### Technical Committee:

OASIS Biometric Services (BIOSERV) TC

### Chair:

Kevin Mangold ([kevin.mangold@nist.gov](mailto:kevin.mangold@nist.gov)), NIST

### Editors:

Kevin Mangold ([kevin.mangold@nist.gov](mailto:kevin.mangold@nist.gov)), NIST  
Kayee Hanaoka ([kayee@nist.gov](mailto:kayee@nist.gov)), NIST

### Additional artifacts:

This prose specification is one component of a Work Product that also includes:

- XML schema: <http://docs.oasis-open.org/bioserv/WSBD/v1.0/cs01/schemas/wsbd-v1.0.xsd>

### Related work:

This specification replaces or supersedes:

- *Specification for WS-Biometric Devices (WS-BD) Version 1.*  
<http://www.nist.gov/itl/iad/ig/upload/NIST-SP-500-288-v1.pdf>
- *WS-Biometric Devices Version 1.0.* Edited by Kevin Mangold and Ross J. Micheals. Latest version: <http://docs.oasis-open.org/biometrics/WS-BD/v1.0/WS-BD-v1.0.html>.

### Declared XML namespace:

- <http://docs.oasis-open.org/bioserv/ns/wsbd-1.0>

### Abstract:

WS-Biometric Devices is a protocol for the command and control of biometric sensors using the same protocols that underlie the web.

### Status:

This document was last revised or approved by the OASIS Biometric Services (BIOSERV) TC on the above date. The level of approval is also listed above. Check the “Latest version” location noted above for possible later revisions of this document. Any other numbered Versions and

other technical work produced by the Technical Committee (TC) are listed at [https://www.oasis-open.org/committees/tc\\_home.php?wg\\_abbrev=bioserv#technical](https://www.oasis-open.org/committees/tc_home.php?wg_abbrev=bioserv#technical).

TC members should send comments on this specification to the TC's email list. Others should send comments to the TC's public comment list, after subscribing to it by following the instructions at the "Send A Comment" button on the TC's web page at <https://www.oasis-open.org/committees/bioserv/>.

This Committee Specification is provided under the **RAND** Mode of the **OASIS IPR Policy**, the mode chosen when the Technical Committee was established. For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the TC's web page (<https://www.oasis-open.org/committees/bioserv/ipr.php>).

Note that any machine-readable content (**Computer Language Definitions**) declared Normative for this Work Product is provided in separate plain text files. In the event of a discrepancy between any such plain text file and display content in the Work Product's prose narrative document(s), the content in the separate plain text file prevails.

**Citation format:**

When referencing this specification the following citation format should be used:

**[WSBD-v1.0]**

*WS-Biometric Devices Version 1.0*. Edited by Kevin Mangold and Kayee Hanaoka. 11 July 2017. OASIS Committee Specification 01. <http://docs.oasis-open.org/bioserv/WSBD/v1.0/cs01/WSBD-v1.0-cs01.html>. Latest version: <http://docs.oasis-open.org/bioserv/WSBD/v1.0/WSBD-v1.0.html>.

## Notices

Copyright © OASIS Open 2017. All Rights Reserved.

All capitalized terms in the following text have the meanings assigned to them in the OASIS Intellectual Property Rights Policy (the "OASIS IPR Policy"). The full [Policy](#) may be found at the OASIS website.

This document and translations of it may be copied and furnished to others, and derivative works that comment on or otherwise explain it or assist in its implementation may be prepared, copied, published, and distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice and this section are included on all such copies and derivative works. However, this document itself may not be modified in any way, including by removing the copyright notice or references to OASIS, except as needed for the purpose of developing any document or deliverable produced by an OASIS Technical Committee (in which case the rules applicable to copyrights, as set forth in the OASIS IPR Policy, must be followed) or as required to translate it into languages other than English.

The limited permissions granted above are perpetual and will not be revoked by OASIS or its successors or assigns.

This document and the information contained herein is provided on an "AS IS" basis and OASIS DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY OWNERSHIP RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

OASIS requests that any OASIS Party or any other party that believes it has patent claims that would necessarily be infringed by implementations of this OASIS Committee Specification or OASIS Standard, to notify OASIS TC Administrator and provide an indication of its willingness to grant patent licenses to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification.

OASIS invites any party to contact the OASIS TC Administrator if it is aware of a claim of ownership of any patent claims that would necessarily be infringed by implementations of this specification by a patent holder that is not willing to provide a license to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification. OASIS may include such claims on its website, but disclaims any obligation to do so.

OASIS takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on OASIS' procedures with respect to rights in any document or deliverable produced by an OASIS Technical Committee can be found on the OASIS website. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this OASIS Committee Specification or OASIS Standard, can be obtained from the OASIS TC Administrator. OASIS makes no representation that any information or list of intellectual property rights will at any time be complete, or that any claims in such list are, in fact, Essential Claims.

The name "OASIS" is a trademark of [OASIS](#), the owner and developer of this specification, and should be used only to refer to the organization and its official outputs. OASIS welcomes reference to, and implementation and use of, specifications, while reserving the right to enforce its marks against misleading uses. Please see <https://www.oasis-open.org/policies-guidelines/trademark> for above guidance.

# 1 Introduction

*The web services framework, has, in essence, begun to create a standard software “communications bus” in support of service-oriented architecture. Applications and services can “plug in” to the bus and begin communicating using standards tools. The emergence of this “bus” has profound implications for identity exchange.*

Jamie Lewis, Burton Group, February 2005  
Forward to *Digital Identity* by Phillip J. Windley

As noted by Jamie Lewis, the emergence of web services as a common communications bus has “profound implications.” The next generation of biometric devices will not only need to be intelligent, secure, tamper-proof, and spoof resistant, but first, they will need to be *interoperable*.

These envisioned devices will require a communications protocol that is secure, globally connected, and free from requirements on operating systems, device drivers, form factors, and low-level communications protocols. WS-Biometric Devices is a protocol designed in the interest of furthering this goal, with a specific focus on the single process shared by all biometric systems—*acquisition*.

## 1.0 IPR Policy

This Committee Specification is provided under the [RAND](#) Mode of the [OASIS IPR Policy](#), the mode chosen when the Technical Committee was established.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the TC’s web page (<https://www.oasis-open.org/committees/bioserv/ipr.php>).

## 1.1 Terminology

This section contains terms and definitions used throughout this document.

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in [RFC2119].

### **biometric capture device**

a system component capable of capturing biometric data in digital form

### **client**

a logical endpoint that originates operation requests

### **HTTP**

Hypertext Transfer Protocol. Unless specified, the term HTTP refers to either HTTP as defined in [RFC2616] or HTTPS as defined in [RFC2660].

### **ISO**

International Organization for Standardization

### **modality**

a distinct biometric category or type of biometric—typically a short, high-level description of a human feature or behavioral characteristic (e.g., “fingerprint,” “iris,” “face,” or “gait”)

### **payload**

41 the content of an HTTP request or response. An **input payload** refers to the XML content of an  
42 HTTP *request*. An **output payload** refers to the XML content of an HTTP *response*.

43 **payload parameter**  
44 an operation parameter that is passed to a service within an input payload

45 **profile**  
46 a list of assertions that a service **MUST** support

47 **REST**  
48 Representational State Transfer

49 **RESTful**  
50 a web service which employs REST techniques

51 **sensor** or **biometric sensor**  
52 a single biometric capture device or a logical collection of biometric capture devices

53 **SOAP**  
54 Simple Object Access Protocol

55 **submodality**  
56 a distinct category or subtype within a biometric modality

57 **target sensor** or **target biometric sensor**  
58 the biometric sensor made available by a particular service

59 **URL parameter**  
60 a parameter passed to a web service by embedding it in the URL

61 **Web service** or **service** or **WS**  
62 a software system designed to support interoperable machine-to-machine interaction over a  
63 network [WSGloss]

64 **XML**  
65 Extensible Markup Language [XML]

## 67 1.3 Document Conventions

### 68 1.3.1 Quotations

69 If the inclusion of a period within a quotation might lead to ambiguity as to whether or not the period  
70 should be included in the quoted material, the period will be placed outside the trailing quotation mark.  
71 For example, a sentence that ends in a quotation would have the trailing period “inside the quotation, like  
72 this quotation punctuated like this.” However, a sentence that ends in a URL would have the trailing  
73 period outside the quotation mark, such as “http://example.com”.

### 74 1.3.2 Machine-Readable Code

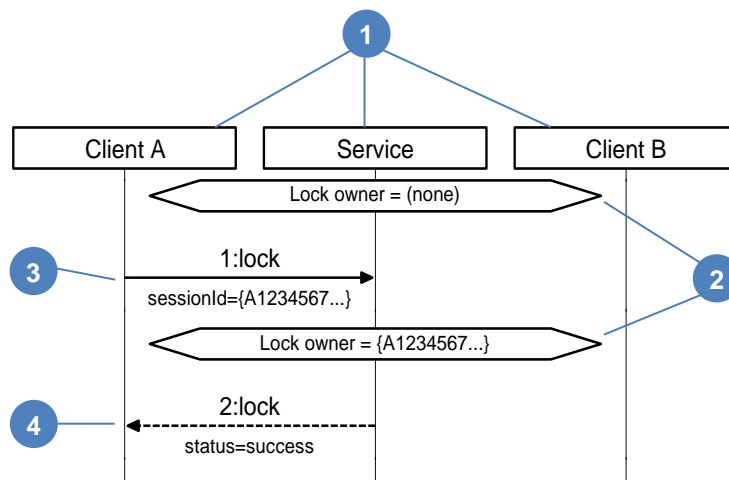

75 With the exception of some reference URLs, machine-readable information will typically be depicted with  
76 a mono-spaced font, such as this.

### 77 1.3.3 Sequence Diagrams

78 Throughout this document, sequence diagrams are used to help explain various scenarios. These  
79 diagrams are informative simplifications and are intended to help explain core specification concepts.  
80 Operations are depicted in a functional, remote procedure call style.

81 The following is an annotated sequence diagram that shows how an example sequence of HTTP request-  
82 responses is typically illustrated. The level of abstraction presented in the diagrams, and the details that  
83 are shown (or not shown) will vary according to the particular information being illustrated. First time  
84 readers may wish to skip this section and return to it as needed.

85  
86  
87

88

89 **Figure 1.** Example of a sequence diagram used in this document.

90

- 91 1. Each actor in the sequence diagram (i.e., a client or a server) has a “swimlane” that chronicles  
92 their interactions over time. Communication among the actors is depicted with arrows. In this  
93 diagram, there are three actors: “Client A,” a WS-BD “Service,” and “Client B.”
- 94 2. State information notable to the example is depicted in an elongated diamond shape within the  
95 swimlane of the relevant actor. In this example, it is significant that the initial “lock owner” for the  
96 “Service” actor is “(none)” and that the “lock owner” changes to “{A1234567...}” after a  
97 communication from Client A.
- 98 3. Unless otherwise noted, a solid arrow represents the request (initiation) of an HTTP request; the  
99 opening of an HTTP socket connection and the transfer of information from a source to its  
100  
101

102 destination. The arrow begins on the swimlane of the originator and ends on the swimlane of the  
103 destination. The order of the request and the operation name (§6.3 through §6.21) are shown  
104 above the arrow. URL and/or payload parameters significant to the example are shown below the  
105 arrow. In this example, the first communication occurs when Client A opens a connection to the  
106 Service, initiating a “lock” request, where the “sessionId” parameter is “{A1234567...}.”

107  
108 4. Unless otherwise noted, a dotted arrow represents the response (completion) of a particular  
109 HTTP request; the *closing* of an HTTP socket connection and the transfer of information back  
110 from the destination to the source. The arrow starts on the originating request's *destination* and  
111 ends on the swimlane of actor that *originated* the request. The order of the request, and the name  
112 of the operation that being replied to is shown above the arrow. Significant data “returned” to the  
113 source is shown below the arrow in the form of a Result (§3.13). Notice that the source,  
114 destination, and operation name provide the means to match the response corresponds to a  
115 particular request—there is no other visual indicator. In this example, the second communication  
116 is the response to the “lock” request, where the service returns a “status” of “success.”

117  
118 In general, “{A1234567...}” and “{B890B123...}” are used to represent session ids (§2.4.3, §3.14.3, §6.3);  
119 “{C1D10123...}” and “{D2E21234...}” represent capture ids (§3.14.3, §6.12.4.14).

### 120 1.3.4 Examples

121 Unless specified otherwise, all examples and sample code are provided for illustrative purposes and are  
122 informative.

---

## 123 2 Design Concepts and Architecture

124 This section describes the major design concepts and overall architecture of WS-BD. The main purpose  
125 of a WS-BD service is to expose a target biometric sensor to clients via web services.

126 This specification provides a framework for deploying and invoking core synchronous operations via  
127 lightweight web service protocols for the command and control of biometric sensors. The design of this  
128 specification is influenced heavily by the REST architecture; deviations and tradeoffs were made to  
129 accommodate the inherent mismatches between the REST design goals and the limitations of devices  
130 that are (typically) oriented for a single-user.

### 131 2.1 Interoperability

132 ISO/IEC 2382-1 (1993) defines *interoperability* as “the capability to communicate, execute programs, or  
133 transfer data among various functional units in a manner that requires the user to have little to no  
134 knowledge of the unique characteristics of those units.”

135 Conformance to a standard does not necessarily guarantee interoperability. An example is conformance  
136 to an HTML specification. An HTML page may be conformant to the HTML 4.0 specification, but it is not  
137 interoperable between web browsers. Each browser has its own interpretation of how the content should  
138 be displayed. To overcome this, web developers add a note suggesting which web browsers are  
139 compatible for viewing. Interoperable web pages need to have the same visual outcome independent of  
140 which browser is used.

141 A major design goal of WS-BD is to *maximize* interoperability, by *minimizing* the required “knowledge of  
142 the unique characteristics” of a component that supports WS-BD. The authors recognize that  
143 conformance to this specification alone cannot guarantee interoperability; although a minimum degree of  
144 functionality is implied. Sensor *profiles* and accompanying conformance tests will need to be developed to  
145 provide better guarantees of interoperability, and will be released in the future.

### 146 2.2 Architectural Components

147 Before discussing the envisioned use of WS-BD, it is useful to distinguish between the various  
148 components that comprise a WS-BD implementation. These are *logical* components that may or may not  
149 correspond to particular *physical* boundaries. This distinction becomes vital in understanding WS-BD's  
150 operational models.

#### 151 2.2.1 Client

152 A *client* is any software component that originates requests for biometric acquisition. Note that a client  
153 might be one of many hosted in a parent (logical or physical) component, and that a client might send  
154 requests to a variety of destinations.

This icon is used to depict an arbitrary WS-BD client. A personal digital assistant (PDA) is used to serve as a reminder that a client might be hosted on a non-traditional computer.

155

#### 156 2.2.2 Sensor

157 A biometric *sensor* is any component that is capable of acquiring a digital biometric sample. Most sensor  
158 components are hosted within a dedicated hardware component, but this is not always true. For example,  
159 a keyboard is a general input device, but might also be used for a keystroke dynamics biometric.

This icon is used to depict a biometric sensor. The icon has a vague similarity to a fingerprint scanner, but should be thought of as an arbitrary biometric sensor.

160 The term “sensor” is used in this document in a singular sense, but may in fact be referring to multiple  
161 biometric capture devices. Because the term “sensor” may have different interpretations, practitioners are  
162 encouraged to detail the physical and logical boundaries that define a “sensor” for their given context.

### 163 2.2.3 Sensor Service

164 The *sensor service* is the “middleware” software component that exposes a biometric sensor to a client  
165 through web services. The sensor service adapts HTTP request-response operations to biometric sensor  
166 command & control.

This icon is used to depict a sensor service. The icon is abstract and has no meaningful form, just as a sensor service is a piece of software that has no physical form.

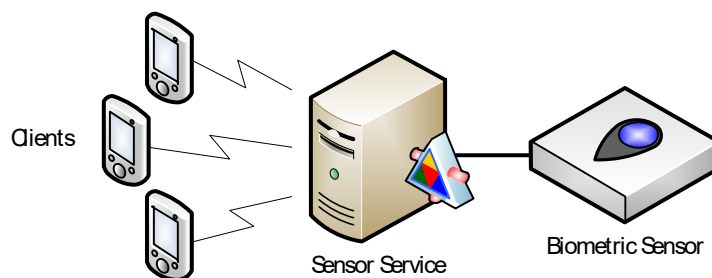

## 167 2.3 Intended Use

168 Each implementation of WS-BD will be realized via a mapping of logical to physical components. A  
169 distinguishing characteristic of an implementation will be the physical location of the sensor service  
170 component. WS-BD is designed to support two scenarios:

- 171 1. **Physically separated.** The sensor service and biometric sensor are hosted by different physical  
172 components. A *physically separated service* is one where there is both a physical and logical  
173 separation between the biometric sensor and the service that provides access to it.
- 174 2. **Physically integrated.** The sensor service and biometric sensor are hosted within the same  
175 physical component. A *physically integrated service* is one where the biometric sensor and the  
176 service that provides access to it reside within the same physical component.

177 Figure 2 depicts a physically separated service. In this scenario, a biometric sensor is tethered to a  
178 personal computer, workstation, or server. The web service, hosted on the computer, listens for  
179 communication requests from clients. An example of such an implementation would be a USB fingerprint  
180 scanner attached to a personal computer. A lightweight web service, running on that computer could  
181 listen to requests from local (or remote) clients—translating WS-BD requests to and from biometric sensor  
182 commands.

183

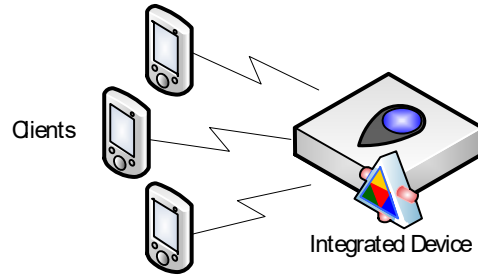

184

185 **Figure 2.** A physically separated WS-Biometric Devices (WS-BD) implementation.

186 Figure 3 depicts a physically integrated service. In this scenario, a single hardware device has an  
187 embedded biometric sensor, as well as a web service. Analogous (but not identical) functionality is seen  
188 in many network printers; it is possible to point a web browser to a local network address, and obtain a  
189 web page that displays information about the state of the printer, such as toner and paper levels (WS-BD  
190 enabled devices do not provide web pages to a browser). Clients make requests directly to the integrated

191 device; and a web service running within an embedded system translates the WS-BD requests to and  
192 from biometric sensor commands.

193  
194 **Figure 3.** A physically integrated WS-Biometric Devices (WS-BD) implementation.

195 The “separated” versus “integrated” distinction is a simplification with a potential for ambiguity. For  
196 example, one might imagine putting a hardware shell around a USB fingerprint sensor connected to a  
197 small form-factor computer. Inside the shell, the sensor service and sensor are on different physical  
198 components. Outside the shell, the sensor service and sensor appear integrated. Logical encapsulations,  
199 i.e., layers of abstraction, can facilitate analogous “hiding”. The definition of what constitutes the “same”  
200 physical component depends on the particular implementation and the intended level of abstraction.  
201 Regardless, it is a useful distinction in that it illustrates the flexibility afforded by leveraging interoperable  
202 communications protocols. As suggested in §2.2.2 practitioners *may* need to clearly define appropriate  
203 logical and physical boundaries for their own context of use.

## 204 2.4 General Service Behavior

205 The following section describes the general behavior of WS-BD clients and services.

### 206 2.4.1 Security Model

207 In this document, it is assumed that if a client is able to establish a connection with the sensor service,  
208 then the client is fully authorized to use the service. This implies that all successfully connected clients  
209 have equivalent access to the same service. Clients might be required to connect through various HTTP  
210 protocols, such as HTTPS with client-side certificates, or a more sophisticated protocol such as Open Id  
211 (<http://openid.net/>) and/or OAuth.

212 Specific security measures are out of scope of this specification, but should be carefully considered when  
213 implementing a WS-BD service. Some recommended solutions to general scenarios are outlined  
214 Appendix D.

### 215 2.4.2 HTTP Request-Response Usage

216 Most biometrics devices are inherently *single user*—i.e., they are designed to sample the biometrics from  
217 a single user at a given time. Web services, on the other hand, are intended for *stateless* and *multiuser*  
218 use. A biometric device exposed via web services *must* therefore provide a mechanism to reconcile these  
219 competing viewpoints.

220 Notwithstanding the native limits of the underlying web server, WS-BD services *must* be capable of  
221 handling multiple, concurrent requests. Services **MUST** respond to requests for operations that do not  
222 require exclusive control of the biometric sensor and **MUST** do so without waiting until the biometric  
223 sensor is in a particular state.

224 Because there is no well-accepted mechanism for providing asynchronous notification via REST, each  
225 individual operation **MUST** block until completion. That is, the web server does not reply to an individual  
226 HTTP request until the operation that is triggered by that request is finished.

227 Individual clients are not expected to poll—rather they make a single HTTP request and block for the  
228 corresponding result. Because of this, it is expected that a client would perform WS-BD operations on an  
229 independent thread, so not to interfere with the general responsiveness of the client application. WS-BD  
230 clients therefore **MUST** be configured in such a manner such that individual HTTP operations have  
231 timeouts that are compatible with a particular implementation.

232 WS-BD operations may take longer than typical REST services. Consequently, there is a clear need to  
233 differentiate between service level errors and HTTP communication errors. WS-BD services MUST pass-  
234 through the status codes underlying a particular request. In other words, services MUST NOT use (or  
235 otherwise ‘piggyback’) HTTP status codes to indicate failures that occur within the service. If a service  
236 successfully receives a well-formed request, then the service MUST return the HTTP status code 200  
237 indicating such. Failures are described within the contents of the XML data returned to the client for any  
238 given operation. The exception to this is when the service receives a poorly-formed request (i.e., the XML  
239 payload is not valid), then the service *may* return the HTTP status code 400, indicating a bad request.

240 This is deliberately different from REST services that override HTTP status codes to provide service-  
241 specific error messages. Avoiding the overloading of status codes is a pattern that facilitates the  
242 debugging and troubleshooting of communication versus client & service failures.

243 **DESIGN NOTE:** Overriding HTTP status codes is just one example of the rich set of features afforded  
244 by HTTP; content negotiation, entity tags (e-tags), and preconditions are other features that could be  
245 leveraged instead of “recreated” (to some degree) within this document. However, the authors  
246 avoided the use of these advanced HTTP features for several reasons:

- 247 • To reduce the overall complexity required for implementation.
- 248 • To ease the requirements on clients and servers (particularly since the HTTP capabilities on  
249 embedded systems may be limited).
- 250 • To avoid dependencies on any HTTP feature that is not required (such as entity tags).

251 In summary, the goal for this initial version of the specification is to provide common functionality  
252 across the broadest set of platforms. As this standard evolves, the authors will continue to evaluate  
253 the integration of more advanced HTTP features, as well as welcome feedback on their use from  
254 users and/or implementers of the specification.

### 255 2.4.3 Client Identity

256 Before discussing how WS-BD balances single-user vs. multi-user needs, it is necessary to understand  
257 the WS-BD model for how an individual client can easily and consistently identify itself to a service.

258 HTTP is, by design, a *stateless* protocol. Therefore, any persistence about the originator of a sequence of  
259 requests MUST be built in artificially to the layer of abstraction above HTTP itself. This is accomplished in  
260 WS-BD via a *session*—a collection of operations that originate from the same logical endpoint. To initiate  
261 a session, a client performs a *registration* operation and obtains a *session identifier* (or “session id”).  
262 During subsequent operations, a client uses this identifier as a parameter to uniquely identify itself to a  
263 server. When the client is finished, it is expected to close a session with an *unregistration* operation. To  
264 conserve resources, services *may* automatically unregister clients that do not explicitly unregister after a  
265 period of inactivity (see §6.4.2.1).

266 This use of a session id directly implies that the particular sequences that constitute a session are entirely  
267 the responsibility of the *client*. A client might opt to create a single session for its entire lifetime, or, might  
268 open (and close) a session for a limited sequence of operations. WS-BD supports both scenarios.

269 It is possible, but discouraged, to implement a client with multiple sessions with the same service  
270 simultaneously. For simplicity, and unless otherwise stated, this specification is written in a manner that  
271 assumes that a single client maintains a single session id. (This can be assumed without loss of  
272 generality, since a client with multiple sessions to a service could be decomposed into “sub-clients”—one  
273 sub-client per session id.)

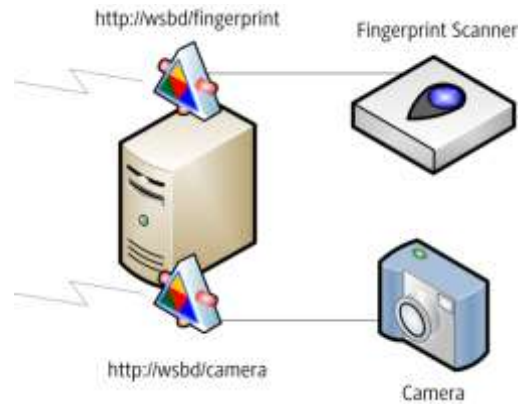

274 Just as a client might maintain multiple session ids, a single session id might be shared among a  
275 collection of clients. By sharing the session id, a biometric sensor may then be put in a particular state by  
276 one client, and then handed-off to another client. This specification does not provide guidance on how to  
277 perform multi-client collaboration. However, session id sharing is certainly permitted, and a deliberate  
278 artifact of the convention of using the session id as the client identifier. Likewise, many-to-many  
279 relationships (i.e., multiple session ids being shared among multiple clients) are also possible, but  
280 SHOULD be avoided.

281 **2.4.4 Sensor Identity**

282 In general, implementers SHOULD map each target biometric sensor to a single endpoint (URI).  
283 However, just as it is possible for a client to communicate with multiple services, a host might be  
284 responsible for controlling multiple target biometric sensors.

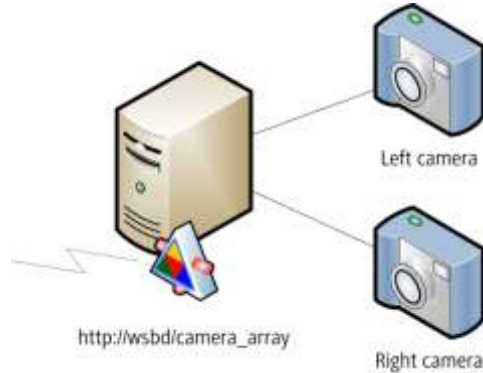

285 Independent sensors SHOULD be exposed via different URIs.

286 **EXAMPLE:** Figure 4 shows a physically separate implementation where a single host machine  
287 controls two biometric sensors—one fingerprint scanner and one digital camera. The devices act  
288 independently and are therefore exposed via two different services—one at the URL  
289 `http://wsbd/fingerprint` and one at `http://wsbd/camera`.

290  
291 **Figure 4.** Independent sensors controlled by separate services

292 A service that controls multiple biometric devices simultaneously (e.g., an array of cameras with  
293 synchronized capture) SHOULD be exposed via the same endpoint.

294  
295 **Figure 5.** A sensor array controlled by a single service

296 **EXAMPLE:** Figure 5 shows a physically separate implementation where a single host machine  
297 controls a pair of cameras used for stereo vision. The cameras act together as a single logical  
298 sensor and are both exposed via the same service, `http://wsbd/camera_array`.

299 **2.4.5 Locking**

300 WS-BD uses a *lock* to satisfy two complementary requirements:

- 301 1. A service MUST have exclusive, sovereign control over biometric sensor hardware to perform a  
302 particular *sensor operation* such as initialization, configuration, or capture.
- 303 2. A client needs to perform an uninterrupted sequence of sensor operations.

304 Each WS-BD service exposes a *single* lock (one per service) that controls access to the sensor. Clients  
305 obtain the lock in order to perform a sequence of operations that SHOULD NOT be interrupted. Obtaining  
306 the lock is an indication to the server (and indirectly to peer clients) that (1) a series of sensor operations  
307 is about to be initiated and (2) that server *may* assume sovereign control of the biometric sensor.

308 A client releases the lock upon completion of its sequence of tasks. This indicates to the server (and  
309 indirectly to peer clients) that the uninterruptable sequence of operations is finished. A client might obtain  
310 and release the lock many times within the same session or a client might open and close a session for  
311 each pair of lock/unlock operations. This decision is entirely dependent on a particular client.

312 The statement that a client might “own” or “hold” a lock is a convenient simplification that makes it easier  
313 to understand the client-server interaction. In reality, each sensor service maintains a unique global  
314 variable that contains a session id. The originator of that session id can be thought of as the client that  
315 “holds” the lock to the service. Clients are expected to release the lock after completing their required  
316 sensor operations, but there is lock *stealing*—a mechanism for forcefully releasing locks. This feature is  
317 necessary to ensure that one client cannot hold a lock indefinitely, denying its peers access to the  
318 biometric sensor.

319 As stated previously (see §2.4.3), it is implied that all successfully connected clients enjoy the same  
320 access privileges. Each client is treated the same and are expected to work cooperatively with each  
321 other. This is critically important, because it is this implied equivalence of “trust” that affords a lock  
322 *stealing* operation.

323 **DESIGN NOTE:** In the early development states of this specification, the authors considered having a  
324 single, atomic sensor operation that performed initialization, configuration *and* capture. This would avoid  
325 the need for locks entirely, since a client could then be ensured (if successful), the desired operation  
326 completed as requested. However, given the high degree of variability of sensor operations across  
327 different sensors and modalities, the explicit locking was selected so that clients could have a higher  
328 degree of control over a service and a more reliable way to predict timing. Regardless of the enforcement  
329 mechanism, it is undesirable if once a “well-behaved” client started an operation and a “rogue” client  
330 changed the internal state of the sensor midstream.

### 331 2.4.5.1 Pending Operations

332 Changing the state of the lock MUST have no effect on pending (i.e., currently running) sensor  
333 operations. That is, a client *may* unlock, steal, or even re-obtain the service lock even if the target  
334 biometric sensor is busy. When lock ownership is transferred during a sensor operation, overlapping  
335 sensor operations are prevented by sensor operations returning `sensorBusy`.

### 336 2.4.6 Operations Summary

337 All WS-BD operations fall into one of eight categories:

- 338 1. Registration
- 339 2. Locking
- 340 3. Information
- 341 4. Initialization
- 342 5. Configuration
- 343 6. Capture
- 344 7. Download
- 345 8. Cancellation

346 Of these, the initialization, configuration, capture, and cancellation operations are all sensor operations  
347 (i.e., they require exclusive sensor control) and require locking. Registration, locking, and download are  
348 all non-sensor operations. They do not require locking and (as stated earlier) MUST be available to  
349 clients regardless of the status of the biometric sensor.

350 *Download* is not a sensor operation. This allows for a collection of clients to dynamically share acquired  
351 biometric data. One client might perform the capture and hand off the download responsibility to a peer.

352 The following is a brief summary of each type of operation:

- 353 • *Registration* operations open and close (unregister) a session.
- 354 • *Locking* operations are used by a client to obtain the lock, release the lock, and *steal* the lock.
- 355 • *Information* operations query the service for information about the service itself, such as the
- 356 supported biometric modalities, and service configuration parameters.
- 357 • The *initialization* operation prepares the biometric sensor for operation.
- 358 • *Configuration* operations get or set sensor parameters.
- 359 • The *capture* operation signals to the sensor to acquire a biometric.
- 360 • *Download* operations transfer the captured biometric data from the service to the client.
- 361 • Sensor operations can be stopped by the *cancellation* operation.

## 362 2.4.7 Idempotency

363 The W3C Web Services glossary [WSGloss] defines idempotency as:

364

365 *[the] property of an interaction whose results and side-effects are the same whether it is done one*  
366 *or multiple times.*

367 When regarding an operation's idempotence, it SHOULD be assumed no *other* operations occur in  
368 between successive operations, and that each operation is successful. Note that idempotent operations  
369 may have side-effects—but the final state of the service MUST be the same over multiple (uninterrupted)  
370 invocations.

371 The following example illustrates idempotency using an imaginary web service.

372 **EXAMPLE:** A REST-based web service allows clients to create, read, update, and delete  
373 customer records from a database. A client executes an operation to update a customer's  
374 address from "123 Main St" to "100 Broad Way."

375 Suppose the operation is idempotent. Before the operation, the address is "123 Main St". After  
376 one execution of the update, the server returns "success", and the address is "100 Broad Way". If  
377 the operation is executed a second time, the server again returns "success," and the address  
378 remains "100 Broad Way".

379 Now suppose that when the operation is executed a second time, instead of returning "success",  
380 the server returns "no update made", since the address was already "100 Broad Way." Such an  
381 operation is *not* idempotent, because executing the operation a second time yielded a different  
382 result than the first execution.

383 The following is an example in the context of WS-BD.

384 **EXAMPLE:** A service has an available lock. A client invokes the lock operation and obtains a  
385 "success" result. A subsequent invocation of the operation also returns a "success" result. The  
386 operation being idempotent means that the results ("success") and side-effects (a locked service)  
387 of the two sequential operations are identical.

388 To best support robust communications, WS-BD is designed to offer idempotent services whenever  
389 possible.

## 390 2.4.8 Service Lifecycle Behavior

391 The lifecycle of a service (i.e., when the service starts responding to requests, stops, or is otherwise  
392 unavailable) SHOULD be modeled after an integrated implementation. This is because it is significantly  
393 easier for a physically separated implementation to emulate the behavior of a fully integrated  
394 implementation than it is the other way around. This requirement has a direct effect on the expected  
395 behavior of how a physically separated service would handle a change in the target biometric sensor.

396 Specifically, on a desktop computer, hot-swapping the target biometric sensor is possible through an  
397 operating system's plug-and-play architecture. By design, this specification does not assume that it is  
398 possible to replace a biometric sensor within an integrated device. Therefore, having a physically  
399 separated implementation emulate an integrated implementation provides a simple means of providing a  
400 common level of functionality.

401 By virtue of the stateless nature of the HTTP protocol, a client has no simple means of detecting if a web  
402 service has been restarted. For most web communications, a client SHOULD NOT require this—it is a  
403 core capability that constitutes the robustness of the web. Between successive web requests, a web  
404 server might be restarted on its host any number of times. In the case of WS-BD, replacing an integrated  
405 device with another (configured to respond on the same endpoint) is an *effective* restart of the service.  
406 Therefore, by the emulation requirement, replacing the device within a physically separated  
407 implementation SHOULD behave similarly.

408 A client may not be directly affected by a service restart, if the service is written in a robust manner. For  
409 example, upon detecting a new target biometric sensor, a robust server could *quiesce* (refusing all new  
410 requests until any pending requests are completed) and automatically restart.

411 Upon restarting, services SHOULD return to a fully reset state—i.e., all sessions SHOULD be dropped,  
412 and the lock SHOULD NOT have an owner. However, a high-availability service *may* have a mechanism  
413 to preserve state across restarts, but is significantly more complex to implement (particularly when using  
414 integrated implementations!). A client that communicated with a service that was restarted would lose  
415 both its session and the service lock (if held). With the exception of the *get service info* operation,  
416 through various fault statuses a client would receive indirect notification of a service restart. If needed, a  
417 client could use the service's common info timestamp (§A.2.1) to detect potential changes in the *get*  
418 *service info* operation.

## 419 3 Data Dictionary

420 This section contains descriptions of the data elements that are contained within the WS-BD data model.  
421 Each data type is described via an accompanying XML Schema type definition [XSDPart1, XSDPart2].

422 Refer to Appendix C for a complete XML schema containing all types defined in this document.

### 423 3.1 Namespaces

424 The following namespaces, and corresponding namespace prefixes are used throughout this document.

Prefix	Namespace	Remarks
xs	http://www.w3.org/2001/XMLSchema	The xs namespace refers to the XML Schema specification. Definitions for the xs data types (i.e., those not explicitly defined here) can be found in [XSDPart2].
xsi	http://www.w3.org/2001/XMLSchema-instance	The xsi namespace allows the schema to refer to other XML schemas in a qualified way.
wsbd	http://docs.oasis-open.org/bioserv/ns/wsbd-1.0	The wsbd namespace is a uniform resource name [RFC1737, RFC2141] consisting of an object identifier [RFC3001] reserved for this specification's schema. This namespace can be written in ASN.1 notation as {joint-iso-ccitt(2) country(16) us(840) organization(1) gov(101) csor(3) biometrics(9) wsbd(3) version1(1)}.

425 All of the datatypes defined in this section (§3) belong to the wsbd namespace defined in the above table.

426 If a datatype is described in the document without a namespace prefix, the wsbd prefix is assumed.

### 427 3.2 UUID

428 A UUID is a unique identifier as defined in [RFC4122]. A service MUST use UUIDs that conform to the  
429 following XML Schema type definition.

```
430 <xs:simpleType name="UUID">  
431   <xs:restriction base="xs:string">  
432     <xs:pattern value="[\da-fA-F]{8}-[\da-fA-F]{4}-[\da-fA-F]{4}-[\da-fA-F]{4}-[\da-fA-F]{12}"/>  
433   </xs:restriction>  
434 </xs:simpleType>
```

435 **EXAMPLE:** Each of the following code fragments contains a well-formed UUID.

```
436 E47991C3-CA4F-406A-8167-53121C0237BA
```

```
437 10fa0553-9b59-4D9e-bbcd-8D209e8d6818
```

```
438 161FdBf5-047F-456a-8373-D5A410aE4595
```

### 439 3.3 Dictionary

440 A Dictionary is a generic container used to hold an arbitrary collection of name-value pairs.

```
441 <xs:complexType name="Dictionary">
442   <xs:sequence>
443     <xs:element name="item" minOccurs="0" maxOccurs="unbounded">
444       <xs:complexType>
445         <xs:sequence>
446           <xs:element name="key" type="xs:string" nillable="true"/>
447           <xs:element name="value" type="xs:anyType" nillable="true"/>
448         </xs:sequence>
449       </xs:complexType>
450     </xs:element>
451   </xs:sequence>
452 </xs:complexType>
```

453 **EXAMPLE:** A query to get the metadata of a capture returns a dictionary of supported settings and the  
454 values at the time of capture.

```
455 <item>
456   <key>imageWidth</key>
457   <value>640</value>
458 </item>
459 <item>
460   <key>imageHeight</key>
461   <value>640</value>
462 </item>
463 <item>
464   <key>captureDate</key>
465   <value>2011-01-01T01:23:45Z</value>
466 </item>
```

467 Dictionary instances are nestable—i.e., the value element of one Dictionary can contain another  
468 Dictionary. The use of xs:anyType allows for an XML element of any structure or definition to be used.  
469 Using types not defined in this document or types defined in W3's XML Schema recommendations  
470 [XSDPart1, XSDPart2] might require a client to have unique knowledge about the service. Because the  
471 requirement of unique knowledge negatively impacts interoperability, using such elements is discouraged.

### 472 3.4 Parameter

473 A Parameter is a container used to describe the parameters or settings of a service or sensor.

```
474 <xs:complexType name="Parameter">
475   <xs:sequence>
476     <xs:element name="name" type="xs:string" nillable="true"/>
477     <xs:element name="type" type="xs:QName" nillable="true"/>
478     <xs:element name="readOnly" type="xs:boolean" minOccurs="0"/>
479     <xs:element name="supportsMultiple" type="xs:boolean" minOccurs="0"/>
480     <xs:element name="defaultValue" type="xs:anyType" nillable="true"/>
481     <xs:element name="allowedValues" nillable="true" minOccurs="0">
482       <xs:complexType>
483         <xs:sequence>
484           <xs:element name="allowedValue" type="xs:anyType" nillable="true" minOccurs="0"
485 maxOccurs="unbounded"/>
486         </xs:sequence>
487       </xs:complexType>
488     </xs:element>
489   </xs:sequence>
490 </xs:complexType>
```

491 See §4 for more information on metadata and the use of Parameter.

#### 492 3.4.1.1 Element Summary

493 The following is a brief informative description of each Parameter element.

Element	Description
name	The name of the parameter.
type	The fully qualified type of the parameter.
readOnly	Whether or not this parameter is read-only.
supportsMultiple	Whether or not this parameter can support multiple values for this parameter (§3.4.1.2).
defaultValue	The default value of this parameter.
allowedValues	A list of allowed values for this parameter (§3.4.1.3).

### 494 3.4.1.2 Supports Multiple

495 In some cases, a parameter might require multiple values. This flag specifies whether the parameter is  
 496 capable of multiple values.

497 When `supportsMultiple` is true, communicating values MUST be done through a defined array type.  
 498 If a type-specialized array is defined in this document, such as a `StringArray` (§3.7) for `xs:string`, such  
 499 type SHOULD be used. The generic `Array` (§3.6) type MUST be used in all other cases.

500 The parameter's `type` element MUST be the qualified name of a single value. For example, if the  
 501 parameter expects multiple strings during configuration, then the type MUST be `xs:string` and not  
 502 `StringArray`.

503 **EXAMPLE:** An iris scanner might have the ability to capture a left iris, right iris, and/or frontal face image  
 504 simultaneously. This example configures the scanner to capture left and right iris images together. The  
 505 first code block is what the service exposes to the clients. The second code block is how a client would  
 506 configure this parameter. The client configures the submodality by supplying a `StringArray` with two  
 507 elements: `left` and `right`—this tells the service to capture both the left and right iris. It is important to note  
 508 that in this example, submodality exposes values for two modalities: `iris` and `face`. The resulting captured  
 509 data MUST specify the respective modality for each captured item in its metadata.

```
510 <name>submodality</name>
511 <type>xs:string</type>
512 <readOnly>false</readOnly>
513 <supportsMultiple>true</supportsMultiple>
514 <defaultValue xsi:type="wsbd:StringArray">
515   <element>leftIris</element>
516   <element>rightIris</element>
517 </defaultValue>
518 <allowedValues>
519   <allowedValue>leftIris</allowedValue>
520   <allowedValue>rightIris</allowedValue>
521   <allowedValue>frontalFace</allowedValue>
522 </allowedValues>
```

523

```
524 <item>
525   <key>submodality</key>
526   <value xsi:type="wsbd:StringArray">
527     <element>leftIris</element>
528     <element>rightIris</element>
529   </value>
530 </item>
```

### 531 3.4.1.3 Allowed Values

532 For parameters that are not read-only and have restrictions on what values it may have, this allows the  
 533 service to dynamically expose its valid values to clients.

534 **EXAMPLE:** The following code block demonstrates a parameter, “CameraFlash”, with only three valid  
535 values.

```
536 <name>cameraFlash</name>  
537 <type>xs:string</type>  
538 <readOnly>false</readOnly>  
539 <supportsMultiple>false</supportsMultiple>  
540 <defaultValue>auto</defaultValue>  
541 <allowedValues>  
542   <allowedValue xsi:type="xs:string">on</allowedValue>  
543   <allowedValue xsi:type="xs:string">off</allowedValue>  
544   <allowedValue xsi:type="xs:string">auto</allowedValue>  
545 </allowedValues>
```

546 Parameters requiring a range of values SHOULD be described by using Range (§3.5). Because the  
547 allowed type is not the same as its parameter type, a service MUST have logic to check for a Range and  
548 any appropriate validation.

549 **EXAMPLE:** The following code block demonstrates a parameter, “CameraZoom”, where the allowed  
550 value is of type Range and consists of integers.

```
551 <name>cameraZoom</name>  
552 <type>xs:integer</type>  
553 <readOnly>false</readOnly>  
554 <supportsMultiple>false</supportsMultiple>  
555 <defaultValue>0</defaultValue>  
556 <allowedValues>  
557   <allowedValue xsi:type="wsbd:Range">  
558     <minimum>0</minimum>  
559     <maximum>100</maximum>  
560   </allowedValue>  
561 </allowedValues>
```

562 Configurable parameters with no restrictions on its value MUST NOT include this element.

## 563 3.5 Range

564 The Range element is a container for elements that define a range and whether its upper and lower  
565 bounds are exclusive. Bounds by default are inclusive.

```
566 <xs:complexType name="Range">  
567   <xs:sequence>  
568     <xs:element name="minimum" type="xs:anyType" nillable="true" minOccurs="0"/>  
569     <xs:element name="maximum" type="xs:anyType" nillable="true" minOccurs="0"/>  
570     <xs:element name="minimumIsExclusive" type="xs:boolean" nillable="true" minOccurs="0"/>  
571     <xs:element name="maximumIsExclusive" type="xs:boolean" nillable="true" minOccurs="0"/>  
572   </xs:sequence>  
573 </xs:complexType>
```

574 **EXAMPLE:** An example range of numbers from 0 to 100. The minimum is exclusive while the maximum is  
575 inclusive.

```
576 <minimum>0</minimum>  
577 <maximum>100</maximum>  
578 <minimumIsExclusive>true</minimumIsExclusive>  
579 <maximumIsExclusive>false</maximumIsExclusive>
```

### 580 3.5.1.1 Element Summary

581 The following is a brief informative description of each Range element.

Element	Description
minimum	The lower bound of the range.

<code>maximum</code>	The upper bound of the range.
<code>minimumIsExclusive</code>	Boolean indicating whether the lower bound is exclusive or not. This is true by default.
<code>maximumIsExclusive</code>	Boolean indicating whether the upper bound is exclusive or not. This is true by default.

## 582 3.6 Array

583 An `Array` is a generic container used to hold a collection of elements.

```
584 <xs:complexType name="Array">
585   <xs:sequence>
586     <xs:element name="element" type="xs:anyType" nillable="true" minOccurs="0"
587     maxOccurs="unbounded"/>
588   </xs:sequence>
589 </xs:complexType>
```

590 **EXAMPLE:** Each of the following code fragments is an example of a valid `Array`.

```
591 <element>flatLeftThumb</element><element>flatRightThumb</element>
```

592 In this fragment (above), the values “flatLeftThumb” and “flatRightThumb” are of type `xs:anyType`,  
593 (and are likely to be deserialized as a generic “object.”

```
594 <element xsi:type="xs:boolean">false</element><element
595 xsi:type="xs:int">1024</element>
```

596 Notice that in this fragment (above) the two values are of *different* types

```
597 <element xsi:type="xs:decimal">2.0</element>
```

598 In this fragment (above) the array contains a single element.

## 599 3.7 StringArray

600 A `StringArray` is a generic container used to hold a collection of strings.

```
601 <xs:complexType name="StringArray">
602   <xs:sequence>
603     <xs:element name="element" type="xs:string" nillable="true" minOccurs="0"
604     maxOccurs="unbounded"/>
605   </xs:sequence>
606 </xs:complexType>
```

607 **EXAMPLE:** Each of the following code fragments is an example of a valid `StringArray`.

```
608 <element>flatLeftThumb</element><element>flatRightThumb</element>
```

```
609 <element>value1</element><element>value2</element>
```

```
610 <element>sessionId</element>
```

## 611 3.8 UuidArray

612 A `UuidArray` is a generic container used to hold a collection of UUIDs.

```
613 <xs:complexType name="UuidArray">
614   <xs:sequence>
615     <xs:element name="element" type="wsbd:UUID" nillable="true" minOccurs="0"
616     maxOccurs="unbounded"/>
```

```
617     </xs:sequence>
618 </xs:complexType>
```

619 **EXAMPLE:** The following code fragment is an example of a *single* UuidArray with three elements.

```
620 <element>E47991C3-CA4F-406A-8167-53121C0237BA</element>
621 <element>10fa0553-9b59-4D9e-bbcd-8D209e8d6818</element>
622 <element>161FdBf5-047F-456a-8373-D5A410aE4595</element>
```

## 623 3.9 ResourceArray

624 A ResourceArray is a generic container used to hold a collection of Resources (§3.10).

```
625 <xs:complexType name="ResourceArray">
626   <xs:sequence>
627     <xs:element name="element" type="wsbd:Resource" nillable="true"
628     minOccurs="0" maxOccurs="unbounded"/>
629   </xs:sequence>
630 </xs:complexType>
```

631 **EXAMPLE:** The following code fragment is an example of a *single* ResourceArray with two elements.

```
632 <element><uri>file:///tmp/test.png<uri><contentType>image/png</contentType></element>
633 <element><uri>http://192.168.1.1/robots.txt<uri><contentType>text/plain</contentType></element>
```

## 635 3.10 Resource

636 Resource is a container to describe a resource at a specified URI.

```
637 <xs:complexType name="Resource">
638   <xs:sequence>
639     <xs:element name="uri" type="xs:anyURI"/>
640     <xs:element name="contentType" type="xs:string" nillable="true" minOccurs="0"/>
641     <xs:element name="relationship" type="xs:string" nillable="true" minOccurs="0"/>
642   </xs:sequence>
643 </xs:complexType>
```

## 644 3.11 Resolution

645 Resolution is a generic container to describe values for a width and height and optionally a description of  
646 the unit.

```
647 <xs:complexType name="Resolution">
648   <xs:sequence>
649     <xs:element name="width" type="xs:decimal"/>
650     <xs:element name="height" type="xs:decimal"/>
651     <xs:element name="unit" type="xs:string" nillable="true" minOccurs="0"/>
652   </xs:sequence>
653 </xs:complexType>
```

### 654 3.11.1.1 Element Summary

655 The following is a brief informative description of each Size element.

Element	Description
width	The decimal value of the width
height	The decimal value of the height
unit	A string describing the units of the width and height values

656 **3.12 Status**

657 The Status represents a common enumeration for communicating state information about a service.

```

658 <xs:simpleType name="Status">
659   <xs:restriction base="xs:string">
660     <xs:enumeration value="success"/>
661     <xs:enumeration value="failure"/>
662     <xs:enumeration value="preparingDownload"/>
663     <xs:enumeration value="configurationNeeded"/>
664     <xs:enumeration value="initializationNeeded"/>
665     <xs:enumeration value="sensorTimeout"/>
666     <xs:enumeration value="sensorFailure"/>
667     <xs:enumeration value="sensorBusy"/>
668     <xs:enumeration value="lockNotHeld"/>
669     <xs:enumeration value="lockHeldByAnother"/>
670     <xs:enumeration value="canceled"/>
671     <xs:enumeration value="canceledWithSensorFailure"/>
672     <xs:enumeration value="unsupported"/>
673     <xs:enumeration value="badValue"/>
674     <xs:enumeration value="noSuchParameter"/>
675     <xs:enumeration value="invalidId"/>
676   </xs:restriction>
677 </xs:simpleType>

```

678 **3.12.1.1 Definitions**

679 The following table defines all of the potential values for the Status enumeration.

Value	Description
<i>success</i>	The operation completed successfully.
<i>failure</i>	The operation failed. The failure was due to a web service (as opposed to a sensor error).
<i>preparingDownload</i>	The operation could not be performed because the service is currently preparing captured data for download. (See §6.16.2.2)
<i>configurationNeeded</i>	The operation could not be performed because the sensor requires configuration.
<i>initializationNeeded</i>	The operation could not be performed because the sensor requires initialization.
<i>sensorTimeout</i>	The operation was not performed because the biometric sensor experienced a timeout.  <b>NOTE:</b> The most common cause of a sensor timeout would be a lack of interaction with a sensor within an expected timeframe.
<i>sensorFailure</i>	The operation could not be performed because of a biometric sensor (as opposed to web service) failure.  <b>NOTE:</b> Clients that receive a status of <i>sensorFailure</i> SHOULD assume that the sensor will need to be reinitialized in order to restore normal operation.
<i>sensorBusy</i>	The operation could not be performed because the sensor is

currently performing another task.

**NOTE:** Services *may* self-initiate an activity that triggers a `sensorBusy` result. That is, it may not be possible for a client to trace back a `sensorBusy` status to any particular operation. An automated self-check, heartbeat, or other activity such as a data transfer *may* place the target biometric sensor into a “busy” mode. (See §6.16.2.2 for information about post-acquisition processing.)

*lockNotHeld* The operation could not be performed because the client does not hold the lock.

**NOTE:** This status implies that at the time the lock was queried, no other client currently held the lock. However, this is not a guarantee that any subsequent attempts to obtain the lock will succeed.

*lockHeldByAnother* The operation could not be performed because another client currently holds the lock.

*canceled* The operation was canceled.

**NOTE:** A sensor service *may* cancel its own operation, for example, if an operation is taking too long. This can happen if a service maintains its own internal timeout that is shorter than a sensor timeout.

*canceledWithSensorFailure* The operation was canceled, but during (and perhaps because of) cancellation, a sensor failure occurred.

This particular status accommodates for hardware that may not natively support cancellation.

*unsupported* The service does not support the requested operation. (See §6.1.2 for information on parameter failures.)

*badValue* The operation could not be performed because a value provided for a particular parameter was either (a) an incompatible type or (b) outside of an acceptable range. (See §6.1.2 for information on parameter failures.)

*noSuchParameter* The operation could not be performed because the service did not recognize the name of a provided parameter. (See §6.1.2 for information on parameter failures.)

*invalidId* The provided id is not valid. This can occur if the client provides a (session or capture) id that is either:  
unknown to the server (i.e., does not correspond to a known registration or capture result), or  
the session has been closed by the service (§6.4.2.1)  
(See §6.1.2 for information on parameter failures.)

680 Many of the permitted status values have been designed specifically to support physically separate  
681 implementations—a scenario where it is easier to distinguish between failures in the web service and  
682 failures in the biometric sensor. This is not to say that within an integrated implementation such a  
683 distinction is not possible, only that some of the status values are more relevant for physically separate  
684 versions.

685 For example, a robust service would allow all sensor operations to be canceled with no threat of a failure.  
686 Unfortunately, not all commercial, off-the-shelf (COTS) sensors natively support cancellation. Therefore,  
687 the *canceledWithSensorFailure* status is offered to accommodate this. Implementers can still offer  
688 cancellation, but have a mechanism to communicate back to the client that sensor initialization might be  
689 required.

### 690 3.13 SensorStatus

691 The SensorStatus represents a common enumeration for communicating state information about a  
692 sensor.

```
693 <xs:simpleType name="SensorStatus">  
694   <xs:restriction base="xs:string">  
695     <xs:enumeration value="ready"/>  
696     <xs:enumeration value="initializing"/>  
697     <xs:enumeration value="configuring"/>  
698     <xs:enumeration value="capturing"/>  
699     <xs:enumeration value="uninitializing"/>  
700     <xs:enumeration value="canceling"/>  
701   </xs:restriction>  
702 </xs:simpleType>
```

#### 703 3.13.1.1 Definitions

704 The following table defines all of the potential values for the Status enumeration.

Value	Description
<i>ready</i>	The sensor is ready to start a new operation.
<i>initializing</i>	The sensor is initializing.
<i>configuring</i>	The sensor is configuring.
<i>capturing</i>	The sensor is capturing.
<i>uninitializing</i>	The sensor is uninitializing.
<i>canceling</i>	The sensor is canceling an operation.

### 705 3.14 Result

706 Unless a service returns with an HTTP error, all WS-BD operations MUST reply with an HTTP message  
707 that contains an element of a Result type that conforms to the following XML Schema snippet.

```
708 <xs:element name="result" type="wsbd:Result" nillable="true"/>  
709  
710 <xs:complexType name="Result">  
711   <xs:sequence>  
712     <xs:element name="status" type="wsbd:Status"/>  
713     <xs:element name="badFields" type="wsbd:StringArray" nillable="true" minOccurs="0"/>  
714     <xs:element name="captureIds" type="wsbd:UuidArray" nillable="true" minOccurs="0"/>  
715     <xs:element name="metadata" type="wsbd:Dictionary" nillable="true" minOccurs="0"/>  
716     <xs:element name="message" type="xs:string" nillable="true" minOccurs="0"/>  
717     <xs:element name="sensorData" type="xs:base64Binary" nillable="true" minOccurs="0"/>  
718     <xs:element name="sessionId" type="wsbd:UUID" nillable="true" minOccurs="0"/>  
719   </xs:sequence>
```

720 </xs:complexType>

### 721 3.14.1 Terminology Shorthand

722 Since a Result is the intended outcome of all requests, this document *may* state that an operation  
723 “returns” a particular status value. This is shorthand for a Result output payload with a `status` element  
724 containing that value.

725 **EXAMPLE:** The following result payload “returns success”. A result might contain other child elements  
726 depending on the specific operation and result status—see §6 for operations and their respective details.

```
727 <result xmlns="http://docs.oasis-open.org/bioserv/ns/wsbd-1.0"  
728         xmlns:xs="http://www.w3.org/2001/XMLSchema"  
729         xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">  
730   <status>success</status>  
731 </result>
```

732 Likewise, the same shorthand is implied by a client “receiving” a status, or an operation “yielding” a  
733 status.

### 734 3.14.2 Required Elements

735 Notice that from a XML Schema validation perspective [XSDPart1], a schema-valid Result **MUST** contain  
736 a `status` element, and may contain any of the remaining elements.

737 The specific permitted elements of a Result are determined via a combination of (a) the operation, and (b)  
738 the result’s status. That is, different operations will have different requirements on which elements are  
739 permitted or forbidden, depending on that operation’s status.

740 **EXAMPLE:** As will be detailed later (§6.3.4.1 and §6.5.4.1), a *register* operation returning a  
741 status of success **MUST** also populate the `sessionId` element. However, a *try lock* operation that  
742 returns a status of success cannot populate any element other than `status`.

743 **DESIGN NOTE:** An XML inheritance hierarchy could have been used to help enforce which elements are  
744 permitted under which circumstances. However, a de-normalized representation (in which all of the  
745 possible elements are valid with respect to a *schema*) was used to simplify client and server  
746 implementation. Further, this reduces the burden of managing an object hierarchy for the sake of  
747 enforcing simple constraints.

### 748 3.14.3 Element Summary

749 The following is a brief informative description of each Result element.

Element	Description
<code>status</code>	The disposition of the operation. All <code>Result</code> elements <b>MUST</b> contain a <code>status</code> element. (Used in all operations.)
<code>badFields</code>	The list of fields that contain invalid or ill-formed values. (Used in almost all operations.)
<code>captureIds</code>	Identifiers that <i>may</i> be used to obtain data acquired from a capture operation (§6.13, §6.14, §6.15).
<code>metadata</code>	This field <i>may</i> hold a) metadata for the service (§6.8), or

- b) a service and sensor's configuration (§6.11, §6.12), or
- c) metadata relating to a particular capture (§6.12.4.14, §6.14, §6.15, §6.16, §6.17, §6.18)

(See §4 for more information regarding metadata)

message	A string providing <i>informative</i> detail regarding the output of an operation. (Used in almost all operations.)
sensorData	The biometric data corresponding to a particular capture identifier (§6.14, §6.16, §6.18, §6.19).
sessionId	A unique session identifier (§6.3).

750 **3.15 Validation**

751 The provided XML schemas MAY be used for initial XML validation. It should be noted that these are not  
 752 strict schema definitions and were designed for easy consumption of web service/code generation tools.  
 753 Additional logic SHOULD be used to evaluate the contents and validity of the data where the schema falls  
 754 short. For example, additional logic will be necessary to verify the contents of a Result are accurate as  
 755 there is not a different schema definition for every combination of optional and mandatory fields.

756 A service MUST have separate logic validating parameters and their values during configuration. The  
 757 type of any allowed values might not correspond with the type of the parameter. For example, if the type  
 758 of the parameter is an integer and an allowed value is a Range, the service MUST handle this within the  
 759 service as it may not be appropriately validated using XML schema.

760

---

## 761 4 Metadata

762 Metadata can be broken down into three smaller categories: service information, sensor information or  
763 configuration, and capture information. Metadata can be returned in two forms: as a key/value pair within  
764 a Dictionary or a Dictionary of Parameter types.

### 765 4.1 Service Information

766 Service information includes read-only parameters unrelated to the sensor as well as parameters that can  
767 be set. Updating the values of a parameter SHOULD be done in the set configuration operation.

768 Service information consists of the required parameters listed in Appendix A. Optional parameters  
769 SHOULD be included. Each parameter MUST be exposed as a Parameter (§3.4).

770 Parameters listed in §A.2, §A.3, and §A.4 MUST be exposed as read-only parameters.

771 Read-only parameters MUST populate the default value field with its current value. Additionally, read-only  
772 parameters MUST NOT provide allowed values. Allowed values are reserved to specify acceptable  
773 values which may be passed to the service to set configuration.

774 **EXAMPLE:** An example snippet from a *get service info* call demonstrating a read-only parameter.

```
775 <name>inactivityTimeout</name>  
776 <type>xs:nonNegativeInteger</type>  
777 <readOnly>true</readOnly>  
778 <supportsMultiple>false</supportsMultiple>  
779 <defaultValue>600</defaultValue>
```

780  
781 Configurable parameters, or those which are not read only, MUST provide information for the default  
782 value as well as allowed values. To specify that an allowed value is within range of numbers, refer to  
783 Range (§3.5).

784 **EXAMPLE:** An example snippet from a *get service info* call. The target service supports a configurable  
785 parameter called “ImageWidth”.

```
786 <name>imageWidth</name>  
787 <type>xs:positiveInteger</type>  
788 <readOnly>false</readOnly>  
789 <supportsMultiple>false</supportsMultiple>  
790 <defaultValue>800</defaultValue>  
791 <allowedValues>  
792 <allowedValue>640</allowedValue>  
793 <allowedValue>800</allowedValue>  
794 <allowedValue>1024</allowedValue>  
795 </allowedValues>
```

796  
797 In many cases, an exposed parameter will support multiple values (see §3.4.1.2). When a parameter  
798 allows this capability, it MUST use a type-specific array, defined in this document, or the generic `Array`  
799 (§3.6) type. The `type` element within a parameter MUST be the qualified name of a single value’s type  
800 (see §3.4.1.2 for an example).

### 801 4.2 Configuration

802 A configuration consists of parameters specific to the sensor or post-processing related to the final  
803 capture result. This MUST only consist of key/value pairs. It MUST NOT include other information about  
804 the parameters, such as allowed values or read-only status.

805 Restrictions for each configuration parameter can be discovered through the *get service info* operation.

806 **EXAMPLE:** The following is an example payload to *set configuration* consisting of three parameters.

```
807 <configuration xmlns="http://docs.oasis-open.org/bioserv/ns/wsbd-1.0"
808               xmlns:xs="http://www.w3.org/2001/XMLSchema"
809               xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
810   <item>
811     <key>imageHeight</key>
812     <value xsi:type="xs:int">480</value>
813   </item>
814   <item>
815     <key>imageWidth</key>
816     <value xsi:type="xs:int">640</value>
817   </item>
818   <item>
819     <key>frameRate</key>
820     <value xsi:type="xs:int">20</value>
821   </item>
822 </configuration>
```

823

### 824 4.3 Captured Data

825 Metadata related to a particular capture operation MUST include the configuration of the sensor at the  
826 time of capture. Static parameters related to the service SHOULD NOT be included in the metadata for a  
827 capture result.

828 A service MAY perform post-processing steps on any captured information. This information SHOULD be  
829 added to the particular capture result's metadata.

830 **EXAMPLE:** Example metadata for a particular capture. Note that this includes parameters related to the  
831 sensor.

```
832 <item>
833   <key>serialNumber</key>
834   <value xsi:type="xs:string">98A8N830LP332-V244</value>
835 </item>
836 <item>
837   <key>imageHeight</key>
838   <value xsi:type="xs:string">600</value>
839 </item>
840 <item>
841   <key>imageWidth</key>
842   <value xsi:type="xs:string">800</value>
843 </item>
844 <item>
845   <key>captureTime</key>
846   <value xsi:type="xs:dateTime">2011-12-02T09:39:10.935-05:00</value>
847 </item>
848 <item>
849   <key>contentType</key>
850   <value xsi:type="xs:string">image/jpeg</value>
851 </item>
852 <item>
853   <key>modality</key>
854   <value xsi:type="xs:string">Finger</value>
855 </item>
856 <item>
857   <key>submodality</key>
858   <value xsi:type="xs:string">LeftIndex</value>
859 </item>
```

860

861 **EXAMPLE:** A service computes the quality score of a captured fingerprint (see previous example). This  
862 score is added to the result's metadata to allow other clients to take advantage of previously completed  
863 processes.

```
864 <item>  
865   <key>quality</key>  
866   <value>78</value>  
867 </item>  
868 <item>  
869   <key>serialNumber</key>  
870   <value>98A8N830LP332-V244</value>  
871 </item>  
872 <item>  
873   <key>captureDate</key>  
874   <value>2011-01-01T15:30:00Z</value>  
875 </item>  
876 <item>  
877   <key>modality</key>  
878   <value>Finger</value>  
879 </item>  
880 <item>  
881   <key>submodality</key>  
882   <value>leftIndex</value>  
883 </item>  
884 <item>  
885   <key>imageHeight</key>  
886   <value>600</value>  
887 </item>  
888 <item>  
889   <key>imageWidth</key>  
890   <value>800</value>  
891 </item>  
892 <item>  
893   <key>contentType</key>  
894   <value>image/bmp</value>  
895 </item>
```

### 896 4.3.1 Minimal Metadata

897 At a minimum, a sensor or service *must* maintain the following metadata fields for each captured result.  
898 Two values are not provided by *getConfiguration*: captureDate and contentType--these values SHOULD  
899 be calculated at the time of capture.

#### 900 4.3.1.1 Capture Date

<b>Formal Name</b>	captureDate
<b>Data Type</b>	xs:dateTime [XSDPart2]

901 This value represents the date and time at which the capture occurred.

#### 902 4.3.1.2 Modality

<b>Formal Name</b>	modality
<b>Data Type</b>	xs:string [XSDPart2]

903 The value of this field **MUST** be present in the list of available modalities exposed by the *getServiceInfo*  
904 operation (§6.8) as defined in §A.1.1. This value represents the modality of the captured result.

#### 905 4.3.1.3 Submodality

<b>Formal Name</b>	submodality
--------------------	-------------

<b>Data Type</b> <code>xs:anyType</code> [XSDPart2]
---

906 The value of this field MUST be present in the list of available submodalities exposed by the *get service*  
907 *info* operation (§6.8) as defined in §A.1.2. This value represents the submodality of the captured result. If  
908 this parameter supports multiple, then the data type MUST be a `StringArray` (§3.7) of values. If  
909 submodality does not support multiple, the data type MUST be `xs:string` [XSDPart2].

#### 910 4.3.1.4 Content Type

<b>Formal Name</b> <code>contentType</code>
---

<b>Data Type</b> <code>xs:string</code> [RFC2045, RFC2046]
--

911 The value of this field represents the content type of the captured data. See A.2 for which content types  
912 are supported.

---

## 913 5 Live Preview

914 The ability to provide live preview of a session provides feedback to the client on when to signal a capture  
915 and/or what is going on during a capture.

### 916 5.1 Endpoints

917 Exposing endpoint information to a client is done through the service information. If live preview is  
918 implemented, a key/value pair SHALL be added where the key is “livePreview” and the value is of type  
919 Parameter (§3.4). This MUST be a read-only parameter. The default value SHALL be of type  
920 ResourceArray (§3.9). An implementation may expose one or more Resources (§3.10) in the  
921 ResourceArray. For the stream parameter, each instance of a Resource SHALL contain the uri,  
922 contentType, and the relationship elements. The content type of the stream and the value of each  
923 Resource’s contentType element SHOULD be listed in Appendix B. The value of the relationship field  
924 MUST begin with “livePreview” and there MUST be at least one entry where the element’s value consists  
925 of only “livePreview”. An implementer may provide additional endpoints with a modified relationship. This  
926 *may* be done by appending a forward slash immediately after “livePreview” and before any additional  
927 content; any additional content MUST *not* occur before the forward slash. Only base-64 characters are  
928 allowed in the relationship field.

929

930 The following snippet is a skeleton service information entry for a stream parameter.

```
931 <item>  
932   <key>livePreview</key>  
933   <value xsi:type="Parameter">  
934     <name>livePreview </name>  
935     <type>Resource</type>  
936     <readOnly>true</readOnly>  
937     <defaultValue xsi:type="ResourceArray">  
938       ...  
939       ...  
940     </defaultValue>  
941   </value>  
942 </item>
```

943

944 **EXAMPLE:** The following snippet is an example service information entry that exposes a Parameter  
945 (§3.4) for live preview resources. This example exposes two different endpoints, each offering a live  
946 preview with different content types.

```
947 <item>  
948   <key>livePreview</key>  
949   <value xsi:type="Parameter">  
950     <name>livePreview</name>  
951     <type>Resource</type>  
952     <readOnly>true</readOnly>  
953     <defaultValue xsi:type="ResourceArray">  
954       <element>  
955         <uri>http://192.168.1.1/stream</uri>  
956         <contentType>video/h264</contentType>  
957         <relationship>livePreview</relationship>  
958       </element>  
959       <element>  
960         <uri>http://192.168.1.1:81/stream</uri>  
961         <contentType>video/mpeg</contentType>  
962         <relationship>livePreview</relationship>  
963       </element>  
964     </defaultValue>  
965 </value>
```

```
966 </value>
967 </item>
```

968

969 **EXAMPLE:** The following snippet is an example service information entry that exposes a Parameter  
970 (§3.4) for live preview resources. This example exposes two different endpoints, one with a modified  
971 relationship value. For example, the second entry *may* be describing an endpoint that has live preview of  
972 a face at 30 frames per second.

```
973 <item>
974 <key>livePreview</key>
975 <value xsi:type="Parameter">
976 <name>livePreview</name>
977 <type>Resource</type>
978 <readOnly>true</readOnly>
979
980 <defaultValue xsi:type="ResourceArray">
981 <element>
982 <uri>http://192.168.1.1/stream</uri>
983 <contentType>video/h264</contentType>
984 <relationship>livePreview</relationship>
985 </element>
986 <element>
987 <uri>http://192.168.1.1:81/stream</uri>
988 <contentType>video/mpeg</contentType>
989 <relationship>livePreview/face+fps=30</relationship>
990 </element>
991 </defaultValue>
992 </value>
993 </item>
```

994

995 A live preview end point *may* only return a single image representing the current frame at the time the  
996 operation was called. This SHALL be reflected in the value of the content type.

997 To increase the security and privacy of an implementation, a registered session id MAY be added to the  
998 URL(s) of end points.

## 999 5.2 Heartbeat

1000 In many cases, live preview may not be ready to provide actual images until a certain point in a session or  
1001 the lifetime of a service (e.g., after initialization). The service has two options on how to proceed when  
1002 streaming is called before it is ready.

- 1003 1. Immediately close the live preview connection. This is only RECOMMENDED if live preview is not  
1004 available for the service. It SHALL NOT be expected that a client will make additional calls to the  
1005 live preview endpoint after a closed connection.
- 1006 2. Send a heartbeat to the client upon a live preview request. The heartbeat SHALL consist of  
1007 minimal null information and SHALL be sent to all clients on a fixed time interval.

1008

1009 **EXAMPLE:** The follow is an example heartbeat frame sent over a multipart/x-mixed-replace stream. For  
1010 this example, the boundary indicator is boundaryString. A service MAY send this null frame as a  
1011 heartbeat to all connected clients every, for example, 10 seconds to alert the client that live preview data  
1012 is available, but not at the current state of the service, sensor, or session.

```
1013 --boundaryString
1014 Content-Type: multipart/x-heartbeat
1015
1016
1017 --boundaryString
```

1018  
1019  
1020  
1021  
1022  
1023  
1024  
1025  
1026  
1027  
1028  
1029  
1030  
1031  
1032  
1033  
1034  
1035  
1036  
1037  
1038  
1039  
1040  
1041  
1042  
1043

## 6 Operations

This section provides detailed information regarding each WS-BD operation.

### 6.1 General Usage Notes

The following usage notes apply to all operations, unless the detailed documentation for a particular operation conflicts with these general notes, in which case the detailed documentation takes precedence.

1. **Failure messages are informative.** If an operation fails, then the message element MAY contain an informative message regarding the nature of that failure. The message is for informational purposes only—the functionality of a client MUST NOT depend on the contents of the message.
2. **Results MUST only contain required and optional elements.** Services MUST only return elements that are either required or optional. All other elements MUST NOT be contained in the result, even if they are empty elements. Likewise, to maintain robustness in the face of a non-conformant service, clients SHOULD ignore any element that is not in the list of permitted Result elements for a particular operation call.
3. **Sensor operations MUST NOT occur within a non-sensor operation.** Services SHOULD only perform any sensor control within the operations:
  - a. *initialize*,
  - b. *get configuration*,
  - c. *set configuration*,
  - d. *capture*, and
  - e. *cancel*.
4. **Sensor operations MUST require locking.** Even if a service implements a sensor operation without controlling the target biometric sensor, the service MUST require that a locked service for the operation to be performed.
5. **Content Type.** Clients MUST make HTTP requests using a content type of `application/xml` [RFC2616, §14].
6. **Namespace.** A data type without an explicit namespace or namespace prefix implies it is a member of the `wsbd` namespace as defined in §3.1.

#### 6.1.1 Precedence of Status Enumerations

To maximize the amount of information given to a client when an error is obtained, and to prevent different implementations from exhibiting different behaviors, all WS-BD services MUST return status values according to a fixed priority. In other words, when multiple status messages might apply, a higher-priority status MUST always be returned in favor of a lower-priority status.

The status priority, listed from highest priority (“invalidId”) to lowest priority (“success”) is as follows:

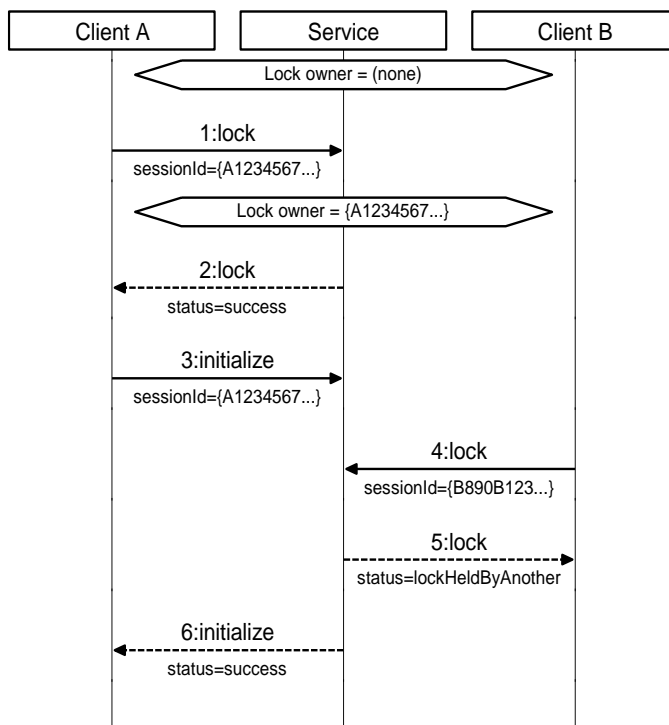

1. `invalidId`
2. `noSuchParameter`
3. `badValue`
4. `unsupported`
5. `canceledWithSensorFailure`
6. `canceled`
7. `lockHeldByAnother`
8. `lockNotHeld`
9. `sensorBusy`
10. `sensorFailure`
11. `sensorTimeout`
12. `initializationNeeded`
13. `configurationNeeded`

1064 14. preparingDownload  
 1065 15. failure  
 1066 16. success  
 1067

1068 Notice that success is the *lowest* priority—an operation SHOULD only be deemed successful if no *other*  
 1069 kinds of (non-successful) statuses apply.

1070 The following example illustrates how this ordering affects the status returned in a situation in which  
 1071 multiple clients are performing operations.

1072 **EXAMPLE:** Figure 6 illustrates that client a cannot receive a “sensorBusy” status if it does not hold  
 1073 the lock, even if a sensor operation is in progress (recall from §2.4.5 that sensor operations require  
 1074 holding the lock). Suppose there are two clients; Client A and Client B. Client A holds the lock and  
 1075 starts initialization on (Step 1–3). Immediately after Client A initiates capture, Client B (Step 4) tries  
 1076 to obtain the lock while Client A is still capturing. In this situation, the valid statuses that could be  
 1077 returned to Client B are “sensorBusy” (since the sensor is busy performing a capture) and  
 1078 “lockHeldByAnother” (since Client A holds the lock). In this case, the service returns  
 1079 “lockHeldByAnother” (Step 5) since “lockHeldByAnother” is higher priority than “sensorBusy.”

1080  
 1081 **Figure 6.** Example illustrating how a client cannot receive a “sensorBusy” status if it does not hold the lock.

## 1082 6.1.2 Parameter Failures

1083 Services MUST distinguish among `badValue`, `invalidId`, `noSuchParameter`, and `unsupported` according to  
 1084 the following rules. These rules are presented here in the order of precedence that matches the previous  
 1085 subsection.

- 1086 1. **Is a recognizable UUID provided?** If the operation requires a UUID as an input URL parameter,  
 1087 and the provided value is not an UUID (i.e., the UUID is *not* parseable), then the service MUST  
 1088 return `badValue`. Additionally, the Result’s `badFields` list MUST contain the name of the offending  
 1089 parameter (`sessionId` or `captureId`).

1090 ...otherwise...  
 1091  
 1092

- 1093 2. **Is the UUID understood?** If an operation requires an UUID as an input URL parameter, and the  
1094 provided value *is* a UUID, but the service cannot accept the provided value, then the service  
1095 MUST return `invalidId`. Additionally, the Result's `badFields` list MUST contain the name of the  
1096 offending parameter (`sessionId` or `captureId`).  
1097  
1098 *...otherwise...*  
1099  
1100 3. **Are the parameter names understood?** If an operation does not recognize a provided input  
1101 parameter *name*, then the service MUST return `noSuchParameter`. This behavior may differ from  
1102 service to service, as different services may recognize (or not recognize) different parameters.  
1103 The unrecognized parameter(s) MUST be listed in the Result's `badFields` list.  
1104  
1105 *...otherwise...*  
1106  
1107 4. **Are the parameter values acceptable?** If an operation recognizes all of the provided parameter  
1108 names, but cannot accept a provided *value* because it is (a) and inappropriate type, or (b) outside  
1109 the range advertised by the service (§4.1), the then service MUST return `badValue`. The  
1110 parameter names associated with the MUST values *must* be listed in the Result's `badFields` list.  
1111 Clients are expected to recover the bad values themselves by reconciling the Result  
1112 corresponding to the offending request.  
1113  
1114 *...otherwise...*  
1115  
1116 5. **Is the request supported?** If an operation accepts the parameter names and values, but the  
1117 particular request is not supported by the service or the target biometric sensor, then the service  
1118 MUST return `unsupported`. The parameter names that triggered this determination MUST be  
1119 listed in the Result's `badFields` list. By returning multiple fields, a service is able to imply that a  
1120 particular *combination* of provided values is unsupported.  
1121

1122 **NOTE:** It may be helpful to think of `invalidId` as a special case of `badValue` reserved for URL  
1123 parameters of type UUID.

## 1124 6.1.3 Visual Summaries

1125 The following two tables provide *informative* visual summaries of WS-BD operations. These visual  
1126 summaries are an overview; they are not authoritative. (§6.3–§6.21 are authoritative.)

### 1127 6.1.3.1 Input & Output

1128 The following table represents a visual summary of the inputs and outputs corresponding to each  
1129 operation.

1130 Operation *inputs* are indicated in the “URL Fragment” and “Input Payload” columns. Operation inputs take  
1131 the form of either (a) a URL parameter, with the parameter name shown in “curly brackets” (“{” and “}”)  
1132 within the URL fragment (first column), and/or, (b) a input payload (defined in §1.1).

1133 Operation *outputs* are provided via Result, which is contained in the body of an operation’s HTTP  
1134 response.  
1135

Summary of Operations Input/Output											
Operation	URL Fragment (Includes inputs)	Method	Input payload	Idempotent	Sensor Operation	Permitted Result Elements (within output payload)					Detailed Documentation (§)
						status	badFields	sessionId	metadata	captureIds	
register	/register	POST	none			●		●			6.3
unregister	/register/{sessionId}	DELETE	none	◆		●	●				6.4
try lock	/lock/{sessionId}	POST	none	◆		●	●				6.5
steal lock		PUT	none	◆		●	●				6.6
unlock		DELETE	none	◆		●	●				6.7
get service info	/info	GET	none	◆		●			●		6.8
initialize	/initialize/{sessionId}	POST	none	◆	■	●	●				6.9
uninitialize		DELETE	none	◆	■	●	●				6.10
get configuration	/configure/{sessionId}	GET	none	◆	■	●	●		●		6.11
set configuration		POST	config	◆	■	●	●				6.12
capture	/capture/{sessionId}	POST	none		■	●	●		●		6.13
begin capture	/capture/{sessionId}/async	POST	none		■	●	●				6.14
end capture	/capture/{sessionId}/async	PUT	none		■	●	●		●		6.15
download	/download/{captureid}	GET	none	◆		●	●		●	●	6.16
get download info	/download/{captureid}/info	GET	none	◆					●		6.17
thrifty download	/download/{captureid}/{maxSize}	GET	none	◆		●	●		●	●	6.18
get sensor data	/download/{captureid}/raw	GET	none	◆		●				●	6.19
cancel operation	/cancel/{sessionId}	POST	none	◆	■	●	●				6.20
get sensor status	/status	GET	none	◆		●			●		6.21

1136

1137 Presence of a symbol in a table cell indicates that operation is idempotent (◆), a sensor operation (■),  
 1138 and which elements may be present in the operation's Result (●). Likewise, the lack of a symbol in a  
 1139 table cell indicates the operation is not idempotent, not a sensor operation, and which elements of the  
 1140 operation's Result are forbidden.

1141 **EXAMPLE:** The *capture* operation (fifth row from the bottom) is not idempotent, but is a sensor  
 1142 operation. The output may contain the elements *status*, *badFields*, and/or *captureIds* in its  
 1143 Result. The detailed information regarding the Result for *capture*, (i.e., which elements are  
 1144 specifically permitted under what circumstances) is found in §6.13.

1145 The *message* element is not shown in this table for two reasons. First, when it appears, it is *always*  
 1146 optional. Second, to emphasize that the *message* content is only to be used for informative purposes; it  
 1147 MUST NOT be used as a vehicle for providing unique information that would inhibit a service's  
 1148 interoperability.

### 1149 6.1.3.2 Permitted Status Values

1150 The following table provides a visual summary of the status values permitted.

1151

Possible Status Values Per Operation																
Operation Description	Status Values															
	success	failure	invalidId	canceled	canceledWithSensorFailure	sensorFailure	lockNotHeld	lockHeldByAnother	initializationNeeded	configurationNeeded	sensorBusy	sensorTimeout	unsupported	badValue	noSuchParameter	preparingDownload
register	•	•														
unregister	•	•	•								•			•		
try lock	•	•	•					•						•		
steal lock	•	•	•											•		
unlock	•	•	•					•						•		
get service info	•	•														
initialize	•	•	•	•	•	•	•	•			•	•		•		
uninitialize	•	•	•	•	•	•	•	•			•	•		•		
get configuration	•	•	•	•	•	•	•	•	•	•	•	•		•		
set configuration	•	•	•	•	•	•	•	•	•		•	•	•	•	•	
capture	•	•	•	•	•	•	•	•	•	•	•	•		•		
begin capture	•	•	•	•	•	•	•	•	•	•	•	•		•		
end capture	•	•	•	•	•	•	•	•			•	•		•		
download	•	•	•											•		•
get download info	•	•	•											•		•
thrifty download	•	•	•										•	•		•
get sensor data																
cancel	•	•	•				•	•						•		
get sensor status	•															

1152 The presence (absence) of a symbol in a cell indicates that the respective status may (may not) be  
1153 returned by the corresponding operation.

1154 **EXAMPLE:** The *register* operation may only return a Result with a Status that contains either  
1155 success or failure. The *unregister* operation may only return success, failure, invalidId,  
1156 sensorBusy, or badValue.

1157 The visual summary does not imply that services may return these values arbitrarily—the services MUST  
1158 adhere to the behaviors as specified in their respective sections.

## 1159 6.2 Documentation Conventions

1160 Each WS-BD operation is documented according to the following conventions.

### 1161 6.2.1 General Information

1162 Each operation begins with the following tabular summary:

<b>Description</b>	A short description of the operation
<b>URL Template</b>	The suffix used to access the operation. These take the form /resourceName

or

```
/resourceName/{URL_parameter_1}/.../{URL_parameter_N}
```

Each parameter, {URL\_parameter...} MUST be replaced, in-line with that parameter's value.

A single, optional parameter, [Optional\_parameter], is allowed. If present, it MUST be the last component of the URL. It MUST be either replaced, in-line with the parameter's value or omitted from the URL.

Parameters have no explicit names, other than defined by this document or reported back to the client within the contents of a `badFields` element.

It is assumed that consumers of the service will prepend the URL to the service endpoint as appropriate.

**EXAMPLE:** The resource `resourceName` hosted at the endpoint

```
http://example.com/Service
```

would be accessible via

```
http://example.com/Service/resourceName
```

<b>HTTP Method</b>	The HTTP method that triggers the operation, i.e., GET, POST, PUT, or DELETE
<b>URL Parameters</b>	A description of the URL-embedded operation parameters. For each parameter the following details are provided: <ul style="list-style-type: none"><li>• the name of the parameter</li><li>• the expected data type (§3)</li><li>• a description of the parameter</li></ul>
<b>Input Payload</b>	A description of the content, if any, to be posted to the service as input to an operation.
<b>Idempotent</b>	Yes—the operation is idempotent (§2.4.7). No—the operation is not idempotent.
<b>Sensor Operation (Lock Required)</b>	Yes—the service may require exclusive control over the target biometric sensor. No—this operation does not require a lock.  Given the concurrency model (§2.4.5) this value doubles as documentation as to whether or not a lock is required

## 1163 6.2.2 Result Summary

1164 This subsection summarizes the various forms of a Result that may be returned by the operation. Each  
1165 row represents a distinct combination of permitted values & elements associated with a particular status.  
1166 An operation that returns `success` MAY also provide additional information other than `status`.

```
success status="success"
```

failure	status="failure" message*=informative message describing failure
[status value]	status=status literal [required element name]=description of permitted contents of the element [optional element name]*=description of permitted contents of the element

1167 For each row, the left column contains a permitted status value, and the right column contains a summary  
1168 of the constraints on the Result when the `status` element takes that specific value. The vertical ellipses  
1169 at the bottom of the table signify that the summary table may have additional rows that summarize other  
1170 permitted status values.

1171 Data types without an explicit namespace or namespace prefix are members of the `wsbd` namespace as  
1172 defined in §3.1.

1173 Element names suffixed with a '\*' indicate that the element is *optional*.

### 1174 6.2.3 Usage Notes

1175 Each of the following subsections describes behaviors & requirements that are specific to its respective  
1176 operation.

### 1177 6.2.4 Unique Knowledge

1178 For each operation, there is a brief description of whether or not the operation affords an opportunity for  
1179 the server or client to exchange information unique to a particular implementation. The term "unique  
1180 knowledge" is used to reflect the definition of interoperability referenced in §2.1.

### 1181 6.2.5 Return Values Detail

1182 This subsection details the various return values that the operation may return. For each permitted status  
1183 value, the following table details the Result requirements:

<b>Status Value</b>	The particular status value
<b>Condition</b>	The service accepts the registration request
<b>Required Elements</b>	A list of the required elements. For each required element, the element name, its expected contents, and expected data type is listed. If no namespace prefix is specified, then the <code>wsbd</code> namespace (§3.1) is inferred.  For example, <code>badFields={"sessionId"} (StringArray, §3.7)</code>  Indicates that <code>badFields</code> is a required element, and that the contents of the element <b>MUST</b> be a <code>wsbd:StringArray</code> containing the single literal "sessionId".
<b>Optional Elements</b>	A list of the required elements. Listed for each optional element are the element names and its expected contents.

1184 Constraints and information unique to the particular operation/status combination may follow the table,  
1185 but some status values have no trailing explanatory text.

1186 A data type without an explicit namespace or namespace prefix implies it is a member of the wsbd  
1187 namespace as defined in §3.1.

## 1188 6.3 Register

<b>Description</b>	Open a new client-server session
<b>URL Template</b>	/register
<b>HTTP Method</b>	POST
<b>URL Parameters</b>	None
<b>Input Payload</b>	None
<b>Idempotent</b>	No
<b>Sensor Operation</b>	No

### 1189 6.3.1 Result Summary

success	status="success" sessionId=session id (UUID, §3.2)
failure	status="failure" message*=informative message describing failure

### 1190 6.3.2 Usage Notes

1191 *Register* provides a unique identifier that can be used to associate a particular client with a server.

1192 In a sequence of operations with a service, a *register* operation is likely one of the first operations  
1193 performed by a client (*get service info* being the other). It is expected (but not required) that a client would  
1194 perform a single registration during that client's lifetime.

1195 **DESIGN NOTE:** By using an UUID, as opposed to the source IP address, a server can distinguish among  
1196 clients sharing the same originating IP address (i.e., multiple clients on a single machine, or multiple  
1197 machines behind a firewall). Additionally, a UUID allows a client (or collection of clients) to determine  
1198 client identity rather than enforcing a particular model (§2.4.3).

### 1199 6.3.3 Unique Knowledge

1200 As specified, the *register* operation cannot be used to provide or obtain knowledge about unique  
1201 characteristics of a client or service.

### 1202 6.3.4 Return Values Detail

1203 The *register* operation MUST return a Result according to the following constraints.

#### 1204 6.3.4.1 Success

<b>Status Value</b>	success
<b>Condition</b>	The service accepts the registration request
<b>Required Elements</b>	status (Status, §3.12) the literal "success"

<code>sessionId</code> (UUID, §3.2)	an identifier that can be used to identify a session
<b>Optional Elements</b>	None

1205 The “register” operation MUST NOT provide a `sessionId` of 00000000-0000-0000-0000-000000000000.

1206 **6.3.4.2 Failure**

<b>Status Value</b>	<code>failure</code>
<b>Condition</b>	The service cannot accept the registration request
<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “failure”
<b>Optional Elements</b>	<code>message</code> (xs:string, [XSDPart2]) an informative description of the nature of the failure

1207 Registration might fail if there are too many sessions already registered with a service. The `message`  
 1208 element SHALL only be used for informational purposes. Clients MUST NOT depend on particular  
 1209 contents of the `message` element to control client behavior.

1210 See §4 and §A.2 for how a client can use sensor metadata to determine the maximum number of current  
 1211 sessions a service can support.

1212 **6.4 Unregister**

<b>Description</b>	Close a client-server session
<b>URL Template</b>	<code>/register/{sessionId}</code>
<b>HTTP Method</b>	DELETE
<b>URL Parameters</b>	<code>{sessionId}</code> (UUID, §3.2) Identity of the session to remove
<b>Input Payload</b>	None
<b>Idempotent</b>	Yes
<b>Sensor Operation</b>	No

1213 **6.4.1 Result Summary**

<code>success</code>	<code>status="success"</code>
<code>failure</code>	<code>status="failure"</code> <code>message*=informative message describing failure</code>
<code>sensorBusy</code>	<code>status="sensorBusy"</code>
<code>badValue</code>	<code>status="badValue"</code> <code>badFields={"sessionId"} (StringArray, §3.7)</code>

1214 **6.4.2 Usage Notes**

1215 *Unregister* closes a client-server session. Although not strictly necessary, clients SHOULD unregister  
1216 from a service when it is no longer needed. Given the lightweight nature of sessions, services SHOULD  
1217 support (on the order of) thousands of concurrent sessions, but this cannot be guaranteed, particularly if  
1218 the service is running within limited computational resources. Conversely, clients SHOULD assume that  
1219 the number of concurrent sessions that a service can support is limited. (See §A.2 for details on  
1220 connection metadata.)

1221 **6.4.2.1 Inactivity**

1222 A service MAY automatically unregister a client after a period of inactivity, or if demand on the service  
1223 requires that least-recently used sessions be dropped. This is manifested by a client receiving a status of  
1224 *invalidId* without a corresponding unregistration. Services SHALL set the inactivity timeout to a value  
1225 specified in minutes. (See §A.2 for details on connection metadata.)

1226 **6.4.2.2 Sharing Session Ids**

1227 A session id is not a secret, but clients that share session ids run the risk of having their session  
1228 prematurely terminated by a rogue peer client. This behavior is permitted, but discouraged. See §2.4 for  
1229 more information about client identity and the assumed security models.

1230 **6.4.2.3 Locks & Pending Sensor Operations**

1231 If a client that holds the service lock unregisters, then a service MUST also release the service lock, with  
1232 one exception. If the unregistering client both holds the lock and is responsible for a pending sensor  
1233 operation, the service MUST return *sensorBusy* (See §6.4.4.3).

1234 **6.4.3 Unique Knowledge**

1235 As specified, the *unregister* operation cannot be used to provide or obtain knowledge about unique  
1236 characteristics of a client or service.

1237 **6.4.4 Return Values Detail**

1238 The *unregister* operation MUST return a Result according to the following constraints.

1239 **6.4.4.1 Success**

<b>Status Value</b>	<i>success</i>
<b>Condition</b>	The service accepted the unregistration request
<b>Required Elements</b>	<i>status</i> (Status, §3.12) the literal “ <i>success</i> ”
<b>Optional Elements</b>	None

1240 If the unregistering client currently holds the service lock, and the requesting client is not responsible for  
1241 any pending sensor operation, then successful unregistration MUST also release the service lock.

1242 As a consequence of idempotency, a session id does not need to ever have been registered successfully  
1243 in order to *unregister* successfully. Consequently, the *unregister* operation cannot return a status of  
1244 *invalidId*.

1245 **6.4.4.2 Failure**

<b>Status Value</b>	failure
<b>Condition</b>	The service could not unregister the session.
<b>Required Elements</b>	status (Status, §3.12) the literal "failure"
<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure

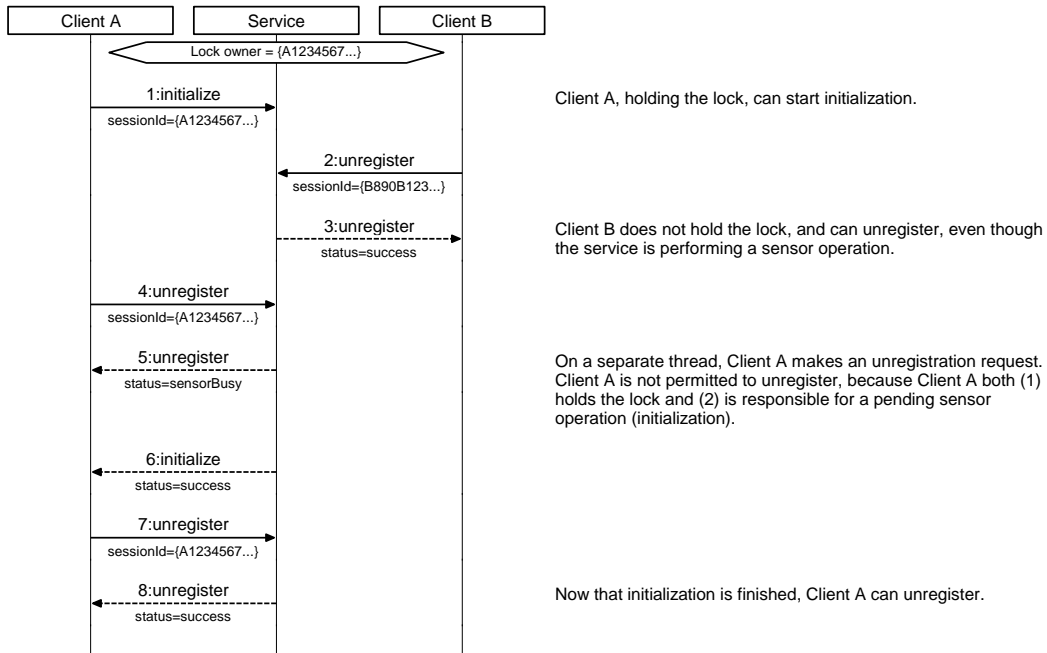

1246 In practice, failure to unregister is expected to be a rare occurrence. Failure to unregister might occur if  
 1247 the service experiences a fault with an external system (such as a centralized database used to track  
 1248 session registration and unregistration)

1249 **6.4.4.3 Sensor Busy**

<b>Status Value</b>	sensorBusy
<b>Condition</b>	The service could not unregister the session because the biometric sensor is currently performing a sensor operation within the session being unregistered.
<b>Required Elements</b>	status (Status, §3.12) the literal "sensorBusy"
<b>Optional Elements</b>	None

1250 This status MUST only be returned if (a) the sensor is busy and (b) the client making the request holds  
 1251 the lock (i.e., the session id provided matches that associated with the current service lock). Any client  
 1252 that does not hold the session lock MUST NOT result in a sensorBusy status.

1253 **EXAMPLE:** The following sequence diagram illustrates a client that cannot unregister (Client A)  
 1254 and a client that can unregister (Client B). After the initialize operation completes (Step 6), Client  
 1255 A can unregister (Steps 7-8).

1256

1257 **Figure 7.** Example of how an `unregister` operation can result in `sensorBusy`.

1258

1259 **6.4.4.4 Bad Value**

<b>Status Value</b>	<code>badValue</code>
<b>Condition</b>	The provided session id is not a well-formed UUID.
<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “ <code>badValue</code> ” <code>badFields</code> (StringArray, §3.7) an array that contains the single field name, “ <code>sessionId</code> ”
<b>Optional Elements</b>	None

1260 See §6.1.2 for general information on how services MUST handle parameter failures.

1261 **6.5 Try Lock**

<b>Description</b>	Try to obtain the service lock
<b>URL Template</b>	<code>/lock/{sessionId}</code>
<b>HTTP Method</b>	POST
<b>URL Parameters</b>	<code>{sessionId}</code> (UUID, §3.2) Identity of the session requesting the service lock
<b>Input Payload</b>	None
<b>Idempotent</b>	Yes

**Sensor Operation** No

## 1262 6.5.1 Result Summary

success	status="success"
failure	status="failure" message*=informative message describing failure
lockHeldByAnother	status="lockHeldByAnother"
badValue	status="badValue" badFields={"sessionId"} (StringArray, §3.7)
invalidId	status="invalidId" badFields={"sessionId"} (StringArray, §3.7)

## 1263 6.5.2 Usage Notes

1264 The *try lock* operation attempts to obtain the service lock. The word “try” is used to indicate that the call  
1265 always returns immediately; it does not block until the lock is obtained. See §2.4.5 for detailed information  
1266 about the WS-BD concurrency and locking model.

## 1267 6.5.3 Unique Knowledge

1268 As specified, the *try lock* cannot be used to provide or obtain knowledge about unique characteristics of a  
1269 client or service.

## 1270 6.5.4 Return Values Detail

1271 The *try lock* operation MUST return a Result according to the following constraints.

### 1272 6.5.4.1 Success

<b>Status Value</b>	success
<b>Condition</b>	The service was successfully locked to the provided session id.
<b>Required Elements</b>	status (Status, §3.12) the literal “success”
<b>Optional Elements</b>	None

1273 See §2.4.5 for detailed information about the WS-BD concurrency and locking model. Cancellation MUST  
1274 have no effect on pending sensor operations (§6.6.2.3).

### 1275 6.5.4.2 Failure

<b>Status Value</b>	failure
<b>Condition</b>	The service could not be locked to the provided session id.
<b>Required Elements</b>	status (Status, §3.12) the literal “failure”
<b>Optional Elements</b>	message (xs:string, [XSDPart2])

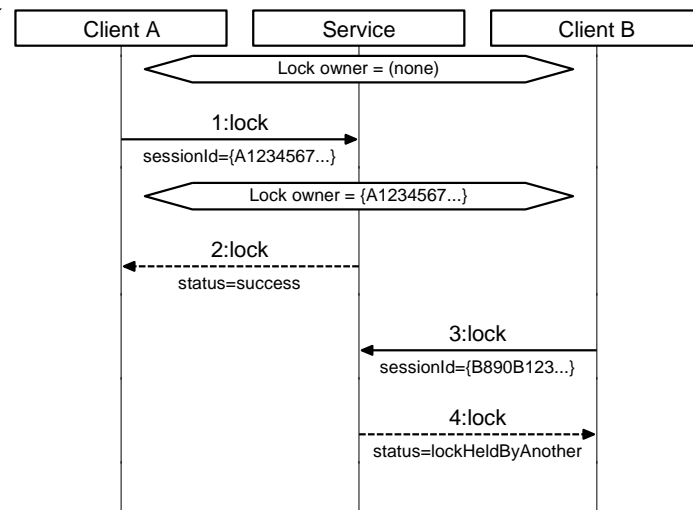

an informative description of the nature of the failure

1276 Services MUST reserve a `failure` status to report system or internal failures and prevent the acquisition  
 1277 of the lock. Most *try lock* operations that do not succeed will not produce a `failure` status, but more likely  
 1278 a `lockHeldByAnother` status (See §6.5.4.3 for an example).

### 1279 6.5.4.3 Lock Held by Another

<b>Status Value</b>	<code>lockHeldByAnother</code>
<b>Condition</b>	The service could not be locked to the provided session id because the lock is held by another client.
<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “ <code>lockHeldByAnother</code> ”
<b>Optional Elements</b>	None

1280 **EXAMPLE:** The following sequence diagram illustrates a client that cannot obtain the lock (Client B)  
 1281 because it is held by another client (Client A).

1282  
 1283 **Figure 8.** Example of a scenario yielding a `lockHeldByAnother` result.

### 1284 6.5.4.4 Bad Value

<b>Status Value</b>	<code>badValue</code>
<b>Condition</b>	The provided session id is not a well-formed UUID.
<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “ <code>badValue</code> ” <code>badFields</code> (StringArray, §3.7) an array that contains the single field name, “ <code>sessionId</code> ”
<b>Optional Elements</b>	None

1285 See §6.1.2 for general information on how services MUST handle parameter failures.

1286 **6.5.4.5 Invalid Id**

<b>Status Value</b>	invalidId
<b>Condition</b>	The provided session id is not registered with the service.
<b>Required Elements</b>	status (Status, §3.12) the literal "invalidId" badFields (StringArray, §3.7) an array that contains the single field name, "sessionId"
<b>Optional Elements</b>	None

1287 A session id is invalid if it does not correspond to an active registration. A session id may become  
 1288 unregistered from a service through explicit unregistration or triggered automatically by the service due to  
 1289 inactivity (§A.2.2).

1290 See §6.1.2 for general information on how services MUST handle parameter failures.

1291 **6.6 Steal Lock**

<b>Description</b>	Forcibly obtain the lock away from a peer client
<b>URL Template</b>	/lock/{sessionId}
<b>HTTP Method</b>	PUT
<b>URL Parameters</b>	{sessionId} (UUID, §3.2) Identity of the session requesting the service lock
<b>Input Payload</b>	None
<b>Idempotent</b>	Yes
<b>Sensor Operation</b>	No

1292 **6.6.1 Result Summary**

success	status="success"
failure	status="failure" message*=informative message describing failure
badValue	status="badValue" badFields={"sessionId"} (StringArray, §3.7)
invalidId	status="invalidId" badFields={"sessionId"} (StringArray, §3.7)

1293 **6.6.2 Usage Notes**

1294 The *steal lock* operation allows a client to forcibly obtain the lock away from another client that already  
 1295 holds the lock. The purpose of this operation is to prevent a client that experiences a fatal error from  
 1296 forever preventing another client access to the service, and therefore, the biometric sensor.

1297 **6.6.2.1 Avoid Lock Stealing**

1298 Developers and integrators SHOULD endeavor to reserve lock stealing for exceptional circumstances—  
1299 such as when a fatal error prevents a client from releasing a lock. Lock stealing SHOULD NOT be used  
1300 as the primary mechanism in which peer clients coordinate biometric sensor use.

1301 **6.6.2.2 Lock Stealing Prevention Period (LSPP)**

1302 To assist in coordinating access among clients and to prevent excessive lock stealing, a service may  
1303 trigger a time period that forbids lock stealing for each sensor operation. For convenience, this period of  
1304 time will be referred to as the *lock stealing prevention period (LSPP)*.

1305 During the LSPP, all attempts to steal the service lock will fail. Consequently, if a client experiences a  
1306 fatal failure during a sensor operation, then all peer clients need to wait until the service re-enables lock  
1307 stealing.

1308 All services SHOULD implement a non-zero LSPP. The recommended time for the LSPP is on the order  
1309 of 100 seconds. Services that enforce an LSPP MUST start the LSPP immediately before sovereign  
1310 sensor control is required. Conversely, services SHOULD NOT enforce an LSPP unless absolutely  
1311 necessary.

1312 If a request provides an invalid `sessionId`, then the operation SHALL return an `invalidId` status instead  
1313 of a `failure` regardless of the LSPP threshold and whether or not it has expired. A `failure` signifies that  
1314 the state of the service is still within the LSPP threshold and the provided `sessionId` is valid.

1315 A service MAY reinitiate a LSPP when an operation yields an undesirable result, such as `failure`. This  
1316 would allow a client to attempt to resubmit the request or recover without worrying about whether or not  
1317 the lock is still owned by the client's session. When an operation yields a desirable result, the service  
1318 SHOULD restart the LSPP. This would allow the client to call multiple successful operations without  
1319 needing to worry about whether or not the lock is still owned by the client's session.

1320 An LSPP ends after a fixed amount of time has elapsed, unless another sensor operation restarts the  
1321 LSPP. Services SHOULD keep the length of the LSPP fixed throughout the service's lifecycle. It is  
1322 recognized, however, that there may be use cases in which a variable LSPP timespan is desirable or  
1323 required. Regardless, when determining the appropriate timespan, implementers should carefully  
1324 consider the tradeoffs between preventing excessive lock stealing, versus forcing all clients to wait until a  
1325 service re-enables lock stealing.

1326 **6.6.2.3 Cancellation & (Lack of) Client Notification**

1327 Lock stealing MUST have no effect on any currently running sensor operations. It is possible that a client  
1328 initiates a sensor operation, has its lock stolen away, yet the operation completes successfully.  
1329 *Subsequent* sensor operations would yield a `lockNotHeld` status, which a client could use to indicate that  
1330 their lock was stolen away from them. Services SHOULD be implemented such that the LSPP is longer  
1331 than any sensor operation.

1332 **6.6.3 Unique Knowledge**

1333 As specified, the *steal lock* operation cannot be used to provide or obtain knowledge about unique  
1334 characteristics of a client or service.

1335 **6.6.4 Return Values Detail**

1336 The *steal lock* operation MUST return a Result according to the following constraints.

1337 **6.6.4.1 Success**

Status Value	success
Condition	The service was successfully locked to the provided session id.

<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “success”
--------------------------	--

<b>Optional Elements</b>	None
--------------------------	------

1338 See §2.4.5 for detailed information about the WS-BD concurrency and locking model. Cancellation MUST  
1339 have no effect on pending sensor operations (§6.6.2.3).

#### 1340 6.6.4.2 Failure

<b>Status Value</b>	<code>failure</code>
---------------------	----------------------

<b>Condition</b>	The service could not be locked to the provided session id.
------------------	---

<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “failure”
--------------------------	--

<b>Optional Elements</b>	<code>message</code> (xs:string, [XSDPart2]) an informative description of the nature of the failure
--------------------------	---

1341 Most *steal lock* operations that yield a `failure` status will do so because the service receives a lock  
1342 stealing request during a lock stealing prevention period (§6.6.2.2). Services MUST also reserve a  
1343 `failure` status for other non-LSPP failures that prevent the acquisition of the lock.

1344 Implementers MAY choose to use the optional `message` field to provide more information to an end-user  
1345 as to the specific reasons for the failure. However (as with all other `failure` status results), clients MUST  
1346 NOT depend on any particular content to make this distinction.

#### 1347 6.6.4.3 Bad Value

<b>Status Value</b>	<code>badValue</code>
---------------------	-----------------------

<b>Condition</b>	The provided session id is not a well-formed UUID.
------------------	--

<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “badValue” <code>badFields</code> (StringArray, §3.7) an array that contains the single field name, “ <code>sessionId</code> ”
--------------------------	---

<b>Optional Elements</b>	None
--------------------------	------

1348 See §6.1.2 for general information on how services MUST handle parameter failures.

#### 1349 6.6.4.4 Invalid Id

<b>Status Value</b>	<code>invalidId</code>
---------------------	------------------------

<b>Condition</b>	The provided session id is not registered with the service.
------------------	---

<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “invalidId” <code>badFields</code> (StringArray, §3.7)
--------------------------	--

an array that contains the single field name, "sessionId"

**Optional Elements** None

1350 A session id is invalid if it does not correspond to an active registration. A session id may become  
1351 unregistered from a service through explicit unregistration or triggered automatically by the service due to  
1352 inactivity (§A.2.2).

1353 See §6.1.2 for general information on how services MUST handle parameter failures.

## 1354 6.7 Unlock

<b>Description</b>	Release the service lock
<b>URL Template</b>	/lock/{sessionId}
<b>HTTP Method</b>	DELETE
<b>URL Parameters</b>	{sessionId} (UUID, §3.2) Identity of the session releasing the service lock
<b>Input Payload</b>	None
<b>Idempotent</b>	Yes
<b>Sensor Operation</b>	No

### 1355 6.7.1 Result Summary

success	status="success"
failure	status="failure" message*=informative message describing failure
sensorBusy	status="sensorBusy"
lockHeldByAnother	status="lockHeldByAnother"
badValue	status="badValue" badFields={"sessionId"} (StringArray, §3.7)
invalidId	status="invalidId" badFields={"sessionId"} (StringArray, §3.7)

### 1356 6.7.2 Usage Notes

1357 The *unlock* operation releases a service lock, making locking available to other clients.

1358 See §2.4.5 for detailed information about the WS-BD concurrency and locking model.

### 1359 6.7.3 Unique Knowledge

1360 As specified, the *unlock* operation cannot be used to provide or obtain knowledge about unique  
1361 characteristics of a client or service.

### 1362 6.7.4 Return Values Detail

1363 The *unlock* operation MUST return a Result according to the following constraints.

1364 **6.7.4.1 Success**

<b>Status Value</b>	success
<b>Condition</b>	The service returned to an unlocked state.
<b>Required Elements</b>	status (Status, §3.12) the literal "success"
<b>Optional Elements</b>	None

1365 Upon releasing the lock, a client is no longer permitted to perform any sensor operations (§2.4.5). By  
 1366 idempotency (§2.4.7), if a client already has released the lock, subsequent *unlock* operations SHOULD  
 1367 also return success.

1368 **6.7.4.2 Failure**

<b>Status Value</b>	failure
<b>Condition</b>	The service could not be transitioned into an unlocked state.
<b>Required Elements</b>	status (Status, §3.12) the literal "failure"
<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure

1369 Services MUST reserve a failure status to report system or internal failures and prevent the release of  
 1370 the service lock. The occurrence of *unlock* operations that fail is expected to be rare.

1371 **6.7.4.3 Sensor Busy**

<b>Status Value</b>	sensorBusy
<b>Condition</b>	The service could not unlock the session because the biometric sensor is currently performing a sensor operation within the session being unlocked.
<b>Required Elements</b>	status (Status, §3.12) the literal "sensorBusy"
<b>Optional Elements</b>	None

1372 This status MUST only be returned if (a) the sensor is busy and (b) the client making the request holds  
 1373 the lock (i.e., the session id provided matches that associated with the current service lock). Any client  
 1374 that does not hold the session lock MUST NOT result in a sensorBusy status.

1375 **6.7.4.4 Lock Held by Another**

<b>Status Value</b>	lockHeldByAnother
<b>Condition</b>	The lock is held by another client.
<b>Required Elements</b>	status (Status, §3.12) the literal "lockHeldByAnother"

<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure
--------------------------	--

1376 **6.7.4.5 Bad Value**

<b>Status Value</b>	badValue
<b>Condition</b>	The provided session id is not a well-formed UUID.
<b>Required Elements</b>	status (Status, §3.12) the literal "badValue" badFields (StringArray, §3.7) an array that contains the single field name, "sessionId"
<b>Optional Elements</b>	None

1377 See §6.1.2 for general information on how services MUST handle parameter failures.

1378 **6.7.4.6 Invalid Id**

<b>Status Value</b>	invalidId
<b>Condition</b>	The provided session id is not registered with the service.
<b>Required Elements</b>	status (Status, §3.12) the literal "invalidId" badFields (StringArray, §3.7) an array that contains the single field name, "sessionId"
<b>Optional Elements</b>	None

1379 A session id is invalid if it does not correspond to an active registration. A session id may become  
1380 unregistered from a service through explicit unregistration or triggered automatically by the service due to  
1381 inactivity (§A.2.2).

1382 See §6.1.2 for general information on how services MUST handle parameter failures.

1383 **6.8 Get Service Info**

<b>Description</b>	Retrieve metadata about the service that does not depend on session-specific information, or sovereign control of the target biometric sensor
<b>URL Template</b>	/info
<b>HTTP Method</b>	GET
<b>URL Parameters</b>	None
<b>Input Payload</b>	None
<b>Idempotent</b>	Yes

1384 **6.8.1 Result Summary**

success	status="success" metadata=dictionary containing service metadata (Dictionary, §3.3)
failure	status="failure" message*=informative message describing failure

1385 **6.8.2 Usage Notes**

1386 The *get service info* operation provides information about the service and target biometric sensor. This  
 1387 operation MUST return information that is both (a) independent of session, and (b) does not require  
 1388 sovereign biometric sensor control. In other words, services MUST NOT control the target biometric  
 1389 sensor during a *get service info* operation itself. Implementations MAY (and are encouraged to) use  
 1390 service startup time to query the biometric sensor directly to create a cache of information and capabilities  
 1391 for *get service info* operations. The service should keep a cache of sensor and service metadata to  
 1392 reduce the amount of operations that query the sensor as this can be a lengthy operation.

1393 The *get service info* operation does *not* require that a client be registered with the service. Unlike other  
 1394 operations, it does *not* take a session id as a URL parameter.

1395 See §4.1 for information about the metadata returned from this operation.

1396 **EXAMPLE:** The following represents a 'raw' request to get the service's metadata.

```
1397 GET http://10.0.0.8:8000/Service/info HTTP/1.1
1398 Content-Type: application/xml
1399 Host: 10.0.0.8:8000
```

1400 **EXAMPLE:** The following is the 'raw' response from the above request. The metadata element of the  
 1401 result contains a Dictionary (§3.3) of parameter names and parameter information represented as a  
 1402 Parameter (§3.4).

```
1403 HTTP/1.1 200 OK
1404 Content-Length: 2931
1405 Content-Type: application/xml; charset=utf-8
1406 Server: Microsoft-HTTPAPI/2.0
1407 Date: Tue, 03 Jan 2012 14:54:51 GMT
1408
1409 <result
1410   xmlns="http://docs.oasis-open.org/bioserv/ns/wsbd-1.0"
1411   xmlns:xs="http://www.w3.org/2001/XMLSchema"
1412   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
1413
1414   <status>success</status>
1415   <metadata>
1416     <item>
1417       <key>width</key>
1418       <value xsi:type="Parameter">
1419         <name>width</name>
1420         <type>xs:unsignedInt</type>
1421         <defaultValue xsi:type="xs:int">800</defaultValue>
1422         <allowedValues>
1423           <allowedValue xsi:type="xs:int">1280</allowedValue>
1424           <allowedValue xsi:type="xs:int">960</allowedValue>
1425           <allowedValue xsi:type="xs:int">800</allowedValue>
1426           <allowedValue xsi:type="xs:int">640</allowedValue>
1427           <allowedValue xsi:type="xs:int">424</allowedValue>

1485 </metadata>
1486 </result>

```

1487

### 1488 6.8.3 Unique Knowledge

1489 As specified, the *get service info* can be used to obtain knowledge about unique characteristics of a  
1490 service. Through *get service info*, a service may expose implementation and/or service-specific  
1491 configuration parameter names and values that are not defined in this document (see Appendix A for  
1492 further information on parameters).

### 1493 6.8.4 Return Values Detail

1494 The *get service info* operation MUST return a Result according to the following constraints.

#### 1495 6.8.4.1 Success

<b>Status Value</b>	success
<b>Condition</b>	The service provides service metadata
<b>Required Elements</b>	status (Status, §3.12)

	the literal "success" metadata (Dictionary, §3.3) information about the service metadata
<b>Optional Elements</b>	None

1496 **6.8.4.2 Failure**

<b>Status Value</b>	failure
<b>Condition</b>	The service cannot provide service metadata
<b>Required Elements</b>	status (Status, §3.12) the literal "failure"
<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure

1497 **6.9 Initialize**

<b>Description</b>	Initialize the target biometric sensor
<b>URL Template</b>	/initialize/{sessionId}
<b>HTTP Method</b>	POST
<b>URL Parameters</b>	{sessionId} (UUID, §3.2) Identity of the session requesting initialization
<b>Input Payload</b>	None
<b>Idempotent</b>	Yes
<b>Sensor Operation</b>	Yes

1498 **6.9.1 Result Summary**

success	status="success"
failure	status="failure" message*=informative message describing failure
sensorTimeout	status="sensorTimeout"
sensorFailure	status="sensorFailure"
sensorBusy	status="sensorBusy"
lockNotHeld	status="lockNotHeld"
lockHeldByAnother	status="lockHeldByAnother"
canceled	status="canceled"
canceledWithSensorFailure	status="canceledWithSensorFailure"
badValue	status="badValue" badFields={"sessionId"} (StringArray, §3.7)

```
invalidId status="invalidId"
      badFields={"sessionId"} (StringArray, §3.7)
```

## 1499 6.9.2 Usage Notes

1500 The *initialize* operation prepares the target biometric sensor for (other) sensor operations.

1501 Some biometric sensors have no requirement for explicit initialization. In that case, the service SHOULD  
1502 immediately return a *success* result.

1503 Services SHOULD directly map this operation to the initialization of the target biometric sensor, unless the  
1504 service can reliably determine that the target biometric sensor is in a fully operational state. In other  
1505 words, a service may decide to immediately return *success* if there is a reliable way to detect if the target  
1506 biometric sensor is currently in an initialized state. This style of “short circuit” evaluation could reduce  
1507 initialization times. However, a service that always initializes the target biometric sensor would enable the  
1508 ability of a client to attempt a manual reset of a sensor that has entered a faulty state. This is particularly  
1509 useful in physically separated service implementations where the connection between the target biometric  
1510 sensor and the web service host may be less reliable than an integrated implementation.

## 1511 6.9.3 Unique Knowledge

1512 As specified, the *initialize* operation cannot be used to provide or obtain knowledge about unique  
1513 characteristics of a client or service.

## 1514 6.9.4 Return Values Detail

### 1515 6.9.4.1 Success

<b>Status Value</b>	<i>success</i>
<b>Condition</b>	The service successfully initialized the target biometric sensor
<b>Required Elements</b>	<i>status</i> the literal "success"
<b>Optional Elements</b>	None

### 1516 6.9.4.2 Failure

<b>Status Value</b>	<i>failure</i>
<b>Condition</b>	The service experienced a fault that prevented successful initialization.
<b>Required Elements</b>	<i>status</i> (Status, §3.12) the literal "failure"
<b>Optional Elements</b>	<i>message</i> (xs:string, [XSDPart2]) an informative description of the nature of the failure

1517 A *failure* status MUST only be used to report failures that occurred within the web service, not within the  
1518 target biometric sensor (§6.9.4.9, §6.9.4.4)

### 1519 6.9.4.3 Sensor Timeout

<b>Status Value</b>	<i>sensorTimeout</i>
---------------------	----------------------

<b>Condition</b>	Initialization could not be performed because the target biometric sensor took too long to complete the initialization request.
<b>Required Elements</b>	status (Status, §3.12) the literal "sensorTimeout"
<b>Optional Elements</b>	None

1520 A service did not receive a timely response from the target biometric sensor. Note that this condition is  
1521 distinct from the client's originating HTTP request, which may have its own, independent timeout. (See  
1522 A.2 for information on how a client might determine timeouts.)

#### 1523 6.9.4.4 Sensor Failure

<b>Status Value</b>	sensorFailure
<b>Condition</b>	The initialization failed due to a failure within the target biometric sensor
<b>Required Elements</b>	status (Status, §3.12) the literal "sensorFailure"
<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure

1524 A sensorFailure status MUST only be used to report failures that occurred within the target biometric  
1525 sensor, not a failure within the web service (§6.9.4.2).

#### 1526 6.9.4.5 Sensor Busy

<b>Status Value</b>	sensorBusy
<b>Condition</b>	Initialization could not be performed because the service is already performing a different sensor operation for the requesting client.
<b>Required Elements</b>	status (Status, §3.12) the literal "sensorBusy"
<b>Optional Elements</b>	None

#### 1527 6.9.4.6 Lock Not Held

<b>Status Value</b>	lockNotHeld
<b>Condition</b>	Initialization could not be performed because the requesting client does not hold the lock
<b>Required Elements</b>	status (Status, §3.12) the literal "lockNotHeld"
<b>Optional Elements</b>	None

1528 Sensor operations require that the requesting client holds the service lock.

1529 **6.9.4.7 Lock Held by Another**

<b>Status Value</b>	lockHeldByAnother
<b>Condition</b>	Initialization could not be performed because the lock is held by another client.
<b>Required Elements</b>	status (Status, §3.12) the literal “lockHeldByAnother”
<b>Optional Elements</b>	None

1530 **6.9.4.8 Canceled**

<b>Status Value</b>	canceled
<b>Condition</b>	The initialization operation was interrupted by a cancellation request.
<b>Required Elements</b>	status (Status, §3.12) the literal “canceled”
<b>Optional Elements</b>	None

1531 See §6.20.2.2 for information about what may trigger a cancellation.

1532 **6.9.4.9 Canceled with Sensor Failure**

<b>Status Value</b>	canceledWithSensorFailure
<b>Condition</b>	The initialization operation was interrupted by a cancellation request and the target biometric sensor experienced a failure
<b>Required Elements</b>	status (Status, §3.12) the literal “canceledWithSensorFailure”
<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure

1533 Services MUST return a canceledWithSensorFailure result if a cancellation request caused a failure  
 1534 within the target biometric sensor. Clients receiving this result may need to reattempt the initialization  
 1535 request to restore full functionality. See §6.20.2.2 for information about what may trigger a cancellation.

1536 **6.9.4.10 Bad Value**

<b>Status Value</b>	badValue
<b>Condition</b>	The provided session id is not a well-formed UUID.
<b>Required Elements</b>	status (Status, §3.12) the literal “badValue” badFields (StringArray, §3.7) an array that contains the single field name, “sessionId”

**Optional Elements** None

1537 See §6.1.2 for general information on how services MUST handle parameter failures.

### 1538 6.9.4.11 Invalid Id

<b>Status Value</b>	invalidId
<b>Condition</b>	The provided session id is not registered with the service.
<b>Required Elements</b>	status (Status, §3.12) the literal "invalidId" badFields (StringArray, §3.7) an array that contains the single field name, "sessionId"
<b>Optional Elements</b>	None

1539 A session id is invalid if it does not correspond to an active registration. A session id may become  
1540 unregistered from a service through explicit unregistration or triggered automatically by the service due to  
1541 inactivity (§A.2.2).

1542 See §6.1.2 for general information on how services MUST handle parameter failures.

## 1543 6.10 Uninitialize

<b>Description</b>	Uninitialize the target biometric sensor
<b>URL Template</b>	/initialize/{sessionId}
<b>HTTP Method</b>	DELETE
<b>URL Parameters</b>	{sessionId} (UUID, §3.2) Identity of the session requesting initialization
<b>Input Payload</b>	None
<b>Idempotent</b>	Yes
<b>Sensor Operation</b>	Yes

### 1544 6.10.1 Return Values Detail

success	status="success"
failure	status="failure" message*=informative message describing failure
sensorTimeout	status="sensorTimeout"
sensorFailure	status="sensorFailure"
sensorBusy	status="sensorBusy"
lockNotHeld	status="lockNotHeld"
lockHeldByAnother	status="lockHeldByAnother"

canceled	status="canceled"
canceledWithSensorFailure	status="canceledWithSensorFailure"
badValue	status="badValue" badFields={"sessionId"} (StringArray, §3.7)
invalidId	status="invalidId" badFields={"sessionId"} (StringArray, §3.7)

1545 **6.10.2 Usage Note**

1546 The *uninitialize* operation closes connection to the target biometric sensor for (other) sensor operations.  
 1547 Some biometric sensors have no requirement for explicit uninitialization. In that case, the service  
 1548 SHOULD immediately return a success result.

1549 **6.10.3 Unique Knowledge**

1550 As specified, the *uninitialize* operation cannot be used to provide or obtain knowledge about unique  
 1551 characteristics of a client or service

1552 **6.10.4 Return Values Detail**

1553 **6.10.4.1 Success**

<b>Status Value</b>	success
<b>Condition</b>	The service successfully uninitialized the target biometric sensor
<b>Required Elements</b>	status the literal "success"
<b>Optional Elements</b>	None

1554 **6.10.4.2 Failure**

<b>Status Value</b>	failure
<b>Condition</b>	The service experienced a fault that prevented successful uninitialization.
<b>Required Elements</b>	status (Status, §3.12) the literal "failure"
<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure

1555 A failure status MUST only be used to report failures that occurred within the web service, not within the  
 1556 target biometric sensor (§6.9.4.9, §6.9.4.4)

1557 **6.10.4.3 Sensor Timeout**

<b>Status Value</b>	sensorTimeout
<b>Condition</b>	Uninitialization could not be performed because the target biometric sensor took too long to complete the uninitialization request.

<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “ <code>sensorTimeout</code> ”
<b>Optional Elements</b>	None

1558 A service did not receive a timely response from the target biometric sensor. Note that this condition is  
 1559 distinct from the client’s originating HTTP request, which may have its own, independent timeout. (See  
 1560 A.2 for information on how a client might determine timeouts.)

#### 1561 6.10.4.4 Sensor Failure

<b>Status Value</b>	<code>sensorFailure</code>
<b>Condition</b>	The uninitialization failed due to a failure within the target biometric sensor
<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “ <code>sensorFailure</code> ”
<b>Optional Elements</b>	<code>message</code> (xs:string, [XSDPart2]) an informative description of the nature of the failure

1562 A `sensorFailure` status MUST only be used to report failures that occurred within the target biometric  
 1563 sensor, not a failure within the web service (§6.9.4.2).

#### 1564 6.10.4.5 Sensor Busy

<b>Status Value</b>	<code>sensorBusy</code>
<b>Condition</b>	Uninitialization could not be performed because the service is already performing a different sensor operation for the requesting client.
<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “ <code>sensorBusy</code> ”
<b>Optional Elements</b>	None

#### 1565 6.10.4.6 Lock Not Held

<b>Status Value</b>	<code>lockNotHeld</code>
<b>Condition</b>	Uninitialization could not be performed because the requesting client does not hold the lock
<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “ <code>lockNotHeld</code> ”
<b>Optional Elements</b>	None

1566 Sensor operations require that the requesting client holds the service lock.

#### 1567 6.10.4.7 Lock Held by Another

<b>Status Value</b>	<code>lockHeldByAnother</code>
---------------------	--------------------------------

<b>Condition</b>	Uninitialization could not be performed because the lock is held by another client.
<b>Required Elements</b>	status (Status, §3.12) the literal "lockHeldByAnother"
<b>Optional Elements</b>	None

1568 **6.10.4.8 Canceled**

<b>Status Value</b>	canceled
<b>Condition</b>	The uninitialization operation was interrupted by a cancellation request.
<b>Required Elements</b>	status (Status, §3.12) the literal "canceled"
<b>Optional Elements</b>	None

1569 See §6.20.2.2 for information about what may trigger a cancellation.

1570 **6.10.4.9 Canceled with Sensor Failure**

<b>Status Value</b>	canceledWithSensorFailure
<b>Condition</b>	The uninitialization operation was interrupted by a cancellation request and the target biometric sensor experienced a failure
<b>Required Elements</b>	status (Status, §3.12) the literal "canceledWithSensorFailure"
<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure

1571 Services MUST return a canceledWithSensorFailure result if a cancellation request caused a failure  
 1572 within the target biometric sensor. Clients receiving this result may need to reattempt the initialization  
 1573 request to restore full functionality. See §6.20.2.2 for information about what may trigger a cancellation.

1574 **6.10.4.10 Bad Value**

<b>Status Value</b>	badValue
<b>Condition</b>	The provided session id is not a well-formed UUID.
<b>Required Elements</b>	status (Status, §3.12) the literal "badValue" badFields (StringArray, §3.7) an array that contains the single field name, "sessionId"
<b>Optional Elements</b>	None

1575 See §6.1.2 for general information on how services MUST handle parameter failures.

1576 **6.10.4.11 Invalid Id**

<b>Status Value</b>	invalidId
<b>Condition</b>	The provided session id is not registered with the service.
<b>Required Elements</b>	status (Status, §3.12) the literal "invalidId" badFields (StringArray, §3.7) an array that contains the single field name, "sessionId"
<b>Optional Elements</b>	None

1577 A session id is invalid if it does not correspond to an active registration. A session id may become  
 1578 unregistered from a service through explicit unregistration or triggered automatically by the service due to  
 1579 inactivity (§A.2.2).

1580 See §6.1.2 for general information on how services MUST handle parameter failures.

1581 **6.11 Get Configuration**

<b>Description</b>	Retrieve metadata about the target biometric sensor's current configuration
<b>URL Template</b>	/configure/{sessionId}
<b>HTTP Method</b>	GET
<b>URL Parameters</b>	{sessionId} (UUID, §3.2) Identity of the session requesting the configuration
<b>Input Payload</b>	None
<b>Idempotent</b>	Yes
<b>Sensor Operation</b>	Yes

1582 **6.11.1 Result Summary**

success	status="success" metadata=current configuration of the sensor (Dictionary, §3.3)
failure	status="failure" message*=informative message describing failure
configurationNeeded	status="configurationNeeded"
initializationNeeded	status="initializationNeeded"
sensorTimeout	status="sensorTimeout"
sensorFailure	status="sensorFailure"
sensorBusy	status="sensorBusy"
lockNotHeld	status="lockNotHeld"

lockHeldByAnother	status="lockHeldByAnother"
canceled	status="canceled"
canceledWithSensorFailure	status="canceledWithSensorFailure"
badValue	status="badValue" badFields={"sessionId"} (StringArray, §3.7)
invalidId	status="invalidId" badFields={"sessionId"} (StringArray, §3.7)

## 1583 6.11.2 Usage Notes

1584 The *get configuration* operation retrieves the service's current configuration.

1585 **EXAMPLE:** The following represents a 'raw' request to retrieve the current configuration information of  
1586 the service.

```
1587 GET http://10.0.0.8:8000/Service/configure/d745cd19-facd-4f91-8774-aac5ca9766a2 HTTP/1.1
1588 Content-Type: application/xml
1589 Host: 10.0.0.8:8000
```

1590 **EXAMPLE:** The following is the 'raw' response from the previous request. The `metadata` element in the  
1591 result contains a Dictionary (§3.3) of parameter names and their respective values.

```
1592 HTTP/1.1 200 OK
1593 Content-Length: 554
1594 Content-Type: application/xml; charset=utf-8
1595 Server: Microsoft-HTTPAPI/2.0
1596 Date: Tue, 03 Jan 2012 14:57:29 GMT
1597
1598 <result xmlns="http://docs.oasis-open.org/bioserv/ns/wsbdl-1.0"
1599       xmlns:i="http://www.w3.org/2001/XMLSchema-instance">
1600   <status>success</status>
1601   <metadata>
1602     <item>
1603       <key>width</key>
1604       <value i:type="a:int" xmlns:a="http://www.w3.org/2001/XMLSchema">800</value>
1605     </item>
1606     <item>
1607       <key>height</key>
1608       <value i:type="a:int" xmlns:a="http://www.w3.org/2001/XMLSchema">600</value>
1609     </item>
1610     <item>
1611       <key>frameRate</key>
1612       <value i:type="a:int" xmlns:a="http://www.w3.org/2001/XMLSchema">15</value>
1613     </item>
1614   </metadata>
1615 </result>
```

## 1616 6.11.3 Unique Knowledge

1617 As specified, the *get configuration* can be used to obtain knowledge about unique characteristics of a  
1618 service. Through *get configuration*, a service may expose implementation and/or service-specific  
1619 configuration parameter names and values that are not explicitly described in this document.

## 1620 6.11.4 Return Values Detail

1621 The *get configuration* operation MUST return a Result according to the following constraints.

1622 **6.11.4.1 Success**

<b>Status Value</b>	success
<b>Condition</b>	The service provides the current configuration
<b>Required Elements</b>	status (Status, §3.12) the literal "success" metadata (Dictionary, §3.3) the target biometric sensor's current configuration
<b>Optional Elements</b>	None

1623 See §4.2 for information regarding configurations.

1624 **6.11.4.2 Failure**

<b>Status Value</b>	failure
<b>Condition</b>	The service cannot provide the current configuration due to service (not target biometric sensor) error.
<b>Required Elements</b>	status (Status, §3.12) the literal "failure"
<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure

1625 Services MUST only use this status to report failures that occur within the web service, not the target  
1626 biometric sensor (see §6.11.4.11, §6.11.4.6).

1627 **6.11.4.3 Configuration Needed**

<b>Status Value</b>	configurationNeeded
<b>Condition</b>	The configuration could not be queried because the target biometric sensor has not been initialized.
<b>Required Elements</b>	status (Status, §3.12) the literal "configurationNeeded"
<b>Optional Elements</b>	None

1628 Services MAY require configuration to be set before a configuration can be retrieved if a service does not  
1629 provide a valid default configuration.

1630 **6.11.4.4 Initialization Needed**

<b>Status Value</b>	initializationNeeded
<b>Condition</b>	The configuration could not be queried because the target biometric sensor has not been initialized.

**Required Elements** status (Status, §3.12)  
the literal "initializationNeeded"

**Optional Elements** None

1631 Services SHOULD be able to provide the sensors configuration without initialization; however, this is not  
1632 always possible. Robust clients SHOULD assume that configuration will require initialization.

#### 1633 6.11.4.5 Sensor Timeout

**Status Value** sensorTimeout

**Condition** The configuration could not be queried because the target biometric sensor took too long to complete the request.

**Required Elements** status (Status, §3.12)  
the literal "sensorTimeout"

**Optional Elements** None

1634 A service did not receive a timely response from the target biometric sensor. Note that this condition is  
1635 distinct from the client's originating HTTP request, which may have its own, independent timeout. (See  
1636 A.2 for information on how a client might determine timeouts.)

#### 1637 6.11.4.6 Sensor Failure

**Status Value** sensorFailure

**Condition** The configuration could not be queried due to a failure within the target biometric sensor.

**Required Elements** status (Status, §3.12)  
the literal "sensorFailure"

**Optional Elements** message (xs:string, [XSDPart2])  
an informative description of the nature of the failure

1638 A sensorFailure status MUST only be used to report failures that occurred within the target biometric  
1639 sensor, not a failure within the web service (§6.9.4.2).

#### 1640 6.11.4.7 Sensor Busy

**Status Value** sensorBusy

**Condition** The configuration could not be queried because the service is already performing a different sensor operation for the requesting client.

**Required Elements** status (Status, §3.12)  
the literal "sensorBusy"

**Optional Elements** None

1641 **6.11.4.8 Lock Not Held**

<b>Status Value</b>	lockNotHeld
<b>Condition</b>	The configuration could not be queried because the requesting client does not hold the lock.
<b>Required Elements</b>	status (Status, §3.12) the literal "lockNotHeld"
<b>Optional Elements</b>	None

1642 Sensor operations require that the requesting client holds the service lock.

1643 **6.11.4.9 Lock Held by Another**

<b>Status Value</b>	lockHeldByAnother
<b>Condition</b>	The configuration could not be queried because the lock is held by another client.
<b>Required Elements</b>	status (Status, §3.12) the literal "lockHeldByAnother"
<b>Optional Elements</b>	None

1644 **6.11.4.10 Canceled**

<b>Status Value</b>	canceled
<b>Condition</b>	The <i>get configuration</i> operation was interrupted by a cancellation request.
<b>Required Elements</b>	status (Status, §3.12) the literal "canceled"
<b>Optional Elements</b>	None

1645 See §6.20.2.2 for information about what may trigger a cancellation.

1646 **6.11.4.11 Canceled with Sensor Failure**

<b>Status Value</b>	canceledWithSensorFailure
<b>Condition</b>	The <i>get configuration</i> operation was interrupted by a cancellation request during which the target biometric sensor experienced a failure
<b>Required Elements</b>	status (Status, §3.12) the literal "canceledWithSensorFailure"
<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure

1647 Services MUST return a `cancelledWithSensorFailure` result if a cancellation request caused a failure  
 1648 within the target biometric sensor. Clients receiving this result may need to perform initialization to restore  
 1649 full functionality. See §6.20.2.2 for information about what may trigger a cancellation.

1650 **6.11.4.12 Bad Value**

<b>Status Value</b>	<code>badValue</code>
<b>Condition</b>	The provided session id is not a well-formed UUID.
<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “ <code>badValue</code> ” <code>badFields</code> (StringArray, §3.7) an array that contains the single field name, “ <code>sessionId</code> ”
<b>Optional Elements</b>	None

1651 See §6.1.2 for general information on how services MUST handle parameter failures.

1652 **6.11.4.13 Invalid Id**

<b>Status Value</b>	<code>invalidId</code>
<b>Condition</b>	The provided session id is not registered with the service.
<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “ <code>invalidId</code> ” <code>badFields</code> (StringArray, §3.7) an array that contains the single field name, “ <code>sessionId</code> ”
<b>Optional Elements</b>	None

1653 A session id is invalid if it does not correspond to an active registration. A session id may become  
 1654 unregistered from a service through explicit unregistration or triggered automatically by the service due to  
 1655 inactivity (§A.2.2).

1656 See §6.1.2 for general information on how services MUST handle parameter failures.

1657 **6.12 Set Configuration**

<b>Description</b>	Set the target biometric sensor’s configuration
<b>URL Template</b>	<code>/configure/{sessionId}</code>
<b>HTTP Method</b>	POST
<b>URL Parameters</b>	<code>{sessionId}</code> (UUID, §3.2) Identity of the session setting the configuration
<b>Input Payload</b>	Desired sensor configuration (Dictionary, §3.3)
<b>Idempotent</b>	Yes

1658 **6.12.1 Result Summary**

success	status="success"
failure	status="failure" message*=informative message describing failure
initializationNeeded	status="initializationNeeded"
sensorTimeout	status="sensorTimeout"
sensorFailure	status="sensorFailure"
sensorBusy	status="sensorBusy"
lockNotHeld	status="lockNotHeld"
lockHeldByAnother	status="lockHeldByAnother"
canceled	status="canceled"
canceledWithSensorFailure	status="canceledWithSensorFailure"
unsupported	status="unsupported" badFields={field names} (StringArray, §3.7)
badValue	status="badValue" badFields={"sessionId"} (StringArray, §3.7) (or) status="badValue" badFields={field names} (StringArray, §3.7)
noSuchParameter	status="unsupported" badFields={field names} (StringArray, §3.7)
invalidId	status="invalidId" badFields={"sessionId"} (StringArray, §3.7)

1659 **6.12.2 Usage Notes**

1660 The *set configuration* operation sets the configuration of a service's target biometric sensor.

1661 **6.12.2.1 Input Payload Information**

1662 The *set configuration* operation is the only operation that takes input within the body of the HTTP request.  
 1663 The desired configuration MUST be sent as a single Dictionary (§3.3) element named *configuration*.  
 1664 See §4.2 for information regarding configurations. See Appendix C for a complete XML Schema for this  
 1665 specification. The root element of the configuration data MUST conform to the following XML definition:

1666 

```
<xs:element name="configuration" type="wsbd:Dictionary" nillable="true"/>
```

1667 **EXAMPLE:** The following represents a 'raw' request to configure a service at  
 1668 `http://10.0.0.8:8000/Sensor` such that `width=800`, `height=600`, and `frameRate=15`. (In this example,  
 1669 each value element contains fully qualified namespace information, although this is not necessary.)

1670 

```
POST http://10.0.0.8:8000/Service/configure/d745cd19-facd-4f91-8774-aac5ca9766a2 HTTP/1.1
```

```

1671 Content-Type: application/xml
1672 Host: 10.0.0.8:8000
1673 Content-Length: 459
1674 Expect: 100-continue
1675
1676 <configuration xmlns:i="http://www.w3.org/2001/XMLSchema-instance" xmlns="http://docs.oasis-
1677 open.org/bioserv/ns/wsbd-1.0">
1678   <item>
1679     <key>width</key>
1680     <value xmlns:d3p1="http://www.w3.org/2001/XMLSchema" i:type="d3p1:int">800</value>
1681   </item>
1682   <item>
1683     <key>height</key>
1684     <value xmlns:d3p1="http://www.w3.org/2001/XMLSchema" i:type="d3p1:int">600</value>
1685   </item>
1686   <item>
1687     <key>frameRate</key>
1688     <value xmlns:d3p1="http://www.w3.org/2001/XMLSchema" i:type="d3p1:int">15</value>
1689   </item>
1690 </configuration>

```

1691 More information regarding the use of the `xmlns` attribute can be found in [XMLNS].

### 1692 6.12.3 Unique Knowledge

1693 The *set configuration* can be used to provide knowledge about unique characteristics to a service.  
 1694 Through *set configuration*, a client MAY provide implementation and/or service-specific parameter names  
 1695 and values that are not defined in this document (see Appendix A for further information on parameters).

### 1696 6.12.4 Return Values Detail

1697 The *set configuration* operation MUST return a Result according to the following constraints.

#### 1698 6.12.4.1 Success

<b>Status Value</b>	success
<b>Condition</b>	The service was able to successfully set the full configuration
<b>Required Elements</b>	status (Status, §3.12) the literal “success”
<b>Optional Elements</b>	None

#### 1699 6.12.4.2 Failure

<b>Status Value</b>	failure
<b>Condition</b>	The service cannot set the desired configuration due to service (not target biometric sensor) error.
<b>Required Elements</b>	status (Status, §3.12) the literal “failure”
<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure

1700 Services MUST only use this status to report failures that occur within the web service, not the target  
 1701 biometric sensor (see §6.12.4.10, §6.12.4.5).

1702 **6.12.4.3 Initialization Needed**

<b>Status Value</b>	initializationNeeded
<b>Condition</b>	The configuration could not be set because the target biometric sensor has not been initialized.
<b>Required Elements</b>	status (Status, §3.12) the literal "initializationNeeded"
<b>Optional Elements</b>	None

1703 Services SHOULD be able to set the configuration without initialization; however, this is not strictly  
 1704 necessary or always possible. Similarly, robust clients SHOULD assume that setting configuration will  
 1705 require initialization.

1706 **6.12.4.4 Sensor Timeout**

<b>Status Value</b>	sensorTimeout
<b>Condition</b>	The configuration could not be set because the target biometric sensor took too long to complete the request.
<b>Required Elements</b>	status (Status, §3.12) the literal "sensorTimeout"
<b>Optional Elements</b>	None

1707 A service did not receive a timely response from the target biometric sensor. Note that this condition is  
 1708 distinct from the client's originating HTTP request, which may have its own, independent timeout. (See  
 1709 A.2 for information on how a client might determine timeouts.)

1710 **6.12.4.5 Sensor Failure**

<b>Status Value</b>	sensorFailure
<b>Condition</b>	The configuration could not be set due to a failure within the target biometric sensor.
<b>Required Elements</b>	status (Status, §3.12) the literal "sensorFailure"
<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure

1711 A sensorFailure status MUST only be used to report failures that occurred within the target biometric  
 1712 sensor, not a failure within the web service (§6.12.4.2). Errors with the configuration itself SHALL be  
 1713 reported via an unsupported (§6.12.4.11), badValue (§6.12.4.12), or badValue status (§6.12.4.13).

1714 **6.12.4.6 Sensor Busy**

<b>Status Value</b>	sensorBusy
<b>Condition</b>	The configuration could not be set because the service is already

	performing a different sensor operation for the requesting client.
<b>Required Elements</b>	status (Status, §3.12) the literal “sensorBusy”
<b>Optional Elements</b>	None

1715 **6.12.4.7 Lock Not Held**

<b>Status Value</b>	lockNotHeld
<b>Condition</b>	The configuration could not be queried because the requesting client does not hold the lock.
<b>Required Elements</b>	status (Status, §3.12) the literal “lockNotHeld”
<b>Optional Elements</b>	None

1716 Sensor operations require that the requesting client holds the service lock.

1717 **6.12.4.8 Lock Held by Another**

<b>Status Value</b>	lockHeldByAnother
<b>Condition</b>	The configuration could not be set because the lock is held by another client.
<b>Required Elements</b>	status (Status, §3.12) the literal “lockHeldByAnother”
<b>Optional Elements</b>	None

1718 **6.12.4.9 Canceled**

<b>Status Value</b>	canceled
<b>Condition</b>	The <u>set configuration</u> operation was interrupted by a cancellation request.
<b>Required Elements</b>	status (Status, §3.12) the literal “canceled”
<b>Optional Elements</b>	None

1719 See §6.20.2.2 for information about what may trigger a cancellation.

1720 **6.12.4.10 Canceled with Sensor Failure**

<b>Status Value</b>	canceledWithSensorFailure
<b>Condition</b>	The <u>set configuration</u> operation was interrupted by a cancellation request during which the target biometric sensor experienced a failure
<b>Required Elements</b>	status (Status, §3.12)

the literal "canceledWithSensorFailure"

**Optional Elements** message (xs:string, [XSDPart2])

an informative description of the nature of the failure

1721 Services MUST return a canceledWithSensorFailure result if a cancellation request caused a failure  
1722 within the target biometric sensor. Clients receiving this result may need to perform initialization to restore  
1723 full functionality. See §6.20.2.2 for information about what may trigger a cancellation.

#### 1724 6.12.4.11 Unsupported

**Status Value** unsupported

**Condition** The requested configuration contains one or more values that are syntactically and semantically valid, but not supported by the service.

**Required Elements** status (Status, §3.12)

the literal "unsupported"

badFields (StringArray, §3.7)

an array that contains the field name(s) that corresponding to the unsupported value(s)

**Optional Elements** None

1725 Returning *multiple* fields allows a service to indicate that a particular *combination* of parameters is not  
1726 supported by a service. See §6.1.2 for additional information on how services MUST handle parameter  
1727 failures.

1728 **EXAMPLE:** A WS-BD service utilizes a very basic off-the-shelf web camera with limited capabilities. This  
1729 camera has three parameters that are all dependent on each other: ImageHeight, ImageWidth, and  
1730 FrameRate. The respective allowed values for each parameter might look like: {240, 480, 600, 768},  
1731 {320, 640, 800, 1024}, and {5, 10, 15, 20, 30}. Configuring the sensor will return  
1732 unsupported when the client tries to set ImageHeight=768, ImageWidth=1024, and FrameRate=30;  
1733 this camera might not support capturing images of a higher resolution at a fast frame rate. Another  
1734 example is configuring the sensor to use ImageHeight=240 and ImageWidth=1024; as this is a very  
1735 basic web camera, it might not support capturing images at this resolution. In both cases, the values  
1736 provided for each parameter are individually valid but the overall validity is dependent on the combination  
1737 of parameters

#### 1738 6.12.4.12 Bad Value

**Status Value** badValue

**Condition** Either:

- (a) The provided session id is not a well-formed UUID, or,
- (b) The requested configuration contains a parameter value that is either syntactically (e.g., an inappropriate data type) or semantically (e.g., a value outside of an acceptable range) invalid.

**Required Elements** status (Status, §3.12)

the literal "badValue"  
 badFields (StringArray, §3.7)  
 an array that contains either  
 (a) the single field name, "sessionId", or  
 (b) the field name(s) that contain invalid value(s)

**Optional Elements** None

1739 Notice that for the *set configuration* operation, an invalid URL parameter or one or more invalid input  
 1740 payload parameters can trigger a badValue status.

1741 See §6.1.2 for general information on how services MUST handle parameter failures.

1742 **6.12.4.13 No Such Parameter**

**Status Value** noSuchParameter

**Condition** The requested configuration contains a parameter name that is not recognized by the service.

**Required Elements** status (Status, §3.12)  
 the literal "noSuchParameter"  
 badFields (StringArray, §3.7)  
 an array that contains the field name(s) that are not recognized by the service

**Optional Elements** None

1743 See §6.1.2 for general information on how services MUST handle parameter failures.

1744 **6.12.4.14 Invalid Id**

**Status Value** invalidId

**Condition** The provided session id is not registered with the service.

**Required Elements** status (Status, §3.12)  
 the literal "invalidId"  
 badFields (StringArray, §3.7)  
 an array that contains the single field name, "sessionId"

**Optional Elements** None

1745 A session id is invalid if it does not correspond to an active registration. A session id may become  
 1746 unregistered from a service through explicit unregistration or triggered automatically by the service due to  
 1747 inactivity (§A.2.2).

1748 **6.13 Capture**

**Description** Capture biometric data

<b>URL Template</b>	/capture/{sessionId}
<b>HTTP Method</b>	POST
<b>URL Parameters</b>	{sessionId} (UUID, §3.2) Identity of the session requesting the capture
<b>Input Payload</b>	None
<b>Idempotent</b>	No
<b>Sensor Operation</b>	Yes

### 1749 6.13.1 Result Summary

success	status="success" captureIds={identifiers of captured data} (UuidArray, §3.8)
failure	status="failure" message*=informative message describing failure
configurationNeeded	status="configurationNeeded"
initializationNeeded	status="initializationNeeded"
sensorTimeout	status="sensorTimeout"
sensorFailure	status="sensorFailure"
sensorBusy	status="sensorBusy"
lockNotHeld	status="lockNotHeld"
lockHeldByAnother	status="lockHeldByAnother"
canceled	status="canceled"
canceledWithSensorFailure	status="canceledWithSensorFailure"
badValue	status="badValue" badFields={"sessionId"} (StringArray, §3.7)
invalidId	status="invalidId" badFields={"sessionId"} (StringArray, §3.7)

### 1750 6.13.2 Usage Notes

1751 The *capture* operation triggers biometric acquisition. On success, the operation returns one or more  
1752 identifiers, or *capture ids*. Naturally, the *capture* operation is *not* idempotent. Each *capture* operation  
1753 returns unique identifiers—each execution returning references that are particular to that capture. Clients  
1754 then can retrieve the captured data itself by passing a *capture id* as a URL parameter to the *download*  
1755 operation.

1756 Multiple *capture ids* are supported to accommodate sensors that return collections of biometric data. For  
1757 example, a multi-sensor array might save an image per sensor. A mixed-modality sensor might assign a  
1758 different capture id for each modality.

1759 **IMPORTANT NOTE:** The *capture* operation MAY include some post-acquisition processing. Although  
 1760 post-acquisition processing is directly tied to the *capture* operation, its effects are primarily on data  
 1761 transfer, and is therefore discussed in detail within the *download* operation documentation (§6.16.2.2)

### 1762 6.13.2.1 Providing Timing Information

1763 Depending on the sensor, a *capture* operation may take anywhere from milliseconds to tens of seconds  
 1764 to execute. (It is possible to have even longer running capture operations than this, but special  
 1765 accommodations may need to be made on the server and client side to compensate for typical HTTP  
 1766 timeouts.) By design, there is no explicit mechanism for a client to determine how long a capture  
 1767 operation will take. However, services can provide “hints” through capture timeout information (A.3.4),  
 1768 and clients can automatically adjust their own timeouts and behavior accordingly.

### 1769 6.13.3 Unique Knowledge

1770 As specified, the *capture* operation cannot be used to provide or obtain knowledge about unique  
 1771 characteristics of a client or service.

### 1772 6.13.4 Return Values Detail

1773 The *capture* operation MUST return a Result according to the following constraints.

#### 1774 6.13.4.1 Success

<b>Status Value</b>	success
<b>Condition</b>	The service successfully performed a biometric acquisition
<b>Required Elements</b>	status (Status, §3.12) the literal “success” captureIds (UuidArray, §3.8) one more UUIDs that uniquely identify the data acquired by the operation
<b>Optional Elements</b>	None

1775 See the usage notes for *capture* (§6.13.2) and *download* (§6.16.2) for full detail.

#### 1776 6.13.4.2 Failure

<b>Status Value</b>	failure
<b>Condition</b>	The service cannot perform the capture due to a service (not target biometric sensor) error.
<b>Required Elements</b>	status (Status, §3.12) the literal “failure”
<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure

1777 Services MUST only use this status to report failures that occur within the web service, not the target  
 1778 biometric sensor (see §6.13.4.11, §6.13.4.6). A service may fail at capture if there is not enough internal  
 1779 storage available to accommodate the captured data (§A.4).

1780 **6.13.4.3 Configuration Needed**

<b>Status Value</b>	configurationNeeded
<b>Condition</b>	The capture could not be set because the target biometric sensor has not been configured.
<b>Required Elements</b>	status (Status, §3.12) the literal "configurationNeeded"
<b>Optional Elements</b>	None

1781 A service SHOULD offer a default configuration to allow capture to be performed without an explicit  
1782 configuration. Regardless, for robustness, clients SHOULD assume that capture requires configuration.

1783 **6.13.4.4 Initialization Needed**

<b>Status Value</b>	initializationNeeded
<b>Condition</b>	The service could not perform a capture because the target biometric sensor has not been initialized.
<b>Required Elements</b>	status (Status, §3.12) the literal "initializationNeeded"
<b>Optional Elements</b>	None

1784 Services SHOULD be able perform capture without explicit initialization. However, the specification  
1785 recognizes that this is not always possible, particularly for physically separated implementations.  
1786 Regardless, for robustness, clients SHOULD assume that setting configuration will require initialization.

1787 **6.13.4.5 Sensor Timeout**

<b>Status Value</b>	sensorTimeout
<b>Condition</b>	The service could not perform a capture because the target biometric sensor took too long to complete the request.
<b>Required Elements</b>	status (Status, §3.12) the literal "sensorTimeout"
<b>Optional Elements</b>	None

1788 A service did not receive a timely response from the target biometric sensor. Note that this condition is  
1789 distinct from the client's originating HTTP request, which may have its own, independent timeout. (See  
1790 §A.3 for information on how a client might determine timeouts.)

1791 **6.13.4.6 Sensor Failure**

<b>Status Value</b>	sensorFailure
<b>Condition</b>	The service could perform the capture due to a failure within the target biometric sensor.
<b>Required Elements</b>	status (Status, §3.12)

	the literal "sensorFailure"
<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure

1792 A sensorFailure status MUST only be used to report failures that occurred within the target biometric  
1793 sensor, not a failure within the web service (§6.13.4.2).

1794 **6.13.4.7 Sensor Busy**

<b>Status Value</b>	sensorBusy
<b>Condition</b>	The service could not perform a capture because the service is already performing a different sensor operation for the requesting client.
<b>Required Elements</b>	status (Status, §3.12) the literal "sensorBusy"
<b>Optional Elements</b>	None

1795 **6.13.4.8 Lock Not Held**

<b>Status Value</b>	lockNotHeld
<b>Condition</b>	The service could not perform a capture because the requesting client does not hold the lock.
<b>Required Elements</b>	status (Status, §3.12) the literal "lockNotHeld"
<b>Optional Elements</b>	None

1796 Sensor operations require that the requesting client holds the service lock.

1797 **6.13.4.9 Lock Held by Another**

<b>Status Value</b>	lockHeldByAnother
<b>Condition</b>	The service could not perform a capture because the lock is held by another client.
<b>Required Elements</b>	status (Status, §3.12) the literal "lockHeldByAnother"
<b>Optional Elements</b>	None

1798 **6.13.4.10 Canceled**

<b>Status Value</b>	canceled
<b>Condition</b>	The <i>capture</i> operation was interrupted by a cancellation request.
<b>Required Elements</b>	status (Status, §3.12)

the literal “canceled”

**Optional Elements** None

1799 See §6.20.2.2 for information about what may trigger a cancellation.

#### 1800 6.13.4.11 Canceled with Sensor Failure

**Status Value** canceledWithSensorFailure

**Condition** The *capture* operation was interrupted by a cancellation request during which the target biometric sensor experienced a failure

**Required Elements** status (Status, §3.12)  
the literal “canceledWithSensorFailure”

**Optional Elements** message (xs:string, [XSDPart2])  
an informative description of the nature of the failure

1801 Services MUST return a canceledWithSensorFailure result if a cancellation request caused a failure  
1802 within the target biometric sensor. Clients receiving this result may need to perform initialization to restore  
1803 full functionality. See §6.20.2.2 for information about what may trigger a cancellation.

#### 1804 6.13.4.12 Bad Value

**Status Value** badValue

**Condition** The provided session id is not a well-formed UUID.

**Required Elements** status (Status, §3.12)  
the literal “badValue”  
badFields (StringArray, §3.7)  
an array that contains the single field name, “sessionId”

**Optional Elements** None

1805 See §6.1.2 for general information on how services MUST handle parameter failures.

#### 1806 6.13.4.13 Invalid Id

**Status Value** invalidId

**Condition** The provided session id is not registered with the service.

**Required Elements** status (Status, §3.12)  
the literal “invalidId”  
badFields (StringArray, §3.7)  
an array that contains the single field name, “sessionId”

**Optional Elements** None

1807 A session id is invalid if it does not correspond to an active registration. A session id may become  
 1808 unregistered from a service through explicit unregistration or triggered automatically by the service due to  
 1809 inactivity (§A.2.2).

1810 See §6.1.2 for general information on how services MUST handle parameter failures.

## 1811 6.14 Begin Capture

<b>Description</b>	Starts the capture of biometric data and returns immediately after the capture starts
<b>URL Template</b>	/capture/{sessionId}/async
<b>HTTP Method</b>	POST
<b>URL Parameters</b>	{sessionId} (UUID, §3.2) Identity of the session requesting the capture
<b>Input Payload</b>	None
<b>Idempotent</b>	No
<b>Sensor Operation</b>	Yes

### 1812 6.14.1 Result Summary

success	status="success"
failure	status="failure" message*=informative message describing failure
configurationNeeded	status="configurationNeeded"
initializationNeeded	status="initializationNeeded"
sensorTimeout	status="sensorTimeout"
sensorFailure	status="sensorFailure"
sensorBusy	status="sensorBusy"
lockNotHeld	status="lockNotHeld"
lockHeldByAnother	status="lockHeldByAnother"
canceled	status="canceled"
canceledWithSensorFailure	status="canceledWithSensorFailure"
badValue	status="badValue" badFields={"sessionId"} (StringArray, §3.7)
invalidId	status="invalidId" badFields={"sessionId"} (StringArray, §3.7)

### 1813 6.14.2 Usage Notes

1814 The *begin capture* operation, used with the *end capture* operation, allows for asynchronous captures and  
 1815 captures over a duration of time. With the *capture* operation, the sensor MUST capture data from a single  
 1816 moment. However, some biometrics, such as voice and signature, use variable length data. While a

1817 *capture* operation could capture voice data with a set length, the asynchronous capture functions allow  
 1818 the client to start the recording and then record the desired length of data. Sensors which do not support  
 1819 asynchronous captures MUST immediately return success when *begin capture* is called, and perform the  
 1820 entire capture sequence when *end capture* is called. This guarantees that on a sensor that does not  
 1821 support asynchronous captures, the client will get the same result with a call to *capture* as with calls to  
 1822 *begin capture* and *end capture*.

### 1823 6.14.3 Unique Knowledge

1824 As specified, the *begin capture* operation cannot be used to provide or obtain knowledge about unique  
 1825 characteristics of a client or service.

### 1826 6.14.4 Return Values Detail

1827 The *begin capture* operation MUST return a Result according to the following constraints.

#### 1828 6.14.4.1 Success

<b>Status Value</b>	success
<b>Condition</b>	The service successfully started the biometric acquisition
<b>Required Elements</b>	status (Status, §3.12) the literal “success” captureIds (UuidArray, §3.8) one more UUIDs that uniquely identify the data acquired by the operation
<b>Optional Elements</b>	None

1829 See the usage notes for *capture* (§6.13.2), *begin capture* (§6.14.2), *end capture* (§6.15.2), and *download*  
 1830 (§6.16.2) for full detail.

#### 1831 6.14.4.2 Failure

<b>Status Value</b>	failure
<b>Condition</b>	The service cannot perform the capture due to a service (not target biometric sensor) error.
<b>Required Elements</b>	status (Status, §3.12) the literal “failure”
<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure

1832 Services MUST only use this status to report failures that occur within the web service, not the target  
 1833 biometric sensor (see §6.13.4.11, §6.13.4.6). A service may fail at capture if there is not enough internal  
 1834 storage available to accommodate the captured data (§A.4).

#### 1835 6.14.4.3 Configuration Needed

<b>Status Value</b>	configurationNeeded
---------------------	---------------------

<b>Condition</b>	The capture could not be set because the target biometric sensor has not been configured.
<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “ <code>configurationNeeded</code> ”
<b>Optional Elements</b>	None

1836 A service SHOULD offer a default configuration to allow capture to be performed without an explicit  
1837 configuration. Regardless, for robustness, clients SHOULD assume that capture requires configuration.

#### 1838 6.14.4.4 Initialization Needed

<b>Status Value</b>	<code>initializationNeeded</code>
<b>Condition</b>	The service could not perform a capture because the target biometric sensor has not been initialized.
<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “ <code>initializationNeeded</code> ”
<b>Optional Elements</b>	None

1839 Services SHOULD be able perform capture without explicit initialization. However, the specification  
1840 recognizes that this is not always possible, particularly for physically separated implementations.  
1841 Regardless, for robustness, clients SHOULD assume that setting configuration will require initialization.

#### 1842 6.14.4.5 Sensor Timeout

<b>Status Value</b>	<code>sensorTimeout</code>
<b>Condition</b>	The service could not perform a capture because the target biometric sensor took too long to complete the request.
<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “ <code>sensorTimeout</code> ”
<b>Optional Elements</b>	None

1843 A service did not receive a timely response from the target biometric sensor. Note that this condition is  
1844 distinct from the client’s originating HTTP request, which may have its own, independent timeout. (See  
1845 §A.3 for information on how a client might determine timeouts.)

#### 1846 6.14.4.6 Sensor Failure

<b>Status Value</b>	<code>sensorFailure</code>
<b>Condition</b>	The service could perform the capture due to a failure within the target biometric sensor.
<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “ <code>sensorFailure</code> ”
<b>Optional Elements</b>	<code>message</code> (xs:string, [XSDPart2])

an informative description of the nature of the failure

1847 A `sensorFailure` status MUST only be used to report failures that occurred within the target biometric  
1848 sensor, not a failure within the web service (§6.13.4.2).

#### 1849 6.14.4.7 Sensor Busy

<b>Status Value</b>	<code>sensorBusy</code>
<b>Condition</b>	The service could not perform a capture because the service is already performing a different sensor operation for the requesting client.
<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “ <code>sensorBusy</code> ”
<b>Optional Elements</b>	None

#### 1850 6.14.4.8 Lock Not Held

<b>Status Value</b>	<code>lockNotHeld</code>
<b>Condition</b>	The service could not perform a capture because the requesting client does not hold the lock.
<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “ <code>lockNotHeld</code> ”
<b>Optional Elements</b>	None

1851 Sensor operations require that the requesting client holds the service lock.

#### 1852 6.14.4.9 Lock Held by Another

<b>Status Value</b>	<code>lockHeldByAnother</code>
<b>Condition</b>	The service could not perform a capture because the lock is held by another client.
<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “ <code>lockHeldByAnother</code> ”
<b>Optional Elements</b>	None

#### 1853 6.14.4.10 Canceled

<b>Status Value</b>	<code>canceled</code>
<b>Condition</b>	The <i><code>begin capture</code></i> operation was interrupted by a cancellation request.
<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “ <code>canceled</code> ”
<b>Optional Elements</b>	None

1854 See §6.20.2.2 for information about what may trigger a cancellation.

#### 1855 6.14.4.11 Canceled with Sensor Failure

<b>Status Value</b>	canceledWithSensorFailure
<b>Condition</b>	The <i>begin capture</i> operation was interrupted by a cancellation request during which the target biometric sensor experienced a failure
<b>Required Elements</b>	status (Status, §3.12) the literal “ canceledWithSensorFailure”
<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure

1856 Services MUST return a canceledWithSensorFailure result if a cancellation request caused a failure  
1857 within the target biometric sensor. Clients receiving this result may need to perform initialization to restore  
1858 full functionality. See §6.20.2.2 for information about what may trigger a cancellation.

#### 1859 6.14.4.12 Bad Value

<b>Status Value</b>	badValue
<b>Condition</b>	The provided session id is not a well-formed UUID.
<b>Required Elements</b>	status (Status, §3.12) the literal “ badValue” badFields (StringArray, §3.7) an array that contains the single field name, “ sessionId”
<b>Optional Elements</b>	None

1860 See §6.1.2 for general information on how services MUST handle parameter failures.

#### 1861 6.14.4.13 Invalid Id

<b>Status Value</b>	invalidId
<b>Condition</b>	The provided session id is not registered with the service.
<b>Required Elements</b>	status (Status, §3.12) the literal “ invalidId” badFields (StringArray, §3.7) an array that contains the single field name, “ sessionId”
<b>Optional Elements</b>	None

1862 A session id is invalid if it does not correspond to an active registration. A session id may become  
1863 unregistered from a service through explicit unregistration or triggered automatically by the service due to  
1864 inactivity (§A.2.2).

1865 See §6.1.2 for general information on how services MUST handle parameter failures.

1866 **6.15 End Capture**

<b>Description</b>	Ends the asynchronous capture of sensor data, blocking if necessary
<b>URL Template</b>	/capture/{sessionId}/async
<b>HTTP Method</b>	PUT
<b>URL Parameters</b>	{sessionId} (UUID, §3.2) Identity of the session requesting the capture
<b>Input Payload</b>	None
<b>Idempotent</b>	No
<b>Sensor Operation</b>	Yes

1867 **6.15.1 Result Summary**

success	status="success" captureIds={identifiers of captured data} (UuidArray, §3.8)
failure	status="failure" message*=informative message describing failure
invalidId	status="invalidId" badFields={"sessionId"} (StringArray, §3.7)
canceled	status="canceled"
canceledWithSensorFailure	status="canceledWithSensorFailure"
sensorFailure	status="sensorFailure"
lockNotHeld	status="lockNotHeld"
lockHeldByAnother	status="lockHeldByAnother"
sensorBusy	status="sensorBusy"
sensorTimeout	status="sensorTimeout"
badValue	status="badValue" badFields={"sessionId"} (StringArray, §3.7)

1868 **6.15.2 Usage Notes**

1869 The End Capture operation will behave slightly different depending on the type of sensor that is capturing  
1870 the data:

- 1871 • Automatic Capture: In the case of sensors that can automatically capture, if a frame has already  
1872 been captured, the call returns immediately; otherwise, the call blocks until a frame is  
1873 successfully captured.
- 1874 • Manual Capture: In the case of sensors that cannot automatically select the best frame, End  
1875 Capture records the current frame at the time End Capture is called to be returned by the  
1876 download method.
- 1877 • Variable Length Capture: In the case of variable length samples, End Capture ends the recording  
1878 of data.

1879 A call to End Capture does not return until the sensor has finished capturing a sample.

1880  
1881

### 1882 6.15.2.1 Transferrable Asynchronous Captures

1883 Consider the following scenario with two clients, Alice and Bob. Alice and Bob both register with the  
1884 service. Alice then obtains the lock and starts an asynchronous capture with *Begin Capture*. Then, Alice  
1885 waits a while, and the Lock Stealing Prevention Period elapses. Bob then steals the lock. In accordance  
1886 with the lock stealing specification, the lock stealing had no effect on the currently running capture. Thus,  
1887 Bob can now call end capture and steal Alice's capture data. Depending on the situation, this behavior  
1888 may or may not be desirable. One case where it would be useful is if Alice started the capture, and then  
1889 her computer crashed. She should then be able to register on another computer, steal the lock, and finish  
1890 her capture without having to start over. However, it also means that one client can obtain another client's  
1891 biometric data, which may be a privacy concern. Thus, sensors MUST , in their sensor information (see  
1892 §A.2), have a transferableAsycCapture flag.

### 1893 6.15.2.2 Status Monitoring

1894 During an asynchronous capture, the client may wish to get feedback from the sensor. This SHOULD be  
1895 done using a live stream. If a sensor provides textual feedback, that can also be sent using a live stream.

### 1896 6.15.3 Unique Knowledge

1897 As specified, the *end capture* operation cannot be used to provide or obtain knowledge about unique  
1898 characteristics of a client or service.

### 1899 6.15.4 Return Values Detail

1900 The *end capture* operation MUST return a Result according to the following constraints.

#### 1901 6.15.4.1 Success

<b>Status Value</b>	success
<b>Condition</b>	The service successfully started the biometric acquisition
<b>Required Elements</b>	status (Status, §3.12) the literal "success" captureIds (UuidArray, §3.8) one more UUIDs that uniquely identify the data acquired by the operation
<b>Optional Elements</b>	None

1902 See the usage notes for *capture* (§6.13.2), *begin capture* (§6.14.2), *end capture* (§6.15.2), and *download*  
1903 (§6.16.2) for full detail.

#### 1904 6.15.4.2 Failure

<b>Status Value</b>	failure
<b>Condition</b>	The service cannot perform the capture due to a service (not target biometric sensor) error. Also returned if no asynchronous capture has been started.

<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “failure”
<b>Optional Elements</b>	<code>message</code> (xs:string, [XSDPart2]) an informative description of the nature of the failure

1905 Services MUST only use this status to report failures that occur within the web service, not the target  
 1906 biometric sensor (see §6.13.4.11, §6.13.4.6). A service may fail at capture if there is not enough internal  
 1907 storage available to accommodate the captured data (§A.4).

### 1908 6.15.4.3 Sensor Timeout

<b>Status Value</b>	<code>sensorTimeout</code>
<b>Condition</b>	The service could not perform a capture because the target biometric sensor took too long to complete the request.
<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “sensorTimeout”
<b>Optional Elements</b>	None

1909 A service did not receive a timely response from the target biometric sensor. Note that this condition is  
 1910 distinct from the client’s originating HTTP request, which may have its own, independent timeout. (See  
 1911 §A.3 for information on how a client might determine timeouts.)

### 1912 6.15.4.4 Sensor Failure

<b>Status Value</b>	<code>sensorFailure</code>
<b>Condition</b>	The service could perform the capture due to a failure within the target biometric sensor.
<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “sensorFailure”
<b>Optional Elements</b>	<code>message</code> (xs:string, [XSDPart2]) an informative description of the nature of the failure

1913 A `sensorFailure` status MUST only be used to report failures that occurred within the target biometric  
 1914 sensor, not a failure within the web service (§6.13.4.2).

### 1915 6.15.4.5 Sensor Busy

<b>Status Value</b>	<code>sensorBusy</code>
<b>Condition</b>	The service could not perform a capture because the service is already performing a different sensor operation for the requesting client.
<b>Required Elements</b>	<code>status</code> (Status, §3.12) the literal “sensorBusy”
<b>Optional Elements</b>	None

1916 **6.15.4.6 Lock Not Held**

<b>Status Value</b>	lockNotHeld
<b>Condition</b>	The service could not perform a capture because the requesting client does not hold the lock.
<b>Required Elements</b>	status (Status, §3.12) the literal "lockNotHeld"
<b>Optional Elements</b>	None

1917 Sensor operations require that the requesting client holds the service lock.

1918 **6.15.4.7 Lock Held by Another**

<b>Status Value</b>	lockHeldByAnother
<b>Condition</b>	The service could not perform a capture because the lock is held by another client.
<b>Required Elements</b>	status (Status, §3.12) the literal "lockHeldByAnother"
<b>Optional Elements</b>	None

1919 **6.15.4.8 Canceled**

<b>Status Value</b>	canceled
<b>Condition</b>	The <u>end capture</u> operation was interrupted by a cancellation request.
<b>Required Elements</b>	status (Status, §3.12) the literal "canceled"
<b>Optional Elements</b>	None

1920 See §6.20.2.2 for information about what may trigger a cancellation.

1921 **6.15.4.9 Canceled with Sensor Failure**

<b>Status Value</b>	canceledWithSensorFailure
<b>Condition</b>	The <u>end capture</u> operation was interrupted by a cancellation request during which the target biometric sensor experienced a failure
<b>Required Elements</b>	status (Status, §3.12) the literal "canceledWithSensorFailure"
<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure

1922 Services MUST return a canceledWithSensorFailure result if a cancellation request caused a failure  
 1923 within the target biometric sensor. Clients receiving this result may need to perform initialization to restore  
 1924 full functionality. See §6.20.2.2 for information about what may trigger a cancellation.

1925 **6.15.4.10 Bad Value**

<b>Status Value</b>	badValue
<b>Condition</b>	The provided session id is not a well-formed UUID.
<b>Required Elements</b>	status (Status, §3.12) the literal "badValue" badFields (StringArray, §3.7) an array that contains the single field name, "sessionId"
<b>Optional Elements</b>	None

1926 See §6.1.2 for general information on how services MUST handle parameter failures.

1927

1928 **6.15.4.11 Invalid Id**

<b>Status Value</b>	invalidId
<b>Condition</b>	The provided session id is not registered with the service.
<b>Required Elements</b>	status (Status, §3.12) the literal "invalidId" badFields (StringArray, §3.7) an array that contains the single field name, "sessionId"
<b>Optional Elements</b>	None

1929 A session id is invalid if it does not correspond to an active registration. A session id may become  
 1930 unregistered from a service through explicit unregistration or triggered automatically by the service due to  
 1931 inactivity (§A.2.2).

1932 See §6.1.2 for general information on how services MUST handle parameter failures.

1933 **6.16 Download**

<b>Description</b>	Download the captured biometric data
<b>URL Template</b>	/download/{captureId}
<b>HTTP Method</b>	GET
<b>URL Parameters</b>	{captureId} (UUID, §3.2) Identity of the captured data to download
<b>Input Payload</b>	None
<b>Idempotent</b>	Yes
<b>Sensor Operation</b>	No

1934 **6.16.1 Result Summary**

success	status="success" metadata=sensor configuration and capture-specific metadata (Dictionary, §3.3, §4.3.1) sensorData=biometric data (xs:base64Binary)
failure	status="failure" message*=informative message describing failure
preparingDownload	status="preparingDownload"
badValue	status="badValue" badFields={"captureId"} (StringArray, §3.7)
invalidId	status="invalidId" badFields={"captureId"} (StringArray, §3.7)

1935 **6.16.2 Usage Notes**

1936 The *download* operation allows a client to retrieve biometric data acquired during a particular capture.

1937 **6.16.2.1 Capture and Download as Separate Operations**

1938 WS-BD decouples the acquisition operation (*capture*) from the data transfer (*download*) operation. This  
1939 has two key benefits. First, it is a better fit for services that have post-acquisition processes. Second, it  
1940 allows multiple clients to download the captured biometric data by exploiting the concurrent nature of  
1941 HTTP. By making *download* a simple data transfer operation, service can handle multiple, concurrent  
1942 downloads without requiring locking.

1943 **6.16.2.2 Services with Post-Acquisition Processing**

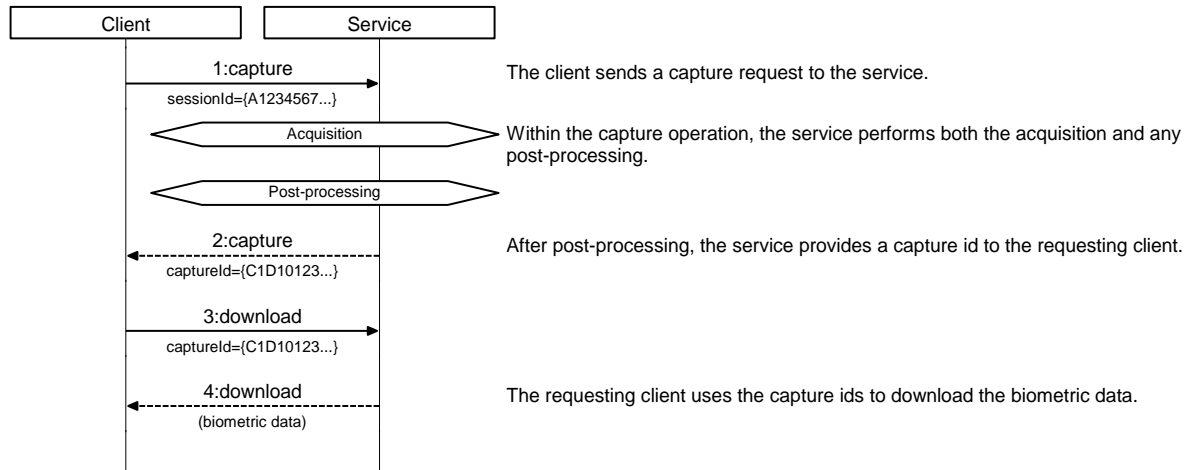

1944 A service does *not* need to make the captured data available immediately after capture; a service MAY  
1945 have distinct acquisition and post-acquisition processes. The following are two examples of such  
1946 services:

**EXAMPLE:** A service exposing a fingerprint scanner also performs post processing on a fingerprint image—segmentation, quality assessment, and templatization.

**EXAMPLE:** A service exposes a digital camera in which the captured image is not immediately available after a photo is taken; the image may need to be downloaded from the camera's internal storage or from the camera to the host computer (in a physically separated implementation). If the digital camera was unavailable for an operation due to a data transfer, a client requesting a sensor operation would receive a *sensorBusy* status.

The first method is to perform the post-processing within the *capture* operation itself. I.e., *capture* not only blocks for the acquisition to be performed, but also blocks for the post-processing—returning when the post-processing is complete. This type of capture is the easier of the two to both (a) implement on the client, and (b) use by a client.

**EXAMPLE:** Figure 9 illustrates an example of a *capture* operation that includes post-processing. Once the post-processing is complete, capture ids are returned to the client.

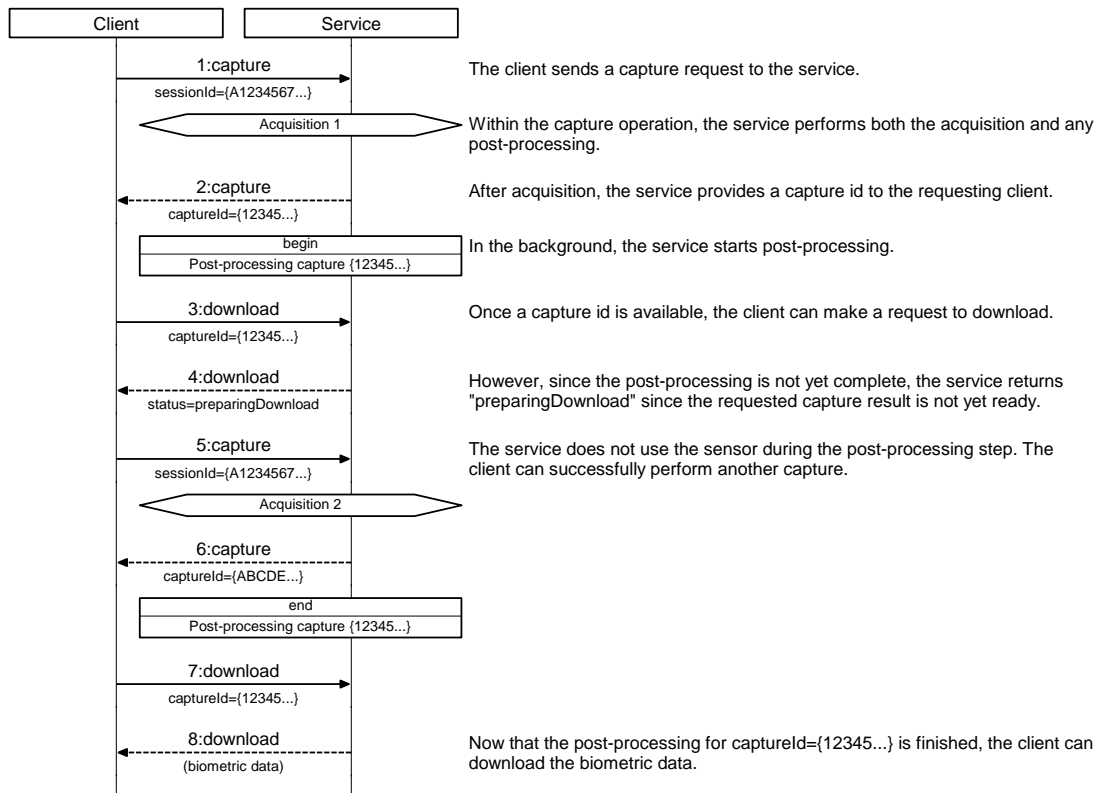

1961  
1962  
1963  
1964

**Figure 9.** Including post-processing in the capture operation means downloads are immediately available when capture completes. Unless specified, the status of all returned operations is `success`.

1965 In the second method, post-processing MAY be performed by the web service *after* the capture operation  
1966 returns. Capture ids are still returned to the client, but are in an intermediate state. This exposes a  
1967 window of time in which the capture is complete, but the biometric data is not yet ready for retrieval or  
1968 download. Data-related operations (*download*, *get download info*, and *thrifty download*) performed within  
1969 this window return a `preparingDownload` status to clients to indicate that the captured data is currently in  
1970 an intermediate state—captured, but not yet ready for retrieval.

1971 **EXAMPLE:** Figure 10 illustrates an example of a *capture* operation with separate post-  
1972 processing. Returning to the example of the fingerprint scanner that transforms a raw biometric  
1973 sample into a template after acquisition, assume that the service performs templating after  
1974 capture returns. During post-processing, requests for the captured data return  
1975 `preparingDownload`, but the sensor itself is available for another capture operation.

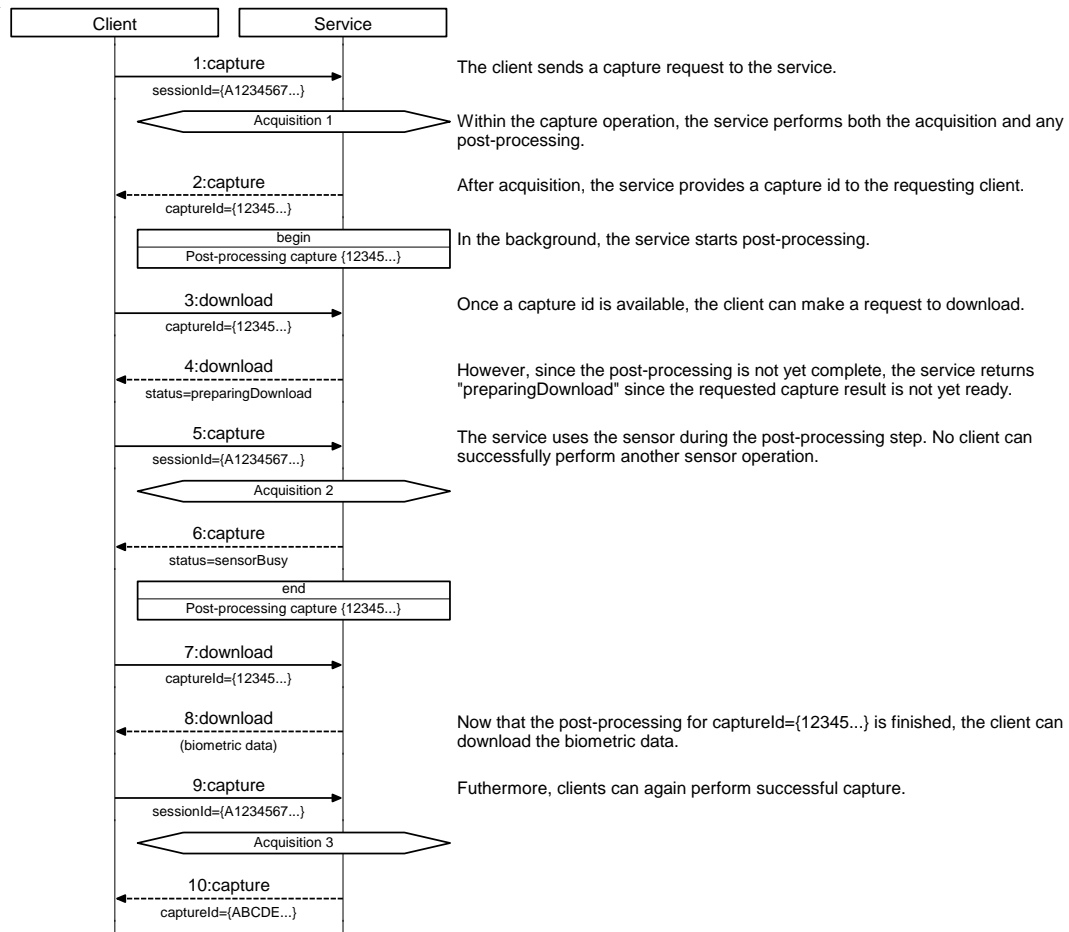

**Figure 10.** Example of capture with separate post-acquisition processing that does involve the target biometric sensor. Because the post-acquisition processing does not involve the target biometric sensor, it is available for sensor operations. Unless specified, the status of all returned operations is *success*.

1976  
1977  
1978  
1979  
1980

1981 Services with an independent post-processing step SHOULD perform the post-processing on an  
1982 independent unit of execution (e.g., a separate thread, or process). However, post-processing may  
1983 include a sensor operation, which would interfere with incoming sensor requests.

1984 **EXAMPLE:** Figure 11 illustrates another variation on a *capture* operation with separate post-  
1985 processing. Return to the digital camera example, but assume that it is a physically separate  
1986 implementation and capture operation returns immediately after acquisition. The service also has  
1987 a post-acquisition process that downloads the image data from the camera to a computer. Like  
1988 the previous example, during post-processing, requests for the captured data return  
1989 *preparingDownload*. However, the sensor is *not* available for additional operations because the  
1990 post-processing step requires complete control over the camera to transfer the images to the host  
1991 machine: preparing them for download.

**Figure 11.** Example of capture with separate post-acquisition processing that does involve the target biometric sensor. Because the post-acquisition processing does not involve the target biometric sensor, it is available for sensor operations. Unless specified, the status of all returned operations is `success`.

1992  
1993  
1994  
1995  
1996

1997 Unless there is an advantage to doing so, when post-acquisition processing includes a sensor operation,  
1998 implementers SHOULD avoid having a capture operation that returns directly after acquisition. In this  
1999 case, even when the capture operation finishes, clients cannot perform a sensor operation until the post-  
2000 acquisition processing is complete.

2001 In general, implementers SHOULD try to combine both the acquisition and post-acquisition processing  
2002 into one capture operation—particularly if the delay due to post-acquisition processing is either  
2003 operationally acceptable or a relatively insignificant contributor to the combined time.

2004 A *download* operation MUST return *failure* if the post-acquisition processing cannot be completed  
2005 successfully. Such failures cannot be reflected in the originating *capture* operation—that operation has  
2006 already returned successfully with capture ids. Services MUST eventually resolve all *preparingDownload*  
2007 statuses to *success* or *failure*. Through *get service info*, a service can provide information to a client on  
2008 how long to wait after capture until a *preparingDownload* is fully resolved.

### 2009 6.16.2.3 Client Notification

2010 A client that receives a *preparingDownload* should poll the service until the requested data becomes  
2011 available. However, through *get service info*, a service can provide “hints” to a client on how long to wait  
2012 after capture until data can be downloaded (§A.3.5)

2013 **6.16.3 Unique Knowledge**

2014 The *download* operation can be used to provide metadata, which may be unique to the service, through  
2015 the *metadata* element. See §4 for information regarding metadata.

2016 **6.16.4 Return Values Detail**

2017 The *download* operation MUST return a Result according to the following constraints.

2018 **6.16.4.1 Success**

<b>Status Value</b>	success
<b>Condition</b>	The service can provide the requested data
<b>Required Elements</b>	status (Status, §3.12) the literal "success" metadata (Dictionary, §3.3) sensor metadata as it was at the time of capture sensorData (xs:base64Binary, [XSDPart2]) the biometric data corresponding to the requested capture id, base-64 encoded
<b>Optional Elements</b>	None

2019 A successful download MUST populate the Result with all of the following information:

- 2020 1. The *status* element MUST be populated with the Status literal "success".
- 2021 2. The *metadata* element MUST be populated with metadata of the biometric data and the  
2022 configuration held by the MUST biometric sensor at the time of capture.
- 2023 3. The *sensorData* element MUST contain the biometric data, base-64 encoded (xs:base64Binary),  
2024 corresponding to the requested capture id.

2025 See the usage notes for both *capture* (§6.13.2) and *download* (§6.16.2) for more detail regarding the  
2026 conditions under which a service is permitted to accept or deny download requests.

2027 **6.16.4.2 Failure**

<b>Status Value</b>	failure
<b>Condition</b>	The service cannot provide the requested data.
<b>Required Elements</b>	status (Status, §3.12) the literal "failure"
<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure

2028 A service might not be able to provide the requested data due to failure in post-acquisition processing, a  
2029 corrupted data store or other service or storage related failure.

2030 **6.16.4.3 Preparing Download**

<b>Status Value</b>	preparingDownload
<b>Condition</b>	The requested data cannot be provided because the service is currently performing a post-acquisition process—i.e., preparing it for download
<b>Required Elements</b>	status (Status, §3.12) the literal “preparingDownload”
<b>Optional Elements</b>	None

2031 See the usage notes for both *capture* (§6.13.2) and *download* (§6.16.2) for full detail.

2032 **6.16.4.4 Bad Value**

<b>Status Value</b>	badValue
<b>Condition</b>	The provided capture id is not a well-formed UUID.
<b>Required Elements</b>	status (Status, §3.12) the literal “badValue” badFields (StringArray, §3.7) an array that contains the single field name, “captureId”
<b>Optional Elements</b>	None

2033 See §6.1.2 for general information on how services MUST handle parameter failures.

2034 **6.16.4.5 Invalid Id**

<b>Status Value</b>	invalidId
<b>Condition</b>	The provided capture id is not recognized by the service.
<b>Required Elements</b>	status (Status, §3.12) the literal “invalidId” badFields (StringArray, §3.7) an array that contains the single field name, “captureId”
<b>Optional Elements</b>	None

2035 A capture id is invalid if it was not returned by a *capture* operation. A capture id may become  
2036 unrecognized by the service automatically if the service automatically clears storage space to  
2037 accommodate new captures (§A.4).

2038 See §6.1.2 for general information on how services MUST handle parameter failures.

2039

2040 **6.17 Get Download Info**

<b>Description</b>	Get only the metadata associated with a particular capture
--------------------	--

<b>URL Template</b>	/download/{captureId}/info
<b>HTTP Method</b>	GET
<b>URL Parameters</b>	{captureId} (UUID, §3.2) Identity of the captured data to query
<b>Input Payload</b>	Not applicable
<b>Idempotent</b>	Yes
<b>Sensor Operation</b>	No

2041 **6.17.1 Result Summary**

success	status="success" metadata=sensor configuration at the time of capture
failure	status="failure" message*=informative message describing failure
preparingDownload	status="preparingDownload"
badValue	status="badValue" badFields={"captureId"} (StringArray, §3.7)
invalidId	status="invalidId" badFields={"captureId"} (StringArray, §3.7)

2042 **6.17.2 Usage Notes**

2043 Given the potential large size of some biometric data the *get download info* operation provides clients with  
 2044 a way to get information about the biometric data without needing to transfer the biometric data itself. It is  
 2045 logically equivalent to the *download* operation, but without any sensor data. Therefore, unless detailed  
 2046 otherwise, the usage notes for *download* (§6.16.2) also apply to *get download info*.

2047 **6.17.3 Unique Knowledge**

2048 The *get download info* operation can be used to provide metadata, which may be unique to the service,  
 2049 through the *metadata* element. See §4 for information regarding metadata.

2050 **6.17.4 Return Values Detail**

2051 The *get download info* operation MUST return a Result according to the following constraints.

2052 **6.17.4.1 Success**

<b>Status Value</b>	success
<b>Condition</b>	The service can provide the requested data
<b>Required Elements</b>	status (Status, §3.12) the literal "success" metadata (Dictionary, §3.3) the sensor's configuration as it was set at the time of capture

**Optional Elements** None

2053 A successful *get download info* operation returns all of the same information as a successful *download*  
2054 operation (§6.16.4.1), but without the sensor data.

#### 2055 6.17.4.2 Failure

<b>Status Value</b>	failure
<b>Condition</b>	The service cannot provide the requested data.
<b>Required Elements</b>	status (Status, §3.12) the literal “failure”
<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure

2056 A service might not be able to provide the requested data due to failure in post-acquisition processing, a  
2057 corrupted data store or other service or storage related failure.

#### 2058 6.17.4.3 Preparing Download

<b>Status Value</b>	preparingDownload
<b>Condition</b>	The requested data cannot be provided because the service is currently performing a post-acquisition process—i.e., preparing it for download
<b>Required Elements</b>	status (Status, §3.12) the literal “preparingDownload”
<b>Optional Elements</b>	None

2059 See the usage notes for both *capture* (§6.13.2) and *download* (§6.16.2) for full detail.

#### 2060 6.17.4.4 Bad Value

<b>Status Value</b>	badValue
<b>Condition</b>	The provided capture id is not a well-formed UUID.
<b>Required Elements</b>	status (Status, §3.12) the literal “badValue” badFields (StringArray, §3.7) an array that contains the single field name, “captureId”
<b>Optional Elements</b>	None

2061 See §6.1.2 for general information on how services MUST handle parameter failures.

#### 2062 6.17.4.5 Invalid Id

<b>Status Value</b>	invalidId
<b>Condition</b>	The provided capture id is not recognized by the service.

**Required Elements** status (Status, §3.12)  
the literal "invalidId"  
badFields (StringArray, §3.7)  
an array that contains the single field name, "captureId"

**Optional Elements** None

2063 A capture id is invalid if it was not returned by a *capture* operation. A capture id may become  
2064 unrecognized by the service automatically if the service automatically clears storage space to  
2065 accommodate new captures (§A.4).

2066 See §6.1.2 for general information on how services MUST handle parameter failures.

## 2067 6.18 Thrifty Download

<b>Description</b>	Download a compact representation of the captured biometric data suitable for preview
<b>URL Template</b>	/download/{captureId}/{maxSize}
<b>HTTP Method</b>	GET
<b>URL Parameters</b>	{captureId} (UUID, §3.2) Identity of the captured data to download {maxSize} (xs:string, [XSDPart2]) Content-type dependent indicator of maximum permitted download size
<b>Input Payload</b>	None
<b>Idempotent</b>	Yes
<b>Sensor Operation</b>	No

### 2068 6.18.1 Result Summary

success	status="success" metadata=minimal metadata describing the captured data (Dictionary, §3.3, §4.3.1) sensorData=biometric data (xs:base64Binary)
failure	status="failure" message*=informative message describing failure
preparingDownload	status="preparingDownload"
unsupported	status="unsupported"
badValue	status="badValue" badFields=either "captureId", "maxSize", or both (StringArray, §3.7)
invalidId	status="invalidId" badFields={"captureId"} (StringArray, §3.7)

2069 **6.18.2 Usage Notes**

2070 The *thrifty download* operation allows a client to retrieve a compact representation of the biometric data  
2071 acquired during a particular capture. It is logically equivalent to the *download* operation, but provides a  
2072 compact version of the sensor data. Therefore, unless detailed otherwise, the usage notes for *download*  
2073 (§6.16.2) also apply to *get download info*.

2074 The suitability of the *thrifty download* data as a biometric is implementation-dependent. For some  
2075 applications, the compact representation may be suitable for use within a biometric algorithm; for others,  
2076 it may only serve the purpose of preview.

2077 For images, the *maxSize* parameter describes the maximum image width or height (in pixels) that the  
2078 service may return; dimensions SHALL NOT exceed *maxSize*. It is expected that servers will dynamically  
2079 scale the captured data to fulfill a client request. This is not strictly necessary, however, as long as the  
2080 maximum size requirements are met.

2081 For non-images, the default behavior is to return unsupported. It is *possible* to use URL parameter  
2082 *maxSize* as general purpose parameter with implementation-dependent semantics. (See the next section  
2083 for details.)

2084 **6.18.3 Unique Knowledge**

2085 The *thrifty download* operation can be used to provide knowledge about unique characteristics to a  
2086 service. Through *thrifty download*, a service MAY (a) redefine the semantics of *maxSize* or (b) provide a  
2087 data in a format that does not conform to the explicit types defined in this document (see A.2 for content  
2088 types).

2089 **6.18.4 Return Values Detail**

2090 The *thrifty download* operation MUST return a Result according to the following constraints.

2091 **6.18.4.1 Success**

<b>Status Value</b>	success
<b>Condition</b>	The service can provide the requested data
<b>Required Elements</b>	status (Status, §3.12) the literal "success" metadata (Dictionary, §3.3) minimal representation of sensor metadata as it was at the time of capture. See §4.3.1 for information regarding minimal metadata. sensorData (xs:base64Binary, [XSDPart2]) the biometric data corresponding to the requested capture id, base-64 encoded, scaled appropriately to the <i>maxSize</i> parameter.
<b>Optional Elements</b>	None

2092 For increased efficiency, a successful *thrifty download* operation only returns the sensor data, and a  
2093 subset of associated metadata. The metadata returned SHOULD be information that is absolutely  
2094 essential to open or decode the returned sensor data.

2095 **6.18.4.2 Failure**

<b>Status Value</b>	failure
<b>Condition</b>	The service cannot provide the requested data.
<b>Required Elements</b>	status (Status, §3.12) the literal “failure”
<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure

2096 A service might not be able to provide the requested data due to a corrupted data store or other service  
2097 or storage related failure.

2098 **6.18.4.3 Preparing Download**

<b>Status Value</b>	preparingDownload
<b>Condition</b>	The requested data cannot be provided because the service is currently performing a post-acquisition process—i.e., preparing it for download
<b>Required Elements</b>	status (Status, §3.12) the literal “preparingDownload”
<b>Optional Elements</b>	None

2099 Like *download*, the availability of *thrifty download* data may also be affected by the sequencing of post-  
2100 acquisition processing. See §6.16.2.2 for detail.

2101 **6.18.4.4 Unsupported**

<b>Status Value</b>	unsupported
<b>Condition</b>	The service does not support thrifty download,
<b>Required Elements</b>	status (Status, §3.12) the literal “unsupported”
<b>Optional Elements</b>	None

2102 Services that capture biometrics that are not image-based SHOULD return unsupported.

2103 **6.18.4.5 Bad Value**

<b>Status Value</b>	badValue
<b>Condition</b>	The provided capture id is not a well-formed UUID.
<b>Required Elements</b>	status (Status, §3.12) the literal “badValue” badFields (StringArray, §3.7) an array that contains one or both of the following fields: - “captureId” if the provided session id is not well-formed

- "maxSize" if the provided maxSize parameter is not well-formed

**Optional Elements** None

2104 See §6.1.2 for general information on how services MUST handle parameter failures.

#### 2105 6.18.4.6 Invalid Id

**Status Value** invalidId

**Condition** The provided capture id is not recognized by the service.

**Required Elements** status (Status, §3.12)  
the literal "invalidId"  
badFields (StringArray, §3.7)  
an array that contains the single field name, "captureId"

**Optional Elements** None

2106 A capture id is invalid if it does not correspond to a *capture* operation. A capture id may become  
2107 unrecognized by the service automatically if the service automatically clears storage space to  
2108 accommodate new captures (§A.4).

2109 See §6.1.2 for general information on how services MUST handle parameter failures.

#### 2110 6.19 Get Sensor Data

**Description** Download a sensor data

**URL Template** /download/{captureId}/raw  
/download/{captureId}/raw/[contentType]

**HTTP Method** GET

**URL Parameters** {captureId} (UUID, §3.2)  
Identity of the captured data to download  
[contentType] (Appendix B)  
Optional – the captured data in the requested content type

**Input Payload** None

**Idempotent** Yes

**Sensor Operation** No

#### 2111 6.19.1 Result Summary

2112 This operation will not return a Result instance. It will return the sensor data in binary form via an HTTP  
2113 response (See section §6 in [RFC2616]).

#### 2114 6.19.2 Usage Notes

2115 The *get sensor data* operation allows for the binary transfer of sensor data.

2116 Values for the optional parameter, `contentType`, MUST conform to values specified in Appendix B. The  
2117 value MUST be URL-encoded to allow for proper handling of potentially unsafe characters.

### 2118 6.19.3 Unique Knowledge

2119 The `get sensor data` operation can be used to provide metadata, which may be unique to the service,  
2120 through the `metadata` element. See §4 for information regarding metadata.

## 2121 6.20 Cancel

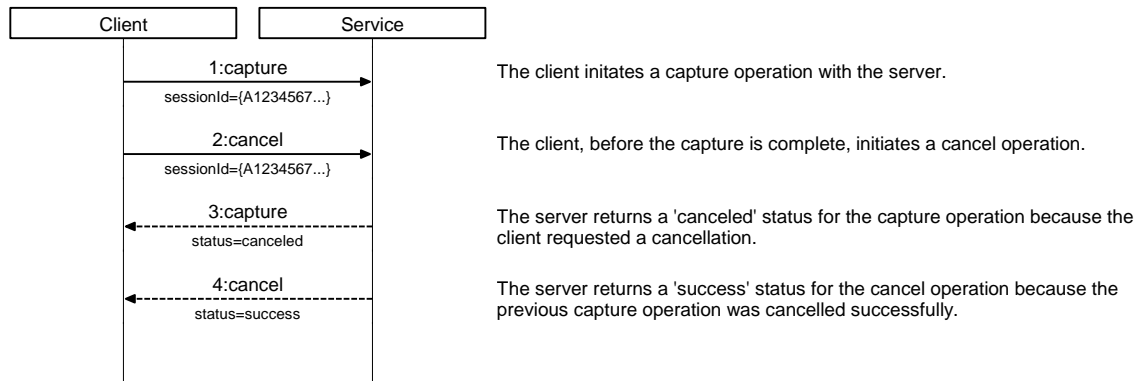

<b>Description</b>	Cancel the current sensor operation
<b>URL Template</b>	<code>/cancel/{sessionId}</code>
<b>HTTP Method</b>	POST
<b>URL Parameters</b>	<code>{sessionId}</code> (UUID, §3.2) Identity of the session requesting cancellation
<b>Input Payload</b>	None
<b>Idempotent</b>	Yes
<b>Sensor Operation</b>	Yes

### 2122 6.20.1 Result Summary

<code>success</code>	<code>status="success"</code>
<code>failure</code>	<code>status="failure"</code> <code>message*=informative message describing failure</code>
<code>lockNotHeld</code>	<code>status="lockNotHeld"</code>
<code>lockHeldByAnother</code>	<code>status="lockHeldByAnother"</code>
<code>badValue</code>	<code>status="badValue"</code> <code>badFields={"sessionId"}</code>
<code>invalidId</code>	<code>status="invalidId"</code>

### 2123 6.20.2 Usage Notes

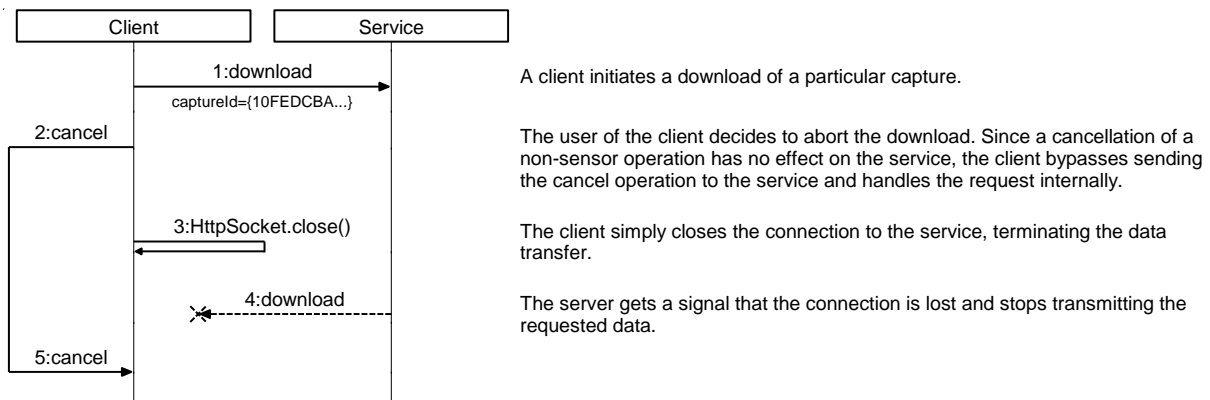

2124 The `cancel` operation stops any currently running sensor operation; it has no effect on non-sensor  
2125 operations. If cancellation of an active sensor operation is successful, `cancel` operation receives a  
2126 success result, while the canceled operation receives a canceled (or `canceledWithSensorFailure`) result.  
2127 As long as the operation is canceled, the `cancel` operation itself receives a success result, regardless if  
2128 cancellation caused a sensor failure. In other words, if cancellation caused a fault within the target  
2129 biometric sensor, as long as the sensor operation has stopped running, the `cancel` operation is  
2130 considered to be successful.

2131  
 2132 **Figure 12.** Example sequence of events for a client initially requesting a capture followed by a cancellation request.  
 2133 All services MUST provide cancellation for all sensor operations.

### 2134 6.20.2.1 Canceling Non-Sensor Operations

2135 Clients are responsible for canceling all non-sensor operations via client-side mechanisms only.  
 2136 Cancellation of sensor operations requires a separate service operation, since a service may need to  
 2137 “manually” interrupt a busy sensor. A service that had its client terminate a non-sensor operation would  
 2138 have no way to easily determine that a cancellation was requested.

2139  
 2140 **Figure 13.** Cancellations of non-sensor operations do not require a cancel  
 2141 operation to be requested to the service. An example of this is where a client  
 2142 initiates then cancels a download operation.

### 2143 6.20.2.2 Cancellation Triggers

2144 Typically, the client that originates the sensor operation to be cancelled also initiates the cancellation  
 2145 request. Because WSBD operations are performed synchronously, cancellations are typically initiated on  
 2146 a separate unit of execution such as an independent thread or process.

2147 Notice that the only requirement to perform cancellation is that the *requesting* client holds the service  
 2148 lock. It is *not* a requirement that the client that originates the sensor operation to be canceled also initiates  
 2149 the cancellation request. Therefore, it is *possible* that a client may cancel the sensor operation initiated by  
 2150 another client. This occurs if a peer client (a) manages to steal the service lock before the sensor  
 2151 operation is completed, or (b) is provided with the originating client's session id.

2152 A service might also *self-initiate* cancellation. In normal operation, a service that does not receive a timely  
 2153 response from a target biometric sensor would return `sensorTimeout`. However, if the service's internal  
 2154 timeout mechanism fails, a service may initiate a cancel operation itself. Implementers should use this as  
 2155 a “last resort” compensating action.

2156 In summary, clients SHOULD be designed to not expect to be able to match a cancellation notification to  
 2157 any specific request or operation.

2158 **6.20.3 Unique Knowledge**

2159 As specified, the *cancel* operation cannot be used to provide or obtain knowledge about unique  
2160 characteristics of a client or service.

2161 **6.20.4 Return Values Detail**

2162 The *cancel* operation MUST return a Result according to the following constraints.

2163 **6.20.4.1 Success**

<b>Status Value</b>	success
<b>Condition</b>	The service successfully canceled the sensor operation
<b>Required Elements</b>	status the literal "success"
<b>Optional Elements</b>	None

2164 See the usage notes for *capture* (§6.13.2) and *download* (§6.16.2) for full detail.

2165 **6.20.4.2 Failure**

<b>Status Value</b>	failure
<b>Condition</b>	The service could not cancel the sensor operation
<b>Required Elements</b>	status (Status, §3.12) the literal "failure"
<b>Optional Elements</b>	message (xs:string, [XSDPart2]) an informative description of the nature of the failure

2166 Services SHOULD try to return *failure* in a timely fashion—there is little advantage to a client if it  
2167 receives the cancellation failure *after* the sensor operation to be canceled completes.

2168 **6.20.4.3 Lock Not Held**

<b>Status Value</b>	lockNotHeld
<b>Condition</b>	The service could cancel the operation because the requesting client does not hold the lock.
<b>Required Elements</b>	status (Status, §3.12) the literal "lockNotHeld"
<b>Optional Elements</b>	None

2169 Sensor operations require that the requesting client holds the service lock.

2170 **6.20.4.4 Lock Held by Another**

<b>Status Value</b>	lockHeldByAnother
<b>Condition</b>	The service could not cancel the operation because the lock is held by another client.

<b>Required Elements</b>	status (Status, §3.12) the literal "lockHeldByAnother"
<b>Optional Elements</b>	None

2171 **6.20.4.5 Bad Value**

<b>Status Value</b>	badValue
<b>Condition</b>	The provided session id is not a well-formed UUID.
<b>Required Elements</b>	status (Status, §3.12) the literal "badValue" badFields (StringArray, §3.7) an array that contains the single field name, "sessionId"
<b>Optional Elements</b>	None

2172 See §6.1.2 for general information on how services MUST handle parameter failures.

2173 **6.20.4.6 Invalid Id**

<b>Status Value</b>	invalidId
<b>Condition</b>	The provided session id is not recognized by the service.
<b>Required Elements</b>	status (Status, §3.12) the literal "invalidId" badFields (StringArray, §3.7) an array that contains the single field name, "sessionId"
<b>Optional Elements</b>	None

2174 A session id is invalid if it does not correspond to an active registration. A session id may become  
 2175 unregistered from a service through explicit unregistration or triggered automatically by the service due to  
 2176 inactivity (§A.2.2).

2177 See §6.1.2 for general information on how services MUST handle parameter failures.

2178

2179 **6.21 Get Sensor Status**

<b>Description</b>	Get the current status of the sensor
<b>URL Template</b>	/status
<b>HTTP Method</b>	GET
<b>URL Parameters</b>	None
<b>Input Payload</b>	None
<b>Idempotent</b>	Yes

2180 **6.21.1 Result Summary**

```

success  status="success"
         metadata=sensor status
    
```

2181 **6.21.2 Usage Notes**

2182 The primary purpose of this operation is to give a client a way to determine the current sensor status after  
 2183 a lock stealing operation. While no lock is required for this operation, if a client wants to be sure that  
 2184 between the time the sensor status is queried and the time an operation starts that no one else uses the  
 2185 sensor, the client SHALL obtain a lock before calling this method.

2186 The sensor can be in any of the following states:

- 2187 • ready
- 2188 • initializing
- 2189 • configuring
- 2190 • capturing
- 2191 • uninitializing
- 2192 • canceling

2193 Each state describes the current sensor operation. The “ready” state means that the sensor is ready to  
 2194 start another operation.

2195 **6.21.3 Unique Knowledge**

2196 As specified, the *get sensor status* operation cannot be used to provide or obtain knowledge about unique  
 2197 characteristics of a client or service.

2198 **6.21.4 Return Values Detail**

2199 The *get sensor status* operation MUST return a Result according to the following constraints.

2200 **6.21.4.1 Success**

<b>Status Value</b>	success
<b>Condition</b>	The service can provide the requested data
<b>Required Elements</b>	status (Status, §3.12) the literal “success” metadata (Dictionary, §3.3) contains one key, sensorStatus, with the status
<b>Optional Elements</b>	None

## 7 Conformance Profiles

This section of the specification describes the requirements around conformance to the WS-Biometric Devices specification.

### 7.1.1 Conformance

Implementations claiming conformance to this specification, **MUST** make such a claim according to all three of the following factors.

1. If the implementation is *general* or *modality specific*
2. The operations that are implemented (§7.1.3)
3. If the implementation includes live preview (§5)

An implementation that is *modality specific* **MUST** implement the service information and configuration metadata according to their respective subsection. For example, a “fingerprint” conformant service **MUST** implement the service and configuration information according to §7.2. Note that it is possible to implement a fingerprint-based WS-Biometric Devices service without adhering to §7.2, however, such an implementation cannot claim *modality specific* conformance.

### 7.1.2 Language

Conformance claims **MUST** take the form  
“WS-Biometric Devices [*modality*] Conformance Level *n* [LA]”

where

- [*modality*] is optional phrase that indicates if the implementation is modality specific
- *L\** is an indicator if the implementation supports live preview.
- Square brackets, [ ], are indicator to the reader of this specification that the phrase is optional; they are not to be included in the claim itself

For example, the phrase “WS-Biometric Devices Conformance Level 3” indicates that the implementation is (a) not modality specific (b) implements the operations *get service information*, *initialize*, *get configuration*, *capture*, *download*, and *get download information* and (c) does NOT support live preview. Likewise, the phrase “WS-Biometric Devices Fingerprint Conformance Level 1L” indicates that the implementation (a) implements the service information and configuration parameters as specified by §7.2, (b) implements all operations and (c) supports live-preview.

For implementations that support multiple modalities, then there **SHALL** be a conformance claim for each modality. For example, a converged device that supports machine readable documents, fingerprint (according to §7.2) and iris (according to §7.4) might claim “WS-Biometric Devices Conformance Level 2, WS-Biometric Devices Fingerprint Conformance Level 3L, and WS-Biometric Devices Iris Conformance Level 1.”

### 7.1.3 Operations

The table below shows three levels of conformance to this specification. An ‘X’ represents that the operation requires functionality and implementation. For operations that lack the identifier, the service **SHOULD** implement the operation minimally by always returning *success* and related arbitrary data. Sending *success* and arbitrary data removes any concern from clients whether or not certain operations are supported by removing the responsibility of functionality and implementation from the implementer/service.

Operation	Conformance Level	1	2	3
Register (§6.3)		X		
Unregister (§6.4)		X		
Try Lock (§6.4.4.4)		X		
Steal Lock (§6.5.4.4)		X		
Unlock (§6.7)		X		
Get Service Information (§6.8)		X	X	X
Initialize (§6.8.4.1)		X	X	X
Get Configuration (§6.11)		X	X	X
Set Configuration (§6.12)		X	X	
Capture (§6.12.4.14)		X	X	X
Download (§6.13.4.13)		X	X	X
Get Download Information (§6.17)		X	X	X
Thrifty Download (§6.18)		X	X	
Cancel (§6.20)		X	X	
Get Sensor Data (§6.19)		X	X	X
Get Sensor Status (§6.21)		X	X	X

2242

### 2243 7.1.3.1 Additional Supported Operations

Operation	Identifier
Live Preview (§5)	L
Asynchronous Capture (§6.14, §6.15)	A

2244

## 2245 7.2 Fingerprint

### 2246 7.2.1 Service Information

#### 2247 7.2.1.1 Submodality

<b>Formal Name</b>	submodality
<b>Description</b>	A distinct subtype of fingerprint modality, supported by the sensor.
<b>Data Type</b>	xs:string [XSDPart2]
<b>Required</b>	Yes

**Allowed Values** RightThumbFlat  
 RightIndexFlat  
 RightMiddleFlat  
 RightRingFlat  
 RightLittleFlat  
 LeftThumbFlat  
 LeftIndexFlat  
 LeftMiddleFlat  
 LeftRingFlat  
 LeftLittleFlat  
 UnknownFlat  
 LeftSlap  
 RightSlap  
 ThumbsSlap  
 TwoFingerSlap  
 UnknownSlap  
 RightThumbRolled  
 RightIndexRolled  
 RightMiddleRolled  
 RightRingRolled  
 RightLittleRolled  
 LeftThumbRolled  
 LeftIndexRolled  
 LeftMiddleRolled  
 LeftRingRolled  
 LeftLittleRolled  
 UnknownRolled

2248 **7.2.1.2 Image Size**

<b>Formal Name</b>	fingerprintImageSize
<b>Description</b>	The width and height of a resulting fingerprint image, in pixels. If this value is calculated after capture, this SHALL be the maximum width and height of a resulting image.
<b>Data Type</b>	resolution [§3.11]
<b>Required</b>	Yes
<b>Allowed Values</b>	The width element can be any positive integer value. The height element can be any positive integer value. The unit element, if defined, MUST be “pixel” or “pixels”.

2249

2250 **7.2.1.3 Image Content Type**

<b>Formal Name</b>	fingerprintImageContentType
--------------------	-----------------------------

<b>Description</b>	The data format of the resulting fingerprint image.
<b>Data Type</b>	xs:string [XSDPart2]
<b>Required</b>	Yes
<b>Allowed Values</b>	Any string value conformant with Appendix B, §B.2.

2251

## 2252 7.2.1.4 Image Density

<b>Formal Name</b>	fingerprintImageDensity
<b>Description</b>	The pixel density of a resulting image represented in pixels per inch (PPI).
<b>Data Type</b>	xs:int [XSDPart2]
<b>Required</b>	Yes
<b>Allowed Values</b>	Any positive integer value.

2253

## 2254 7.3 Face

### 2255 7.3.1 Service Information

#### 2256 7.3.1.1 Submodality

<b>Formal Name</b>	submodality
<b>Description</b>	A distinct subtype of face modality, supported by the sensor.
<b>Data Type</b>	xs:string [XSDPart2]
<b>Required</b>	Yes
<b>Allowed Values</b>	Face2d Face3d

#### 2257 7.3.1.2 Image Size

<b>Formal Name</b>	faceImageSize
<b>Description</b>	The width and height of a resulting face image, in pixels. If this value is calculated after capture, this SHALL be the maximum width and height of a resulting image.
<b>Data Type</b>	resolution [§3.11]
<b>Required</b>	Yes
<b>Allowed Values</b>	The width element can be any positive integer value. The height element can be any positive integer value. The unit element, if defined, MUST be “pixel” or “pixels”.

2258

2259 **7.3.1.3 Image Content Type**

<b>Formal Name</b>	faceImageContentType
<b>Description</b>	The data format of the resulting face image.
<b>Data Type</b>	xs:string [XSDPart2]
<b>Required</b>	Yes
<b>Allowed Values</b>	Any string value conformant with Appendix B, §B.2

2260

2261 **7.4 Iris**

2262 **7.4.1 Service Information**

2263 **7.4.1.1 Submodality**

<b>Formal Name</b>	submodality
<b>Description</b>	A distinct subtype of iris modality, supported by the sensor.
<b>Data Type</b>	xs:string [XSDPart2]
<b>Required</b>	Yes
<b>Allowed Values</b>	LeftIris RightIris BothIrises

2264 **7.4.1.2 Image Size**

<b>Formal Name</b>	irisImageSize
<b>Description</b>	The width and height of a resulting iris image, in pixels. If this value is calculated after capture, this SHALL be the maximum width and height of a resulting image.
<b>Data Type</b>	resolution [§3.11]
<b>Required</b>	Yes
<b>Allowed Values</b>	The width element can be any positive integer value. The height element can be any positive integer value. The unit element, if defined, MUST be “pixel” or “pixels”.

2265

2266 **7.4.1.3 Image Content Type**

<b>Formal Name</b>	irisImageContentType
<b>Description</b>	The data format of the resulting iris image.

<b>Data Type</b>	xs:string [XSDPart2]
<b>Required</b>	Yes
<b>Allowed Values</b>	Any string value conformant with Appendix B, §B.2.

2267

## 2268 7.5 Unknown

### 2269 7.5.1 Service Information

#### 2270 7.5.1.1 Submodality

<b>Formal Name</b>	submodality
<b>Description</b>	A distinct subtype of face modality, supported by the sensor.
<b>Data Type</b>	xs:string [XSDPart2]
<b>Required</b>	Yes
<b>Allowed Values</b>	Unknown

2271

#### 2272 7.5.1.2 Image Size

<b>Formal Name</b>	UnknownImageSize
<b>Description</b>	The width and height of a resulting unknown image, in pixels. If this value is calculated after capture, this SHALL be the maximum width and height of a resulting image.
<b>Data Type</b>	resolution [§3.11]
<b>Required</b>	Yes
<b>Allowed Values</b>	The width element can be any positive integer value. The height element can be any positive integer value. The unit element, if defined, MUST be “pixel” or “pixels”.

2273

#### 2274 7.5.1.3 Image Content Type

<b>Formal Name</b>	unknownImageContentType
<b>Description</b>	The data format of the resulting iris image.
<b>Data Type</b>	xs:string [XSDPart2]
<b>Required</b>	Yes
<b>Allowed Values</b>	Any string value conformant with Appendix B, §B.2.

2275

## 2276 Appendix A. Parameter Details

2277 This appendix details the individual parameters available from a *get service info* operation. For each  
2278 parameter, the following information is listed:

- 2279 • The formal parameter name
- 2280 • The expected data type of the parameter's value
- 2281 • If the service is required to implement the parameter

### 2282 A.1 Sensor Service

2283 The following parameters describe information about the sensor and its supporting features

#### 2284 A.1.1 Modality

<b>Formal Name</b>	modality
<b>Data Type</b>	xs:string [XSDPart2]
<b>Required</b>	Yes

2285 This parameter describes which modality or modalities are supported by the sensor.

2286 The following table enumerates the list of modalities, as defined in [CBEFF2010], which provides the valid  
2287 values for this field for currently identified modalities. Implementations are not limited to the following  
2288 values, but SHALL use them if such modality is exposed. For example, if an implementation is exposing  
2289 fingerprint capture capability, "Finger" SHALL be used. If an implementation is exposing an unlisted  
2290 modality, it MAY use another value.

Modality Value	Description
Scent	Information about the scent left by a subject
DNA	Information about a subject's DNA
Ear	A subject's ear image
Face	An image of the subject's face, either in two or three dimensions
Finger	An image of one of more of the subject's fingerprints
Foot	An image of one or both of the subject's feet.
Vein	Information about a subject's vein pattern
HandGeometry	The geometry of an subject's hand
Iris	An image of one of both of the subject's irises
Retina	An image of one or both of the subject's retinas
Voice	Information about a subject's voice
Gait	Information about a subject's gait or ambulatory movement

<b>Keystroke</b>	Information about a subject's typing patterns
<b>LipMovement</b>	Information about a subject's lip movements
<b>SignatureSign</b>	Information about a subject's signature or handwriting
<b>Unknown</b>	Unknown information about a subject's biometric

## 2291 A.1.2 Submodality

<b>Formal Name</b>	submodality
<b>Data Type</b>	xs:string [XSDPart2]
<b>Required</b>	Yes

2292 This parameter describes which submodalities are supported by the sensor. See §6.21 for submodality  
2293 requirements for a particular modality.

## 2294 A.2 Connections

2295 The following parameters describe how the service handles session lifetimes and registrations.

### 2296 A.2.1 Last Updated

<b>Formal Name</b>	lastUpdated
<b>Data Type</b>	xs:dateTime [XSDPart2]
<b>Required</b>	Yes

2297 This parameter provides a timestamp of when the service last *updated* the common info parameters (this  
2298 parameter notwithstanding). The timestamp **MUST** include time zone information. Implementers  
2299 **SHOULD** expect clients to use this timestamp to detect if any cached values of the (other) common info  
2300 parameters may have changed.

### 2301 A.2.2 Inactivity Timeout

<b>Formal Name</b>	inactivityTimeout
<b>Data Type</b>	xs:nonNegativeInteger [XSDPart2]
<b>Required</b>	Yes

2302 This parameter describes how long, in *seconds*, a session can be inactive before it may be automatically  
2303 closed by the service. A value of '0' indicates that the service never drops sessions due to inactivity.

2304 Inactivity time is measured *per session*. Services **MUST** measure it as the time elapsed between (a) the  
2305 time at which a client initiated the session's most recent operation and (b) the current time. Services  
2306 **MUST** only use the session id to determine a session's inactivity time. For example, a service does not  
2307 maintain different inactivity timeouts for requests that use the same session id, but originate from two  
2308 different IP addresses. Services **MAY** wait longer than the inactivity timeout to drop a session, but **MUST**  
2309 **NOT** drop inactive sessions any sooner than the *inactivityTimeout* parameter indicates.

2310 **A.2.3 Maximum Concurrent Sessions**

<b>Formal Name</b>	maximumConcurrentSessions
<b>Data Type</b>	xs:positiveInteger [XSDPart2]
<b>Required</b>	Yes

2311 This parameter describes the maximum number of concurrent sessions a service can maintain. Upon  
2312 startup, a service MUST have zero concurrent sessions. When a client registers successfully (§6.3), the  
2313 service increases its count of concurrent sessions by one. After successful unregistration (§6.4), the  
2314 service decreases its count of concurrent sessions by one .

2315 **A.2.4 Least Recently Used (LRU) Sessions Automatically Dropped**

<b>Formal Name</b>	autoDropLRUSessions
<b>Data Type</b>	xs:boolean [XSDPart2]
<b>Required</b>	Yes

2316 This parameter describes whether or not the service automatically unregisters the least-recently-used  
2317 session when the service has reached its maximum number of concurrent sessions. If *true*, then upon  
2318 receiving a registration request, the service MAY drop the least-recently used session if the maximum  
2319 number of concurrent sessions has already been reached. If *false*, then any registration request that  
2320 would cause the service to exceed its maximum number of concurrent sessions results in failure. The  
2321 service SHALL NOT drop a session that currently holds the lock unless the session's inactivity is outside  
2322 of the inactivity timeout (§A.2.2) threshold.

2323 **A.3 Timeouts**

2324 Clients SHOULD NOT block indefinitely on any operation. However, since different services may differ  
2325 significantly in the time they require to complete an operation, clients require a means to determine  
2326 appropriate timeouts. The timeouts in this subsection describe how long a *service* waits until the service  
2327 either returns *sensorTimeout* or initiates a service-side cancellation (§6.20.2.1). Services may wait longer  
2328 than the times reported here, but, (under normal operations) MUST NOT report a *sensorTimeout* or  
2329 initiate a cancellation before the reported time elapses. In other words, a client should be able to use  
2330 these timeouts to help determine a reasonable upper bound on the time required for sensor operations.

2331 Note that these timeouts do not include any round-trip and network delay—clients SHOULD add an  
2332 additional window to accommodate delays unique to that particular client-server relationship.

2333 **A.3.1 Initialization Timeout**

<b>Formal Name</b>	initializationTimeout
<b>Data Type</b>	xs:positiveInteger [XSDPart2]
<b>Required</b>	Yes

2334 This parameter describes how long, in *milliseconds*, a service will wait for a target biometric sensor to  
2335 perform initialization before it returns *sensorTimeout* (§6.9.4.3) or initiates a service-side cancellation  
2336 (§6.20.2.1).

2337 **A.3.2 Get Configuration Timeout**

<b>Formal Name</b>	getConfigurationTimeout
<b>Data Type</b>	xs:positiveInteger [XSDPart2]
<b>Required</b>	Yes

2338 This parameter describes how long, in *milliseconds*, a service will wait for a target biometric sensor to  
2339 retrieve its configuration before it returns sensorTimeout (§6.11.4.5) or initiates a service-side cancellation  
2340 (§6.20.2.1).

2341 **A.3.3 Set Configuration Timeout**

<b>Formal Name</b>	setConfigurationTimeout
<b>Data Type</b>	xs:positiveInteger [XSDPart2]
<b>Required</b>	Yes

2342 This parameter describes how long, in *milliseconds*, a service will wait for a target biometric sensor to set  
2343 its configuration before it returns sensorTimeout (§6.12.4.4) or initiates a service-side cancellation  
2344 (§6.20.2.1).

2345 **A.3.4 Capture Timeout**

<b>Formal Name</b>	captureTimeout
<b>Data Type</b>	xs:positiveInteger [XSDPart2]
<b>Required</b>	Yes

2346 This parameter describes how long, in *milliseconds*, a service will wait for a target biometric sensor to  
2347 perform biometric acquisition before it returns sensorTimeout (§6.12.4.4) or initiates a service-side  
2348 cancellation (§6.20.2.1).

2349 **A.3.5 Post-Acquisition Processing Time**

<b>Formal Name</b>	postAcquisitionProcessingTime
<b>Data Type</b>	xs:nonNegativeInteger [XSDPart2]
<b>Required</b>	Yes

2350 This parameter describes an upper bound on how long, in *milliseconds*, a service takes to perform post-  
2351 acquisition processing. A client SHOULD NOT expect to be able to download captured data *before* this  
2352 time has elapsed. Conversely, this time also describes how long after a capture a server is permitted to  
2353 return preparingDownload for the provided capture ids. A value of zero ('0') indicates that the service  
2354 includes any post-acquisition processing within the capture operation or that no post-acquisition  
2355 processing is performed.

2356 **A.3.6 Lock Stealing Prevention Period**

<b>Formal Name</b>	lockStealingPreventionPeriod
--------------------	------------------------------

<b>Data Type</b>	xs:nonNegativeInteger [XSDPart2]
------------------	----------------------------------

<b>Required</b>	Yes
-----------------	-----

2357 This parameter describes the length, in *milliseconds*, of the lock stealing prevention period (§6.6.2.2).

## 2358 **A.4 Storage**

2359 The following parameters describe how the service stores captured biometric data.

### 2360 **A.4.1 Maximum Storage Capacity**

<b>Formal Name</b>	maximumStorageCapacity
--------------------	------------------------

<b>Data Type</b>	xs:positiveInteger [XSDPart2]
------------------	-------------------------------

<b>Required</b>	Yes
-----------------	-----

2361 This parameter describes how much data, in bytes, the service is capable of storing.

### 2362 **A.4.2 Least-Recently Used Capture Data Automatically Dropped**

<b>Formal Name</b>	lruCaptureDataAutomaticallyDropped
--------------------	------------------------------------

<b>Data Type</b>	xs:boolean [XSDPart2]
------------------	-----------------------

<b>Required</b>	Yes
-----------------	-----

2363 This parameter describes whether or not the service automatically deletes the least-recently-used capture  
2364 to stay within its maximum storage capacity. If *true*, the service MAY automatically delete the least-  
2365 recently used biometric data to accommodate for new data. If *false*, then any operation that would require  
2366 the service to exceed its storage capacity would fail.

---

## 2367 Appendix B. Content Type Data

2368 This appendix contains a catalog of content types for use in conformance profiles and parameters. When  
2369 possible, the identified data formats SHALL be used.

### 2370 B.1 General Type

application/xml	Extensible Markup Language (XML) <b>[XML]</b>
text/plain	Plaintext <b>[RFC2046]</b>
text/xml	Extensible Markup Language (XML) <b>[XML]</b>
text/event-stream	Server Sent Events <b>[SSE]</b>

2371

### 2372 B.2 Image Formats

2373 Refer to **[CMediaType]** for more information regarding a registered image type.

image/jpeg	Joint Photographics Experts Group <b>[JPEG]</b>
image/png	Portable Network Graphics <b>[PNG]</b>
image/tiff	Tagged Image File Format <b>[TIFF]</b>
image/x-ms-bmp	Windows OS/2 Bitmap Graphics <b>[BMP]</b>
image/x-wsq	Wavelet Scalar Quantization (WSQ) <b>[WSQ]</b>

2374

### 2375 B.3 Video Formats

2376 Refer to **[CMediaType]** for more information regarding a registered video type.

multipart/x-mixed-replace	multipart/x-mixed-replace <b>[HTML5]</b>
video/h264	H.264 Video Compression <b>[H264]</b>
video/mpeg	Moving Pictures Experts Group <b>[MPEG]</b>
video/quicktime	QuickTime File Format <b>[QTFF]</b>
video/x-avi	Audio Video Interleave <b>[AVI]</b>
video/x-ms-asf	Advanced Systems Format <b>[ASF]</b>
video/x-ms-asx	Advanced Stream Redirector <b>[ASX]</b>
video/x-ms-wmv	Windows Media Video <b>[ASF]</b>

2377

### 2378 B.4 Audio Formats

2379 Refer to **[CMediaType]** for more information regarding a registered audio type.

audio/3gpp	3rd Generation Partnership Project Multimedia files <b>[3GPP]</b>
audio/3gpp2	3rd Generation Partnership Project Multimedia files <b>[3GPP2]</b>
audio/mpeg	Moving Pictures Experts Group <b>[MPEG1]</b>
audio/ogg	Vorbis OGG Audio File <b>[OGG]</b>
audio/x-aiff	Audio Interchange File Format <b>[AIFF]</b>
audio/x-ms-wav	Waveform Audio File Format <b>[WAVE]</b>
audio/x-ms-wma	Windows Media Audio <b>[ASF]</b>
audio/x-sphere	NIST Speech Header Resources <b>[SPHERE]</b>

2380

## 2381 **B.5 General Biometric Formats**

x-biometric/x-ansi-nist-itl-2000	Information Technology: American National Standard for Information Systems—Data Format for the Interchange of Fingerprint, Facial, & Scar Mark & Tattoo (SMT) Information <b>[AN2K]</b>
x-biometric/x-ansi-nist-itl-2007	Information Technology: American National Standard for Information Systems—Data Format for the Interchange of Fingerprint, Facial, & Other Biometric Information – Part 1 <b>[AN2K7]</b>
x-biometric/x-ansi-nist-itl-2008	Information Technology: American National Standard for Information Systems—Data Format for the Interchange of Fingerprint, Facial, & Other Biometric Information – Part 2: XML Version <b>[AN2K8]</b>
x-biometric/x-ansi-nist-itl-2011	Information Technology: American National Standard for Information Systems—Data Format for the Interchange of Fingerprint, Facial & Other Biometric Information <b>[AN2K11]</b>
x-biometric/x-cbeff-2010	Common Biometric Exchange Formats Framework with Support for Additional Elements <b>[CBEFF2010]</b>
x-biometric/x-cbeff-2015	Common Biometric Exchange Formats Framework with Support for Additional Elements <b>[CBEFF2015]</b>

2382

## 2383 **B.6 ISO / Modality-Specific Formats**

x-biometric/x-iso-19794-2-05	Finger Minutiae Data <b>[BDIF205]</b>
x-biometric/x-iso-19794-2-15	Finger Minutiae Data <b>[BDIF215]</b>
x-biometric/x-iso-19794-3-06	Finger Pattern Spectral Data <b>[BDIF306]</b>
x-biometric/x-iso-19794-4-05	Finger Image Data <b>[BDIF405]</b>
x-biometric/x-iso-19794-4-15	Finger Image Data <b>[BDIF415]</b>

x-biometric/x-iso-19794-5-05	Face Image Data <b>[BDIF505]</b>
x-biometric/x-iso-19794-5-15	Face Image Data <b>[BDIF515]</b>
x-biometric/x-iso-19794-6-05	Iris Image Data <b>[BDIF605]</b>
x-biometric/x-iso-19794-6-11	Iris Image Data <b>[BDIF611]</b>
x-biometric/x-iso-19794-6-15	Iris Image Data <b>[BDIF615]</b>
x-biometric/x-iso-19794-7-07	Signature/Sign Time Series Data <b>[BDIF707]</b>
x-biometric/x-iso-19794-7-15	Signature/Sign Time Series Data <b>[BDIF715]</b>
x-biometric/x-iso-19794-8-06	Finger Pattern Skeletal Data <b>[BDIF806]</b>
x-biometric/x-iso-19794-8-06	Finger Pattern Skeletal Data <b>[BDIF814]</b>
x-biometric/x-iso-19794-9-07	Vascular Image Data <b>[BDIF907]</b>
x-biometric/x-iso-19794-9-15	Vascular Image Data <b>[BDIF915]</b>
x-biometric/x-iso-19794-10-07	Hand Geometry Silhouette Data <b>[BDIF1007]</b>

## Appendix D. Security (Informative)

2547 This section is an informative appendix that provides security control recommendations for systems that  
2548 include the use of WS-Biometric Devices.

2549 Security requirements are context and organizational dependent. However, by providing general  
2550 guidance, the OASIS Biometrics TC hopes to provide a common baseline that can be used to help  
2551 ensure interoperability among components that leverage WS-Biometric Devices. If the approach to  
2552 security varies widely among WS-BD enabled components, there is significantly less chance that off-the-  
2553 shelf products will interoperate. This appendix is not a comprehensive security standard—therefore,  
2554 updates to security guidance incorporated by reference should take precedence to any recommendation  
2555 made here. In addition, security recommendations tend to be continuously updated, evolved, and  
2556 improved; always seek the latest version of any of the referenced security specifications.

2557 Further, the security controls described here are specific to the WS-Biometric Devices protocols and the  
2558 components using it. It is assumed controls described here are only one component of an  
2559 implementation’s overall security.

### 2560 D.1 References

2561 The following references are used in this Appendix and can provide more specific security guidance for  
2562 the identified technology.

Abbreviation	Technology	Citation

## 2563 D.2 Overview

2564 WS-Biometric Devices components are only useful in the context of the system within which they  
2565 participate. Therefore, recommended security controls are defined with respect to two orthogonal  
2566 characteristics of those enclosing systems:

- 2567 1. An *overall sensitivity level* of *low* (L), *medium* (M), or *high* (H) defines a set of recommended  
2568 security controls. These levels roughly, but not directly, correspond to those defined in [NIST  
2569 SP 800-60]. The 800-60 level accompanies other information as inputs for determining the  
2570 set of recommended controls specific for WS-BD. For the sake of disambiguation, “L,” “M,” or  
2571 “H” will refer to a set of controls recommended by this appendix.
- 2572 2. For each sensitivity level, a set of controls is recommended to be applied at a particular layer  
2573 of abstraction. For each sensitivity level, recommendations are made for controls to be  
2574 applied at the *network, transport and/or application* level. These levels roughly, but not  
2575 directly, correspond to the network, transport, and application layers defined in the OSI model  
2576 [OSI].

## 2577 D.3 Control Set Determination

2578 The following criteria are recommended for helping users and system owners in identifying a  
2579 recommended set of security controls.

### 2580 D.3.1 “L” Security Control Criteria

2581 The set of “L” controls are recommended if, for a given system, each of the following three clauses are  
2582 true:

- 2583 1. The system is used in a *non-production* environment **or** has an overall NIST SP 800-60 sensitivity  
2584 of “Low”
- 2585 2. All WS-Biometric Devices clients and servers reside within the same trusted network
- 2586 3. The network that provides the WS-Biometric Devices interconnectivity network is completely  
2587 isolated **or** otherwise security separated from untrusted networks with a strong buffer such as a  
2588 comprehensive network firewall.

2589 Examples that may qualify for “L” security controls are the use of WS-Biometric devices:

- 2590 • In product development, testing, or other research where no real biometric data is stored or  
2591 captured
- 2592 • Across physical or logical components that are within an embedded device with other physical or  
2593 logical controls that make it difficult to access or surreptitiously monitor the channels that carry  
2594 WS-Biometric Devices traffic.

### 2595 D.3.2 “M” Security Control Criteria

2596 The set of “M” controls are recommended if, for a given system, each of the following three clauses are  
2597 true:

- 2598 1. The system is used in a *production* environment **or** the system has an overall NIST SP 800-60  
2599 sensitivity of “Medium”
- 2600 2. All WS-Biometric Devices clients and servers reside within the same trusted network
- 2601 3. The system’s network is either completely isolated or otherwise security separated from untrusted  
2602 networks with a buffer such as a firewall.

2603 Examples that may qualify for “M” security controls are the use of WS-Biometric devices:

- 2604 • In an identification enrollment station, where WS-Biometric Devices is used as a “wire  
2605 replacement” for other less interoperable connectors. The WS-Biometric Devices network could

- 2606 be composed solely of the enrollment workstation and a biometric device with an Ethernet cable  
 2607 between them.
- 2608 • In a border screening application in which attended workstations in physically secure locations  
 2609 are used to submit biometrics to various law enforcement watch lists.

### 2610 D.3.3 “H” Security Control Criteria

2611 The set of “H” controls are recommended if the overall system has an NIST SP 800-60 sensitivity of  
 2612 “High” or if WS-Biometric Devices is used across an untrusted network.

## 2613 D.4 Recommended & Candidate Security Controls

2614 The following table outlines the candidate & recommended security controls. *Recommended* security  
 2615 controls are likely to be relevant and beneficial for all systems of a particular category. *Candidate* controls  
 2616 are those that are likely to more application and implementation specific.

2617 Candidate controls are marked with an asterisk (\*). For example, in all “L” systems, any wireless  
 2618 networking should use WPA-2 Personal with 256-bit strength encryption (or better), and is therefore  
 2619 RECOMMENDED. However, the use of TLS is a *candidate* since an “L” system might comprise a  
 2620 communications channel that is physically isolated or otherwise embedded in a system. In that case,  
 2621 foregoing TLS may be an acceptable tradeoff.

2622 There may be a degree of redundancy among these controls; for example, multiple layers of encryption.  
 2623 However, using multiple layers of security also affords more granular policy enforcement. For example,  
 2624 IPSEC may allow the communications among one set of systems, but TLS client certificates would restrict  
 2625 WS-Biometric Devices communications to a particularly trustworthy subset.

### L M H

Network Layer	L	M	H
Wired	None	802.1x and/or IPSEC*	IPSEC
Wireless	WPA-2 Personal	WPA-2 Enterprise	WPA-2 Enterprise
Transport Layer	TLS [SP 800-52]	TLS [SP 800-52]	TLS with client certificates [SP 800-52]
Application Layer	None	Biometric payload encryption with AES*	Full payload encryption with AES

2626

### 2627 D.4.1 “L” Security Controls

2628 **Network.** No network security controls are recommended for wired networks. For wireless networks,  
 2629 WPA-2, personal or enterprise mode is recommended.

2630 **Transport.** TLS as described in [800-52]; the use of client certificates is optional.

2631 **Application.** No application layer security control is recommended.

### 2632 D.4.2 “M” Security Controls

2633 **Network.** Networks should be secured with 802.1x [802.1x] and/or IPSEC [SP 800-77].

2634 **Transport.** TLS as described in [800-52]; the use of client certificates is optional.

2635 **Application.** All biometric data (the contents of a Result’s sensorData) should be encrypted with AES as  
 2636 described in [FIPS 197] and [SP 800-38A].

2637 **D.4.3 “H” Security Controls**

2638 **Network.** Networks should be secured with an IPSEC [800-77].

2639 **Transport.** TLS with client certificates as described in [800-52].

2640 **Application.** All biometric data (the contents of a Result’s sensorData) should be encrypted with AES as  
2641 described in [FIPS 197] and [SP 800-38A].

2642

## Appendix E. Acknowledgments

2643 The following individuals have participated in the creation of this specification and are gratefully  
2644 acknowledged:

2645 **Participants:**

2646 Abbie Barbir, Aetna  
2647 Dwayne Bock, U.S. Bank  
2648 Adam Dale, US Department of Defense (DoD)  
2649 Angela Dormagen, US Department of Defense (DoD)  
2650 Sander Fieten, Individual  
2651 Kayee Hanoaka, NIST  
2652 Mr. Kevin Mangold, NIST  
2653 Karen Marshall, NIST  
2654 Dr. Raul Sanchez-Reillo, Carlos III University of Madrid  
2655 Julian White, United Kingdom Cabinet Office

2656 **Past Participants:**

2657 Almog Aley-Raz, Nuance  
2658 Mr. Jeremiah Bruce, US Department of Homeland Security  
2659 Mr. Doron Cohen, SafeNet, Inc.  
2660 Robin Cover, OASIS  
2661 Matthias de Haan, Tandent Vision Science, Inc  
2662 Mr. Francisco Diez-Jimeno, Carlos III University of Madrid  
2663 Dr. Jeff Dunne, Johns Hopkins University Applied Physics Laboratory  
2664 Mr. Chet Ensign, OASIS  
2665 Richard Friedhoff, Tandent Vision Science, Inc  
2666 Bob Gupta, Viometric, LLC  
2667 Emily Jay, NIST  
2668 Mr. Ken Kamakura, Fujitsu Limited  
2669 Dr. Ross Micheals, NIST  
2670 Derek Northrope, Fujitsu Limited  
2671 Mr Tony Pham, Bank of America  
2672 Dr. Raul Sanchez-Reillo, Carlos III University of Madrid  
2673 Mrs. Dee Schur, OASIS  
2674 Mr. Jeffrey Shultz, US Department of Defense (DoD)  
2675 Casey Smith, Tandent Vision Science, Inc  
2676 Mr. Kevin Strickland, Tandent Vision Science, Inc  
2677 Cathy Tilton, Daon  
2678 Mr. Ryan Triplett, Booz Allen Hamilton  
2679 Ms. Maria Vachino, Johns Hopkins University Applied Physics Laboratory  
2680 Mr. Steven Venable, Lockheed Martin  
2681 Anne Wang, 3M HIS  
2682 Youngrock Yoon, Tandent Vision Science, Inc

2683 **Notable Contributions and Support**

2684 Jacob Glueck

2685 **Authors of initial NIST specification**

2686 Ross J. Micheals  
2687 Kevin Mangold  
2688 Matt Aronoff  
2689 Kristen Greene  
2690 Kayee Kwong  
2691 Karen Marshall

2692 **Acknowledgments listed in initial NIST specification**

2693 The authors thank the following individuals and organizations for their participation in the creation  
2694 of this specification.

2695 Biometric Standards Working Group, Department of Defense

2696 Michael Albright, Vision and Security Technology Laboratory, University of Colorado at Colorado  
2697 Springs

2698 Senaka Balasuriya, SolidBase Consulting

2699 Terrance Boulton, Vision and Security Technology Laboratory, University of Colorado at Colorado  
2700 Springs
