tendency to understate the ultimate losses existed in projections from second and third reports as well but that the magnitude of the differences was reduced. This suggests to us that the ratemaking methodology should be revised to incorporate two or more policy years in the estimation of the loss ratio for the year for which the rates will be in effect.

The incorporation of additional years would require increased reliance on the trending procedure. That is, the objective of using more mature data is to improve the accuracy and reduce the variability of the projected ultimate losses for prior policy years. However, this will require the trending process to cover a longer time span,

PREMIUM AND LOSS DEVELOPMENT FACTORS

thereby potentially increasing the variability resulting from this step of the ratemaking process. Thus, there is a trade-off which only additional testing can evaluate.

While our tests focused on policy year data, it is reasonable to expect similar results with accident year data. In fact, we would expect more variability in the accident year projections from first report, because accident year losses at first report are less mature than policy year losses at first report. Thus, the analysis of the number of years used in the loss ratio projections should encompass the accident year indications as well.

We recommend that future NCCI filings develop projections of ultimate, trended loss ratios based on the latest two or three policy years or the latest two or three policy and accident years. Judgment will need to be exercised in selecting standard weights (or a variable weighting system), although tests of predictive accuracy may be helpful in making this judgment.

F. Impact of Premium Development on Calendar Year Premiums

Standard Earned Premium for workers compensation is a function of, among other things, the insured's payroll during the coverage period. Payrolls are initially estimated at policy inception, with the final payroll (and premium) determined by audit after policy expiration. As a result, policy year earned premium will change after the policy year expires. The policy year premium development factors reflect this phenomenon. For most states, policy year premium development factors from the expiration of a policy year (First Report) are in the range of 1.03 to 1.06, however, factors in excess of this are not uncommon.

The accident year rate indication derived by NCCI is based on calendar year earned premiums. Calendar year premiums are adjusted to current rate levels using methodology described in another part of the M&R study. The current methodology has two shortcomings in the use of calendar year premiums as a basis for measuring the accident year exposure. First, the calendar year premiums include audit premiums from policy years prior to the previous policy year. The adjustments do not reflect the rate levels underlying these premiums, nor the growth in volume of

PREMIUM AND LOSS DEVELOPMENT FACTORS

business (in most states) between the exposure periods related to the audits and the accident year of interest.

We can illustrate this with the adjustment calculation from the Florida rate filing effective 1/1/90. The following calculation, adjusting the calendar year 1988 premium, is reproduced from that filing:

Rate Change Date	(1) Premium Level <u>Change</u>	(2) Cumulative Index	(3) Weight	(4) Product <u>(2)x(3)</u>	(5) Adj. Factor Pres. Index/ <u>Sum Col. (4)</u>
1/1/87	Base	1.000	.390	.390	1.351
1/1/88	1.137	1.137	.610	<u>.694</u>	
1/1/89	1.288	1.464		1.084	

Column (3) represents the percentage of the calendar year premium that is assumed to be contributed from policies written at the rate level that took effect on the date in the left hand column. Thus, the calculation assumes 39% of the calendar year 1988 earned premium is from policy year 1987, and 61% is from policy year 1988.

As discussed above, a portion of calendar year 1988 premium is from audit adjustments for policy year 1986. Florida premium development data indicates that about 5% of policy year premium is booked as earned after the policy year expires. This premium would be at 1986 rate levels, which were lower than the 1987-1989 levels. This premium is not adjusted to the appropriate rate level in the current calculation.

In addition, the actual audit adjustments from policy year 1986 are, in effect, used as estimates of the audit adjustments relating to exposure during 1988, with no reflection in changes in volume of exposure.

The second shortcoming exists in the fact that the weights applied to the respective policy years do not reflect differences between the underlying exposure volumes of the two policy years. The different weights above (.390; .610) are a reflection of policy year contributions solely due to the distribution of premiums written by month

PREMIUM AND LOSS DEVELOPMENT FACTORS

within the policy year. They do not reflect any difference which may have existed between the level of exposures written in the two policy years.

An alternative approach, which resolves both of the shortcomings, follows:

1. Develop Policy Year 1987 premium to ultimate;
2. Determine the component of Policy Year 1987 premium that relates to accident year 1988 exposure. This could be done by using the distribution of premium writings, by month, which is used in the current methodology;
3. Adjust this premium component to the current rate level;
4. Do the same for Policy Year 1988; and
5. Add the two components.

In the above approach, audit premiums are reflected by the development to ultimate. Growth is reflected in the separate projections of the two policy years.

The approach described above would provide a more theoretically correct matching of losses and exposures. We have constructed a hypothetical example to measure the impact of the recommended approach. The example considered several assumptions regarding annual rate changes, annual payroll growth rates and policy year premium earning patterns. The following is a summary of the results:

PREMIUM AND LOSS DEVELOPMENT FACTORS

<u>Annual Rate Increase</u>	<u>Annual Payroll Growth</u>	<u>Premium Earning Pattern (1)</u>	<u>Ratio of Theoretical Value to NCCI Value (2)</u>
5.0%	5.0%	60/40/0/0	0.999
5.0	5.0	55/40/5/0	1.009
5.0	5.0	50/40/7/3	1.021
5.0	10.0	60/40/0/0	0.999
5.0	10.0	55/40/5/0	1.012
5.0	10.0	50/40/7/3	1.029
10.0	5.0	60/40/0/0	0.999
10.0	5.0	55/40/5/0	1.012
10.0	5.0	50/40/7/3	1.029
15.0	0.0	60/40/0/0	1.000
15.0	0.0	55/40/5/0	1.013
15.0	0.0	50/40/7/3	1.030
15.0	15.0	60/40/0/0	0.995
15.0	15.0	55/40/5/0	1.020
15.0	15.0	50/40/7/3	1.050

(1) Percent of Premium Booked as Earned by Calendar Year, i.e. 60/40 = 60% in first calendar year; 40% in second calendar year. The "true" earning of the underlying policy year exposure is assumed to be 60/40, in all of the examples.

(2) Value greater than one indicates that theoretical value exceeds NCCI value. This implies an overstatement of the accident year loss ratio. Since the calendar-accident year loss ratio receives 50% weight in the rate level indication, the impact on the rate level will be one half of the impact on the calendar-accident year loss ratio.

Clearly, the impact depends on a number of factors. For most states, the theoretically correct calculation appears likely to reduce the indicated rate level by less than 1 percent.

**PREMIUM AND LOSS
DEVELOPMENT FACTORS**

PREMIUM AND LOSS DEVELOPMENT FACTORS

VI. OBJECTIVE 1b -- EVALUATION OF NCCI'S PROCEDURES FOR RECONCILING DIFFERENCES BETWEEN DEVELOPMENT TECHNIQUES

A. Impact of Changes in Claim Processing and Reserving

The main assumptions underlying each of the development techniques are:

The paid loss development techniques assume that loss payment patterns are relatively consistent through the underlying history.

The paid plus outstanding loss development techniques assume that case (plus bulk if applicable) reserving practices are relatively consistent through the underlying history.

The incurred loss development techniques assume that total (case plus bulk plus IBNR) reserving practices are relatively consistent through the underlying history.

When considering the above assumptions it is important to recognize that many of the types of changes that may materially affect each of the techniques for an individual carrier are less likely to affect the industry as a whole. For example, an individual company may implement a new data processing system which records claims activity (payments and reserves) more quickly. While this type of change will affect that company's paid and paid plus case development patterns, it is not likely to significantly impact the aggregate industry development patterns. Thus, in considering events that may cause violation of the underlying assumptions, one should focus primarily on external factors, which affect the industry as a whole, rather than on changes in individual companies' claim processes. Additionally, changes in the market share of insurers within a state can have an impact on development patterns reflecting different claim practices.

Further, in considering how the various methods will be affected by these factors, we need to consider whether the changes are gradual or sudden. For example, the industry has seen, in some states, a long term tendency towards more litigation of

PREMIUM AND LOSS DEVELOPMENT FACTORS

workers compensation claims. This tendency may have manifested itself in a lengthening of the payment pattern over time, such that any diagnostics based on year over year changes in (for example) paid to incurred ratios may not discern any changes. This type of change has less of a distorting effect on loss development projections than sudden changes, for example a significant change in the benefit structure or in the benefit delivery system. Nevertheless, it can introduce a bias in the loss development projections.

The point of the above discussion is that while tests of the various development methods can be meaningful in evaluating the resulting loss projections, the analysis of these tests represents only half of the process in deciding among the available methods. Equally important is an understanding of the forces impacting the development history. This should include an understanding of the impact of benefit changes as well as changes taking place in the claim environment which can be learned about through communication with companies.

B. Tests Performed by NCCI

As discussed earlier, NCCI has designed an "Early Warning System" which is intended to assist NCCI in selecting among the loss development methodologies. The test focuses primarily on two key values.

- Two year average Incurred loss development factor from first report to fifth report.
- Paid to incurred ratio at first report.

If either of these values changes by more than a specified amount (+/- .05 for the development factors, and +/- .03 for the paid/incurred ratio), it is taken as an indication of possible changes in reserve adequacy.

The two tests have a practical advantage in that they are readily produced from information which is currently available to NCCI. However, there are other diagnostic tests which could be produced from currently available data, as well as tests which require additional data. We will discuss these in a later section.

PREMIUM AND LOSS DEVELOPMENT FACTORS

NCCI, in its reviews of the experience, incorporates other tests of development and reserve adequacy. The early warning system serves as the starting point for their analysis of the experience. However, there is no systematic NCCI approach beyond the early warning system.

We understand that the two specific early warning tests were established with the premise that the "standard methodology" would be based on incurred losses. The tests were designed to identify situations where the incurred methodology might be influenced by changes in adequacy of IBNR, and other methodologies might be more reliable.

Our conclusion in a previous section was that the incurred method should be replaced as the primary methodology by the average of the ultimate losses from the paid plus outstanding method and the ultimate losses from the paid method. The two early warning tests could be replaced with corresponding tests utilizing these loss measures, i.e.

- Paid loss development factor from first report to fifth report.
- Paid plus outstanding loss development factor from first report to fifth report.
- Paid to paid plus outstanding ratio at first report.

Other tests, to be discussed later, will supplement these tests in providing diagnostic tools to assess the validity of the various methodologies. The value of additional tests can be illustrated with an example.

C. Illustrative Example

We will illustrate the value of additional diagnostics using the current NCCI tests.

The illustration is based on medical losses for the state of Wisconsin. The case that will be isolated is the projection of policy year 1984 losses from first report. From Exhibits 26 through 28, a history of projections from first report, restated to a common (incurred) level, is:

**PREMIUM AND LOSS
DEVELOPMENT FACTORS**

<u>Method</u>	<u>Policy Year: 1981</u>	<u>Policy Year: 1982</u>	<u>Policy Year: 1983</u>	<u>Policy Year: 1984</u>
Paid	72,747,106	74,856,485	84,006,593	96,117,248
Paid Plus Outstanding	67,394,747	71,524,618	81,918,983	101,942,981
Incurred	68,855,845	71,287,196	81,897,172	103,475,484

For the 1984 policy year, the relative magnitude of the paid projection has reversed relative to prior years. This reversal requires a judgment of whether the paid projection has decreased relative to final ultimate losses, or the paid + outstanding and the incurred projections have increased relative to final ultimate losses.

One early warning test used by NCCI is an analysis of paid to incurred ratios. From these ratios, shown on Exhibit 29, we see that NCCI's early warning test for these ratios is positive for 1984, having changed at least 3.0 percentage points from the preceding year's ratio:

<u>Policy Year</u>	<u>Paid/Incurred Ratio at First Report</u>	<u>Change in Ratio at First Report</u>
1981	67.4%	xxx
1982	65.7%	-1.7%
1983	64.2%	-1.5%
1984	61.2%	-3.0%

Further, the other early warning test, which is based on incurred development factors out to fifth report, indicates an increasing tendency for the incurred loss development factors in recent years:

**PREMIUM AND LOSS
DEVELOPMENT FACTORS**

<u>Projected Policy Year</u>	<u>Two-Year Average Development Factor First to Fifth</u>	<u>Change in Development Factor First to Fifth</u>
1981	0.969	xxx
1982	0.932	-3.7%
1983	0.928	-0.4%
1984	0.967	3.9%

Although this test does not exceed the NCCI's warning value of a 5.0 percentage point change, the increase in the development factor to be applied to 1984, taken with the change in 1984's paid/incurred ratio signals that the incurred projection may be expected to be overstated.

As it turns out, the paid projection for 1984 actually was on the low side:

<u>Method</u>	<u>Projections for 1984 at 1st Report (From 1985 Evaluation)</u>	<u>Projections for 1984 at 5th Report (From 1989 Evaluation)</u>
Paid	96,117,248	103,189,583
Paid Plus Outstanding	101,942,981	101,918,112
Incurred	103,475,484	102,669,065

Additional diagnostic tests may have suggested this in 1985.

PREMIUM AND LOSS DEVELOPMENT FACTORS

D. Diagnostics

1. Diagnostic Tests

Each of the development techniques has, inherent in its use, underlying assumptions regarding the claim process.

The paid loss development technique assumes that loss payment patterns are relatively consistent through the underlying history.

The paid plus outstanding loss development technique assumes that case (plus bulk if applicable) reserving practices are relatively consistent through the underlying history.

The incurred loss development technique assumes that total (case plus bulk plus IBNR) reserving practices are relatively consistent through the underlying history.

In the following paragraphs, we will discuss several diagnostics which can test these assumptions. We will then identify those diagnostics which we believe will be most useful for evaluating the various methodologies.

Each of the diagnostic tests is derived by calculating either a ratio or an average value, for each element of a loss triangle. In all cases, (e.g., paid losses/paid plus case losses) the values are derived by dividing each value in the numerator triangle by the corresponding value in the denominator triangle. In some cases, (e.g., closed claim counts/ultimate claim counts), the values in the denominator will be the same for all evaluations of a given policy or accident year.

In each of the tests, we would be looking for two things:

First, and most important, would be a significant difference in the current statistic (i.e., the value along the last diagonal) from that of the prior years. This would suggest a recent event giving rise to a change in the statistic being evaluated. An example of this would be the implementation of a significant

PREMIUM AND LOSS DEVELOPMENT FACTORS

change in workers compensation benefits in a state, and a corresponding industrywide change in payment patterns or reserve requirements.

The second phenomenon we would be looking for would be a trend in the statistics over time. This would suggest a longer term change in the payment patterns or reserve levels.

Exhibits 30-32 summarize a variety of tests which could be constructed to evaluate each of the three methodologies:

- Paid Losses (Exhibit 30)
- Paid plus Outstanding Losses (Exhibit 31)
- Incurred Losses (Exhibit 32)

Paid plus case losses could easily be substituted for paid plus outstanding losses.

For each method, we have identified whether the data is currently available, and what the diagnostic would be testing.

It should be noted that some tests are common to more than one of the methods. For example, we identified the ratio of paid losses to paid plus outstanding losses as a test for both paid loss development and paid plus outstanding loss development. This is because a change in the ratio could be evidence of either a change in payment patterns or a change in case reserve adequacy. Further analysis of other tests is required before drawing conclusions.

As an example, one might find that the paid/paid plus outstanding ratio for the most recent policy year (at first report) is notably lower than for prior years. One might also find that the paid losses/earned premiums are reasonably stable relative to prior years, but that outstanding reserves/earned premiums are noticeably higher than average. This would suggest a change in case reserve adequacy. Alternatively, one might note that a change in the benefit levels enacted last year resulted in a more liberal benefit structure. The statistics might suggest that the industry is reacting to this change by increasing case reserves. If, in this example, the benefit changes were estimated to extend the payment of benefits beyond the historical levels, the conclusion might be

PREMIUM AND LOSS DEVELOPMENT FACTORS

that the paid development method will understate the ultimate value for the most recent year.

The point of the above discussion is that the reserve and loss estimation process cannot be reduced to a single mechanical methodology and a series of tests. Informed judgment is required to interpret the tests, and the various techniques, and to convert them to a reasonable estimate of ultimate losses.

2. Recommended Diagnostics

We do not believe that it is practical to develop all of the diagnostics referred to in the previous section. However, we do recommend that additional diagnostics be calculated by NCCI.

Our recommendations are based on our previous conclusions that the incurred method should be replaced by the paid and paid plus outstanding methods as the primary ratemaking methodology. Thus, the recommended diagnostic tests are those which will assist in evaluating these two. The tests would be derived for both medical and indemnity losses. In the tests, "claims" refer to the number of claims.

a. Tests with available data

Paid Losses/Paid plus Outstanding Losses
Paid Losses/Earned Premiums at Current Rate Level
Outstanding Losses/Earned Premiums at Current Rate Level
Paid Losses/Incurred Claims⁴

b. Tests with data not currently available

We recommend the expansion of the annual calls to collect the number of claims closed with indemnity payments. It will be necessary to clearly and carefully define the closed claim count description in the financial calls, to

4 Incurred indemnity claims can be used in both the indemnity and medical diagnostics.

PREMIUM AND LOSS DEVELOPMENT FACTORS

ensure that this item is consistently reported by companies. These would allow the following diagnostic tests to be produced.

Paid Losses/Closed Claims
Closed Claims/Incurred Claims
Outstanding Reserves/Open Claims

3. Additional Discussion of Diagnostics

A common feature exhibited by almost all of the loss development data, both state and regional, is the existence of an upward trend in the development factors, particularly at the early ages of development (first to second, second to third, etc.). That is, factors are increasing as we look down the column. As discussed above, this trend is the chief reason for the frequent success of the two year exponential average as the "best predictor" of development factors. However, in most cases, the average development factors have understated the actual subsequent factors. Analysis is required to determine the possible causes of the trend.

A trend in paid loss development factors could signal either a lengthening or a shortening of payment patterns. The following example illustrates this.

Consider the following development history:

HYPOTHETICAL PAID LOSS DEVELOPMENT HISTORY

<u>Year</u>	<u>First Report</u>	<u>Second Report</u>	<u>Third Report</u>
1975	1000	1500	1750
1976	1000	1500	1750
1977	1000	1500	1750
1978	1000	1500	1750

PREMIUM AND LOSS DEVELOPMENT FACTORS

Development Factors are:

First to <u>Second</u>	Second to <u>Third</u>
1.500	1.167

Now, assume that events occur to "shift" payment of losses from first to second report, and the shift is 10% per year.

SCENARIO #1: LENGTHENING DEVELOPMENT PATTERNS

<u>Year</u>	<u>First Report</u>	<u>Second Report</u>	<u>Third Report</u>
1978	1000	1500	1750
1979	900	1500	1750
1980	810	1500	1750
1981	729	1500	1750
1982	656	1500	1750

Development factors are:

<u>Year</u>	First to <u>Second</u>	Second to <u>Third</u>
1978	1.500	1.167
1979	1.667	1.167
1980	1.852	1.167
1981	2.058	1.167
1982	2.287	1.167

The upward trend in development factors from first to second report is due to lengthening of payment patterns.

PREMIUM AND LOSS DEVELOPMENT FACTORS

Alternatively, assume that the shift is from third report to second report, again at 10% per year.

SCENARIO #2: SHORTENING DEVELOPMENT PATTERNS

<u>Year</u>	<u>First Report</u>	<u>Second Report</u>	<u>Third Report</u>
1978	1000	1500	1750
1979	1000	1525	1750
1980	1000	1548	1750
1981	1000	1568	1750
1982	1000	1586	1750

Development factors are:

<u>Year</u>	<u>First to Second</u>	<u>Second to Third</u>
1978	1.500	1.167
1979	1.525	1.148
1980	1.548	1.130
1981	1.568	1.116
1982	1.586	1.103

The upward trend in development factors from first to second report in this case is due to a shortening of the payment pattern, and is offset by a downward trend in subsequent factors (which might not be as obvious if it occurred at later maturities).

In reality, such readily detectable causes of trend in development factors are unlikely to exist in isolation. Thus, we must rely on other diagnostics, coupled with knowledge of external forces which may be affecting the loss payment patterns, to appropriately interpret the loss development patterns.

PREMIUM AND LOSS DEVELOPMENT FACTORS

Following an illustration presented in Section V I-C, we commented that additional diagnostics can be useful in evaluating the results of the various projections.

In the illustration, we focused on the estimate of ultimate medical losses for policy years 1981-1984. The projections from first report for policy year 1984 were:

Paid	96,117,248
Paid Plus Outstanding	101,942,981
Incurred	103,475,484

One of the diagnostic items suggested is the ratio of losses to earned premiums at current rate levels. This ratio is presented below:

<u>Policy Year</u>	Ratio to Earned Premiums ⁵		
	<u>Paid Losses</u> ⁶	<u>Outstanding Losses</u> ⁶	<u>IBNR Losses</u> ⁶
1981	.153	.055	.019
1982	.164	.064	.021
1983	.180	.076	.025
1984	.181	.086	.028

The paid losses do not demonstrate the growth patterns (trends) which are evident in previous years, and which are also evident in the outstanding and IBNR losses. This suggests that something has occurred to slow down the upward trend in loss payments. If this has occurred, one might expect the paid loss development projection to understate the ultimate value. As the earlier illustration demonstrated, this was the case.

Adding diagnostics to the ratemaking process will not necessarily simplify the process. No one set of diagnostics will always provide clear answers in a time of changing payment patterns or reserve adequacy. However, the diagnostics discussed and

5 Earned Premium at first report, adjusted to common rate level.

6 Losses are at first report.

PREMIUM AND LOSS DEVELOPMENT FACTORS

illustrated above can help one to get a better understanding of the forces affecting the losses and, correspondingly, the rate indications.

E. Alternate Techniques

As discussed above, loss development methods are fundamental to many loss projections. They are not, however, the only methods used in this area. The following discussion will focus on two types of alternate estimation techniques utilized in practice today. These are frequency/severity and stochastic modelling estimates.

1. Frequency/Severity Estimates

As discussed in the diagnostics section above, an understanding of loss development "anomalies" can sometimes be obtained by reviewing claim count related statistics. The frequency/severity methods take this a step further by developing separate estimates of the two components of losses, namely frequency (number of claims per exposure) and severity (average cost per claim).

The advantage of these methods is that changes in the underlying trends affecting either of these two components are more readily discerned and adjusted for than in the loss development approaches.

These approaches can be particularly relevant to workers compensation losses, where benefit changes can have sudden and significant impact upon one or both of the components. Where such benefit changes may have been estimated to have an impact on the severity of claims the historical loss data can be adjusted accordingly.

Just as there are a variety of loss development methods, there also exist a number of frequency/severity methods. Frequency and severity projections can be made from closed claims, reported claims or open claims. As with the loss development methods, no one method is appropriate at all times.

NCCI currently collects only incurred indemnity claim counts and, until recently, the definition was not clear. Consequently, a consistent history of incurred claim counts is not yet available. In addition, we have concerns about the consistency of claim count

PREMIUM AND LOSS DEVELOPMENT FACTORS

data which would be reported by carriers. That is, different definitions of claim counts among companies give rise to potential changes in the frequency and severity measures which are solely due to changes in the underlying mix of companies represented by the data rather than to trends in the frequencies and severities themselves.

As a result, while the use of frequency/severity estimates can be valuable in evaluating ultimate workers compensation losses, the data does not presently exist in a format which can be immediately integrated into the ratemaking process for NCCI.

2. Stochastic Modelling

Stochastic modelling is an emerging area of loss estimation methods. Generally, stochastic models are those projection techniques that specifically incorporate a probabilistic or statistical structure.

Stochastic modelling starts with a general equation defining the claim process, and incorporates specific features thought to represent the situation applicable to the loss data being analyzed.

Stochastic modelling techniques generally fall into three broad categories:

- regression models
- adaptive models
- collective risk theory

a. Regression models use regression techniques to provide forecasts as well as estimates of the statistical error in those forecasts and uncertainty regarding the fitted parameters. A fairly simple example of this type of approach would be to model the incremental payments for accident year i in development period j $\{P(i,j)\}$ by:

$$\frac{P(i,j)}{\text{Exp}(i)} = A(i) \times D(j) \times E(i,j)$$

PREMIUM AND LOSS DEVELOPMENT FACTORS

Here, $\text{Exp}(i)$ are exposures, $A(i)$ parameters reflect the accident year influence on payments (i.e., measure of expected pure premiums for accident year i), $D(j)$ parameters reflect the development year influence, and $E(i,j)$ is an error term.

If we view $\text{Exp}(i) \times A(i)$ as the ultimate losses in accident year i , and $D(j)$ as the expected percentage of ultimate losses paid in development interval j , the above formula is conceptually similar to a paid loss development projection.

A transformation, by taking logarithms produces a linear formula:

$$\ln \left\{ \frac{P(i,j)}{\text{Exp}(i)} \right\} = \ln(A(i)) + \ln(D(j)) + \ln(E(i,j))$$

which can be analyzed by using regression techniques.

Another example of a regression model is

$$\frac{P(i,j)}{\text{Exp}(i)} = A \times D(j) \times E(i,j)$$

In this case, the pure premium parameters ($A(i)$) become a single parameter (A) meaning that losses per exposure are expected to be the same for all years.

The formulas above are very general. In practice, they can be adapted to specific situations, either through modification of the parameters or through additional transformations of the data. For example, for workers compensation, the relationship between successive ultimate accident year losses will be affected not only by the relationship between exposures but also by relative benefit levels for each of the two years. This can be reflected in the data by adjusting all losses to a common benefit level. If there are trends in the rate of losses per exposure, the losses can be trended to a common level. Alternatively, the exposures can be adjusted or a trend parameter can be introduced directly into the model.

PREMIUM AND LOSS DEVELOPMENT FACTORS

In addition, the formula can be adapted to situations where, for example, claim closing patterns are changing, by defining the development period, in terms of percent of ultimate claims closed (rather than the more conventional definition which relates to the chronological maturity of the accident year.)

The use of regression techniques generally assumes that the error terms ($E(i,j)$) have a normal distribution with a mean of 0 (in our example above, this means that the multiplicative error then has a lognormal distribution). This may not be a valid assumption. Sometimes, further transformation of the data will create a situation with normally distributed error terms. If not, other techniques can be used to evaluate the parameters of the formula.

b. Adaptive models differ from regression models in that, rather than having a fixed set of parameters applicable to all development years, adaptive methods allow the parameters to change between years as a reflection of the data for those years. For example, consider the two regression models above:

$$\frac{P(i,j)}{\text{Exp}(i)} = A(i) \times D(j) \times E(i,j), \text{ and} \quad (1)$$

$$\frac{P(i,j)}{\text{Exp}(i)} = A \times D(j) \times E(i,j) \quad (2)$$

In model (1), pure premiums for each year i are fitted independently, whereas in model (2) pure premiums are set equal for all years.

If the relationship between $A(i)$ and $A(i+1)$ is merely trend, then a transformation or a trend parameter, as discussed above, will allow model (2) to be used. If however, other elements come into play which cannot be easily filtered out of the general data, adaptive models allow the $A(i)$ parameters to be related but to change over time, giving some weight to the actual data for each year. For example, one might define the following relationship:

$$A(i+1) = w(i) \times A(i) + (1-w(i)) \times A^*(i+1)$$

PREMIUM AND LOSS DEVELOPMENT FACTORS

where $A^*(i+1)$ is the observed value of a parameter for year $i+1$, and $w(i)$ is a weight between 0 and 1. Various approaches are available to determine the optimal weights.

c. Collective Risk Theory models decompose the claim process into frequency and severity components. However, unlike the frequency/severity methods discussed earlier, risk theoretic models assume probability distributions for the number of claims, length of time between occurrence of an event and settlement of the claim, and severity of claims settled in specific time intervals. Statistical methods are used to determine the parameters of the distributions, which then define a loss development process.

One of the main advantages of stochastic models is in their derivation of measures of variability about the estimates. However, the models are also valuable in that they involve a decomposition of the loss process into its constituent parts. The workers compensation claim process is a result of many forces working in tandem. By isolating each component, stochastic models can better react to underlying changes.

In conclusion, we believe that stochastic modelling techniques can be adapted for use in the NCCI's process of projecting ultimate losses for past policy years and accident years. We anticipate that a large amount of research and testing will be needed in order to create reliable models, but our judgment is that this work has potential for improving the estimates of ultimate losses.

WESTERN	2,462,594,483	247	138	58	10	15	32	37	
NORTHERN	6,173,015,621	155	79	42	48	31	17	15	
SOUTHERN	7,064,274,158	609	194	45	34	30	15	7	

The following is a hypothetical example which illustrates the NCCI's current tail methodology.

Assumptions:	Growth -- 10% per year	
	Development -- 8th - 9th	1.058
	9th - 10th	1.044
	10th - 11th	1.032
	11th - 12th	1.020
	Beyond 12th	1.000

Thus, the tail (8th - Ult) is: 1.163

Consider the following triangle:

	8th	9th	10th	11th	12th	13th
1975	860	910	950	980	1000	1000
1976	946	1001	1045	1078	1100	
1977	1041	1101	1150	1186		
1978	1145	1211	1265			
1979	1260	1332				
1980	1386					

A year later, the data triangle is:

	8th	9th	10th	11th	12th	13th	14th
1975	860	910	950	980	1000	1000	1000
1976	946	1001	1045	1078	1100	1100	
1977	1041	1101	1150	1186	1210		
1978	1145	1211	1265	1305			
1979	1260	1332	1391				
1980	1386	1467					

Differencing the two diagonals to get Calendar Year Development (which is the numerator of the tail) produces a total of 204.

The NCCI old procedure would relate this to the most recent policy year at 8th report, i.e., 1386. Thus, the old tail would be $(1+204/1386) = 1.147$

The current NCCI procedure relates it to the average of the most recent three years at 8th report, i.e., 1264. Thus, the current tail would be $(1+204/1264) = 1.161$.

Thus, the current approach comes much closer to the true tail.

TECHNICAL APPENDIX**

I. INTRODUCTION

Accompanying this appendix is a series of exhibits prepared in the course of our analysis of the National Council on Compensation Insurance's (NCCI) development factor selection and experience projection methodologies. The discussion that follows will provide an overview of these exhibits, and will illustrate the calculations involved in the tests that the exhibits present. Finally, we will discuss the manner in which the tests tie in to the summary exhibits included in the main body of the report.

**PREMIUM AND LOSS
DEVELOPMENT FACTORS:
TECHNICAL APPENDIX**

**PREMIUM AND LOSS
DEVELOPMENT FACTORS:
TECHNICAL APPENDIX**

II. SCOPE OF THE TESTS

The exhibits that support our tests and analysis were prepared for eleven states distributed among the three regions:

<u>Northern Region</u>	<u>Southern Region</u>	<u>Western Region</u>
Maine	North Carolina	Utah
Wisconsin	Louisiana	Nebraska
Connecticut	Florida	Oregon
Michigan		
Illinois		

For each state, we received nine reports (diagonals) of policy year premium and loss data. The reports, or evaluation dates, spanned the period 1981 to 1989. The corresponding range of policy years is 1973 (for which the 1981 evaluation date constitutes the eighth report) to 1987 (for which the 1989 evaluation date constitutes the second report.)

The same exhibits were prepared for each state. These exhibits¹, in order of presentation, are:

- Premium - Development by Diagonal, Showing Variance
- Premium - Tests of Minimum Average Squared Deviations
- Indemnity - Paid - Development by Diagonal, Showing Variance
- Indemnity - Paid - Tests of Minimum Average Squared Deviations
- Indemnity - Paid + Outstanding - Development by Diagonal, Showing Variance
- Indemnity - Paid + Outstanding - Tests of Minimum Average Squared Deviations
- Indemnity - Incurred - Development by Diagonal, Showing Variance
- Indemnity - Incurred - Tests of Minimum Average Squared Deviations
- Medical - Paid - Development by Diagonal, Showing Variance
- Medical - Paid - Tests of Minimum Average Squared Deviations

¹ Note: These exhibits follow Exhibits E-1 through E-16. The E-xx exhibits are provided, along with a narrative discussion, to provide the reader with more of the details underlying the calculations on the referenced state exhibits.

**PREMIUM AND LOSS
DEVELOPMENT FACTORS:
TECHNICAL APPENDIX**

- Medical - Paid + Outstanding - Development by Diagonal, Showing Variance
- Medical - Paid + Outstanding - Tests of Minimum Average Squared Deviations
- Medical - Incurred - Development by Diagonal, Showing Variance
- Medical - Incurred - Tests of Minimum Average Squared Deviations
- Indemnity - Comparison of Projections
- Indemnity - Comparison of Projections Restated to Incurred Level
- Medical - Comparison of Projections
- Medical - Comparison of Projections Restated to Incurred Level

(As a technical note, NCCI has recently begun analyzing paid plus case projections, as case reserves have been separately identified in their data base beginning with the December 31, 1986 evaluation. Prior to this date, the financial calls did not allow a decomposition of outstanding losses into their case and bulk components. Since total outstanding losses have also been included in the subsequent reports, a complete history of them was available. For this reason, our tests are based on paid plus outstanding (as well as paid and incurred) rather than on paid plus case; this serves as an approximate indication of the predictive ability that can be expected to emerge from the paid plus case projections as future reports become available.) The following is a brief overview of the exhibits for each state.

NCCI projects:

Premium

Indemnity Paid Losses	Medical Paid Losses
Indemnity Paid + Outstanding Losses	Medical Paid + Outstanding Losses
Indemnity Incurred Losses	Medical Incurred Losses

For each of seven different development projections that NCCI performs in each rate review, we have prepared two initial tests.

For each of these data types, we have tabulated the sample variance resulting for each report-to-report development period. This is the variance of the column of development factors for each period, based on the nine diagonals of data for each state. Also shown on the exhibit for each state are the variances for the corresponding

PREMIUM AND LOSS DEVELOPMENT FACTORS: TECHNICAL APPENDIX

region. For each data type, this is the state exhibit referred to above as "Development by Diagonal, Showing Variance."

Also for each data type, we have tabulated the total of the average squared deviations for each report-to-report development period. Deviation is defined as the difference between a predicted development factor, based on the preceding diagonals, and the actual value of the factor. The squares of these deviations have been averaged across common years for each report-to report development period, for each of these six different development factor averaging methods:

- Two-Year Straight Average
- Three-Year Straight Average
- Four-Year Straight Average
- Two-Year Exponentially Weighted Average
- Three-Year Exponentially Weighted Average
- Four-Year Exponentially Weighted Average

The down-the-column averages are then summed across the development periods to provide a total measure of the historical predictive ability of each of the six averaging methods. The lower the total, the closer a particular method comes to predicting the factor, and thus the better the method's past predictive ability. For each data type, this is the state exhibit referred to above as "Tests of Minimum Average Squared Deviations". The final four exhibits for each state analyze projection results. The same two exhibits appear for both indemnity and medical. These exhibits compare projection results based each of three types of data:

- Paid Losses
- Paid + Outstanding Losses
- Incurred (including IBNR) Losses

The projections are to eighth report, and the development factors used to project to eighth report are based on the NCCI's current selection procedure of two-year straight averages.

PREMIUM AND LOSS DEVELOPMENT FACTORS: TECHNICAL APPENDIX

Once the projections have been calculated, they are compared by policy year for each data type to indicate the variability of the projection methods over time. The variability in the projections results from the use of prior development patterns to project the actual emergence of losses; two measures of this variability we have used are report-to-report fluctuations and deviations relative to the latest available projection for each policy year. These measures of variability are presented in the exhibits referred to as "Comparisons of Projections" for both indemnity and medical.

The projections are only done to eighth report, corresponding to the latest generally available evaluation of each policy year, thus the projections are intrinsically on different levels. In order to make them comparable, the paid projections and the paid plus outstanding projections are adjusted to the incurred level. After adjustment, a second element of variability has been incorporated for the affected loss statistic types: the projections reflect not only the difference between predicted and actual loss emergence noted above, but now also reflect the difference between predicted and actual factors at the incurred level of the eighth report. Therefore, report-to-report fluctuations in the projections and deviations to the last available projection by policy year are again compiled. These tests are presented in the exhibits referred to as "Comparisons of Projections - Restated to Incurred Level" for both indemnity and medical.

So far, a general overview of the exhibits presented for each state has been given. The next sections of this memorandum will cover the details behind the exhibits, and how the exhibits relate to the summary exhibits that appear in the main body of the report. These sections will refer to a series of illustrative exhibits, attached as Exhibit E-1 to Exhibit E-24.

**PREMIUM AND LOSS
DEVELOPMENT FACTORS:
TECHNICAL APPENDIX**

III. FACTOR SELECTION TESTS

Our first test for factors was intended to investigate the variability of development factors as a function of the underlying volume of data. The intent was to evaluate the appropriateness of including regional, or other broader-based, data with state data in selecting development factors. A clear relationship between increasing size and decreasing variance would indicate that the stability of state factor selections might be improved by giving weight to broader-based factors.

The test will be illustrated with Nebraska indemnity paid losses. The process began by compiling state and regional development triangles for policy year data. For Nebraska indemnity paid losses, these triangles appear as Exhibits E-1 to E-4. (Nebraska is in the Western region.)

The state and regional development factors for each report-to-report development period are then carried forward from Exhibits E-2 and E-4, respectively, to Exhibit E-5, which is the "Development by Diagonal, Showing Variance" exhibit discussed above. For each report-to-report period, the sample variance has been calculated for both the state and regional experience.

For Nebraska and the Western region, we see that the following sample variances (in millionths) for each report-to-report period were found:

	First to <u>Second</u>	Second to <u>Third</u>	Third to <u>Fourth</u>	Fourth to <u>Fifth</u>	Fifth to <u>Sixth</u>	Sixth to <u>Seventh</u>	Seventh to <u>Eighth</u>
Nebraska	5513	714	308	209	38	120	60
West	4194	847	123	27	10	11	7

These are then carried to the summary exhibit for variance in development factors used in our report, which is reproduced here as Exhibit E-6. On Exhibit E-6, the states and regions are arranged in increasing order of size (as measured by 1987 standard earned premium at second report), to allow the nature of variance as a function of size to be discerned. Our conclusions on the value of broadening the experience

**PREMIUM AND LOSS
DEVELOPMENT FACTORS:
TECHNICAL APPENDIX**

base in the selection of development factors were drawn from this exhibit and corresponding exhibits for the other data types.

Note that this test is performed for seven data types that NCCI projects in each rate review. Thus, for each state (and its corresponding region), the above test is performed for:

Premium

Indemnity Paid Losses	Medical Paid Losses
Indemnity Paid + Outstanding Losses	Medical Paid + Outstanding Losses
Indemnity Incurred Losses	Medical Incurred Losses

The second test of development factors considers different alternatives in the selection process, by using more than two years, and also by using non-uniform weights by year. The test measure is the average squared deviation for each averaging alternative; the deviations are between the predicted development factor for year N (as predicted from years N-1, N-2, and N-3 and N-4, as needed), and the factor that ultimately resulted for year N. The average squared deviations are subsequently compiled for each report-to-report period, and then summed across periods to give an aggregate measure of the performance of each weighting alternative.

An illustration will again be used to make the design of the test and its use in our report clearer. Continuing with the example of Nebraska indemnity paid losses, the development factors from Exhibit E-2 are posted in the top part of Exhibit E-7. From the factors, tables of the squared deviations for each averaging alternative are created immediately below. (Exhibit E-7 shows the 2-, 3-, and 4-year straight average alternatives; Exhibit E-8 shows the exponentially weighted average alternatives.)

As an example of the calculation of the squared deviations, we consider first to second report development culminating with the 1981, 1982, and 1983 evaluation dates. For these periods, the first-to-second report development factors can be calculated for the 1979, 1980, and 1981 policy years, respectively. Further, under a two year straight average, the policy year 1979 and 1980 factors are used to predict

PREMIUM AND LOSS DEVELOPMENT FACTORS: TECHNICAL APPENDIX

the policy year 1981 first-to-second report development factor. In this example, the policy year 1981 paid development factor is thus estimated as:

$$(1/2) \times (1.462 + 1.498) = 1.480.$$

The policy year 1981 first-to-second development factor was actually 1.521. Thus, the squared deviation between the predicted factor and the actual factor is:

$$(1.480 - 1.521)^2 = (-.041)^2 = .001681.$$

This number can be found as the first entry in the table for "Squared Errors for Predictions from Two-Year Straight Averages" in Exhibit E-7. Subsequent entries down the column are calculated in a similar fashion, and averages are computed for each report-to-report period.

As the number of years averaged into the predicted factor increases, the predictions can be made for fewer years. For example, where four years are built into the prediction, development culminating with the 1985 report becomes the first period for which predictions can be performed. The average squared deviations were computed across common development periods beginning with the 1985 report to remove any potential distortions. Thus, the averages shown across the 1985-1989 development periods for each averaging method are used for comparisons across the methods.

Similar average squared deviations are calculated for the exponentially weighted averaging methods. The only difference is that the prediction of the paid loss development factor (PLDF) at N is of the form:

$$\hat{PLDF}_N = \frac{.9^1 \times PLDF_{N-2} + .9^0 \times PLDF_{N-1}}{.9^1 + .9^0}$$

This form assumes the two year period is being used for predictions; the extension of this formula to three or four years is analogous. The results of applying this family of

**PREMIUM AND LOSS
DEVELOPMENT FACTORS:
TECHNICAL APPENDIX**

formulas are seen in Exhibit E-8, with the average squared deviations across the 1985-1989 development periods again being the pertinent statistic.

Exhibit E-9 summarizes the results from the six averaging methods in Exhibits E-7 and E-8. (A version of this summary exhibit has been prepared for each loss type for each state.) The average squared deviations by report-to-report period are posted and totaled across periods. The method producing the lowest total average squared deviations across periods is then designated in Exhibit E-9, and tabulated in the summary exhibit (shown here as Exhibit E-10) which was presented in the report.

Exhibit E-9 includes two sets of variance comparisons. In the second set, the factor averaging method that produces the minimum average squared deviation for each report-to-report period is identified. The method that has the minimum average squared deviation for the most report-to-report periods is identified on Exhibit E-9, and then tabulated on Exhibit E-10.

The two tables in Exhibit E-10 are different ways of evaluating the methods of averaging and weighting prior development factors that would have worked best in the past.

**PREMIUM AND LOSS
DEVELOPMENT FACTORS:
TECHNICAL APPENDIX**

IV. PROJECTION METHOD TESTS

Our tests for the loss projections from the three different loss statistic types (paid, paid plus outstanding, incurred) are designed to identify stability and predictive accuracy in the projection results.

Our projection tests begin with a restatement of experience reported to NCCI. The restatement is performed by starting with the last available report for each policy year and successively dividing out the prior report-to-report development factors derived from the NCCI data for that policy year. The restatement removes the impact of differences in reporting carriers; that is, it eliminates the problem of "matching" companies, by restating each policy year's losses to the level of the companies included in the last available report for the year. The restated Nebraska indemnity paid loss triangle is presented here as Exhibit E-11.

As an illustration of the restatement process, the paid loss data in Exhibit E-1 is related to the restated paid loss data in Exhibit E-11 as follows. First, the paid losses at seventh and eighth report in Exhibit E-11 come directly from the matching seventh and eighth report columns of Exhibit E-1. Then, for example, Exhibit E-1 shows the policy year 1974 development (for matching companies) from sixth to seventh report as:

$$\frac{\text{Paid losses at seventh report}}{\text{Paid losses at sixth report}} = \frac{8,997,989}{8,725,874} = 1.031.$$

This development factor is divided out of the policy year 1974 restated paid losses at seventh report to calculate the corresponding policy year 1974 restated paid losses at sixth report:

$$8,999,016 \div 1.031 = 8,728,435$$

This procedure is continued until all reports have been restated for the composition of companies included in the eighth (or latest available) report of the policy year.

PREMIUM AND LOSS DEVELOPMENT FACTORS: TECHNICAL APPENDIX

The projections that were performed utilized predicted development factors based on NCCI's current two-year straight average selection procedure. Exhibit E-12 gives the triangle of predicted report-to-report development factors, as found by taking two-year averages of the factors in Exhibit E-2.

Projections were made to eighth report for two reasons. First, eighth report marks the terminal point in the data that was historically available for individual policy years. Second, for the paid and paid plus outstanding methods, the development tail beyond eighth report is based on the incurred loss development tail. Hence, it is to eighth report for which the last projection incorporating the unique aspects of each data type's own development history can be performed.

To make projections to eighth report, development factors were accumulated from each earlier report to eighth report. Exhibit E-13, which is an example of this for Nebraska indemnity paid losses, is essentially the multiplication of Exhibit E-12 along the diagonals. Projections are then shown in Exhibit E-14. The triangle of projections in Exhibit E-14 is simply the product of corresponding entries in Exhibits E-11 (restated paid losses) and E-13 (cumulative development factors to eighth report).

To illustrate the projection process, we first consider the computation of cumulative development factors. For example, the predicted development factor to be applied to policy year 1977 paid losses at fifth report to bring them up to eighth report is found as:

Policy year 1975	7th to 8th		1.0335 [unrounded]
Policy year 1976	6th to 7th	x	<u>1.040</u>
Cumulative	6th to 8th		1.07484
Policy year 1977	5th to 6th	x	<u>1.034</u>
Cumulative	5th to 8th		1.11138456

This cumulative factor is as shown in Exhibit E-13, where it is the factor shown to three decimal places as 1.111. The factor is then multiplied by the 1977 restated paid losses at fifth report:

**PREMIUM AND LOSS
DEVELOPMENT FACTORS:
TECHNICAL APPENDIX**

$$13,164,899 \times 1.11138456 = 14,631,265.$$

This result appears on Exhibit E-14 as the policy year 1977 projection of paid losses at eighth report from fifth report.

Exhibit E-14 provides a means for comparing the stability of projections across reports, within data type and policy year. The tests are intended to measure variability of the projections to eighth report. The values shown do not represent estimates converted to a common (incurred) basis. That is, variability reflected in the conversion to incurred at eighth report is not reflected in this test.

To convert the projections to an equivalent level, adjustment factors are derived for each evaluation year. The adjustment factors are ratios of either paid or paid plus outstanding to incurred, and are applied by evaluation year in order to match the manner in which they emerge.

The example of Nebraska indemnity paid losses is continued in Exhibit E-15, where a paid to incurred ratio for each evaluation year is calculated. The ratio that is then applied to restate the paid projections to an incurred level for each evaluation year is the average of the preceding evaluation year's ratio with the current evaluation year's ratio. For example, Exhibit E-15 shows that the eighth report for evaluation year 1981 (the age of policy year 1973) has a paid to incurred ratio of .8016 and the eighth report for evaluation 1982 (the age of policy year 1974) has a paid to incurred ratio of .8097. Hence, the average of these two ratio values, .8057, is used to modify all projections from the evaluation year 1982 diagonal: the policy year 1981 from first report, the policy year 1980 projection from second report, etc., out to the policy year 1974 projection from eighth report.

The restated paid projections based on the adjustment ratios in Exhibit E-15 are shown in Exhibit E-16. As an example of the derivation of the values in Exhibit E-16, we recall that the paid projection of policy year 1977 from fifth to eighth report was 14,631,265. This is a projection from the 1982 evaluation year, so the paid to incurred ratio of the preceding paragraph is relevant. Dividing the unadjusted paid

**PREMIUM AND LOSS
DEVELOPMENT FACTORS:
TECHNICAL APPENDIX**

projection by the unrounded average paid to incurred ratio for the 1982 evaluation date, the restated projection at the incurred level is then:

$$14,631,265 + .8056521 = 18,160,773$$

The value can be confirmed on Exhibit E-16.

Projections are now available to compare not only from report to report, but between projection methods. Exhibits E-17 and E-18 perform these comparisons. Versions of these exhibits accompany this appendix for each state for each of indemnity and medical losses.

Exhibits E-17 and E-18 focus on policy years 1978 to 1984, because earlier and later policy years do not have enough report dates available to produce meaningful comparisons. Exhibit E-17 covers unadjusted projections (at the level of each data type), and Exhibit E-18 covers projections adjusted to the level of incurred losses at eighth report.

The unadjusted Nebraska indemnity paid loss projections have been posted from Exhibit E-14 to Exhibit E-17, by policy year and by report date. Once the projections have been posted on Exhibit E-17, two sets of ratios are developed. First, within each data type (paid, paid plus outstanding, or incurred) and within each policy year, the deviation of each projection from the last available projection is ratioed to the last available projection. As an example of this, consider the 1984 policy year, for which the last available projection is from fifth report data:

**PREMIUM AND LOSS
DEVELOPMENT FACTORS:
TECHNICAL APPENDIX**

<u>Report</u>	<u>Paid Projection from Report</u>	<u>Absolute Deviation to Fifth Report</u>	<u>Deviation Ratioed to Fifth Report</u>
First	30,520,025	3,384,627	9.98%
Second	31,182,956	2,721,696	8.03%
Third	32,308,387	1,596,265	4.71%
Fourth	33,671,319	233,333	0.69%
Fifth	33,904,652	xxx	xxx

In the last two columns of Exhibit E-17, the deviations are averaged, and compared across the three different data types. The deviation ratios are a measure of stability, so the lower the average, the more stable the method.

There is a second set of ratios on Exhibit E-17. These ratios are also computed within each data type (paid, paid plus outstanding, or incurred) and within each policy year. They are the ratios of the absolute deviations of adjacent projections (i.e., projections from successive reports), to the earlier report's projection. Again looking at the 1984 policy year:

<u>Report</u>	<u>Paid Projection from Report</u>	<u>Absolute Deviation from prior Report</u>	<u>Deviation Ratioed to prior Report</u>
First	30,520,025	xxx	xxx
Second	31,182,956	662,931	2.17%
Third	32,308,387	1,125,431	3.61%
Fourth	33,671,319	1,362,932	1.22%
Fifth	33,904,652	233,333	0.69%

PREMIUM AND LOSS DEVELOPMENT FACTORS: TECHNICAL APPENDIX

In the last two columns of Exhibit E-17, these deviations are also averaged and then compared across the three different data types. The deviation ratios are a measure of stability, so the lower the average, the more stable the method. The difference between this test and the test to latest projection is that this test generates higher ratios if there are oscillations in the projections than if there are not.

The adjusted Nebraska indemnity paid loss projections are posted from Exhibit E-16 to Exhibit E-18. Once the projections have been posted, the same ratio tests performed on Exhibit E-17 are also utilized on Exhibit E-18. Since the projections in Exhibit E-18 have all been adjusted to the incurred level, they reflect not only the variability inherent in report-to-report development, but also the variability between the three different loss data types.

Exhibits E-19 through E-22 are reproductions of summary exhibits included in the main body of our report. These summary exhibits key off of exhibits similar to E-17 and E-18, by picking up the last two columns for each state. Exhibit E-19 comes from the sections of Exhibit E-17 pertaining to the deviations from the last available projections, and Exhibit E-20 comes from the sections of Exhibit E-17 pertaining to the deviations from the prior projections. Exhibit E-21 and E-22 correspond similarly to the average deviations shown on Exhibit E-18. These exhibits provide a global test, across all states in our study, of the stability of the three different projection types. Our conclusions about the relative stability of the paid, paid plus outstanding, and incurred projections are based in large part upon these exhibits.

Two final global tests were performed for each combination of coverage (indemnity or medical) and data type. These tests focus on policy years 1981 to 1984; examples are presented for Nebraska indemnity paid projections as Exhibit E-23 (for unadjusted projections) and as Exhibit E-24 (for projections restated to the incurred level). In each of these exhibits, projections for each of the first three reports within each policy year are ratioed to the latest available projection (i.e. eighth report for policy year 1981, down to fifth report for policy year 1984). The deviations for each report are then averaged across states and policy years. These tests not only provide additional insight into the stability and predictive ability of projections from a particular data type, but also indicate how quickly the projections converge to a reasonable estimate.

NOTES: ADJUSTMENTS TO INCURRED ARE DONE BY EVALUATION YEAR. ALL EVALUATION YEAR N PROJECTIONS (FOR POLICY YEARS N-1 AT FIRST REPORT TO POLICY YEAR N-8 AT EIGHTH REPORT) USE THE SAME RATIO TO ADJUST TO THE INCURRED LEVEL.

THE RATIO USED TO ADJUST THE EVALUATION YEAR N PAID LOSS PROJECTIONS UP TO THE LEVEL OF THE INCURRED PROJECTIONS IS BASED ON THE STRAIGHT AVERAGE OF PAID TO INCURRED RATIOS AT EIGHTH REPORT FOR THE TWO MOST RECENT EVALUATIONS YEARS. THIS INCLUDES THE CURRENT EVALUATION YEAR ITSELF, SO THE AVERAGE THUS CONSISTS OF THE PAID TO INCURRED RATIOS FOR EVALUATION YEARS N-1 AND N.
