COMPOST ANALYSIS REPORT

Compost Test 3A

Analyte	Results	Results
	(As is basis)	(Dry weight basis)
рН	6.7	
Soluble Salts (1:5 w:w)	4.78 mmhos/cm	
Solids	47.3 %	
Moisture	52.7 %	
Organic Matter	38.0 %	80.4 %
Total Nitrogen (N)	1.2 %	2.6 %
Organic Nitrogen ¹	1.1 %	2.3 %
Ammonium N (NH ₄ -N)	1324.2 mg/kg	2800.2 mg/kg
	or 0.1324 %	or 0.2800 %
Carbon (C)	19.2 %	40.7 %
Carbon:Nitrogen (C:N) Ratio	15.60	15.60
Phosphorus (as P_2O_5) ²	1.06 %	2.24 %
Potassium (as K_2O) ²	0.35 %	0.74 %
Calcium (Ca)	0.26 %	0.55 %
Magnesium (Mg)	0.09 %	0.20 %
Particle size (< 9.5 mm)	97.00 %	
Fecal Coliform ³	< 1.8 MPN per g	< 4 MPN per g

¹See comments on back of report .

²To convert phosphorus (as P₂O₅) into elemental phosphorus (P), divide by 2.29. To convert potassium (as K₂O) into elemental potassium (K), divide by 1.20.

³Fecal Coliform subcontracted to Fairway Lab, Altoona, Pa

Sampled was shipped overnight on ice.

INTERPRETATION

- pHpH is a measure of active acidity in the feedstock or compost. The pH scale is 0 (acidic) to 14 (basic) with 7 being
neutral. Most finished composts will have pH values in the range of 5.0 to 8.5. Ideal pH depends on compost use.
A lower pH is preferred for certain ornamental plants while a neutral pH is suitable for most other applications. pH
is not a measure of the total acidity or alkalinity and cannot be used to predict the effect of compost on soil pH.
- SolubleSoluble salts are determined by measuring electrical conductivity (EC) in a 1:5 (compost:water, weight ratio)Saltsslurry. EC is related to the total soluble salts dissolved in the slurry and is measured in units of millimhos/cm
(mmhos/cm). Compost soluble salt levels typically range from 1 to 10 mmhos/cm. High salinity may be toxic to
plants. Ideal soluble salt levels will depend on the end use of the compost. Final compost blends with soil or
container media/potting mixes should be tested for soluble salts.
- % Solids,
 % Moisutre
 The ideal moisture content for composting will depend on the water holding capacity of the materials being composted. In general, high organic matter materials have a higher water holding capacity and a higher ideal moisture content. A typical starting compost mix will have an ideal % solids content of 35-55 % (65-45 % moisture). Finished compost should have a % solids content of 50-60 % (50-40 % moisture).
- % Organic There is no ideal organic matter level for feedstocks or finished compost. Organic matter content will decrease during composting. The organic matter content (dry weight basis) of typical feedstocks and starting mixes will be greater than 60 % while that of finished compost will be in the range of 30-70 %. An organic matter content (dry weight basis) of 50-60 % is desirable for most compost uses.

Nitrogen :Total nitrogen (N) includes all forms of nitrogen: organic N, ammonium N (NH4-N), and nitrate N (NO3-N). TotalTotal,N will normally range from less than 1 % to around 5 % (dry weight basis) in most feedstocks and from 0.5 to 2.5Organic,% (dry weight basis) in finished composts. NO3-N (an optional test) is generally present in only lowAmmonium,and Nitrateand Nitrateconcentrations in immature composts, although it may increase as the compost matures. NH4-N levels may be highduring initial stages of the composting process, but decrease as maturity increases. Organic N is determined bysubtracting the inorganic N forms, NH4-N and NO3-N, from total N. However, because NO3-N levels are generallyvery low, total nitrogen minus NH4-N provides a good estimate of organic N in most composts and is the valueshown on the front of this report. In stable, finished composts, most of the N should be in the organic form. WhileNH4-N and NO3-N are immediately available to plants, organic N is only slowly available, approximately 10 to 20% per year. However, mineralization or break-down of organic N into available inorganic forms depends on the C:

N ratio (see below) as well as factors such as soil moisture and temperature.Total carbon (C) is a direct measurement of all organic and inorganic carbon in the compost sample. Unless the

TotalTotal carbon (C) is a direct measurement of all organic and inorganic carbon in the compost sample. Unless the
sample has a high pH (> 8.3) or is known to contain carbonates, essentially all carbon will be in the organic form.
Compost organic matter typically contains around 54 % organic carbon by weight. The carbon content of
individual feedstocks may vary from this ratio.

Carbon:This is the ratio of total carbon (C) to total nitrogen (N) in the compost sample provided. C:N ratio may be used as
an indicator of compost stability and N availability. Compost C:N ratio typically decreases during composting if
the starting C:N ratio is > 25, but may increase if the starting C:N ratio is low (< 15) and N is lost during the
composting process. Composts with high C:N ratios (> 30) will likely immobilize or tie-up N if applied to soil,
while those with low C:N ratios (< 20) will mineralize or break-down organic N to inorganic (plant-available) N.</th>

Phosphorus,
PotassiumPhosphorus (P) and potassium (K) are plant macronutrients. Values reported are for total amounts given in the
oxide forms (P_2O_5 and K_2O). These results provide an indication of the nutrient value of the compost sample.
However, plant availability of total phosphorus and potassium in compost has not yet been established.

Nitrogen,
Phosphorus,When compost is applied on the basis of nitrogen (N), most composts will have an excess of phosphorus (P) and
potassium (K) relative to crop demand. These mineral elements and salts can accumulate to above optimum levels
with repeated application. Growers using compost should regularly soil test to monitor P, K and salt accumulation
and should consider using other nutrient sources or nitrogen fixing legumes in their crop rotation especially when
P and K levels are above optimum.

COMPOST BIOASSAY Seedling Emergence and Relative Growth

	TEST PARAMETERS			
Test Dates:	7/17/2015 to 7/24/2015			
Seed Type:	Cucumber-Marketmore 76 Variety			
Media Type: (Control)	Miracle Gro Moisture Control			
Vermiculite:	NK Professional Grade			

	TEST RESULTS					
Emergence: (% of control)	100					
Seedling Vigor: (%):	100					

COMMENTS

INTERPRETATION

The bioassay test provides a screen for the presence of phytotoxins in compost based on seedling emergence and seedling vigor relative to a control. It provides an assessment of compost maturity although should not be used as a stand-alone indicator. The U.S. Compost Council Test Methods for the Examination of Composting and Compost provides the following Maturity Indicator Ratings based on this test.

Maturity Indicator Rating¹

Test Parameter	Very Mature	Mature	Immature
Emergence %	> 90	80-90	< 80
Seedling Vigor %	> 95	85-95	< 85

RESPIROMETRY

Carbon Dioxide (CO₂) Evolution Rate

TEST RESULTS				
mg CO2-C/g solids/day:	0.5			
mg CO2-C/g organic matter/day:	0.6			

INTERPRETATION

Respirometry (CO_2 Evolution) provides a measurement of the relative microbial activity in a compost and, hence can be used as an estimate of compost stability. The intrepretive index below from the U.S. Compost Council Test Methods for the Examination of Composting and Compost assumes optimal conditions for microbial activity are present including temperature, mositure and nutrients and that toxic components that would inhibit microbial respiration are absent.

Result*	Stability Rating	General Characteristics
< 2	Very Stable	Well cured Compost No continued decomposition
		No odors No potential for volatile fatty acid phytotoxicity and odor
2-8	Stable	Cured Compost
		Odor production not likely Limited potential for volatile fatty acid phytotoxicity and odor Minimal impact on soil carbon and nitrogen dynamics
8-15	Moderately unstable, raw compost	Uncured compost Minimal odor production Moderate to high potential for volatile fatty acid phytotoxicity Moderate potential for negative impact on soil carbon and nitrogen dynamics
15-40	Raw compost or raw organic products	Uncured Compost Odor production likely High potential for volatile fatty acid phytotoxicity and odor High potential for negative impact on soil carbon and soil nitrogen dynamics
> 40	Raw feedstocks, unstable material	Raw, extremely unstable material Odor production expected Probably volatile fatty acid phytotoxicity with most materials Negative impact on soil carbon and nitrogen dynamics expected Generally not recommended for use as compost

* Units in mg CO₂-C/g organic matter/day
