

Several presentations:

- Simultaneous laser tracking and Light Curve recording for a large re-entry object (12 m x 3 m cylinder, upper stage rocket body)
- Detailed analysis of Ajisai mirror reflectivity; a way also to determine shape of debris objects?
- TOPEX / Poseidon missed Jason-2 by about 400 m:
 - Within 24 hours TOPEX tracking by ILRS stations re-started;
 - Resulted in a much more accurate orbit:
 - e.g. TB reduced from ± 100 ms (usual TLE) or more to ± 1 ms (AAS)
- SAT Trace program: Displays sat infos; freely available from Graz
- Outlook: Now: < 10 stations with strong laser for tracking un-cooperative targets; in a few years: > 20 expected worldwide
