

## MEMORANDUM

---

**PROJECT NO. 201122.11**

**DATE: 11/22/2023**

**PROJECT:** Seward ARRC Seward Passenger Dock Inspection 2023

**TO:** Elizabeth Greer

**CC:**

**FROM:** Sean Baginski

**SUBJECT:** ARRC Seward Passenger Dock Significant Findings

---

Dear Liz,

PND Engineers, Inc. (PND) inspectors Taylor Mortensen and Jhon Landicho inspected Alaska Railroad's (ARRC) Seward Passenger Dock between July 5<sup>th</sup> and July 10<sup>th</sup>, 2023. Coffman Engineers, Inc. (Coffman) performed an inspection of the impressed current cathodic protection system of the Passenger Dock between July 10<sup>th</sup> and July 11<sup>th</sup>, 2023. Global Diving & Salvage, Inc. (Global) performed the underwater dive inspection between August 21<sup>st</sup> and September 12<sup>th</sup>, 2023.

This memo is to present you with the significant findings of the inspection. Significant findings include immediate action repair items, load reductions, and safety concerns. Minor deficiencies, such as loose bolts in ancillary locations, areas of minor corrosion, coating damage, etc., were identified; however, these items are not deemed to be significant findings and are not addressed in this memo. It should be noted that there will likely be additional immediate action items, which were deemed not necessary for the timing of this memo, included in the final reports. A comprehensive report for the dock is being compiled and will be provided to ARRC as soon as it is complete. See below for significant findings of the Passenger Dock with recommendations provided below each finding in *italics*.

### Passenger Dock

Significant findings were identified during the inspection of the Passenger Dock and include immediate action items and load reductions. The dock was found to generally be in **Severe** condition per ASCE MOP 130 guidelines due to structural bends and buckling of the support piles as well as loss of nominal thickness exceeding 50% (globally). Localized areas of 100% section loss of piling were also observed on multiple piling. From data collected by PND and provided by Global, average section loss was found to be ~50% on the majority of the dock (Bents 7-62); however, near the abutment (Bents 1-6) the average section loss was found to be ~70%. These averages do not include areas of 100% section loss [holes in web, flange(s), or both] or complete loss of piling. Below is a list of significant findings that should be addressed immediately:

- 23 vertical support H-piles were observed to be considered complete loss of piling (Photo 3). An additional 151 vertical support H-piles were observed to have overstressing, buckling, localized 100% section loss, or have >70% section loss (measured) globally (Photos 4 and 5). These 174 piles are identified as areas of **significant concern**. Heat maps with the areas of concern are provided in Attachments.

Bents 5 and 6 were found to be the most concerning area beneath the dock (Photo 6). Video and data collected from Global showed multiple adjacent piles along the bents to be near-complete or complete section loss at/near mudline. PND was able to confirm these findings during low-tide inspection. PND cannot assume any capacity is available in the complete section loss piles. There were jacketed repairs made in these areas; however, PND and ARRC do not have details for these repairs and depth of repair is unknown. ARRC performed an inspection of the pile cap and other adjacent components and did not observe any signs of overstressing caused by shear or bending.

- *The northern portions of the west side of the dock (including gate access) shall remain closed to vehicle traffic until repairs are made.*
- *Limit the use of the remaining portions of the dock to vehicle travel, to that which is absolutely necessary until repairs are made. Based on ARRC's observation of the pile caps and adjacent components at Bents 5 and 6 (most concerning areas), continued light vehicle use is acceptable in the short term.*
- *Repairing the concerning areas beneath the terminal building supports near the abutment prior to winter is recommended to prevent further overstressing from snow loads and snow removal equipment loads. If not repaired by winter, limit snow removal means to pickup trucks with plows or approved equal equipment.*
- *Begin engineering, procurement, and permitting immediately to address all areas of significant concern.*  
**Note:** PND has provided ARRC with repair recommendations and priority of repairs.
- *Begin engineering, procurement, and permitting immediately for temporary and permanent repair plans of Bents 5 and 6.*  
**Note:** PND has provided ARRC with repair recommendations and priority of repairs.

Photo 1. Typical Pile Considered Complete Loss of Section (Pile 28-21)

Photo 2. Typical Localized Buckling (Bent 3 Shown)

Photo 3. Typical Localized 100% Section Loss (Bent 2 Shown)

Photo 6. Typical Bent 5 and 6 Condition (Bent 5 West Side Shown)

- Approximately 20% of the piles have been UT tested, findings within these measurements indicate widespread severe section loss in non-consistent areas. There are likely many areas of severe loss and these areas should be located for repair or avoidance to ensure safe operation of the dock.
  - *100% UT is recommended (~80% remaining) on the vertical support piles.*

Based on the observed condition of the dock and MOP 130 guidelines, it is recommended the dock be inspected on an **annual** basis. UT measurement scope should be taken similar to this inspection, each year, until 100% UT of vertical piles is obtained.

Please feel free to reach out with any questions or concerns.

Sincerely,

PND Engineers, Inc. | Anchorage Office

Sean Baginski, P.E., S.E.

Principal Engineer

- Notes:
- Envelope UT measurements taken from mudline, 0-ft elevation, and splash zone.
  - Excludes H-piles with 100% section loss or buckled flange (Deficiency Category 9 and above, see page 1).
  - Exclude assumptions on piles without UT measurements (i.e., Bent 1-6, 70% section loss and Bent 6-63, 50% section loss
