1. Overview

In 2017, FEMA's National Integration Center (NIC) Technical Assistance (TA) Branch identified a need to establish a data-driven basis for prioritizing locations for TA investment and guiding local emergency management planning. To achieve this goal, FEMA tasked Argonne National Laboratory (Argonne) with identifying commonly used indicators of community resilience across the landscape of published peer-reviewed research.

FEMA and Argonne completed the first analysis of community resilience indicators in 2018 and repeated the process in 2022. The analysis process begins with a literature review and cataloguing of published peer-reviewed assessment methodologies on social vulnerability and community resilience. The literature review findings are then filtered by inclusion criteria established by the research team to ensure the methodologies are:

- Quantitative,
- Data and methodology are publicly available,
- Calculated at the county level or lower,
- Examine generalized hazard risk (rather than a singular hazard), and
- Focused on pre-disaster community conditions.

After this, the research team identifies the commonly used indicators across these methodologies and selects the best data source for each indicator. Finally, the research team bins the data for visual display, conducts a correlation analysis and creates a composite index, the FEMA Community Resilience Challenges Index (FEMA CRCI).

In 2018, this analysis identified eight resilience and vulnerability assessment methodologies and 20 commonly used indicators (indicators used in three or more of the eight methodologies). The FEMA CRCI in 2018 was created from these 20 indicators and was produced at the county level. In 2022, the FEMA and Argonne research team updated the literature review which expanded the list of methodologies examined to 14 methodologies published between 2003 and 2021. Examining the indicators used in these methodologies, the research team identified 22 indicators¹ as commonly used (indicators used in five or more of the 14 methodologies). In 2022, the research team produced the FEMA CRCI at the county and the census tract levels.

¹ Five indicators were added to the list in 2022, and three indicators were retired from the 2018 list.

To make the CRCI data more accessible and more actionable, each individual indicator and the FEMA CRCI is binned and included in FEMA's Resilience Analysis and Planning Tool (RAPT).² RAPT enables emergency managers and community partners to quickly visualize relative differences in potential resilience by county, tribe and census tract.

By reviewing the data for each of these 22 indicators individually, emergency managers can gain insights for targeted outreach strategies, planning, mitigation investments and response and recovery operations. Communities, regional governments and others can use this data to better understand potential challenges to resilience. As the social science field of examining and validating indicators of resilience evolves, FEMA will update RAPT to provide emergency managers and community partners with additional data and tools to inform planning, mitigation, response and recovery.

It is important to understand that the role of the emergency manager is not to change or to "improve" the data, but to plan appropriately for the community characteristics reflected in the data. These datasets are community characteristics that researchers have identified as important considerations for resilience. For example, people with disabilities may have greater challenges to be resilient to disasters. If a community has a high population of people with disabilities, the emergency manager(s) may need to create tailored preparedness outreach programs and strategies to ensure those residents have support if evacuation is necessary.

Rather than label the CRCI and the underlying indicators as an absolute measure of resilience, FEMA considers this data as "potential challenges to resilience." Everyone is vulnerable to disasters. While scholars theorize that certain characteristics may make an individual or a household less resilient (or more socially vulnerable), the data does not reflect measures that individuals and/or communities have taken to address potential challenges, such as emergency management planning and outreach or household preparedness measures. To aid emergency managers in understanding how to use these indicators, calling them potential challenges to resilience supports a more positive and strategic application of the data in all phases of emergency management.

2. 2018 CRCI Summary

To identify the set of methodologies for the first analysis of community resilience indicators, Argonne catalogued peer-reviewed methodologies cited in meta-analyses of community resilience published between 2013-2017. The research team then selected the methodologies that met the following inclusion criteria.

- **Quantitative measures:** To ensure that indicators could be easily compared across methodologies, the team only included methodologies that used exclusively quantitative measures.

² RAPT is a free, online, geographic information system (GIS) tool with data layers on population characteristics, infrastructure and hazards. RAPT is designed to support all phases of emergency management. Access RAPT here: www.fema.gov/rapt.

- **Publicly available methodology:** For the analysis and findings to be transparent, the team only included methodologies that were publicly available.
- **Public data source:** To ensure transparency, replicability and updates over time, indicator data had to be from publicly available secondary sources, such as the U.S. Census and the Bureau of Labor Statistics.
- **At least county-level unit of analysis:** The team only included studies where the unit of analysis was, or could be easily adapted to, a U.S. County. Although more granularity offers greater clarity, many studies do not include data below the county level.
- **Generalized risk:** Because the NIC provides technical assistance relative to a wide range of hazards, the inclusion criteria retained methodologies that applied to multiple hazards. Methodologies that focused on one specific risk (such as earthquakes, food security, poverty or public health) were included in the CRIA analysis. Although these studies offer insights for these topic areas, studies with an all-hazards perspective were more appropriate for comparative purposes.
- **Pre-disaster conditions:** As NIC TA supports communities to build resilience prior to a disaster, the research team focused on community characteristics present before an incident occurred.

Using these inclusion criteria as a filter, the research team identified eight methodologies for further analysis in 2018. The names of some methodologies highlight social vulnerability and some highlight community resilience. While community resilience encompasses more than population characteristics, the research team drew from methodologies with either focus to capture the broadest research set. The research team also included methodologies from developed countries other than the United States.

After cataloguing more than 100 unique indicators used across the eight methodologies, the team identified 20 indicators that were used in three or more of these methodologies. Identifying indicators used in multiple methodologies suggests researcher agreement on the importance of these indicators.

Argonne then selected U.S. datasets for each of the 20 indicators (from the U.S. Census American Community Survey five-year estimates and other public data sources), binned the data and created GIS data layers to include in RAPT. The research team used the American Community Survey (ACS) five-year estimates because it provides greater statistical reliability of population and community characteristics than one-year data, especially for smaller geographic areas. In addition to the individual data layers, FEMA and Argonne created the FEMA CRI at the county level using standard deviation to calculate the spread of values for the country.

The first report on this analysis, released in December 2018, used data from the 2012-2016 ACS 5-year estimates. FEMA updated the indicator data with the ACS 5-year estimates from 2013-2017 in the November 2019 RAPT release. In March 2020, FEMA updated RAPT with ACS 5-year estimates for 2015-2019.

3. 2022 CRCI Summary

3.1. Literature Review and Selected Methodologies

To capture the most current community resilience research, FEMA conducted another literature review in 2021 to identify peer-reviewed articles published from 2018-2021.

The literature review was conducted via a Web of Science library search using the search terms: “resilience” and “index, methodology(ies), or indicator(s)” and “community or disaster.” The 2021 literature search identified 2,151 records. Argonne reviewed the abstracts for all records and selected articles that discussed resilience assessment methodologies not included in the 2018 analysis. The team then compared the resulting 17 articles against the analysis inclusion criteria to identify additional methodologies for analysis.

Appendix A includes the comprehensive list of over 90 methodologies identified from the 2018 and 2021 literature reviews. The table includes the methodologies names, dates of publication, a link to the methodology reports or developers and a determination for each inclusion criterion.

Combining the findings from both literature reviews, 14 methodologies met all of the inclusion criteria. Full citations for these methodologies are included in Appendix B.

The methodologies met the inclusion criteria from the 2022 literature review:

- Fraser: Japanese Social Capital and Social Vulnerability Indices
- Nursey-Bray: Indicators for Adaptive Capacity
- Regional Climate Resilience Index (RCRI)
- Composite Community Disaster Resilience Index (CCDRI)
- Comprehensive Disaster Resilience Index (CDRI2)
- Social Vulnerability Index (SoVI)

The following methodologies met the inclusion criteria from the 2018 literature review:

- Australian National Disaster Resilience Index (ANDRI)
- Baseline Resilience Indicators for Communities (BRIC)
- Community Disaster Resilience Index (CDRI)
- Community Resilience Index (CRI2)
- Disaster Resilience of Place (DROP)
- Resilient Capacity Index (RCI)
- Social Vulnerability Index (SVI)
- The Composite Resilience Index (TCRI)

3.2. Commonly Used Indicators and Data Sources

To identify the commonly used indicators across the 2022 CRIA set of 14 methodologies, the team first documented all the indicators used in each of the six newly identified methodologies (157 in

total) and added them to the list of the indicators from the 2018 methodologies. The research team then established the threshold of commonly used indicators as those used in five or more of the 14 methodologies (in at least 35% of the methodologies). This analysis resulted in identifying 22 common indicators. The research team also documented citations from the methodologies' authors that explained their reasoning for using the indicators.

The following table lists the 22 indicators and references how many of the 14 methodologies used that indicator. Five indicators that were not on the 2018 list have been added: inactive voters, unemployed women, workforce employed in the dominant sector, households with a smartphone and population below poverty level. Three indicators were retired from the list because they were not used in at least five of the new set of 14 methodologies (listed in *blue* italics): public school capacity, rental property capacity and hotel/motel capacity.

Table 1: 2022 CRCI Indicators

| Commonly Used Indicators | Number of Methodologies Using this Indicator (of 14) |
|--|--|
| Unemployed labor force | 13 |
| Population without a high school diploma | 11 |
| Percent of inactive voters* | 10 |
| Households without a vehicle | 9 |
| Number of hospitals | 9 |
| Population age 65 and older | 9 |
| Medical professional capacity | 8 |
| Population with a disability | 7 |
| Households with limited English | 7 |
| Single-parent households | 7 |
| Population without health insurance | 7 |
| Unemployed women labor force* | 7 |
| Presence of civic and social organizations | 6 |
| Median household income | 6 |
| Income inequality | 6 |
| Population change | 6 |
| Population without religious affiliation | 6 |
| Mobile homes as percentage of housing | 6 |
| Owner-occupied housing | 6 |
| Workforce in predominant sector* | 5 |
| Households without a smartphone* | 5 |
| Population below poverty level* | 5 |
| <i>Public school capacity</i> | 4 |
| <i>Rental property capacity</i> | 4 |
| <i>Hotel/motel capacity</i> | 3 |

Indicators added in 2022 are marked with an asterisk “*”

Indicators in *blue italics* were included in the 2018 analysis but are not used in at least five of the 2022 methodologies.

After identifying the 22 commonly used indicators, the research team selected the most authoritative data source for each indicator metric. Most of the indicators related to population and community characteristics are available from the U.S. Census Bureau. When available, the research team selected datasets for U.S. counties, census tracts and tribes.

To assist emergency managers with analyzing their community, the research team grouped the 22 2022 CRCI Indicators into six categories:

Population Characteristics

- Population without a High School Education
- Population 65 and Older
- Population with a Disability

Household Characteristics

- Households without a Vehicle
- Households with Limited English
- Single-Parent Households
- Households without a Smartphone

Housing

- Mobile Homes as Percentage of Housing
- Owner-Occupied Housing

Healthcare

- Number of Hospitals*
- Medical Professional Capacity*
- Population without Health Insurance

Economic

- Population Below Poverty Level
- Median Household Income
- Unemployed Labor Force
- Unemployed Women Labor Force
- Income Inequality+
- Workforce in Predominant Sector

Connection to Community

- Presence of Civic and Social Organizations*
- Population with Religious Affiliation*
- Percent of Inactive Voters*
- Population Change*

Census tract data is available for all indicators, except:

** Indicates County level data only,*

+ Indicates County and Tribal level data only

3.3. Data Binning

With such large datasets, binning the data and assigning consistent color ramps for the bins provides a visual cue to quickly grasp a data range. While the specific datapoint for the geography (county, census tract or tribe) is also available, the bins provide a more immediate high-level understanding of a geographic area's characteristics.

To bin each dataset for mapping, Argonne used the Python Spatial Analysis Library, PySAL, and its Exploratory Spatial Data Analysis sub-package. Python is an open-source, high-level programming language that is used in social science research. The package includes nine binning methods. Rather than make arbitrary "breaks" in the data, these binning methods allowed the research team to use the best binning method that would group data that are close in value to each other and maximize the variance between bins.

The team evaluated which of the nine binning methods 1) best fit the relationships of the breaks to each dataset's means and medians and 2) could be consistently replicated. This analysis identified four binning methods as the best fit for most datasets. For the county-level datasets, the research team binned the dataset into five bins. For the indicators with census tract data, the research team binned the dataset into seven bins, allowing greater differentiation with these substantially larger datasets.

The binning methods for the 22 CRCI indicators are:

- **Fisher–Jenks Breaks:** This method aims to return class breaks such that classes are internally homogenous while assuring heterogeneity among classes. The Python toolkit calculates squared deviations against class means.
- **Jenks–Caspall Breaks:** This method aims to minimize the absolute deviation from within-class medians. Python’s calculation focuses on within-class absolute deviations from the median.
- **Head/Tail Breaks:** Algorithmically optimal breaks and the number of classes are based on the dataset itself. The Head/Tails Breaks method works well with heavily tailed datasets, iterating through the data to minimize around the mean.³
- **Other:** In specific cases, the team used alternative criteria to select binning methodologies.
 - Income: A convention for displaying income data already exists: \$0–20,000, \$20,001–\$40,000, etc. (an intuitive methodology similar to equal intervals).
 - Population Change: The population change dataset is provided by the U.S. Census as “net migration,” which provides a positive (increase in population) or negative (decrease in population) number.⁴ Large population changes in either direction could cause challenges to resilience. The team chose to represent the population change data as standard deviations from zero, where less change is preferred to more change (regardless of whether the change is positive or negative).

Appendix C provides the indicator, data source, national average, binning method and other information about each of the 22 indicators. In the 2022 release of RAPT, all datasets drawing from the U.S. Census are from the 2016-2020 ACS 5-year estimates and the census tract boundaries are the updated boundaries from the 2020 Decennial Census. FEMA will update RAPT with new ACS data annually as new U.S. Census data is released.

3.4. Correlation Analysis

The research team conducted a correlation analysis to measure and describe the strength and direction of the relationships among the 22 CRCI indicators. The correlation analysis shows how individual indicators may be related to each other. Understanding these correlations helps communities design resilience strategies that take these relationships into account.

The Pearson Correlation Coefficient is a numerical measure of linear correlation from -1 to 1 .

³ Jiang, B., 2013, Head/tail Breaks: A New Classification Scheme for Data with a Heavy-tailed Distribution. *The Professional Geographer*, 65, 482-494.

⁴ U.S. Census Bureau. https://www.census.gov/glossary/#term_Netmigration, accessed March 28, 2022.

- A coefficient closer to 1 indicates a positive correlation (variable A increases as variable B increases).
- A coefficient of 0 indicates no correlation.
- A coefficient closer to -1 indicates a negative correlation (variable A increases as variable B decreases).

As jurisdictions consider strategies to address indicator metrics that reveal challenges to resilience, the correlation analysis helps identify populations that may face multiple challenges concurrently. For example, there is a high correlation between individuals that are unemployed and those that are more likely to speak a language other than English and be without access to a vehicle. Outreach to these populations should consider all three of these characteristics.

The full chart of Pearson Correlation Coefficients can be found in Appendix D.

3.5. FEMA Community Resilience Challenges Index (CRCI)

The research team developed a process to create a composite index comprised of the 22 commonly used indicators, the FEMA CRCI. This index provides a relative composite value by county and by census tract, measured as an average of counts of standard deviations from the national mean for each indicator. The 2023 update to the FEMA CRCI uses the most currently available census data, the 2017-2021 ACS 5-year estimates, and will be updated annually.

To produce the CRCI, the team first oriented all the datasets in the same direction (higher numbers or percentages represent higher resilience challenges) and then converted each county and census tract's data point to a standardized score value based on standard deviations above or below the indicator's national mean (except for population change calculated as standard deviations from zero). The team then averaged the 22 standardized score values for each county and census tract to create the FEMA CRCI value. Because there is no validated method for weighting resilience indicators, the research team did not weight individual indicators in developing the FEMA CRCI.

- **County CRCI:** When data for an indicator was not available for a given county, the team used the national mean for that indicator; this approach does not artificially push an aggregate indicator more positive or more negative. Though the team examined linear and non-linear models, they determined that using the national mean for missing county data, the simplest solution, was the best solution.
- **Census Tract CRCI:** When data for an indicator was not available at the census tract level, the research team imputed the county data for the census tract calculation.

The FEMA CRCI process produces a numerical standard deviation data point for each county and each census tract. As with the indicator datasets, the FEMA CRCI is binned into five bins for the county and seven bins for the census tract and are included in RAPT. Including the CRCI data in RAPT allows users to view both the composite index and datapoints for each indicator comprising the index to better understand the drivers behind the composite index values.

3.6. Limitations and Benefits

Limitations

Incomplete national datasets. The U.S. Census's primary datasets do not include information for many of the U.S. territories, including Guam, the U.S. Virgin Islands, American Samoa, and the Commonwealth of the Northern Mariana Islands. Territories other than Puerto Rico may face some of the highest challenges to resilience in the U.S. but have not been assessed in this report because the data are not included in national datasets.

Some data unavailable at census tract level. Some CRCI indicators have data available at the county level but not at the census tract level (Presence of Civic and Social Organizations, Inactive Voters, Number of Hospitals, Religious Affiliation and Population Change). When developing the census tract CRI, the research team imputed the county data for the census tract CRCI calculation.

Universal application of indicators. With the exception of not including the Households with Limited English indicator for CRCI in Puerto Rico, the CRCI for all other jurisdictions includes all 22 indicators. The CRCI does not factor in potential differences for challenges to resilience based on rural, sub-urban, or urban locations.

No assessment of hazard risk or community capacity. This analysis identifies potential challenges to community resilience to help communities plan, prepare, and build resilience. This analysis does not capture specific hazard risk nor ways that a community may have developed the capacity to address these challenges. For example, communities with relatively lower levels of hospitals or medical professions per capita may have developed surge capacity support for medical services by training the public, supporting volunteer programs, or investing in mobile clinics.

Benefits

Peer-reviewed research. The analysis in this paper draws exclusively from the current body of peer-reviewed research on community resilience and social vulnerability in disasters. The peer review process helps to ensure that the research methodologies have been subjected to the scrutiny of experts in related academic fields.

Commonly used indicators suggest research agreement. This analysis identifies specific, individual indicators used in multiple methodologies (at least five methodologies out of 14 methodologies meeting the inclusion criteria). This approach captures multiple research perspectives to identify important resilience indicators rather than choosing one methodology among many.

Both an index and data for individual indicators. In addition to producing a composite index, this analysis also provides county and census tract datapoints for each indicator. Many research methodologies produce an index to support high-level relative values and, in some cases, sub-

indices, without providing the underlying data for each indicator. By providing data for each indicator, this approach may help pinpoint specific areas to develop community capacity.

Open-source data. The research team used only publicly available data to ensure that this analysis was fully transparent and could be replicated at no cost. The appendix outlines the source data for each indicator.

Broad application of findings. In addition to helping to prioritize locations for FEMA technical assistance, this analysis is useful for all phases of emergency management and can be used by many FEMA program areas and State, Local, Tribal and Territorial partners.

3.7. Future Research

As the social science of community resilience continues to evolve, additional analysis could evaluate the usefulness of weighting the indicators, validating the indicators, examining specific indicators by risk and adding or retiring indicators. Principal component analysis, factor analysis, regression analysis, or structured sensitivity analysis could provide findings on the relative importance and weight of an indicator's contribution to overall resilience. It may also be of interest to examine how these indicators may have different impacts in rural versus urban areas or differences by region.

The researchers involved in developing the CRCI process, and RAPT continue to look for opportunities to evaluate the validity and usefulness of this set of indicators with the goal of ensuring that the data is easily accessible and a useful focusing tool for initial situational awareness for preparedness, mitigation, response and recovery efforts.

Appendix B: Methodologies

Meeting CRCI Inclusion Criteria

* Indicates a methodology in the 2018 CRIA

^ Indicates an international methodology

Australian Natural Disaster Resilience Index (ANDRI)*^

Phil Morley, Melissa Parsons and Sarb Johal, 2017, "The Australian Natural Disaster Resilience Index: A System for Assessing the Resilience of Australian Communities to Natural Hazards," Bushfire & Natural Hazards CRC. Available at <https://www.bnhcrc.com.au/research/hazard-resilience/251>, accessed March 20, 2023.

Baseline Resilience Indicators for Communities (BRIC)*

Susan L. Cutter, Kevin D. Ash and Christopher T. Emrich, 2014, "Baseline Resilience Indicators for Communities, the Geographies of Community Disaster Resilience," *Global Environmental Change* 29, 65–77. Available at

https://www.sciencedirect.com/science/article/pii/S0959378014001459?casa_token=30407z10Qm0AAAAA:Y5ulORVy-s9vrNcwASxOb28AD15MgS35Urfa1VCQ1n7Hae3Mt3oR6y-Kjes9Y7K_f1HQiOYB, accessed March 30, 2023.

Composite Community Disaster Resilience Index (CCDRI)

Rifat, S. A. A., & Liu, W., 2020, "Measuring Community Disaster Resilience in the Conterminous Coastal United States." *ISPRS International Journal of Geo-Information*. Available at <https://www.mdpi.com/2220-9964/9/8/469/pdf> accessed March 30, 2023.

Community Disaster Resilience Index (CDRI)*

Walter Gillis Peacock, et al., 2010, "Advancing Resilience of Coastal Localities: Developing, Implementing, and Sustaining the Use of Coastal Resilience Indicators: A Final Report," *Hazard Reduction and Recovery Center*, December. Available at

https://www.researchgate.net/profile/Walter_Peacock/publication/254862206_Final_Report_Advancing_the_Resilience_of_Coastal_Localities_10-02R/links/00b7d51feb3e3d0d4a000000.pdf, accessed March 30, 2023.

Comprehensive Disaster Resilience Index (CDRI2)^

Marzi, S., Mysiak, J., Essenfelder, A. H., Amadio, M., Giove, S., & Fekete, A., 2019, "Constructing a Comprehensive Disaster Resilience Index: The Case of Italy." *PloS one*. Available at <https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0221585>, accessed March 30, 2023.

Community Resilience Index (CRI2)*

Kathleen Sherrieb, Fran H. Norris and Sandro Galea, 2010, "Measuring Capacities for Community Resilience," *Social Indicators Research* 99: 227–247. Available at <https://link.springer.com/article/10.1007/s11205-010-9576-9>, accessed March 30, 2023.

Disaster Resilience of Place (DROP)*

Susan L. Cutter, Christopher G. Burton and Christopher T. Emrich, 2010, "Disaster Resilience of Place, Disaster Resilience Indicators for Benchmarking Baseline Conditions," *Journal of Homeland Security and Emergency Management* 7. Available at <https://www.degruyter.com/abstract/j/jhsem.2010.7.1/jhsem.2010.7.1.1732/jhsem.2010.7.1.1732.xml>, accessed March 30, 2023.

Fraser^

Fraser, T., 2021, "Japanese Social Capital and Social Vulnerability Indices: Measuring Drivers of Community Resilience 2000–2017." *International Journal of Disaster Risk Reduction*. Available at https://www.sciencedirect.com/science/article/pii/S2212420920314679?casa_token=oaC86iYRuwgAAAAA:ChyrqLcLG-4TT_ZqxEMMDP9oFyRMJODxO6To9x5yfaLmZxYOMUb4qc3UIx1UdteBCftuEd7d, accessed March 30, 2023.

Nursey-Bray^

Nursey-Bray, M., Gillanders, B., & Maher, J. A., 2021, "Developing Indicators for Adaptive Capacity for Multiple Use Coastal Regions: Insights from the Spencer Gulf, South Australia." *Ocean & Coastal Management*. Available at https://www.sciencedirect.com/science/article/pii/S0964569121002118?casa_token=ofxgFiTUUEOAAAAA:qsHc0N1BtTDGnr4w5Phl6g9B_QGfpCj1y-GaF1CottH2i3eLEsQzPKLGC40C39LABoed8qmK, accessed March 30, 2023.

Resilience Capacity Index (RCI)*

Kathryn A. Foster, 2014, "Resilience Capacity Index: Disaster Resilience Measurements: Stocktaking of Ongoing Efforts in Developing Systems for Measuring Resilience," *United Nations Development Programme*, February, p. 38. Available at https://www.preventionweb.net/files/37916_disasterresiliencemeasurementsundpt.pdf, accessed March 30, 2023.

Regional Climate Resilience Index (RCRI)^

Feldmeyer, D., Wilden, D., Jamshed, A., & Birkmann, J., 2020, "Regional Climate Resilience Index: A Novel Multimethod Comparative Approach for Indicator Development, Empirical Validation and Implementation." *Ecological indicators*. Available at https://www.sciencedirect.com/science/article/pii/S1470160X20307998?casa_token=VRVTAEajgUAAAAA:pTCrOfbuAU7Y7mjURGNV44_JYPRbhjy2cqXNXdiDcGhwt6SE-IUfzKFQOpJOpKyZ2wwwTYB, accessed March 30, 2023.

Social Vulnerability Index (SoVI)

Cutter, Susan L., Bryan J. Boruff and W. Lynn Shirley, 2003, "Social Vulnerability to Environmental Hazards." *Social Science Quarterly* 84.2. Available at https://onlinelibrary.wiley.com/doi/pdfdirect/10.1111/1540-6237.8402002?casa_token=IUAXvoqNhUUAAAAA:SAFjsqpLIMmcdZHyB0n4s6DyUlw65Vv0u9XKwX4nRakED59dUqGHEW5FKDXDDRjiSTKlvmNzhM1lw, accessed March 30, 2023.

Social Vulnerability Index (SVI)*¹

Barry E. Flanagan, et al., 2011, "A Social Vulnerability Index for Disaster Management," *Journal of Homeland Security and Emergency Management* 8. Available at <https://svi.cdc.gov/Documents/Data/A%20Social%20Vulnerability%20Index%20for%20Disaster%20Management.pdf>, March 30, 2023.

The Composite Resilience Index (TCRI)*

T. Perfrement and T. Lloyd, 2015, "The Composite Resilience Index: The Modelling Tool to Measure and Improve Community Resilience to Natural Hazards," *The Resilience Index*. Available at <https://theresilienceindex.weebly.com/our-solution.html>, accessed March 30, 2023.

¹ The CRCI literature review was conducted in 2021. The SVI has since been updated as of December 2022.

Appendix C: List of Commonly Used Indicators from Selected Methodologies

This appendix provides details about each of the 22 indicators identified through the 2022 analysis process. For each indicator, the tables below include:

- Indicator metric;
- Data source;
- National average;
- Binning method used;
- Data geography (available at county, census tract, tribal, Puerto Rico and other);
- Methodologies using this indicator; and
- Author rationale for including this indicator.

Each table notes which of the following methodologies are used each indicator. Below are the methodologies used in the CRCI, their abbreviations (as applicable), and the reference letter that corresponds to the citations found in the “author rationale for including this indicator” section in the tables below. Full citations for these methodologies are found in Appendix B.

- Australian Disaster Resilience Index (ANDRI) ^a
- Baseline Resilience Indicators for Communities (BRIC) ^b
- Composite Community Disaster Resilience Index (CCDRI) ^c
- Community Disaster Resilience Index (CDRI) ^d
- Comprehensive Disaster Resilience Index (CDRI2) ^e
- Disaster Resilience of Place (DROP) ^f
- Fraser ^g
- Nursey-Bray ^h
- Resilience Capacity Index (RCI) ⁱ
- Regional Climate Resilience Index (RCRI) ^j
- Social Vulnerability Index (SoVI) ^k
- Social Vulnerability Index (SVI) ^l
- The Composite Resilience Index (TCRI) ^m

Population Characteristics: 3 Indicators

| Population without High School Diploma | | | | | | | | | | | | | | |
|--|-------|------|------|------|------|-----|--|-----|------|-----|-----------------------|------|-------|--------|
| Metric | | | | | | | Data Source | | | | | | | |
| Percentage of population over age 25 without a high school diploma or General Educational Development (GED) | | | | | | | American Community Survey (ACS) 2017–2021 five-year estimates, Table S1501 | | | | | | | |
| National Average | | | | | | | Binning Methods | | | | | | | |
| 11.1% of the population over age 25 do not have a high school diploma or GED. | | | | | | | Census Tract: Jenks Caspall | | | | County: Jenks Caspall | | | |
| Data Geography | | | | | | | | | | | | | | |
| Data is available at the Census tract, county and Tribal levels. Puerto Rico is included. | | | | | | | | | | | | | | |
| Methodologies Using This Indicator | | | | | | | | | | | | | | |
| # of 14 | ANDRI | BRIC | CDRI | CR12 | DROP | RCI | SoVI | SVI | TCRI | N-B | CCDRI | RCRI | CDRI2 | Fraser |
| 11 | X | X | X | X | X | X | X | X | | X | | | X | X |
| Author Rationale for Including This Indicator | | | | | | | | | | | | | | |
| Higher levels of education are associated with health, as well as an improved ability to communicate and comprehend information. ^{b,m} | | | | | | | | | | | | | | |
| Education is included as an input to economic resilience as higher levels of education is a characteristic of a strong labor force and supports individuals' ability to access community resources. ^{d,j} | | | | | | | | | | | | | | |
| Higher levels of education can improve the capacity to prepare for, and respond to, the stress of disasters. ^{a,g,n} | | | | | | | | | | | | | | |
| For individuals with lower levels of education, the practical and bureaucratic hurdles to assist in coping with, and recovering from, a disaster are much more difficult to navigate. ^m | | | | | | | | | | | | | | |

| Population Age 65 and Older | | | | | | | | | | | | | | |
|--|-------|------|------|------|--|-----|------|-----|------|-----------------------|-------|------|-------|--------|
| Metric | | | | | Data Source | | | | | | | | | |
| Percentage of the population age 65 and older | | | | | ACS 2017–2021 five-year estimates, Table S0101 | | | | | | | | | |
| National Average | | | | | Binning Methods | | | | | | | | | |
| 16.0% of the U.S. population is age 65 and older. | | | | | Census Tract: Fisher Jenks | | | | | County: Jenks Caspall | | | | |
| Data Geography | | | | | | | | | | | | | | |
| Data is available at the Census tract, county and Tribal levels. Puerto Rico is included. | | | | | | | | | | | | | | |
| Methodologies Using This Indicator | | | | | | | | | | | | | | |
| # of 14 | ANDRI | BRIC | CDRI | CRI2 | DROP | RCI | SoVI | SVI | TCRI | N-B | CCDRI | RCRI | CDRI2 | Fraser |
| 9 | X | X | | | X | | X | X | X | | | X | X | X |
| Author Rationale for Including This Indicator | | | | | | | | | | | | | | |
| Several methodologies noted that the percentage of elderly adults in the population could affect resilience. ^{a,b,g} | | | | | | | | | | | | | | |
| Those over 65 tend to be less mobile. ⁿ | | | | | | | | | | | | | | |
| Those over 65 may find it more difficult to prepare for disasters and adapt to extreme circumstances. ⁿ | | | | | | | | | | | | | | |
| Many people over 65 require assistance from family, neighbors and others, which might not be available during a disaster. ^m | | | | | | | | | | | | | | |

| Population with a Disability | | | | | | | | | | | | | | |
|---|-------|------|------|------|--|-----|------|-----|------|-----------------------------|-------|------|-------|--------|
| Metric | | | | | Data Source | | | | | | | | | |
| Percentage of the population with a disability ⁵ | | | | | ACS 2017–2021 five-year estimates, Table S1810 | | | | | | | | | |
| National Average | | | | | Binning Methods | | | | | | | | | |
| 12.7% of the U.S. population has a disability | | | | | Census Tract: Fisher Jenks | | | | | County: Jenks Caspall Jenks | | | | |
| Data Geography | | | | | | | | | | | | | | |
| Data is available at the Census tract, county and Tribal level. Puerto Rico is included. | | | | | | | | | | | | | | |
| Methodologies Using This Indicator | | | | | | | | | | | | | | |
| # of 14 | ANDRI | BRIC | CDRI | CRI2 | DROP | RCI | SoVI | SVI | TCRI | N-B | CCDRI | RCRI | CDRI2 | Fraser |
| 7 | X | X | | | X | X | | X | X | X | | | | |
| Author Rational for Including This Indicator | | | | | | | | | | | | | | |
| Individuals with disabilities tend to be more vulnerable to physical, social and economic challenges. ^{b,j} | | | | | | | | | | | | | | |
| Having functional, mobility, or access needs can make responding to disasters more challenging, including adapting to extreme circumstances and dealing with the increased stress. ^{a,j,n} | | | | | | | | | | | | | | |
| During an emergency, family members, neighbors, or a caretaker may be less able to provide support to individuals with special needs that require the assistance of others. ^m | | | | | | | | | | | | | | |

⁵ Per the ACS question wording, this definition would include individuals with the following conditions: serious difficulty hearing, seeing, walking and/or dressing; serious difficulty because of a physical, mental or emotional condition; serious difficulty concentrating, remembering, making decisions, or doing errands alone.

Household Characteristics: 4 Indicators

| Households Without a Vehicle | | | | | | | | | | | | | | |
|---|-------|------|------|------|------|-----|---|-----|------|-----|--------------------------|------|-------|--------|
| Metric | | | | | | | Data Source | | | | | | | |
| Percentage of occupied housing units with no vehicles available | | | | | | | ACS 2017–2021 five-year estimates, Table B08201 | | | | | | | |
| National Average | | | | | | | Binning Methods | | | | | | | |
| 8.3% of households are without a vehicle. | | | | | | | Census Tract: Jenks Caspall | | | | County: Head Tail Breaks | | | |
| Data Geography | | | | | | | | | | | | | | |
| Data is available at the Census tract, county and Tribal levels. Puerto Rico is included. | | | | | | | | | | | | | | |

| # of 14 | ANDRI | BRIC | CDRI | CRI2 | DROP | RCI | SoVI | SVI | TCRI | N-B | CCDRI | RCRI | CDRI2 | Fraser |
| 9 | X | X | X | | X | | X | X | X | | X | | | X |
| Author Rationale for Including This Indicator | | | | | | | | | | | | | | |
| Access to transportation helps individuals support their livelihoods and provides critical mobility to adapt to the extreme circumstances of a disaster. ^{d,g,n} | | | | | | | | | | | | | | |
| Communities where fewer individuals have access to a vehicle may have less resilience to a disaster. ^b | | | | | | | | | | | | | | |
| Lack of access to vehicle can be especially problematic in terms of evacuation in urban areas where automobile ownership is lower, especially among inner city poor populations. ^m | | | | | | | | | | | | | | |

| Households with Limited English | | | | | | | | | | | | | | |
|---|-------|------|------|------|--|-----|------|-----|------|-----------------------|-------|------|-------|--------|
| Metric | | | | | Data Source | | | | | | | | | |
| Percentage of households in which everyone 14 and older has difficulty speaking English. ⁶ | | | | | ACS 2017–2021 five-year estimates, Table S1602 | | | | | | | | | |
| National Average | | | | | Binning Methods | | | | | | | | | |
| 4.2% of U.S. households are limited English-speaking households where all members 14 or older have difficulty speaking English. | | | | | Census Tract: Fisher Jenks | | | | | County: Jenks Caspall | | | | |
| Data Geography | | | | | | | | | | | | | | |
| Data is available at the Census tract, county and Tribal levels. Puerto Rico is included. | | | | | | | | | | | | | | |

| 7 | X | X | X | | X | | X | X | X | | | | | |
| Author Rationale for Including This Indicator | | | | | | | | | | | | | | |
| Proficiency in English supports community resilience because of improved ability to communicate between individuals, as well as allowing individuals to better access community resources. ^{a,d,m} | | | | | | | | | | | | | | |
| Greater numbers of proficient English speakers can be vital for effective communication interactions in the event of a disaster. ^{b,n} | | | | | | | | | | | | | | |
| In communities where the first language is neither English nor Spanish, accurate translations of advisories may be scarce. ^m | | | | | | | | | | | | | | |
| Communities with fewer English-speaking residents may demonstrate lower levels of resilience. ^g | | | | | | | | | | | | | | |

⁶ A “limited English-speaking household” is one in which no member 14 years and older speaks only English or speaks a non-English language and speaks English “very well.” In other words, all members 14 years and older have at least some difficulty with English (<https://census.gov/library/visualizations/2017/comm/english-speaking.html.html>, accessed August 7, 2018).

| Single-Parent Households | | | | | | | | | | | | | | |
|--|-------|------|------|------|---|-----|------|-----|------|-----------------------|-------|------|-------|--------|
| Metric | | | | | Data Source | | | | | | | | | |
| Percentage of households with single parents of children under 18 (no spouse/partner present) | | | | | ACS 2017–2021 five-year estimates, Table B09005 | | | | | | | | | |
| National Average | | | | | Binning Method | | | | | | | | | |
| 25.1% of U.S. family households are single parent households. | | | | | Census Tract: Jenks Caspall | | | | | County: Jenks Caspall | | | | |
| Data Geography | | | | | | | | | | | | | | |
| Data is available at the Census tract, county and Tribal levels. Puerto Rico is included. | | | | | | | | | | | | | | |
| Methodologies Using This Indicator | | | | | | | | | | | | | | |
| # of 14 | ANDRI | BRIC | CDRI | CRI2 | DROP | RCI | SoVI | SVI | TCRI | N-B | CCDRI | RCRI | CDRI2 | Fraser |
| 7 | X | | | X | | | X | X | | X | | | X | X |
| Author Rationale for Including This Indicator | | | | | | | | | | | | | | |
| Single-parent households are more vulnerable to a disaster because they tend to have lower socioeconomic status and fewer sources of social support than that of two-parent families. ^{f,m} | | | | | | | | | | | | | | |
| Single-parent households are also vulnerable as all daily responsibilities fall to one parent, making recovery more difficult. ^m | | | | | | | | | | | | | | |

| Households without a Smartphone | | | | | | | | | | | | | | |
|---|-------|------|------|------|---|-----|------|-----|------|-----------------------|-------|------|-------|--------|
| Metric | | | | | Data Source | | | | | | | | | |
| Percent of households without a smartphone | | | | | ACS 2017–2021 5-year estimates, Table S2801 | | | | | | | | | |
| National Average | | | | | Binning Method | | | | | | | | | |
| 13.5% of U.S. households do not have a smartphone. | | | | | Census Tract: Jenks Caspall | | | | | County: Jenks Caspall | | | | |
| Data Geography | | | | | | | | | | | | | | |
| Data is available at the Census tract, county and Tribal levels. Puerto Rico is included. | | | | | | | | | | | | | | |
| Methodologies Using This Indicator | | | | | | | | | | | | | | |

| 5 | X | X | X | | X | | | | | | X | | | |
| Author Rationale for Including This Indicator | | | | | | | | | | | | | | |
| Access to telephones enables communication which is vital during disaster events. ^b | | | | | | | | | | | | | | |
| Communities with more access to telephone services will be better prepared for and will respond better before and during a disaster. ^c | | | | | | | | | | | | | | |
| Availability and accessibility of natural hazard information and community engagement encourages risk awareness. ^a | | | | | | | | | | | | | | |

Housing: 2 Indicators

| Mobile Homes as A Percentage of Housing Units | | | | | | | | | | | | | | |
|--|-------|------|------|------|---|-----|------|-----|------|----------------------|-------|------|-------|--------|
| Measure | | | | | Data Source | | | | | | | | | |
| Percentage of housing units that are mobile homes | | | | | U.S. Census American Community Survey (ACS) 2017–2021 five-year estimates, Table DP04 | | | | | | | | | |
| National Average | | | | | Binning Methods | | | | | | | | | |
| 5.9% of housing units in the U.S. are mobile homes. | | | | | Census Tract: Fisher Jenks | | | | | County: Fisher Jenks | | | | |
| Data Geography | | | | | | | | | | | | | | |
| Data is available at the Census tract, county and Tribal levels. Puerto Rico is included. | | | | | | | | | | | | | | |
| Methodologies Using This Indicator | | | | | | | | | | | | | | |
| # of 14 | ANDRI | BRIC | CDRI | CRI2 | DROP | RCI | SoVI | SVI | TCRI | N-B | CCDRI | RCRI | CDRI2 | Fraser |
| 6 | X | X | | | X | | X | X | | | X | | | |
| Author Rationale for Including This Indicator | | | | | | | | | | | | | | |
| Higher numbers of mobile homes in a community are related to lower levels of resilience because of the lower-quality construction of these homes and lack of basements, which makes them particularly susceptible to damage from hazards. ^{b,g,m} | | | | | | | | | | | | | | |
| Mobile homes are frequently found outside of metropolitan areas that may not be readily accessible by interstate highways or public transportation. ^m | | | | | | | | | | | | | | |

| Owner-Occupied Housing | | | | | | | | | | | | | | |
|--|-------|------|------|------|------|-----|---|-----|------|-----|----------------------|------|-------|--------|
| Metric | | | | | | | Data Source | | | | | | | |
| Percentage of housing units that are owner-occupied | | | | | | | ACS 2017–2021 five-year estimates, Table DP04 | | | | | | | |
| National Average | | | | | | | Binning Methods | | | | | | | |
| 57.4% of housing units in the U.S. are owner-occupied. | | | | | | | Census Tract: Jenks Caspall | | | | County: Fisher Jenks | | | |
| Data Geography | | | | | | | | | | | | | | |
| Data is available at the Census tract, county and Tribal levels. Puerto Rico is included. | | | | | | | | | | | | | | |

| # of 14 | ANDRI | BRIC | CDRI | CRI2 | DROP | RCI | SoVI | SVI | TCRI | N-B | CCDRI | RCRI | CDRI2 | Fraser |
| 6 | X | X | X | | X | X | | | X | | | | | |
| Author Rationale for Including This Indicator | | | | | | | | | | | | | | |
| Home ownership is often included as a measure of a community’s economic strength and thus is a marker of community resilience. ^{b,d,g,n} | | | | | | | | | | | | | | |
| Home ownership is also used to reflect residents’ levels of place attachment to their communities. ^{d,j} | | | | | | | | | | | | | | |
| Low levels of home ownership can indicate a community with a faltering economy and a population with less long-term commitment to the community, which could hamper both individual and community mitigation actions to prepare for disaster as well as recovery efforts. ^{a,j} | | | | | | | | | | | | | | |

Healthcare: 3 Indicators

| Number of Hospitals | | | | | | | | | | | | | | |
|--|-------|------|------|------|--|-----|------|-----|------|--------------------------|-------|------|-------|--------|
| Metric | | | | | Data Source | | | | | | | | | |
| The number of hospitals per 10,000 people | | | | | U.S. Census Bureau, 2020 County Business Patterns, Table 00A1, NAICS code 622110 | | | | | | | | | |
| National Average | | | | | Binning Method | | | | | | | | | |
| There are .17 hospitals per 10,000 people in the U.S. | | | | | Census Tract: Fisher Jenks | | | | | County: Head Tail Breaks | | | | |
| Data Geography | | | | | | | | | | | | | | |
| Data is available at the county level. Puerto Rico is included. | | | | | | | | | | | | | | |
| Methodologies Using This Indicator | | | | | | | | | | | | | | |

| 9 | X | X | X | | X | | X | | X | | X | X | | X |
| Author Rationale for Including This Indicator | | | | | | | | | | | | | | |
| This measure represents essential community infrastructure, both because it represents the capacity of the healthcare system to support residents' overall health and to provide critical emergency medical care. ^{a,b,d,g,n} | | | | | | | | | | | | | | |
| Lack of this critical capacity negatively affects a community's ability to respond to and recover from disasters. ^d | | | | | | | | | | | | | | |

| Medical Professional Capacity | | | | | | | | | | | | | | |
|---|-------|------|------|------|------|-----|--|-----|------|-----|----------------------|------|-------|--------|
| Metric | | | | | | | Data Source | | | | | | | |
| The number of health-diagnosing and treating practitioners per 1,000 population | | | | | | | ACS 2017–2021 five-year estimates, Table S2401 | | | | | | | |
| National Average | | | | | | | Binning Methods | | | | | | | |
| There are 20.2 health diagnosing and treating practitioners per 1,000 population in the U.S. | | | | | | | Census Tract: Jenks Caspall | | | | County: Fisher Jenks | | | |
| Data Geography | | | | | | | | | | | | | | |
| Data is available at the county level. Puerto Rico is included. | | | | | | | | | | | | | | |
| Methodologies Using This Indicator | | | | | | | | | | | | | | |
| # of 14 | ANDRI | BRIC | CDRI | CRI2 | DROP | RCI | SoVI | SVI | TCRI | N-B | CCDRI | RCRI | CDRI2 | Fraser |
| 8 | X | X | X | X | X | | | | | | X | X | | X |
| Author Rationale for Including This Indicator | | | | | | | | | | | | | | |
| Availability of physicians is linked with the overall physical and mental health of community residents. ^{b,d,f,g} | | | | | | | | | | | | | | |
| Lack of access to physicians is related to lower levels of overall community resilience as indicated by low birthweight and premature mortality. ^f | | | | | | | | | | | | | | |
| Physicians are a critical emergency resource in the response to and recovery from a disaster. ^a | | | | | | | | | | | | | | |

| Population without Health Insurance | | | | | | | | | | | | | | |
|--|-------|------|------|------|---|-----|------|-----|------|----------------------|-------|------|-------|--------|
| Metric | | | | | Data Source | | | | | | | | | |
| Percentage of the population without health insurance | | | | | ACS 2017–2021 5-year estimates, Table S2701 | | | | | | | | | |
| National Average | | | | | Binning Methods | | | | | | | | | |
| 8.8% of the U.S. population does not have health insurance. | | | | | Census Tract: Jenks Caspall | | | | | County: Fisher Jenks | | | | |
| Data Geography | | | | | | | | | | | | | | |
| Data is available at the Census tract, county and tribal levels. Puerto Rico is included. | | | | | | | | | | | | | | |
| Methodologies Using This Indicator | | | | | | | | | | | | | | |
| # of 14 | ANDRI | BRIC | CDRI | CRI2 | DROP | RCI | SoVI | SVI | TCRI | N-B | CCDRI | RCRI | CDRI2 | Fraser |
| 7 | | X | X | | X | X | X | | | | X | | | X |
| Author Rationale for Including This Indicator | | | | | | | | | | | | | | |
| Health is a critical component of community well-being. An unhealthy population has more difficulty accessing community support or engaging in the process of building disaster resilience. ^{d,g} | | | | | | | | | | | | | | |
| Communities with more individuals covered by health insurance tend to have higher measures of physical and mental health. ^{b,g} | | | | | | | | | | | | | | |
| Health insurance coverage is one indication of individuals' capacity to effectively respond to and recover from a crisis, both mentally and physically. ^j | | | | | | | | | | | | | | |
| Communities with lower percentages of individuals with health insurance may have lower levels of resilience. ^g | | | | | | | | | | | | | | |

Economic: 6 Indicators

| Unemployed Labor Force | | | | | | | | | | | | | | |
|--|-------|------|------|------|---|-----|------|-----|------|----------------------|-------|------|-------|--------|
| Metric | | | | | Data Source | | | | | | | | | |
| Percentage of the civilian labor force age 16 and over who are unemployed | | | | | ACS 2017–2021 five-year estimates, Table DP03 | | | | | | | | | |
| National Average | | | | | Binning Methods | | | | | | | | | |
| 5.5% of the civilian labor force age 16 and over are unemployed. | | | | | Census Tract: Jenks Caspall | | | | | County: Fisher Jenks | | | | |
| Data Geography | | | | | | | | | | | | | | |
| Data is available at the Census tract, county and tribal levels. Puerto Rico is included. | | | | | | | | | | | | | | |
| Methodologies Using This Indicator | | | | | | | | | | | | | | |
| # of 14 | ANDRI | BRIC | CDRI | CRI2 | DROP | RCI | SoVI | SVI | TCRI | N-B | CCDRI | RCRI | CDRI2 | Fraser |
| 13 | X | X | X | X | X | | X | X | X | X | X | X | X | X |
| Author Rationale for Including This Indicator | | | | | | | | | | | | | | |
| High levels of employment contribute to a healthy community economy, which supports community resilience. ^{a,b,f,g,n} | | | | | | | | | | | | | | |
| Employment also provides residents with financial resources that contribute to their livelihoods. ^d | | | | | | | | | | | | | | |
| Unemployed persons do not have the employee benefit plans that provide income and health cost assistance in the event of injury or death. ^m | | | | | | | | | | | | | | |
| Counties with higher levels of unemployment may have fewer community resources to support residents' needs and a population that is both less prepared for a disaster and less able to cope with the aftermath. ⁿ | | | | | | | | | | | | | | |

| Income Inequality | | | | | | | | | | | | | | |
|---|-------|------|------|------|------|-----|---|-----|------|-----|----------------------|------|-------|--------|
| Metric | | | | | | | Data Source | | | | | | | |
| Gini Index of income distribution across a population; the closer to 1, the greater the income inequality. ⁷ | | | | | | | ACS 2017–2021 five-year estimates, Table B19083 | | | | | | | |
| National Average | | | | | | | Binning Method | | | | | | | |
| The average Gini Index in the U.S. is .48. | | | | | | | Census Tract: Jenks Caspall | | | | County: Fisher Jenks | | | |
| Data Geography | | | | | | | | | | | | | | |
| Data is available at the county and Tribal levels. Puerto Rico is included. | | | | | | | | | | | | | | |
| Methodologies Using This Indicator | | | | | | | | | | | | | | |
| # of 14 | ANDRI | BRIC | CDRI | CR12 | DROP | RCI | SoVI | SVI | TCRI | N-B | CCDRI | RCRI | CDRI2 | Fraser |
| 10 | | X | | X | X | X | | | | | X | | X | |
| Author Rationale for Including This Indicator | | | | | | | | | | | | | | |
| The economic environment is a major factor in a community’s resilience; and when income inequality is present, earnings tend to be distributed in a way that does not support broader community goals. ^{b,f,g} | | | | | | | | | | | | | | |
| A skewed distribution of economic resources may negatively affect the cohesiveness of the residents’ response to a disaster. ^j | | | | | | | | | | | | | | |

⁷ The Gini Index or coefficient uses a scale of 0–1 to measure the difference between the ideal distribution of income (perfect equality [0] where 50 percent of the population would receive 50 percent of the available income) and the actual distribution. The closer the number is to 1, the greater the income inequality.

| Median Household Income | | | | | | | | | | | | | | |
|--|-------|------|------|------|------|-----|--|-----|------|-----|----------------|------|-------|--------|
| Metric | | | | | | | Data Source | | | | | | | |
| Median household income | | | | | | | ACS 2017–2021 five-year estimates, Table S1903 | | | | | | | |
| National Average | | | | | | | Binning Methods | | | | | | | |
| The median household income in the U.S. is \$69,021. | | | | | | | Census Tract: Manual | | | | County: Manual | | | |
| Data Geography | | | | | | | | | | | | | | |
| Data is available at the Census tract, county and tribal levels. Puerto Rico is included. | | | | | | | | | | | | | | |
| Methodologies Using This Indicator | | | | | | | | | | | | | | |
| # of 14 | ANDRI | BRIC | CDRI | CRI2 | DROP | RCI | SoVI | SVI | TCRI | N-B | CCDRI | RCRI | CDRI2 | Fraser |
| 6 | X | | X | X | | | | | X | X | | | X | |
| Author Rationale for Including This Indicator | | | | | | | | | | | | | | |
| There is a strong relationship between individuals’ financial resources and their resilience to a disaster. ^{b,d} | | | | | | | | | | | | | | |
| Low-income households are at greater risk because they tend to live in lower-quality housing situated in higher risk areas, are less likely to have prepared for a disaster and have fewer resources to support recovery. ^d | | | | | | | | | | | | | | |
| The median household income of a community may also reflect its economic resilience and the community resources available to support recovery. ⁿ | | | | | | | | | | | | | | |

| Unemployed Women in the Labor Force | | | | | | | | | | | | | | |
|---|-------|--|------|------|------|-----|----------------------|-----|------|-----|-------|------|-------|--------|
| Metric | | Data Source | | | | | | | | | | | | |
| Percent of women in the civilian work force age 16 and over who are unemployed | | ACS 2017 – 2021 5-year estimates, Table DP03 | | | | | | | | | | | | |
| National Average | | Binning Method | | | | | | | | | | | | |
| 5.6% of women in the workforce age 16 and over are unemployed. | | Census Tract: Jenks Caspall | | | | | County: Fisher Jenks | | | | | | | |
| Data Geography | | | | | | | | | | | | | | |
| Data is available at the Census tract, county and Tribal levels. Puerto Rico is included. | | | | | | | | | | | | | | |
| Methodologies Using This Indicator | | | | | | | | | | | | | | |
| # of 14 | ANDRI | BRIC | CDRI | CRI2 | DROP | RCI | SoVI | SVI | TCRI | N-B | CCDRI | RCRI | CDRI2 | Fraser |
| 6 | | X | | | X | | X | | | X | | | X | X |
| Author Rationale for Including This Indicator | | | | | | | | | | | | | | |
| Communities enhance disaster resilience through nondiscriminatory wage policies, ensuring that all groups have fair access to resources. ^b | | | | | | | | | | | | | | |
| Economic stability at the community level, particularly the stability of livelihoods is an indicator of resilience. ^g | | | | | | | | | | | | | | |

| Population Below Poverty Level | | | | | | | | | | | | | | | |
|---|-------|------|------|------|------|-----|------|---|------|-----|-------|-----------------------|-------|--------|--|
| Metric | | | | | | | | Data Source | | | | | | | |
| Population below U.S. Census poverty level in past 12 months ⁸ | | | | | | | | ACS 2017–2021 5-year estimates, Table S1701 | | | | | | | |
| National Average | | | | | | | | Binning Method | | | | | | | |
| 12.6% of the U.S. population lives below the poverty level. | | | | | | | | Census Tract: Jenks Caspall | | | | County: Jenks Caspall | | | |
| Data Geography | | | | | | | | | | | | | | | |
| Data is available at the Census tract, county and Tribal levels. Puerto Rico is included. | | | | | | | | | | | | | | | |
| Methodologies Using This Methodology | | | | | | | | | | | | | | | |

| 10 | X | X | X | X | X | X | | | | | X | X | X | X |
| Author Rationale for Including This Indicator | | | | | | | | | | | | | | |
| An active voting population is an indicator of having a community that is engaged, enhancing overall community resilience. ^c | | | | | | | | | | | | | | |
| Participation in elections increases social and political trust. ^d | | | | | | | | | | | | | | |
| Civic engagement, including voting, is an important form of bridging social capital. ^h | | | | | | | | | | | | | | |

9 Inactive voter is defined by each State. For more information see:

| Author Rationale for Including This Indicator | | | | | | | | | | | | | | |
| This measure indicates the level of community engagement by looking at the level of civic infrastructure through which residents support their communities. ^{b,f,g,j} | | | | | | | | | | | | | | |
| Participation in civic organizations provides a mechanism for residents to invest in and take from their community and also increases networking and trusted relationships. ^{d,j} | | | | | | | | | | | | | | |
| The availability of formal social networks can be critical during response and recovery to quickly mobilize resources and disseminate information. ^{b,d,f} | | | | | | | | | | | | | | |
| Residents who participate in local civic organizations can use them for help and provide mutually beneficial cooperation during a crisis. ^{b,f} | | | | | | | | | | | | | | |

| Population without Religious Affiliation | | | | | | | | | | | | | | |
|--|-------|------|------|------|------|-----|--|-----|------|-----|-----------------------|------|-------|--------|
| Metric | | | | | | | Data Source | | | | | | | |
| Percentage of the population that do not affiliate with a religion | | | | | | | Association of Statisticians of American Religious Bodies. 2020 U.S. Religion Census. http://www.usreligioncensus.org/index.php | | | | | | | |
| National Average | | | | | | | Binning Method | | | | | | | |
| 48.8 % of the U.S. population are not religious adherents. | | | | | | | Census Tract: Jenks Caspall | | | | County: Jenks Caspall | | | |

| Author Rationale for Including This Indicator | | | | | | | | | | | | | | |
| Affiliation with a religious organization or civic organization can be used as a proxy measure for social connectedness, and how much a community may be able to rely on the good will of other local citizens, leading to reciprocity and mutually beneficial cooperation. ^{b,f,g} | | | | | | | | | | | | | | |
| Religious adherents can access additional support beyond their family and neighbors. Religious organizations are often organized to actively provide physical and social support to their congregations and communities during times of individual and community crisis. ^{b,d,f} | | | | | | | | | | | | | | |

| Population Change | | | | | | | | | | | | | | |
|---|-------|------|------|------|------|-----|---|-----|------|-----|----------------------------|------|-------|--------|
| Metric | | | | | | | Data Source | | | | | | | |
| Net change in population from people moving in or out of the county relative to the U.S. mean. | | | | | | | U.S. Census Bureau, Population Division. Table: Cumulative Estimate of the Components of Resident Population Change (PEPTCOMP): 2017–2021 | | | | | | | |

| 6 | X | X | | X | | X | | | | X | X | | | |
| Author Rationale for Including This Indicator | | | | | | | | | | | | | | |
| Communities where large numbers of residents have lived for extended periods are likely to have strong place attachment, be invested in the well-being of the community before a disaster and willing to respond to revitalize a community after a disaster. ^{b,j} | | | | | | | | | | | | | | |
| Familiarity can help individuals navigate a community during an acute crisis, as well as know how to access services after the crisis has passed. ^j | | | | | | | | | | | | | | |
| A rapid influx of new residents may result in lower levels of attachment to the community, less familiarity with local hazards and how to prepare for them and fewer community connections that can provide support during a crisis. ^{b,f,j} | | | | | | | | | | | | | | |
| A reduction in population will reduce local tax income and community resources to respond to a disaster. ^b | | | | | | | | | | | | | | |

Appendix D: CRCI Correlation Matrix

The research team conducted a correlation analysis to measure and describe the strength and direction of the relationships among the 22 commonly used community resilience indicators. Correlation analysis shows how individual indicators may be related to each other. Understanding these correlations will help communities design resilience strategies that take these relationships into account.

The Pearson Correlation Coefficient¹² is a numerical measure of linear correlation from -1 to 1 .

- A coefficient closer to 1 indicates a positive correlation (variable A increases as variable B increases).
- A coefficient of 0 indicates no correlation.
- A coefficient closer to -1 indicates a negative correlation (variable A increases as variable B decreases).

As jurisdictions consider strategies to address those indicators that reveal challenges to resilience, they should consider relationships between indicators signifying populations that may face multiple challenges. For example, campaigns focusing on individuals that are unemployed should also consider that they are more likely to be single-parent households, have difficulty speaking English, lack a high school diploma and be without access to a vehicle.

Table 1 summarizes some highlights of the county correlation analysis.

Table 2: Highlighted County Correlation Relationships

| Indicator | Positively Correlates With | Negatively Correlates With |
|----------------------------|---|--|
| Age (adults over 65) | <ul style="list-style-type: none"> ▪ No smartphone (r = 0.45) | <ul style="list-style-type: none"> ▪ Limited English Speaking (r = -0.26) ▪ Household Income (r = -0.26) |
| Low Educational Attainment | <ul style="list-style-type: none"> ▪ Poverty (r = 0.62) ▪ No health insurance (r = 0.46) | <ul style="list-style-type: none"> ▪ Household Income (r = -0.56) ▪ Medical Professional Capacity (r = -0.45) (access to healthcare) |
| Disability | <ul style="list-style-type: none"> ▪ No smartphone (r = 0.53) ▪ Presence of mobile homes (r = 0.45) ▪ Poverty (r = 0.46) | <ul style="list-style-type: none"> ▪ Household Income (r = -0.64) ▪ Medical Professional Capacity (r = -0.32) (access to healthcare) |
