

**DOCUMENTATION OF THE  
DETAIL NATALITY FILE FOR  
2002 DATA**

Public Use Data Tape Documentation - Natality Detail 2002 Data

This tape documentation was prepared in the Division of Vital Statistics. Vanetta Harrington of the Systems, Programming, and Statistical Resources Branch was responsible for coordinating the natality documentation.

Martha Munson of the Reproductive Statistics Branch prepared the Technical Appendix. The Registration Methods Section and the Data Acquisition and Evaluation Branch provided consultation to State Vital Statistics offices regarding collection of birth certificate data.

Questions on the documentation or general questions concerning the natality file should be directed to the Systems, Programming, and Statistical Resources Branch, Division of Vital Statistics, NCHS, 3311 Toledo Road, Hyattsville, MD 20782-2003 (301-458-4777).

Questions concerning the Technical Appendix or substantive questions concerning the natality data should be directed to the Reproductive Statistics Branch, Division of Vital Statistics, NCHS, 3311 Toledo Road, Hyattsville, MD 20782-2003 (301-458-4111).

## Documentation of the Detail Natality Data File for 2002 Data

Since 1985 natality statistics for all States and the District of Columbia have been based on information from the total file of records. The information is received on computer data tapes coded by the States and provided to the National Center for Health Statistics (NCHS) through the Vital Statistics Cooperative Program. NCHS receives the data for this file from the registration offices of all States, the District of Columbia, and New York City. Natality data for Puerto Rico, Virgin Islands, Guam, American Samoa and the Commonwealth of the Northern Mariana Islands (referred to as Northern Marianas) are included as a separate data-set in the public-use file.

Natality data for the United States are limited to births occurring within the United States to U.S. residents and nonresidents. Births to nonresidents of the United States are excluded from all tabulations by place of residence. Births occurring to U.S. citizens outside the United States are not included in this file. Natality data for Puerto Rico, Virgin Islands, Guam, American Samoa and Northern Marianas are limited to births occurring within the respective territories.

Effective January 1, 1989, a revised U.S. Standard Certificate of Live Birth replaced the 1978 revision. The 1989 revision provides a wide variety of new information on maternal and infant health characteristics, representing a significant departure from previous versions in both content and format. For a more detailed discussion of the revised and new items, refer to the technical appendix part of this document.

The Office of Management and Budget revised its designation of metropolitan statistical areas based on figures from the 1990 Census. Effective with the 1990 data file, NCHS has been using these new definitions and codes as indicated in the listing of 320 Metropolitan Statistical Areas (MSA's), Primary Metropolitan Statistical Areas (PMSA's), and New England County Metropolitan Areas (NECMA'S) included in this documentation. There are also 20 Consolidated Metropolitan Statistical Areas (CMSA's), which are made up of PMSA's. Because other geographic changes based on 1990 Census became effective with 1994 data file, the metropolitan statistical area destinations were updated as well. Effective with the 1994 data-file there are 311 MSA's, PMSA's, and NECMA'S and 18 CMSA's as indicated in the listing included in this documentation.

NCHS has adopted a new policy on release of vital statistics unit record data files. This new policy was implemented for the 1989 vital event files to prevent the inadvertent disclosure of individuals and institutions. As a result, the files for 1989 and later years do not contain the actual day of the birth or the dates of birth of the mother or father. The geographic detail is also restricted; only counties and cities of 100,000 or more population based on the 1990 Census, as well as metropolitan areas of 100,000 or more population based on the 1990 Census, are identified.

Included in this document are:

1. List of data elements and tape locations.
2. Machine/File/Data Characteristics.
3. Detail Record Layout.
4. Geographic Code Outline.
5. Metropolitan Statistical Areas as adapted for use by NCHS/DVS.
6. Technical Appendix.
7. Table 1. Counts of Births by occurrence and residence for each State

<u>Data Items</u>	<u>Locations</u>
1. General	
a. Data year	1-4
b. Record type	5
c. Resident status	6
2. Occurrence	
a. NCHS State	16-17
b. Expanded NCHS State	14-15
c. NCHS County	18-20
d. Population size - county	26
e. Division	12
f. Region	11
g. FIPS State	21-22
h. FIPS County	23-25
3. Residence	
a. NCHS State	32-33
b. Expanded NCHS State	30-31
c. NCHS County	34-36
d. NCHS City	37-39
e. Population size - city	40
f. Population size - county	58
g. NCHS PSMA/MSA	347-349
h. Met/Nonmet county	41
i. Division	28
j. Region	27
k. FIPS State	42-43
l. FIPS County	44-46
m. FIPS Place	47-51
n. CMSA	52-53
o. FIPS PSMA/MSA	54-57
4. Prenatal Care	
a. Month began	106-109
b. Number of visits	110-113
c. Adequacy of care recode	93
5. Child	
a. Sex	188-189
b. Number at delivery	201
c. Birthweight	193-199
d. Apgar score	205-207
e. Gestation	181-187,208-209
f. Month/year of birth	172-173,176-179
g. Day of week of birth	180

List of Data Elements and Tape Locations

<u>Data Items</u>	<u>Locations</u>
6. Mother	
a. Age	68-76,91-92
b. Race	79-82
c. Marital status	86-87
d. Education	83-85
e. Place of birth	88-90
f. Hispanic origin	77-78
7. Pregnancy History	
a. Born alive, now living	94-95
b. Born alive, now dead	96-97
c. Other terminations	98-99
d. Total birth order	103-105
e. Live birth order	100-102
8. Father	
a. Age	154-157,166-167
b. Race	160-162
c. Hispanic origin	158-159
9. Other Items	
a. Residence reporting flags	307-326
b. Attendant at birth	10
c. Place of delivery	8-9
d. Interval since last live birth	128-132
10. Medical and Health Data	
a. Method of delivery	217-222,224
b. Medical risk factors	225-241
c. Other risk factors	
Tobacco	242-245
Alcohol	246-249
Weight gain during pregnancy	250-252
d. Obstetric procedures	253-259
e. Complications of labor and/or delivery	260-275
f. Abnormal conditions of the newborn	276-284
g. Congenital anomalies	285-306

United States occurrence

Beginning with 1992 data, some areas started reporting additional Asian or Pacific Islander codes for race. Codes 18-68 replace old code 08 for these areas. Code 78 replaces old code 08 for all other areas. For consistency with Census race code 09 (all other races) used prior to 1992 has been Changed to 99.

## Vital Statistics Geographic Code Outline for the United States

The following pages show in detail the geographic codes used by the Division of Vital Statistics in the processing of vital event data occurring in the United States. When an event occurs to a nonresident of the United States, residence data are coded only to the "State" level; several western hemisphere countries or the remainder of the world are uniquely identified. Along with the Division of Vital Statistics codes the Federal Information Processing Standards (FIPS) codes are shown for several items. Both sets of codes appear on the vital event public-use files. The Metropolitan Statistical Area codes are effective with the 1996 data year and are based on the 1990 Census.

To aid the user in interpreting the geographic codes, a brief explanation of the codes and of the column headings/abbreviations shown on the following pages are:

**State (St):** Each State and the District of Columbia are numbered alphabetically. In addition, several unique codes are used to identify nonresidents of the U.S.

**County (Cnty):** Counties and county equivalents (independent and coextensive cities) are numbered alphabetically within each State.

**P/MSA:** Primary metropolitan statistical areas and metropolitan statistical areas are those established by the U.S. Office of Management and Budget (OMB) using 1990 Census population counts. For New England, the New England County Metropolitan Areas (NECMA) are used.

**M/NM:** Metropolitan counties (code 1) are component counties of P/MSA's. Nonmetropolitan counties (code 2) are not part of any P/MSA.

**City or place:** Cities/places are numbered alphabetically within each State and identify each city with a population of 10,000 or more in 1990.

**P/S:** Population size code for city of residence based on the 1990 Census. Refer to the code outline given earlier in this document for specific codes and meanings.

**Name:** Each State, county, and city name is listed along with its respective code. In addition, places used to identify nonresidents of the U.S. are also listed along with their codes.

**FIPS:** For an explanation of FIPS codes, reference should be made to various National Institute of Standards & Technology (NITS) publications.

**So! How do I find Yavapai county, Arizona; or Tupelo city, Mississippi?**

Since counties and cities/places are numbered within State, the State and county or the State and city/places codes must be used to select these areas. It is most helpful if the county is known when looking for a particular city since areas are shown by State, county, and city.

Yavapai county, Arizona - State and county codes NCHS: 03 014; FIPS: 04 025.

Tupelo, Mississippi - State and city/place codes NCHS: 25 032; FIPS: 28 74840; or State, county, city/place codes NCHS: 25 041 032; FIPS: 28 081 74840.

## **Vital Statistics Geographic Code Outline for Puerto Rico, Virgin Islands, Guam, American Samoa and Northern Marianas**

The following pages show in detail the geographic codes used by the Division of Vital Statistics in the processing of vital event data occurring in Puerto Rico, the Virgin Islands, or Guam. When an event occurs to a nonresident of these areas, residence data are coded only to the "State" level; each U.S. state, several western hemisphere countries or the remainder of the world are uniquely identified. Along with the Division of Vital Statistics codes, the Federal Information Processing Standards (FIPS) codes are shown for several items. Both sets of codes appear on the vital event public-use files. Codes are effective with the 1994 data year and are based on results of the 1990 Census.

To aid the user in interpreting the geographic codes, a brief explanation of the codes and of the column headings/abbreviations shown on the following pages are:

### **Puerto Rico:**

**State (St):** Puerto Rico has its own unique code. In addition, several unique codes are used to identify nonresidents of Puerto Rico.

**County (Cnty):** Each municipio (county equivalent) is numbered alphabetically.

**P/MSA:** Primary metropolitan statistical areas and metropolitan statistical areas are those established by the U.S. Office of Management and Budget (OMB) using 1990 Census population counts.

**M/NM:** Metropolitan counties (code 1) are component counties of P/MSA's. Nonmetropolitan counties (code 2) are not part of any P/MSA.

**City or Place:** No city/places in Puerto Rico are identified.

**Name:** Puerto Rico and each municipio are listed along with their respective codes. In addition, places used to identify nonresidents of Puerto Rico are also listed along with their codes.

**FIPS:** For an explanation of FIPS codes, reference should be made to various National Institute of Standards and Technology (NIST) publications.

### **Virgin Islands:**

**State (St):** The Virgin Islands has its own unique code. In addition, several unique codes are used to identify nonresidents of the Virgin Islands.

**County (Cnty):** Several Islands (county equivalent) are numbered alphabetically.

**P/MSA:** None are identified in the Virgin Islands.

**M/NM:** No metropolitan areas are identified for the Virgin Islands.

**City or Place:** City/places are numbered alphabetically within each State and identify each city with a population of 10,000 or more in 1990.

**P/S: Population size code for city of residence based on the 1990 Census. Refer to the code outline given earlier in this document for specific codes and meanings.**

**Name: The Virgin Islands as a whole and several islands are listed along with their respective codes. In addition, places used to identify nonresidents of the Virgin Islands are also listed along with their codes.**

### **Guam:**

**State (St): Guam has its own unique code. In addition, several unique codes are used to identify nonresidents of Guam.**

**County (Cnty): None are identified in Guam**

**P/MSA: None are identified in Guam.**

**M/NM: No metropolitan areas are identified for Guam.**

**City or Place: None are identified in Guam.**

**P/S: No population size groups are identified for Guam.**

**Name: Guam as a whole is listed along with its respective code. In addition, places used to identify nonresidents of Guam are also listed along with their codes.**

### **American Samoa:**

**State (St): American Samoa has its own unique code. In addition, several unique codes are used to identify nonresidents of American Samoa.**

**County (Cnty): None are identified in American Samoa**

**P/MSA: None are identified in American Samoa.**

**M/NM: No metropolitan areas are identified for American Samoa.**

**City or Place: None are identified in American Samoa.**

**P/S: No population size groups are identified for American Samoa.**

**Name: American Samoa as a whole is listed along with its respective code. In addition, places used to identify nonresidents of American Samoa are also listed along with their codes.**

### **Northern Marianas:**

**State (St):** Northern Marianas has its own unique code. In addition, several unique codes are used to identify nonresidents of Northern Marianas.

**County (Cnty):** None are identified in Northern Marianas.

**P/MSA:** None are identified in Northern Marianas.

**M/NM:** No metropolitan areas are identified for Northern Marianas.

**City or Place:** None are identified in Northern Marianas.

**P/S:** No population size groups are identified for Northern Marianas.

**Name:** Northern Marianas as a whole is listed along with its respective code. In addition, places used to identify nonresidents of Northern Marianas are also listed along with their codes.

**TECHNICAL APPENDIX FROM**

**VITAL STATISTICS OF  
THE UNITED STATES**

**2002**

**NATALITY**

**U.S. DEPARTMENT OF  
HEALTH AND HUMAN SERVICES**

**CENTERS FOR DISEASE CONTROL AND PREVENTION  
NATIONAL CENTER FOR HEALTH STATISTICS**

**Hyattsville, Maryland: December 2003**

# ACKNOWLEDGMENTS

The technical appendix preparation was coordinated by Martha Little Munson and Paul D. Sutton in the Division of Vital Statistics (DVS) under the general direction of Stephanie J. Ventura, Chief of the Reproductive Statistics Branch. The vital statistics computer file on which it is based was prepared by DVS staff.

The Division of Vital Statistics, Charles J. Rothwell, Director, and James A. Weed, Deputy Director, managed the Vital Statistics Cooperative Program, through which the vital registration offices of all States, the District of Columbia, New York City, Puerto Rico, Virgin Islands, Guam, American Samoa, and the Commonwealth of the Northern Mariana Islands provided the data to the National Center for Health Statistics (NCHS). This Division also processed computer edits, designed and programmed the tabulations, reviewed the data, prepared documentation for this publication, and was responsible for receipt and processing of the basic data file. The following management staff provided overall direction: Rajesh Virkar, James A. Weed, and Nicholas F. Pace. Important contributors were Judy M. Barnes, Brenda L. Brown, Faye Cavalchire, Linda P. Currin, Thomas D. Dunn, Connie M. Gentry, Brenda A. Green, Bonita Gross, Brady E. Hamilton, Kathy B. Holiday, Christina K. Jarman, Millie B. Johnson, David W. Justice, Virginia J. Justice, Julia L. Kowaleski, Annie Liu, Joyce A. Martin, T.J. Mathews, Susan L. McBroom, Fay Menacker, Jaleh Mousavi, Gail Parr, Phyllis Powell-Hobgood, Adrienne L. Rouse, Jordan Sacks, Manju Sharma, Steven Steimel, Pam Stephenson, George C. Tolson, Mary M. Trotter, James G. Williams, Francine D. Winter, and Jiaquan Xu.

The Division of Information Services, Phillip R. Beattie, Director, and Linda Bean, Chief of the Information Design and Publishing Branch, were responsible for publication management and editorial review. Important contributors were Kathy Sedgwick, Margaret Avery, and Christine J. Brown.

The Office of Research and Methodology was responsible for the application of mathematical statistics methods to the development and implementation of quality assurance procedures. Important contributions in this area were made by Kenneth Harris.

NCHS acknowledges the essential role of the vital registration offices of all States and territories in maintaining the system through which vital statistics data are obtained and their cooperation in providing the information on which this publication is based.

## Text Tables

A. Percentage of birth records on which specified items were not stated: United States and each State and territory, 2002	26
B. Births by place of occurrence and residence for births occurring in the 50 States, the District of Columbia, U.S. territories, and other countries, 2002	31
C. Lower and upper 95 percent and 96 percent confidence limit factors for a birth rate based on a Poisson variable of 1 through 99 births, <i>B</i>	32
D. Sources for the resident population and population including Armed Forces abroad: Birth-and death-registration States, 1900–1932, and United States, 1900–2002	34
E. Percentage net undercount, by age, sex, and race/Hispanic origin: United States, April 1, 2000	35

## Population Tables

4–1. Population of birth-and death-registration States, 1900–1932, and United States, 1900–2002	36
4–2. Estimated total population by race and estimated female population by age and race: United States, 2003	37
4–3. Estimated total population by specified Hispanic origin and estimated female population by age and specified Hispanic origin and by race for women of non-Hispanic origin: United States, 2002	38
4–4. Estimated total population and female population aged 15–44 years: United States, each State, and territory, July 1, 2002	39

## **Introduction**

This report, published by the Centers for Disease Control and Prevention's National Center for Health Statistics (NCHS), is an updated and abridged version of the "1999 Technical Appendix" and focuses on information for the 2002 data file (1). This "Appendix" is also included in "Vital Statistics of the United States, 2002, Volume I, Natality" (in preparation). Reference will be made to the "1999 Technical Appendix" for historical discussion of the variables, definitions, quality, and completeness of the birth data (2). This report supplements the "Technical Notes" section of "Births: Final data for 2002" (3) and is recommended for use with the public-use file for 2002 births, available on CD-ROM from NCHS, and the tabulated data of "Vital Statistics of the United States, 2002, Volume I, Natality."

## **Definition of Live Birth**

Every product of conception that gives a sign of life after birth, regardless of the length of the pregnancy, is considered a live birth. This concept is included in the definition set forth by the World Health Organization in 1950 and revised in 1988 by a working group formed by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists (4-6):

Live birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached; each product of such a birth is considered liveborn.

This definition distinguishes in precise terms a live birth from a fetal death (see section on fetal deaths in the "Technical Appendix" of "Vital Statistics of the United States, Volume II"). In the interest of comparable natality statistics, both the Statistical Commission of the United Nations and NCHS have adopted this definition (7,8).

## **History of Birth-Registration Area**

Currently the birth-registration system of the United States covers the 50 States, the District of Columbia, the independent registration area of New York City, and Puerto Rico, the U.S. Virgin Islands, Guam, American Samoa, and the Commonwealth of the Northern Mariana Islands (referred to as Northern Marianas). However, in the statistical tabulations, "United States" refers only to the aggregate of the 50 States (including New York City) and the District of Columbia. Information on the history and development of the birth-registration area is available elsewhere (2).

## Sources of Data

### Natality statistics

Since 1985 natality statistics for all States and the District of Columbia have been based on information from the total file of records. The information is received on electronic files of individual records processed by the States and provided to NCHS through the Vital Statistics Cooperative Program. NCHS receives these files from the registration offices of all States, the District of Columbia, and New York City. Information for Puerto Rico and the Virgin Islands is also received through the Vital Statistics Cooperative Program. Information for Guam, American Samoa, and the Northern Marianas is obtained from microfilm copies of original birth certificates and is based on the total file of records for all years. Data from American Samoa first became available in 1997. Data from the Northern Marianas first became available in 1998.

U.S. natality data are limited to births occurring within the United States, including those occurring to U.S. residents and nonresidents. Births to nonresidents of the United States have been excluded from all tabulations by place of residence beginning in 1970 (for further discussion see “Classification by occurrence and residence”). Births occurring to U.S. citizens outside the United States are not included in any tabulation in this report. Data for Puerto Rico, the Virgin Islands, Guam, American Samoa, and the Northern Marianas are limited to births registered in these areas.

### Standard certificate of live birth

The U.S. Standard Certificate of Live Birth, issued by the Public Health Service, has served for many years as the principal means of attaining uniformity in the content of the documents used to collect information on births in the United States. It has been modified in each State to the extent required by the particular State's needs or by special provisions of the State's vital statistics law. However, most State certificates conform closely in content to the standard certificate.

*1989 revision*—Effective January 1, 1989, a revised U.S. Standard Certificate of Live Birth ([figure 4–A](#)) replaced the 1978 revision. This revision provided a wide variety of new information on maternal and infant health characteristics, representing a significant departure from previous versions in both content and format. The most significant format change was the use of checkboxes to obtain detailed medical and health information about the mother and child. Details of the nature and content of the 1989 revision are available elsewhere (2).

## Classification of Data

One of the principal values of vital statistics data is realized through the presentation of rates that are computed by relating the vital events of a class to the population of a similarly defined class. Vital statistics and population statistics, therefore, must be classified according to similarly defined systems and tabulated in comparable groups. Even when the variables common to both, such as geographic area, age, race, and sex, have been similarly classified and tabulated, significant discrepancies may result from differences between the enumeration method of obtaining population data and the registration method of obtaining vital statistics data.

The general rules used to classify geographic and personal items for live births are set

forth in “Vital Statistics Classification and Coding Instructions for Live Birth Records, 1999–2001,” *NCHS Instruction Manual*, Part 3a (9). This material is incorporated in the basic file layout on the CD-ROM (1). The instruction materials are for States to use in coding the data items; they do not include any NCHS recodes. Therefore, the file layout is a better source of information on the code structure because it provides the exact codes and recodes that are available. Classification of certain important items is discussed in the following pages. Information on the completeness of reporting of birth certificate data is shown in [table A](#), which presents a listing of items and the percentage of records that were not stated for each State, Puerto Rico, the Virgin Islands, Guam, American Samoa, and the Northern Marianas.

### **Classification by occurrence and residence**

In tabulations by place of residence, births occurring within the United States to U.S. citizens and to resident aliens are allocated to the usual place of residence of the mother in the United States, as reported on the birth certificate. Beginning in 1970, births to nonresidents of the United States occurring in the United States are excluded from these tabulations. Births to U.S. residents occurring outside this country are not included in tabulations by place of residence.

The total count of births for the United States by place of residence and by place of occurrence will not be identical. Births to nonresidents of the United States are included in data by place of occurrence but excluded from data by place of residence, as previously indicated. See [table B](#) for the number of births by residence and occurrence for the 50 States and the District of Columbia for 2002.

*Residence error*—A nationwide test of birth-registration completeness in 1950 provided measures of residence error for natality statistics. According to the 1950 test (which has not been repeated), errors in residence reporting for the country as a whole tend to overstate the number of births to residents of urban areas and to understate the number of births to residents of other areas (10). Recent experience demonstrates that this is still a concern based on anecdotal evidence from the States. This tendency has assumed special importance because of a concomitant development—the increased utilization of hospitals in cities by residents of nearby places—with the result that a number of births are erroneously reported as having occurred to residents of urban areas. Another factor that contributes to this overstatement of urban births is the customary practice of using city addresses for persons living outside the city limits. Residence error should be taken into consideration in interpreting data for small areas and for cities. Both birth and infant mortality patterns can be affected.

*Incomplete residence*—Beginning in 1973 where only the State of residence is reported with no city or county specified and the State named is different from the State of occurrence, the birth is allocated to the largest city of the State of residence. Before 1973, such births were classified according to the exact place of occurrence.

### **Geographic classification**

The rules followed in the classification of geographic areas for live births are contained in the instruction manual mentioned previously. The geographic code structure for 2002 is given in another manual, “Vital Records Geographic Classification, 1995,” *NCHS Instruction Manual*, Part 8, which is included with the documentation file on CD-ROM (1). The geographic code structure in 2002 is based on results of the 1990 Census of Population.

*United States*—In the statistical tabulations, “United States” refers only to the aggregate of the 50 States and the District of Columbia. Alaska has been included in the U.S. tabulations

since 1959 and Hawaii since 1960.

Details of the classification of births for metropolitan statistical areas, metropolitan and nonmetropolitan counties, and population size groups for cities and urban places are presented elsewhere (2).

Places with a population of less than 100,000 are not separately identified on the public-use file because of confidentiality limitations.

### **Race or national origin**

Beginning with the 1989 data year, birth data are tabulated primarily by race of mother. Since 1989 the criteria for reporting the race of the parents has not changed and continues to reflect the response of the informant (usually the mother). Beginning with the 1992 issue of "Vital Statistics of the United States, Volume I, Natality," trend data for years beginning with 1980 have been retabulated by race of mother. The factors influencing the decision to tabulate births by race of the mother have been discussed in detail elsewhere (2,11). Information on tabulation procedures for data by race prior to 1989 is presented elsewhere (2). The change in the tabulation of births by race presents some problems when analyzing birth data by race, particularly trend data. The problem is likely to be acute for races other than white and black.

The categories for race or national origin are "White," "Black," "American Indian" (including Aleuts and Eskimos), "Chinese," "Japanese," "Hawaiian," "Filipino," and "Other Asian or Pacific Islander" (including Asian Indian). Before 1992, there was also an "Other" category, which is now combined with the "Not stated" category. Before 1978, the category "Other Asian or Pacific Islander" was not identified separately but included with "Other" races. The separation of this category from "Other" allows for identification of the category "Asian or Pacific Islander" by combining the new category "Other Asian or Pacific Islander" with Chinese, Japanese, Hawaiian, and Filipino.

Since 1992 States with the largest Asian or Pacific Islander (API) populations have provided NCHS with data for additional API subgroups. The API subgroups include Vietnamese, Asian Indian, Korean, Samoan, Guamanian, and other API women. In 2002, 11 States were included in this reporting area: California, Hawaii, Illinois, Minnesota, Missouri, New Jersey, New York, Texas, Virginia, Washington, and West Virginia. At least two-thirds of the U.S. population of each of these additional API groups lived in the 11-State reporting area (12). The data are available on the detailed natality tapes and CD-ROMs beginning with the 1992 data year. An analytic report based on the 1992 data year is also available upon request (13).

If the race or national origin of an Asian parent is ill-defined or not clearly identifiable with one of the categories used in the classification (for example, if "Oriental" is entered), an attempt is made to determine the specific race or national origin from the entry for place of birth. If the birthplace is China, Japan, or the Philippines, the race of the parent is assigned to that category. When race cannot be determined from birthplace, it is assigned to the category "Other Asian or Pacific Islander."

Hispanic origin and race are reported independently on the birth certificate. Data for Hispanic subgroups are shown in most cases for four specific groups: Mexican, Puerto Rican, Cuban, Central and South American; and an additional subgroup: "Other and unknown Hispanic." More specific Hispanic origin information for the "Other and unknown Hispanic" category is not available. In tabulations of birth data by race only, data for persons of Hispanic origin are included in the data for each race group according to the mother's reported race. The category "White" comprises births reported as white and births where race, as distinguished from

Hispanic origin, is reported as Hispanic. In tabulations of birth data by race and Hispanic origin, data for persons of Hispanic origin are not further classified by race because the vast majority of births to Hispanic women are reported as white (98 percent in 2002). In these tabulations, data for non-Hispanic persons are classified according to the race of the mother because there are substantial differences in fertility and maternal and infant health between Hispanic and non-Hispanic white women. A recode variable is available that provides cross tabulations of race by Hispanic origin.

*Race or national origin not stated*—If the race of the mother is not defined or not identifiable with one of the categories used in the classification (0.5 percent of births in 2002) and the race of the father is known, the race of the father is assigned to the mother. If information for both parents is missing, the race of the mother is allocated according to the specific race of the mother on the preceding record with a known race of mother. Data for both parents were missing for only 0.3 percent of birth certificates for 2002. Nearly all statistics by race or national origin for the United States as a whole in 1962 and 1963 are affected by a lack of information for New Jersey, which did not report the race of the parents in those years. Birth rates by race for those years are computed on a population base that excluded New Jersey. For the method of estimating the U.S. population by age, sex, and race excluding New Jersey in 1962 and 1963, see page 4-8 in the “Technical Appendix” of “Vital Statistics of the United States, Volume I, 1963.” The percentage of records for which Hispanic origin of the parents was not reported in 2002 is shown by State in [table A](#).

### **Age of mother**

Beginning in 1989 a “Date of birth” item on the birth certificate replaced the “Age (at time of this birth)” item. Not all States revised this item, and, therefore, the age of mother either is derived from the reported month and year of birth or coded as stated on the certificate. In 2002 age of mother was reported directly by five States (Kentucky, Nevada, North Dakota, Virginia, and Wyoming) and American Samoa. From 1964 to 1996 age of mother was considered not stated and therefore imputed for ages under 10 years or 50 years and over. Beginning in 1997 age of mother was considered not stated and imputed for ages under 10 years or 55 years and over. The numbers of births to women aged 50–54 years are too small for computing age-specific birth rates. These births have been included with births to women aged 45–49 years for computing birth rates.

Age-specific birth rates are based on populations of women by age, prepared by the U.S. Census Bureau. In census years the decennial census counts are used. In intercensal years, estimates of the population of women by age are published by the U.S. Census Bureau in *Current Population Reports*. The 2000 Census of Population derived age in completed years as of April 1, 2000, from responses to questions on age at last birthday and month and year of birth, with the latter given preference. In the 1960, 1970, 1980, and 1990 Census of Population, age was also derived from month and year of birth. Age in completed years was asked in censuses before 1960. This was nearly the equivalent of the former birth certificate question, which the 1950 test of matched birth and census records confirms by showing a high degree of consistency in reporting age in these two sources (14). More recently, reporting of maternal age on the birth certificate was compared with reporting of age in a survey of women who had recently given birth. Reporting of age was very consistent between the two sources (15).

*Median age of mother*—Median age is the value that divides an age distribution into two equal parts, one-half of the values being less and one-half being greater. Median ages of mothers

for 1960 to the present have been computed from birth rates for 5-year age groups rather than from birth frequencies. This method eliminates the effects of changes in the age composition of the childbearing population over time. Changes in the median ages from year to year can thus be attributed solely to changes in the age-specific birth rates. Trend data on the median age is shown in table 1–5 of “Vital Statistics of the United States, Volume 1, Natality” (at <http://www.cdc.gov/nchs/datawh/statab/unpubd/natality/natab99.htm>).

*Not stated date of birth of mother*– In 2002 age of mother was not reported on 0.01 percent of the records. Beginning in 1964 birth records with date of birth of mother and/or age of mother not stated have had age imputed according to the age of mother from the previous birth record of the same race and total-birth order (total of fetal deaths and live births). (See “Computer Edits for Natality Data, Effective 1993” *NCHS Instruction Manual*, Part 12, page 9) (16). Editing procedures for 1963 and earlier years are described elsewhere (2).

### **Age of father**

Age of father is derived from the reported date of birth or coded as stated on the birth certificate. If the age is under 10 years, it is considered not stated and grouped with those cases for which age is not stated on the certificate. Information on age of father is often missing on birth certificates of children born to unmarried mothers, greatly inflating the number in the “Not stated” category in all tabulations by age of father. In computing birth rates by age of father, births tabulated as age of father not stated are distributed in the same proportions as births with known age within each 5-year-age classification of the mother. This procedure is followed because, while father’s age is missing in 13 percent of the birth certificates in 2002, 25 percent of these were on records where the mother is a teenager. This distribution procedure is done separately by race. The resulting distributions are summed to form a composite frequency distribution that is the basis for computing birth rates by age of father. This procedure avoids the distortion in rates that would result if the relationship between age of mother and age of father were disregarded. Births with age of father not stated are distributed only for rates, not for frequency tabulations (3).

### **Live-birth order and parity**

Live-birth order and parity classifications refer to the total number of live births the mother has had including the 2002 birth. Fetal deaths are excluded.

Live-birth order indicates what number the present birth represents; for example, a baby born to a mother who has had two previous live births (even if one or both are not now living) has a live-birth order of three. Parity indicates how many live births a mother has had. Before delivery a mother having her first baby has a parity of zero, and a mother having her third baby has a parity of two. After delivery the mother of a baby who is a first live birth has a parity of one, and the mother of a baby who is a third live birth has a parity of three.

Live-birth order and parity are determined from two items on the birth certificate, “Live births now living” and “Live births now dead.” Editing procedures for live birth order are summarized elsewhere (2,16).

*Not stated birth order*–All births tabulated in the “Not stated birth order” category are excluded from the computation of percentages. In computing birth rates by live-birth order, births tabulated as birth order not stated are distributed in the same proportion as births of known live-birth order.

## **Educational attainment**

National data on educational attainment are currently available only for the mother (2). Beginning in 1995, NCHS ceased to collect information on the educational attainment of the father.

The educational attainment of the mother is defined as the number of years of school completed. Only those years completed in regular schools are counted, that is, a formal educational system of public schools or the equivalent in accredited private or parochial schools. Business or trade schools, such as beauty and barber schools, are not considered regular schools for the purposes of this item. No attempt has been made to convert years of school completed in foreign school systems, ungraded school systems, and so forth, to equivalent grades in the American school system. Such entries are included in the “Not stated” category.

Women who have completed only a partial year in high school or college are tabulated as having completed the highest preceding grade. For those certificates on which a specific degree is stated, years of school completed is coded to the level at which the degree is most commonly attained; for example, women reporting B.A., A.B., or B.S. degrees are considered to have completed 16 years of school.

*Education not stated*—The “Not stated” category includes all records in reporting areas for which there is no information on years of school completed as well as all records for which the information provided is not compatible with coding specifications.

Births tabulated as education not stated are excluded from the computations of percentages.

## **Marital status**

National estimates of births to unmarried women are based on two methods of determining marital status. For 1994 through 1996 birth certificates in 45 States and the District of Columbia included a question about the mother's marital status. Beginning in 1997, the marital status of women giving birth in California and Nevada is determined by a direct question in the birth registration process. Beginning June 15, 1998, Connecticut discontinued inferring the mother's marital status and added a direct question on mother's marital status to the State's birth certificate.

In the two States (Michigan and New York) which used inferential procedures to compile birth statistics by marital status in 2002, a birth is inferred as nonmarital if any of these factors, listed in priority-of-use order, is present: a paternity acknowledgment was received or the father's name is missing. In recent years, a number of States have extended their efforts to identify the fathers when the parents are not married in order to enforce child support obligations. The presence of a paternity acknowledgment, therefore, is the most reliable indicator that the birth is nonmarital in the States not reporting this information directly; this is now the key indicator in the nonreporting States. Details of the changes in reporting procedures are described in previous reports (17,18).

The procedures for reporting marital status in California, Nevada, and New York City changed beginning January 1, 1997, and in Connecticut on June 15, 1998. The methods used to determine marital status and the impact of the procedures on the data were discussed in detail in a previous report (17).

The mother's marital status was not reported in 2002 on 0.03 percent of the birth records in the 48 States and the District of Columbia where this information is obtained by a direct question. Marital status was imputed as married for these records.

When births to unmarried women are reported as second or higher order births, it is not known whether the mother was married or unmarried when the previous deliveries occurred because her marital status at the time of these earlier births is not available from the birth record.

### **Place of delivery and attendant at birth**

The 1989 revision of the U.S. Standard Certificate of Live Birth included separate categories for freestanding birthing centers, the mother's residence, and clinic or doctor's office as the place of birth. Beginning in 1989 births occurring in clinics and in birthing centers not attached to a hospital are classified as "Not in hospital." This change in classification may account in part for the lower proportion of "In hospital" births compared with previous years. (The change in classification of clinics should have minor impact because comparatively few births occur in these facilities, but the effect of any change in classification of freestanding birthing centers is unknown.)

Beginning in 1975 the attendant at birth and place of delivery items were coded independently, primarily to permit the identification of the person in attendance at hospital deliveries. Additional information on these items is presented elsewhere (2).

Babies born on the way to or on arrival at the hospital are classified as having been born in the hospital. This may account for some of the hospital births not delivered by physicians or midwives. The "Not in hospital" category includes births for which no information is reported on place of birth.

In 2000 Illinois started collecting data on certified nurse-midwives (CNM) and making corrections for "Other midwife" and "Other" categories. Data for earlier years were incomplete for Illinois births. As a result, the number of CNMs has significantly increased while the number of "Other midwife" has sharply decreased compared to earlier years.

Procedures in some hospitals may require that a physician be listed as the attendant for every birth and that a physician sign each birth certificate, even if the birth is attended by a midwife and no physician is physically present. Therefore, the number of live births attended by midwives may be understated in some areas.

### **Birthweight**

In some areas birthweight is reported in pounds and ounces rather than in grams. However, the metric system has been used in tabulating and presenting the statistics to facilitate comparison with data published by other groups. The categories for birthweight were changed in 1979 to be consistent with the recommendations in the *International Classification of Diseases, Ninth Revision (ICD-9)* and remain the same for the *International Classification of Diseases, Tenth Revision (ICD-10)* (5). The categories in gram intervals and their equivalents in pounds and ounces are as follows:

Less than 500 grams = 1 lb 1 oz or less  
500–999 grams = 1 lb 2 oz–2 lb 3 oz  
1,000–1,499 grams = 2 lb 4 oz–3 lb 4 oz  
1,500–1,999 grams = 3 lb 5 oz–4 lb 6 oz  
2,000–2,499 grams = 4 lb 7 oz–5 lb 8 oz  
2,500–2,999 grams = 5 lb 9 oz–6 lb 9 oz  
3,000–3,499 grams = 6 lb 10 oz–7 lb 11 oz  
3,500–3,999 grams = 7 lb 12 oz–8 lb 13 oz

4,000–4,499 grams = 8 lb 14 oz–9 lb 14 oz  
4,500–4,999 grams = 9 lb 15 oz–11 lb 0 oz  
5,000 grams or more = 11 lb 1 oz or more

ICD–9 and ICD–10 define low birthweight as less than 2,500 grams. This is a shift of 1 gram from the previous criterion of 2,500 grams or less, which was recommended by the American Academy of Pediatrics in 1935 and adopted in 1948 by the World Health Organization in the *International Lists of Diseases and Causes of Death, Sixth Revision*.

After data classified by pounds and ounces are converted to grams, median weights are computed and rounded before publication. To establish the continuity of class intervals needed to convert pounds and ounces to grams, the end points of these intervals are assumed to be half an ounce less at the lower end and half an ounce more at the upper end. For example, 2 lb 4 oz–3 lb 4 oz is interpreted as 2 lb 3 ½ oz–3 lb 4 ½ oz.

Births for which birthweight is not reported are excluded from the computation of percentages and medians.

### **Period of gestation**

The period of gestation is defined as beginning with the first day of the last normal menstrual period (LMP) and ending with the day of the birth. The LMP is used as the initial date because it can be more accurately determined than the date of conception, which usually occurs 2 weeks after the LMP.

Births occurring before 37 completed weeks of gestation are considered to be preterm or premature for purposes of classification. At 37–41 weeks gestation, births are considered to be term, and at 42 completed weeks and over, postterm. These distinctions are according to the ICD–9 and ICD–10 (5) definitions.

The 1989 revision of the U.S. Standard Certificate of Live Birth included a new item, “Clinical estimate of gestation” that is being compared with length of gestation computed from the LMP date when the latter appears to be inconsistent with birthweight. This is done for normal weight births of apparently short gestations and very low birthweight births reported to be full term. The use of the clinical estimate in the 2002 data file is described in the “Technical Notes” of “Births: Final data for 2002” (3).

Before 1981, the period of gestation was computed only when there was a valid month, day, and year of LMP. However, length of gestation could not be determined from a substantial number of live-birth certificates each year because the day of LMP was missing. Beginning in 1981, weeks of gestation have been imputed for records with missing day of LMP when there is a valid month and year. The imputation procedure and its effect on the data are described elsewhere (2,19).

Because of postconception bleeding or menstrual irregularities, the presumed date of LMP may be in error. In these instances, the computed gestational period may be longer or shorter than the true gestational period, but the extent of such errors is unknown.

### **Month of pregnancy prenatal care began**

If the name of the month is entered for this item, instead of first, second, third, and so forth, the month of pregnancy in which prenatal care began is determined from the month named and the month last normal menses began. For these births, if the date last normal menses began is not stated, the month of pregnancy in which prenatal care began is tabulated as not stated.

### **Number of prenatal visits**

Tabulations of the number of prenatal visits were presented for the first time in 1972. Beginning in 1989 these data were collected from the birth certificates of all States. Percentage distributions and the median number of prenatal visits exclude births to mothers who had no prenatal care.

### **Apgar score**

The 1– and 5–minute Apgar scores were added to the U.S. Standard Certificate of Live Birth in 1978 to evaluate the condition of the newborn infant at 1 and 5 minutes after birth. The Apgar score is a useful measure of the need for resuscitation and a predictor of the infant's chances of surviving the first year of life. It is a summary measure of the infant's condition based on heart rate, respiratory effort, muscle tone, reflex irritability, and color. Each of these factors is given a score of 0, 1, or 2; the sum of these 5 values is the Apgar score, which ranges from 0 to 10. A score of 10 is optimum, and a low score raises some concerns about the potential survival and subsequent health of the infant. Beginning in 1995, NCHS collected information only on the 5–minute Apgar score. Since 1991, the reporting area for the 5–minute Apgar score has been comprised of 48 States and the District of Columbia, accounting for 77 percent of all births in the United States in 2002. California and Texas did not have information on Apgar scores on their birth certificates.

### **Tobacco and alcohol use during pregnancy**

The checkbox format allows for classification of a mother as a smoker or drinker during pregnancy and for reporting the average number of cigarettes smoked per day or drinks consumed per week. Procedures for determining the consistency between smoking and/or drinking status and the quantity of cigarettes or drinks reported are described elsewhere (2).

Information on smoking and drinking status was reported by 49 States and the District of Columbia (not available for California), accounting for 87 percent of U.S. births in 2002. Information on number of cigarettes smoked per day was reported in a consistent manner for 46 States, the District of Columbia, and New York City ([figure 4–A](#)). Indiana and New York State (except for New York City) reported this information but in a format that was inconsistent with NCHS standards. Information was not available for California and South Dakota. The areas reporting on the number of cigarettes smoked comprised 81 percent of U.S. births in 2002.

### **Weight gain during pregnancy**

Weight gain is reported in pounds. A loss of weight is reported as zero gain. Computations of median weight gain were based on ungrouped data. This item was included on the certificates of 49 States and the District of Columbia; California did not report this information. This reporting area, excluding California, accounted for 87 percent of all births in the United States in 2002.

### **Medical risk factors for this pregnancy**

An item on medical risk factors was included on the 1989 birth certificate, but 2 States did not report all of the 16 risk factors in 2002. Texas did not report genital herpes or uterine bleeding, and Kansas did not report Rh sensitization.

The format allows for the designation of more than one risk factor and includes a choice of “None.” Accordingly, if the item is not completed, it is classified as not stated.

Definitions adapted and abbreviated from a set of definitions compiled by a committee of Federal and State health statistics officials for the Association for Vital Records and Health Statistics are available elsewhere (3).

### **Obstetric procedures**

This item includes six specific obstetric procedures. Birth records with “Obstetric procedures” left blank are considered not stated. Data on obstetric procedures were reported by all States and the District of Columbia in 2002.

Definitions adapted and abbreviated from a set of definitions compiled by a committee of Federal and State health statistics officials for the National Association for Public Health Statistics and Information Systems (NAPHSIS), formerly the Association for Vital Records and Health Statistics, are available elsewhere (3).

### **Complications of labor and/or delivery**

The checkbox format allows for the selection of 15 specific complications and for the designation of more than one complication where appropriate. A choice of “None” is also included. Accordingly, if the item is not completed, it is classified as not stated.

All States and the District of Columbia included this item on their birth certificates in 2002. However, Texas did not report anesthetic complications or fetal distress.

Definitions adapted and abbreviated from a set of definitions compiled by a committee of Federal and State health statistics officials are available elsewhere (3).

### **Abnormal conditions of the newborn**

This item provides information on eight specific abnormal conditions. More than one abnormal condition may be reported for a given birth or “None” may be selected. If the item is not completed it is tabulated as not stated. This item was included on the birth certificates of all States and the District of Columbia in 2002. However, four areas did not include all conditions. Nebraska and Texas did not report birth injury, New York City did not report assisted ventilation less than 30 minutes or assisted ventilation of 30 minutes or more, and Wisconsin did not report fetal alcohol syndrome.

Definitions adapted and abbreviated from a set of definitions compiled by a committee of Federal and State health statistics are available elsewhere (3).

### **Congenital anomalies of child**

The data provided in this item relate to 21 specific anomalies or anomaly groups. It is well documented that congenital anomalies, except for the most visible and most severe, are incompletely reported on birth certificates (20). The completeness of reporting specific anomalies depends on how easily they are recognized in the short time between birth and birth-registration. Forty-nine States and the District of Columbia included this item on their birth certificates (New Mexico did not). This reporting area included 99 percent of all births in the United States in 2002. The format allows for the identification of more than one anomaly including a choice of “None” should no anomalies be evident. The “Not stated” category includes birth records for which the item is not completed.

In 2002 Oklahoma’s rates for the “Other central nervous system anomalies” category may be overstated because of misreporting.

Definitions adapted and abbreviated from a set of definitions compiled by a committee of

Federal and State health statistics officials are available elsewhere (3).

### **Method of delivery**

The birth certificate contains a checkbox for method of delivery. Choices include vaginal delivery, with the additional options of forceps, vacuum, and vaginal birth after previous cesarean section (VBAC), as well as a choice of primary or repeat cesarean. When only forceps, vacuum, or VBAC is checked, a vaginal birth is assumed. In 2002 this information was collected from the birth certificates of all States and the District of Columbia.

Several rates are computed for method of delivery. The overall cesarean section rate or total cesarean rate is computed as the proportion of all births that were delivered by cesarean section. The primary cesarean rate is a measure that relates the number of women having a primary cesarean birth to all women giving birth who have never had a cesarean delivery. The denominator for this rate is the sum of women with a vaginal birth excluding VBACs and women with a primary cesarean birth. The VBAC delivery rate is computed by relating all VBAC deliveries to the sum of VBAC and repeat cesarean deliveries, that is, to women with a previous cesarean section. VBAC rates are computed for first births because the rates are computed based on previous pregnancies, not just live births.

### **Hispanic parentage**

The 1989 revision of the U.S. Standard Certificate of Live Births includes items to identify the Hispanic origin of the parents. All 50 States and the District of Columbia reported Hispanic origin of the parents for 2002.

In computing birth and fertility rates for the Hispanic population, births with origin of mother not stated are included with non-Hispanic births rather than being distributed. Thus, rates for the Hispanic population are underestimates of the true rates to the extent that the births with origin of mother not stated (0.6 percent in 2002) were actually to Hispanic mothers. The population with origin not stated was imputed. The effect on the rates is believed to be small.

## **Quality of Data**

Although vital statistics data are useful for a variety of administrative and scientific purposes, they cannot be correctly interpreted unless various qualifying factors and methods of classification are taken into account. The factors to be considered depend on the specific purposes for which the data are to be used. It is not feasible to discuss all the pertinent factors in the use of vital statistics tabulations, but some of the more important ones should be mentioned.

Most of the factors limiting the use of data arise from imperfections in the original records or from the impracticability of tabulating these data in very detailed categories. These limitations should not be ignored, but their existence does not lessen the value of the data for most general purposes.

### **Completeness of registration**

An estimated 99 percent of all births occurring in the United States in 2002 were registered; for white births registration was 99.5 percent complete and for all other births, 98.6 percent complete. These estimates are based on the results of the 1964–68 test of

birth-registration completeness according to place of delivery (in or out of hospital) and race. (This test has not been conducted more recently.) The primary purpose of the test was to obtain current measures of registration completeness for births in and out of hospital by race on a national basis. Data for States were not available as they had been from the previous birth-registration tests in 1940 and 1950. A detailed discussion of the method and results of the 1964–68 birth-registration test is available (21). Information on procedures for adjusting births for underregistration (for cohort fertility tables) is presented elsewhere (2).

### **Completeness of reporting**

Interpretation of these data must include evaluation of item completeness. The “Not stated” percentage is one measure of the quality of the data. Completeness of reporting varies among items and States. See [table A](#) for the percentage of birth records on which specified items were not stated. Data users should note that levels of incomplete or inaccurate reporting for some of the items are quite high in some States. The 2002 data for Alaska, the District of Columbia, and Washington are of particular concern.

### **Quality control procedures**

As electronic files are received at NCHS, they are automatically checked for completeness, individual item code validity, and unacceptable inconsistencies between data items. The registration area is notified of any problems. In addition, NCHS staff review the files on an ongoing basis to detect problems in overall quality such as inadequate reporting for certain items, failure to follow NCHS coding rules, and systems and software errors. Traditionally, quality assurance procedures were limited to review and analysis of differences between NCHS and registration area code assignments for a small sample of records. In recent years, as electronic birth registration became prevalent, this procedure was augmented by analyses of year-to-year and area-to-area variations in the data. These analyses are based on preliminary tabulations of the data that are cumulated by State on a year-to-date basis each month. NCHS investigates all differences that are judged to have consequences for quality and completeness. In the review process, statistical tests are used to call initial attention to differences for possible followup. As necessary, registration areas are informed of differences encountered in the tables and asked to verify the counts or to determine the nature of the differences. Missing records (except those permanently voided) and other problems detected by NCHS are resolved, and corrections are transmitted to NCHS in the same manner as for those corrections identified by the registration area.

### **Random variation and significance testing for natality data**

A detailed discussion of random variation and significance testing for natality data is presented in the “Technical Notes” of “Births: Final data for 2002” (3). This section presents information specifically for Hispanic subgroups.

### **Computing confidence intervals for Hispanic subgroups**

Birth and fertility rates for Mexicans, Puerto Ricans, Cubans, and “Other” Hispanics for 2002 are shown in tables 6, 8, 9, and 14 in “Births: Final data for 2002” (3) and in tables 1–4 and 1–12 of “Vital Statistics of the United States, Part 1, Natality.” Population estimates for Hispanic subgroups are derived from the U.S. Census Bureau’s *Current Population Survey* (CPS) and

adjusted to resident population control totals as shown in [table 4-3](#). As a result, the rates are subject to the variability of the denominator as well as the numerator. For these Hispanic subgroups only (not for all origin, total Hispanic, total non-Hispanic, non-Hispanic white, or non-Hispanic black populations), the following formulas are used:

***Approximate 95-percent confidence interval: 100 or more births***

When the number of events in the numerator is greater than 100, the confidence interval for the birth rate can be estimated from the following formulas:

For crude and age-specific birth rates,

$$\text{Lower limit} = R - 1.96 * R * \sqrt{\left(\frac{1}{B}\right) + f\left(a + \frac{b}{P}\right)}$$

$$\text{Upper limit} = R + 1.96 * R * \sqrt{\left(\frac{1}{B}\right) + f\left(a + \frac{b}{P}\right)}$$

where:

$R$  = rate (births per 1,000 population)

$B$  = total number of births upon which rate is based

$f$  = factor that depends on whether the population estimate is based on demographic analysis or CPS and the number of years used, equals 0.670 for single year

$a$  and  $b$  are single year averages of the 2001 and 2002 CPS standard error parameters (22, 23)

$a$  = -0.000200

$b$  = 3,809

$P$  = total estimated population upon which rate is based

***Example***

Suppose that the fertility rate of Cuban women 15–44 years of age was 51.2 per 1,000 based on 13,088 births in the numerator and an estimated resident population of 255,399 in the denominator. The 95-percent confidence interval would be:

$$\begin{aligned} \text{Lower limit} &= 51.2 - 1.96 * 51.2 * \sqrt{\left(\frac{1}{13,088}\right) + 0.670 * \left[-0.000200 + \left(\frac{3,809}{255,399}\right)\right]} \\ &= 51.2 - 1.96 * 51.2 * \sqrt{0.000076406 + (0.670 * 0.0147139)} \\ &= 51.2 - 1.96 * 51.2 * \sqrt{0.0099347} \\ &= 51.2 - 1.96 * 51.2 * 0.099673 \\ &= 41.20 \end{aligned}$$

$$\begin{aligned}
\text{Upper limit} &= 51.2 + 1.96 * 51.2 * \sqrt{\left(\frac{1}{13,088}\right) + 0.670 * \left[-0.000200 + \left(\frac{3,809}{255,399}\right)\right]} \\
&= 51.2 + 1.96 * 51.2 * \sqrt{0.000076406 + (0.670 * 0.0147139)} \\
&= 51.2 + 1.96 * 51.2 * \sqrt{0.0099347} \\
&= 51.2 + 1.96 * 51.2 * 0.1099673 \\
&= 61.20
\end{aligned}$$

This means that the chances are 95 out of 100 that the actual fertility rate of Cuban women 15–44 years of age is between 41.20 and 61.20.

**Approximate 95-percent confidence interval: 1–99 births**

When the number of events in the numerator is less than 20, an asterisk is shown in place of the rate. When the number of events in the numerator is greater than 20 but less than 100, the confidence interval for the birth rate can be estimated using the formulas that follow and the values in [table C](#).

For crude and age-specific birth rates,

$$\text{Lower limit} = R * L(1 - \alpha = .96, B) * \left(1 - 2.576 \sqrt{f \left(a + \frac{b}{P}\right)}\right)$$

$$\text{Upper limit} = R * U(1 - \alpha = .96, B) * \left(1 + 2.576 \sqrt{f \left(a + \frac{b}{P}\right)}\right)$$

where:

$R$  = rate (births per 1,000 population)

$B$  = total number of births upon which rate is based

$L$  = the value in table C that corresponds to the number  $B$ , using the 96 percent CI column

$U$  = the value in table C that corresponds to the number  $B$ , using the 96 percent CI column

$f$  = factor that depends on whether the population estimate is based on demographic analysis or CPS and the number of years used, equals 0.670 for single year

$a$  and  $b$  are CPS standard error parameters (see previous section on 95-percent confidence interval for 100 or more births for description and specific values)

$P$  = total estimated population upon which rate is based

**Example**

Suppose that the birth rate of Puerto Rican women 45–49 years of age was 0.4 per 1,000, based on 35 births in the numerator and an estimated resident population of 87,892 in the denominator. Using [table C](#), the 95-percent confidence interval would be:

$$\begin{aligned}
\text{Lower limit} &= 0.4 * 0.68419 * \left( 1 - 2.576 \sqrt{0.670 \left( -0.000200 + \left( \frac{3,809}{87,892} \right) \right)} \right) \\
&= 0.4 * 0.68419 * \left( 1 - 2.576 \sqrt{0.289020} \right) \\
&= 0.4 * 0.68419 * \left( 1 - 2.576 * 0.170006 \right) \\
&= 0.4 * 0.68419 * 0.562065 \\
&= 0.2
\end{aligned}$$

$$\begin{aligned}
\text{Upper limit} &= 0.4 * 1.41047 * \left( 1 + 2.576 \sqrt{0.670 \left( -0.000200 + \left( \frac{3,809}{87,892} \right) \right)} \right) \\
&= 0.4 * 1.41047 * \left( 1 + 2.576 \sqrt{0.289020} \right) \\
&= 0.4 * 1.41047 * \left( 1 + 2.576 * 0.170006 \right) \\
&= 0.4 * 1.41047 * 1.437935 \\
&= 0.8
\end{aligned}$$

This means that the chances are 95 out of 100 that the actual birth rate of Puerto Rican women 45–49 years of age lies between 0.2 and 0.8.

NOTE: In the formulas above, the confidence limits are estimated from the nonsampling error in the number of births, the numerator, and the sampling error in the population estimate, the denominator. A 96 percent standard error is computed for the numerator and a 99 percent standard error is computed for the denominator in order to compute a 95-percent confidence interval for the rate.

### Significance testing for Hispanic subgroups

When both rates are based on 100 or more events, the difference between the two rates is considered statistically significant if it exceeds the statistic in the formula below. This statistic equals 1.96 times the standard error for the difference between two rates.

$$= 1.96 * \sqrt{R_1^2 * \left[ \left( \frac{1}{B_1} \right) + f \left( a + \frac{b}{P_1} \right) \right] + R_2^2 * \left[ \left( \frac{1}{B_2} \right) + f \left( a + \frac{b}{P_2} \right) \right]}$$

If the difference is greater than this statistic, then the difference would occur by chance less than 5 times out of 100. If the difference is less than this statistic, the difference might occur by chance more than 5 times out of 100. We would therefore conclude that the difference is not statistically significant at the 95-percent Confidence level.

### Example

Suppose the birth rate for Mexican mothers 15–19 years of age ( $R_1$ ) is 94.5, based on 97,744 births and an estimated population of 1,033,878, and the birth rate for Puerto Rican mothers 15–19 years of age ( $R_2$ ) is 61.4, based on 10,006 births and an estimated population of 162,899.

Using the above formula, the z score is computed as follows:

$$\begin{aligned}
 &= 1.96 * \sqrt{94.5^2 * \left[ \left( \frac{1}{97,744} \right) + 0.670 \left( -0.0002000 + \frac{3,809}{1,033,878} \right) \right] + 61.4^2 * \left[ \left( \frac{1}{10,006} \right) + 0.670 \left( -0.000200 + \frac{3,809}{162,899} \right) \right]} \\
 &= 1.96 * \sqrt{8930.25 * (0.000010231 + 0.670 * 0.003484) + 3769.96 * (0.00009994 + 0.670 * 0.023183)} \\
 &= 1.96 * \sqrt{(8930.25 * 0.0023445) + (3769.96 * 0.0156326)} \\
 &= 1.96 * \sqrt{20.94 + 58.93} \\
 &= 1.96 * 8.94 \\
 &= 17.52
 \end{aligned}$$

Since the difference between the two rates of 33.1 is greater than the value above, the two rates are statistically significantly different at the 0.05 level of significance.

## Computation of Rates and Other Measures

### Population bases

The rates shown in this report were computed based on population statistics prepared by the U.S. Census Bureau. Rates for 1940, 1950, 1960, 1970, 1980, 1990, and 2000 are based on the population enumerated as of April 1 in the censuses of those years. Rates for all other years are based on the estimated midyear (July 1) population for the respective years. These populations have been modified to be consistent with Office of Management and Budget (OMB) racial categories and historical categories for birth data and, in the case of age, to reflect age as of the census reference date (24).

An asterisk (\*) is shown in place of any derived rate based on fewer than 20 births in the numerator, or a population denominator of less than 50 (unweighted) for decennial years and 75,000 (weighted) for all other years for the Hispanic subgroups. Rates based on populations below these minimum levels lack sufficient reliability for analytic purposes.

Populations in [tables 4–1](#) through [4–4](#) differ from those used to calculate birth and fertility rates published in “Births: Final data for 2001” and “Births: Final data for 2000” (3,25). Rates in these publications were based on postcensal population estimates based on the 1990 census. Populations for April 1, 2000, and July 1, 2001, provided in this report were produced under a collaborative arrangement with the U.S. Census Bureau (26–28) and are based on the 2000 census counts by age, race, and sex, which were modified to be consistent with OMB racial categories of 1977 and historical categories for birth data and, in the case of age, to reflect age as of the census reference date. The modification procedures are described in detail elsewhere (24, 29–30).

Reflecting the new guidelines issued in 1997 by the OMB, the 2000 census included an option for individuals to report more than one race as appropriate for themselves and household members (31). The 1997 OMB guidelines also provided for the reporting of Asian persons separately from Native Hawaiians or other Pacific Islanders. Under the prior OMB standards (issued in 1977), data for Asian or Pacific Islander persons were collected as a single group (32). Birth certificates currently collect only one race for the mother and father in the same categories as specified in the 1977 guidelines, (that is, the certificates do not report Asians separately from

Native Hawaiians or other Pacific Islanders). Birth data by race (the numerators for birth rates) are thus currently incompatible with the population data collected in the 2000 census (denominators by race).

To produce birth rates for 2000–2002 and revised intercensal rates for 1991–99, it was necessary to bridge the reported population data for multiple-race persons back to single-race categories. In addition, the 2000 census counts were modified to be consistent with the 1977 OMB race categories, that is, to report the data for Asian persons and Native Hawaiians or Other Pacific Islanders as a combined category, Asian or Pacific Islanders (24). The procedures used to produce the bridged populations are described elsewhere (29,30).

It is anticipated that bridged population data will be used over the next few years for computing population-based rates. Beginning with births occurring in 2003, several States began reporting multiple race data. Once all State birth certificates are revised to be compliant with the 1997 OMB standard, the use of bridged populations can be discontinued.

The special report “Revised Birth and Fertility Rates for the United States, 2000 and 2001” (33) updates the rates published in “Births: Final data for 2001” and “Births: Final data for 2000” (3,25). The revised birth and fertility rates in the special report include rates by race and Hispanic origin, by age of mother, and by age of father for 2000 and 2001. Rates for unmarried women are also presented. A subsequent special report shows revised birth and fertility rates, including rates by marital status for the United States, and rates by age of mother by State, for the intercensal years, 1991–99, along with the rates for 2000 and 2001 (34). Additional information on the revised populations is available at:

<http://www.cdc.gov/nchs/about/major/dvs/popbridge/popbridge.htm>

Birth rates for the United States, individual States, and metropolitan areas are based on the total resident populations of the respective areas (table 4–4). Except as noted these populations exclude the Armed Forces abroad but include the Armed Forces stationed in each area. The resident population of the birth- and death-registration States for 1900–32 and for the United States for 1900–2002 is shown in table 4–1. In addition, the population including Armed Forces abroad is shown for the United States. Table D shows the sources for these populations. A detailed discussion of historical population bases is presented elsewhere (2).

### **Net census undercounts and overcounts**

Studies conducted by the U.S. Census Bureau indicate that some age, race, and sex groups are more completely enumerated than others. These census miscounts can have consequences for vital statistics measures. For example, an adjustment to increase the population denominator would result in a smaller rate compared to the unadjusted rate. A more detailed discussion of census undercounts and overcounts can be found in the “1999 Technical Appendix” (2). Adjusted rates for 2000 can be computed by multiplying the reported rates by ratios of the 2000 census-level population adjusted for the estimated net census miscounts, which are shown in table E.

### **Cohort fertility tables**

The various fertility measures shown for cohorts of women are computed from births adjusted for underregistration and population estimates corrected for under enumeration and misstatement of age. Data published after 1974 use revised population estimates prepared by the U.S. Census Bureau and have been expanded to include data for the two major racial groups. Heuser has prepared a detailed description of the methods used in deriving these measures as

well as more detailed data for earlier years (35). Tables for the most currently-available years are available at <http://www.cdc.gov/nchs/dataawh/statab/unpubd/natality/natab99.htm>.

*Parity distribution*—The percentage distribution of women by parity (number of children ever born alive to mother) is derived from cumulative birth rates by order of birth. The percentage of 0-parity women is found by subtracting the cumulative first birth rate from 1,000 and dividing by 10. The proportions of women at parities one through six are found from the following formula:

$$\text{Percent at N parity} = ((\text{cum. rate, order N}) - (\text{cum. rate, order N} + 1)) / 10$$

The percentage of women at seventh and higher parities is found by dividing the cumulative rate for seventh-order births by 10.

*Birth probabilities*—Birth probabilities indicate the likelihood that a woman of a certain parity and age at the beginning of the year will have a child during the year. Birth probabilities differ from central birth rates in that the denominator for birth probabilities is specific for parity as well as for age.

### **Total fertility rate**

The total fertility rate is the sum of the birth rates by age of mother (in 5-year age groups) multiplied by 5. It is an age-adjusted rate because it is based on the assumption that there are the same number of women in each age group. The rate of 2,013 in 2002, for example, means that if a hypothetical group of 1,000 women were to have the same birth rates in each age group that were observed in the actual childbearing population in 2002, they would have a total of 2,013 children by the time they reached the end of the reproductive period (taken here to be age 50 years), assuming that all of the women survived to that age.

### **Seasonal adjustment of rates**

The seasonally adjusted birth and fertility rates are computed from the X-11 variant of Census Method II (36). This method, used since 1964, differs slightly from the U.S. Bureau of Labor Statistics (BLS) Seasonal Factor Method, which was used for *Vital Statistics of the United States*, 1964. The fundamental technique is the same in that it is an adaptation of the ratio-to-moving-average method. Before 1964, the method of seasonal adjustment was based on the X-9 variant and other variants of Census Method II. A comparison of the Census Method II with the BLS Seasonal Factor Method shows the differences in the seasonal patterns of births to be negligible.

### **Computations of percentages, percentage distributions, and medians**

Births for which a particular characteristic is unknown were subtracted from the figures for total births that were used as denominators before percentages, percentage distributions, and medians were computed. The percentage of records with missing information for each item is shown by State in [table A](#). The median number of prenatal visits also excludes births to mothers who had no prenatal care. Computations of the median years of school completed and the median number of prenatal visits were based on ungrouped data. The median age of mother is computed from birth rates in 5-year age groups, which eliminates the effects of changes in the age composition of the childbearing population over time. An asterisk is shown in place of any derived statistic based on fewer than 20 births in the numerator or denominator.

**Table A. Percentage of birth records on which specified items were not stated: United States and each State and territory, 2002— Con.**

0.0 Quantity more than zero but less than 0.05.

--- Data not available.

- Quantity zero.

<sup>1</sup> Excludes data for Puerto Rico, Virgin Islands, Guam, American Samoa, and the Commonwealth of the Northern Marianas.

<sup>2</sup> California reports date last normal menses began but does not report clinical estimate of gestation.

<sup>3</sup> Indiana and New York State report tobacco use but do not report the average number of cigarettes smoked per day in standard categories; data for New York City are reported in standard categories.

<sup>4</sup> Kansas does not report Rh sensitization.

<sup>5</sup> South Dakota and the Commonwealth of the Northern Marianas report tobacco and alcohol use but do not report the average number of cigarettes smoked per day or the average number of drinks per week.

<sup>6</sup> Texas does not report genital herpes and uterine bleeding.

<sup>7</sup> Nebraska and Texas do not report birth injury.

<sup>8</sup> New York City does not report assisted ventilation less than 30 minutes and assisted ventilation of 30 minutes or more.

<sup>9</sup> Rates of "Other central nervous system anomalies" may be overstated for Oklahoma for 2002.

<sup>10</sup> Texas does not report anesthetic complications and fetal distress.

<sup>11</sup> Wisconsin does not report fetal alcohol syndrome.

**Table B. Births by place of occurrence and residence for births occurring in the 50 States, the District of Columbia, U.S. territories, and other countries, 2002**

Area	Occurrence	Residence
United States	4,027,376	4,021,726

1995	National Center for Health Statistics. Intercensal estimates of the July 1, 1995, United States resident population by State and county, age, sex, bridged race, and Hispanic origin, prepared under a collaborative arrangement with the U.S. Census Bureau. File icen1995.txt. Internet released, April 15, 2003. Available at: <a href="http://www.cdc.gov/nchs/about/major/dvs/popbridge/popbridge.htm">http://www.cdc.gov/nchs/about/major/dvs/popbridge/popbridge.htm</a> .
1994	National Center for Health Statistics. Intercensal estimates of the July 1, 1994, United States resident population by State and county, age, sex, bridged race, and Hispanic origin, prepared under a collaborative arrangement with the U.S. Census Bureau. File icen1994.txt. Internet released, April 15, 2003. Available at: <a href="http://www.cdc.gov/nchs/about/major/dvs/popbridge/popbridge.htm">http://www.cdc.gov/nchs/about/major/dvs/popbridge/popbridge.htm</a> .
1993	National Center for Health Statistics. Intercensal estimates of the July 1, 1993, United States resident population by State and county, age, sex, bridged race, and Hispanic origin, prepared under a collaborative arrangement with the U.S. Census Bureau. File icen1993.txt. Internet released, April 15, 2003. Available at: <a href="http://www.cdc.gov/nchs/about/major/dvs/popbridge/popbridge.htm">http://www.cdc.gov/nchs/about/major/dvs/popbridge/popbridge.htm</a> .
1992	National Center for Health Statistics. Intercensal estimates of the July 1, 1992, United States resident population by State and county, age, sex, bridged race, and Hispanic origin, prepared under a collaborative arrangement with the U.S. Census Bureau. File icen1992.txt. Internet released, April 15, 2003. Available at: <a href="http://www.cdc.gov/nchs/about/major/dvs/popbridge/popbridge.htm">http://www.cdc.gov/nchs/about/major/dvs/popbridge/popbridge.htm</a> .
1991	National Center for Health Statistics. Intercensal estimates of the July 1, 1991, United States resident population by State and county, age, sex, bridged race, and Hispanic origin, prepared under a collaborative arrangement with the U.S. Census Bureau. File icen1991.txt. Internet released, April 15, 2003. Available at: <a href="http://www.cdc.gov/nchs/about/major/dvs/popbridge/popbridge.htm">http://www.cdc.gov/nchs/about/major/dvs/popbridge/popbridge.htm</a> .
1990	U.S. Bureau of the Census, Unpublished data from the 1990 census. 1990 CPH-L-74 and unpublished data consistent with <i>Current Population Reports</i> , Series P-25, No. 1095, Feb. 1993.
1989	U.S. Bureau of the Census, <i>Current Population Reports</i> , Series P-25, No. 1057, Mar. 1990.
1988	U.S. Bureau of the Census, <i>Current Population Reports</i> , Series P-25, No. 1045, Jan. 1990.
1986–87	U.S. Bureau of the Census, <i>Current Population Reports</i> , Series P-25, No. 1022, Mar. 1988.
1985	U.S. Bureau of the Census, <i>Current Population Reports</i> , Series P-25, No. 1000, Feb. 1987.
1984	U.S. Bureau of the Census, <i>Current Population Reports</i> , Series P-25, No. 985, Apr. 1986.
1983	U.S. Bureau of the Census, <i>Current Population Reports</i> , Series P-25, No. 965, Mar. 1985.
1982	U.S. Bureau of the Census, <i>Current Population Reports</i> , Series P-25, No. 949, May 1984.
1981	U.S. Bureau of the Census, <i>Current Population Reports</i> , Series P-25, No. 929, May 1983.
1980	U.S. Bureau of the Census, <i>U.S. Census of Population: 1980, Number of Inhabitants</i> , PC80-1-A1, United States Summary, 1983.
1971–79	U.S. Bureau of the Census, <i>Current Population Reports</i> , Series P-25, No. 917, July 1982.
1970	U.S. Bureau of the Census, <i>U.S. Census of Population: 1970, Number of Inhabitants, Final Report</i> PC(1)-A1, United States Summary,
1961–69	U.S. Bureau of the Census, <i>Current Population Reports</i> , Series P-25, No. 519, April 1974.
1960	U.S. Bureau of the Census, <i>U.S. Census of Population: 1960, Number of Inhabitants</i> , PC(1)-A1, United States Summary, 1964.
1951–59	U.S. Bureau of the Census, <i>Current Population Reports</i> , Series P-25, No. 310, June 30, 1965.
1940–50	U.S. Bureau of the Census, <i>Current Population Reports</i> , Series P-25, No. 499, May 1973.
1930–39	U.S. Bureau of the Census, <i>Current Population Reports</i> , Series P-25, No. 499, May 1973, and National Office of Vital Statistics, <i>Vital Statistics Rates in the United States</i> , 1900–1940, 1947.
1920–29	National Office of Vital Statistics, <i>Vital Statistics Rates in the United States</i> , 1900–1940, 1947.
1917–19	Same as for 1930–39.
1900–1916	Same as for 1920–29.

**Table E. Percentage net undercount, by age, sex, and race/Hispanic origin: United States, April 1, 2000**

Characteristic	Estimate (%)
Total	-0.49
Age/sex	
10–17 Male and female	-1.32
18–29 Male	1.12
18–29 Female	-1.39
30–49 Male	2.01
30–49 Female	-0.60
50 years and over male	-0.80
50 years and over female	-2.53
Race/Hispanic origin	
Non-Hispanic white	-1.13
Non-Hispanic black	1.84
Hispanic	0.71

## Births: Final Data for 2002

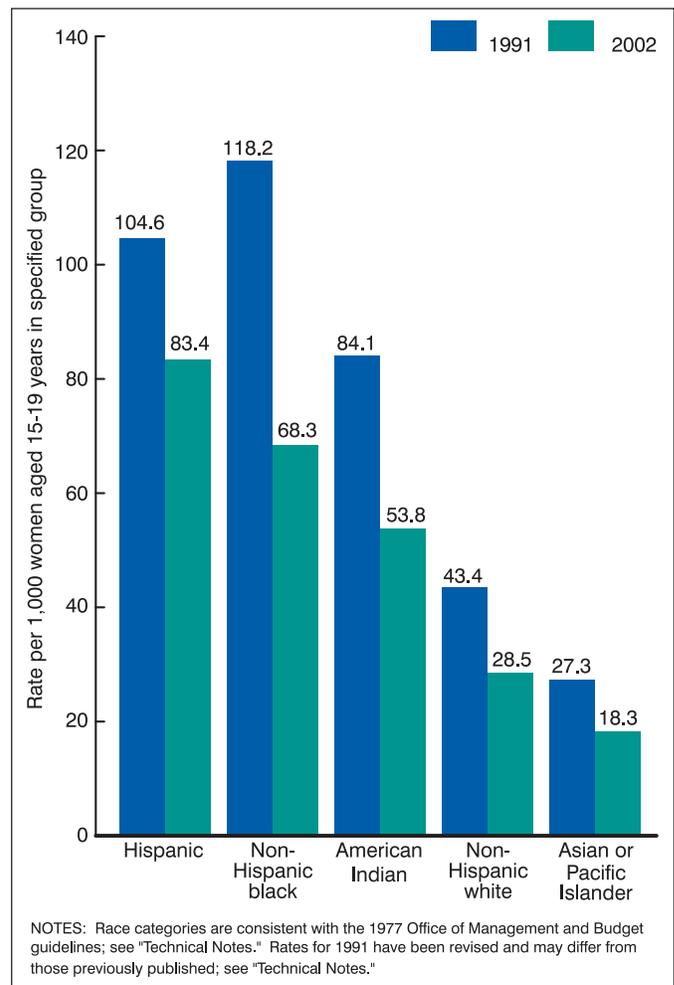

by Joyce A. Martin, M.P.H.; Brady E. Hamilton, Ph.D.; Paul D. Sutton, Ph.D.;  
Stephanie J. Ventura, M.A.; Fay Menacker, Dr. P.H.; and Martha L. Munson, M.S.; Division of Vital Statistics

### Abstract

**Objectives**—This report presents 2002 data on U.S. births according to a wide variety of characteristics. Data are presented for maternal demographic characteristics including age, live-birth order, race, Hispanic origin, marital status, and educational attainment; maternal characteristics (medical risk factors, weight gain, tobacco, and alcohol use); medical care utilization by pregnant women (prenatal care, obstetric procedures, complications of labor and/or delivery, attendant at birth, and method of delivery); and infant characteristics (period of gestation, birthweight, Apgar score, abnormal conditions, congenital anomalies, and multiple births). Also presented are birth and fertility rates by age, live-birth order, race, Hispanic origin, and marital status. Selected data by mother's State of residence are shown, as well as data on month and day of birth, sex ratio, and age of father. Trends in fertility patterns and maternal and infant characteristics are described and interpreted.

**Methods**—Descriptive tabulations of data reported on the birth certificates of the 4.022 million births that occurred in 2002 are presented. Denominators for population-based rates are derived from the 2000 U.S. census. Rates for 1991–2001 may differ from those published previously based on the 1990 U.S. census.

**Results**—There were 4,021,726 live births in 2002, essentially unchanged from 2001. The birth rate, fertility rate, and total fertility rates all declined 1 percent in 2002. The teenage birth rate dropped 5 percent, reaching another record low. The birth rates for women 20–24 years declined, whereas the rate for women 25–29 years was stable. The birth rate for women 30–34 years declined, but the rate for women 35–44 years continued to rise. Births to unmarried women changed very little. Smoking during pregnancy was down again. The timeliness of prenatal care continued to improve. The cesarean delivery rate climbed to the highest level ever reported in the United States (26.1 percent) and the rate of vaginal birth after previous cesarean plummeted 23 percent to 12.6 percent. Preterm and low birthweight levels both rose for 2002. The twin birth rate continued to climb, but the rate of triplet/+ births was down slightly.

**Figure 1. Birth rates for teenagers by race and/or Hispanic origin for 1991 and 2002**

**Keywords:** births • birth certificate • maternal and infant health • birth rates • maternal characteristics

### Acknowledgments

This report was prepared under the general direction of Charles J. Rothwell, Director of the Division of Vital Statistics (DVS), James A. Weed, Deputy Director of DVS, and Stephanie J. Ventura, Chief of the Reproductive Statistics Branch (RSB). Nicholas F. Pace, Chief of the Systems, Programming, and Statistical Resources Branch (SPSRB), and Steve Steimel, Gail Parr, Bonita Gross, Jaleh Mousavi, Candace Cosgrove, Jordan Sacks, Manju Sharma, Jiaquan Xu, and Thomas D. Dunn provided computer programming support and statistical tables. Yashodhara Patel of RSB also provided statistical tables. T.J. Mathews and Yashodhara Patel of RSB provided content review. Staff of the Data Acquisition and Evaluation Branch carried out quality evaluation and acceptance procedures for the State data files on which this report is based. The Registration Methods staff of DVS consulted with State vital statistics offices regarding the collection of birth certificate data. This report was edited by Demarius V. Miller, typeset by Jacqueline M. Davis, and graphics were produced by Jamila G. Ogburn of the Information Design and Publishing Branch, Division of Information Services.

### Highlights

- There were 4,021,726 **births** in the United States in 2002, similar to the number reported for 2001. Births to non-Hispanic white and non-Hispanic black women were down, but births to Hispanic, American Indian, and Asian or Pacific Islander (API) women increased.
- The 2002 U.S. **birth rate** fell to the lowest rate ever recorded for the United States, 13.9 per 1,000 total population. The **general fertility rate** declined 1 percent for 2001–2002 to 64.8 births per 1,000 women aged 15–44 years. Fertility rates were down 1 to 2 percent among non-Hispanic white, non-Hispanic black, and Hispanic women, and were essentially unchanged for American Indian and API women.
- The **teenage birth rate** dropped 5 percent in 2002, to 43.0 births per 1,000 females aged 15–19 years, another historical low. This rate has fallen 30 percent since 1991 (61.8). Rates declined for teenagers of all ages; the rate for the youngest teenagers, 10–14 years, declined to 0.7 per 1,000, exactly half the rate reported for 1994. Rates for teenagers 15–17 and 18–19 years attained record lows for the Nation; the rate for ages 15–17 years was 23.2 per 1,000, 40 percent below the 1991 level; the rate for ages 18–19 years was 72.8, down 23 percent since 1991. Teenage childbearing has declined among all racial and/or Hispanic origin groups since 1991; the rate for young black teenagers 15–17 years has plummeted by more than half. Teenage pregnancy rates have also declined during the 1990s, reflecting reductions in teenage birth and abortion rates. See [figure 1](#).
- The **birth rate for women 20–24 years** declined 2 percent, to 103.6 per 1,000, whereas the rate for women 25–29 years was stable at 113.6. After rising steadily for a decade, the **birth rate for women 30–34 years** declined to 91.5 per 1,000 in 2002. The rate for women 35–39 years, however, rose to 41.4, the highest level in more than three decades. The **birth rate for women 40–44 years** increased to the highest level since 1969 (8.3 per 1,000). The number of births to women 50–54 years increased to 263, 10 percent higher than in 2001. The **first birth rate** declined 1 percent in 2002 to 25.8 births per 1,000 women aged 15–44 years. Since 1990, first birth rates have declined for women under age 30 years, but have risen for women aged 30 years and over.
- The mean or **average age at first birth** was 25.1 years, an all-time high for the Nation. This average has risen from 21.4 years since 1970.
- **Unmarried childbearing** has changed very little since 1995. The birth rate for 2002 was stable at 43.7 births per 1,000 unmarried women aged 15–44 years. The number of births rose 1 percent to 1,365,966, the highest number ever reported, while the percent of births to unmarried women increased from 33.5 to 34.0 percent. Birth rates for unmarried teenagers, especially younger teenagers, continued to decline.
- **Cigarette smoking** during pregnancy dropped to 11.4 percent of all mothers in 2002, a decline of 42 percent from 1989. Smoking rates declined for all age groups and most race and Hispanic origin groups in 2002. Infant health can be seriously compromised by prenatal smoking; 12.2 percent of mothers who smoked had a low birthweight child in 2002 compared with 7.5 percent of non-smokers.
- Timely initiation of prenatal care improved again for 2002, rising to 83.7 percent. The percent of mothers who began **prenatal care** in the first trimester of pregnancy has risen slowly but steadily, since 1990, by 10 percent. Late (care in the last trimester) or no prenatal care declined to 3.6 percent, and has dropped from 6.1 percent since 1990. Improved levels of timely care were reported for most race and Hispanic origin groups for 2002.
- The **rate of induction of labor** increased slightly for 2002 to 20.6 percent, more than double the 1989 level (9 percent).
- The **rate of cesarean delivery** increased 7 percent to 26.1 percent of all births from 2001 to 2002, the highest rate ever reported in the United States. The cesarean rate fell between 1989 and 1996, but has risen 26 percent since 1996. The escalation in the total cesarean rate is fueled by both the rise in the **primary cesarean rate** and the steep decline in the rate of **vaginal birth after cesarean (VBAC) delivery**. The primary rate rose 7 percent in 2002, and the rate of VBAC delivery plunged 23 percent.
- The **rate of preterm births** (less than 37 completed weeks of gestation) increased again in 2002 to 12.1 percent of all births. Preterm delivery is a leading cause of neonatal mortality and birth-related morbidity. Influenced in part by the rising rate of multiple births (multiples are more likely to be born early), the proportion of preterm infants has risen 14 percent since 1990. Over this same period, the **preterm rate for singleton births** only has risen 7 percent, from 9.7 to 10.4 percent. Preterm rates increased for non-Hispanic white, non-Hispanic black, and Hispanic infants between 2001 and 2002. The percent of births delivered **postterm** (at 42 or greater weeks of gestation) fell to 6.7 in 2002. This measure has tumbled 41 percent since 1990 (from 11.3 percent).
- The **low birthweight (LBW) rate** (less than 2,500 grams) increased to 7.8 percent, the highest level reported in more than three decades. Also influenced by the growth in multiple births, LBW has risen 15 percent since the mid-1980s; the rate of **LBW among singleton** infants has increased by a more modest 5 percent. The rate of **very low birthweight (VLBW)** (less than 1,500 grams) was 1.46 percent for 2002, compared with 1.44 percent for 2001. LBW levels were up for the three largest racial and/or ethnic groups for 2002.

- The **twin birth rate** continued its steady climb, rising 3 percent for 2002 to 31.1 per 1,000. The twinning rate has risen 38 percent since 1990, and 65 percent since 1980. The rate of **triplet and other higher order multiple births** (triplet/+) declined slightly to 184.0. The decline in the triplet/+ rate in 3 of the last 4 years may signal an end to the steep hike (more than 400 percent between 1980 and 1998) in these high-risk births.

## Introduction

This report presents detailed data on numbers and characteristics of births in 2002, birth and fertility rates, maternal lifestyle and health characteristics, medical services utilization by pregnant women, and infant health characteristics. These data provide important information on fertility patterns among American women by such characteristics as age, live-birth order, race, Hispanic origin, marital status, and educational attainment. Up-to-date information on these fertility patterns is critical to understanding population growth and change in this country and in individual States. Data on maternal characteristics such as weight gain, tobacco and alcohol use, and medical risk factors are useful in accounting for differences in birth outcomes. Information on use of prenatal care, obstetric procedures, complications of labor and/or delivery, attendant at birth and place of delivery, and method of delivery by maternal demographic characteristics can also help to explain differences in birth outcomes. It is very important that data on birth outcomes, especially levels of low birthweight and preterm birth, be continuously monitored, because these variables are important predictors of infant mortality and morbidity.

A report of preliminary birth statistics for 2002 presented data on selected topics based on a substantial sample (97.9 percent) of the 2002 birth file (1). Findings for the selected measures (age, race, Hispanic origin, marital status of mother, live-birth order, prenatal care, cesarean delivery, preterm births, and low birthweight) based on the preliminary data are very similar to those presented here based on final data.

In addition to the tabulations included in this report, more detailed analysis is possible by using the Natality public-use file, which is issued for each year. The data file is available on tape and in CD-ROM format since 1968, and a selection of tables of detailed data are available on the National Center for Health Statistics (NCHS) home page at <http://www.cdc.gov/nchs/datawh/statab/unpubd/natality/natab99.htm> (2,3).

## Methods

Data shown in this report are based on 100 percent of the birth certificates registered in all States and the District of Columbia. More than 99 percent of births occurring in this country are registered (4). Tables showing data by State also provide separate information for Puerto Rico, Virgin Islands, Guam, American Samoa, and the Commonwealth of the Northern Marianas. However, these areas are not included in totals for the United States.

In this report, tabulations of births beginning with 1980 data are by race of mother; for years prior to 1980, tabulations are by race of child. Details of the differences in tabulation procedure are described in the “[Technical Notes](#).” Text references to black births and black mothers or white births and white mothers are used interchangeably for ease in writing.

Race and Hispanic origin are reported independently on the birth certificate. In tabulations of birth data by race and Hispanic origin, data for Hispanic persons are not further classified by race because the majority of women of Hispanic origin are reported as white. Most tables in this report show data for these categories: white total; non-Hispanic white; black total; non-Hispanic black; and Hispanic. Data for American Indian and Asian or Pacific Islander (API) births are not shown separately by Hispanic origin because the majority of these populations are non-Hispanic. Data are also presented for four specific Hispanic subgroups: Mexican, Puerto Rican, Cuban, and Central and South American, and for an additional subgroup “other and unknown Hispanic.” More specific Hispanic origin information for the “other and unknown Hispanic” category is not available. Data are shown for five API subgroups: Chinese, Japanese, Hawaiian, Filipino, and “other” API. In addition, 11 States report data on API subgroups included in the “other API” category (Vietnamese, Asian Indian, Korean, Samoan, Guamanian, and remaining API); see “[Technical Notes](#).”

Rates for 1991–2001 may differ from those published in “Births: Final Data for 2001” (5), but are consistent with those published in “Revised Birth and Fertility Rates for the 1990s and New Rates for the Hispanic Populations, 2000 and 2001: United States” (6). U.S. and State-level birth and fertility rates for 2000–2002, and the intercensal period 1991–99 are computed using populations that were produced under a cooperative agreement with the U.S. Census Bureau and are based on counts from the 2000 census. Reflecting the new guidelines issued in 1997 by the Office of Management and Budget (OMB), the 2000 census included an option for individuals to report more than one race as appropriate for themselves and household members (7); see “[Technical Notes](#).” The 1997 OMB guidelines also provided for the reporting of Asian persons separately from Native Hawaiians or other Pacific Islanders. Under the prior OMB standards (issued in 1977), data for API persons were collected as a single group (8). Birth certificates currently collect only one race for the mother and father in the same categories as specified in the 1977 guidelines (that is, the certificates do not report Asians separately from native Hawaiians or other Pacific Islanders). Birth data by race (the numerators for birth rates) are thus currently incompatible with the population data collected in the 2000 census (denominators by race). To produce birth rates for 2000–2002, and revised intercensal rates for 1991–99, it was necessary to “bridge” the reported population data for multiple-race persons back to single-race categories. In addition, the 2000 census counts were modified to be consistent with the 1977 OMB race categories, that is, to report the data for Asian persons and Native Hawaiians or other Pacific Islanders as a combined category, Asian or Pacific Islanders (9). The procedures used to produce the “bridged” populations are described elsewhere (10,11). It is anticipated that “bridged” population data will be used over the next few years for computing population-based rates. Beginning with births occurring in 2003, several States began reporting multiple-race data. Once all State birth certificates are revised to be compliant with the 1997 OMB standard, the use of “bridged” populations can be discontinued.

Information on the measurement of marital status, gestational age, and birthweight; the computation of derived statistics and rates; population denominators; random variation and relative standard error; and the definitions of terms are presented in the “[Technical Notes](#).”

Information on births by age, race, or marital status of mother is imputed if it is not reported on the birth certificate. These items were not reported for less than 1 percent of U.S. births in 2002. (See

“Technical Notes” for additional information.) All other maternal and infant characteristics (except items on which length of gestation is calculated) are not imputed. Births for which a particular characteristic is unknown are subtracted from the figures for total births that are used as denominators before percents, percent distributions, and medians are computed. Thus, for example, the proportion of women receiving care in the first trimester of pregnancy is computed on the basis of births for which month prenatal care began was reported. Levels of nonreporting vary substantially by specific item and by State. Table I in the “Technical Notes” provides information on the percent of records with missing information for each item by State for 2002. Readers should note that the levels of incomplete or inaccurate reporting for some of the items are quite high in some States. Data for 2002 for Alaska, Washington, and the District of Columbia are of particular concern.

## Demographic Characteristics

### Births and birth rates

#### Number of births

The **number of births** in the United States was essentially unchanged for 2002, 4,021,726 compared with 4,025,933 in 2001. Between 1990, the most recent high point, and 1997, the most recent low point, the number of births declined 7 percent. The number of births increased 5 percent between 1997 and 2000, but has declined slightly since. (See tables 1–12 for national and State data by age, live-birth order, race, and Hispanic origin.)

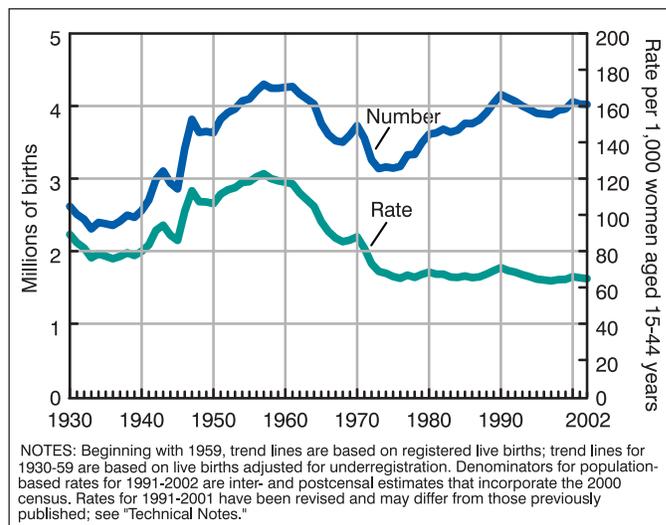

While the overall number of births for 2002 was unchanged, quite different trends were observed by **race and Hispanic origin** (tables 1 and 6). Births to non-Hispanic white and non-Hispanic black women fell 1 to 2 percent, whereas Hispanic births rose 3 percent. American Indian and Asian or Pacific Islanders (API) also rose, by 1 and 5 percent, respectively. Among the API subgroups, increases ranged from 2 percent for Japanese and Filipino, to 7 percent for Chinese births. Among Hispanics, the number of Puerto Rican births was essentially unchanged in 2002, but increases were reported for all other groups, from 2 percent for Cuban, to 7 percent for “other” Hispanic women.

#### Crude birth rate

The **crude birth rate** (CBR) fell to 13.9 live births per 1,000 total population in 2002 from 14.1 in 2001, a decrease of 1 percent. This is the lowest birth rate on record for the United States since these data became available in 1909 (3). The CBR has fallen 17 percent since 1990 (16.7), with most of the decline between 1990 and 1997. After fluctuating somewhat between 1998 and 2000, the CRB has trended downward.

#### Fertility rate

The **general fertility rate** (GFR), which relates births to the number of women in their childbearing ages, was 64.8 live births per 1,000 women aged 15–44 years in 2002, a decline of 1 percent from 2001 (65.3) and 9 percent from 1990 (70.9). From 1990 to 1997 the GFR fell 10 percent, increased 4 percent between 1997 and 2000, but has declined for the past 2 years (figure 2 and table 1).

**Figure 2. Live births and fertility rates: United States, 1930–2002**

Fertility was down for the largest race and Hispanic origin groups in 2002. Rates decreased 1 to 2 percent for non-Hispanic white (57.4 per 1,000 women aged 15–44 years in 2002), non-Hispanic black (67.4), and Hispanic women (94.4). GFRs for American Indian (58.0) and API women (64.1) were essentially unchanged. (Birth and fertility rates for the API subgroups cannot be computed because the necessary populations are not available; see “Technical Notes.”) Although fertility declined among Hispanics overall, rates were up 4 percent for Cuban and “other” Hispanic women (tables 1 and 6).

While fertility has generally declined for all race and Hispanic origin groups since 1990, a comparison of recent trends reveals important differences. Declines of 8 to 9 percent were reported for non-Hispanic white and API women, compared with 24 percent for non-Hispanic black and American Indian women. Fertility was down 12 percent for Hispanics overall since 1990, with declines ranging from 14 percent for Mexican, to 21 percent for Puerto Rican women. The rate for Cuban women increased 12 percent.

#### Age of mother

**Teenagers**—Birth rates for teenagers continued to fall in 2002, reaching record lows for the United States. Rates dropped for all age groups, and generally for all race and/or ethnicity populations (tables 3, 4, 8, and 9). The **birth rate for the youngest teenagers** declined to 0.7 births per 1,000 females aged 10–14 years. The 2002 rate was exactly one-half the rate reported in 1994. Births to this age group have also declined steeply, from 12,000 to 13,000 annually in the early to mid-1990s to 7,315 in 2002. All of the recent decline in numbers of births is due to the lower likelihood of young teenagers giving birth; the number of females aged 10–14 years has risen 16 percent since 1992 (6) (table II).

The **birth rate for teenagers 15–19 years** dropped 5 percent between 2001 and 2002, from 45.3 to 43.0 per 1,000 (tables A, 4, and 9). This rate has fallen 30 percent since 1991 (61.8). The number of births to 15–19 year-olds in 2002 (425,493) was nearly 100,000 fewer than the recent peak, 521,826 in 1990. This decline resulted entirely from the falling birth rate; the number of female teenagers has increased 18 percent since 1992 (6) (table II).

**Table A. Birth rates for women aged 15–19 years, by age, race, and Hispanic origin: United States, 1991, 2001, and 2002, and percent change in rates, 1991–2002**

[Rates per 1,000 women in specified group]

Age and race and Hispanic origin of mother	2002	2001	1991	Percent change, 1991–2002
<b>10–14 years</b>				
All races <sup>1</sup>	0.7	0.8	1.4	–50
Non-Hispanic white	0.2	0.3	0.5	–60
Non-Hispanic black	1.9	2.1	4.9	–61

Asian or Pacific Islander total <sup>2</sup>	31.5	32.8	43.0	–27
Hispanic <sup>3</sup>	133.0	135.5	155.1	–14

<sup>1</sup>Includes races other than white and black.<sup>2</sup>Race and Hispanic origin are reported separately on the birth certificate. Data for persons of Hispanic origin are included in the data for each race group according to the mother's reported race; see "Technical Notes."<sup>3</sup>Includes all persons of Hispanic origin of any race; see "Technical Notes."

NOTES: Race categories are consistent with the 1977 Office of Management and Budget guidelines; see "Technical Notes." Rates for 1991 and 2001 have been revised and may differ from those previously published; see "Technical Notes."

**Birth rates have declined for teenagers 15–17 and 18–19 years (tables 4 and 9).** The rate for teenagers 15–17 years fell 6 percent, from 24.7 per 1,000 in 2001 to 23.2 in 2002. This rate has plunged 40 percent since 1991 (38.6). The rate for older teenagers 18–19 years was 72.8 per 1,000 in 2002, down 4 percent from 2001 (76.1), and 23 percent from 1991 (94.0). The number of births to teenagers 15–17 years declined to 138,731, the fewest in half a century (138,578 in 1953). Births to older teenagers have also fallen steeply, to 286,762, the fewest reported since 1946 (235,282).

**Teenage birth rates by race and ethnicity continue to differ considerably (tables 3, 4, 8, and 9).** In 2002 the rates per 1,000 females aged 15–19 years ranged from 18.3 for API to 94.5 for Mexicans. The rates for other groups were 28.5, non-Hispanic white; 53.8, American Indian; 61.4, Puerto Rican; 63.0, "other" Hispanic; and 68.3, non-Hispanic black.

Teenage childbearing has fallen for all groups since the early 1990s. Declines for non-Hispanic black teenagers are particularly striking, with the rate per 1,000 aged 15–19 years falling 42 percent

from 1991 (118.2) to 68.3 in 2002 (figure 1). The rate for young black teenagers has plummeted by more than half, from 86.2 per 1,000 aged 15–17 years in 1991 to 41.0 in 2002.

Since 1991 teenage birth rates per 1,000 females aged 15–19 years fell 33 to 36 percent for American Indian, API, and non-Hispanic white teenagers, and 20 percent for Hispanic teenagers. The rate for Mexican teenagers peaked more recently, in 1995, and has declined 18 percent since then.

#### **Teenage pregnancy rates have fallen steeply in recent years.**

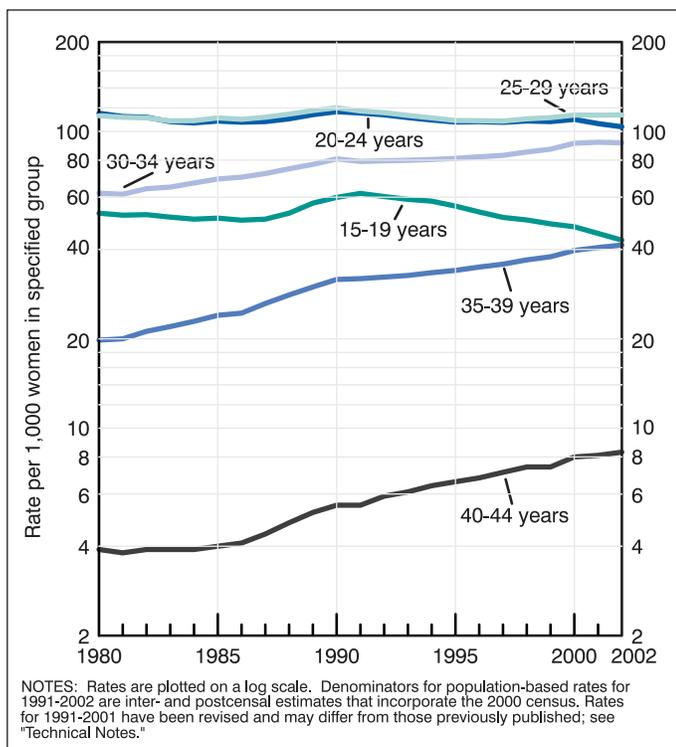

Pregnancy rates are based on the sums of live births, induced abortions, and fetal deaths. Teenage pregnancy rates are available through 1999, the most recent year for which detailed abortion data have been published (12,13). The pregnancy rate per 1,000 females aged 15–19 years for 1999 was 86.7, the lowest ever reported since the Centers for Disease Control and Prevention (CDC), NCHS series of pregnancy estimates began in 1976. The 1999 rate was 25 percent lower than the recent peak of 116.3 in 1990. The declines in teenage pregnancy rates in the 1990s reflect reductions in both live births and induced abortions.

A number of factors have been suggested to account for the recent declines in teenage pregnancy and birth rates. There have been steady reductions in the proportions of teenagers who are sexually experienced. A report of the most recently conducted Youth Risk Behavior Survey conducted by CDC in 2001 cites findings of decreases in the proportions of teenagers who have ever had sex and who have had multiple partners, along with increases in condom use among sexually active teenagers (14). Over the past decade, many public and private efforts have focused teenagers' attention on the importance of pregnancy prevention through abstinence and responsible behavior (15,16). Findings from the just-completed Cycle 6 of the National Survey of Family Growth (available in 2004) are expected to help explain the trends and patterns in teenage pregnancy rates.

#### **Women aged 20 years and over: women in their twenties—**

The birth rate for women aged 20–24 years was 103.6 per 1,000 in 2002, a decrease of 2 percent from 2001 (106.2). During the first half of the 1990s, the rate for this group steadily declined, falling 8 percent from 1990 (116.5) to 1995 (107.5). Between 1995 and 2000, the rate fluctuated, but has renewed its downward trend, falling 6 percent from 2000 (109.7) (figure 3, tables 3, 4, 8, and 9). The rate for women aged 25–29 years in 2002, 113.6 per 1,000, did not essentially change from 2001 (113.4). Between 1990 and 1997, the rate for this group also steadily declined, falling 10 percent, from 120.2 to 108.3. Following increases during 1998–2000, the rate has been relatively stable. Women in their twenties, the principal childbearing ages, historically account for the largest share of births. However, the proportion of births to these women has declined in recent years, dropping from two-thirds of all births in 1980, to about half in 2002.

**Women in their thirties—**The birth rate for women aged 30–34 years declined to 91.5 per 1,000 in 2002 from 91.9 in 2001 (tables 4 and 9). This marks the first decline in the birth rate for this age group in more than a decade; the rate had increased steadily at about 1 percent per year between 1991 and 2001. The number of births to women for this age group increased 1 percent for the current year, reflecting the increase in the number of women in that age group. The birth rate for women aged 35–39 years increased 2 percent in 2002, to 41.4 births per 1,000 women from 40.6 in 2001. Between 1990 and 2002, the rate rose by 31 percent, with an average increase of 3 percent per year. The number of births to women aged 35–39 years

**Figure 3. Birth rates by age of mother: United States, 1980–2002**

reached another record high in 2002 (453,927). This number has risen by 43 percent since 1990 (317,583), compared with a 9 percent increase in the population of this age group (9,17).

**Women in their forties**—The birth rate for women aged 40–44 years increased from 8.1 to 8.3 per 1,000 for 2001–2002, the highest rate reported since 1969. Rates for this age group have risen 51 percent since 1990 (from 5.5). During 1990–2002, the number of births to this age group nearly doubled, from 48,607 to 95,788. The birth rate for women aged 45–49 years was unchanged in 2002 at 0.5. This rate more than doubled between 1990 and 2000, but has been stable since 2000. The number of births to women aged 45–49 years increased 8 percent (to 5,224) between 2001 and 2002, and has more than quadrupled since 1984 (1,108). The current number is the highest reported since 1945 (5,554). This increase reflects both the continued increase in the number of women in this age group (born between 1953 and 1957), and their greater likelihood to give birth.

**Births to women aged 50 years and over**—There were 263 births to women aged 50–54 years in 2002, a 10-percent increase over the 239 births reported for 2001 (tables 2 and 7). The number of births to this group has increased 13 percent annually since 1997 (144) when data for this age group became available again. (From 1964 to 1996, age of mother was imputed if the reported age was under 10 years or 50 years and over; see "Technical Notes.") Despite the increase, the number of births to women aged 50–54 years remains too small to compute age-specific birth rates. In computing birth rates by age of mother since 1997, births to women aged 50–54 years have been included with births to women aged 45–49 years; the denominator for the rate is women aged 45–49 years.

The increase in birth rates for women 35 years of age and over during the past 20 years has been linked, at least in part, to the use

of fertility-enhancing therapies (18). The proportion of childless women aged 35–44 years reporting impaired fecundity who sought fertility treatment rose considerably from 1982 to 1995 (19–21). In 2002, 1 out of 18 births to women aged 40–44 years, and 2 out of 9 births to women aged 45–54 years was a multiple delivery, an outcome associated with infertility treatment (see section on "Multiple births").

### Live-birth order

The first birth rate for women in their childbearing years declined 1 percent in 2002 to 25.8 per 1,000 from 26.0 in 2001 (table 5). The rate for 2002 was 11 percent lower than in 1990 (29.0). Rates for second- and third-order births also decreased by 1 percent between 2001 and 2002, whereas the rates for fourth- and sixth- and higher order births were unchanged. The rate for fifth-order births decreased (from 1.6 to 1.5).

The first birth rate decreased 1 percent overall, but there were substantial differences in trends by age of mother (see table 3). First birth rates declined for women 15–24 years, but increased for most age groups 25 years of age and over. Since 1990, first birth rates have decreased for women under age 30 years and increased for women aged 30 years and over; see figure 4.

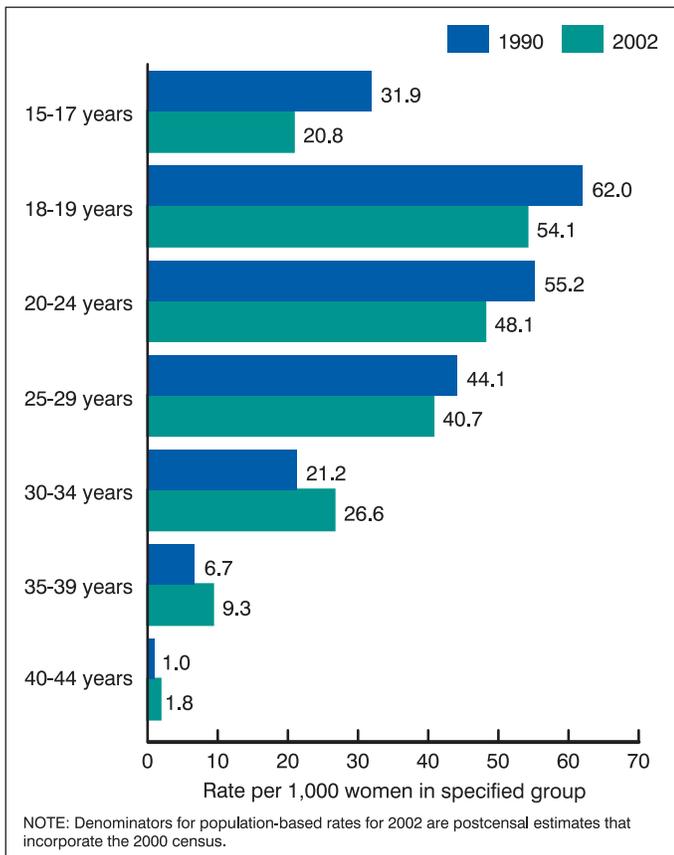

Another useful measure in interpreting childbearing patterns is the mean age at first birth. The mean is the arithmetic average of the age of mothers at the time of birth and is computed directly from the frequency of first births by age of mother. The mean age of first-time mothers was slightly higher in 2002, 25.1 years, compared with 25.0 years in 2001. This is an all-time high for the United States and attests to the continuing tendency of women to postpone childbearing (22). Since 1970, the mean age at first birth has risen 3.7 years (from 21.4 years) (data not shown).

Mean age at first birth varies considerably by race and Hispanic origin. In 2002 Japanese women had the highest mean age at first birth, 31.0 years, whereas American Indian women have the lowest, 21.8 years (figure 5). From 1990 to 2002, the mean age at first birth increased (on average 1 year) for nearly all race and Hispanic origin groups.

### Total fertility rate

The total fertility rate (TFR) summarizes the potential impact of current fertility patterns on completed family size. The TFR estimates the number of births that a hypothetical cohort of 1,000 women would have if they experienced throughout their childbearing years the same age-specific birth rates observed in a given year. The rate can be expressed as the average number of children that would be born per woman. Because it is computed from age-specific birth rates, the TFR is age-adjusted and can be readily compared for populations across time or among geographic areas.

The TFR in 2002 was 2,013 (or 2.01 births per woman), 1 percent lower than the rate in 2001 (2,034) (tables 4 and 9). Throughout most of the 1990s, the TFR declined, dropping 5 percent between 1990 and 1997 (from 2,081, the most recent high, to 1,971). After a brief increase from 1997 to 2000 (2,056.0), the TFR has declined 2 percent. The decrease in the TFR between 2001 and 2002 is the result of a decrease in the age-specific birth rates for women under age 25 years and women aged 30–34 years (see section on "Age of mother").

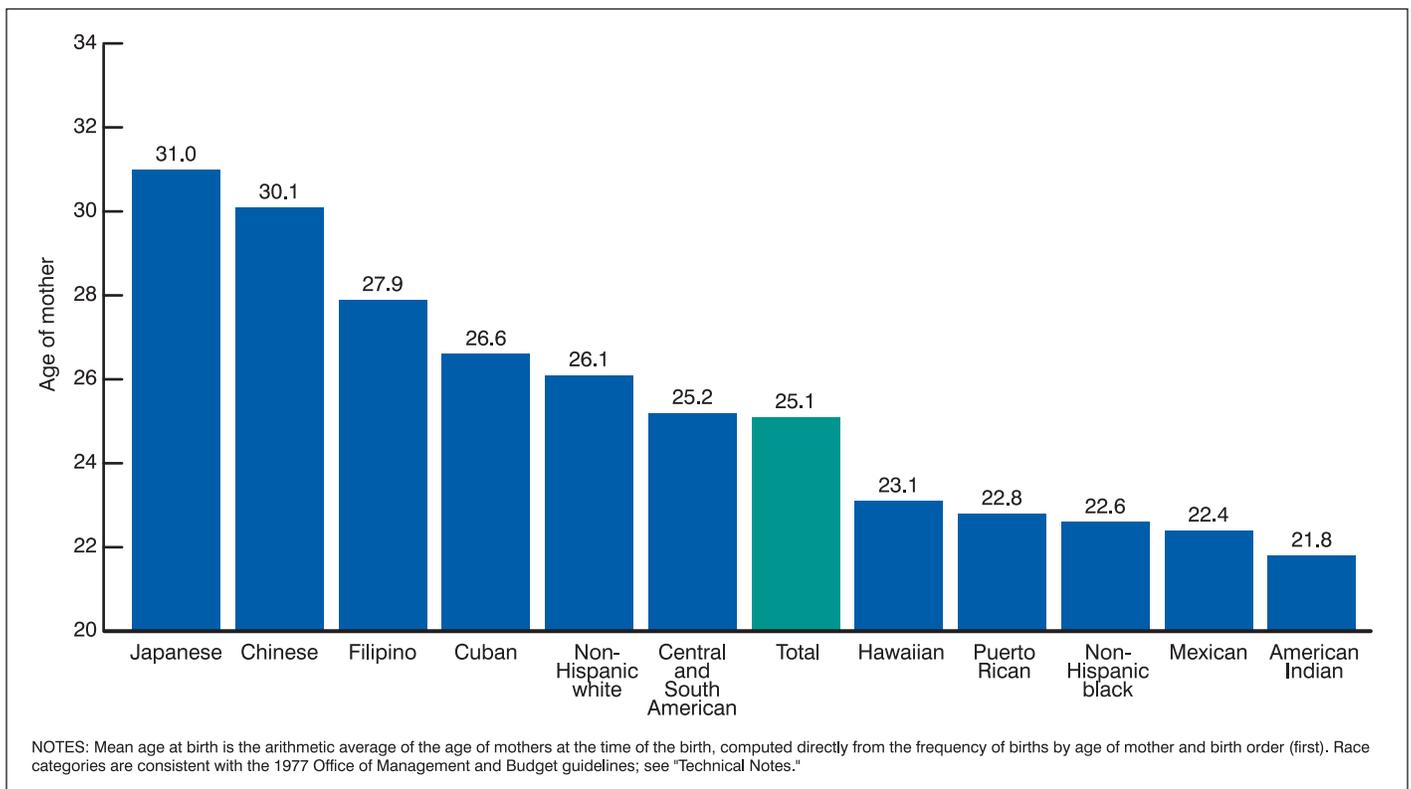

**Figure 4. First birth rates by age of mother: United States, 1990 and 2002**

The TFRs for most race and ethnic groups decreased 3 percent or less between 2001 and 2002; substantial differences among the groups persist. The TFR for Puerto Rican women decreased 10 percent, whereas the TFRs for “other” Hispanic and Cuban women were up 4 and 8 percent, respectively. The TFRs for American Indian and API women were essentially unchanged.

Differences between these groups are even more apparent when their rates are compared with the “replacement” rate. The “replacement” rate is the rate at which a given generation can exactly replace itself (2,100 births per 1,000 women). The U.S. TFR (2,013) was below the “replacement” rate in 2002. Although the TFRs for most groups were below “replacement” in 2002, the rate was above “replacement” for Mexican (2,880) and “other” Hispanic women (2,611) (tables 4, 9, 13, and 14). State-specific TFRs for 2002 are discussed in the next section.

#### Births and birth rates by State

Between 2001 and 2002, the number of births in the United States was essentially unchanged. However, the number of births increased significantly in six States (Arizona, Colorado, Nevada, Texas, Utah, and Wyoming) and decreased in seven States (Alabama, Illinois, Indiana, Michigan, New York, Ohio, and South Carolina), Puerto Rico, Guam, and the Northern Marianas (tables 10–12). Of the six States with increasing numbers of births, all were located west of the Mississippi River. Four of these States (Arizona, Colorado, Nevada, and Texas) have substantial proportions (31 to 48 percent) of births to Hispanic women, the population group with the largest absolute increase in births in 2002. Increased births in the west were offset by declines in many eastern States, which as a

**Figure 5. Mean age of mother at first birth by race and Hispanic origin of mother: United States, 2002**

group have accounted for a gradually decreasing proportion of all births since 1990 (56 percent in 2002 compared with 58 percent in 1990).

Much of the westward shift in the distribution of births in the United States is attributable to a westward shift in the distribution of the overall population. However, notable differences persist between eastern and western States when changes in the size of the underlying population are taken into account (i.e., when crude birth rates are examined). In 2002 the **crude birth rate** by State ranged from 10 births per 1,000 total population (Maine and Vermont) to 21 per 1,000 (Utah) (**table 10**). Between 2001 and 2002 rates declined significantly in 19 States (17 eastern States), Puerto Rico, Guam, and the Northern Marianas. The birth rate for Wyoming was the only rate to increase significantly.

In 2002 **State-specific fertility rates**, which provide a more refined picture of childbearing, ranged from a low of 49 births per 1,000 women aged 15–44 years (Vermont) to a high of 91 (Utah) (**table 10**). Between 2001 and 2002, fertility rates declined significantly in 10 States (9 of which were east of the Mississippi), Puerto Rico, Guam, and the Northern Marianas. Significant increases were observed in Colorado, Texas, and Wyoming.

State-specific **TFRs** for 2002, which provide a summary of lifetime fertility, are shown in **table 10**. The TFRs by State for 2002 also vary substantially, ranging from highs for Alaska and Utah of 2,550.5 and 2,544.0, respectively (or 2.6 and 2.5 births per woman), to a low of 1,604.0 (1.6 births per woman) for Vermont. The lowest TFR reported for 2002 was for the District of Columbia (1,582.5). Differences in TFRs and changes between 2001 and 2002 by State are similar to those noted for the general fertility rate.

### Birth rate for teenagers by State

Birth rates for teenagers by State are shown for 2002 in **tables B and 10**. In 2002 State-specific birth rates per 1,000 women aged 15–19 years ranged from 20.0 (New Hampshire) to 64.7 (Mississippi). The highest rate reported for 2002 was for the District of Columbia, 69.1. Between 2001 and 2002 teenage birth rates declined in 45 States with significant decreases in 23 States, Puerto Rico, and the Northern Marianas. Other changes between 2001 and 2002 were not statistically significant. Since 1991 teenage birth rates have declined significantly in all States, the District of Columbia, Guam, Puerto Rico, and the Virgin Islands. Birth rates for teenagers declined by 30 percent or more in 19 States, the District of Columbia, and Guam. A review of trends and variations in teenage childbearing by age, race, and Hispanic origin, is presented in a recent report (23).

### Sex ratio

In 2002 there were 2,057,979 male and 1,963,747 female live births, or 1,048 males for every 1,000 females births (**tables 13 and 14**). This year's overall sex ratio is similar to last year's ratio of 1,046; the U.S. sex ratio has changed very little over the past half century.

Similar to previous years, some of the highest sex ratios were for infants of API mothers. The highest sex ratio in 2002 was for infants of Japanese mothers (1,089), followed by Hawaiian (1,075), Chinese, and Filipino (1,070). The sex ratio of infants born to Hispanic mothers (1,041), as in previous years, fell between non-Hispanic white (1,054) and non-Hispanic black (1,032). Sex ratios for Hispanic subgroups

ranged from 1,038 for infants born to Mexican mothers, to 1,061 for Puerto Rican. In 2002 the lowest sex ratio of any group was for American Indians (1,023).

### Month of birth

As would be expected in a year when overall birth and fertility rates declined, monthly birth and fertility rates were down for most months in 2002. Between 2001 and 2002 observed monthly birth and fertility rates, which take into account the different number of days in the month, increased significantly over the previous year for 3 months (July, September, and December). Birth rates declined for all other months. Fertility rates were down for 6 months (January, March, May, June, August, and November). The birth rate peaked in August and September (14.7) and was lowest in November (13.4) (**table 15**). Similarly, the fertility rate was highest in September (68.4) and lowest in November (62.4), consistent with the historic pattern of rates peaking during the summer and falling in the late fall and winter.

### Day of the week of birth

In 2002 there were on average 11,018 births per day (**table 16**). As in previous years, however, the average number of births varied considerably by day of the week. In 2002 the average number of births on Tuesday (12,581) was two-thirds more than on Sunday (7,526).

Variation in the daily pattern of births can be measured with an index of occurrence. The index is defined as the ratio of the average number of births per day of the week to the average number of births per day of the year with the base set at 100. In 2002 the index for Tuesday was 114.2, indicating that there were 14.2 percent more births on Tuesday than on the average day. As in previous years, infants in 2002 were much less likely to be born on weekends; Sunday (68.3), followed by Saturday (77.8). The overall index of occurrence for Saturday and Sunday has declined 12 and 20 percent, respectively, since 1982.

A weekend deficit exists for vaginal deliveries, but is conspicuously larger for cesarean deliveries, particularly repeat cesareans, which are more likely to be scheduled and thus less likely to occur on weekends. In 2002 the Sunday index for vaginal births was 75.0, compared with 60.5 for primary cesareans, and 33.5 for repeat cesareans. Since 1989, when these data first became available, the weekend birth deficit for cesarean births has grown. Between 1989 and 2002 the Sunday index for all cesarean deliveries fell 18 percent, from 60.7 to 49.9.

### Births to unmarried women

The **birth rate for unmarried** women was essentially unchanged in 2002, at 43.7 births per 1,000 unmarried women aged 15–44 years, compared with 43.8 in 2001 (**tables C, 17, and 18**). The rate has changed little since 1995, ranging from 42.9 (1997) to 44.3 (1995); **see figure 6**. The **number of births to unmarried** women reached 1,365,966 in 2002, a 1-percent increase compared with 2001 (1,349,249), and the highest number ever reported in the more than six decades for which comparable data are available (24). Increases in the number of nonmarital births since 1995 are due almost entirely to the 10-percent rise in the number of unmarried women of childbearing age (25–27); the birth *rate* for unmarried women has been essentially stable. Of all births in 2002, **34.0**

**Table B. Birth rates for teenagers 15–19 years by State, 1991 and 2002, and percent change, 1991–2002: United States and each State and territory**

[Birth rates per 1,000 estimated female population aged 15–19 years in each area]

State	1991	2002	Percent change, 1991–2002	State	1991	2002	Percent change, 1991–2002

--- Data not available.

<sup>1</sup>Excludes data for the territories.

NOTE: Rates for 1991 have been revised and may differ from those previously published; see "Technical Notes."

**percent were to unmarried women.** This percent has increased very slowly in recent years, from 32.4 (1996–97) to 34.0 in 2002.

In 2002 as in every year since 1998, all States except Michigan and New York reported mother's marital status through a direct question on the birth certificates. Michigan and New York infer the mother's marital status on the basis of other information on the birth certificate; see "[Technical Notes](#)" for detailed information.

Birth rates for unmarried women are typically highest for women in their early twenties ([tables 17 and 18](#)). The rate in 2002 was 70.5 births per 1,000 aged 20–24 years. The rate for unmarried women aged 25–29 years was 61.5, and for older teenagers 18–19 years, it was 58.6 per 1,000. Rates were considerably lower for women in their thirties and older, as well as for younger teenagers 15–17 years.

**Birth rates for unmarried women vary widely by race and Hispanic origin.** In 2002 the rate for Hispanic women was highest at 87.9 per 1,000, followed by black women at 66.2, non-Hispanic white women at 27.8, and Asian or Pacific Islander (API) women, at 21.3. The birth rate for unmarried black women has fallen steeply during the 1990s through 2002, from 90.5 per 1,000 in 1990 to 66.2 in 2002, a 27-percent drop. The rate for non-Hispanic white women has varied little since 1994 (28.5). The rate for API women, available only for 2000–2002, has also been essentially stable. The rate for Hispanic women in 2002 was 8 percent below its 1994 peak, but has trended slowly up since 1998 (82.8 per 1,000).

Birth rates for unmarried black and Hispanic teenagers are quite comparable, but at ages 20 years and over, rates for Hispanic women are increasingly higher than for black women with advancing maternal age. Birth rates by age for unmarried API women are consistently lowest of all.

Birth rates for unmarried teenagers continued to decline in 2002. The overall rate for ages 15–19 years has dropped 23 percent since 1994; declines for younger teenagers were more than double the declines for older teenagers (34 compared with 15 percent). Among population subgroups, rates for unmarried black teenagers have fallen most steeply. The rate for unmarried black teenagers 15–17 years has fallen by half since 1991, from 79.9 to 39.9 per 1,000, and the rate for older black teenagers declined by 29 percent, to 104.1. Since the mid-1990s rates for unmarried non-Hispanic white teenagers have declined as well, by 36 percent for ages 15–17 years and 14 percent for ages 18–19 years, whereas the rates for unmarried Hispanic teenagers have declined more slowly.

The birth rate for unmarried women aged 20–24 years has declined slightly since 2000, by 2 percent, while the rate for women aged 25–29 years has risen steadily since 1997, by 15 percent. Rates for women in their thirties and older have increased as well since the mid-1990s.

The **proportions of all births that are to unmarried women** increased slightly for non-Hispanic white (23.0 percent) and Hispanic

**Table C. Number, rate, and percent of births to unmarried women, and birth rate for married women: United States, 1980 and 1985–2002**

Year	Births to unmarried women			Birth rate for married women <sup>3</sup>
	Number	Rate <sup>1</sup>	Percent <sup>2</sup>	
2002 . . . . .	1,365,966	43.7	34.0	86.3

<sup>1</sup>Births to unmarried women per 1,000 unmarried women aged 15–44 years.

<sup>2</sup>Percent of all births to unmarried women.

<sup>3</sup>Births to married women per 1,000 married women aged 15–44 years.

NOTE: Rates for 1991–2001 have been revised and may differ from those previously published; see “Technical Notes.”

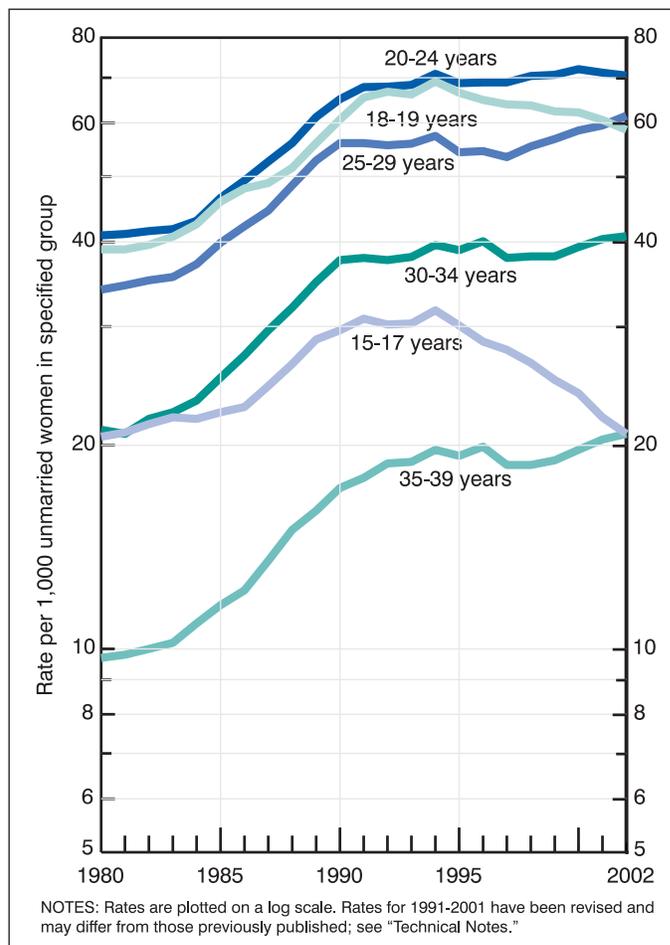

women (43.5 percent) in 2002. The proportion of births to non-Hispanic black women declined slightly to 68.4 percent. The percent for American Indian women was 59.7, and for API women, it was 14.9. There are substantial variations in these proportions for Hispanic and API subgroups (tables 13, 14, 17, and 19).

Changes in both marital and nonmarital fertility affect the proportion of births that are to unmarried women. In recent years, the proportion has inched up, primarily because births to married women have declined by 2 percent since 2000, whereas births to unmarried women increased slightly, by 1 percent.

The numbers and proportions of births to unmarried women by race and Hispanic origin by State are shown in table 19. In general, the number of States reporting increases in these measures far outpaced the number with declines. The number of births to unmarried women rose in 37 States and American Samoa, and declined in 13 States, the District of Columbia, and in all territories except for American Samoa. The percent of births to unmarried women increased in 41 States and all territories except for Guam, declined in 5 States, the District of Columbia, and Guam, and was unchanged in 4 States.

**Age of father**

The birth rate per 1,000 men aged 15–54 years was 48.4 in 2002 (table 20), a decrease of 1 percent from 2001 (49.0 per 1,000) and the lowest level ever reported. Between 1990 and 1997, the overall birth rate for men declined 15 percent; the rate fluctuated slightly between 1998 and 2000 and has declined since. For 2001–2002, age-specific birth rates for males under age 35 years were down, birth rates for men between ages 35 and 49 years were up; rates for men aged 50 years and over were unchanged.

**Figure 6. Birth rates for unmarried women, by age of mother: United States, 1980–2002**

The birth rates for teenage males (15–19 years) fell 6 percent between 2001 and 2002 (from 18.5 to 17.4) and has declined 29 percent, from 24.6 per 1,000 since 1994. The downturn in birth rates for male teenagers echoes declines in the birth rate for female teenagers that began in the early 1990s (see section on “Age of mother”). Declining birth rates among younger fathers as well as rising birth rates among older fathers have resulted in a 1-year increase in the median age of fathers, from 28.7 to 29.7 years, between 1992 and 2002 (tabular data not shown).

Information on age of father is often missing on birth certificates of children born to women under 25 years of age and unmarried women (24). In 2002 age of father was not reported for 13 percent of all births, 24 percent of births to all women under 25 years of age, and 38 percent of all nonmarital births. In computing birth rates by age of father, births where age of father is not stated were distributed in the same proportion as births where age of father is stated within each 5-year age interval of mother. This procedure avoids the distortion in rates that would result if the relationship between age of mother and age of father were disregarded. The procedures for computing birth rates by age of father are described in more detail in the “Technical Notes.”

## Educational attainment

In 2002, 78.5 percent of women who gave birth had at least 12 or more years of schooling (a high school education), and 25.9 percent had 16 or more years of schooling (4 years of college) ([table 21](#)), slight increases from 78.3 percent and 25.2 percent in 2001. The educational attainment of women giving birth (based on completed years of education at the time of birth) has increased substantially over the past few decades. Since 1970 the proportion of mothers with 12 or more years of schooling has increased 14 percent (from 69 percent) and those with 16 or more years of schooling has nearly tripled (from 9 percent). This trend reflects in part increases in educational attainment of all women during that time (28).

Maternal education has long been considered an important factor in fertility and health. The educational attainment of women has been shown to have a profound effect on the number of births and the risk of adverse birth outcome. Women with higher educational attainment are more likely to desire and give birth to fewer children and are less likely to engage in behaviors detrimental to health and pregnancy (19,23,29).

The median educational attainment for all mothers was 12.9 years in 2002, unchanged since 1998. Since 1970 the median education of mothers has increased less than 1 year (12.4) (tabular data not shown).

Although the overall trend in educational attainment has increased, variations by race and ethnicity exist. Almost all Japanese women giving birth in 2002 completed 12 years of school (98 percent), whereas slightly more than half of Hispanic women completed high school (52 percent). While the overall proportion of Hispanic mothers with at least 12 years of schooling was comparatively low, variation among Hispanic subgroups was wide, ranging from 46 percent of Mexican mothers to 88 percent of Cuban mothers. In 2002, 88 percent of non-Hispanic white women and 76 percent of non-Hispanic black women completed high school ([tables 13, 14, and 21](#)).

## Maternal Lifestyle and Health Characteristics

### Weight gain

In 2002 the median weight gain for all pregnancies was 30.5 pounds, unchanged over the previous 5 years. Between 1990 and the present, this measure has varied only one-tenth of a pound. In 2002, 10.8 percent of women with at least term births (40 weeks of gestation or more) gained less than 16 pounds, considered inadequate weight gain for most women; 21.2 percent had weight gains of more than 40 pounds, considered excessive in most cases ([table 22](#)). Between 1989 (when data became available) and 2002, the percent of all mothers who gained less than 16 pounds increased 33 percent (from 9.4 to 12.2) and the percent who gained over 40 pounds rose by a similar amount (from 15.1 to 19.2). In 2002 a large proportion of mothers had weight gains outside of the guidelines recommended by the Institute of Medicine (IOM) (30).

Both excessive and insufficient maternal weight gain during pregnancy influence pregnancy outcomes. Inadequate maternal weight gain has been associated with an increased risk of intrauterine growth retardation, shortened period of gestation, low birthweight, and perinatal mortality. High weight gain during pregnancy has been linked with an elevated risk of a large-for-gestational-age (LGA) infant, cesarean

delivery, and long-term maternal weight retention. Based on the mother's body mass index (BMI), the IOM guidelines recommend that women who are underweight gain 28 to 40 pounds, and those who are of normal weight gain 15 to 25 pounds. For extremely obese women, the IOM recommends a minimum weight gain of 15 pounds. However, it recommends that weight gain goals be tailored to individual needs (30).

BMI is calculated from a woman's prepregnancy weight and height, neither of which is available from the birth certificate, which only captures information on weight gained during pregnancy. Therefore, it is not possible from these data to determine whether the weight gain was within the recommendations for the mother's BMI. However, these data do allow us to estimate weight gain outside of the recommended ranges for women of any BMI.

Weight gained during pregnancy differed widely by racial/ethnic groups. The percent of non-Hispanic black women with inadequate weight gains of under 16 pounds was 17.8 in 2002, 75 percent higher than the level for non-Hispanic white women (10.2 percent) ([table 25](#)). American Indian women also had comparatively high rates of inadequate weight gain (17.0 percent gained under 16 pounds). Among the API subgroups, Japanese women were most likely to gain under 16 pounds in 2002 (11.8 percent) and Chinese women were the least likely (6.9 percent) ([table 24](#)). Among the Hispanic subgroups, Mexican mothers were more than twice as likely to gain less than 16 pounds than Cuban mothers (16.7 compared with 7.9 percent) ([table 25](#)).

Levels of both inadequate and excessive weight gain have increased since 1989 for almost all racial and Hispanic origin groups. The rise in excessive weight gains of over 40 pounds cannot be attributed to the sharp rise in the multiple birth rate (women with multifetal pregnancies tend to gain more weight than women with singleton pregnancies) (30). Excessive weight gain has increased among mothers of singleton deliveries at the same pace (27 percent) as that for all pluralities.

Maternal weight gain also has been shown to have a positive correlation with infant birthweight. In 2002 as in previous years, the percent of low birthweight infants declined with increasing maternal weight gain through 36 to 40 pounds (from 13.9 to 5.6 percent) ([table 23](#)). The declining trend begins to reverse for weight gains of 40 pounds or more, but does not approach the level of risk for inadequate gain.

### Medical risk factors

In 2002 the most frequently reported medical risk factors were **pregnancy-associated hypertension** (37.8 per 1,000 live births), **diabetes** (32.8), and **anemia** (25.7) ([table 26](#)). These have been the most frequently reported risk factors since these data have been available from birth certificates (1989). The rate of pregnancy-associated hypertension (at 37.8 for 2002) has been essentially unchanged since 2000, after steadily rising during the 1990s (from 27.2). Rates for diabetes and anemia rose about 40 percent between 1989 and 2002. Pregnancy-associated hypertension, chronic hypertension, and eclampsia are all closely related hypertensive disorders, but the latter two are rarer conditions. The rate for **chronic hypertension** has increased since 1990 (6.5 in 1990; 8.4 in 2002), whereas the **eclampsia rate** has declined (4.0 in 1990; 3.2 in 2002).

Medical risk factors during pregnancy can contribute to serious complications and maternal and infant morbidity and mortality,

particularly if not treated properly (31–33). Sixteen medical risk factors that can affect pregnancy outcome are separately identified on the birth certificate (table 26). Medical risk factor data were missing from only 0.7 percent of records for 2002, continuing a trend of considerable improvement over previous years. However, birth certificate data may underreport or incorrectly report medical risk factor prevalence due to a lack of adherence to uniform definitions and difficulty in interpreting data from medical records (34). Rates for rarely occurring medical risk factors and for smaller population groups can vary from year to year and should be used with caution.

The risk of having a medical condition during pregnancy often differs by maternal age (table 26). For example, teenage mothers are one-and-a-half times as likely to have anemia during pregnancy compared with women aged 40 years and over (3.6 compared with 2.1 percent). Older mothers, however, are much more prone to chronic conditions such as diabetes (7.7 for mothers 40 years and over compared with 1.0 for mothers under age 20 years); chronic hypertension (2.6 compared with 0.3); and cardiac disease (1.0 compared with 0.3). Other risk factors, however, such as lung disease and pregnancy-associated hypertension, have higher rates at both the oldest and youngest ages.

The reported rate of **hydramnios/oligohydramnios** (the excess or shortage of amniotic fluid) has consistently increased during the 1990s, more than doubling between 1990 and 2002 (from 5.9 to 13.9). These conditions have been associated with maternal diabetes. **Acute or chronic lung disease** (e.g., asthma, tuberculosis) also has risen dramatically. The rate of lung disease has more than tripled between 1990 and 2002 (from 3.0 to 12.3 per 1,000) and has increased for all age groups, most notably for younger women. In the early 1990s, this condition was slightly more prevalent in older women.

The levels of medical risk factors during pregnancy can also vary greatly by maternal race and ethnicity (tables 27 and 28). In 2002 both American Indian and Hawaiian women had higher rates of anemia than other groups (56.7 and 55.2 per 1,000, respectively, compared with 22.9 percent for white women). Rates for diabetes ranged from a low of 30.4 per 1,000 for black women, to a high of 59.8 for Filipinos. Hawaiian women had the highest rate of pregnancy-associated hypertension (48.2), whereas Chinese women had the lowest (11.6 per 1,000).

Among Hispanic women, the levels of anemia, diabetes, and pregnancy-associated hypertension were highest for Puerto Rican mothers, and those of other or unknown Hispanic origin (table 28). Non-Hispanic black women had almost twice the level of anemia of non-Hispanic white women (40.7 and 21.5), but similar levels of diabetes (30.3 and 31.2, respectively) and pregnancy-related hypertension (41.8 and 42.6 per 1,000).

### Tobacco use during pregnancy

**Smoking during pregnancy** has decreased steadily since 1989, from 19.5 to 11.4 percent in 2002, a 42-percent decline. Not only has prenatal smoking declined overall, but the proportion of smokers who smoked half a pack (11 cigarettes) or more has fallen as well, from 41 percent in 1989 to 26 percent in 2002 (see tables 29–32 for 2002 data). All States except for California reported information on tobacco use on their birth certificates in 2002, as in 2000–2001. The reporting area accounted for 87 percent of U.S. births in 2002.

While prenatal smoking is believed to be somewhat underreported on the birth certificate, the trends and variations in maternal smoking based on birth certificate data have been largely corroborated by data from nationally representative surveys (35,36). The completeness of reporting of tobacco use on the birth certificate is believed to be affected by a number of factors, including the lack of a specific time reference for smoking status, variations in the source of information for the birth certificate, and the stigma associated with tobacco use, especially during pregnancy, and particularly in cases of poor birth outcome (35,37,38).

Tobacco use during pregnancy has long been associated with a number of adverse outcomes, including low birthweight, intrauterine growth retardation, miscarriage, and infant mortality, as well as negative consequences for child health and development (39). Substantial costs result from these adverse outcomes (40).

Variations in smoking during pregnancy have been consistent over the 14 years for which birth certificate data have been available (41). Older teenagers, 18–19 years, have the highest rate, at 18.2 percent in 2002, followed by women aged 20–24 years, 16.7 percent, and younger teenagers 15–17 years, 13.4 percent. Smoking rates declined for women in all age groups in 2002. While smoking rates are considerably lower for women in age groups 25 years and over, those women who smoke are much more likely to be heavier smokers. For example, among women aged 25–29 years who smoked in 2002, 31 percent smoked half a pack or more, compared with 20 percent of their counterparts aged 18–19 years.

**Smoking rates generally declined for women in all racial and Hispanic origin groups;** there was a slight increase for Japanese women (tables 24 and 25). Substantial variations persist among population subgroups. Rates in 2002 were highest for American Indian, non-Hispanic white, and Hawaiian women, and lowest for Chinese, Japanese, Filipino, Mexican, and Cuban women.

Smoking rates are highest for women who have attended but have not completed high school and lowest for college-educated women (table 31). This relationship has been observed consistently over the period for which birth certificate data are available. When data are limited to women aged 20 years and over, who have had the opportunity to complete high school, this pattern remains. In 2002, 27 percent of women with 9 to 11 years of schooling smoked during pregnancy, compared with 7 percent of women with a grade school education, 16 percent for high school graduates, 9 percent of women with some college, and 2 percent for college-educated women (tabular data not shown).

The negative consequences of prenatal smoking on birth outcome have been well documented over time (39,42,43). Overall, 12.2 percent of births to smokers were low birthweight (less than 2,500 grams/5 pounds 8 ounces) compared with 7.5 percent of births to nonsmokers. The disparity by smoking status is smallest for teenagers and increases with advancing maternal age, most likely a reflection of the greater cigarette consumption among older women (tables 29 and 32). The impact of smoking on a low birthweight outcome tends to be more severe for women who smoke more cigarettes, but the data also show that there is no “safe” level of smoking. In 2002, 11.5 percent of babies born to light smokers, that is, women smoking fewer than six cigarettes daily, were low birthweight (LBW), more than 50 percent above the LBW rate for births to nonsmokers. Light smokers accounted for about one-third of all smokers in 2002.

## Alcohol use during pregnancy

Alcohol use during pregnancy is a major risk factor for poor birth outcome, independent of other maternal health risk and behavior factors (44,45). Questions on alcohol use are included on the birth certificates of the District of Columbia and all States except for California. This reporting area accounted for 87 percent of U.S. births in 2002.

Unfortunately, alcohol use is substantially underreported on the birth certificate, compared with data collected in nationally representative surveys of pregnant women. Only 0.8 percent of women giving birth in 2002 reported alcohol use during pregnancy, down from 0.9 percent in 2001, and 4.1 percent in 1989, the first year this information was collected on birth certificates (**data for 2002 shown in tables 24 and 25**).

According to the most recently conducted Behavioral Risk Factor Surveillance System (BRFSS) survey, 12.8 percent of women reported alcohol use during pregnancy in 1999, compared with 1.0 percent based on 1999 birth certificate data (46). While the BRFSS data indicate that alcohol use declined during the late 1990s, no decline in “binge” drinking was found (46).

The current birth certificate question on alcohol use is evidently not sensitive enough to measure this behavior accurately. This is unfortunate because alcohol use is clearly a critical risk factor for poor birth outcome and it is implicated as well in delayed infant and child development (44,45). The question wording as well as the lack of specific time reference for the birth certificate questions are probably factors contributing to the underreporting.

## Medical Services Utilization

### Prenatal care

Women were slightly more likely to receive prenatal care in the first trimester of pregnancy in 2002, 83.7 percent, compared with 83.4 percent in 2001. Timely initiation of prenatal care has improved slowly but steadily in recent years, rising 10 percent since 1990 (from 75.8 percent). See **tables D, 33, 34, and 35**. One percent of all women who gave birth in 2002 (approximately 40,000 mothers)

received no prenatal care at all; an additional 2.6 percent of women did not receive care until the last trimester of pregnancy. The proportion of mothers with late or no care has improved markedly since 1990, dropping from 6.1 to 3.6 percent. The effect of medical care during pregnancy on maternal and infant health is difficult to measure (47,48). However, it is evident that prenatal care can enhance pregnancy outcome by providing health care advice and managing chronic and pregnancy-related health conditions (47,49).

Modest gains in the proportion of women beginning prenatal care in the first trimester of pregnancy were observed for each age group and most racial/ethnic groups for 2001–2002. Since 1990, levels have risen more than 20 percent among non-Hispanic black women (from 60.7 to 75.2 percent), Hispanic (from 60.2 to 76.7 percent), and American Indian women (from 57.9 to 69.8 percent) (**tables 24 and 25**). Concurrent substantial decreases in the percent of women with late or no care have also been seen for these groups. Still, in 2002, more than 5 percent of black, Hispanic, and American Indian mothers received no care at all. Recent improvements in prenatal care utilization may be partly related to the expansion of Medicaid for pregnant women in the late 1980s (50).

Increased levels of first trimester prenatal care were reported for each Hispanic subgroup except “Other and unknown Hispanics” for the current year. Levels ranged from 75.7 percent for Mexican mothers to 92.0 percent for Cuban mothers (the highest rate reported for any race or ethnic group). Among APIs, Japanese women were the most likely to receive first trimester care (90.5 percent); Hawaiian women were the least likely (78.1 percent).

The New England States (Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont) and Iowa reported the highest levels of prenatal care utilization for 2002; first trimester care ranged from 88 to 92 percent, and levels of late or no care were 2 percent or less (**table 34**). Since 1990 substantial expansion in prenatal care utilization has been observed for most States and for the District of Columbia (data not shown).

The “month that prenatal care began” can be a useful measure of prenatal care timing, but it does not take into account the number of prenatal care visits or gestational age at delivery, important factors in determining the appropriateness of care (51). The Adequacy of Prenatal Care Utilization (**APNCU**) Index, an alternative measure that is based on recommendations from the American College of Obstetricians and Gynecologists, incorporates the month that care began, the number of prenatal visits, and adjusts for the infant's gestational age (51,52). The APNCU categorizes care as: intensive, adequate, intermediate, and inadequate. For 2002, 74.6 percent of mothers received at least adequate prenatal care, a modest improvement over 2001 (74.5 percent), and the percent of women with inadequate care declined from 11.6 to 11.3. The APNCU, like the “month care began,” indicates that there has been substantial gain in prenatal care initiation in recent years. According to the APNCU, since 1990 the proportion of women with at least adequate care has risen 12 percent (with almost all of the increase for women with intensive use of care), and the proportion with inadequate care has declined by more than one-third (from 17.4 percent). See **table E**.

### Obstetric procedures

In 2002 as in past years, electronic fetal monitoring (EFM) was the most frequently reported of the six specific obstetric procedures

**Table D. First trimester prenatal care by race and Hispanic origin of mother: United States, 1980, 1985, 1990, 1995, 2000–2002**

Year	All races <sup>1</sup>	Non-Hispanic		American Indian <sup>2</sup>	Asian or Pacific Islander <sup>2</sup>	Hispanic <sup>3</sup>
		White	Black			
2002 . . . . .	83.7	88.6	75.2	69.8	84.8	76.7

NOTE: See reference 51 for information on calculation of this measure.

listed on the birth certificate. The rate has continually climbed since 1989 from 68.4 to 85.2 percent for 2002 (or more than 3.4 million live births) (table 36). The benefits and risks of routine use of EFM remain controversial (53). The use of EFM and other obstetric procedures may be underreported on the birth certificate (54).

In 2002, 68 percent of mothers who had live births received ultrasound. The use of this procedure also has increased steadily since 1989, from 47.7 percent. Advances in this technology allow early screening for fetal anomalies (55).

The rate of induction of labor increased slightly from 2001 to 2002 (20.5 to 20.6). The rate for 2002 was more than double the 1989 level of 9.0 percent. Between 1989 (the first year these data were reported on the birth certificate) and 2000, the rate of induction rose steadily every year for all gestational ages, including preterm deliveries (less than 37 completed weeks of gestation). However, since 2000, the induction rate has decreased slightly for preterm deliveries but has continued to increase for gestational ages of 37 to 41 weeks (data not shown).

For 2001–2002 rates of induction increased for most racial and ethnic groups. The induction rates have risen more than twofold among the largest racial and ethnic groups between 1989 and 2002 (table F). There was wide variation in the rates in 2002. For example, the rate for non-Hispanic white women (24.6 percent) was substantially higher than that for non-Hispanic black women (17.5). Current year rates for

**Table F. Rate of induction of labor by race and Hispanic origin of mother: United States, 1989, 1995, 2000, 2001, and 2002, and percent change, 1989–2002**

[Rates are births with induction per 100 total births in specified group]

Race and Hispanic origin of mother	Year					Percent change 1989–2002
	2002	2001	2000	1995	1989 <sup>1</sup>	
	Percent					
All races <sup>2</sup> . . . . .	20.6	20.5	19.9	16.0	9.0	129
Non-Hispanic white . . . . .	24.6	24.4	23.6	18.9	10.5	134
Non-Hispanic black . . . . .	17.5	17.1	16.5	11.7	6.7	161
American Indian total <sup>3</sup> . . . . .	20.9	20.3	20.1	15.6	8.4	149
Asian or Pacific Islander total <sup>3</sup> . . . . .	13.9	14.0	13.3	10.8	5.5	153
Hispanic <sup>4</sup> . . . . .	13.8	13.5	13.2	10.2	5.3	160

<sup>1</sup>Excludes data for Louisiana, Nebraska, and Oklahoma, which did not report induction of labor in 1989.

<sup>2</sup>Includes races other than white and black.

<sup>3</sup>Race and Hispanic origin are reported separately on the birth certificate. Data for persons of Hispanic origin are included in the data for each race group according to the mother's reported race; see "Technical Notes."

<sup>4</sup>Includes all persons of Hispanic origin of any race; see "Technical Notes."

NOTE: Race categories are consistent with the 1977 Office of Management and Budget guidelines; see "Technical Notes."

2002 among the Hispanic subgroups ranged from 12.9 percent for Mexican, to 20.5 percent for Cuban mothers. There was less variability among the API subgroups however; rates ranged from 12.1 (Filipino) to 15.9 percent (Hawaiian) (tables 27 and 28). These patterns are consistent across time.

It has been suggested that increasing induction rates may be related, in part, to an increase in elective inductions (inductions with no medical or obstetric indication). In a study of variation in induction rates among hospitals and clinicians, 25 percent of inductions had no apparent medical indication (56). Studies have shown that induction (including elective induction) may increase the risk of cesarean delivery in nulliparous women (57).

The rate of stimulation of labor was 17.3 percent for 2002; this rate has fluctuated only slightly since 1997, but has risen 60 percent since the 1989 rate (10.9 percent). The overall rate for tocolysis, the use of agents that inhibit or delay uterine activity for the management of preterm labor, was 2.1 percent in 2001 and 2002. The rate of tocolysis has been fairly stable since 1996. Discussion on the safety and efficacy of these agents is ongoing (58).

The overall rate for amniocentesis decreased to 2.0 percent of births in 2002, from 2.2 percent in 2001, and 3.2 percent in 1989. This change may reflect increased use of screening tests that are noninvasive (e.g., ultrasound and measurement of serum markers) in place of amniocentesis (59).

### Complications of labor and/or delivery

The most prevalent complication reported on the birth certificate for 2002, as for previous years, is moderate or heavy meconium, which occurs at a rate of 50.1 per 1,000 births or in 5.0 percent of all deliveries resulting in a live birth. The presence of meconium during labor and delivery can directly alter the amniotic fluid, reduce antibacterial activity (and subsequently increase the risk of perinatal bacterial infection) and damage the infant's lungs if inhaled (32). Depending on the severity of the condition, other complications of labor and delivery reported on the birth certificate may require medical interventions and can affect the health of the infant. Of the 15 complications of labor and/or delivery reported on the birth certificate, the other four most frequently reported complications for 2002 were: fetal distress (3.9 percent), breech/malpresentation (3.8 percent), dysfunctional labor (2.9 percent), and premature rupture of membrane (PROM) (2.3 percent) (table 37).

Complication rates vary among racial/ethnic groups (tables 27 and 28). For example, non-Hispanic black women had higher meconium rates than non-Hispanic white women, whereas non-Hispanic black women had substantially lower rates of cephalopelvic disproportion and breech/malpresentation (leading risk factors for cesarean delivery) than non-Hispanic white women. A wide range of values was also apparent among API subgroups. Rates for meconium ranged from 4.4 percent for Japanese women to 6.7 percent for Hawaiian women. Differences in rates also were evident among Hispanic subgroups. In 2002 rates for meconium ranged from a low of 3.6 percent for Cuban mothers to a high of 6.2 percent for Central and South American mothers.

## Attendant at birth and place of delivery

In 2002 the percentage of all births delivered by physicians in hospitals was unchanged from 2001 (91.3 percent) ([table 38](#)). This proportion has declined since 1975 (98.7). In 2002 as in previous years, almost all doctor-attended births were attended by doctors of medicine (MDs). However, the percent of all births attended by doctors of osteopathy (DOs) has continued to grow slowly, from 2.8 percent in 1989 (the first year data on DOs were available from the birth certificate), to 4.8 percent in 2002.

The percentage of births attended by midwives has increased steadily since 1975, climbing from less than 1.0 percent (60) to 8.1 percent in 2002. Nearly all of the increase in midwife-attended births has been for those in hospitals (61). Midwifery education as well as practice has increased over the past decade (62). The vast majority of all midwife-attended births in 2002 (94.6 percent) was by certified nurse midwives (CNMs). This rate was stable at 95.0 percent for 1996–2000. Due to underreporting of midwife-attended deliveries, these data should be considered lower estimates of the actual number of midwife-attended births (4,60). In a recent report comparing similar groups of low-income, low-risk women, those whose care was managed or co-managed by CNMs with the option of delivering at a birthing center required fewer medical interventions and procedures (i.e., augmentation of labor, episiotomy, cesarean section) than those receiving traditional care (i.e., care by physicians with delivery in a hospital setting) (63).

Ninety-nine percent of births in 2002 were delivered in hospitals, a rate essentially unchanged over the past several decades. Out-of-hospital births occurred predominantly in a residence (65 percent); 27 percent were in a freestanding birthing center. These levels have fluctuated only moderately since 1989.

About 92 percent of births to non-Hispanic white women and non-Hispanic black women were attended by a physician in a hospital compared with 90 percent of births to Hispanic women. As in earlier years, in 2002 non-Hispanic white and black women were less likely to have a midwife-attended hospital birth (6.8 and 7.0 percent, respectively) than Hispanic women (9.4 percent).

Among the Hispanic subgroups, for Cuban women the rate of physician-attended hospital births reached 95.4 percent, compared with Mexican, Puerto Rican, and Central or South American women (89 to 90 percent). Cuban women also had the lowest rate of midwife-attended hospital births (4 percent) compared with Central or South American women, Puerto Rican, and Mexican women (9 to 10 percent) (data not shown).

## Method of delivery

The rate of cesarean delivery increased to 26.1 percent of all births for 2002, the highest rate ever reported in the United States. The 2002 rate is a 7-percent rise from 2001 (24.4 percent) and a 14-percent increase from 1989 (22.8 percent). The cesarean rate fell between 1989 and 1996, but has risen each year since 1996, by a total of 26 percent (5,64) ([tables 39 and 40](#)). The escalation in the total cesarean rate is fueled by both the rise in the primary cesarean rate and the steep decline in the rate of vaginal birth after cesarean (VBAC) delivery. Controversy continues to stimulate research and discussion on the risks, benefits, and long-term consequences of cesarean (medically indicated or elective) delivery and VBAC delivery (65–67).

In 2002 the primary cesarean rate (18.0 per 100 live births to women who had no previous cesarean) was 7 percent higher than in 2001 (16.9), 12 percent higher than in 2000, and 23 percent higher than the low reported for 1996–97 (14.6). The rates for low-risk women (i.e., women with full-term, singleton deliveries, with vertex presentations) have increased similarly (data not shown) (68). The increase in primary cesarean deliveries may be related to nonmedical factors such as demographics, physician practice patterns, and maternal choice (69–71). It has been suggested that increasing use of medical technology, such as continuous EFM and induction of labor may have also contributed to this increase (e.g., inconsistent definition and interpretation of EFM patterns may lead to more intervention; induction prior to 41 weeks gestation has been linked to an increased risk of cesarean delivery) (70).

The rate of vaginal birth after cesarean (VBAC) delivery fell 23 percent between 2001 and 2002—from 16.4 per 100 women with a previous cesarean to 12.6 (the lowest level reported from birth certificate data). The VBAC rate has fallen precipitously since 1996, by 55 percent, after increasing by 50 percent between 1989 (18.9) and 1996 (28.3). For low-risk women, this rate has shown a similar rate of decline (data not shown).

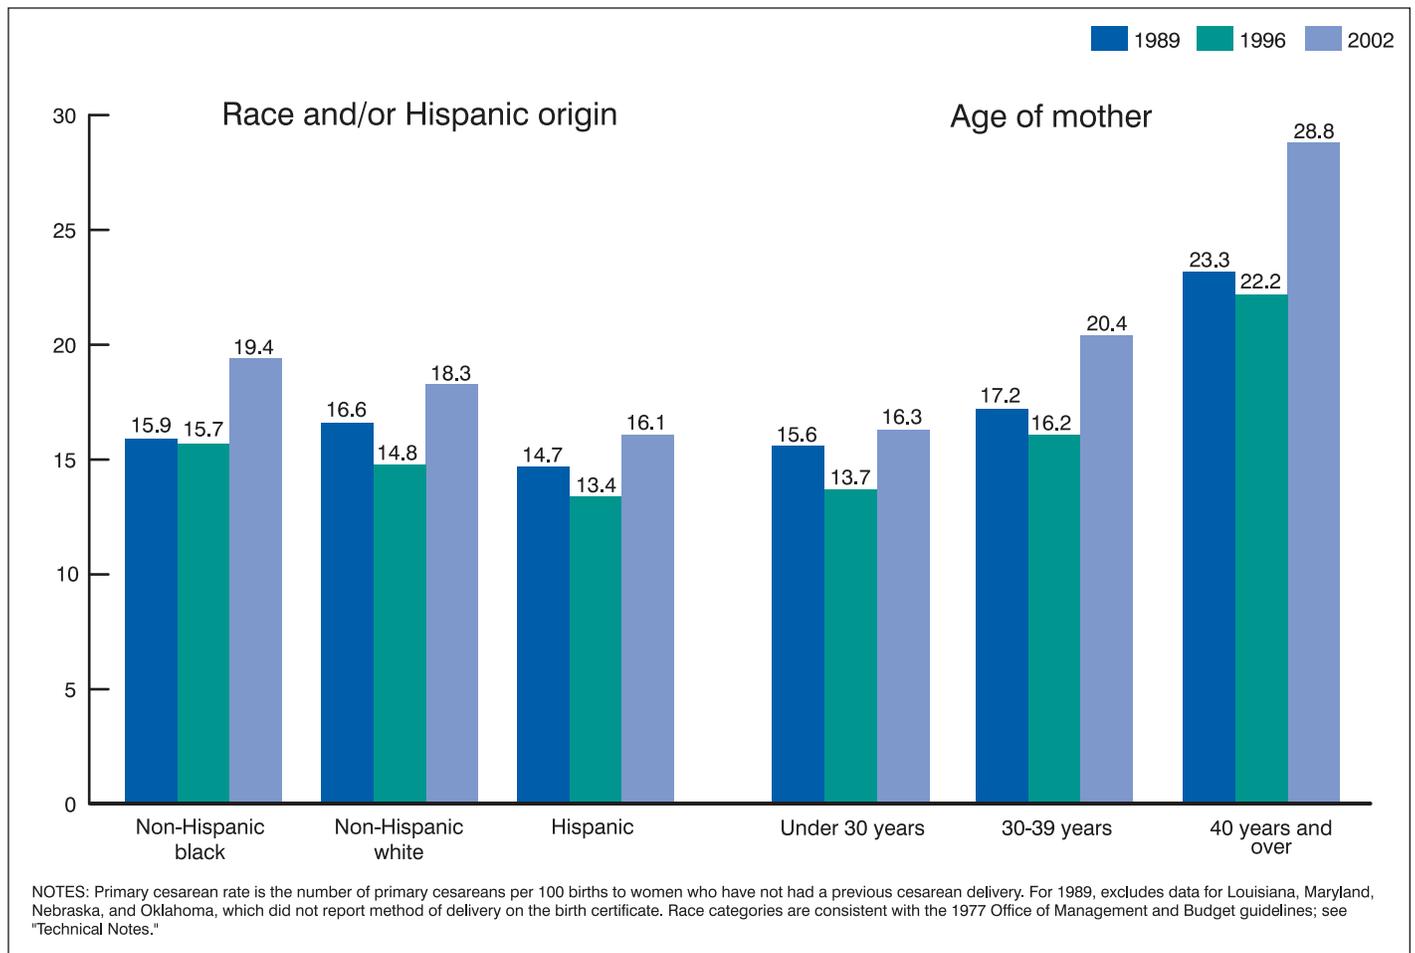

The sharp decline in VBAC deliveries may be related to reports on the risks associated with VBAC, more conservative practice guidelines, legal pressures, as well as the continuing debate regarding the harms and benefits of vaginal birth versus cesarean section, especially with regard to VBAC (69,70,72–74).

The primary rate increased and the VBAC rate decreased for all age, racial, and ethnic groups (including subgroups) for 2001–2002. Rates by age and by race and Hispanic origin paralleled the overall primary and VBAC rates for 1989–96 and 1996–2002 ([figures 7 and 8](#)). As in past years, overall cesarean rates rise as maternal age increases; the 2002 rate for mothers 40–54 years of age (40.7) was more than double that of mothers under age 20 years (18.0) ([table 40](#)). The increased likelihood of cesarean delivery in older women may be related to biologic factors, patient and/or practitioner concerns (75), and the increased rate of multiple births.

Between 2001 and 2002, the primary cesarean rate rose 6 percent for non-Hispanic white, non-Hispanic black, and Hispanic women. The primary rate for non-Hispanic black women (19.4) remained higher than the rate for non-Hispanic white women (18.3) and Hispanic women (16.1). The VBAC rate declined at least 21 percent for each group for the current year.

The overall cesarean rate for American Indian women in 2002 (23.1 percent) was lower than the national rate ([tables 24 and 25](#)). Among the Hispanic subgroups, the rate of cesarean delivery ranged between 24.5 for Mexican mothers, and 36.9 for Cuban mothers. Among the Hispanic subgroups, Cuban mothers had the highest percent of total births to women aged 30 years and over, as well as the highest rate of cesarean delivery for every age group (data not shown). All API subgroups, except Filipino mothers (28.5), had lower rates of cesarean delivery than either non-Hispanic white or black mothers. Among the API subgroups, Japanese mothers continue to have the lowest rate (20.8), although they have the highest percent of mothers aged 35 years and over (data not shown).

Cesarean rates increased for all 50 States and the District of Columbia. For 2001–2002, variation in cesarean rates by State was considerable, ranging from under 20 percent for Alaska, New Mexico,

**Figure 7. Primary cesarean rates by age, race, and Hispanic origin of mother: United States, 1989, 1996, and 2002**

and Utah, to over 30 percent for Louisiana, Mississippi, and New Jersey (table 41). The rate for Puerto Rico was 44.8.

Between 2001 and 2002, VBAC rates decreased in each of the 50 States and the District of Columbia. Rates for 2002 ranged from 6.4 in Louisiana to 25.6 per 100 in Vermont.

Mothers reported to have the medical risk factors and complications of labor and/or delivery reported on the birth certificate often have higher rates of cesarean delivery (table 42). For example, more than half of mothers with eclampsia and almost all mothers with cephalopelvic disproportion (96.5 percent) and breech/malpresentation (86.9) had a cesarean delivery.

Concurrent with the rise in the cesarean delivery rate, the percent of births delivered by either forceps or vacuum extraction has decreased since 1996 (data not shown). The 2002 rate (5.9 percent) is 61 percent lower than the high of 9.5 percent in 1994 (61).

## Infant Health Characteristics

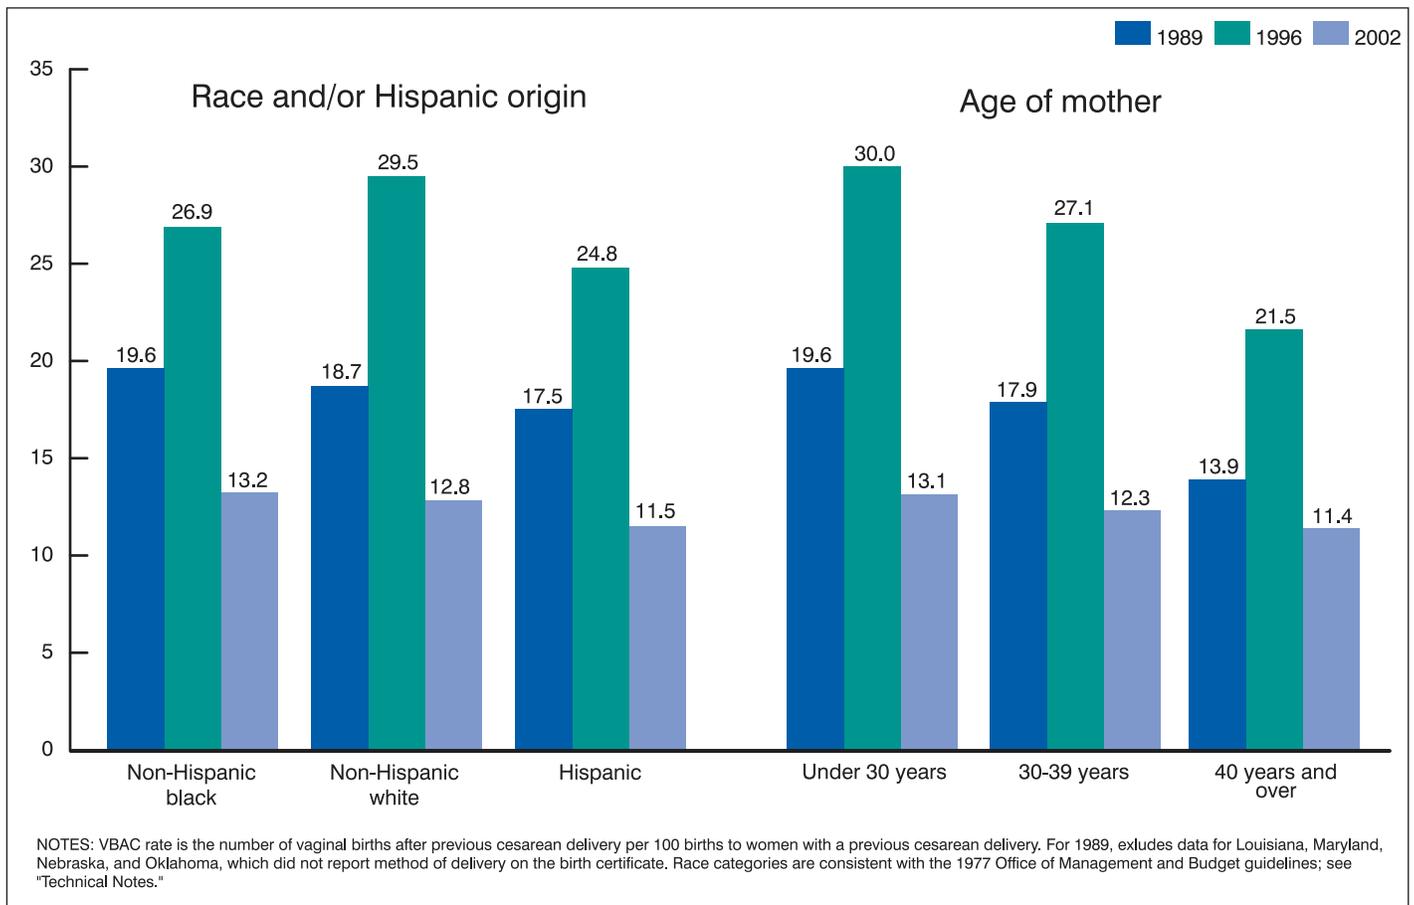

### Period of gestation

The preterm birth rate increased again in 2002, to 12.1 percent of all births, from 11.9 percent in 2001. The proportion of infants born preterm (less than 37 completed weeks of gestation) has risen 14 percent since 1990 (10.6 percent) and 29 percent since 1981

(9.4 percent). The bulk of the rise for 2001–2002 was for moderately preterm births, that is, infants born at 32–35 weeks; the percent of infants born very preterm (less than 32 weeks) was essentially unchanged at 1.96 percent (1.95 percent in 2001). This level has risen from 1.81 percent since 1981. See tables 24, 25, 43, and 44. (For information on the measurement of gestational age, see the "Technical Notes.")

The risk of infant death declines steeply at 40–41 weeks of gestation and rises very slightly thereafter. In 2001, 41 percent of all infants born earlier than 28 weeks of gestation did not survive their first year, compared with 5 percent of infants born at 28–31 weeks and 1 percent of infants delivered at 32–35 weeks; 0.3 percent of term births did not survive the first year of life (76). Preterm birth is among the leading causes of infant death and is associated with nearly half of all congenital neurological defects (e.g., cerebral palsy) (77). Unfortunately, meaningful reduction in preterm births is unlikely until its causes are better understood (77,78).

The steep rise in multiple births over the past two decades has had an important influence on the overall preterm birth rate (79); twins, triplets, and higher order multiples are much more likely to be born earlier than singletons (see section on "Multiple births"). However, the preterm rate for singletons alone has also risen, by 7 percent between 1990 and 2002 (from 9.7 to 10.4 percent). Fortunately, the increase in singleton preterm births has been restricted to those born moderately

**Figure 8. Vaginal birth after cesarean (VBAC) rates by age, race, and Hispanic origin of mother: United States, 1989, 1996, and 2002**

preterm; the singleton very preterm birth rate declined slightly over this period (from 1.69 to 1.57). See [table G](#).

In recent years, there has also been a marked change in the proportion of births born at and postterm, with births increasingly more likely to be delivered earlier in term, or at 37–39 weeks of gestation, and less likely to be delivered at 40 weeks and later. Between 1990 and 2002, the proportion of births at 40 weeks or more declined from 48 to 37 percent. Concurrently, the percent of infants born at 37–39 weeks increased from 41 to 51 percent. The decline in postterm births (42 or more weeks) is particularly striking, down 40 percent (from 11.3 to 6.7 percent) between 1990 and 2002. See [figure 9](#). This shift toward earlier term delivery suggests changes in the use of delivery management techniques such as cesarean delivery and induction of labor (80–82).

Since 1990 preterm birth rates have increased substantially for all ages 20 years and over. Among women with singleton deliveries in 2002, the youngest and the oldest were the most likely to give birth preterm (21 percent of mothers under age 15 years compared with 17 percent of mothers aged 45 years and over). Women aged 30–34 years were the least likely to have an early delivery (9 percent) (data not shown).

Between 2001 and 2002, the preterm birth rate rose among the three largest racial/ethnic groups: non-Hispanic white (10.8 to 11.0 percent), non-Hispanic black (17.6 to 17.7 percent), and Hispanic (11.4 to 11.6 percent). Since 1990 preterm rates have risen 5 percent for

Hispanic, and 29 percent for non-Hispanic white births, but have declined modestly (6 percent) for non-Hispanic black infants. Despite these differing trends, the risk of preterm birth, and especially very preterm birth, continues to be significantly higher for non-Hispanic black infants than for infants of other racial/ethnic groups.

In 2002, 13.1 percent of American Indian infants were delivered preterm, essentially unchanged from 2001. The highest preterm rate reported among API subgroups in 2002 was 13.5 percent for Hawaiians; the lowest was 7.7 percent for Japanese (the lowest rate reported for any group). Preterm rates for the Hispanic subgroups ranged from 10.5 (Cuban) to 14.0 percent (Puerto Rican). See [tables 24 and 25](#).

The proportion of births delivered at gestational ages of less than 37 weeks increased for all jurisdictions except Georgia between 1990 and 2002. Preterm births declined in the District of Columbia for this period. See [table H](#). Preterm rates by State for the current year varied from 17.2 percent for Mississippi, to less than 10 percent for Alaska, Minnesota, New Hampshire, Oregon, Vermont, and Washington. These broad differences in preterm risk among States can be at least partly linked to differences in State demographics (e.g., maternal age distributions and multiple birth rates).

### Birthweight

The **low birthweight (LBW) rate** rose from 7.7 to 7.8 percent for 2001–2002, the highest level reported in more than 3 decades.

**Table G. Rate of preterm birth among singletons by race and Hispanic origin of mother: United States, 1990, 1995, 2001, and 2002**

<sup>1</sup>Data for 1990 by race and Hispanic origin exclude data for New Hampshire and Oklahoma, which did not require reporting of Hispanic origin of mother.

<sup>2</sup>Includes births to races not shown.

<sup>3</sup>Includes persons of Hispanic origin of any race.

NOTE: Race categories are consistent with the 1977 Office of Management and Budget guidelines; see "Technical Notes."

The percent LBW (birthweight of less than 2,500 grams) has risen fairly steadily since the mid-1980s, by 15 percent (from 6.8 percent). (See tables 43–47 and figure 10.) The percent of infants born **very low birthweight (VLBW)** (less than 1,500 grams) was 1.46 percent for 2002, compared with 1.44 percent for the previous year. The VLBW level has climbed from 1.15 percent in 1980. LBW, and especially VLBW, are major predictors of infant morbidity and mortality. For VLBW infants, the risk of dying in the first year of life is nearly 100 times that of normal birthweight infants; the risk for moderately LBW infants (1,500–2,499 grams) is more than five times higher (83). LBW, especially VLBW, infants who do survive are more likely to suffer long-term disabilities (84).

Recent trends in LBW are influenced by the rise in the multiple birth rate (79,85); multiples are much more likely to be born LBW than singletons (for the current year, as in earlier years, more than half of all multiple births weighed less than 2,500 grams at birth; see the section on "Multiple births"). In 2002 multiple births accounted for 24 percent of all LBW infants in the United States, compared with 15 percent in 1980.

Among non-Hispanic white births, LBW increased from 6.8 to 6.9 percent between 2001 and 2002, continuing the distinct upward trend of the past two decades; the rate of singleton non-Hispanic white LBW was 5.02 percent for 2002, compared with 4.96 percent for 2001. Since 1990 non-Hispanic white LBW has risen more than 20 percent (from 5.6 percent). Among non-Hispanic white singletons only, the

upturn is significant but more modest, increasing 10 percent since 1990, with most of the rise among moderately LBW infants. See table J. A recent study suggests that singletons conceived with assisted-reproductive technology, which account for an increasing number of births (86,87), are at greater risk of LBW than those conceived spontaneously (88).

The LBW rate also rose among non-Hispanic black births, from 13.1 to 13.4 between 2001 and 2002, largely erasing the recent modest downturn (13.6 percent in 1991). The percent of non-Hispanic black infants who were VLBW was 3.15 in 2002, compared with 3.08 in 2001, and 2.93 for 1990. When only singleton births are examined, the LBW trend is slightly more positive, down from 11.9 to 11.4 percent between 1990 and 2002; however, no corresponding improvement in black singleton VLBW is observed (table J).

In 2002, 6.5 percent of Hispanic infants weighed less than 2,500 grams, unchanged from 2002. Since 1990 Hispanic LBW has risen moderately, from 6.1 percent. Hispanic VLBW was 1.17 percent in 2002 (1.14 percent for 2001). LBW among Hispanic singletons has also increased slightly since 1990, from 0.87 percent to 0.96.

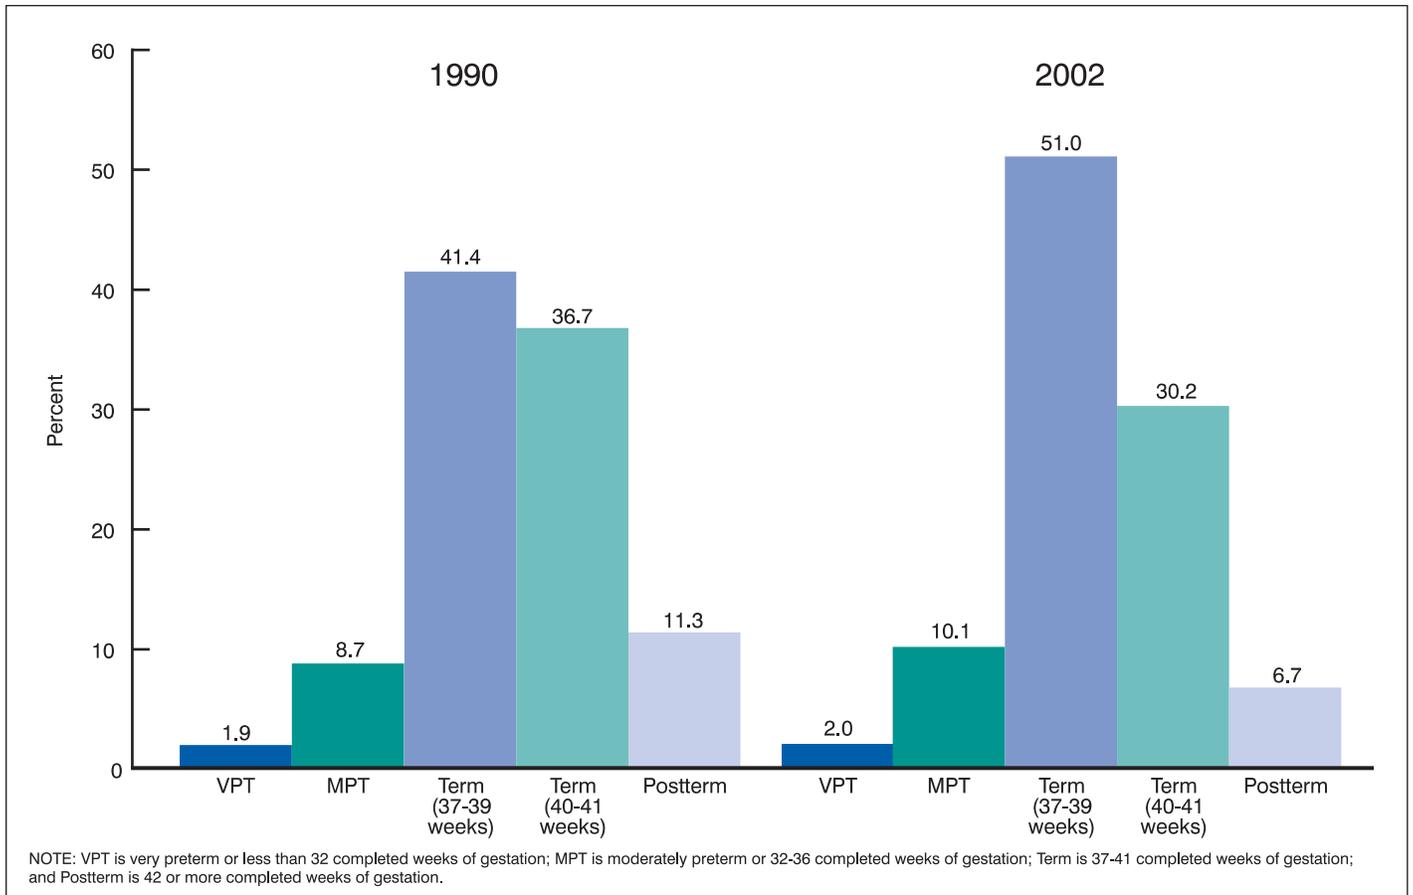

The diversity in LBW levels among Hispanics is demonstrated in table 25. The risk of LBW was 50 percent higher for Puerto Rican compared with Mexican infants (9.7 versus 6.2 percent). Large differences were also apparent among the API subgroups; LBW rates ranged from 5.5 percent (Chinese) to 8.6 percent (Filipino) (table 24).

The percent of **higher birthweight or macrosomic births** (4,000 grams or more, or at least 8 pounds, 14 ounces) declined again in 2002, to 9.2, from 9.4 for 2001, and 9.9 in 2000. (See table 45 and figure 10.) The proportion of higher birthweight infants has dropped more than 20 percent since the 1980s (from over 11 percent). The proportion of macrosomic infants decreased slightly for non-Hispanic white (10.8 percent for 2002), non-Hispanic black (4.9 percent), and Hispanic infants (8.5 percent) for the current year (tables 24 and 25).

The **mean or average birthweight** for all singletons and for Hispanic singletons was 3,332 grams (7 pounds, 6 ounces) in 2002 (table J). The average non-Hispanic white singleton weighed 3,392 grams in 2002, 264 grams (9 ounces) more than the average non-Hispanic black singleton (3,128 grams).

The risk of delivering a LBW infant differs importantly by **maternal age**, with the highest risk for the youngest and oldest mothers. In 2002, 13.5 percent of infants to mothers under age 15 years weighed less than 2,500 grams, compared with 6.9 percent of infants to women aged 25–29 years, and 20.2 percent of those born to women aged 45 years and over. Much of the excess LBW among older mothers, however, can be attributed to their higher multiple birth rates. In 2002, multiples accounted for almost two-thirds (63 percent) of all LBW infants delivered to mothers aged 45 years and over, but only 13 percent of all LBW among women under age 20 years (data not shown). Just under 10 percent (9.6 percent) of singleton births to mothers aged 45 years and over were LBW, compared with 8.7 percent of births to mothers under age 20 years.

**LBW risk also varies widely by State.** For 2002 levels for non-Hispanic white births ranged from a low of 4.6 percent for Alaska, to a high of 8.7 percent for West Virginia (tables 46 and 47). For States reporting 1,000 or more births to non-Hispanic black women, LBW rates ranged from 9.8 to 15.2 percent (Iowa and Mississippi, respectively).

**Figure 9. Distribution of births by gestational age: United States, 1990 and 2002**

### Apgar score

The Apgar score, developed over 50 years ago by Virginia Apgar, M.D., is a routinely performed means of evaluating the general physical condition of the newborn at 1 minute, 5 minutes, and if desired, at additional 5-minute intervals after delivery. The score measures five easily identifiable infant characteristics—heart rate, respiratory effort, muscle tone, reflex irritability, and color. Each characteristic is assessed and assigned a value of 0 to 2, with 2 being optimum. The total score is the sum of the scores of the five components. A score of 0 to 3 indicates an infant in need of resuscitation; a score in the range of 4 to 6 is considered intermediate; a score of 7 or greater indicates that the neonate is in good to excellent physical condition.

The 1-minute Apgar, no longer available from national vital statistics data, signals the need for immediate resuscitation. The 5-minute Apgar score can be a useful clinical indicator of the effectiveness of resuscitation efforts, but has limited use in determining the severity of the problem and correlates poorly with future neurologic outcome. All States except California and Texas reported information on the 5-minute Apgar score in 2002.

The proportion of newborns with Apgar scores of 9 or 10, indicating excellent infant health status, has increased very slowly from 88.6 percent to 90.3 percent between 1978 and 2002. The proportion of births with low Apgar scores (below 7) declined over 30 percent from 1978 to 1993 (2.1 percent to 1.4) but has been unchanged since (tables 24 and 25).

For non-Hispanic black infants, the percent of unfavorable Apgar scores have declined and excellent Apgar scores have increased in the past decade, while low and high Apgar ratings have remained steady for non-Hispanic whites. Despite the improvement in scores for non-Hispanic black infants, disparities persist between the two groups. In 2002, 2.3 percent of non-Hispanic black infants had Apgar scores under 7 compared with 1.2 percent of non-Hispanic white infants.

Of all LBW infants, 9 percent had low Apgar scores for 2002, compared with 1 percent of normal weight (2,500 to 3,900 grams) infants.

### Abnormal conditions of the newborn

Of the eight abnormal conditions reported on the birth certificate, the three most frequently reported are assisted ventilation less than 30 minutes, assisted ventilation of 30 minutes or longer, and hyaline membrane disease/respiratory distress syndrome (RDS) (table 48).

Abnormal conditions may be underreported on the birth certificate (89), especially those with features that might be difficult to discern at birth, such as fetal alcohol syndrome (90).

The rate for assisted ventilation less than 30 minutes in 2002 was 21.2 per 1,000. This is nearly twice the 1989 rate of 11.4. The rate of assisted ventilation of 30 minutes or longer was 9.6 per 1,000. This rate has gradually increased since 1989 (6.9). Assisted ventilation is basic to the treatment of respiratory disorders such as RDS (91).

In 2002 the overall rate of hyaline membrane disease/RDS was 6.1 per 1,000. This rate has been decreasing since the highest levels

**Table H. Preterm birth rates by State: United States and each State, 1990 and 2002**

Montana . . . . .	11.3	8.5	34				

NOTE: Preterm is defined as less than 37 completed weeks of gestation.

were reported for 1994–95 (6.7). Hyaline membrane disease/RDS is a frequent cause of morbidity in preterm infants (92). Risk factors include early gestational age, poorly controlled maternal diabetes, multiple births, and fetal asphyxia (91). Elective (vs. spontaneous) delivery before labor for early-term infants (gestational ages 37 and 38 weeks) may also be a risk factor for RDS, possibly due to lung immaturity (93).

Since 1989 the rate for meconium aspiration syndrome (1.3 in 2002) has slowly decreased (from 3.2); the rate for anemia for the current year (1.0) was half the 1989 rate (2.0).

### Congenital anomalies

In 2002 rates for the 21 malformations/groups of malformations listed on the birth certificate were essentially unchanged from 2001. Among the most commonly reported specific anomalies, cleft lip/palate was reported at a rate of 78.5 per 100,000 births. The rate of clubfoot was 59.6 per 100,000; the rate of Down's syndrome was 46.7. Research using birth certificate data has corroborated a positive association between maternal smoking and certain birth defects, including cleft lip/palate and clubfoot (94,95).

Congenital anomalies remain the leading cause of infant deaths in the United States (83). They also cause structural and functional defects, metabolic disorders, and disability (96). Congenital anomalies are reported on the birth certificates of 49 States and the District of Columbia, accounting for more than 99 percent of births in 2002 (table 49).

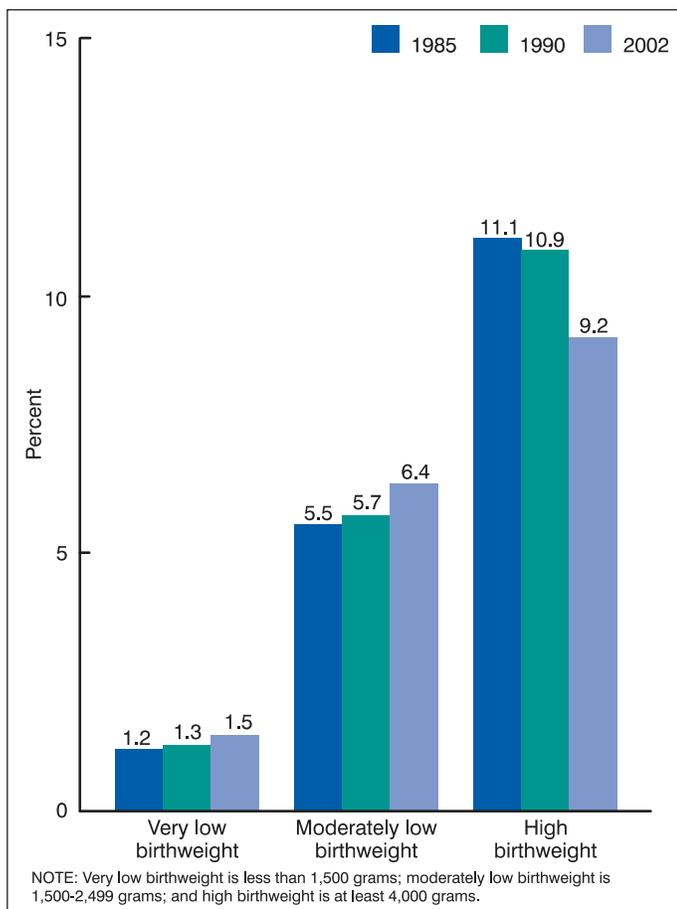

Congenital anomalies are underreported on the birth certificate; however, birth certificate data may be a valuable resource for explor-

atory or corroborative studies (94). Many anomalies are hard to detect at birth, which limits early ascertainment and complete reporting. The most serious and/or apparent anomalies are more likely to be identified and reported prior to hospital discharge (97). The congenital anomalies reported on birth certificates are rare events. Since a small change in the number of anomalies reported can result in a relatively large change in rates, caution should also be used in comparing yearly rates for a specific anomaly.

Rates for certain anomalies differ widely with maternal age (table 49). For example, in 2002 as in past years, rates for omphalocele/gastroschisis are highest for infants of mothers under age 20 years; rates for Down's syndrome and heart malformations are highest for infants of mothers over 34 years of age.

Since 1992 there has been a nationwide effort to prevent neural tube defects (NTDs), such as spina bifida and anencephalus, by encouraging increased intake of folic acid among women of childbearing age (98). Since 1998 there has been mandatory fortification of all cereal and grain products with folic acid (98); increased folate use among women of childbearing age has been reported (99).

The rate for the NTD spina bifida/meningocele in 2002 was 20.0 per 100,000 births; the rate for anencephalus was 9.9, unchanged from 2001. However, trends show significant declines in the rates for these conditions between 1996 (prefortification) and 2001 (98). Recent reports suggest that healthy prepregnancy weight may protect against NTDs and certain other birth defects (100), and that multivitamin supplementation may also protect against defects other than NTDs (101).

**Figure 10. Percent very low, moderately low, and high birthweight births: United States, 1985, 1990, 2002**

## Multiple births

The twin birth rate, which has risen steadily since 1981, rose another 3 percent in 2002, to 31.1 twins per 1,000 total live births. (See table 50 for 2002 data.) The twinning rate has climbed 38 percent since 1990 (22.6 per 1,000), and 65 percent since 1980 (18.9 per 1,000). There were 125,134 live births in twin deliveries in 2002, compared with 68,339 for 1980 (102).

In contrast to the continued rise in twin birth rates, the remarkable upswing in triplet and higher order multiples (triplet/+) of the past two decades may have ended, at least temporarily. The rate of triplet/+ births (the number of triplets, quadruplets, and quintuplets and other higher order multiples per 100,000 live births) was down very slightly (1 percent) to 184.0 for 2002, from 185.6 in 2001. Between 1980 and 1998, the triplet/+ birth rate soared from 37.0 to 193.5 per 100,000, with an average annual increase of 13 percent for 1990–98. The rate has been comparatively stable since, however, trending slightly downward; the current year rate is 5 percent lower than the 1998 high. See figure 11. In 2002 there were 6,898 triplet, 434 quadruplet, and 69 quintuplet and higher order multiple births.

Twinning rates increased among the three largest racial/ethnic groups for 2001–2002; by 4 percent for non-Hispanic white (34.8 per 1,000 in 2002), and 2 percent for non-Hispanic black (34.7), and Hispanic mothers (20.7). Since 1990 the likelihood of giving birth to a

<sup>1</sup>Data for 1990 by race and Hispanic origin exclude data for New Hampshire and Oklahoma, which did not require reporting of Hispanic origin of mother.

<sup>2</sup>Includes births to races not shown separately.

<sup>3</sup>Computed in grams.

<sup>4</sup>Includes persons of Hispanic origin of any race.

NOTES: Very low birthweight is less than 1,500 grams. Low birthweight is less than 2,500 grams. Race categories are consistent with the 1977 Office of Management and Budget guidelines; see "Technical Notes."

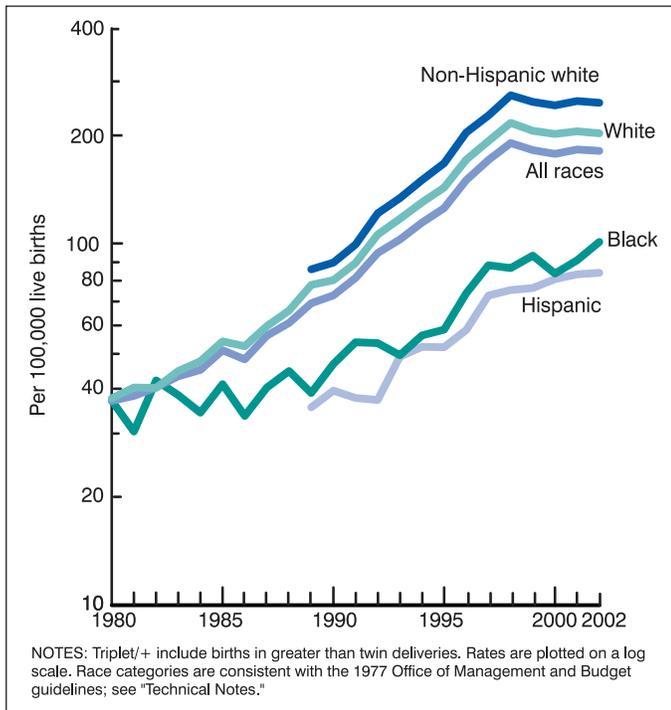

twin has risen by more than 50 percent among non-Hispanic white, 30 percent among non-Hispanic black, and 15 percent among Hispanic women (102).

Twin birth rates were also up for all age groups for 2001–2002, but increases were most pronounced among older mothers (10 percent for women aged 40 years and over). The number of twin births to women aged 45–49 years has soared from only 39 to 991 between 1990 and 2002, and the twin birth rate from 23.8 to 189.7 per 1,000 (102). See figure 12.

The rate of triplet/+ births among non-Hispanic white women declined slightly for the current year (from 253.3 to 250.4 per 100,000 for 2001–2002), continuing the generally downward trend observed for this group since 1998. Rates for non-Hispanic black (102.2 for 2002) and Hispanic women (84.1) rose for the current year, however, and have risen quite steadily since 1998.

Although triplet/+ birth rates have risen for all age groups during most of the 1990s, increases were most pronounced for women aged 25 years and over. Since 1998, however, rates for women under age 25 years have risen, but those for women aged 25 years and over have declined (7 percent).

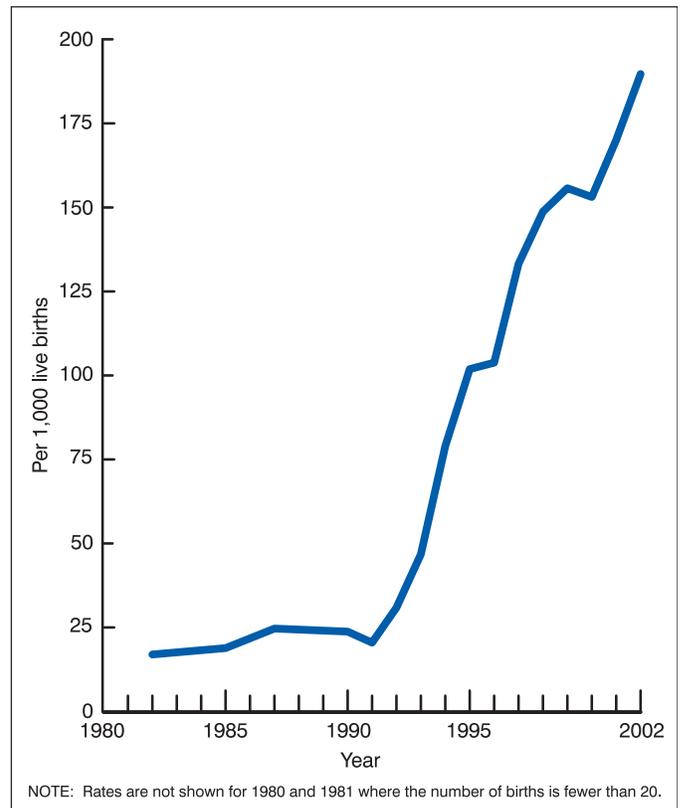

The upsurge in multiple births over the past two decades, especially in triplet/+ births, has been associated with two related trends: advances in, and greater access to, fertility therapies (assisted reproductive technologies (ART) such as *in vitro* fertilization and non-ART procedures such as intrauterine insemination and ovulation-inducing

**Figure 11. Triplet+ birth rates by race and Hispanic origin of mother, 1980–2002**

drugs), and with the older age of childbearing (women in their thirties are more likely to have a multiple birth than younger women even without the use of fertility therapies) (18,103,104). A study of triplet+ births occurring in the year 2000 found that 43 percent resulted from ART, 40 percent were “unexplained” (likely the result of non-ART fertility treatments such as ovulation-inducing drugs); only 18 percent of triplet+ births were naturally conceived (87).

In 1999 The American College of Obstetricians and Gynecologists and The American Society of Reproductive Medicine issued recommendations intended to prevent triplet+ pregnancies because of their high risk of adverse outcome (105,106). These recommendations, plus refinements to assisted reproductive technologies, may be contributing to the current abatement in the incidence of higher order multiple births (107–109). A recent study found that the proportion of ART procedures involving the transfer of three or more embryos, a predictor of triplet+ birth outcome, declined between 1997 and 2000 (87).

**Figure 12. Twin birth rates for women 45–49 years of age: United States, 1980–2002**

The higher the plurality of a pregnancy, the greater the risk of poor perinatal outcome. The average twin in 2002 was delivered more than 3 weeks earlier than the average singleton (35.3 compared with 38.8), and weighed about 1,000 grams (2 pounds) less. [table K](#). The typical triplet weighed about half of its singleton counterpart (1,687 grams) at birth; the average quintuplet less than one-third (or only 3 pounds). As one consequence, twins are nearly 5 times, and triplets/+ 12 times as likely to die by their first birthday (83). Survivors are at increased risk of long-term disabilities such as cerebral palsy (110).

**Table K. Gestational age and birthweight characteristics by plurality: United States, 2002**

	Twins	Triplets	Quadruplets	Quintuplets/+	Singletons
Number . . . . .	125,134	6,898	434	69	3,889,191

19. Number and percent of births to unmarried women by race and Hispanic origin of mother: United States, each State and territory, 2002 . . . . . 57

20. Birth rates by age and race of father: United States, 1980–2002 . . . . . 58

21. Live births by educational attainment, and percent of mothers completing 12 years or more and 16 years or more of school, by age and race and Hispanic origin of mother: United States, 2002 . . . . . 60

22. Number of live births and percent distribution by weight gain of mother during pregnancy and median weight gain, according to period of gestation and race and Hispanic origin of mother: Total of 49 reporting States and the District of Columbia, 2002 . . . . . 62

23. Percent low birthweight by weight gain of mother during pregnancy, period of gestation, and race and Hispanic origin of mother: Total of 49 reporting States and the District of Columbia, 2002 . . . . . 64

24. Percent of births with selected medical or health characteristics by detailed race of mother, by place of birth of mother: United States, 2002 . . . . . 65

25. Percent of births with selected medical or health characteristics, by Hispanic origin of mother and by race for mothers of non-Hispanic origin and by place of birth of mother: United States, 2002 . . . . . 66

26. Live births to mothers with selected medical risk factors and rates by age of mother, by race of mother: United States, 2002 . . . . . 67

27. Number and rate of live births to mothers with selected medical risk factors, complications of labor, and obstetric procedures, by detailed race of mother: United States, 2002. . . . . 68

28. Number and rate of live births to mothers with selected medical risk factors, complications of labor, and obstetric procedures, by Hispanic origin of mother and by race for mothers of non-Hispanic origin: United States, 2002 . . . . . 69

29. Number of live births by smoking status of mother, percent smokers, and percent distribution by average number of cigarettes smoked by mothers per day, according to age and race of mother: Total of 49 reporting States and the District of Columbia, 2002 . . . . . 70

30. Number of live births by smoking status of mother and percent of mothers who smoked cigarettes during pregnancy, by age and Hispanic origin of mother and by race for mothers of non-Hispanic origin: Total of 49 reporting States and the District of Columbia, 2002 . . . . . 71

31. Number of live births, percent of mothers who smoked cigarettes during pregnancy, and percent distribution of average number of cigarettes smoked by mothers per day, according to educational attainment and race and Hispanic origin of mother: Total of 49 reporting States and the District of Columbia, 2002 . . . . . 72

32. Percent low birthweight by smoking status, age, and race and Hispanic origin of mother: Total of 49 reporting States and the District of Columbia, 2002 . . . . . 73

33. Live births by month of pregnancy prenatal care began and percent of mothers beginning care in the first trimester and percent with late or no care, by age and race and Hispanic origin of mother: United States, 2002 . . . . . 74

34. Percent of mothers beginning prenatal care in the first trimester and percent of mothers with late or no prenatal care, by race and Hispanic origin of mother: United States, each State and territory, 2002 . . . . . 76

35. Live births by month of pregnancy prenatal care began, number of prenatal visits, and median number of visits, by race and Hispanic origin of mother: United States, 2002 . . . . . 77

## List of Detailed Tables

1. Live births, birth rates, and fertility rates, by race: United States, specified years 1940–55 and each year, 1960–2002. . . . . 30

2. Live births by age of mother, live-birth order, and race of mother: United States, 2002 . . . . . 31

3. Fertility rates and birth rates by age of mother, live-birth order, and race of mother: United States, 2002 . . . . . 32

4. Total fertility rates and birth rates by age of mother: United States, 1970–2002, and by age and race of mother: United States, 1980–2002 . . . . . 33

5. Fertility rates and birth rates by live-birth order and race of mother: United States, 1980–2002. . . . . 36

6. Live births, birth rates, and fertility rates by Hispanic origin of mother and by race for mothers of non-Hispanic origin: United States, 1989–2002 . . . . . 38

7. Live births by age of mother, live-birth order, Hispanic origin of mother, and by race for mothers of non-Hispanic origin: United States, 2002 . . . . . 39

8. Fertility rates and birth rates by age of mother, live-birth order, Hispanic origin of mother, and by race for mothers of non-Hispanic origin: United States, 2002 . . . . . 41

9. Total fertility rates, fertility rates, and birth rates by age and Hispanic origin of mother and by race for mothers of non-Hispanic origin: United States, 1989–2002 . . . . . 43

10. Number of births, birth rates, fertility rates, total fertility rates, and birth rates for teenagers 15–19 years by age of mother: United States, each State and territory, 2002 . . . . . 46

11. Live births by race of mother: United States, each State and territory, 2002. . . . . 47

12. Live births by Hispanic origin of mother and by race for mothers of non-Hispanic origin: United States, each State and territory, 2002 . . . . . 48

13. Total number of births, rates (birth, fertility, and total fertility), and percent of births with selected demographic characteristics, by detailed race of mother and place of birth of mother: United States, 2002 . . . . . 49

14. Total number of births, rates (birth, fertility, and total fertility), and percent of births with selected demographic characteristics, by Hispanic origin of mother and by race for mothers of non-Hispanic origin and by place of birth of mother: United States, 2002 . . . . . 50

15. Live births by race of mother and observed and seasonally adjusted birth and fertility rates, by month: United States, 2002 . . . . . 51

16. Live births by day of week and index of occurrence by method of delivery, day of week, and race of mother: United States, 2002 . . . . . 52

17. Number, birth rate, and percent of births to unmarried women by age, race, and Hispanic origin of mother: United States, 2002 . . . . . 53

18. Birth rates for unmarried women by age of mother: United States, 1970, 1975, and 1980–2001 and by age, race, and Hispanic origin of mother: United States, 1980–2002 . . . . . 54

36. Live births to mothers with selected obstetric procedures and rates by age of mother, by race of mother: United States, 2002 . . . . .	79
37. Live births to mothers with selected complications of labor and/or delivery and rates by age of mother, by race of mother: United States, 2002 . . . . .	80
38. Live births by attendant, place of delivery, and race and Hispanic origin of mother: United States, 2002. . . . .	81
39. Live births by method of delivery and rates of cesarean delivery and vaginal birth after previous cesarean delivery, by race and Hispanic origin of mother: United States, 1989–2002 . . . . .	82
40. Live births by method of delivery and rates of cesarean delivery and vaginal birth after previous cesarean delivery, by age and race and Hispanic origin of mother: United States, 2002 . . . . .	84
41. Rates of cesarean delivery and vaginal birth after previous cesarean delivery, by race and Hispanic origin of mother: United States, each State and territory, 2002 . . . . .	85
42. Rates of cesarean delivery and vaginal birth after previous cesarean delivery, by selected maternal medical risk factors and complications of labor and/or delivery: United States, 2002 . . . . .	86
43. Live births by birthweight and percent very low and low birthweight, by period of gestation and race and Hispanic origin of mother: United States, 2002 . . . . .	87
44. Percent of live births very preterm and preterm and percent of live births of very low birthweight and low birthweight, by race and Hispanic origin of mother: United States, 1981–2002 . . . . .	89
45. Number and percent low birthweight and number of live births by birthweight, by age and race and Hispanic origin of mother: United States, 2002 . . . . .	90
46. Number and percent of births of low birthweight, by race and Hispanic origin of mother: United States, each State and territory, 2002 . . . . .	93
47. Number and percent of births of very low birthweight, by race and Hispanic origin of mother: United States, each State and territory, 2002 . . . . .	94
48. Live births with selected abnormal conditions of the newborn and rates by age of mother, by race of mother: United States, 2002 . . . . .	95
49. Live births with selected congenital anomalies and rates by age of mother, by race of mother: Total of 49 reporting States and the District of Columbia, 2002 . . . . .	96
50. Live births by plurality of birth and ratios, by age and race and Hispanic origin of mother: United States, 2002 . . . . .	98

<sup>6</sup>Includes Hispanic, non-Hispanic white, and non-Hispanic black.

**Table 1. Live births, birth rates, and fertility rates, by race: United States, specified years 1940–55 and each year, 1960–2002**

[Birth rates are live births per 1,000 population in specified group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Population enumerated as of April 1 for census years and estimated as of July 1 for all other years. Beginning with 1970, excludes births to nonresidents of the United States]

Year	Number					Birth rate					Fertility rate

--- Data not available. <sup>1</sup>For 1960–91 includes births to races not shown separately. For 1992 and later years, unknown race of mother is imputed; see "Technical Notes."

<sup>2</sup>Includes births to Aleuts and Eskimos.

<sup>3</sup>Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see "Technical Notes."

<sup>4</sup>Based on a 50-percent sample of births.

<sup>5</sup>Based on a 20- to 50-percent sample of births.

<sup>6</sup>Figures by race exclude New Jersey.

NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget guidelines. In this table all women (including Hispanic women) are classified only according to their race; see "Technical Notes." Rates for 1991–2001 may differ from those published in "Births: Final Data for 2001," but are consistent with those published in "Revised Birth and Fertility Rates for the 1990s and New Rates for Hispanic Populations, 2000 and 2001: United States."

**Table 2. Live births by age of mother, live-birth order, and race of mother: United States, 2002**

[Live-birth order refers to number of children born alive to mother]

Live-birth order and race of mother	Age of mother														
	All ages	Under 15 years	15–19 years						20–24 years	25–29 years	30–34 years	35–39 years	40–44 years	45–49 years	50–54 years

– Quantity zero.

<sup>1</sup>Includes births of Aleuts and Eskimos.

NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget guidelines. In this table all women (including Hispanic women) are classified only according to their race; see "Technical Notes."

**Table 3. Fertility rates and birth rates by age of mother, live-birth order, and race of mother: United States, 2002**

[Rates are live births per 1,000 women in specified age and racial group. Fertility rate computed by relating total births, regardless of age of mother, to women aged 15–44 years. Population estimated as of July 1. Live-birth order refers to number of children born alive to mother. Figures for live-birth order not stated are distributed]

Live-birth order and race of mother	Age of mother										
	15–44 years	10–14 years	15–19 years			20–24 years	25–29 years	30–34 years	35–39 years	40–44 years	45–49 years <sup>1</sup>

\* Figure does not meet standards of reliability or precision; based on fewer than 20 births in numerator.

0.0 Quantity more than zero but less than 0.05.

<sup>1</sup>Birth rates computed by relating births to women aged 45–54 years to women aged 45–49 years.

<sup>2</sup>Includes births to Aleuts and Eskimos.

NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget guidelines. In this table all women (including Hispanic women) are classified only according to their race; see "Technical Notes."

**Table 4. Total fertility rates and birth rates by age of mother: United States, 1970–2002, and by age and race of mother: United States, 1980–2002**

[Total fertility rates are sums of birth rates for 5-year age groups multiplied by 5. Birth rates are live births per 1,000 women in specified group. Population enumerated as of April 1 for 1970, 1980, 1990, and 2000, and estimated as of July 1 for all other years]

Year and race	Total fertility rate	Age of mother									
		10–14 years	15–19 years			20–24 years	25–29 years	30–34 years	35–39 years	40–44 years	45–49 years <sup>1</sup>

**Table 4. Total fertility rates and birth rates by age of mother: United States, 1970–2002, and by age and race of mother: United States, 1980–2002—Con.**

[Total fertility rates are sums of birth rates for 5-year age groups multiplied by 5. Birth rates are live births per 1,000 women in specified group. Population enumerated as of April 1 for 1970, 1980, 1990, and 2000, and estimated as of July 1 for all other years]

Year and race	Total fertility rate	Age of mother									
		10–14 years	15–19 years			20–24 years	25–29 years	30–34 years	35–39 years	40–44 years	45–49 years <sup>1</sup>

\* Figure does not meet standards of reliability or precision; based on fewer than 20 births in numerator.

<sup>1</sup>Beginning 1997, rates computed by relating births to women aged 45–54 years to women aged 45–49 years.

<sup>2</sup>For 1970–91 includes births to races not shown separately. For 1992 and later years, unknown race of mother is imputed; see “Technical Notes.”

<sup>3</sup>Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see “Technical Notes.”

<sup>4</sup>Based on a 50-percent sample of births.

<sup>5</sup>Includes births to Aleuts and Eskimos.

NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget guidelines. In this table all women (including Hispanic women) are classified only according to their race; see “Technical Notes.” Rates for 1991–2001 may differ from those published in “Births: Final Data for 2001,” but are consistent with those published in “Revised Birth and Fertility Rates for the 1990s and New Rates for Hispanic Populations, 2000 and 2001: United States.”

**Table 5. Fertility rates and birth rates by live-birth order and race of mother: United States, 1980–2002**

[Rates are live births per 1,000 women aged 15–44 years. Population enumerated as of April 1 for 1980, 1990, and 2000, and estimated as of July 1 for all other years. Figures for live-birth order not stated or distributed]

**Table 5. Fertility rates and birth rates by live-birth order and race of mother: United States, 1980–2002—Con.**

[Rates are live births per 1,000 women aged 15–44 years. Population enumerated as of April 1 for 1980, 1990, and 2000, and estimated as of July 1 for all other years. Figures for live-birth order not stated or distributed]

<sup>1</sup>Includes races other than white and black.

<sup>2</sup>Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see "Technical Notes."

NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget guidelines. In this table all women (including Hispanic women) are classified only according to their race; see "Technical Notes." Rates for 1991–2001 may differ from those published in "Births: Final Data for 2001," but are consistent with those published in "Revised Birth and Fertility Rates for the 1990s and New Rates for Hispanic Populations, 2000 and 2001: United States."

**Table 6. Live births, birth rates, and fertility rates by Hispanic origin of mother and by race for mothers of non-Hispanic origin: United States, 1989–2002**

[Birth rates are live births per 1,000 population in specified group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Population enumerated as of April 1 for 1990 and 2000, and estimated as of July 1 for all other years]

<sup>1</sup>Includes origin not stated.

<sup>2</sup>Includes races other than white and black.

<sup>3</sup>Excludes data for New Hampshire, which did not report Hispanic origin.

<sup>4</sup>Excludes data for New Hampshire and Oklahoma, which did not report Hispanic origin.

<sup>5</sup>Excludes data for Louisiana, New Hampshire, and Oklahoma, which did not report Hispanic origin.

<sup>6</sup>Rates for the Central and South American population includes other and unknown Hispanic.

<sup>7</sup>Rates are estimated for the United States based on birth data for 49 States and the District of Columbia. Births for New Hampshire that did not report Hispanic origin are included in the rates for non-Hispanic women; see "Technical Notes."

NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget guidelines. Persons of Hispanic origin may be of any race. In this table Hispanic women are classified only by place of origin; non-Hispanic women are classified by race; see "Technical Notes." Rates for 1991–2001 may differ from those published in "Births: Final Data for 2001," but are consistent with those published in "Revised Birth and Fertility Rates for the 1990s and New Rates for Hispanic Populations, 2000 and 2001: United States."

**Table 7. Live births by age of mother, live-birth order, Hispanic origin of mother, and by race for mothers of non-Hispanic origin: United States, 2002**

[Live-birth order refers to number of children born alive to mother. Includes births with stated origin of mother only]

– Quantity zero.  
<sup>1</sup>Includes origin not stated, not shown separately.  
<sup>2</sup>Includes races other than white and black.

NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget guidelines. Persons of Hispanic origin may be of any race. In this table Hispanic women are classified only by place of origin; non-Hispanic women are classified by race. See "Technical Notes."

**Table 8. Fertility rates and birth rates by age of mother, live-birth order, Hispanic origin of mother, and by race for mothers of non-Hispanic origin: United States, 2002**

[Fertility rates are computed by relating total births, regardless of age of mother, to women aged 15–44 years. Birth rates are live births per 1,000 women in specified age and racial group. Populations estimated as of July 1. Live-birth order refers to number of children born alive to mother. Figures for live-birth order not stated are distributed]

\* Figure does not meet standards of reliability or precision; based on fewer than 20 births in the numerator or, for the Hispanic subgroups, fewer than 75,000 women in the denominator; see "Technical Notes." These guidelines for denominator size follow the suggestions of the U.S. Census Bureau.

0.0 Quantity more than zero but less than 0.05.

<sup>1</sup>Fertility rates computed by relating total births, regardless of age of mother, to women aged 15–44 years.

<sup>2</sup>Birth rates computed by relating births to women aged 45–54 years to women aged 45–49 years.

<sup>3</sup>Includes Central and South American and other and unknown Hispanic.

<sup>4</sup>Includes origin not stated.

<sup>5</sup>Includes races other than white and black.

NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget guidelines. Persons of Hispanic origin may be of any race. In this table only non-Hispanic women are classified by race.

**Table 9. Total fertility rates, fertility rates, and birth rates by age and Hispanic origin of mother and by race for mothers of non-Hispanic origin: United States, 1989–2002**

[Fertility rates are live births per 1,000 women aged 15–44 years in specified racial group and birth rates are live births per 1,000 women in specified age and racial group. Population enumerated as of April 1 for 1990 and 2000, and estimated as of July 1 for all other years. Total fertility rates are sums of birth rates for 5-year age groups multiplied by 5]

--- Data not available.

\* Figure does not meet standards of reliability or precision; based on fewer than 20 births in the numerator or, for the Hispanic subgroups, fewer than 50 women for census years and 75,000 women for noncensus years in the denominator; see "Technical Notes." These guidelines follow the suggestions of the U.S. Census Bureau.

0.0 Quantity more than zero but less than 0.05.

<sup>1</sup>Fertility rates computed by relating total births, regardless of age of mother, to women 15–44 years.

<sup>2</sup>Beginning 1997, rates computed by relating births to women aged 45–54 years to women aged 45–49 years.

<sup>3</sup>Excludes data for New Hampshire, which did not report Hispanic origin.

<sup>4</sup>Excludes data for New Hampshire and Oklahoma, which did not report Hispanic origin.

<sup>5</sup>Excludes data for Louisiana, New Hampshire, and Oklahoma, which did not report Hispanic origin.

<sup>6</sup>Includes Central and South American and other and unknown Hispanic.

<sup>7</sup>Includes origin not stated.

<sup>8</sup>Includes races other than white and black.

NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget guidelines. Persons of Hispanic origin may be of any race. In this table Hispanic women are classified only by place of origin; non-Hispanic women are classified by race; see "Technical notes." Rates for 1991–2001 may differ from those published in "Births: Final Data for 2001," but are consistent with those published in "Revised Birth and Fertility Rates for the 1990s and New Rates for Hispanic Populations, 2000 and 2001: United States."

**Table 10. Number of births, birth rates, fertility rates, total fertility rates, and birth rates for teenagers 15–19 years by age of mother: United States, each State and territory, 2002**

[By place of residence. Birth rates are live births per 1,000 estimated population in each area; fertility rates are live births per 1,000 women aged 15–44 years estimated in each area; total fertility rates are sums of birth rates for 5-year age groups multiplied by 5; birth rates by age are live births per 1,000 women in specified age group estimated in each area. Populations estimated as of July 1]

--- Data not available.

-- Quantity zero.

<sup>1</sup>Includes races other than white and black.<sup>2</sup>Excludes data for the territories.

NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget guidelines. Persons of Hispanic origin may be of any race. In this table Hispanic women are classified only by place of origin; non-Hispanic women are classified by race. See "Technical Notes."

**Table 13. Total number of births, rates (birth, fertility, and total fertility), and percent of births with selected demographic characteristics, by detailed race of mother and place of birth of mother: United States, 2002**

[Birth rates are live births per 1,000 population. Fertility rates are computed by relating total births, regardless of age of mother, to women aged 15–44 years. Total fertility rates are sums of birth rates for 5-year age groups multiplied by 5. Populations estimated as of July 1]

<sup>1</sup>Index is the ratio of the average number of births by a specified method of delivery on a given day of the week to the average daily number of births by a specified method of delivery for the year, multiplied by 100.

<sup>2</sup>Includes method of delivery not stated.

<sup>3</sup>Includes races other than white and black.

NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget guidelines. In this table all women (including Hispanic women) are classified only according to their race; see "Technical Notes."

--- Data not available.

<sup>1</sup>Includes races other than white and black and origin not stated.<sup>2</sup>Race and Hispanic origin are reported separately on the birth certificate. Race categories are consistent with the 1977 Office of Management and Budget guidelines. Data for persons of Hispanic origin are included in the data for each race group according to the mother's reported race; see "Technical Notes."<sup>3</sup>Includes births to Aleuts and Eskimos.<sup>4</sup>Includes all persons of Hispanic origin of any race.<sup>5</sup>Birth rates computed by relating total births to unmarried mothers, regardless of age of mother, to unmarried women aged 15–44 years.<sup>6</sup>Birth rates computed by relating births to unmarried mothers aged 40 years and over to unmarried women aged 40–44 years.

NOTES: For 48 States and the District of Columbia, marital status is reported on the birth certificate; for Michigan and New York, mother's marital status is inferred; see "Technical Notes." Rates cannot be computed for unmarried non-Hispanic black women or for American Indian women because the necessary populations are not available.

**Table 18. Birth rates for unmarried women by age of mother: United States, 1970, 1975, and 1980–2001, and by age, race, and Hispanic origin of mother: United States, 1980–2002**

[Rates are live births to unmarried women per 1,000 unmarried women. Population estimated as of July 1 for all years]

--- Data not available.

<sup>1</sup>Rates computed by relating total births to unmarried mothers, regardless of age of mother, to unmarried women aged 15–44 years.<sup>2</sup>Rates computed by relating births to unmarried mothers aged 40 years and over to unmarried women aged 40–44 years.<sup>3</sup>Includes races other than white, black, and Asian or Pacific Islander.<sup>4</sup>Data for States in which marital status was not reported have been inferred and included with data from the remaining States; see "Technical Notes."<sup>5</sup>Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see "Technical Notes."<sup>6</sup>Births to unmarried women are estimated for the United States from data for registration areas in which marital status of mother was reported; see "Technical Notes."<sup>7</sup>Based on a 50-percent sample of births.<sup>8</sup>Rates for 1990 based on data for 48 States and the District of Columbia that reported Hispanic origin on the birth certificate. Rates shown for 1990 for ages 35–39 years are based on births to unmarried women aged 35–44 years.<sup>9</sup>Includes all persons of Hispanic origin of any race.

NOTES: Race and Hispanic origin are reported separately on the birth certificate. Race categories are consistent with the 1977 Office of Management and Budget guidelines. Data for persons of Hispanic origin are included in the data for each race group according to the mother's reported race; see "Technical Notes." Rates cannot be computed for unmarried non-Hispanic black women or for American Indian women because the necessary populations are not available. Rates for 1991–2001 may differ from those published in "Births: Final Data for 2001," but are consistent with those published in "Revised Birth and Fertility Rates for the 1990s and New Rates for Hispanic Populations, 2000 and 2001: United States."

**Table 20. Birth rates by age and race of father: United States, 1980–2002—Con.**

[Rates are live births per 1,000 men in specified group. Population enumerated as of April 1 for 1980, 1990, and 2000, and estimated as of July 1 for all other years. Figures for age of father not stated are distributed]

<sup>1</sup>Rates computed by relating total births, regardless of age of father, to men aged 15–54 years.

<sup>2</sup>Rates computed by relating births of fathers under 20 years of age to men aged 15–19 years.

<sup>3</sup>Includes races other than white and black.

<sup>4</sup>Based on 100 percent of births in selected States and on a 50-percent sample of births in all other States; see “Technical Notes.”

NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget guidelines. In this table all men (including Hispanic men) are classified only according to their race; see “Technical Notes.” Age of father was not stated for 13 percent of births in 2002. Rates for 1991–2001 may differ from those published in Births: Final Data for 2001, but are consistent with those published in “Revised Birth and Fertility Rates for the 1990s and New Rates for Hispanic Populations, 2000 and 2001: United States.”

**Table 21. Live births by educational attainment, and percent of mothers completing 12 years or more and 16 years or more of school, by age and race and Hispanic origin of mother: United States, 2002**

... Category not applicable.

<sup>1</sup>Expressed in completed weeks.

<sup>2</sup>Includes births with period of gestation not stated.

<sup>3</sup>Includes races other than white and black and origin not stated.

<sup>4</sup>Race and Hispanic origin are reported separately on the birth certificate. Race categories are consistent with the 1977 Office of Management and Budget guidelines. Data for persons of Hispanic origin are included in the data for each race group according to the mother's reported race; see "Technical Notes."

<sup>5</sup>Includes all persons of Hispanic origin of any race.

NOTE: Excludes data for California, which did not require reporting of weight gain during pregnancy.

**Table 23. Percent low birthweight by weight gain of mother during pregnancy, period of gestation, and race and Hispanic origin of mother: Total of 49 reporting States and the District of Columbia, 2002**

[Low birthweight is defined as weight of less than 2,500 grams (5 lb 8 oz)]

\*Figure does not meet standards of reliability or precision; based on fewer than 20 births in the numerator.

<sup>1</sup>Includes births to Aleuts and Eskimos.

<sup>2</sup>Excludes data for California, which did not report tobacco use on the birth certificate.

<sup>3</sup>Excludes data for California, which did not report alcohol use on the birth certificate.

<sup>4</sup>Excludes data for California, which did not report weight gain on the birth certificate. Median weight shown in pounds.

<sup>5</sup>Born prior to 37 completed weeks of gestation.

<sup>6</sup>Birthweight of less than 1,500 grams (3 lb 4 oz).

<sup>7</sup>Birthweight of less than 2,500 grams (5 lb 8 oz).

<sup>8</sup>Equivalent to 8 lb 14 oz.

<sup>9</sup>Excludes data for California and Texas, which did not report 5-minute Apgar score on the birth certificate.

NOTES: Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget guidelines. In this table all women (including Hispanic women) are classified only according to their race; see "Technical Notes."

**Table 25. Percent of births with selected medical or health characteristics, by Hispanic origin of mother and by race for mothers of non-Hispanic origin and by place of birth of mother: United States, 2002**

\* Figure does not meet standards of reliability or precision; based on fewer than 20 births in the numerator.

<sup>1</sup>Includes races other than white and black and origin not stated.<sup>2</sup>Race and Hispanic origin are reported separately on the birth certificate. Race categories are consistent with the 1977 Office of Management and Budget guidelines. Data for persons of Hispanic origin are included in the data for each race group according to the mother's reported race; see "Technical Notes."<sup>3</sup>Includes all persons of Hispanic origin of any race.<sup>4</sup>Excludes data for Indiana, New York State (but includes New York City), and South Dakota, which did not report average number of cigarettes smoked per day in standard categories.

NOTE: Excludes data for California, which did not require reporting of tobacco use during pregnancy.

<sup>1</sup>Includes races other than white and black and origin not stated.

<sup>2</sup>Race and Hispanic origin are reported separately on the birth certificate. Race categories are consistent with the 1977 Office of Management and Budget guidelines. Data for persons of Hispanic origin are included in the data for each race group according to the mother's reported race; see "Technical Notes."

<sup>3</sup>Includes all persons of Hispanic origin of any race.

**Table 34. Percent of mothers beginning prenatal care in the first trimester and percent of mothers with late or no prenatal care, by race and Hispanic origin of mother: United States, each State and territory, 2002**

– Quantity zero.

<sup>1</sup>Includes races other than white and black and origin not stated.<sup>2</sup>Includes births occurring en route to or on arrival at hospital.<sup>3</sup>Race and Hispanic origin are reported separately on the birth certificate. Race categories are consistent with the 1977 Office of Management and Budget guidelines. Data for persons of Hispanic origin are included in the data for each race group according to the mother's reported race; see "Technical Notes."<sup>4</sup>Includes all persons of Hispanic origin of any race.

**Table 39. Live births by method of delivery and rates of cesarean delivery and vaginal birth after previous cesarean delivery, by race and Hispanic origin of mother: United States, 1989–2002**

Year and race and Hispanic origin of mother	Births by method of delivery							Cesarean delivery rate		Rate of vaginal birth after previous cesarean <sup>3</sup>
	All births	Vaginal		Cesarean			Total <sup>1</sup>	Primary <sup>2</sup>

--- Data not available.

<sup>1</sup>Percent of all live births by cesarean delivery.<sup>2</sup>Number of vaginal births after previous cesarean delivery per 100 live births to women with a previous cesarean delivery.<sup>3</sup>Includes races other than white and black and origin not stated.<sup>4</sup>Race and Hispanic origin are reported separately on the birth certificate. Race categories are consistent with the 1977 Office of Management and Budget guidelines. Data for persons of Hispanic origin are included in the data for each race group according to the mother's reported race; see "Technical Notes."<sup>5</sup>Includes all persons of Hispanic origin of any race.<sup>6</sup>Excludes data for the territories.

**Table 42. Rates of cesarean delivery and vaginal birth after previous cesarean delivery, by selected maternal medical risk factors and complications of labor and/or delivery: United States, 2002**

– Quantity zero. 0.0 Quantity more than zero but less than 0.05. <sup>1</sup>Equivalents of the gram weights in pounds and ounces are shown in the "Technical Notes."<sup>2</sup>Expressed in completed weeks. <sup>3</sup>Includes races other than white and black and origin not stated.<sup>4</sup>Birthweight of less than 1,500 grams (3 lb 4 oz).<sup>5</sup>Birthweight of less than 2,500 grams (5 lb 8 oz).<sup>6</sup>Race and Hispanic origin are reported separately on the birth certificate. Race categories are consistent with the 1977 Office of Management and Budget guidelines. Data for persons of Hispanic origin are included in the data for each race group according to the mother's reported race; see "Technical Notes."<sup>7</sup>Includes all persons of Hispanic origin of any race.

– Quantity zero.

<sup>1</sup>Less than 2,500 grams (5 lb 8 oz).

<sup>2</sup>Equivalents of gram weights in terms of pounds and ounces are shown in "Technical Notes."

<sup>3</sup>Includes races other than white and black and origin not stated.

<sup>4</sup>Race and Hispanic origin are reported separately on the birth certificate. Race categories are consistent with the 1977 Office of Management and Budget guidelines. Data for persons of Hispanic origin are included in the data for each race group according to the mother's reported race; see "Technical Notes."

<sup>5</sup>Includes all persons of Hispanic origin of any race.

**Table 46. Number and percent of births of low birthweight, by race and Hispanic origin of mother: United States, each State and territory, 2002**

[By place of residence. Low birthweight is birthweight of less than 2,500 grams (5 lb 8 oz)]

\* Figure does not meet standards of reliability or precision; based on fewer than 20 births in the numerator.

<sup>1</sup>Total number of births to residents of areas reporting specified congenital anomaly.<sup>2</sup>No response reported for the congenital anomalies item.<sup>3</sup>Includes races other than white and black.

NOTES: Excludes data for New Mexico, which did not report congenital anomalies. Race and Hispanic origin are reported separately on birth certificates. Race categories are consistent with the 1977 Office of Management and Budget guidelines. In this table all women (including Hispanic women) are classified only according to their race; see "Technical Notes."

\* Figure does not meet standards of reliability or precision; based on fewer than 20 births in the numerator.

<sup>1</sup>Includes races other than white and black and origin not stated.<sup>2</sup>Race and Hispanic origin are reported separately on the birth certificate. Race categories are consistent with the 1977 Office of Management and Budget guidelines. Data for persons of Hispanic origin are included in the data for each race group according to the mother's reported race; see "Technical Notes."<sup>3</sup>Includes all persons of Hispanic origin of any race.<sup>4</sup>Births in greater than twin deliveries.

## Technical Notes

### Source of data

Data shown in this report for 2002 are based on 100 percent of the birth certificates in all States and the District of Columbia. The data are provided to the National Center for Health Statistics (NCHS) through the Vital Statistics Cooperative Program (VSCP). In 1984 and earlier years, the VSCP included varying numbers of States that provided data based on 100 percent of their birth certificates. Data for States not in the VSCP were based on a 50-percent sample of birth certificates filed in those States. Information on the percent of records with missing information for maternal and infant characteristics included in this report is shown by State in [table I](#). Data are not shown for the variables race, age, and marital status of mother. Missing data are imputed in these cases; see separate sections in the “[Technical Notes](#)” for more information.

### Age of mother

Age of mother is computed in most cases from the mother’s and infant’s dates of birth as reported on the birth certificate. The mother’s age is directly reported by five States (Kentucky, Nevada, North Dakota, Virginia, and Wyoming) and American Samoa. From 1964 to 1996, mother’s age was edited for ages 10–49 years. Births reported to occur to mothers younger than age 10 or older than age 49 years had age imputed according to the age of mother from the previous record with the same race and total birth order (total of live births and fetal deaths). Beginning in 1997, age of mother is imputed for ages 9 years or under and 55 years and over. A review and verification of unedited birth data for 1996 showed that the vast majority of births reported as occurring to women aged 50 years and over were to women aged 50–54 years. The numbers of births to women aged 50–54 years are too small for computing age-specific birth rates. These births have been included with births to women aged 45–49 years for computing birth rates.

In 2002 age of mother was not reported on 0.01 percent of the records; for these records age of mother was imputed according to the last record with the same race and total birth order.

### Race and Hispanic origin

Race and Hispanic origin are reported separately on the birth certificate. Beginning with the 1989 data year, NCHS started tabulating its birth data primarily by race of the mother. In 1988 and prior years, births were tabulated by the race of the child, which was determined from the race of the parents as entered on the birth certificate.

Trend data by race shown in this report are by race of mother for all years beginning with the 1980 data year. To facilitate continuity and analysis of the data, trend tables showing data for years prior to 1980 show data for both race of mother and race of child for 1980. This makes it possible to distinguish the effects of this change from real changes in the data. The text discussions of data by race are based on tabulations by race of mother. Text references to white births and white mothers or black births and black mothers are used interchangeably for ease in writing.

The factors influencing the decision to tabulate births by race of the mother have been discussed in detail elsewhere (111). They include

the 1989 revision of the birth certificate, which includes many more health questions that are directly associated with the mother. In these instances, it is more appropriate to tabulate births by the mother’s race. A second factor has been the increasing incidence of interracial parentage. In 2002, 5.4 percent of births were to parents of different races compared with just 1.9 percent for 1980. A third factor influencing the decision to tabulate births by race of mother is the large proportion of births with race of father not stated, 14 percent in 2002. Although this proportion declined slightly in the 1990s, it is still higher than in 1979, 11 percent. The high proportion of records with the father’s race not reported reflects the increase in the proportion of births to unmarried women; in many such cases, no information is reported on the father. These births are already assigned the race of the mother because there is no alternative. Tabulating all births by race of mother, therefore, provides for a more uniform approach, rather than a necessarily arbitrary combination of parental races.

In 1997 the Office of Management and Budget (OMB) issued “Revisions to the Standards for the Classification of Federal Data on Race and Ethnicity,” which revised the “1977 Statistical Policy Directive 15, Race and Ethnic Standards for Federal Statistics and Administrative Reporting” (8,7,10). These documents specify guidelines for collection, tabulation, and presentation of race and ethnicity data within the Federal statistical system. The 1977 standards required Federal agencies to report race-specific tabulations using a minimum set of four single-race categories: American Indian or Alaska Native, Asian or Pacific Islander, Black, and White. The 1997 revision incorporated two major changes designed to reflect changing national racial and ethnic profiles of the United States. First, the revision increased from four to five the minimum set of categories to be used by Federal agencies for identification of race. The five categories for race specified in the 1997 standards are: American Indian or Alaska Native, Asian, Black or African American, Native Hawaiian or Other Pacific Islander, and White. Collection of additional detail on race and ethnicity is permitted, as before, so long as the additional categories can be aggregated into the minimum categories. The revised standards also require Federal data collection programs to allow respondents to select *one or more race categories*.

For the 2000 decennial census, the U.S. Census Bureau collected race and ethnicity data in accordance with the revised OMB standard. However, the National Vital Statistics System, which is based on data collected by the States, will not be fully compliant with the new standards until States revise their birth certificates to reflect the new standards. Birth certificates currently report only one race for each parent in the categories specified in the earlier 1977 OMB guidelines. In addition, birth certificate data do not report Asians separately from Native Hawaiians or Other Pacific Islanders. Thus, beginning with the 2000 data year, the numerators (births) for birth rates are incompatible with the denominators (populations) (see “Population denominators”). To compute rates, it is necessary to “bridge” the reported population data for multiple-race persons back to single-race categories. This has been done for birth rates by race presented in this report. Beginning with births occurring in 2003, several States began reporting multiple-race data. Once all States revise their birth registration systems to be compliant with the 1997 OMB standard, the use of “bridged” populations can be discontinued.

Race of mother is reported by all registration areas in eight categories: white, black, American Indian, Chinese, Japanese, Hawaiian, Filipino, and “other” Asian or Pacific Islander (API). In

0.0 Quantity more than zero but less than 0.05. — Quantity zero. --- Data not available.

<sup>1</sup>Excludes data for Puerto Rico, Virgin Islands, Guam, American Samoa, and the Commonwealth of the Northern Marianas. <sup>2</sup>California reports date last normal menses began but does not report clinical estimate of gestation. <sup>3</sup>Kansas does not report Rh sensitization.<sup>4</sup>Indiana and New York State report tobacco use but do not report the average number of cigarettes smoked per day in standard categories; data for New York City are reported in standard categories.<sup>5</sup>South Dakota and the Commonwealth of the Northern Marianas report tobacco and alcohol use but do not report the average number of cigarettes smoked per day or the average number of drinks per week. <sup>6</sup>Texas does not report genital herpes and uterine bleeding. <sup>7</sup>Nebraska and Texas do not report birth injury.<sup>8</sup>New York City does not report assisted ventilation less than 30 minutes and assisted ventilation of 30 minutes or more. <sup>9</sup>Texas does not report anesthetic complications and fetal distress.<sup>10</sup>Wisconsin does not report fetal alcohol syndrome.<sup>11</sup>Rates of "Other central nervous system anomalies" may be overstated for Oklahoma for 2002.

addition, 11 States (California, Hawaii, Illinois, Minnesota, Missouri, New Jersey, New York, Texas, Virginia, Washington, and West Virginia) report data on API subgroups included in the “other” API category (Vietnamese, Asian Indian, Korean, Samoan, Guamanian, and remaining API). A report on births in 1992 to women in these API subgroups has been published (112).

In 2002 race of mother was not reported for 0.5 percent of births. In these cases, if the race of the father was known, the race of the father was assigned to the mother. When information was not available for either parent, the race of the mother was imputed according to the specific race of the mother on the preceding record with a known race of mother. This was necessary for just 0.3 percent of births in 2002.

Hispanic origin and race are reported independently on the birth certificate, as noted previously. Data for Hispanic subgroups are shown in most cases for five groups: Mexican, Puerto Rican, Cuban, Central and South American, and other and unknown Hispanic. In tabulations of birth data by race only, data for persons of Hispanic origin are included in the data for each race group according to the mother’s reported race. In tabulations of birth data by race and Hispanic origin, data for persons of Hispanic origin are not further classified by race because the vast majority of births to Hispanic women are reported as white. In these tabulations, data for non-Hispanic persons are classified according to the race of the mother, because there are substantial differences in fertility and maternal and infant health between Hispanic and non-Hispanic white women.

Items asking for the Hispanic origin of the mother and the father have been included on the birth certificates of all States and the District of Columbia, the Virgin Islands, and Guam since 1993 (113). Puerto Rico, American Samoa, and the Northern Marianas do not collect this information. The percent of records for which Hispanic origin of the parents was not reported in 2002 is shown by State in [table 1](#).

### Marital status

National estimates of births to unmarried women are based on two methods of determining marital status. For 1994–96, birth certificates in 45 States and the District of Columbia included a question about the mother’s marital status. Beginning in 1997, the marital status of women giving birth in California and Nevada is determined by a direct question in the birth registration process. Beginning June 15, 1998, Connecticut discontinued inferring the mother’s marital status and added a direct question on mother’s marital status to the State’s birth certificate.

In the two States (Michigan and New York) that use inferential procedures to compile birth statistics by marital status in 2002, a birth is inferred as nonmarital if any of these factors, listed in priority-of-use order, is present: a paternity acknowledgment was received or the father’s name is missing. In recent years, a number of States have extended their efforts to identify the fathers when the parents are not married in order to enforce child-support obligations. The presence of a paternity acknowledgment therefore is the most reliable indicator that the birth is nonmarital in the States not reporting this information directly; this is now the key indicator in the nonreporting States. Details of the changes in reporting procedures are described in previous reports (24,114).

The mother’s marital status was not reported in 2002 on 0.03 percent of the birth records in the 48 States and the District of Columbia where this information is obtained by a direct question. Marital status was imputed as “married” for these records.

### Tobacco use

Beginning in 2000, data on whether or not the mother smoked during pregnancy is available for all States (except California) and the District of Columbia. These areas comprised 87 percent of U.S. births in 2002. Data on the number of cigarettes smoked daily were available in a comparable format for 46 States, the District of Columbia, and New York City. Indiana, New York State (except for New York City), and South Dakota reported information on number of cigarettes smoked in a format that was inconsistent with the NCHS standard (see [figure 1](#)). California did not report this information. The areas reporting on the number of cigarettes smoked comprised 81 percent of U.S. births in 2002.

### Gestation

The primary measure used to determine the gestational age of the newborn is the interval between the first day of the mother’s last normal menstrual period (LMP) and the date of birth. It is subject to error for several reasons, including imperfect maternal recall or misidentification of the LMP because of postconception bleeding, delayed ovulation, or intervening early miscarriage. These data are edited for LMP-based gestational ages, which are clearly inconsistent with the infant’s plurality and birthweight (see below), but reporting problems for this item persist and may occur more frequently among some subpopulations and among births with shorter gestations (115,116).

The U.S. Standard Certificate of Live Birth includes an item, “clinical estimate of gestation,” which was compared with length of gestation computed from the date the LMP began when the latter appeared to be inconsistent with birthweight. This was done for normal weight births of apparently short gestations and very low birthweight births reported to be full term. The clinical estimate was also used if the LMP date was not reported. The period of gestation for 4.6 percent of the births in 2002 was based on the clinical estimate of gestation. For 97 percent of these records, the clinical estimate was used because the LMP date was not reported. For the remaining 3 percent, the clinical estimate was used because it was compatible with the reported birthweight, whereas the LMP-based gestation was not. In cases where the reported birthweight was inconsistent with both the LMP-computed gestation and the clinical estimate of gestation, the LMP-computed gestation was used and birthweight was re-classified as “not stated.” This was necessary for 284 births or 0.007 percent of all birth records in 2002. The levels of the adjustments in 2002 data were similar to those for earlier years (5).

### Birthweight

Birthweight is reported in some areas in pounds and ounces rather than in grams. However, the metric system has been used in tabulating and presenting the statistics to facilitate comparison with data published by other groups. Equivalents of the gram weights in terms of pounds and ounces are as follows:

Less than 500 grams = 1 lb 1 oz or less  
 500–999 grams = 1 lb 2 oz–2 lb 3 oz  
 1,000–1,499 grams = 2 lb 4 oz–3 lb 4 oz  
 1,500–1,999 grams = 3 lb 5 oz–4 lb 6 oz  
 2,000–2,499 grams = 4 lb 7 oz–5 lb 8 oz

Figure I. Selected maternal and infant health items from the 1989 revision of the U.S. Standard Certificate of Live Birth

- 2,500–2,999 grams = 5 lb 9 oz–6 lb 9 oz
- 3,000–3,499 grams = 6 lb 10 oz–7 lb 11 oz
- 3,500–3,999 grams = 7 lb 12 oz–8 lb 13 oz
- 4,000–4,499 grams = 8 lb 14 oz–9 lb 14 oz
- 4,500–4,999 grams = 9 lb 15 oz–11 lb 0 oz
- 5,000 grams or more = 11 lb 1 oz or more

**Method of delivery**

Several rates are computed for method of delivery. The overall cesarean section rate or *total cesarean* rate is computed as the percent of all births that were delivered by cesarean section. The *primary cesarean* rate is a measure that relates the number of women having a first cesarean delivery to all women giving birth who have never had a cesarean delivery. The denominator for this rate includes all births less those with method of delivery classified as repeat cesarean, *vaginal birth after previous cesarean (VBAC)*, or method not stated. The rate for VBAC delivery is computed by relating all VBAC deliveries to the sum of VBAC and repeat cesarean deliveries, that is, to women with a previous cesarean section.

**Computations of percents, percent distributions, and medians**

Births for which a particular characteristic is unknown were subtracted from the figures for total births that were used as

denominators before percents, percent distributions, and medians were computed. The percent of records with missing information for each item is shown by State in table I. The median number of prenatal visits also excludes births to mothers who had no prenatal care. Computations of the median years of school completed and the median number of prenatal visits were based on ungrouped data. An asterisk (\*) is shown in place of any derived statistic based on fewer than 20 births in the numerator.

**Population denominators**

Birth and fertility rates for 2002 shown in tables 1, 3–6, 8, 9, 13, 14, A, B, and C are based on populations estimated from the 2000 census, as of July 1, 2002. These populations are shown in tables II and III. The population estimates have been provided by the U.S. Census Bureau (17) and are based on the 2000 census counts by age, race, and sex, which have been modified to be consistent with OMB racial categories as of 1977 and historical categories for birth data. The modification procedures are described in detail elsewhere (10,11).

Birth and fertility rates by State shown in table 10 are based on State-level population estimates projected from the 2000 census provided by the U.S. Census Bureau (17). Rates by State shown in this report may differ from rates computed on the basis of other population estimates. Birth and fertility rates by month shown in table 15 are based

<sup>1</sup>Includes Central and South American and other and unknown Hispanic.

<sup>2</sup>Includes races other than white and black.

NOTES: These population counts are estimated based on the 2000 census; see "Technical Notes." Race categories are consistent with the 1977 Office of Management and Budget guidelines.

SOURCE: U.S. Census Bureau. See reference 17.

on monthly population estimates also based on the 2002 estimates. Rates for unmarried women shown in tables 17 and 18 are based on distributions of the population by marital status as of March 2002 as reported by the U.S. Census Bureau in the March Current Population Survey (26), that have been adjusted to July 2002 population levels (17) by the Division of Vital Statistics, NCHS (24,114). Birth and fertility rates for the Hispanic population, shown in tables 6, 8, 9, and 14, are based on estimates of the total Hispanic population as of July 1, 2002 (17). Rates for Hispanic subgroups are based on special population estimates that are presented in table III in the "Technical Notes." More information about the populations for Hispanic subgroups is presented elsewhere (117).

The populations used in this report were produced under a collaborative arrangement with the U.S. Census Bureau and are based

on the 2000 census counts. Reflecting the new guidelines issued in 1997 by the OMB, the 2000 census included an option for individuals to report more than one race as appropriate for themselves and household members (7). In addition, the 1997 OMB guidelines called for reporting of Asian persons separately from Native Hawaiians or Other Pacific Islanders. In the earlier 1977 OMB guidelines, data for Asian or Pacific Islander persons were collected as a single group (8). Birth certificates currently report only one race for each parent in the categories specified in the 1977 OMB guidelines (see "Race and Hispanic origin"). In addition, birth certificate data do not report Asians separately from Native Hawaiians or Other Pacific Islanders. Thus, birth certificate data by race (the numerators for birth and fertility rates) currently are incompatible with the population data collected in the 2000 census (the denominators for the rates).

In order to produce birth and fertility rates for 1991 through 2002, it was necessary to “bridge” the reported population data for multiple-race persons back to single race categories. In addition, the 2000 census counts were modified to be consistent with the 1977 OMB racial categories, that is, to report the data for Asian persons and Native Hawaiians or Other Pacific Islanders as a combined category of Asian or Pacific Islanders (9,118). The procedures used to produce the “bridged” populations are described in separate publications (10,11). Beginning with births occurring in 2003, several States began reporting multiple-race data. Once all States revise their birth certificates to be compliant with the 1997 OMB standard, the use of “bridged” populations can be discontinued.

Populations used to calculate the rates for 1991–99 are based on population estimates as of July 1 of each year and were produced by the U.S. Census Bureau, with support from the National Cancer Institute (10,6,119). These intercensal population estimates for 1991–99 are revised based on the April 1, 2000, census. The rates for 1990 and 2000 are based on populations from the censuses in those years as of April 1.

Birth and fertility rates for 1991–2001 shown in this report have been revised from those published in the annual reports of final data for 2001 (5). Previously published birth and fertility rates for 1991 to 2001 were based on postcensal population estimates derived from the 1990 census. The revised rates shown here are based on revised population estimates consistent with the 2000 census. The revised population estimates are based on the 2000 census counts by age, race, and sex, which have been modified to be consistent with OMB racial categories as of 1977 (8) and historical categories for birth data. The modification procedures are described in detail elsewhere (10,11).

The 1991–99 population estimates for women aged 15–17 and 18–19 years by race and by age for the Hispanic subgroups were prepared by the Division of Vital Statistics, NCHS. The population estimates were produced by applying proportions derived from the 1990-based population estimates (according to data year, race, and Hispanic origin for the female teenage population, and data year, sex, and age for the Hispanic subgroup population) to the 2000-based population of women aged 15–19 years, and Hispanic females by age group, and adjusting the sum of the population estimates to be consistent with the total population of women aged 15–19 years for each race group and for Hispanics by age (2000 based). Rates for teenagers based on these population estimates are intended as interim measures, and caution should be used in interpreting the rates and trends. When the necessary population estimates based on the 2000 census become available from the U.S. Census Bureau, the rates for women aged 15–17 and 18–19 years will be recalculated and presented. Revised population estimates for the Hispanic subgroups are not expected.

Readers should keep in mind that the population data used to compile birth and fertility rates by race and ethnicity shown in this report are based on special estimation procedures, and are not actual counts. This is the case even for the 2000 populations that are based on the 2000 census. As a result, the estimation procedures used to develop these populations may contain some errors. Smaller populations, for example, American Indians, are likely to be affected much more than larger populations by potential measurement error (10). While the nature and magnitude of error is unknown, the potential for error should be kept in mind when evaluating trends and differentials. As more accurate information becomes available, further revisions of the estimates may be necessary.

## Computation of rates

In computing birth rates by live-birth order, births with birth order not stated were distributed in the same proportion as births of known live-birth order. This procedure is done separately by race.

In computing birth and fertility rates for the Hispanic population, births with origin of mother not stated are included with non-Hispanic births rather than being distributed. Thus, rates for the U.S. Hispanic population are underestimates of the true rates to the extent that the births with origin of mother not stated (0.6 percent) were actually to Hispanic mothers (see [table I](#)). In computing the rates, the census-based populations with origin not stated are imputed. The effect on the rates is believed to be small.

An asterisk (\*) is shown in place of any derived rate based on fewer than 20 births in the numerator, or a population denominator of less than 50 (unweighted) for decennial years and 75,000 (weighted) for all other years for the Hispanic subgroups. Rates based on populations below these minimum levels lack sufficient reliability for analytic purposes. These guidelines follow the suggestions of the U.S. Census Bureau (120,121). The population estimates for some Hispanic subgroups, especially Cubans, do not meet the above minimum. Therefore, age-specific rates are not shown for some groups. However, summary fertility measures (i.e., crude birth rate, general fertility rate, and total fertility rate) are possible, and these have been included.

**Age of father**—Information on age of father is often missing on birth certificates of children born to unmarried women ([table I](#)). In computing birth rates by age of father, births where age of father is not stated are distributed in the same proportions as births with known age within each 5-year age classification of mother. This procedure is followed because, while father’s age is missing on 13 percent of the birth certificates, one-quarter of these were on records where the mother is a teenager. This distribution procedure is done separately by race. The resulting distributions are summed to form a composite frequency distribution that is the basis for computing birth rates by age of father. This procedure avoids the distortion in rates that would result if the relationship between age of mother and age of father were disregarded.

## Graphic presentation

Trend data shown in [figures 3, 6, and 11](#) are plotted using a logarithmic scale. This approach is taken to facilitate comparison of the relative change in rates over time for each series of rates as well as the differentials among rates for different series. The trend lines in [figure 3](#), for example, show that women aged 40–44 years experienced the most change of any group over the period, and also that they had the greatest increase in rates since 1985.

## Random variation and significance testing for natality data

The number of births reported for an area is essentially a complete count, because more than 99 percent of all births are registered. Although this number is not subject to sampling error, it may be affected by nonsampling errors in the registration process such as mistakes in recording the mother’s residence or age during the registration process.

When the number of births is used for analytic purposes (that is, the comparison of numbers, rates, and percents over time, for different areas, or between different groups), the number of events that *actually* occurred can be thought of as one outcome in a large series of possible results that *could have* occurred under the same (or similar) circumstances. When considered in this way, the number of births is subject to random variation and a probable range of values estimated from the actual figures, according to certain statistical assumptions.

The confidence interval is the range of values for the number of births, birth rates, or percent of births that you could expect in 95 out of 100 cases. The confidence limits are the end points of this range of values (the highest and lowest values). Confidence limits tell you how much the number of events or rates could vary under the same (or similar) circumstances.

Confidence limits for numbers, rates, and percents can be estimated from the actual number of vital events. Procedures differ for rates and percents and also differ depending on the number of births on which these statistics are based. Below are detailed procedures and examples for each type of case.

When the number of vital events is large, the distribution is assumed to follow a normal distribution (where the relative standard error is small). When the number of events is small and the probability of the event is small, the distribution is assumed to follow a Poisson probability distribution. Considerable caution should be observed in interpreting the occurrence of infrequent events.

#### 95-percent confidence limits for numbers less than 100

When the number of births is less than 100 and the rate is small, the data are assumed to follow a Poisson probability distribution (122). Confidence limits are estimated using the following formulas:

$$\text{Lower limit} = B \times L$$

$$\text{Upper limit} = B \times U$$

where

$B$  = number of births

$L$  = the value in [table IV](#) that corresponds to the number of events  $B$

$U$  = the value in [table IV](#) that corresponds to the number of events  $B$

#### Example

Suppose that the number of first births to American Indian women aged 40–44 years was 47. The confidence limits for this number would be:

$$\begin{aligned} \text{Lower limit} &= 47 \times 0.73476 \\ &= 35 \end{aligned}$$

$$\begin{aligned} \text{Upper limit} &= 47 \times 1.32979 \\ &= 63 \end{aligned}$$

This means that the chances are 95 out of 100 that the actual number of first births to American Indian women aged 40–44 years would lie between 35 and 63.

#### 95-percent confidence limits for numbers of 100 or more

When the number of events is greater than 100, the data are assumed to approximate a normal distribution. Formulas for 95-percent confidence limits are:

$$\text{Lower limit} = B - (1.96 \times \sqrt{B})$$

$$\text{Upper limit} = B + (1.96 \times \sqrt{B})$$

where

$B$  = number of births

#### Example

Suppose that the number of first births to white women aged 40–44 years was 14,108. The 95-percent confidence limits for this number would be:

$$\begin{aligned} \text{Lower limit} &= 14,108 - (1.96 \times \sqrt{14,108}) \\ &= 14,108 - 233 \\ &= 13,875 \end{aligned}$$

$$\begin{aligned} \text{Upper limit} &= 14,108 + (1.96 \times \sqrt{14,108}) \\ &= 14,108 + 233 \\ &= 14,341 \end{aligned}$$

This means that the chances are 95 out of 100 that the actual number of first births to white women aged 40–44 years would lie between 13,875 and 14,341.

#### Computing confidence intervals for rates

The same statistical assumptions can be used to estimate the variability in birth rates. Again, one formula is used for rates based on numbers of events less than 100, and another formula for rates based on numbers of 100 or greater. For our purposes, assume that the denominators of these rates (the population estimates) have no error. While this assumption is technically correct *only* for denominators based on the census that occurs every 10 years, the error in intercensal population estimates is usually small, difficult to measure, and therefore not considered. (See however, discussion of population denominators earlier in the [“Technical Notes.”](#))

#### 95-percent confidence limits for rates based on fewer than 100 events

When the number of events in the numerator is less than 20 (or the population denominator is less than 50 for decennial years and 75,000 for all other years for the Hispanic subgroups), an asterisk (\*) is shown in place of the rate because there were too few births or the population is too small to compute a statistically reliable rate. When the number of events in the numerator is greater than 20 but less than 100 (and the population denominator for the Hispanic subgroups is above the minimum), the confidence interval for a rate can be estimated using the two formulas that follow and the values in [table IV](#).

$$\text{Lower limit} = R \times L$$

$$\text{Upper limit} = R \times U$$

**Table IV. Values of L and U for calculating 95-percent confidence limits for numbers of events and rates when the number of events is less than 100**

<i>N</i>	<i>L</i>	<i>U</i>	<i>N</i>	<i>L</i>	<i>U</i>

40	0.71441	1.36172	90	0.80412	1.22917
41	0.71762	1.35661	91	0.80514	1.22778
42	0.72071	1.35171	92	0.80614	1.22641
43	0.72370	1.34699	93	0.80713	1.22507
44	0.72660	1.34245	94	0.80810	1.22375
45	0.72941	1.33808	95	0.80906	1.22245
46	0.73213	1.33386	96	0.81000	1.22117
47	0.73476	1.32979	97	0.81093	1.21992
48	0.73732	1.32585	98	0.81185	1.21868
49	0.73981	1.32205	99	0.81275	1.21746
50	0.74222	1.31838			

where

$R$  = birth rate

$L$  = the value in table IV that corresponds to the number of events  $B$

$U$  = the value in table IV that corresponds to the number of events  $B$

#### Example

Suppose that the first birth rate for American Indian women aged 40–44 years was 0.50 per 1,000, based on 47 births in the numerator. Using table IV:

$$\text{Lower limit} = 0.50 \times 0.73476 = 0.37$$

$$\text{Upper limit} = 0.50 \times 1.32979 = 0.66$$

This means that the chances are 95 out of 100 that the actual first birth rate for American Indian women aged 40–44 years lies between 0.37 and 0.66.

#### 95-percent confidence limits for rates when the numerator is 100 or more

In this case, use the following formula for the birth rate  $R$  based on the number of births  $B$ :

$$\text{Lower limit} = R - [1.96 \times (R / \sqrt{B})]$$

$$\text{Upper limit} = R + [1.96 \times (R / \sqrt{B})]$$

where

$R$  = birth rate  
 $B$  = number of births

**Example**

Suppose that the first birth rate for white women aged 40–44 years was 1.55 per 1,000, based on 14,108 births in the numerator. Therefore, the 95-percent confidence interval would be:

$$\begin{aligned} \text{Lower limit} &= 1.55 - [1.96 \times (1.55 / \sqrt{14,108})] \\ &= 1.55 - 0.026 \\ &= 1.52 \end{aligned}$$

$$\begin{aligned} \text{Upper limit} &= 1.55 + [1.96 \times (1.55 / \sqrt{14,108})] \\ &= 1.55 + 0.026 \\ &= 1.58 \end{aligned}$$

This means that the chances are 95 out of 100 that the actual first birth rate for white women aged 40–44 years lies between 1.52 and 1.58.

**Computing 95-percent confidence intervals for percents**

In many instances we need to compute the confidence intervals for percents. Percents derive from a binomial distribution. As with birth rates, an asterisk (\*) will be shown for any percent that is based on fewer than 20 births in the numerator. We easily compute a 95-percent confidence interval for a percent when the following conditions are met:

$$B \times p \geq 5 \text{ and } B \times q \geq 5$$

where

$B$  = number of births in the denominator  
 $p$  = percent divided by 100  
 $q = 1 - p$

For natality data, these conditions will be met except for very rare events in small subgroups. If the conditions are not met, the variation in the percent will be so large as to render the confidence intervals meaningless. When these conditions are met the 95-percent confidence interval can be computed using the normal approximation of the binomial. The 95-percent confidence intervals are computed by the following formulas:

$$\text{Lower limit} = p - [1.96 \times (\sqrt{p \times q / B})]$$

$$\text{Upper limit} = p + [1.96 \times (\sqrt{p \times q / B})]$$

where

$p$  = percent divided by 100  
 $q = 1 - p$   
 $B$  = number of births in the denominator

**Example**

Suppose that the percent of births to Hispanic women in Arizona that were to unmarried women was 49.7 percent. This was based on

14,751 births in the numerator and 29,682 births in the denominator. First we test to make sure we can use the normal approximation of the binomial:

$$\begin{aligned} 29,682 \times 0.497 &= 14,752 \\ 29,682 \times (1 - 0.497) &= 29,682 \times 0.503 = 14,930 \end{aligned}$$

Both 14,752 and 14,930 are greater than 5 so we can proceed. The 95-percent confidence interval would be:

$$\begin{aligned} \text{Lower limit} &= 0.497 - [1.96 \times (\sqrt{0.497 \times 0.503 / 29,682})] \\ &= 0.497 - 0.006 \\ &= 0.491 \text{ or } 49.1 \text{ percent} \end{aligned}$$

$$\begin{aligned} \text{Upper limit} &= 0.497 + [1.96 \times (\sqrt{0.497 \times 0.503 / 29,682})] \\ &= 0.497 + 0.006 \\ &= 0.503 \text{ or } 50.3 \text{ percent} \end{aligned}$$

This means that the chances are 95 out of 100 that the actual percent of births to unmarried Hispanic women in Arizona lies between 49.1 and 50.3 percent.

**Significance testing**

**One or both of the rates is based on fewer than 100 cases**

To compare two rates, when one or both of those rates are based on less than 100 cases, you first compute the confidence intervals for both rates. Then you check to see if those intervals overlap. If they **do** overlap, the difference is not statistically significant at the 95-percent level. If they **do not** overlap, the difference is statistically significant.

**Example**

Suppose that the first birth rate for American Indian women aged 40–44 years was 0.70 per 1,000 in year X and 0.57 in year Y. Is the rate for year X significantly higher than the rate for year Y? The two rates are based on 63 events in year X and 54 events in year Y. Both rates are based on fewer than 100 events; therefore, the first step is to compute the confidence intervals for both rates.

	Lower Limit	Upper Limit
Year X . . . . .	0.54	0.90
Year Y . . . . .	0.43	0.74

These two confidence intervals overlap. Therefore, the first birth rate for American Indian women aged 40–44 in year X is not significantly higher (at the 95-percent confidence level) than the rate in year Y.

This method of comparing confidence intervals is a conservative test for statistical significance. That is, the difference between two rates may, in fact, be statistically significant even though confidence intervals for the two rates overlap (123). Thus, caution should be observed when interpreting a nonsignificant difference between two rates, especially when the lower and upper limits being compared overlap only slightly.

**Both rates are based on 100 or more events**

When both rates are based on 100 or more events, the difference between the two rates, irrespective of sign (+/-), is

considered statistically significant if it exceeds the statistic in the formula below. This statistic equals 1.96 times the standard error for the difference between two rates.

$$1.96 \times \sqrt{\frac{R_1^2}{N_1} + \frac{R_2^2}{N_2}}$$

where

$R_1$  = first rate

$R_2$  = second rate

$N_1$  = first number of births

$N_2$  = second number of births

If the difference is **greater** than this statistic, then the difference would occur by chance less than 5 times out of 100. If the difference is **less than or equal** to this statistic, the difference might occur by chance more than 5 times out of 100. We say that the difference is not statistically significant at the 95-percent confidence level.

### Example

Is the first birth rate for black women aged 40–44 years (1.08 per 1,000) significantly lower than the comparable rate for white women (1.55)? Both rates are based on more than 100 births (1,535 for black women and 14,108 for white women). The difference between the rates is  $1.55 - 1.08 = 0.47$ . The statistic is then calculated as follows:

$$\begin{aligned} & 1.96 \times \sqrt{\frac{1.08^2}{1,535} + \frac{1.55^2}{14,108}} \\ &= 1.96 \times \sqrt{[(1.166/1,535) + (2.403/14,108)]} \\ &= 1.96 \times \sqrt{0.00076 + 0.00017} \\ &= 1.96 \times \sqrt{0.00093} \\ &= 1.96 \times 0.03 \\ &= 0.06 \end{aligned}$$

The difference between the rates (0.47) is greater than this statistic (0.06). Therefore, the difference is statistically significant at the 95-percent confidence level.

### Testing differences between two percents

When testing the difference between two percents, both percents must meet the following conditions:

$$B \times p \geq 5 \text{ and } B \times q \geq 5$$

where

$B$  = number of births in the denominator

$p$  = percent divided by 100

$q = 1 - p$

When both percents meet these conditions then the difference between the two percents is considered statistically significant if it is greater than the statistic in the formula below. This statistic equals 1.96 times the standard error for the difference between two percents.

$$1.96 \times \sqrt{p(1-p) \times \left( \frac{1}{B_1} + \frac{1}{B_2} \right)}$$

where

$B_1$  = number of births in the denominator of the first percent

$B_2$  = number of births in the denominator of the second percent

$$p = \frac{B_1 \times p_1 + B_2 \times p_2}{B_1 + B_2}$$

$p_1$  = the first percent

$p_2$  = the second percent

### Example

Is the percent of births to Hispanic women that were to unmarried women higher in New Mexico (50.2) than in Arizona (49.7)? Suppose that the number in the denominator was 13,714 in New Mexico and 29,682 in Arizona. The necessary conditions are met for both percents (calculations not shown). The difference between the two percents is  $0.502 - 0.497 = 0.005$ . The statistic is then calculated as follows:

$$\begin{aligned} & 1.96 \times \sqrt{0.499 \times (0.501) \times (0.000106609)} = 1.96 \times \sqrt{0.000026652} \\ &= 1.96 \times 0.005162563 \\ &= 0.010 \end{aligned}$$

The difference between the percents (0.005) is less than this statistic (0.010). Therefore, the difference is not statistically significant at the 95-percent confidence level.

Information on computing confidence intervals for and testing differences between rates for Hispanic subgroups is available elsewhere (117).

### Definitions of medical terms

The 1989 revision of the U.S. Standard Certificate of Live Birth includes several maternal and infant health items in checkbox format, including obstetric procedures, medical risk factors, complications of labor and delivery, abnormal conditions of the newborn, and congenital anomalies of the child (**figure 1**). The definitions that follow are adapted and abbreviated from a set of definitions compiled by a committee of Federal and State health statistics officials for the National Association of Public Health Statistics and Information Systems, formerly known as the Association for Vital Records and Health Statistics (124).

### Medical risk factors for this pregnancy

*Anemia*—Hemoglobin level of less than 10.0 g/dL during pregnancy or a hematocrit of less than 30 percent during pregnancy.

*Cardiac disease*—Disease of the heart.

*Acute or chronic lung disease*—Disease of the lungs during pregnancy.

*Diabetes*—Metabolic disorder characterized by excessive discharge of urine and persistent thirst; includes juvenile onset, adult onset, and gestational diabetes during pregnancy.

*Genital herpes*—Infection of the skin of the genital area by herpes simplex virus.

*Hydramnios/Oligohydramnios*—Any noticeable excess (hydramnios) or lack (oligohydramnios) of amniotic fluid.

*Hemoglobinopathy*—A blood disorder caused by alteration in the genetically determined molecular structure of hemoglobin (example: sickle cell anemia).

*Hypertension, chronic*—Blood pressure persistently greater than 140/90 diagnosed prior to onset of pregnancy or before the 20th week of gestation.

*Hypertension, pregnancy-associated*—An increase in blood pressure of at least 30 mm Hg systolic or 15 mm Hg diastolic on two measurements taken 6 hours apart after the 20th week of gestation.

*Eclampsia*—The occurrence of convulsions and/or coma unrelated to other cerebral conditions in women with signs and symptoms of preeclampsia.

*Incompetent cervix*—Characterized by painless dilation of the cervix in the second trimester or early in the third trimester of pregnancy, with premature expulsion of membranes through the cervix and ballooning of the membranes into the vagina, followed by rupture of the membranes and subsequent expulsion of the fetus.

*Previous infant 4,000+ grams*—The birthweight of a previous live-born child was over 4,000+ grams (8 pounds 14 ounces).

*Previous preterm or small-for-gestational-age infant*—Previous birth of an infant prior to term (before 37 completed weeks of gestation) or of an infant weighing less than the 10th percentile for gestational age using a standard weight-for-age chart.

*Renal disease*—Kidney disease.

*Rh sensitization*—The process or state of becoming sensitized to the Rh factor as when an Rh-negative woman is pregnant with an Rh-positive fetus.

*Uterine bleeding*—Any clinically significant bleeding during the pregnancy taking into consideration the stage of pregnancy; any second or third trimester bleeding of the uterus prior to the onset of labor.

## Obstetric procedures

*Amniocentesis*—Surgical transabdominal perforation of the uterus to obtain amniotic fluid to be used in the detection of genetic disorders, fetal abnormalities, and fetal lung maturity.

*Electronic fetal monitoring*—Monitoring with external devices applied to the maternal abdomen or with internal devices with an electrode attached to the fetal scalp and a catheter through the cervix into the uterus, to detect and record fetal heart tones and uterine contractions.

*Induction of labor*—The initiation of uterine contractions before the spontaneous onset of labor by medical and/or surgical means for the purpose of delivery.

*Stimulation of labor*—Augmentation of previously established labor by use of oxytocin.

*Tocolysis*—Use of medications to inhibit preterm uterine contractions to extend the length of pregnancy and, therefore, avoid a preterm birth.

*Ultrasound*—Visualization of the fetus and the placenta by means of sound waves.

## Complications of labor and/or delivery

*Febrile*—A fever greater than 100 degrees F. or 38 C. occurring during labor and/or delivery.

*Meconium, moderate/heavy*—Meconium consists of undigested debris from swallowed amniotic fluid, various products of secretion, excretion, and shedding by the gastrointestinal tract; moderate to heavy amounts of meconium in the amniotic fluid noted during labor and/or delivery.

*Premature rupture of membranes (more than 12 hours)*—Rupture of the membranes at any time during pregnancy and more than 12 hours before the onset of labor.

*Abruptio placenta*—Premature separation of a normally implanted placenta from the uterus.

*Placenta previa*—Implantation of the placenta over or near the internal opening of the cervix.

*Other excessive bleeding*—The loss of a significant amount of blood from conditions other than abruptio placenta or placenta previa.

*Seizures during labor*—Maternal seizures occurring during labor from any cause.

*Precipitous labor (less than 3 hours)*—Extremely rapid labor and delivery lasting less than 3 hours.

*Prolonged labor (more than 20 hours)*—Abnormally slow progress of labor lasting more than 20 hours.

*Dysfunctional labor*—Failure to progress in a normal pattern of labor.

*Breech/Malpresentation*—At birth, the presentation of the fetal buttocks rather than the head, or other malpresentation.

*Cephalopelvic disproportion*—The relationship of the size, presentation, and position of the fetal head to the maternal pelvis that prevents dilation of the cervix and/or descent of the fetal head.

*Cord prolapse*—Premature expulsion of the umbilical cord in labor before the fetus is delivered.

*Anesthetic complications*—Any complication during labor and/or delivery brought on by an anesthetic agent or agents.

*Fetal distress*—Signs indicating fetal hypoxia (deficiency in amount of oxygen reaching fetal tissues).

## Congenital anomalies of child

*Anencephalus*—Absence of the cerebral hemispheres.

*Spina bifida/meningocele*—Developmental anomaly characterized by defective closure of the bony encasement of the spinal cord, through which the cord and meninges may or may not protrude.

*Hydrocephalus*—Excessive accumulation of cerebrospinal fluid within the ventricles of the brain with consequent enlargement of the cranium.

*Microcephalus*—A significantly small head.

*Other central nervous system anomalies*—Other specified anomalies of the brain, spinal cord, and nervous system.

*Heart malformations*—Congenital anomalies of the heart.

*Other circulatory/respiratory anomalies*—Other specified anomalies of the circulatory and respiratory systems.

*Rectal atresia/stenosis*—Congenital absence, closure, or narrowing of the rectum.

*Tracheo-esophageal fistula/Esophageal atresia*—An abnormal passage between the trachea and the esophagus; esophageal atresia is the congenital absence or closure of the esophagus.

*Omphalocele/Gastroschisis*—An omphalocele is a protrusion of variable amounts of abdominal viscera from a midline defect at the base of the umbilicus. In gastroschisis, the abdominal viscera protrude through an abdominal wall defect, usually on the right side of the umbilical cord insertion.

*Other gastrointestinal anomalies*—Other specified congenital anomalies of the gastrointestinal system.

*Malformed genitalia*—Congenital anomalies of the reproductive organs.

*Renal agenesis*—One or both kidneys are completely absent.

*Other urogenital anomalies*—Other specified congenital anomalies of the organs concerned in the production and excretion of urine, together with organs of reproduction.

*Cleft lip/palate*—Cleft lip is a fissure or elongated opening of the lip; cleft palate is a fissure in the roof of the mouth. These are failures of embryonic development.

*Polydactyly/Syndactyly/Adactyly*—Polydactyly is the presence of more than five digits on either hands and/or feet; syndactyly is having fused or webbed fingers and/or toes; adactyly is the absence of fingers and/or toes.

*Club foot*—Deformities of the foot, which is twisted out of shape or position.

*Diaphragmatic hernia*—Herniation of the abdominal contents through the diaphragm into the thoracic cavity usually resulting in respiratory distress.

*Other musculoskeletal/integumental anomalies*—Other specified congenital anomalies of the muscles, skeleton, or skin.

*Down's syndrome*—The most common chromosomal defect with most cases resulting from an extra chromosome (trisomy 21).

*Other chromosomal anomalies*—All other chromosomal aberrations.

### Abnormal conditions of the newborn

*Anemia*—Hemoglobin level of less than 13.0 g/dL or a hematocrit of less than 39 percent.

*Birth injury*—Impairment of the infant's body function or structure due to adverse influences that occurred at birth.

*Fetal alcohol syndrome*—A syndrome of altered prenatal growth and development occurring in infants born to women who consumed excessive amounts of alcohol during pregnancy.

*Hyaline membrane disease/RDS*—A disorder primarily of prematurity, manifested clinically by respiratory distress and pathologically by pulmonary hyaline membranes and incomplete expansion of the lungs at birth.

*Meconium aspiration syndrome*—Aspiration of meconium by the fetus or newborn affecting the lower respiratory system.

*Assisted ventilation (less than 30 minutes)*—A mechanical method of assisting respiration for newborns with respiratory failure.

*Assisted ventilation (30 minutes or more)*—Newborn placed on assisted ventilation for 30 minutes or longer.

*Seizures*—A seizure of any etiology.

### Related reports

Many of the topics discussed in this report are covered in more analytic detail in other reports published by NCHS. Topics include age of mother (22); Hispanic origin births (113); twin births (102); trends in teenage births (23); cesarean deliveries (125); attendant at birth, place of delivery, and obstetric procedures (60,61); births to unmarried mothers (24); trends in pregnancies and pregnancy rates (12); and trends in smoking (41,43).
