

**Incident Management Situation Report  
Friday, February 24, 2023 – 0730 MDT  
National Preparedness Level 1**

**National Fire Activity (February 17, 2023 – February 23, 2023):**

<b>Fire Activity and Teams Assigned</b>	<b>Total</b>
Initial attack activity:	Light (486)
New large incidents:	4
Large fires contained:	2
Uncontained large fires: **	2
Area Command teams committed:	0
NIMOs committed:	0
Type 1 IMTs committed:	0
Type 2 IMTs committed:	0
<a href="#">Complex IMTs</a> committed:	0

Nationally, there are zero fires being managed under a strategy other than full suppression.

\*\*Uncontained large fires only include fires being managed under a full suppression strategy.

## **Predictive Services Discussion:**

Widespread precipitation will spread across the West through much of next week during multiple storm passages, with below normal temperatures and low snow levels. Heavy precipitation is expected on the West Coast, especially in the Sierra and Peninsular and Transverse Ranges of southern California. With troughing in the West and downslope flow on the High Plains, west-southwest winds will strengthen amid low relative humidity of 8-25% and lead to elevated to critical fire weather conditions across portions of the southern Plains, especially the southern High Plains this weekend into mid-next week. Elevated conditions are also likely to spread into central and possibly south Texas at times.

Above normal temperatures are expected across much of the Southeast, Mid-Atlantic, and into the Mid-Mississippi and Ohio Valleys, with little to no rain likely along the Gulf and southeast Atlantic Coasts. The Florida Peninsula is likely to have minimum relative humidity below 40% daily, including relative humidity below 25% and breezy post-frontal winds at times.

Another round of severe weather is likely on the southern Plains Sunday, with widespread precipitation from the Lower Missouri and Mid-Mississippi Valleys through the Midwest and Great Lakes into the Ohio Valley and Northeast next week. Heavy snowfall is possible on the northern fringe of the precipitation from the central Plains into the Great Lakes. However, much of the High Plains and northern Plains are likely to receive little to no precipitation.
