- Simplified Chinese: NetApp I/O
- Spanish: E/S NetApp

## Remarks

Consider the following [remarks](#) <sup>1379</sup> and requirements for this sensor:

Remark	Description
Enabled ONTAPI access	<p>The ONTAPI user account that you use with this sensor requires access to the <a href="#">DATA ONTAP API (ONTAPI)</a> so that the sensor can request data from it. The access is enabled by default.</p> <p><b>i</b> If access is disabled, locally use the following command on the cluster console to enable ONTAPI access for the user:</p> <pre>services web&gt; modify -vserver clusterd -name ontapi -enabled true</pre> <p>For this sensor, read-only user rights are sufficient for the ONTAPI user account that you use to access ONTAPI. Modify or add this user with a suitable role in the console under Cluster   ClusterX   Configuration   Security   Users</p>
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node.</p> <p><b>i</b> If the framework is missing, you cannot create this sensor.</p> <p><b>■</b> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
NetApp versions	<p>This sensor supports NetApp cDOT as of version 8.3 and NetApp ONTAP as of version 9.0.</p>
IPv6	<p>This sensor supports IPv6.</p>
Performance impact	<p>This sensor has a <a href="#">very low</a> performance impact.</p>

Remark	Description
Credentials	You can define NetApp API credentials (User Name and Password) in the <a href="#">credentials for Windows systems</a> settings of the parent device. This way, you do not need to individually enter credentials for each NetApp sensor that you add to the same device.

### Basic Sensor Settings

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are

Setting	Description
	<p>available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
CIFS Ops	<p>The number of CIFS operations</p> <p><b>i</b> This channel is the primary channel by default.</p>
Disk Read	The disk read speed

Channel	Description
Disk Write	The disk write speed
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
FCP Ops	The number of FCP operations
FCP Read	The FCP read speed
FCP Write	The FCP write speed
HDD Read	The HDD read speed
HDD Write	The HDD write speed
HTTP Ops	The number of HTTP operations
ISCSI Ops	The number of iSCSI operations
ISCSI Partner Ops	The number of iSCSI partner operations
ISCSI Partner Read	The iSCSI partner read speed
ISCSI Partner Write	The iSCSI partner write speed
ISCSI Read	The iSCSI read speed
ISCSI Write	The iSCSI write speed
Network Read	The network read speed
Network Write	The network write speed
NFS Ops	The number of NFS operations
SSD Read	The SSD read speed
SSD Write	The SSD write speed
Tape Read	The tape read speed

Channel	Description
Tape Write	The tape write speed

## 7.8.107 NetApp LIF Sensor

### IMPORTANT INFORMATION

This sensor supports NetApp cDOT as of version 8.3 or ONTAP from versions 9.0 to 9.12. If you use ONTAP as of version 9.10, we recommend that you use the [NetApp LIF v2<sup>\[1372\]</sup>](#) sensor.

The NetApp LIF sensor monitors logical interfaces of a NetApp cDOT or ONTAP cluster accessing the application programming interface (API) via the Simple Object Access Protocol (SOAP).

NetApp LIF Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List<sup>\[1397\]</sup>](#).

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Is Home	If the LIF is on the home port

Channel	Description
	<ul style="list-style-type: none"> <li>▪ Up status: At Home</li> <li>▪ Down status: Not At Home</li> <li>▪ Unknown status: Channel Value Not Set</li> </ul>
State	<p>The LIF status</p> <ul style="list-style-type: none"> <li>▪ Up status: Up</li> <li>▪ Down status: Down</li> <li>▪ Unknown status: Channel Value Not Set</li> </ul> <p> This channel is the primary channel by default.</p>
Throughput Read	The number of bytes read
Throughput Total	The total number of bytes read and written
Throughput Write	The number of bytes written

## 7.8.109 NetApp LUN Sensor

### IMPORTANT INFORMATION

This sensor supports NetApp cDOT as of version 8.3 or ONTAP from versions 9.0 to 9.12. If you use ONTAP as of version 9.6, we recommend that you use the [NetApp LUN v2](#) sensor.

The NetApp LUN sensor monitors the logical unit number (LUN) of a NetApp cDOT or ONTAP storage system accessing the application programming interface (API) via the Simple Object Access Protocol (SOAP).

NetApp LUN Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: NetApp LUN
- French: NetApp LUN

- German: NetApp LUN
- Japanese: NetApp LUN
- Portuguese: LUN NetApp
- Russian: LUN NetApp
- Simplified Chinese: NetApp LUN
- Spanish: LUN NetApp

## Remarks

Consider the following [remarks](#) <sup>[1406]</sup> and requirements for this sensor:

Remark	Description
Enabled ONTAPI access	<p>The ONTAPI user account that you use with this sensor requires access to the <a href="#">DATA ONTAP API (ONTAPI)</a> so that the sensor can request data from it. The access is enabled by default.</p> <p><b>i</b> If access is disabled, locally use the following command on the cluster console to enable ONTAPI access for the user:</p> <pre>services web&gt; modify -vserver clusterd -name ontapi -enabled true</pre> <p>For this sensor, read-only user rights are sufficient for the ONTAPI user account that you use to access ONTAPI. Modify or add this user with a suitable role in the console under Cluster   ClusterX   Configuration   Security   Users</p>
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node.</p> <p><b>i</b> If the framework is missing, you cannot create this sensor.</p> <p><b>■</b> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
NetApp versions	<p>This sensor supports NetApp cDOT as of version 8.3 and NetApp ONTAP as of version 9.0.</p>
IPv6	<p>This sensor supports IPv6.</p>
Performance impact	<p>This sensor has a <a href="#">very low</a> performance impact.</p>
Credentials	<p>You can define NetApp API credentials (User Name and Password) in the <a href="#">credentials for Windows systems</a> settings of the parent device. This way, you do not need to individually enter credentials for each NetApp sensor that you add to the same device.</p>

Remark	Description
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.

## 7.8.113 NetApp Physical Disk Sensor

### IMPORTANT INFORMATION

This sensor supports NetApp cDOT as of version 8.3 or ONTAP from versions 9.0 to 9.12. If you use ONTAP as of version 9.9, we recommend that you use the [NetApp Physical Disk v2<sup>\[1438\]</sup>](#) sensor.

The NetApp Physical Disk sensor monitors disks of a NetApp cDOT or ONTAP storage system accessing the application programming interface (API) via the Simple Object Access Protocol (SOAP).

NetApp Physical Disk Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List<sup>\[1438\]</sup>](#).

### Sensor in Other Languages

- Dutch: NetApp Fysieke Schijf
- French: NetApp disque physique
- German: NetApp Physikal. Laufwerk
- Japanese: NetApp 物理ディスク
- Portuguese: Disco físico NetApp

- Russian: Физический диск NetApp
- Simplified Chinese: NetApp 物理磁盘

Setting	Description
	<p>available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Healthy	<p>If the system is healthy</p> <ul style="list-style-type: none"> <li>▪ Up status: Yes</li> </ul>

Channel	Description
	<ul style="list-style-type: none"> <li>▪ Down status: No</li> </ul> <p><b>i</b> This channel is the primary channel by default.</p>
Lag	The lag transfer duration
Last Transfer Duration	The last transfer duration
Last Transfer Size	The last transfer size
Last Transfer Timestamp	The time stamp of the last transfer
Mirror State	<p>The mirror status</p> <ul style="list-style-type: none"> <li>▪ Up status: Snapmirrored</li> <li>▪ Warning status: Uninitialized</li> <li>▪ Down status: Broken-Off, Unknown</li> </ul>
Relationship Type	<p>The relationship type</p> <ul style="list-style-type: none"> <li>▪ Up status: Mirror, Mirror and Vault, Vault</li> <li>▪ Down status: Unknown</li> </ul>
Resync Fails	The number of resynchronization fails
Transfer Status	<p>The transfer status (relationship status returned from the API)</p> <ul style="list-style-type: none"> <li>▪ Up status: Aborting, Checking, Finalizing, Idle, Preparing, Queued, Quiesced, Quiescing, Transferring</li> <li>▪ Warning status: Breaking, Unknown</li> </ul>
Update Fails	The number of update fails

What security features does PRTG include?

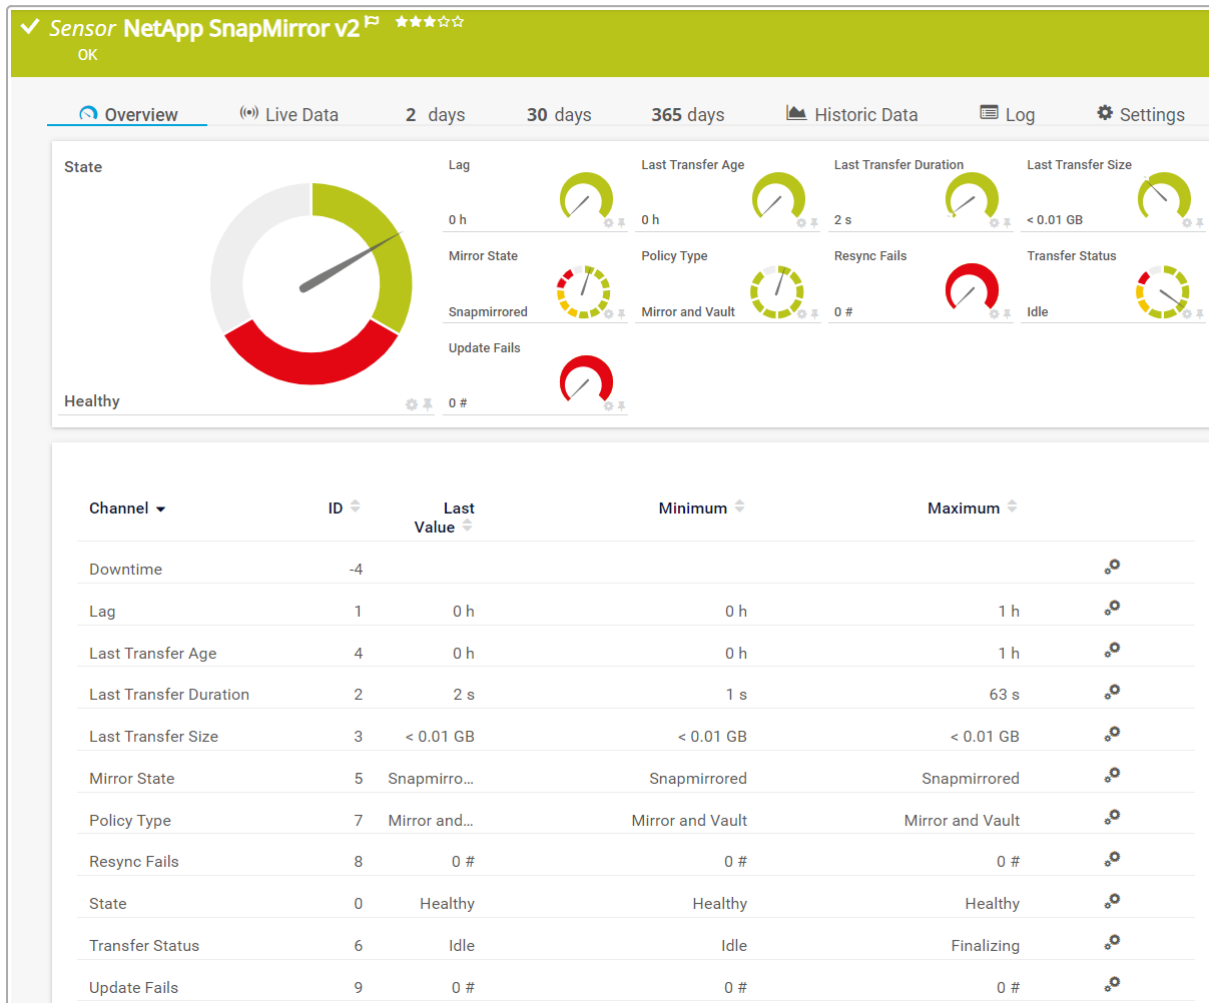

- <https://kb.paessler.com/en/topic/61108>

## 7.8.117 NetApp System Health Sensor

### IMPORTANT INFORMATION

This sensor supports NetApp cDOT as of version 8.3 or ONTAP from versions 9.0 to 9.12. If you use ONTAP as of version 9.6, we recommend that you use the [NetApp System Health v2](#)<sup>[1465]</sup> sensor.

The NetApp System Health sensor monitors the health of a NetApp cDOT or ONTAP storage system accessing the application programming interface (API) via the Simple Object Access Protocol (SOAP).

NetApp System Health Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[1462]</sup>.

### Sensor in Other Languages

- Dutch: NetApp Systeemstatus
- French: NetApp état du système
- German: NetApp Systemzustand
- Japanese: NetApp システム正常性

- Portuguese: Saúde do sistema NetApp
- Russian: Работоспособность системы NetApp
- Simplified Chinese: NetApp 系统健康状况
- Spanish: Salud de sistema NetApp

## Remarks

Consider the following [remarks](#)<sup>[1458]</sup> and requirements for this sensor:

Remark	Description
Enabled ONTAPI access	<p>The ONTAPI user account that you use with this sensor requires access to the <a href="#">DATA ONTAP API (ONTAPI)</a> so that the sensor can request data from it. The access is enabled by default.</p> <p><b>i</b> If access is disabled, locally use the following command on the cluster console to enable ONTAPI access for the user:</p> <pre>services web&gt; modify -vserver clusterd -name ontapi -enabled true</pre> <p><b>i</b> This sensor requires administrator rights for the ONTAPI user account that you use to access ONTAPI. Modify or add this user with a suitable role in the console under Cluster   ClusterX   Configuration   Security   Users</p>
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node.</p> <p><b>i</b> If the framework is missing, you cannot create this sensor.</p> <p><b>■</b> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
NetApp versions	<p>This sensor supports NetApp cDOT as of version 8.3 and NetApp ONTAP as of version 9.0.</p>
IPv6	<p>This sensor supports IPv6.</p>
Performance impact	<p>This sensor has a <a href="#">very low</a> performance impact.</p>
Read-only	<p>As an <a href="#">alternative to administrator rights</a><sup>[1462]</sup>, you can add a specific Role Attribute and use read-only rights.</p>
Credentials	<p>You can define NetApp API credentials (User Name and Password) in the <a href="#">credentials for Windows systems</a> settings of the parent device. This way, you do not need to individually enter credentials for each NetApp sensor that you add to the same device.</p>

Remark	Description
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Limits	This sensor has predefined <a href="#">limits</a> for several metrics.

## Basic Sensor Settings

### Basic Sensor Settings

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

### Sensor Display

**Sensor Display**

**Primary Channel** ⓘ

Downtime

---

**Graph Type** ⓘ

Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are

Setting	Description
	<p>available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Permissions: Alternative to Administrator Rights

If you do not want to provide administrator rights for the ONTAPI user account that you use with the NetApp System Health sensor, you can add a new command to the selected role of the user that makes read-only rights sufficient.

- Edit the Role of this user in the console under Cluster | ClusterX | Configuration | Security | Users.
- Add the command storage aggregate check\_spare\_low with access control list (ACL) all to the Role Attributes.

With this role attribute, read-only rights are sufficient for the NetApp System Health sensor.

## Channel List

- i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
CPU	<p>The CPU load (%)</p> <ul style="list-style-type: none"> <li>ⓘ This channel is the primary channel by default.</li> <li>ⓘ This channel has default limits: <ul style="list-style-type: none"> <li>▪ Upper error limit: 90%</li> <li>▪ Upper warning limit: 80%</li> </ul> </li> </ul>
Downtime	<p>In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status</p>

## 7.8.119 NetApp Volume Sensor

### IMPORTANT INFORMATION

This sensor supports NetApp cDOT as of version 8.3 or ONTAP from versions 9.0 to 9.12. If you use ONTAP as of version 9.6, we recommend that you use the [NetApp Volume v2](#) sensor.

The NetApp Volume sensor monitors volumes on a NetApp cDOT or ONTAP storage system accessing the application programming interface (API) via the Simple Object Access Protocol (SOAP).

NetApp Volume Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: NetApp Volume
- French: NetApp volume de stockage

- German: NetApp Volume
- Japanese: NetApp ボリューム
- Portuguese: Volume NetApp
- Russian: Том NetApp
- Simplified Chinese: NetApp 卷
- Spanish: Volumen NetApp

## Remarks

Consider the following [remarks](#)<sup>[1473]</sup> and requirements for this sensor:

Remark	Description
Enabled ONTAPI access	<p>The ONTAPI user account that you use with this sensor requires access to the <a href="#">DATA ONTAP API (ONTAPI)</a> so that the sensor can request data from it. The access is enabled by default.</p> <p><b>i</b> If access is disabled, locally use the following command on the cluster console to enable ONTAPI access for the user:</p> <pre>services web&gt; modify -vserver clusterd -name ontapi -enabled true</pre> <p>For this sensor, read-only user rights are sufficient for the ONTAPI user account that you use to access ONTAPI. Modify or add this user with a suitable role in the console under Cluster   ClusterX   Configuration   Security   Users</p>
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node.</p> <p><b>i</b> If the framework is missing, you cannot create this sensor.</p> <p><b>■</b> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
NetApp versions	<p>This sensor supports NetApp cDOT as of version 8.3 and NetApp ONTAP as of version 9.0.</p>
IPv6	<p>This sensor supports IPv6.</p>
Performance impact	<p>This sensor has a <a href="#">very low</a> performance impact.</p>
Credentials	<p>You can define NetApp API credentials (User Name and Password) in the <a href="#">credentials for Windows systems</a> settings of the parent device. This way, you do not need to individually enter credentials for each NetApp sensor that you add to the same device.</p>
Add Sensor dialog	<p>Volumes that are offline do not appear in the Add Sensor dialog.</p>

## 7.8.120 NetApp Volume v2 Sensor

The NetApp Volume v2 sensor monitors a volume of a NetApp storage system via the Representational State Transfer (REST) application programming interface (API) using ONTAP as of version 9.6.

**i** This sensor was converted to a new framework so that it will continue to function after the changes of the ONTAP REST API.

NetApp Volume Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[1483]</sup>.

### Sensor in Other Languages

- Dutch: NetApp Volume v2
- French: NetApp volume de stockage v2

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

## 7.8.121 NetFlow v5 Sensor

The NetFlow v5 sensor receives traffic data from a NetFlow v5-compatible device and shows the traffic by type. This sensor has several filter options to divide traffic into different channels.

**i** Make sure that the sensor matches the NetFlow version that your device exports.

Channel	ID	Last Value (volume)	Last Value (speed)	Minimum	Maximum
Chat	3004	0.01 MByte	< 0.01 Mbit/s	0 Mbit/s	< 0.01 Mbit/s
Citrix	3010	0 MByte	0 Mbit/s	0 Mbit/s	< 0.01 Mbit/s
Downtime	-4				
FTP/P2P	3002	0.04 MByte	< 0.01 Mbit/s	0 Mbit/s	< 0.01 Mbit/s
Infrastructure	3007	0 MByte	0 Mbit/s	0 Mbit/s	< 0.01 Mbit/s

NetFlow v5 Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[1494]</sup>.

### Sensor in Other Languages

- Dutch: NetFlow v5
- French: NetFlow v5

- German: NetFlow v5
- Japanese: NetFlow v5
- Portuguese: NetFlow v5
- Russian: NetFlow v5
- Simplified Chinese: NetFlow v5
- Spanish: NetFlow v5

## Remarks

Consider the following [remarks](#)<sup>[1487]</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a very high performance impact. We recommend that you use no more than <b>50</b> of this sensor on each probe.
NetFlow	This sensor requires that the NetFlow export of the respective version is enabled on the target system. The target system must send the flow data stream to the IP address of the probe system.
Cluster probe	This sensor does not support cluster probes. You can only set it up on local probes or remote probes.
IPv6	This sensor supports IPv6.
Clone sensor	If you clone this sensor to the <b>same</b> probe, PRTG keeps the <a href="#">selected IP addresses</a> <sup>[1489]</sup> on which it listens for Flow (NetFlow, jFlow, sFlow, IPFIX) packets. If you clone this sensor to a <b>different</b> probe, PRTG selects <b>all</b> available IP addresses by default.
Knowledge Base	<ul style="list-style-type: none"> <li>▪ Knowledge Base: <a href="#">What is the Active Flow Timeout in flow sensors?</a></li> <li>▪ Knowledge Base: <a href="#">How can I change the default groups and channels for flow and Packet Sniffer sensors?</a></li> </ul>
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

**Stream Data Handling** ⓘ

Discard stream data (default)

Store stream data only for the 'Other' channel

Store all stream data

NetFlow v5 Specific Settings

Setting	Description
Receive Packets on UDP Port	<p>Enter the User Datagram Protocol (UDP) port number on which PRTG receives the flow packets. It must match the UDP port number in the NetFlow export options of the hardware router device. Enter an integer.</p> <p> When you configure the export, make sure that you select the appropriate NetFlow version for this sensor.</p>
Sender IP Address	<p>Enter the IP address of the sending device that you want to receive the NetFlow from. Enter an IP address to only receive data from a specific device or leave the field empty to receive data from any device on the specified port.</p>
Receive Packets on IP Address	<p>Select the IP addresses on which PRTG listens to NetFlow packets. The list of IP addresses is specific to your setup. To select an IP address, enable a check box in front of the respective line. The IP address that you select must match the IP address in the NetFlow export options of the hardware router device.</p> <p> When you configure the export, make sure that you select the appropriate NetFlow version for this sensor.</p> <p> You can also select all items or cancel the selection by using the check box in the table header.</p>
Active Flow Timeout (Minutes)	<p>Enter a time span in minutes after which the sensor must receive new flow data. If the timeout elapses and the sensor receives no new data during this time, it shows the Unknown <a href="#">status</a>. Enter an integer. The maximum timeout is 60 minutes.</p> <p> We recommend that you set the timeout one minute longer than the timeout in the hardware router device.</p> <p> If you set this value too low, flow information might be lost.</p> <p> For more information, see the Knowledge Base: <a href="#">What is the Active Flow Timeout in flow sensors?</a></p> <p> If the target device sends incorrect time information that results in wrong monitoring data, try to use 0 as the active flow timeout. This ignores the start and stop information of a flow as provided by the device and accounts all data to the current point in time. It might result in spikes but the sensor captures all data.</p>
Sampling Mode	<p>Define if you want to use the sampling mode:</p> <ul style="list-style-type: none"> <li>▪ Disable (default): Use the standard flow.</li> <li>▪ Enable: Use the sampling mode and specify the Sampling Rate below.</li> </ul> <p> This setting must match the setting in the xFlow exporter.</p>

Setting	Description
Sampling Rate	<p><a href="#">This setting is only visible if you select Enable above.</a></p> <p>Enter a number that matches the sampling rate in the exporting device. If the number is different, monitoring results will be incorrect. Enter an integer.</p>
Stream Data Handling	<p>Define what PRTG does with the stream and packet data:</p> <ul style="list-style-type: none"> <li>▪ Discard stream data (default): Do not store the stream and packet data.</li> <li>▪ Store stream data only for the 'Other' channel: Only store stream and packet data that is not otherwise filtered and is therefore accounted to the default Other channel. PRTG stores this data in the \StreamLog subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Streams Sensor [ID] (1).csv. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> <li>▪ Store all stream data: Store all stream and packet data. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p><b>i</b> Use with caution. It can create huge data files. We recommend that you only use this setting for a short time.</p>

Channel Selection	<p>Define the categories that the sensor accounts the traffic to:</p> <ul style="list-style-type: none"> <li>▪ Web: Internet web traffic.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ File Transfer: Traffic from FTP.</li> <li>▪ Mail: Internet mail traffic.</li> <li>▪ Chat: Traffic from chat and instant messaging.</li> <li>▪ Remote Control: Traffic from remote control applications such as RDP, SSH, Telnet, and Virtual Network Computing (VNC).</li> <li>▪ Infrastructure: Traffic from network services such as DHCP, DNS, Ident, ICMP, and SNMP.</li> <li>▪ NetBIOS: Traffic from NetBIOS communication.</li> <li>▪ Citrix: Traffic from Citrix applications.</li> <li>▪ Other Protocols: Traffic from various other protocols via UDP and TCP.</li> </ul> <p>For each group, you can select how many channels the sensor uses, that is, how detailed the sensor divides the traffic:</p> <ul style="list-style-type: none"> <li>▪ No (✘): Do not account traffic of this group in its own channel. The sensor accounts all traffic of this group to the default channel named Other.</li> <li>▪ Yes (✔): Count all traffic of this group and summarize it in one channel.</li> <li>▪ Detail (🗨): Count all traffic of this group and further divide it into different channels. The traffic appears in several channels that you can see in the Content column.</li> </ul> <p><b>i</b> Extensive use of this option can cause load problems on the probe system. We recommend that you set specific, well-chosen filters for the data that you really want to analyze.</p> <p><b>■</b> You can change the default configuration for groups and channels. For more information, see the Knowledge Base: <a href="#">How can I change the default groups and channels for flow and Packet Sniffer sensors?</a></p>

## Filtering

**■** For more information, see section [Filter Rules](#)<sup>[1494]</sup>.

**Filtering**

**Filters** To include and exclude specific traffic, you can define filter rules based on the following format guidelines:

- field[filter]

**Fields:**  
IP, Port, SourceIP, SourcePort, DestinationIP, DestinationPort, Protocol (values TCP, UDP, ICMP, OSPFIGP or any number), ToS, DSCP

**Additional IPFIX fields:**  
Interface, ASI, InboundInterface, OutboundInterface, SourceASI, DestinationASI, MAC, SourceMAC, DestinationMAC, Mask, SourceMask, DestinationMask ('Masks' represent subnet masks in the form of a single number ('number of contiguous bits')), NextHop (IP Address), VLAN, SourceVLAN, DestinationVLAN ('VLANs' represent a VLAN identifier)

Include Filter ⓘ

Exclude Filter ⓘ

Filtering

Setting	Description
Include Filter	Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special <a href="#">syntax</a> .
Exclude Filter	First, the sensor considers the filters in Include Filter. From this subset, you can explicitly exclude traffic, using the same syntax.

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.  ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.
Graph Type	Define how this sensor shows different channels:

Setting	Description
	<ul style="list-style-type: none"> <li>Show channels independently (default): Show a graph for each channel.</li> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.                             <ul style="list-style-type: none"> <li> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Primary Toplist

**Primary Toplist** Primary Toplist ⓘ Top Connections

Primary Toplist

Setting	Description
Primary Toplist	<p>Define which Toplist is the primary Toplist of the sensor:</p> <ul style="list-style-type: none"> <li>Top Talkers</li> <li>Top Connections</li> <li>Top Protocols</li> <li><a href="#">[Any custom Toplists you add]</a></li> </ul> <p> PRTG shows the primary Toplist in maps when you add a Toplist object.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Toplists

For all Flow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

■ For more information, see section [Toplists](#).

## Filter Rules

■ For more information, see section [Filter Rules for Flow, IPFIX, and Packet Sniffer Sensors](#).

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Chat	The traffic from chat and instant messaging (IRC, AIM)
Citrix	The traffic from Citrix applications
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
FTP/P2P	The traffic from file transfer (FTP/P2P)
Infrastructure	The traffic from network services (DHCP, DNS, Ident, ICMP, SNMP)
Mail	The internet mail traffic (IMAP, POP3, SMTP)
NetBIOS	The traffic from NetBIOS communication
Other	The traffic from various other protocols (UDP, TCP)
Remote Control	The traffic from remote control applications (RDP, SSH, Telnet, Virtual Network Computing (VNC))
Total	The total traffic <b>i</b> This channel is the primary channel by default.
Various	The traffic from various other sources

Channel	Description
WWW	The traffic from the web (HTTP, HTTPS)

## 7.8.122 NetFlow v5 (Custom) Sensor

The NetFlow v5 (Custom) sensor receives traffic data from a NetFlow v5-compatible device and shows the traffic by type. With this sensor, you can define your own channel definitions to divide traffic into different channels.

**i** Make sure that the sensor matches the NetFlow version that your device exports.

Channel	ID	Last Value (volume)	Last Value (speed)	Minimum	Maximum
Chat	3004	0.01 MBy...	< 0.01 M...	0 Mbit/s	< 0.01 Mbit/s
Citrix	3010	0 MByte	0 Mbit/s	0 Mbit/s	< 0.01 Mbit/s
Downtime	-4				
FTP/P2P	3002	0.04 MBy...	< 0.01 M...	0 Mbit/s	< 0.01 Mbit/s
Infrastructure	3007	0 MByte	0 Mbit/s	0 Mbit/s	< 0.01 Mbit/s

NetFlow v5 (Custom) Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[1503]</sup>.

### Sensor in Other Languages

- Dutch: NetFlow v5 (aangepast)

- French: NetFlow v5 personnalisé
- German: NetFlow v5 (Benutzerdefiniert)

- Russian: NetFlow v5 (настраиваемый)
- Simplified Chinese: NetFlow v5 (自定义)
- Spanish: NetFlow v5 (personalizado)

## Remarks

Consider the following [remarks](#)<sup>1497</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a very high performance impact. We recommend that you use no more than <b>50</b> of this sensor on each probe.
NetFlow	This sensor requires that the NetFlow export of the respective version is enabled on the target system. The target system must send the flow data stream to the IP address of the probe system.
Channels	This sensor does not officially support more than <a href="#">50 channels</a> .
Cluster probe	This sensor does not support cluster probes. You can only set it up on local probes or remote probes.
IPv6	This sensor supports IPv6.
Knowledge Base	Knowledge Base: <a href="#">What is the Active Flow Timeout in flow sensors?</a>
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

NetFlow v5 Specific Settings

Setting	Description
Receive Packets on UDP Port	<p>Enter the User Datagram Protocol (UDP) port number on which PRTG receives the flow packets. It must match the UDP port number in the NetFlow export options of the hardware router device. Enter an integer.</p> <p> When you configure the export, make sure that you select the appropriate NetFlow version for this sensor.</p>
Sender IP Address	<p>Enter the IP address of the sending device that you want to receive the NetFlow from. Enter an IP address to only receive data from a specific device or leave the field empty to receive data from any device on the specified port.</p>
Receive Packets on IP Address	<p>Select the IP addresses on which PRTG listens to NetFlow packets. The list of IP addresses is specific to your setup. To select an IP address, enable a check box in front of the respective line. The IP address that you select must match the IP address in the NetFlow export options of the hardware router device.</p> <p> When you configure the export, make sure that you select the appropriate NetFlow version for this sensor.</p> <p> You can also select all items or cancel the selection by using the check box in the table header.</p>
Active Flow Timeout (Minutes)	<p>Enter a time span in minutes after which the sensor must receive new flow data. If the timeout elapses and the sensor receives no new data during this time, it shows the Unknown <a href="#">status</a>. Enter an integer. The maximum timeout is 60 minutes.</p> <p> We recommend that you set the timeout one minute longer than the timeout in the hardware router device.</p> <p> If you set this value too low, flow information might be lost.</p> <p> For more information, see the Knowledge Base: <a href="#">What is the Active Flow Timeout in flow sensors?</a></p> <p> If the target device sends incorrect time information that results in wrong monitoring data, try to use 0 as the active flow timeout. This ignores the start and stop information of a flow as provided by the device and accounts all data to the current point in time. It might result in spikes but the sensor captures all data.</p>
Sampling Mode	<p>Define if you want to use the sampling mode:</p> <ul style="list-style-type: none"> <li>▪ Disable (default): Use the standard flow.</li> <li>▪ Enable: Use the sampling mode and specify the Sampling Rate below.</li> </ul> <p> This setting must match the setting in the xFlow exporter.</p>

Setting	Description
Sampling Rate	<p>This setting is only visible if you select <a href="#">Enable</a> above.</p> <p>Enter a number that matches the sampling rate in your device that exports the flows. If the number is different, monitoring results will be incorrect. Enter an integer.</p>
Channel Definition	<p>Enter a channel definition to divide the traffic into different channels. Enter each definition in one line. The sensor accounts all traffic that you do not define a channel for to the default channel Other.</p> <p> For more information, see section <a href="#">Channel Definitions for Flow, IPFIX and Packet Sniffer Sensors</a>.</p> <p> Extensive use of many filters can cause load problems on the probe system. We recommend that you define specific, well-chosen filters for the data that you really want to analyze. We recommend that you do not use more than 20 channels in graphs and tables, and not more than 100 channels in total. For performance reasons, we recommend that you add several sensors with fewer channels each.</p>
Stream Data Handling	<p>Define what PRTG does with the stream and packet data:</p> <ul style="list-style-type: none"> <li>▪ Discard stream data (default): Do not store the stream and packet data.</li> <li>▪ Store stream data only for the 'Other' channel: Only store stream and packet data that is not otherwise filtered and is therefore accounted to the default Other channel. PRTG stores this data in the \StreamLog subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Streams Sensor [ID] (1).csv. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> <li>▪ Store all stream data: Store all stream and packet data. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p> Use with caution. It can create huge data files. We recommend that you only use this setting for a short time.</p>

## Filtering

 For more information, see section [Filter Rules](#) 1503.

**Filtering**

**Filters** To include and exclude specific traffic, you can define filter rules based on the following format guidelines:

- field[filter]

**Fields:**

IP, Port, SourceIP, SourcePort, DestinationIP, DestinationPort, Protocol (values TCP, UDP, ICMP, OSPFIGP or any number), ToS, DSCP

**Additional IPFIX fields:**

Interface, ASI, InboundInterface, OutboundInterface, SourceASI, DestinationASI, MAC, SourceMAC, DestinationMAC, Mask, SourceMask, DestinationMask ('Masks' represent subnet masks in the form of a single number ('number of contiguous bits')), NextHop (IP Address), VLAN, SourceVLAN, DestinationVLAN ('VLANs' represent a VLAN identifier)

Include Filter ⓘ

Exclude Filter ⓘ

Filtering

Setting	Description
Include Filter	Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special <a href="#">syntax</a> .
Exclude Filter	First, the sensor considers the filters in Include Filter. From this subset, you can explicitly exclude traffic, using the same syntax.

## Sensor Display

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.  ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.
Graph Type	Define how this sensor shows different channels:

Setting	Description
	<ul style="list-style-type: none"> <li>Show channels independently (default): Show a graph for each channel.</li> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.                             <ul style="list-style-type: none"> <li> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Primary Toplist

**Primary Toplist** Primary Toplist ⓘ Top Connections

Primary Toplist

Setting	Description
Primary Toplist	<p>Define which Toplist is the primary Toplist of the sensor:</p> <ul style="list-style-type: none"> <li>Top Talkers</li> <li>Top Connections</li> <li>Top Protocols</li> <li><a href="#">[Any custom Toplists you add]</a></li> </ul> <p> PRTG shows the primary Toplist in maps when you add a Toplist object.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Toplists

For all Flow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

■ For more information, see section [Toplists](#).

## Filter Rules

■ For more information, see section [Filter Rules for Flow, IPFIX, and Packet Sniffer Sensors](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
[Custom]	The traffic by type according to the channel definition
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Other	All traffic for which no channel is defined
Total	The total traffic ⓘ This channel is the primary channel by default.

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.  ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.
Graph Type	Define how this sensor shows different channels:

Setting	Description
	<ul style="list-style-type: none"> <li>Show channels independently (default): Show a graph for each channel.</li> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.                             <ul style="list-style-type: none"> <li> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Primary Toplist

**Primary Toplist** Primary Toplist ⓘ Top Connections

Primary Toplist

Setting	Description
Primary Toplist	<p>Define which Toplist is the primary Toplist of the sensor:</p> <ul style="list-style-type: none"> <li>Top Talkers</li> <li>Top Connections</li> <li>Top Protocols</li> <li><a href="#">[Any custom Toplists you add]</a></li> </ul> <p> PRTG shows the primary Toplist in maps when you add a Toplist object.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Toplists

For all Flow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

■ For more information, see section [Toplists](#).

## Filter Rules

■ For more information, see section [Filter Rules for Flow, IPFIX, and Packet Sniffer Sensors](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Chat	The traffic from chat and instant messaging (IRC, AIM)
Citrix	The traffic from Citrix applications
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
FTP/P2P	The traffic from file transfer (FTP/P2P)
Infrastructure	The traffic from network services (DHCP, DNS, Ident, ICMP, SNMP)
Mail	The internet mail traffic (IMAP, POP3, SMTP)
NetBIOS	The traffic from NetBIOS communication
Other	The traffic from various other protocols (UDP, TCP)
Remote Control	The traffic from remote control applications (RDP, SSH, Telnet, Virtual Network Computing (VNC))
Total	The total traffic ⓘ This channel is the primary channel by default.
Various	The traffic from various other sources

Channel	Description
WWW	The traffic from the web (HTTP, HTTPS)

NetFlow Tester

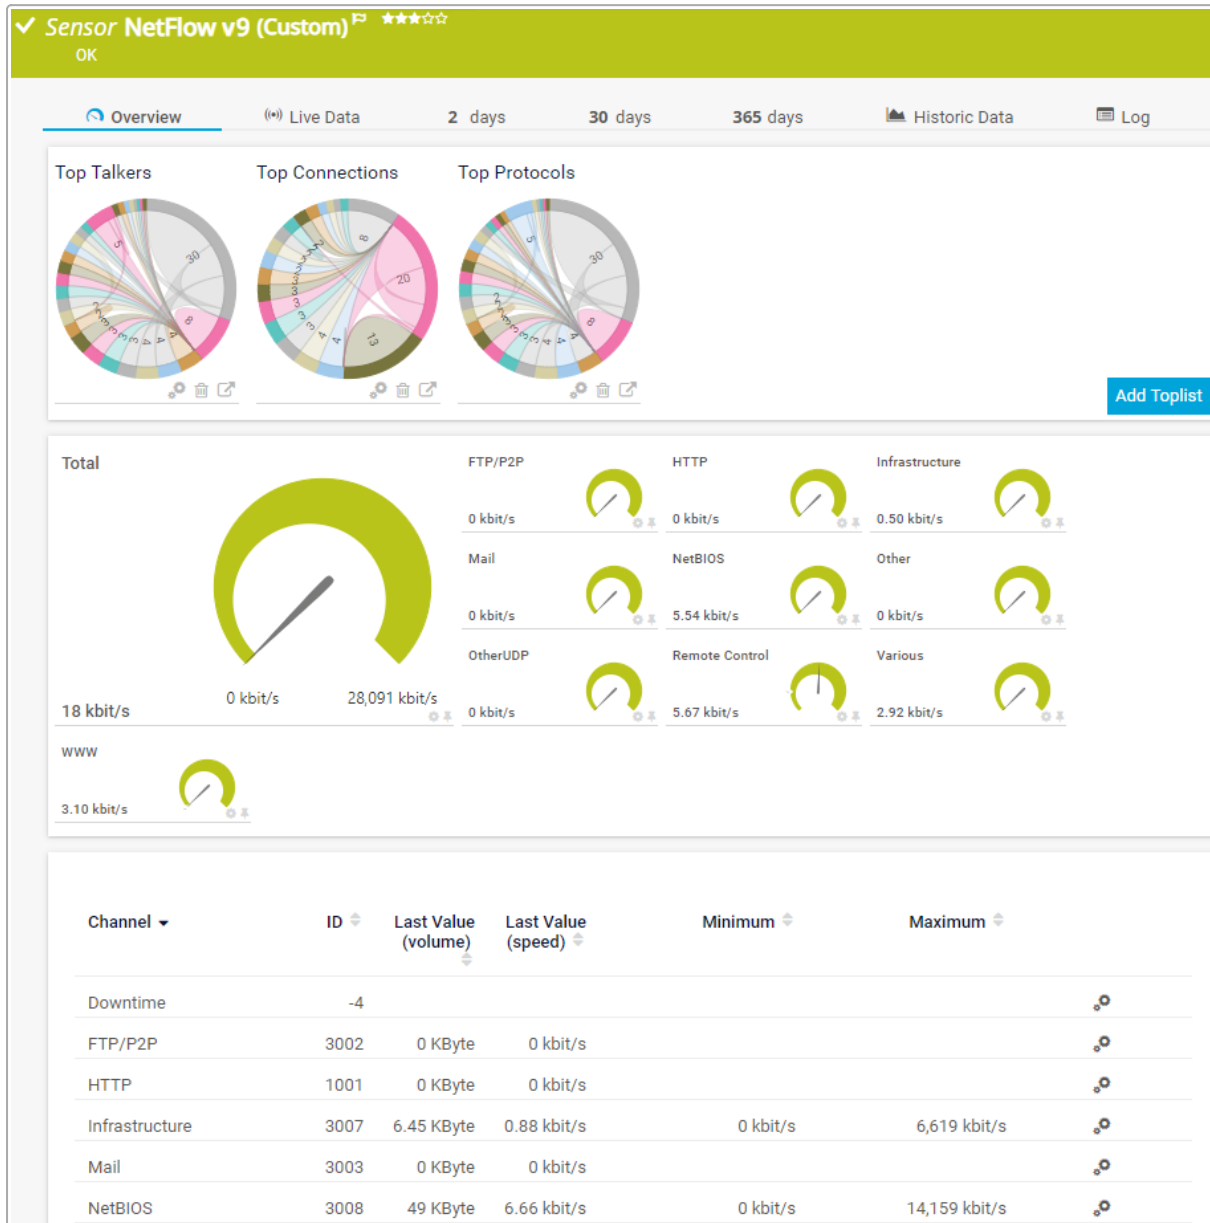

- <https://www.paessler.com/tools/netflowtester>

## 7.8.124 NetFlow v9 (Custom) Sensor

The NetFlow v9 (Custom) sensor receives traffic data from a NetFlow v9-compatible device and shows the traffic by type. With this sensor, you can define your own channel definitions to divide traffic into different channels.

**i** Make sure that the sensor matches the NetFlow version that your device exports.

NetFlow v9 (Custom) Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) <sup>(1522)</sup>.

### Sensor in Other Languages

- Dutch: NetFlow v9 (aangepast)

- French: NetFlow v9 personnalisé
- German: NetFlow v9 (Benutzerdefiniert)

- Portuguese: NetFlow v9 (customizado)
- Russian: NetFlow v9 (настраиваемый)
- Simplified Chinese: NetFlow v9 (自定义)
- Spanish: NetFlow v9 (personalizado)

## Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a very high performance impact. We recommend that you use no more than <b>50</b> of this sensor on each probe.
NetFlow	This sensor requires that the NetFlow export of the respective version is enabled on the target system. The target system must send the flow data stream to the IP address of the probe system.
Channels	This sensor does not officially support more than <a href="#">50 channels</a> .
Cluster probe	This sensor does not support cluster probes. You can only set it up on local probes or remote probes.
IPv6	This sensor supports IPv6.
Knowledge Base	Knowledge Base: <a href="#">What is the Active Flow Timeout in flow sensors?</a>
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Basic Sensor Settings

**Stream Data Handling** ⓘ

Discard stream data (default)

Store stream data only for the 'Other' channel

Store all stream data

NetFlow v9 Specific Settings

Setting	Description
Receive Packets on UDP Port	<p>Enter the User Datagram Protocol (UDP) port number on which PRTG receives the flow packets. It must match the UDP port number in the NetFlow export options of the hardware router device. Enter an integer.</p> <p> When you configure the export, make sure that you select the appropriate NetFlow version for this sensor.</p>
Sender IP Address	<p>Enter the IP address of the sending device that you want to receive the NetFlow from. Enter an IP address to only receive data from a specific device or leave the field empty to receive data from any device on the specified port.</p>
Receive Packets on IP Address	<p>Select the IP addresses on which PRTG listens to NetFlow packets. The list of IP addresses is specific to your setup. To select an IP address, enable a check box in front of the respective line. The IP address that you select must match the IP address in the NetFlow export options of the hardware router device.</p> <p> When you configure the export, make sure that you select the appropriate NetFlow version for this sensor.</p> <p> You can also select all items or cancel the selection by using the check box in the table header.</p>
Active Flow Timeout (Minutes)	<p>Enter a time span in minutes after which the sensor must receive new flow data. If the timeout elapses and the sensor receives no new data during this time, it shows the Unknown <a href="#">status</a>. Enter an integer. The maximum timeout is 60 minutes.</p> <p> We recommend that you set the timeout one minute longer than the timeout in the hardware router device.</p> <p> If you set this value too low, flow information might be lost.</p> <p> For more information, see the Knowledge Base: <a href="#">What is the Active Flow Timeout in flow sensors?</a></p> <p> If the target device sends incorrect time information that results in wrong monitoring data, try to use 0 as the active flow timeout. This ignores the start and stop information of a flow as provided by the device and accounts all data to the current point in time. It might result in spikes but the sensor captures all data.</p>
Sampling Mode	<p>Define if you want to use the sampling mode:</p> <ul style="list-style-type: none"> <li>▪ Disable (default): Use the standard flow.</li> <li>▪ Enable: Use the sampling mode and specify the Sampling Rate below.</li> </ul> <p> This setting must match the setting in the xFlow exporter.</p>

Setting	Description
Sampling Rate	<p>This setting is only visible if you select <a href="#">Enable</a> above.</p> <p>Enter a number that matches the sampling rate in your device that exports the flows. If the number is different, monitoring results will be incorrect. Enter an integer.</p>
Channel Definition	<p>Enter a channel definition to divide the traffic into different channels. Enter each definition in one line. The sensor accounts all traffic that you do not define a channel for to the default channel Other.</p> <p>■ For more information, see section <a href="#">Channel Definitions for Flow, IPFIX and Packet Sniffer Sensors</a>.</p> <p>ⓘ Extensive use of many filters can cause load problems on the probe system. We recommend that you define specific, well-chosen filters for the data that you really want to analyze. We recommend that you do not use more than 20 channels in graphs and tables, and not more than 100 channels in total. For performance reasons, we recommend that you add several sensors with fewer channels each.</p>
Stream Data Handling	<p>Define what PRTG does with the stream and packet data:</p> <ul style="list-style-type: none"> <li>▪ Discard stream data (default): Do not store the stream and packet data.</li> <li>▪ Store stream data only for the 'Other' channel: Only store stream and packet data that is not otherwise filtered and is therefore accounted to the default Other channel. PRTG stores this data in the \StreamLog subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Streams Sensor [ID] (1).csv. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> <li>▪ Store all stream data: Store all stream and packet data. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p>ⓘ Use with caution. It can create huge data files. We recommend that you only use this setting for a short time.</p>

## Filtering

■ For more information, see section [Filter Rules](#) <sup>[1522]</sup>.

**Filtering**

**Filters** To include and exclude specific traffic, you can define filter rules based on the following format guidelines:

- field[filter]

**Fields:**

IP, Port, SourceIP, SourcePort, DestinationIP, DestinationPort, Protocol (values TCP, UDP, ICMP, OSPFIGP or any number), ToS, DSCP

**Additional IPFIX fields:**

Interface, ASI, InboundInterface, OutboundInterface, SourceASI, DestinationASI, MAC, SourceMAC, DestinationMAC, Mask, SourceMask, DestinationMask ('Masks' represent subnet masks in the form of a single number ('number of contiguous bits')), NextHop (IP Address), VLAN, SourceVLAN, DestinationVLAN ('VLANs' represent a VLAN identifier)

Include Filter ⓘ

Exclude Filter ⓘ

Filtering

Setting	Description
Include Filter	Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special <a href="#">syntax</a> .
Exclude Filter	First, the sensor considers the filters in Include Filter. From this subset, you can explicitly exclude traffic, using the same syntax.

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.  ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.
Graph Type	Define how this sensor shows different channels:

Setting	Description
	<ul style="list-style-type: none"> <li>Show channels independently (default): Show a graph for each channel.</li> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.                             <ul style="list-style-type: none"> <li> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Primary Toplist

**Primary Toplist** Primary Toplist ⓘ Top Connections

Primary Toplist

Setting	Description
Primary Toplist	<p>Define which Toplist is the primary Toplist of the sensor:</p> <ul style="list-style-type: none"> <li>Top Talkers</li> <li>Top Connections</li> <li>Top Protocols</li> <li><a href="#">[Any custom Toplists you add]</a></li> </ul> <p> PRTG shows the primary Toplist in maps when you add a Toplist object.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Toplists

For all Flow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

■ For more information, see section [Toplists](#).

## Filter Rules

■ For more information, see section [Filter Rules for Flow, IPFIX, and Packet Sniffer Sensors](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
[Custom]	The traffic by type according to the channel definition
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Other	All traffic for which no channel is defined
Total	The total traffic ⓘ This channel is the primary channel by default.

## Remarks

Consider the following [remarks](#)<sup>1537</sup> and requirements for this sensor:

Remark	Description
Valid port	This sensor requires a <a href="#">valid port</a> for the connection to the OPC UA server.
Credentials	This sensor requires credentials for OPC UA in the settings of the parent device.
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">low</a> performance impact.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Scanning interval	The minimum scanning interval of this sensor is <a href="#">30 seconds</a> .
Multi-platform probe	You can add this sensor to a multi-platform probe.
Knowledge Base	Knowledge Base: <a href="#">Which OPC UA data types does the OPC UA Custom sensor support?</a>

## Add Sensor

Setting	Description
Channel #1 – #10 Naming Method	<p>Select the naming method for the channels of the sensor:</p> <ul style="list-style-type: none"> <li>▪ Use automatic naming (default): The sensor uses the name provided by the OPC UA node. <ul style="list-style-type: none"> <li> You cannot use automatic naming after sensor creation.</li> </ul> </li> <li>▪ Enter custom name: Enter a custom name in field Channel #1 - #10 Name. <ul style="list-style-type: none"> <li> You can change this value later in the <a href="#">channel settings</a> of this sensor.</li> </ul> </li> </ul>
Channel #1 - #10 Unit	<p>Enter the unit for the numeric value that this sensor monitors.</p> <ul style="list-style-type: none"> <li> You can change this value later in the <a href="#">channel settings</a> of this sensor.</li> </ul>

Setting	Description
Channel #1 – #10 NodeID	<p>Enter the NodeID from which you want to receive numeric data.</p> <p><b>i</b> A NodeID looks like this, for example: <code>ns=1;i=1234</code>, <code>ns=2;s=test_one</code>, or <code>'ns=1;s=test_one'[4]</code>. The sensor supports string identifiers, numeric identifiers, and array syntaxes.</p>
Channel #2 - #10	<p>You can define up to 10 channels. You must define at least one channel, so you see all available settings for Channel #1. Specify how to handle all other possible channels:</p> <ul style="list-style-type: none"> <li>▪ Disable: Do not create this channel.</li> <li>▪ Enable: Create this channel.</li> </ul> <p><b>i</b> It is not possible to enable or disable channels after sensor creation.</p>

### Basic Sensor Settings

#### Basic Sensor Settings

**Sensor Name** i

**Tags** i  x +

Basic Sensor Settings

The sensor has the following **default tags** that are automatically predefined in the sensor's settings when you add the sensor:

- opcua
- opcuacustom

■ For more information about basic sensor settings, see section [Sensor Settings](#) <sup>667</sup>.

### OPC UA Specific

#### OPC UA Specific

**Sensor Message Node ID** i

**Channel #1 Node ID** i

OPC UA Specific

Setting	Description
Sensor Message NodeID	<p>Optionally enter the NodeID from which you want to receive a string that the sensor shows as sensor message.</p> <p><b>i</b> A NodeID looks like this, for example: <code>ns=1;i=1234</code>, <code>ns=2;s=test_one</code>, or <code>'ns=1;s=test_one'[4]</code>. The sensor supports string identifiers, numeric identifiers, and array syntaxes.</p> <p><b>i</b> The sensor only shows the received string if the sensor is in the Up status. If the sensor enters the Down status, the sensor message shows the error message instead.</p>
Channel #x NodeID	<p>The NodeID from which the sensor receives numeric data.</p> <p><b>i</b> A NodeID looks like this, for example: <code>ns=1;i=1234</code>, <code>ns=2;s=test_one</code>, or <code>'ns=1;s=test_one'[4]</code>. The sensor supports string identifiers, numeric identifiers, and array syntaxes.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>

Setting	Description
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Debug Options

**Debug Options**

Result Handling ⓘ

Discard result (default)  
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p><span style="font-size: 0.8em;">☁</span> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p><span style="font-size: 0.8em;">ⓘ</span> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
[Value]	The returned numeric values in up to ten channels

## 7.8.128 OPC UA Server Status Sensor

The OPC UA Server Status sensor monitors the server status, uptime, and diagnostic information of an OPC Unified Architecture (OPC UA) server.

OPC UA Server Status Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: OPC UA Serverstatus
- French: OPC UA statut du serveur
- German: OPC UA Serverzustand
- Japanese: OPC UA サーバーステータス
- Portuguese: Status de servidor OPC UA

- Russian: Состояние сервера OPC UA
- Simplified Chinese: OPC UA 服务器状态
- Spanish: Estado del servidor OPC UA

## Remarks

Consider the following [remarks](#)<sup>1543</sup> and requirements for this sensor:

Remark	Description
Activated server diagnostics on your OPC UA server	This sensor requires activated diagnostic summary information settings on your OPC UA server to create all diagnostic channels. Without activated diagnostic summary information settings, the sensor can only show the server status and the uptime.  <b>i</b> Note that not all vendors support diagnostic summary information.
Valid port	This sensor requires a <a href="#">valid port</a> for the connection to the OPC UA server.
Credentials	This sensor requires credentials for OPC UA in the settings of the parent device.
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">very low</a> performance impact.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Multi-platform probe	You can add this sensor to a multi-platform probe.

- <https://kb.paessler.com/en/topic/61108>

## 7.8.129 Oracle SQL v2 Sensor

The Oracle SQL v2 sensor monitors a database on an Oracle server and executes a query.

- i** The sensor can also process the data table and show the values that you define in individual channels.

Oracle SQL v2 Sensor

- For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: Oracle SQL v2
- French: Oracle SQL v2
- German: Oracle SQL v2
- Japanese: Oracle SQL v2
- Portuguese: Oracle SQL v2
- Russian: Oracle SQL v2
- Simplified Chinese: Oracle SQL v2
- Spanish: Oracle SQL v2

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
SQL query storage	This sensor requires that you store the SQL query in a file on the probe system. In a cluster, copy the file to every cluster node.  ■ For more information, see the Knowledge Base: <a href="#">Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?</a>
.NET 4.7.2 or later	This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node.  ❗ If the framework is missing, you cannot create this sensor.  ■ For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a>
Oracle version	This sensor supports Oracle database servers as of version 10.2
IPv6	This sensor supports IPv6.
Lookups	This sensor can use <a href="#">lookups</a> <sup>[1554]</sup> . Select Lookup as Channel #x Unit and define the lookup file in Channel #x Lookup.
Credentials	Define the credentials for database management systems in settings that are higher in the object hierarchy.
Knowledge Base	<ul style="list-style-type: none"> <li>▪ Knowledge Base: <a href="#">How to set up the SQL v2 sensors in PRTG? Is there a guide?</a></li> <li>▪ Knowledge Base: <a href="#">How can I monitor strings from an SQL database and show a sensor status depending on it?</a></li> <li>▪ Knowledge Base: <a href="#">How can I monitor error tables in SQL databases?</a></li> <li>▪ Knowledge Base: <a href="#">Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?</a></li> </ul>
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Basic Sensor Settings

Basic Sensor Settings

The sensor has the following [default tags](#) that are automatically predefined in the sensor's settings when you add the sensor:

- sqlsensor

■ For more information about basic sensor settings, see section [Sensor Settings](#)<sup>667</sup>.

## Database Specific

### Database Specific

**Identifier** ⓘ orcl

---

**Identification Parameter** ⓘ

SID (default)

SERVICE\_NAME

Database Specific

Setting	Description
Identifier	<p>Enter the <a href="#">Oracle System ID (SID)</a> or the <a href="#">SERVICE_NAME</a> of the database that the sensor connects to. Specify the Identification Parameter below. By default, the sensor uses the SID as the connection string.</p> <p> ⓘ You can find the SID or SERVICE_NAME in the <a href="#">CONNECT_DATA</a> part of the <a href="#">TNSNames.ora</a> file on the Oracle server. For example, a SID can look like this: <code>orcl</code></p>
Identification Parameter	<p>Define the type of identifier that you want to use to connect to the database:</p> <ul style="list-style-type: none"> <li>▪ <b>SID (default):</b> Connect to the database instance using the SID as the connection string.</li> <li>▪ <b>SERVICE NAME:</b> Connect to the database instance using the <a href="#">SERVICE_NAME</a> as the connection string.</li> </ul>

Setting	Description
	<p><b>i</b> The type of identifier that you need to use depends on the configuration of the Oracle server.</p>

## Data

**Data**

**SQL Query File** ⓘ *Demo Serveruptime.sql*

**Input Parameter Handling** ⓘ

Do not use input parameter (default)

Use input parameter

**Transaction Handling** ⓘ

Do not use transaction (default)

Use transaction and always roll back

Use transaction and commit on success

**Data Processing** ⓘ *Only execute query (default)*

**Result Handling** ⓘ

Discard result (default)

Store result

Data

Setting	Description
SQL Query File	<p>Select the SQL query file that includes a valid SQL statement that the sensor executes on the server with every scanning interval. The list contains SQL scripts from the \Custom Sensors\sql subfolder of the <a href="#">PRTG program directory</a> on the probe system. Store your script there. If you use the script on a cluster probe, you must store the script on all cluster nodes.</p> <p>A correct expression in the file could be: <code>SELECT AVG(UnitPrice) FROM Products</code>. If you want to use transactions, separate the individual steps with semicolons ";".</p> <p><b>i</b> Note that with each request, PRTG transfers the full result set, so use filters and limits in your query.</p> <p><b>i</b> The demo script Demo Serveruptime.sql is available by default. You can use it to monitor the uptime of the target server.</p> <p><b>■</b> See also the Knowledge Base: <a href="#">Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?</a></p> <p><b>i</b> You cannot change this value after sensor creation.</p>

Setting	Description
Input Parameter Handling	<p>Define if you want to pass a parameter to the SQL query file:</p> <ul style="list-style-type: none"> <li>▪ Do not use input parameter (default): Execute the SQL query file without using variables.</li> <li>▪ Use input parameter: Execute an SQL query file that contains a variable. Provide the parameter that you want to use in the query below.</li> </ul>
Input Parameter	<p><b>This setting is only visible if you select Use input parameter above.</b></p> <p>Enter the parameter that you want to pass to the SQL query file. This parameter replaces the variables <code>@prtg</code>, <code>:prtg</code>, or <code>?</code> in the SQL query, considering the general rules for SQL variables.</p> <p>You can also use PRTG placeholders for custom sensors (command-line parameters) as input parameters, for example, <code>%sensorid</code> or <code>%deviceid</code>. For more information, see section <a href="#">Custom Sensors</a>.</p> <p><b>i</b> Provide strings as they are and do not surround them with quotation marks. PRTG automatically and correctly inserts string parameters into the query.</p>
Transaction Handling	<p>Define if you want to use transactions and if they affect the database content:</p> <ul style="list-style-type: none"> <li>▪ Do not use transaction (default): Do not execute transactions.</li> <li>▪ Use transaction and always roll back: The query does not change data in the database. In the SQL query file, separate the single steps of the transaction with semicolons.</li> <li>▪ Use transaction and commit on success: The query changes data in the database. The changes only apply if all execution steps succeed without any errors. In the SQL query file, separate the single steps of the transaction with semicolons.</li> </ul>
Data Processing	<p>Define whether the sensor processes data from the database:</p> <ul style="list-style-type: none"> <li>▪ Only execute query (default): Only show information about the number of affected rows and the execution time of the query. Affected rows are rows that were changed by the query (for example, created, deleted, or edited).</li> <li>▪ Count table rows: Execute a <code>SELECT</code> statement and monitor how many rows of the data table this statement returns.</li> <li>▪ Process data table: Read and analyze the data table. If you select this option, the sensor counts rows with <code>SELECT</code> statements as well.</li> </ul> <p><b>i</b> You cannot change this value after sensor creation.</p>

Setting	Description
DBNull Handling	<p><b>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</b></p> <p>Define the sensor behavior if the query returns <b>DBNull</b>:</p> <ul style="list-style-type: none"> <li>▪ Error: Show the Down status if the query returns <b>DBNull</b>.</li> <li>▪ Number 0: Recognize the result <b>DBNull</b> as a valid value and interpret it as the number <b>0</b>.</li> </ul>
Select Channel Value by	<p><b>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</b></p> <p>Define how to select the desired cell in the database table:</p> <ul style="list-style-type: none"> <li>▪ Column number: Determine the channel value by using the value in row 0 of the column whose number you specify in Channel #x Column Number.</li> <li>▪ Column name: Determine the channel value by using the value in row 0 of the column whose name you specify in Channel #x Column Name.</li> <li>▪ Row number: Determine the channel value by using the value in column 0 of the row whose number you specify in Channel #x Row Number.</li> <li>▪ Key value pair: Determine the channel value by searching in column 0 for the key you specify in Channel #x Key and by returning the value in column 1 of the same row where the key value was found.</li> </ul> <p><b>i</b> Defining how the desired cell in the database table is selected is necessary to configure the cells that are used in the channels.</p> <p><b>i</b> The option you select here also defines the method of how to optionally determine a value for the sensor message. For more information, see setting Use Data Table Value in Message.</p> <p><b>■</b> For an example for channel value selection, see section <a href="#">Monitoring Databases</a>.</p>
Channel #2 - #10	<p><b>This setting is only visible if you select Process data table above.</b></p> <p>You can define up to 10 channels. You must define at least one channel, so you see all available settings for <b>Channel #1</b>. Specify how to handle all other possible channels:</p> <ul style="list-style-type: none"> <li>▪ Disable: Do not create this channel.</li> <li>▪ Enable: Create this channel.</li> </ul> <p><b>i</b> It is not possible to enable or disable channels after sensor creation.</p>

Setting	Description
Channel #x Name	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</p> <p>Enter a name for the channel. Enter a string. The sensor dynamically generates channels with this name as identifier.</p> <p><b>i</b> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Channel #x Column Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Column number for the setting Select Channel Value by.</p> <p>Provide the number of the column to use to determine the channel value in row 0. Enter an integer.</p>
Channel #x Column Name	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Column name for the setting Select Channel Value by.</p> <p>Provide the name of the column to use to determine the channel value in row 0. Enter an integer.</p>
Channel #x Row Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Row number for the setting Select Channel Value by.</p> <p>Provide the number of the column to use to determine the channel value in row 0. Enter an integer.</p>
Channel #x Key	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Key value pair for the setting Select Channel Value by.</p> <p>Provide the key to search for in column 0 of the data table. The value in column 1 of the same row where the key value was found to use to determine the channel value. Enter a string.</p>
Channel #x Mode	<p>This setting is only visible if you select Process data table above.</p> <p>Define how to display the determined value in the channel:</p> <ul style="list-style-type: none"> <li>▪ Absolute (default): Show the value as the sensor retrieves it from the data table.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Difference: The sensor calculates and shows the difference between the last and the current value returned from the data table.               <ul style="list-style-type: none"> <li>ⓘ This mode is not compatible with the unit Lookup.</li> <li>ⓘ This mode only works if the difference between the last and the current value is positive and increases with each scanning interval. This mode does not support negative and decreasing values.</li> </ul> </li> <li>▪ Absolute (recommended): Show the value as the sensor retrieves it from the data table.</li> <li>▪ Difference: The sensor calculates and shows the difference between the last and the current value returned from the data table.               <ul style="list-style-type: none"> <li>ⓘ This mode is not compatible with the unit Lookup.</li> <li>ⓘ This mode only works if the difference between the last and the current value is positive and increases with each scanning interval. This mode does not support negative and decreasing values.</li> </ul> </li> <li>ⓘ You cannot change this value after sensor creation.</li> </ul>
<p>Channel #x Unit</p>	<p><a href="#">This setting is only visible if you select Process data table above.</a></p> <p>Define the unit of the channel value:</p> <ul style="list-style-type: none"> <li>▪ BytesBandwidth</li> <li>▪ BytesMemory</li> <li>▪ BytesDisk</li> <li>▪ Temperature</li> <li>▪ Percent</li> <li>▪ TimeResponse</li> <li>▪ TimeSeconds</li> <li>▪ TimeHours</li> <li>▪ Count</li> <li>▪ CPU</li> <li>▪ BytesFile</li> <li>▪ SpeedDisk</li> <li>▪ SpeedNet</li> <li>▪ Custom</li> <li>▪ Lookup</li> </ul> <p> For more information about the available units, see section <a href="#">Custom Sensors</a>.</p>

Setting	Description
	<p><b>i</b> To use <a href="#">lookups</a> with this channel, select Lookup and define the lookup file in Channel #x Lookup. Do not use Custom if you use lookups with this sensor.</p> <p><b>i</b> It is not possible to use the unit Lookup in combination with the Difference mode. You are not able to create the sensor in this case.</p>
Channel #x Custom Unit	<p>This setting is only visible if you select Custom above.</p> <p>Define a unit for the channel value. Enter a string.</p>
Channel #x Lookup	<p>This setting is only visible if you select Lookup above.</p> <p>Select a <a href="#">lookup</a> file that you want to use with this channel.</p>
Use Data Table Value in Message	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</p> <p>Define if the sensor message shows a value from the data table:</p> <ul style="list-style-type: none"> <li>▪ Disable: Do not use a custom sensor message.</li> <li>▪ Enable: Define a custom sensor message with a defined value of the data table. Define the value selection below.</li> </ul> <p><b>i</b> The method of how to determine a value for the sensor message is defined in the setting Select Channel Value by above.</p>
Message Column Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Column name for the setting Select Channel Value by, and if you select Enable above.</p> <p>Enter the number of a column. The sensor message shows the value in row 0 of this column. Enter an integer.</p>
Message Column Name	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Column name for the setting Select Channel Value by, and if you select Enable above.</p> <p>Enter the name of a column. The sensor message shows the value in row 0 of this column. Enter a string.</p> <p><b>i</b> Columns start with index 0.</p>
Message Row Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Row number for the setting Select Channel Value by, and if you select Enable above.</p>

Setting	Description
	<p>Enter the name of a column. The sensor message shows the value in row 0 of this column. Enter the number of a row. The sensor message shows the value in column 0 of this row. Enter an integer.</p> <p><b>i</b> Rows start with index 0.</p>
<p>Message Key</p>	<p><b>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Key value pair for the setting Select Channel Value by, and if you select Enable above.</b></p> <p>Enter a key to search for in column 0 of the data table. The sensor message shows the value in column 1 of the row where the key was found. Enter a string.</p>
<p>Message</p>	<p><b>This setting is only visible if you select Enable above.</b></p> <p>Define the sensor message. Enter a string. Use the placeholder <code>{0}</code> at the position where you want to display the value.</p> <p>Example: <code>The message is {0}</code></p> <p><b>i</b> PRTG does not support the number sign (#) in sensor messages. If a message contains a number sign, PRTG clips the message at this point.</p>
<p>If Message Changes</p>	<p><b>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</b></p> <p>Define what the sensor does when its message changes:</p> <ul style="list-style-type: none"> <li>▪ Ignore (default): Do nothing.</li> <li>▪ Trigger 'change' notification: Send an internal message that indicates a change.</li> </ul> <p><b>i</b> In combination with a <a href="#">change trigger</a>, you can use this to <a href="#">trigger a notification</a> if a change occurs.</p>
<p>Result Handling</p>	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the <code>\Logs\sensors</code> subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are <code>Result of Sensor [ID].txt</code>, <code>Result of Sensor [ID].Data.txt</code>, and <code>Result of Sensor [ID].log</code>. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Affected Rows	The number of rows that were addressed by the query (including <b>SELECT</b> statements if you process data tables)
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Execution Time	The execution time of the entire request (including connection buildup, query execution, transaction handling, disconnection)  <span>ⓘ</span> This channel is the primary channel by default.
Query Execution Time	The execution time of the specified query

## SQL Variables

You can use the following variables in the SQL query file to be replaced by an input parameter. This is useful if you have various SQL sensors with queries that differ in only one parameter.

- Microsoft SQL, MySQL, PostgreSQL: [@prtg](#)
- Oracle SQL: [:prtg](#)
- ADO SQL: [?](#) (question mark)

ⓘ [@prtg](#), [:prtg](#), and [?](#) are common SQL query parameters and they are used in a parameterized SQL query. This means that the query and the parameter are forwarded without any changes to the database. This leads to some restrictions on the database side. For example, you cannot use variables as placeholders for table names or as lists in IN operators.

Examples for variables usage:

```
SELECT * FROM Table WHERE name = @prtg
SELECT @prtg FROM Table
```

## 7.8.130 Oracle Tablespace Sensor

The Oracle Tablespace sensor monitors a tablespace on an Oracle server.

Oracle Tablespace Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>1564</sup>.

### Sensor in Other Languages

- Dutch: Oracle Tablespace
- French: Tablespace Oracle
- German: Oracle Tablespace
- Japanese: Oracle テーブルスペース
- Portuguese: Oracle Tablespace
- Russian: Tablespace Oracle
- Simplified Chinese: Oracle 表空间
- Spanish: Oracle Tablespace

## Remarks

Consider the following [remarks](#) <sup>(1561)</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
Sufficient account privileges	This sensor requires sufficient privileges for the account that you use for the connection.   Use an account for the connection that has the privileges to see all (or specific) views. We recommend that you use the <a href="#">SYSTEM</a> account if possible, otherwise grant your database administrator the <a href="#">SELECT_CATALOG_ROLE</a> to the account that you use. Without sufficient privileges, you might see the error message <a href="#">ORA-00942: table or view does not exist</a> .
.NET 4.7.2 or later	This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node.   If the framework is missing, you cannot create this sensor.   For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a>
Overprovisioning	This sensor does not support overprovisioning.
Oracle version	This sensor supports Oracle database servers as of version 10.2
IPv6	This sensor supports IPv6.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Limits	This sensor has predefined <a href="#">limits</a> for several metrics.
Credentials	Define the credentials for database management systems in settings that are higher in the object hierarchy.
Knowledge Base	Knowledge Base: <a href="#">Why is my Oracle Tablespace sensor showing negative values?</a>
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## 7.8.131 Packet Sniffer Sensor

The Packet Sniffer sensor monitors the headers of data packets that pass a local network card using a built-in packet sniffer. You can choose from predefined channels.

**i** This sensor analyzes only header traffic.

Packet Sniffer Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[1573]</sup>.

### Sensor in Other Languages

- Dutch: Packet Sniffer
- French: Reniflage de paquets
- German: Packet Sniffer

- Japanese: パケットスニファー
- Portuguese: Sniffer de pacotes
- Russian: Анализатор пакетов
- Simplified Chinese: 数据包嗅探程序
- Spanish: Analizador de paquetes

## Remarks

Consider the following [remarks](#)  and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a very high performance impact. We recommend that you use no more than <b>50</b> of this sensor on each probe.
Probe device	By default, this sensor works only on a probe device.
IPv6	This sensor supports IPv6.
Network Mapper	Using Network Mapper (Nmap) on the parent probe system might cause high CPU load. If you have this issue, restarting the PRTG probe service might help.
Knowledge Base	Knowledge Base: <a href="#">How can I change the default groups and channels for flow and Packet Sniffer sensors?</a>
Traffic	By default, you can only monitor traffic passing the probe system where the probe device with the sensor is set up. To monitor other traffic in your network, you can configure a monitoring port (if available) that the switch sends a copy of all traffic to. You can then physically connect this port to a network card of the probe system (either local probe or remote probe system). This way, PRTG can analyze the complete traffic that passes through the switch. This feature of your hardware might be called Switched Port Analyzer (SPAN), port mirroring, or port monitoring.
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Known Issues

- The sensor does not support the Simulate Error Status option in the Context Menu. If you trigger this action, the sensor does not show a simulated Down status.

Include Filter	Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special <a href="#">syntax</a> .
Exclude Filter	First, the sensor considers the filters in Include Filter. From this subset, you can explicitly exclude traffic, using the same syntax.
Channel Definition	<p>Enter a channel definition to divide the traffic into different channels. Enter each definition in one line. The sensor accounts all traffic that you do not define a channel for to the default channel Other.</p> <p> For more information, see section <a href="#">Channel Definitions for Flow, IPFIX and Packet Sniffer Sensors</a>.</p> <p> Extensive use of many filters can cause load problems on the probe system. We recommend that you define specific, well-chosen filters for the data that you really want to analyze. We recommend that you do not use more than 20 channels in graphs and tables, and not more than 100 channels in total. For performance reasons, we recommend that you add several sensors with fewer channels each.</p>

Setting	Description
Network Adapters	<p>Select the network adapters that this sensor monitors. You see a list of all adapters that are available on the probe system. To select an adapter, enable the check box in front of the respective name.</p> <ul style="list-style-type: none"> <li> You can also select all items or cancel the selection by using the check box in the table header.</li> <li> You cannot change this setting if the probe is not connected.</li> </ul>
Stream Data Handling	<p>Define what PRTG does with the stream and packet data:</p> <ul style="list-style-type: none"> <li>▪ Discard stream data (default): Do not store the stream and packet data.</li> <li>▪ Store stream data only for the 'Other' channel: Only store stream and packet data that is not otherwise filtered and is therefore accounted to the default Other channel. PRTG stores this data in the \StreamLog subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Streams Sensor [ID] (1).csv. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> <li>▪ Store all stream data: Store all stream and packet data. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <ul style="list-style-type: none"> <li> Use with caution. It can create huge data files. We recommend that you only use this setting for a short time.</li> <li> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</li> </ul>

## Sensor Display

**Sensor Display**

Primary Channel  Downtime

Graph Type 
 Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <ul style="list-style-type: none"> <li> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</li> </ul>

Setting	Description
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>Show channels independently (default): Show a graph for each channel.</li> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> <li> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

### Primary Toplist

Primary Toplist

Primary Toplist 
Top Connections

Primary Toplist

Setting	Description
Primary Toplist	<p>Define which Toplist is the primary Toplist of the sensor:</p> <ul style="list-style-type: none"> <li>Top Talkers</li> <li>Top Connections</li> <li>Top Protocols</li> <li><a href="#">[Any custom Toplists you add]</a></li> </ul> <p> PRTG shows the primary Toplist in maps when you add a Toplist object.</p>

### Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Toplists

For all Flow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

■ For more information, see section [Toplists](#).

## Filter Rules

The following filter rules apply to all Flow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors.

■ For more information, see section [Filter Rules for Flow, IPFIX, and Packet Sniffer Sensors](#).

Field	Possible Filter Values
IP	IP address or DNS name
Port	Any number
SourceIP	IP address or DNS name
SourcePort	Any number
DestinationIP	IP address or DNS name
DestinationPort	Any number
Protocol	<a href="#">Transmission Control Protocol (TCP)</a> , <a href="#">User Datagram Protocol (UDP)</a> , <a href="#">Internet Control Message Protocol (ICMP)</a> , <a href="#">Open Shortest Path First (OSPF)</a> , any number
ToS	<a href="#">Type of Service (ToS)</a> : any number
DSCP	<a href="#">Differentiated Services Code Point (DSCP)</a> : any number

The following filter rules apply to Packet Sniffer sensors only.

Field	Possible Filter Values
MAC	Physical address
SourceMAC	Physical address

Field	Possible Filter Values
DestinationMAC	Physical address
EtherType	IPV4, ARP, RARP, APPLE, AARP, IPV6, IPXold, IPX, any number
VlanPCP	IEEE 802.1Q VLAN Priority Code Point
VlanID	IEEE 802.1Q VLAN Identifier
TrafficClass	IPv6 Traffic Class: corresponds to TOS used with IPv4
FlowLabel	IPv6 Flow Label

## Channel List

- i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
[Custom]	The traffic by type according to the channel definition
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Other	All traffic for which no channel is defined
Total	The total traffic <b>i</b> This channel is the primary channel by default.

## 7.8.133 PerfCounter Custom Sensor

The PerfCounter Custom sensor monitors a configured set of Windows performance counters. You can define your own channels.

**i** This sensor does not have any predefined channels.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>1587</sup>.

### Sensor in Other Languages

- Dutch: Prestatie Meters Klantspecifiek
- French: Windows PerfCounter personnalisé
- German: Leistungsindikator (benutzerdef.)
- Japanese: パフォーマンスカウンターカスタム
- Portuguese: PerfCounter (customizado)
- Russian: Специальные настройки PerfCounter
- Simplified Chinese: 性能计数器自定义
- Spanish: PerfCounter (personalizado)

### Remarks

Consider the following [remarks](#)<sup>1583</sup> and requirements for this sensor:

Remark	Description
Windows version	This sensor requires <a href="#">at least Windows Server 2008 R2</a> on the probe system (on every cluster node, if on a cluster probe).
Remote Registry Windows service	<p>This sensor requires that the <a href="#">Remote Registry</a> Windows service runs on the target system.</p> <p><b>i</b> If this service does not run, a connection via performance counters is not possible.</p> <p><b>i</b> To enable the service, log in to the respective system and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p>
Credentials	<p>This sensor requires credentials for Windows systems.</p> <p><b>i</b> We recommend that you use Windows domain credentials. If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target system.</p> <p>Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.</p> <p><b>i</b> The user account must be a member of the <a href="#">Performance Monitor Users</a> user group on the target system.</p>
Same name	You cannot add different performance counters with the same name to one sensor.
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">low</a> performance impact.
Angle brackets	If a performance counter contains angle brackets (< or >), do not edit the channel settings because this might cause an error.
Knowledge Base	<ul style="list-style-type: none"> <li>▪ Knowledge Base: <a href="#">How can I find out the names of available performance counters?</a></li> <li>▪ Knowledge Base: <a href="#">My performance counter sensor does not work. What can I do?</a></li> </ul>
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

- performancecountercustom

■ For more information about basic sensor settings, see section [Sensor Settings](#) <sup>667</sup>.

## Performance Counter Settings

Performance Counter Settings

Performance Counters ⓘ

Value Display Mode ⓘ

Performance Counter Settings

Setting	Description
Performance Counters	<p>Enter the performance counters that you want to query. Enter each counter in one line. PRTG creates one channel for each performance counter that you select. Use the following syntax: the name of the counter, followed by two colons (:), and the unit.</p> <p>Example: <code>\Processor(_Total)\% Processor Time::%</code></p> <p> ⓘ You cannot monitor different performance counters with the same name in one sensor. The sensor uses the performance counter as the channel name, so this would create duplicate channels, which PRTG does not support. If you want to monitor different performance counters with the same name, add one sensor for each counter. You can also create a <a href="#">custom sensor</a>. For example, you can write a PowerShell query that connects to the target device, retrieves the desired counters with the <a href="#">Get-Counter</a> cmdlet, and reports them to PRTG as individual channels.</p>

Setting	Description
	<p><b>i</b> If a custom performance counter includes angle brackets (&lt; or &gt;), do not edit the <a href="#">channel settings</a> (for example, limits) after sensor creation. This might lead to a malfunctioning sensor.</p> <p><b>i</b> You cannot change this value after sensor creation.</p>
Value Display Mode	<p>Determine if the sensor displays the returned value as an absolute value or if it displays the difference between the last and the current value:</p> <ul style="list-style-type: none"> <li>Absolute (default): Display the returned value as an absolute value.</li> <li>Difference: Display the difference between last and current value. <ul style="list-style-type: none"> <li><b>i</b> Make sure that all performance counters that you monitor are capable of this mode.</li> </ul> </li> </ul> <p><b>i</b> You cannot change this value after sensor creation.</p>

Timeout (Sec.)	Enter a timeout in seconds for the ping. If the reply takes longer than this value, PRTG cancels the request and shows an error message. Enter an integer. The maximum timeout value is <b>300</b> seconds (5 minutes).
Packet Size (Bytes)	Enter the packet size for the ping in bytes. You can enter any value between <b>1</b> and <b>10000</b> . Enter an integer.   We recommend that you use the default value.
Ping Method	Define the kind of ping check that the sensor performs with each scanning interval: <ul style="list-style-type: none"> <li>▪ <b>Send one single ping:</b> Send a single ping only. The sensor then shows the ping time only.</li> </ul>  This setting is useful for monitoring availability.

Setting	Description
	<ul style="list-style-type: none"> <li>Send multiple ping requests (default): Send multiple pings in a row. The sensor then also shows the minimum and the maximum ping time as well as the packet loss (in percent).                             <ul style="list-style-type: none"> <li><b>i</b> This setting is useful if you want to create reports about average ping times out of a series of ping requests.</li> <li><b>i</b> If you select this setting, all of the ping requests must be lost for the sensor to show the Down <a href="#">status</a>. For example, if only one ping request is answered in a series of five, the sensor still shows the Up status.</li> </ul> </li> </ul>
Ping Count	<p>This setting is only visible if you select Send multiple ping requests (default) <a href="#">above</a>.</p> <p>Enter the number of pings that the sensor sends in a row in one scanning interval. Enter an integer. The default value is <b>5</b>.</p>
Ping Delay (ms)	<p>This setting is only visible if you select Send multiple ping requests (default) <a href="#">above</a>.</p> <p>Enter the time in milliseconds (ms) that the sensor waits between two ping requests. Enter an integer. The default value is <b>5</b>.</p> <ul style="list-style-type: none"> <li><b>i</b> Increase the value if the target device drops ping packets because of denial of service (DoS) suspicion.</li> </ul>
Time to Live (Hops)	<p>Define the time to live (TTL) for the request. You can limit the number of network hops that the request can traverse before it is dropped. The default value is <b>64</b>.</p>

## Sensor Display

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p>

Setting	Description
	<p><b>i</b> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>Show channels independently (default): Show a graph for each channel.</li> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> <li><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Debug Options

**Debug Options**

**Result Handling** 
  
 Discard result (default)
  
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>Discard result (default): Do not store the sensor result.</li> <li>Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Maximum Response Time	The maximum ping time when using more than one ping per interval
Minimum Response Time	The minimum ping time when using more than one ping per interval
Packet Loss	The packet loss when using more than one ping per interval (%)
Response Time	The ping time  This channel is the primary channel by default.
Status	The target status <ul style="list-style-type: none"> <li>▪ Up status: Reachable</li> <li>▪ Down status: Unreachable</li> </ul>  This is the primary channel if you enable Inverted Error Status.

## 7.8.137 Ping Jitter Sensor

The Ping Jitter sensor sends a series of Internet Control Message Protocol (ICMP) echo requests ("pings") to a URI to determine the statistical jitter.

Ping Jitter Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: Ping Jitter
- French: Gigue du Ping
- German: Ping Jitter
- Japanese: Ping ジッター監視
- Portuguese: Jitter Ping
- Russian: Дрожание пинга
- Simplified Chinese: Ping 抖动
- Spanish: Jitter de Ping

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node. If the sensor shows the error PE087, additionally install .NET 3.5 on the probe system.</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
Windows Server	We recommend Windows Server 2016 on the probe system for best performance of this sensor.
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">medium</a> performance impact.

	<ul style="list-style-type: none"> <li>Show channels independently (default): Show a graph for each channel.</li> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.                             <ul style="list-style-type: none"> <li> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Available	<p>The time until a request to a port is accepted</p> <ul style="list-style-type: none"> <li> This channel is the primary channel by default.</li> </ul>
Downtime	<p>In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status</p>

What security features does PRTG include?

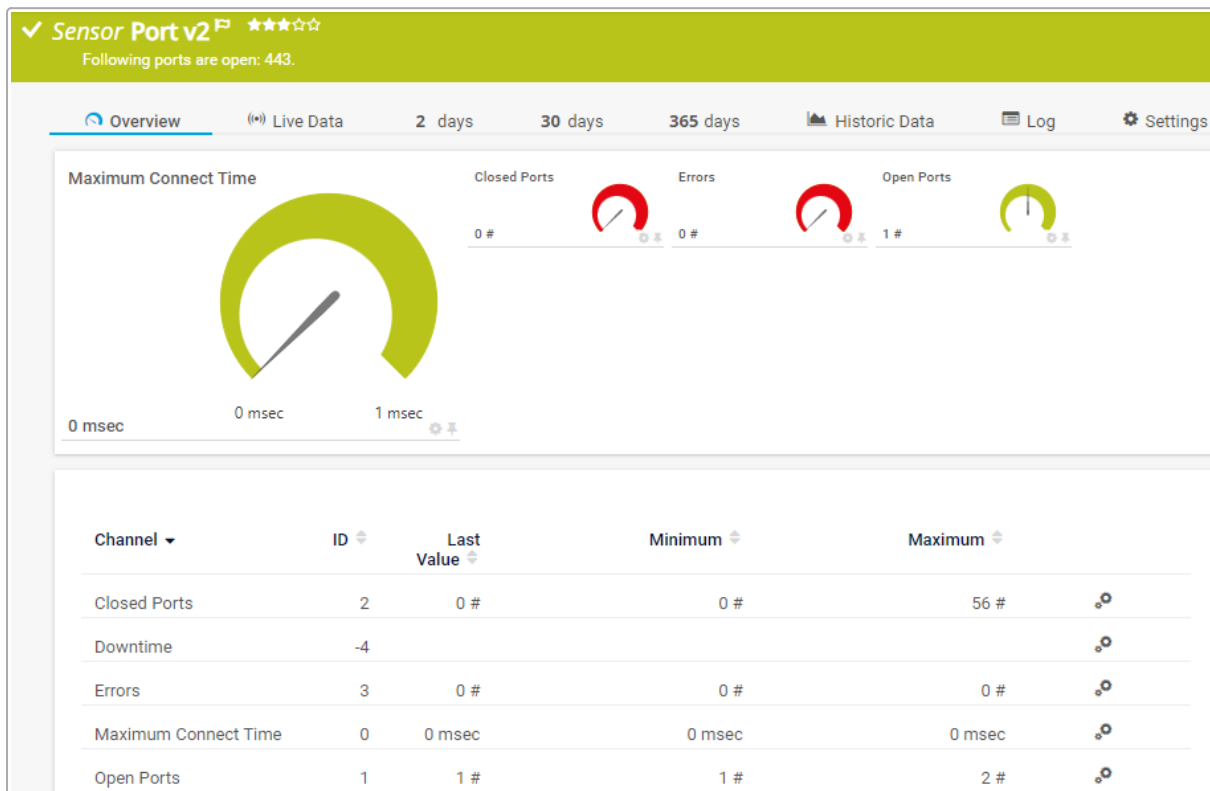

- <https://kb.paessler.com/en/topic/61108>

## 7.8.140 Port v2 Sensor (BETA)

The Port v2 sensor monitors a network service by connecting to one or more of its TCP/IP ports.

**i** Depending on your settings, the sensor can alert you either when the monitored port is open or when it is closed.

**BETA** This sensor is in beta status. The operating methods and the available settings are still subject to change. Do not expect that all functions work properly, or that this sensor works as expected at all.

Port v2 Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: Poort v2
- French: Port v2
- German: Port v2
- Japanese: ポート v2
- Portuguese: Porta v2
- Russian: Порт v2
- Simplified Chinese: Port v2
- Spanish: Puerto v2

## Remarks

Consider the following [remarks](#)<sup>[1627]</sup> and requirements for this sensor:

Remark	Description
Enabled Beta Sensors experimental feature	This sensor requires that the Beta Sensors <a href="#">experimental feature</a> is enabled.  ■ For more information, see the Knowledge Base: <a href="#">What are beta sensors and how can I use them?</a>
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">very low</a> performance impact.
Scanning interval	This sensor has a fixed minimum scanning interval for performance reasons. You cannot use a shorter scanning interval. Consequently, shorter scanning intervals in the <a href="#">Monitoring</a> settings are not available for this sensor.  <ul style="list-style-type: none"> <li>▪ The minimum scanning interval of this sensor is <a href="#">1 minute</a>.</li> <li>▪ The recommended scanning interval of this sensor is <a href="#">5 minutes</a>.</li> </ul>
Multi-platform probe	You can add this sensor to a multi-platform probe.

## Known Issues

- The sensor shows the Unknown state if a sensor scan was executed during the scan of the port list. If this issue occurs, reduce the list of monitored ports or increase the [Scanning Interval](#)<sup>[1630]</sup> of the sensor. The scan of each port takes about two seconds. For example, if you monitor the ports [1-900](#), the sensor needs around 1,800 seconds (30 minutes) to complete the port list.

## Add Sensor

Setting	Description
Goal	Define how the sensor reports on the ports:  <ul style="list-style-type: none"> <li>▪ Open: Shows the Up <a href="#">status</a> if the port is open, and the Down status if the port is closed.</li> <li>▪ Closed: Shows the Up status if the port is closed, and the Down status if the port is open.</li> </ul> <p>❗ You can modify the limits in the channel settings to change the sensor behavior. For more information, see section <a href="#">Channel Settings</a>.</p>

## Basic Sensor Settings

### Basic Sensor Settings

**Sensor Name** ⓘ Example Name

---

**Tags** ⓘ exampletag ✕ ⊕

## 7.8.141 Port Range Sensor

The Port Range sensor monitors a network service by connecting to various TCP/IP ports. It tries to connect to the specified TCP/IP port numbers of a device in succession and waits for the device to accept each request.

- Optionally, you can set limits in the [channel settings](#). This way, you can get alerts about open and closed ports.

Port Range Sensor

- For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

## 7.8.142 PostgreSQL Sensor

The PostgreSQL sensor monitors a database on a PostgreSQL server and executes a query.

- i** The sensor can also process the data table and show the values that you define in individual channels.

PostgreSQL Sensor

- For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>1647</sup>.

### Sensor in Other Languages

- Dutch: PostgreSQL
- French: PostgreSQL
- German: PostgreSQL
- Japanese: PostgreSQL
- Portuguese: PostgreSQL
- Russian: PostgreSQL
- Simplified Chinese: PostgreSQL
- Spanish: PostgreSQL

### Remarks

Consider the following [remarks](#)<sup>1637</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
SQL query storage	<p>This sensor requires that you store the SQL query in a file on the probe system. In a cluster, copy the file to every cluster node. Save the SQL script with the query in the \Custom Sensors\sql\postgresql subfolder of the <a href="#">PRTG program directory</a>.</p> <ul style="list-style-type: none"> <li>■ For more information, see the Knowledge Base: <a href="#">Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?</a></li> </ul>
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node.</p> <ul style="list-style-type: none"> <li>ⓘ If the framework is missing, you cannot create this sensor.</li> <li>■ For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></li> </ul>
PostgreSQL version	This sensor supports as of PostgreSQL 7.x.
IPv6	This sensor supports IPv6.
Lookups	This sensor can use <a href="#">lookups</a> <sup>[1644]</sup> . Select Lookup as Channel #x Unit and define the lookup file in Channel #x Lookup.
Credentials	Define the credentials for database management systems in settings that are higher in the object hierarchy.
Knowledge Base	Knowledge Base: <a href="#">How can I monitor strings from an SQL database and show a sensor status depending on it?</a>
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Database Specific

Setting	Description
Database	Enter the name of the PostgreSQL database to which the sensor connects, for example <a href="#">MyDatabase</a> . This is a logical entity on the database server where database objects exist.
SSL Mode	<p>Select the PostgreSQL Secure Sockets Layer (SSL) mode for the connection:</p> <ul style="list-style-type: none"> <li>▪ Disable: Do not use SSL.</li> <li>▪ Allow: Use SSL if the server demands it.</li> <li>▪ Prefer: Use SSL if the server supports it.</li> <li>▪ Require: Always use SSL and deny the connection if the server does not support it.</li> </ul>

Setting	Description
	<p>The SSL mode options that you can choose are the same as the values of the PostgreSQL <code>sslmode</code> parameter. PRTG sends it with the sensor requests.</p> <ul style="list-style-type: none"> <li><span style="color: red;">❗</span> PostgreSQL SSL connections require OpenSSL to be installed on both the target server and on the probe system.</li> <li><span style="color: blue;">❗</span> For more information about the PostgreSQL SSL modes, refer to the PostgreSQL documentation.</li> </ul>

## Data

**Data**

SQL Query File ⓘ *Demo Serveruptime.sql*

Input Parameter Handling ⓘ  Do not use input parameter (default)  
 Use input parameter

Transaction Handling ⓘ  Do not use transaction (default)  
 Use transaction and always roll back  
 Use transaction and commit on success

Data Processing ⓘ *Only execute query (default)*

Result Handling ⓘ  Discard result (default)  
 Store result

Data

Setting	Description
SQL Query File	<p>Select the SQL query file that includes a valid SQL statement that the sensor executes on the server with every scanning interval. The list contains SQL scripts from the <code>\Custom Sensors\sql</code> subfolder of the <a href="#">PRTG program directory</a> on the probe system. Store your script there. If you use the script on a cluster probe, you must store the script on all cluster nodes.</p> <p>A correct expression in the file could be: <code>SELECT AVG(UnitPrice) FROM Products</code>. If you want to use transactions, separate the individual steps with semicolons <code>;</code>.</p> <ul style="list-style-type: none"> <li><span style="color: blue;">❗</span> Note that with each request, PRTG transfers the full result set, so use filters and limits in your query.</li> <li><span style="color: blue;">❗</span> The demo script <code>Demo Serveruptime.sql</code> is available by default. You can use it to monitor the uptime of the target server.</li> </ul>

Setting	Description
	<p>■ See also the Knowledge Base: <a href="#">Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?</a></p> <p>ⓘ You cannot change this value after sensor creation.</p>
Input Parameter Handling	<p>Define if you want to pass a parameter to the SQL query file:</p> <ul style="list-style-type: none"> <li>▪ Do not use input parameter (default): Execute the SQL query file without using variables.</li> <li>▪ Use input parameter: Execute an SQL query file that contains a variable. Provide the parameter that you want to use in the query below.</li> </ul>
Input Parameter	<p><b>This setting is only visible if you select Use input parameter above.</b></p> <p>Enter the parameter that you want to pass to the SQL query file. This parameter replaces the variables <code>@prtg</code>, <code>:prtg</code>, or <code>?</code> in the SQL query, considering the general rules for SQL variables.</p> <p>You can also use PRTG placeholders for custom sensors (command-line parameters) as input parameters, for example, <code>%sensorid</code> or <code>%deviceid</code>. For more information, see section <a href="#">Custom Sensors</a>.</p> <p>ⓘ Provide strings as they are and do not surround them with quotation marks. PRTG automatically and correctly inserts string parameters into the query.</p>
Transaction Handling	<p>Define if you want to use transactions and if they affect the database content:</p> <ul style="list-style-type: none"> <li>▪ Do not use transaction (default): Do not execute transactions.</li> <li>▪ Use transaction and always roll back: The query does not change data in the database. In the SQL query file, separate the single steps of the transaction with semicolons.</li> <li>▪ Use transaction and commit on success: The query changes data in the database. The changes only apply if all execution steps succeed without any errors. In the SQL query file, separate the single steps of the transaction with semicolons.</li> </ul>
Data Processing	<p>Define whether the sensor processes data from the database:</p> <ul style="list-style-type: none"> <li>▪ Only execute query (default): Only show information about the number of affected rows and the execution time of the query. Affected rows are rows that were changed by the query (for example, created, deleted, or edited).</li> <li>▪ Count table rows: Execute a <b>SELECT</b> statement and monitor how many rows of the data table this statement returns.</li> <li>▪ Process data table: Read and analyze the data table. If you select this option, the sensor counts rows with <b>SELECT</b> statements as well.</li> </ul>

Setting	Description
	<p> You cannot change this value after sensor creation.</p>
DBNull Handling	<p><a href="#">This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</a></p> <p>Define the sensor behavior if the query returns <b>DBNull</b>:</p> <ul style="list-style-type: none"> <li>▪ Error: Show the Down status if the query returns <b>DBNull</b>.</li> <li>▪ Number 0: Recognize the result <b>DBNull</b> as a valid value and interpret it as the number <b>0</b>.</li> </ul>
Select Channel Value by	<p><a href="#">This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</a></p> <p>Define how to select the desired cell in the database table:</p> <ul style="list-style-type: none"> <li>▪ Column number: Determine the channel value by using the value in row 0 of the column whose number you specify in Channel #x Column Number.</li> <li>▪ Column name: Determine the channel value by using the value in row 0 of the column whose name you specify in Channel #x Column Name.</li> <li>▪ Row number: Determine the channel value by using the value in column 0 of the row whose number you specify in Channel #x Row Number.</li> <li>▪ Key value pair: Determine the channel value by searching in column 0 for the key you specify in Channel #x Key and by returning the value in column 1 of the same row where the key value was found.</li> </ul> <p> Defining how the desired cell in the database table is selected is necessary to configure the cells that are used in the channels.</p> <p> The option you select here also defines the method of how to optionally determine a value for the sensor message. For more information, see setting Use Data Table Value in Message.</p> <p> For an example for channel value selection, see section <a href="#">Monitoring Databases</a>.</p>
Channel #2 - #10	<p><a href="#">This setting is only visible if you select Process data table above.</a></p> <p>You can define up to 10 channels. You must define at least one channel, so you see all available settings for <b>Channel #1</b>. Specify how to handle all other possible channels:</p> <ul style="list-style-type: none"> <li>▪ Disable: Do not create this channel.</li> <li>▪ Enable: Create this channel.</li> </ul> <p> It is not possible to enable or disable channels after sensor creation.</p>

Setting	Description
Channel #x Name	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</p> <p>Enter a name for the channel. Enter a string. The sensor dynamically generates channels with this name as identifier.</p> <p><b>i</b> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Channel #x Column Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Column number for the setting Select Channel Value by.</p> <p>Provide the number of the column to use to determine the channel value in row 0. Enter an integer.</p>
Channel #x Column Name	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Column name for the setting Select Channel Value by.</p> <p>Provide the name of the column to use to determine the channel value in row 0. Enter an integer.</p>
Channel #x Row Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Row number for the setting Select Channel Value by.</p> <p>Provide the number of the column to use to determine the channel value in row 0. Enter an integer.</p>
Channel #x Key	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Key value pair for the setting Select Channel Value by.</p> <p>Provide the key to search for in column 0 of the data table. The value in column 1 of the same row where the key value was found to use to determine the channel value. Enter a string.</p>
Channel #x Mode	<p>This setting is only visible if you select Process data table above.</p> <p>Define how to display the determined value in the channel:</p> <ul style="list-style-type: none"> <li>▪ Absolute (default): Show the value as the sensor retrieves it from the data table.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Difference: The sensor calculates and shows the difference between the last and the current value returned from the data table.</li> <li>ⓘ This mode is not compatible with the unit Lookup.</li> <li>ⓘ This mode only works if the difference between the last and the current value is positive and increases with each scanning interval. This mode does not support negative and decreasing values.</li> <li>ⓘ You cannot change this value after sensor creation.</li> </ul>
Channel #x Unit	<p>This setting is only visible if you select Process data table above.</p> <p>Define the unit of the channel value:</p> <ul style="list-style-type: none"> <li>▪ BytesBandwidth</li> <li>▪ BytesMemory</li> <li>▪ BytesDisk</li> <li>▪ Temperature</li> <li>▪ Percent</li> <li>▪ TimeResponse</li> <li>▪ TimeSeconds</li> <li>▪ TimeHours</li> <li>▪ Count</li> <li>▪ CPU</li> <li>▪ BytesFile</li> <li>▪ SpeedDisk</li> <li>▪ SpeedNet</li> <li>▪ Custom</li> <li>▪ Lookup</li> </ul> <p>■ For more information about the available units, see section <a href="#">Custom Sensors</a>.</p> <p>ⓘ To use <a href="#">lookups</a> with this channel, select Lookup and define the lookup file in Channel #x Lookup. Do not use Custom if you use lookups with this sensor.</p> <p>ⓘ It is not possible to use the unit Lookup in combination with the Difference mode. You are not able to create the sensor in this case.</p>
Channel #x Custom Unit	<p>This setting is only visible if you select Custom above.</p> <p>Define a unit for the channel value. Enter a string.</p>

Setting	Description
Channel #x Lookup	<p>This setting is only visible if you select <a href="#">Lookup</a> above.</p> <p>Select a <a href="#">lookup</a> file that you want to use with this channel.</p>
Use Data Table Value in Message	<p>This setting is only visible if you select <a href="#">Process data table</a> for the setting <a href="#">Data Processing</a> during sensor creation.</p> <p>Define if the sensor message shows a value from the data table:</p> <ul style="list-style-type: none"> <li>▪ <b>Disable:</b> Do not use a custom sensor message.</li> <li>▪ <b>Enable:</b> Define a custom sensor message with a defined value of the data table. Define the value selection below.</li> </ul> <p><b>i</b> The method of how to determine a value for the sensor message is defined in the setting <a href="#">Select Channel Value by</a> above.</p>
Message Column Number	<p>This setting is only visible if you select <a href="#">Process data table</a> for the setting <a href="#">Data Processing</a> during sensor creation, if you select <a href="#">Column name</a> for the setting <a href="#">Select Channel Value by</a>, and if you select <a href="#">Enable</a> above.</p> <p>Enter the number of a column. The sensor message shows the value in row 0 of this column. Enter an integer.</p>
Message Column Name	<p>This setting is only visible if you select <a href="#">Process data table</a> for the setting <a href="#">Data Processing</a> during sensor creation, if you select <a href="#">Column name</a> for the setting <a href="#">Select Channel Value by</a>, and if you select <a href="#">Enable</a> above.</p> <p>Enter the name of a column. The sensor message shows the value in row 0 of this column. Enter a string.</p> <p><b>i</b> Columns start with index 0.</p>
Message Row Number	<p>This setting is only visible if you select <a href="#">Process data table</a> for the setting <a href="#">Data Processing</a> during sensor creation, if you select <a href="#">Row number</a> for the setting <a href="#">Select Channel Value by</a>, and if you select <a href="#">Enable</a> above.</p> <p>Enter the name of a column. The sensor message shows the value in row 0 of this column. Enter the number of a row. The sensor message shows the value in column 0 of this row. Enter an integer.</p> <p><b>i</b> Rows start with index 0.</p>
Message Key	<p>This setting is only visible if you select <a href="#">Process data table</a> for the setting <a href="#">Data Processing</a> during sensor creation, if you select <a href="#">Key value pair</a> for the setting <a href="#">Select Channel Value by</a>, and if you select <a href="#">Enable</a> above.</p>

Setting	Description
	Enter a key to search for in column 0 of the data table. The sensor message shows the value in column 1 of the row where the key was found. Enter a string.
Message	<p><b>This setting is only visible if you enable</b> <a href="#">Use Data Table Value in Message above</a>.</p> <p>Define the sensor message. Enter a string. Use the placeholder <code>{0}</code> at the position where you want to display the value.</p> <p>Example: <a href="#">The message is {0}</a></p> <p><b>i</b> PRTG does not support the number sign (#) in sensor messages. If a message contains a number sign, PRTG clips the message at this point.</p>
If Message Changes	<p><b>This setting is only visible if you select</b> <a href="#">Process data table for the setting Data Processing during sensor creation</a>.</p> <p>Define what the sensor does when its message changes:</p> <ul style="list-style-type: none"> <li>Ignore (default): Do nothing.</li> <li>Trigger 'change' notification: Send an internal message that indicates a change. <ul style="list-style-type: none"> <li><b>i</b> In combination with a <a href="#">change trigger</a>, you can use this to <a href="#">trigger a notification</a> if a change occurs.</li> </ul> </li> </ul>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>Discard result (default): Do not store the sensor result.</li> <li>Store result: Store the last sensor result in the <code>\Logs\sensors</code> subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are <code>Result of Sensor [ID].txt</code>, <code>Result of Sensor [ID].Data.txt</code>, and <code>Result of Sensor [ID].log</code>. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel **i** Downtime

---

Graph Type **i** 
 Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Affected Rows	The number of rows that were addressed by the query (including <b>SELECT</b> statements if you process data tables)

Channel	Description
Execution Time	The execution time of the entire request (including connection buildup, query execution, transaction handling, disconnection)   This channel is the primary channel by default.
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Query Execution Time	The execution time of the specified query

## SQL Variables

You can use the following variables in the SQL query file to be replaced by an input parameter. This is useful if you have various SQL sensors with queries that differ in only one parameter.

- Microsoft SQL, MySQL, PostgreSQL: @prtg
- Oracle SQL: :prtg
- ADO SQL: ? (question mark)

 @prtg, :prtg, and ? are common SQL query parameters and they are used in a parameterized SQL query. This means that the query and the parameter are forwarded without any changes to the database. This leads to some restrictions on the database side. For example, you cannot use variables as placeholders for table names or as lists in IN operators.

Examples for variables usage:

```
SELECT * FROM Table WHERE name = @prtg
SELECT @prtg FROM Table
```

## 7.8.143 Probe Health Sensor

The Probe Health sensor monitors internal PRTG parameters. It shows the status of the probe system and checks various parameters of the probe system that can affect the quality of the monitoring results.

**i** This sensor does not support multi-platform probes. Use the [Multi-Platform Probe Health<sup>1347</sup>](#) sensor instead.

Probe Health Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List<sup>1651</sup>](#).

### Sensor in Other Languages

Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Data Storage Free	<p>The free disk space on the probe system</p> <p><b>i</b> PRTG dynamically creates limits for this channel. This means that Enable alerting based on limits is enabled in the <a href="#">channel settings</a> but the limits are empty. Because of this, you cannot save any changes to the channel settings. Enter limits or select Disable limits to save changes to the channel settings.</p>
Downtime	<p>In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status</p>
Handles	<p>The counter for the data structures of the operating system. It is responsible for internal resource management. Investigate obviously increasing values that occur repeatedly.</p>
Health	<p>The sum of the probe state as a value between 100% (healthy) and 0% (failing). Investigate frequent or repeated health values below 100%.</p> <p><b>i</b> This channel is the primary channel by default.</p>
Interval Delay non-WMI&SNMP	<p>The interval delay in percent for all sensors that are not of the type SNMP or WMI. If this value is above 0%, try to increase the <a href="#">scanning intervals</a> or distribute your sensors among <a href="#">probes</a>.</p> <p><b>i</b> This channel has default limits:</p> <ul style="list-style-type: none"> <li>▪ Upper error limit: 100%</li> <li>▪ Upper warning limit: 50%</li> </ul>
Interval Delay SNMP	<p>The interval delay in percent for SNMP sensors. If this value is above 0%, there are probably too many SNMP v3 sensors that are very slow. In this case, try to increase the scanning intervals or distribute the sensors among probes.</p> <p><b>i</b> This channel has default limits:</p> <ul style="list-style-type: none"> <li>▪ Upper error limit: 100%</li> <li>▪ Upper warning limit: 50%</li> </ul>
Interval Delay WMI	<p>The interval delay in percent for WMI sensors. If this value is above 0%, WMI sensors were not able to check the target device according to their interval. 100% means that WMI sensors are checked with twice their interval on average. For values above 0%, try to increase the scanning intervals or distribute the sensors among probes to keep the number of WMI sensors per probe below 120 (with a 60-second scanning interval) or 600 (with a 300-second scanning interval).</p>

Channel	Description
	<p><b>i</b> This channel has default limits:</p> <ul style="list-style-type: none"> <li>▪ Upper error limit: <b>100%</b></li> <li>▪ Upper warning limit: <b>50%</b></li> </ul>
Lost Flow Packets	<p>The number of lost <b>Flow</b> packets. The higher this value, the less flow packages PRTG can handle. Usually, this value should be <b>0%</b>. Investigate increasing values.</p> <p><b>i</b> This channel has default limits:</p> <ul style="list-style-type: none"> <li>▪ Upper error limit: <b>10%</b></li> <li>▪ Upper warning limit: <b>1%</b></li> </ul>
Memory Usage	<p>The amount of memory that is used by the PRTG probe service as reported by the memory manager. Investigate obviously increasing values that occur repeatedly. If the value is constantly above <b>2 GB</b>, this indicates that PRTG runs at its limits. In this case, you should distribute some sensors among <b>remote probes</b>.</p> <p><b>i</b> This channel has default limits:</p> <ul style="list-style-type: none"> <li>▪ Upper error limit: <b>3221225472 bytes</b></li> <li>▪ Upper warning limit: <b>1610612736 bytes</b></li> </ul>
Message Queue	<p>The number of monitoring results that have not been processed by the PRTG core server yet. This value should usually stay below <b>1/10</b> of the sensor count.</p>
Open Requests	<p>The number of active monitoring requests. This value should stay below the maximum of <b>500</b> open requests.</p> <p><b>i</b> This channel has default limits:</p> <ul style="list-style-type: none"> <li>▪ Upper error limit: <b>400</b></li> <li>▪ Upper warning limit: <b>100</b></li> </ul>
Probe Process CPU Load	<p>The CPU load (%) that the probe process causes. Extensive CPU load can lead to false, incomplete, and incorrect monitoring results. This value should usually stay below <b>50%</b>.</p>
Syslog Buffer	<p>The number of buffered syslog packages. Usually, this value should be <b>0</b> (or very low). Investigate increasing values.</p>
Syslog Drop	<p>The number of dropped syslog packages</p>

Channel	Description
Threads	<p>The number of program parts that are running simultaneously. This value can increase with heavy load. Usually, the number should not exceed <a href="#">100</a>.</p> <p><b>i</b> This channel has default limits:</p> <ul style="list-style-type: none"> <li>▪ Upper error limit: <a href="#">1400</a></li> <li>▪ Upper warning limit: <a href="#">1000</a></li> </ul>
Toplist Memory	<p>The amount of RAM that the <a href="#">Toplists</a> on this probe are using. Stay below <a href="#">1 GB</a> memory usage (depending on the available memory on the probe system). If necessary, reduce the number of Toplists or distribute them among probes.</p> <p><b>i</b> This channel has default limits:</p> <ul style="list-style-type: none"> <li>▪ Upper error limit: <a href="#">2147483648 bytes</a></li> <li>▪ Upper warning limit: <a href="#">1073741824 bytes</a></li> </ul>
Trap Buffer	<p>The number of buffered SNMP traps. Usually, this value should be <a href="#">0</a> (or very low). Investigate increasing values.</p>

My probe system is running out of disk space. What can I do?

- <https://kb.paessler.com/en/topic/64628>

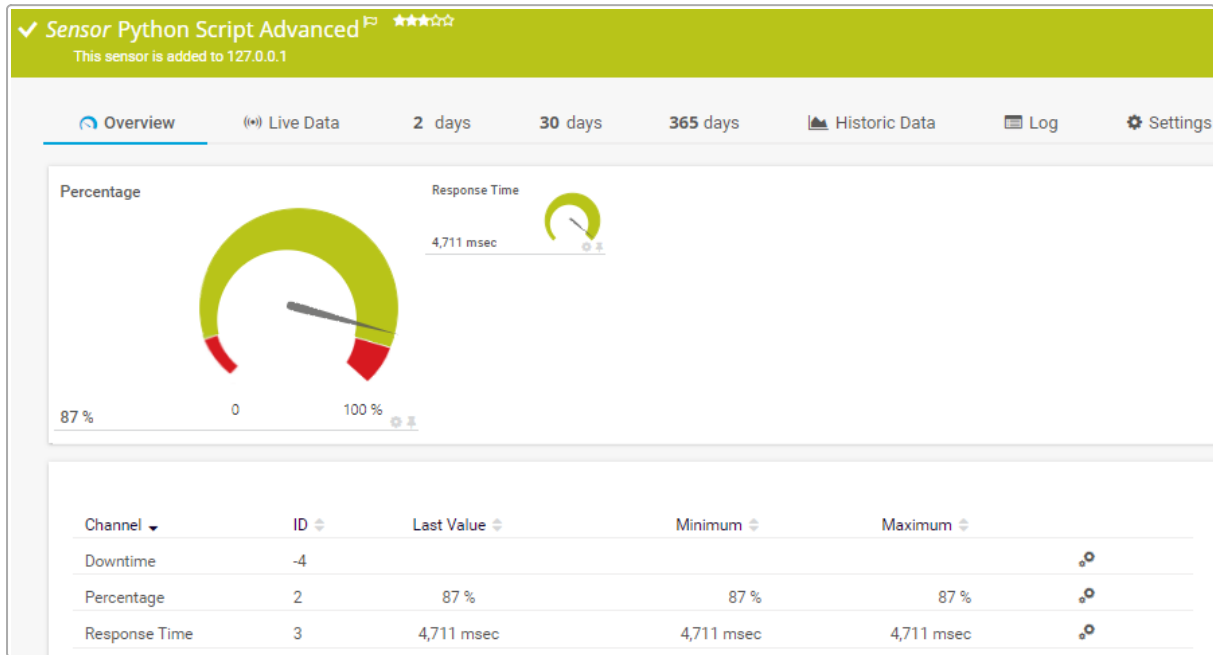

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

## 7.8.144 Python Script Advanced Sensor

The Python Script Advanced sensor executes a Python script on the probe system. This option is available as part of the PRTG API.

- i The return value of this sensor must be valid JavaScript Object Notation (JSON) or Extensible Markup Language (XML).

Python Script Advanced Sensor

- For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: Python Script Geavanceerd
- French: Script Python avancé
- German: Python-Skript (Erweitert)
- Japanese: Python スクリプト( 上級)
- Portuguese: Script Python (avançado)
- Russian: Скрипт Python (дополнительно)
- Simplified Chinese: Python 脚本高级
- Spanish: Script Python (avanzado)

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
File storage	This sensor requires that you store the script file on the probe system. In a cluster, copy the file to every cluster node.
Windows Server	We recommend Windows Server 2016 on the probe system for best performance of this sensor.
Channels	This sensor does not officially support more than <a href="#">50 channels</a> . This sensor does not support channel values greater than 2^62.
Print commands	This sensor does not support print commands in the Python script. They lead to an invalid JSON result.
Exceptions	This sensor does not support exceptions in the Python script.
Python environment	PRTG uses its own Python environment. This is located in the \python subfolder of the PRTG program directory. To avoid issues, we recommend that you do not have other Python environments running on a probe system. We also recommend that you do not uninstall the paesslerag_prtg_sensor_api package.
Timeout	The timeout of the sensor is its <a href="#">scanning interval</a> <sup>1662</sup> minus 1 second. Make sure that your Python script does not run longer than this.
Sensor usage	For best sensor usage, we recommend that the return value is JSON encoded.
Performance impact	This sensor has a <a href="#">medium</a> performance impact.
Knowledge Base	<ul style="list-style-type: none"> <li>▪ Knowledge Base: <a href="#">What is the Mutex Name in the EXE/Script sensor settings?</a></li> <li>▪ Knowledge Base: <a href="#">Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?</a></li> <li>▪ Knowledge Base: <a href="#">After updating to PRTG 20.1.55, my Python Script Advanced sensors are down</a></li> </ul>
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

 Use Windows credentials from parent device

Device Credentials ⓘ  
 Do not transmit device credentials (default)  
 Transmit Windows credentials  
 Transmit Linux credentials  
 Transmit SNMP credentials  
 Transmit all device credentials

Additional Parameters ⓘ

Mutex Name ⓘ

Sensor Settings

Setting	Description
Script	<p>Select a Python script from the list. The sensor executes it with every <a href="#">scanning interval</a> <sup>1662</sup>.</p> <p>This list shows all Python script files that are available in the \Custom Sensors\python subfolder of the <a href="#">PRTG program directory</a> on the probe system. For the files to appear in this list, store the files in this subfolder with the extension <a href="#">.py</a>.</p> <p><span style="color: #c00000;">ⓘ</span> To show the expected values and sensor status, your files must return the expected XML or JSON format to standard output. The values and message must be embedded in the XML or JSON. We recommend JSON-encoded return values.</p> <p><span style="color: #0070c0;">■</span> For more information on how to create custom sensors and for the return format, see section <a href="#">Custom Sensors</a>.</p> <p><span style="color: #c00000;">ⓘ</span> If you use custom sensors on the <a href="#">cluster probe</a>, copy your files to every cluster node.</p> <p><span style="color: #c00000;">ⓘ</span> You cannot change this value after sensor creation.</p>
Security Context	<p>Define the Windows user account that the sensor uses to run the Python interpreter:</p> <ul style="list-style-type: none"> <li>▪ Use security context of PRTG probe service (default): Run the Python script file under the same Windows user account that the probe system runs under. By default, this is the Windows system user account.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>Use Windows credentials from parent device: Use the Windows user account from the <a href="#">settings of the parent device</a>.</li> </ul>
Device Credentials	<p>PRTG adds the device credentials to the JSON object that is passed to the script as a command-line parameter. Define if you want to transmit device credentials to the Python script:</p> <ul style="list-style-type: none"> <li>Do not transmit device credentials: Transmit no device credentials to the script.</li> <li>Transmit Windows credentials: Transmit <a href="#">Windows credentials</a> to the script.</li> <li>Transmit Linux credentials: Transmit <a href="#">Linux credentials</a> to the script.</li> <li>Transmit SNMP credentials: Transmit <a href="#">SNMP credentials</a> to the script.</li> <li>Transmit all device credentials: Transmit Windows, Linux, and Simple Network Management Protocol (SNMP) credentials to the script.</li> </ul> <p><b>i</b> The sensor transmits all parameters in plain text.</p>
Additional Parameters	<p>Define additional parameters to add to the JSON object that is passed to the script as a command-line parameter. Enter a string or leave the field empty.</p> <p><b>i</b> The sensor passes a custom JSON object within a dictionary to the script. The dictionary contains the key <a href="#">params</a> that contains all additional parameters in one string.</p> <p>Use the following command to load the dictionary that the sensor sends to the script:</p> <pre>data = json.loads(sys.argv[1])</pre> <p>Use the following command to load the additional parameters:</p> <pre>params = json.loads(data["params"])</pre> <p><b>i</b> If the string contains more than one parameter, you can use the <a href="#">Split()</a> function in Python to split the string.</p> <p><b>i</b> The sensor transmits all parameters in plain text.</p>
Mutex Name	<p>Define a mutual exclusion (mutex) name for the process. Enter a string or leave the field empty.</p> <p><b>i</b> PRTG executes all Python Script Advanced sensors that have the same mutex serially, not simultaneously. This is useful if you use a lot of sensors and want to avoid high resource usage because of simultaneously running processes.</p> <p><b>■</b> See the Knowledge Base: <a href="#">What is the Mutex Name in the EXE/Script sensor settings?</a></p>

## Debug Options

**Debug Options**

**Result Handling** ⓘ  Discard result (default)  
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].Data.txt and Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p> ⓘ You can use Store result to inspect the passed JSON object that contains all parameters. This way, you can find out which key you can access when you script.</p> <p> ☁ This option is not available in PRTG Hosted Monitor.</p> <p> ⓘ PRTG masks transmitted passwords in the log file.</p> <p> ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

- Russian: Одностороннее качество обслуживания
- Simplified Chinese: QoS (服务质量) 单向

- Spanish: Unidireccional QoS (calidad de servicio)

## Remarks

Consider the following [remarks](#) <sup>1665</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <b>high</b> performance impact. We recommend that you use no more than <b>200</b> of this sensor on each probe.
Remote probe	This sensor requires that you configure at least one <a href="#">classic remote probe</a> in your PRTG Network Monitor setup, and at least two classic remote probes in PRTG Hosted Monitor.
IPv4	This sensor only supports IPv4.
Sensor creation	You can create this sensor on the probe device of a local probe or a classic remote probe.
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

<b>Quality of Service Measurement</b>	
Timeout (Sec.) ⓘ	60
Target Probe ⓘ	Local Probe ▾
Target Host/IP Address ⓘ	127.0.0.1
Port ⓘ	50000
Number of Packets ⓘ	1000
Packet Size (Bytes) ⓘ	172
Packet Delay (ms) ⓘ	20
<p><small>Use "Windows Policy-based Quality of Service" if you need to apply QoS parameters to the test packets of this sensor (for example, DSCP parameters). These parameters cannot be set from inside PRTG. See <a href="https://technet.microsoft.com/en-us/library/hh831689.aspx">https://technet.microsoft.com/en-us/library/hh831689.aspx</a> and <a href="https://msdn.microsoft.com/library/aa374094.aspx">https://msdn.microsoft.com/library/aa374094.aspx</a> for details.</small></p>	

Quality of Service Measurement

Setting	Description
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer. The maximum timeout value is <b>900</b> seconds (15 minutes).</p> <p> ⓘ If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
Target Probe	<p>Define the target probe that receives the UDP packets. The dropdown list shows all local probes and remote probes in your setup.</p> <p>If you want to run the sensor on the local probe, select a remote probe as the Target Probe. If no remote probe is available, <a href="#">install and connect a remote probe</a> first.</p> <p>If you want to run the sensor on a remote probe, select either a different remote probe or the local probe as the target. The sensor measures values for the network track between the parent probe and the target probe.</p> <p> ⓘ You must make sure that firewalls or network address translation (NAT) rules allow UDP packets to reach the target probe. The probe automatically opens the Windows firewall on the target system.</p> <p> ☁ In PRTG Hosted Monitor, you can only select a different remote probe as the target probe. QoS measurements for connections to the hosted probe are not possible.</p>
Target Host/IP Address	Define the IP address of the target probe.
Port	Define the <b>source</b> and <b>target</b> port for the UDP packets. Both the source probe and the target probe use this port. Enter an integer. The default port is <b>50000</b> . PRTG supports the port numbers <b>1024-65536</b> for UDP packets.

Setting	Description
	<ul style="list-style-type: none"> <li><span style="color: red;">❗</span> Use a different port for each QoS (Quality of Service) One Way sensor to make sure that PRTG can assign packets correctly.</li> <li><span style="color: red;">❗</span> The port must be available on both the source system and the target system.</li> </ul>
Number of Packets	<p>Define the number of packets that the sensor sends with each scanning interval. Enter an integer. The default value is <b>1000</b>. The minimum value is <b>10</b>. The maximum value is <b>1000</b>.</p> <p><span style="color: blue;">❗</span> We recommend that you use the default value.</p>
Packet Size (Bytes)	<p>Define the size of the packets in bytes that the sensor sends. Enter an integer. The default value is <b>172</b>. The minimum value is <b>172</b>. The maximum value is <b>4500</b>.</p> <p><span style="color: blue;">❗</span> We recommend that you use the default value.</p>
Packet Delay (ms)	<p>Define the time in milliseconds (ms) that the sensor waits between two packets. Enter an integer. The default value is <b>20</b>. The minimum value is <b>10</b>. The maximum value is <b>1000</b>.</p> <p><span style="color: blue;">❗</span> We recommend that you use the default value.</p>

## Sensor Display

**Sensor Display**

## 7.8.146 QoS (Quality of Service) Round Trip Sensor

The QoS (Quality of Service) Round Trip sensor monitors parameters regarding the quality of a network connection between two probes.

**i** The sensor sends a series of User Datagram Protocol (UDP) packets from the source probe to a target probe at the end of the connection line. Then, the target probe sends the packets back to the source probe.

QoS (Quality of Service) Round Trip Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>1670</sup>.

### Sensor in Other Languages

- Dutch: QoS (Quality of Service) Heen en weer
- French: QoS (qualité de service) aller-retour
- German: QoS (Quality of Service) Round Trip
- Japanese: ラウンドトリップ QoS( Quality of Service)

- Portuguese: Ida e volta QoS (qualidade de serviço)
- Russian: Цикл тестирования качества обслуживания
- Simplified Chinese: QoS (服务质量) 往返
- Spanish: Ida y vuelta QoS (calidad de servicio)

## Remarks

Consider the following [remarks](#) <sup>1672</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
Remote probe	This sensor requires that you configure at least one <a href="#">classic remote probe</a> in your PRTG Network Monitor setup and at least two classic remote probes in PRTG Hosted Monitor, or you must set up the <a href="#">PRTG QoS Reflector</a> tool on the target system at the endpoint of the connection that you want to monitor.
Cluster probe	This sensor does not support cluster probes. You can only set it up on local probes or remote probes.
IPv4	This sensor only supports IPv4.

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select Stack channels on top of each other above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Response Time	The response time ⓘ This channel is the primary channel by default.

## 7.8.149 Redfish Power Supply Sensor

The Redfish Power Supply sensor monitors the power supply of a Redfish Scalable Platforms Management API (Redfish)-capable server.

Redfish Power Supply Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: Redfish Voeding
- French: Redfish alimentation
- German: Redfish Stromversorgung
- Japanese: Redfish 電源
- Portuguese: Fonte de alimentação Redfish
- Russian: Блок питания Redfish
- Simplified Chinese: Redfish 电源
- Spanish: Suministro de alimentación Redfish

## Remarks

Consider the following [remarks](#)<sup>1690</sup> and requirements for this sensor:

Remark	Description
Credentials	This sensor requires credentials for Redfish in settings that are higher in the <a href="#">object hierarchy</a> .
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">very low</a> performance impact.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Limits	This sensor has predefined <a href="#">limits</a> for several metrics.
Redfish support	Supporters of the Redfish standard include <a href="#">Dell</a> , <a href="#">Eaton</a> , <a href="#">Emerson</a> , <a href="#">Fujitsu</a> , <a href="#">HPE</a> , <a href="#">Intel</a> , <a href="#">Lenovo</a> , <a href="#">NetApp</a> , <a href="#">Supermicro</a> , and <a href="#">VMware</a> .
Multi-platform probe	You can add this sensor to a multi-platform probe.

## 7.8.152 REST Custom Sensor

The REST Custom sensor queries a Representational State Transfer (REST) application programming interface (API) endpoint and maps the JavaScript Object Notation (JSON) or Extensible Markup Language (XML) result to sensor values.

- i** The mapping rule must be available as a REST configuration file in JSON template (\*.template) format according to the PRTG API definition for custom sensors.

REST Custom Sensor

- For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[1726]</sup>.

### Sensor in Other Languages

- Dutch: REST Aangepast
- French: REST personnalisé
- German: REST (Benutzerdef.)
- Japanese: REST カスタム
- Portuguese: REST (customizado)

- Russian: Специальные настройки REST
- Simplified Chinese: REST 自定义
- Spanish: REST (personalizado)

## Remarks

Consider the following [remarks](#)<sup>1709</sup> and requirements for this sensor:

Remark	Description
File storage	The sensor requires that you store the REST configuration file that contains the mapping rules on the probe system. In a cluster, copy the file to every cluster node.
Channels	This sensor does not officially support more than <a href="#">50 channels</a> . If there are more than 50 channel mappings in the REST configuration file, the sensor shows an error.
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">medium</a> performance impact.
Cluster	In a cluster, status changes triggered by limits only work on the master node.
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Authentication Method	<p>Select the authentication method for access to the REST API:</p> <ul style="list-style-type: none"> <li>▪ No authentication (default): Do not use any authentication for the request.</li> <li>▪ Basic authentication: Use a user name and password for authentication.</li> <li>▪ Basic authentication with Windows credentials from parent device: Use the Windows credentials from the parent device.  <input type="checkbox"/> For more information, see section <a href="#">Inheritance of Settings</a>.</li> <li>▪ Token: Use a <a href="#">JSON Web Token (JWT)</a> or <a href="#">OAuth2 Bearer Token</a> for authentication.</li> </ul>
User Name	<p><a href="#">This setting is only visible if you select Basic authentication above.</a></p> <p>Enter a user name for the REST API. Enter a string.</p>
Password	<p><a href="#">This setting is only visible if you select Basic authentication above.</a></p> <p>Enter a password for the REST API. Enter a string.</p>
Token	<p><a href="#">This setting is only visible if you select Token above.</a></p> <p>Enter a JWT or OAuth2 Bearer Token that the REST API requires for authentication.</p>
HTTP Headers	<p>Define if you want to send custom HTTP headers to the target URL:</p> <ul style="list-style-type: none"> <li>▪ Do not send custom HTTP headers</li> <li>▪ Send custom HTTP headers</li> </ul>
Custom HTTP Headers	<p><a href="#">This setting is only visible if you select Send custom HTTP headers above.</a></p>

Setting	Description
	<p>Enter a list of custom HTTP headers with their respective values that you want to transmit to the target URL, each pair in one line. The syntax of a header-value pair is <code>header1:value1</code>.</p> <ul style="list-style-type: none"> <li><span style="color: red;">❗</span> If you enter more than one header-value pair, you must separate them with delimiters. The syntax is <code>header1:value1 header2:value2 header3:value3</code></li> <li><span style="color: red;">❗</span> The sensor does not support the header field names <code>user-agent</code>, <code>content-length</code>, <code>host</code>.</li> <li><span style="color: red;">❗</span> Make sure that the HTTP header statement is valid. Otherwise, the sensor request cannot be successful.</li> <li><span style="color: red;">❗</span> If you select the POST as Request Method setting above, enter the content type, for example <code>application/x-www-form-urlencoded</code>, as the custom HTTP header.</li> </ul>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer. The maximum timeout value is <code>900</code> seconds (15 minutes).</p> <ul style="list-style-type: none"> <li><span style="color: red;">❗</span> If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</li> </ul>
REST Query	<p>The REST query that this sensor executes. To change it, enter a valid query for the target REST API. The syntax is: <code>[:port]/path[?var1=val1&amp;...]</code></p> <ul style="list-style-type: none"> <li><span style="color: red;">❗</span> The sensor always inherits the first part of the address from the address of the parent device. Only enter the path to the REST endpoint of the parent device. You can override the port if necessary.</li> </ul> <p>For example, if you add the sensor to a probe device, a query to the REST API of your PRTG installation that returns the number of sensors on the probe could look like this:</p> <pre style="background-color: #f0f0f0; padding: 5px;">/api/table.json? id=1&amp;passhash=&lt;passhash&gt;&amp;username=&lt;username&gt;&amp;content=sensorx ref&amp;noraw=1&amp;filter_basetype=probe&amp;columns=totalsens=extraw</pre>
REST Configuration	<p>Select a REST configuration file from the list. The sensor uses it to map the JSON or XML result from the REST query to sensor values.</p> <p>The default REST configuration file is <code>channelDiscovery</code>. If you select this file, the sensor parses the returned JSON or XML and automatically creates channels based on available values: one channel for each number and boolean for strings if they are convertible into numbers.</p> <p>This list shows all REST configuration files that are available in the <code>\Custom Sensors\rest</code> subfolder of the <a href="#">PRTG program directory</a> on the probe system. For the files to appear in this list, store the files as JSON template (*.template) in this subfolder.</p>

Setting	Description
	<p>☁ To use custom REST configurations in PRTG Hosted Monitor, <a href="#">contact the Paessler support team</a>, or add this sensor to a remote probe instead and save the file on the remote probe system.</p> <p>❗ To show the expected values and sensor status, your files must return the expected JSON format. Channels, values, and messages must be embedded in valid JSON using JSONPath. For more information, see section <a href="#">Define Channels and Select Channel Values</a> <sup>1714</sup>.</p> <p>■ For more information on how to create custom sensors and for the return format, see section <a href="#">Custom Sensors</a>.</p> <p>❗ If you use custom sensors on the <a href="#">cluster probe</a>, copy your files to every cluster node.</p>

## Debug Options

**Debug Options**

Result Handling ⓘ

Discard result (default)  
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>❗ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Define Channels and Select Channel Values

In your REST configuration file, you must define which values of the returned JSON or XML are mapped to which channels.

- A channel is defined by the channel key in your REST configuration. See the JSON Return Format: Minimum Example in section [Custom Sensors](#).
- A channel value is defined by an expression that retrieves and processes the value from the JSON source. The expression can contain [JSONPath](#)<sup>[1716]</sup>, [gval operators](#)<sup>[1720]</sup>, and [functions](#)<sup>[1722]</sup>.

### Example

For this example, we take PRTG as REST endpoint and query the sensor status statistics for the local probe. The REST query that we enter in the sensor settings looks like this:

```
/api/table.json?id=1&passhash=<passhash>&username=<username>&content=sensorxref&
noraw=1&filter_basetype=probe&columns=totalsens=extraw,upsens=extraw,
downsens=extraw,partialdownsens=extraw,warnsens=extraw,pausedsens=extraw,
unusualsens=extraw,undefinedsens=extraw,downacksens=extraw
```

This REST query returns some JSON, for example:

```
{
  "prtg-version": "17.3.33.2517",
  "treesize": 1,
  "state": "ok",
  "sensorxref": [
    {
      "totalsens": 28,
      "upsens": 18,
      "downsens": 0,
      "partialdownsens": 0,
      "warnsens": 0,
      "pausedsens": 9,
      "unusualsens": 1,
      "undefinedsens": 0,
      "downacksens": 0
    }
  ]
}
```

Your REST configuration has to translate this JSON for the sensor. It has to be available as JSON template (\*template) in the \Custom Sensors\rest subfolder of the [PRTG program directory](#) on the probe system. See section [Custom Sensors](#) for details about the JSON return format.

The following example returns two channels from the JSON resource that are added to the sensor in PRTG, Total (total sensor count) and Alarms (sensors in the Down status), each selected by their keys in the returned JSON.

```
{
  "prtg": {
    "result": [
      {
        "channel": "Total" ,
        "value": $.sensorxref[0].totalsens
      },
      {
        "channel": "Alarms" ,
        "value": $.sensorxref[0].downsens
      }
    ]
  }
}
```

The channel values are the values of the corresponding properties of the REST result defined in JSONPath notation, [\\$.sensorxref\[0\].totalsens](#) (28) and [\\$.sensorxref\[0\].downsens](#) (0).

Each value's property (destination) and the text property is set to the appropriate transformation rules from source to destination. This is the JSON path of the source. The sensor replaces each path with the value from the source.

- ⓘ Several REST configuration files are available in the \Custom Sensors\rest subfolder by default. They are ready for use. You can also analyze them to see how to write your own REST configuration.

## JSONPath

The REST Custom sensor uses [JSONPath](#) to assign values from the returned JSON to channels. With JSONPath, you provide the path to the value in the JSON source that you want to monitor in a channel.

- ⓘ The JSONPath implementation that PRTG uses for the REST Custom sensor might differ from other JSONPath implementations. You can [test and debug your definitions](#)<sup>[1724]</sup> using the command line. To test simple JSONPath expressions and calculations, you can also use [JSONPath Online Evaluator](#)<sup>[1726]</sup>, for example. Note that this tool might not work properly with complex JSONPath expressions that PRTG supports.

### Example

To demonstrate the practical usage of JSONPath, we use this JSON example that a REST query might have returned as reference in this section.

```
{
  "devices": [
    {
      "firmware": {
        "id": "0.7",
        "date": "2017-05-18T17:11:43.7049944Z",
        "channel": "beta"
      },
      "networks": {
        "a": {
          "rx_bytes": 35985021,
          "rx_packets": 176791,
          "rx_errors": 0,
          "rx_dropped": 476,
          "tx_bytes": 7229493,
          "tx_packets": 35518,
          "tx_errors": 0,
          "tx_dropped": 1
        },
        "b": {
          "rx_bytes": 40085321,
          "tx_bytes": 55294975
        }
      }
    },
    {
      "networks": {
        "a": {
          "rx_bytes": 63685865,
          "tx_bytes": 7229472
        }
      }
    }
  ]
}
```

### REST Custom Sensor: JSONPath

Root

The dollar sign (\$) matches the root element of the JSON data.

REST Custom Sensor: JSONPath	
Child	<p>You can match a child with <code>.&lt;key&gt;</code> or <code>[&lt;key&gt;]</code>.</p> <ul style="list-style-type: none"> <li><code>.&lt;key&gt;</code> must only contain letters, numbers, and underscore (<code>_</code>). Hyphens (<code>-</code>) are not supported.</li> <li><code>[&lt;key&gt;]</code> must only contain a number or a quoted string.</li> </ul> <p> Example</p> <p>This expression matches 35985021 in the example above:</p> <pre>\$.devices.0.networks.a.rx_bytes</pre> <p>You get the same result with this expression:</p> <pre>\$["devices"][0]["networks"]["a"]["rx_bytes"]</pre> <p>If an element contains a hyphen (<code>-</code>), the <code>.&lt;key&gt;</code> notation does not work. Use the <code>[&lt;key&gt;]</code> notation in this case:</p> <pre>\$["data"][0]["system-stats"]["temps"]["Board (CPU)"]</pre>
Wildcard	<p>To match multiple values, you can use the asterisk symbol (<code>*</code>).</p> <ul style="list-style-type: none"> <li><code>.*</code></li> <li><code>[*]</code></li> </ul> <p> Example</p> <p>This expression matches 35985021 and 40085321 in the example above:</p> <pre>\$.devices[0].networks.*.rx_bytes</pre>
Recursive Descent	<p>You can match all subitems of a node with two dots (<code>..</code>).</p> <p> Example</p> <p>This expression matches 7229493 and 55294975 and 7229472 in the example above:</p> <pre>\$...tx_bytes</pre>
Union	<p>You can match multiple children with <code>[&lt;key1&gt;,&lt;key2&gt;,&lt;...&gt;]</code>.</p> <p> Example</p> <p>This expression matches 35985021 and 7229493 in the example above:</p> <pre>\$.devices.0.networks.a["rx_bytes","tx_bytes"]</pre>
Slice	<p>You can match multiple children of an array with <code>[&lt;begin&gt;:&lt;end&gt;]</code> or <code>[&lt;begin&gt;:&lt;end&gt;:&lt;step&gt;]</code>.</p> <ul style="list-style-type: none"> <li>By default, <code>begin</code>, <code>end</code>, and <code>step</code> are either integers or empty.</li> </ul>

REST Custom Sensor: JSONPath	
	<ul style="list-style-type: none"> <li>The default approach is to go step by step from the first array element to the last element.</li> <li><b>Step</b> can also be a negative integer to go through the array in reversed order.</li> </ul> <p> Example</p> <p>This expression matches 63685865 in the example above:</p> <pre>\$.devices[-1:].networks.a.rx_bytes</pre>
Current	<p>The @ symbol matches the current element.</p> <p> Example</p> <p>This expression matches 40.085321 and 55.294975 in the example above and can be used to receive a percentage value:</p> <pre>\$.devices[1].networks.a.[ "rx_bytes", "tx_bytes" ] (@/100000000*100)</pre>
Filter	<p>You can filter matches with [?&lt;expression&gt;].</p> <p> Example</p> <p>This expression matches 35985021 in the example above because the first device is the only one with a beta channel:</p> <pre>\$.devices[?@.firmware.channel=="beta"].networks.a.rx_bytes</pre>
Script	<p>You can modify matches with (&lt;expression&gt;) and keys with [&lt;expression&gt;].</p> <p> Example</p> <p>This expression matches true and false in the example above because only the first device has a beta channel:</p> <pre>\$.devices[*](@.firmware.channel=="beta")</pre>
Placeholder	<p>Placeholders give access to values of wildcards in a match. A placeholder #n (where n is a natural number) represents the value of the nth wildcard. You can use this in the keys of JSON arrays.</p> <p> Example</p> <p>This expression creates a JSON map from ids to the corresponding firmware channel and matches {"0.7":"beta"} in the example above:</p> <pre>{\$.devices[#0].id:\$.devices[*].channel}</pre> <p> This is an extension of the official JSONPath.</p>

REST Custom Sensor: JSONPath	
Constant	<ul style="list-style-type: none"> <li>Numeric constants as 64-bit floating point: 12345.678</li> <li>String constants with double quotation marks ("): "switch"</li> <li>Boolean constants: true and false</li> </ul>
Operator	<ul style="list-style-type: none"> <li>Parentheses control the order of evaluation: (&lt;expression&gt;)</li> <li>Arrays with brackets: [&lt;expression&gt;, &lt;expression&gt;, ...]</li> <li>Objects: {&lt;expression&gt;:&lt;expression&gt;, &lt;expression&gt;:&lt;expression&gt;, ...}</li> <li>Conditionals: &lt;condition&gt; ? &lt;expression&gt; : &lt;expression&gt;</li> </ul>

### Calculating Channel Values and Functions

You can perform calculations with the values of the source JSON or XML. The sensor uses the Paessler [gval](#) package for the calculations. For more information, refer to the [gval documentation](#)<sup>1726</sup>.

The following operators and functions are available to calculate channel values.

REST Custom Sensor: Operators				
	Operator	Description	Operand Type	Output Type
Infix Modifiers	+	plus	number	number
	-	minus	number	number
	*	times	number	number
	**	power of	number	number
	%	modulo	number	number
	/	divide	number	number
	&	bitwise and	number	number
		bitwise or	number	number
	^	bitwise xor	number	number

REST Custom Sensor: Operators				
	<<	shift left	number	number
	>>	shift right	number	number
Logical Infix Operators	>	greater than	number/string	bool
	>=	equal or greater than	number/string	bool
	<	less than	number/string	bool
	<=	equal or less than	number/string	bool
	==	equal	any	bool
	!=	not equal	any	bool
	=~	match regular expression	string	bool
	!~	mismatch regular expression	string	bool
	in	contains element	any, array	bool
	&&	and	and	bool
		or	or	bool
	??	coalescence	any	any
Prefix Operators	-	negative	number	number
	~	bitwise not	number	number

REST Custom Sensor: Operators				
	!	not	bool	bool

REST Custom Sensor: Functions	
duration(start,end)	<ul style="list-style-type: none"> <li>Calculates the nanoseconds between start and end.</li> <li>Both parameters must be RFC3339 date time strings.</li> </ul> <p> Example</p> <pre>duration(\$.devices[0].firmware.date, "017-05-18T17:11:43.7049944Z")</pre>
now()	<ul style="list-style-type: none"> <li>Returns the current date time in RFC3339.</li> </ul> <p> Example</p> <pre>duration(\$.devices[0].firmware.date, now())</pre>
number(string, [base])	<ul style="list-style-type: none"> <li>Converts a string to a floating point number.</li> <li>If the base is not set, it is detected via the prefix of the string. <ul style="list-style-type: none"> <li>"0": base = 8</li> <li>"0X": base = 16</li> <li>otherwise: base = 10</li> <li>Decimals are only supported at base 10.</li> </ul> </li> </ul> <p> Examples</p> <pre>number("10.5") number("a", 16)</pre>
len(object/array/string)	<ul style="list-style-type: none"> <li>Returns the length of an array or string and counts the number of properties in a JSON object.</li> </ul> <p> Example</p> <pre>len(\$..(number(@)))</pre> <p>This expression counts every number or string that can be converted into a number. It returns 13 in the example above.</p>
sum(array-/object-of-numbers)	<ul style="list-style-type: none"> <li>Returns the sum of an array of numbers.</li> </ul> <p> Example</p>

REST Custom Sensor: Functions	
	<pre>sum([1,2,3])</pre> <p>This expression returns 6.</p>
mean(array-/object-of-numbers)	<ul style="list-style-type: none"> <li>Returns the average value of an array of numbers.</li> </ul> <p> Example</p> <pre>mean([1,2,3])</pre> <p>This expression returns 2.</p>
lookup(string, string, string, ...)	<ul style="list-style-type: none"> <li>Returns the index of the specified string in a string list, or -1 if the string is not found.</li> </ul> <p> Example</p> <pre>lookup(\$.device[0].firmware.channel, "stable", "beta", "alpha")</pre> <p>This expression returns 1 because \$.device[0].firmware.channel resolves to beta.</p>
implode(array-/object-of-string, string)	<ul style="list-style-type: none"> <li>Returns the concatenation of each string in the array, separated by the specified string.</li> </ul> <p> Example</p> <pre>implode(\$.tx_bytes, ",")</pre> <p>This expression returns 7229493,7229472.</p>

## Generic Channels

You can create a template in your REST configuration that defines generic channels. Generic channels are created based on the data that the REST endpoint returns. When the returned value is an array or object, the sensor creates a channel for each element and concatenates the corresponding key to the channel name.

### Example

Imagine that you want to have a total byte channel for each network card that is defined in the JSON example above. You can do this by creating a dynamic channel like in the following example.

```
{
  "prtg": {
    "result": [
      {
        "value": {
          "Total bytes on device" + #0 + " in network " + #1: $.devices.*.networks[*]
          (@.rx_bytes + @.tx_bytes)
        },
        "CustomUnit": "Bytes"
      }
    ]
  }
}
```

**i** Every channel must have a unique name. You cannot remove channels once they have been added and they keep their last received value. You can add new channels.

## XML Sources

If the REST source returns XML instead of JSON, the sensor transforms the XML result to JSON before replacing the value paths with source values. Because of this, you do not know the structure of the source JSON to correctly provide the paths.

In this case, manually execute the sensor executable `rest.exe` from the `\Sensor System` subfolder of the [PRTG program directory](#) on the probe system. Execute `rest.exe` with the address of the XML endpoint and the parameter `passthrough`. The `rest` executable returns the converted XML to a JSON result that you can use to define the desired paths.

```
rest.exe <xml-endpoint-url> passthrough
```

## Usage and Debugging

To create a suitable REST configuration for the sensor, you might want to check the returned JSON or XML and see what happens when your mapping rules apply.

The REST Custom sensor is an EXE sensor, so you can test and debug your configuration by executing `rest.exe` with several parameters. The `rest.exe` file is located in the `\Sensor System` subfolder of the PRTG program directory.

The command syntax is as follows:

```
rest.exe url template|passthrough|channelDiscovery [flags]
```

### rest.exe: Parameters

url

- Address of the REST API endpoint that returns JSON or XML

rest.exe: Parameters	
template	<ul style="list-style-type: none"> <li>Fully qualified path and file name of your REST configuration file used to map the JSON result to the sensor</li> </ul>
passthrough	<ul style="list-style-type: none"> <li>No mapping, only returning the queried JSON or XML</li> <li>Useful to analyze XML that has been converted to JSON</li> </ul>
channelDiscovery	<ul style="list-style-type: none"> <li>Creates a channel for every number or boolean in the returned JSON or XML</li> <li>If possible, it converts string values to number or boolean values.</li> </ul>

rest.exe: Flags	
-authtoken <string>	<ul style="list-style-type: none"> <li>JWT or OAuth2 Bearer Token to send with the request in authorization header as Bearer</li> </ul>
-authusername <string>	<ul style="list-style-type: none"> <li>User name for basic authentication</li> </ul>
-authuserpwd <string>	<ul style="list-style-type: none"> <li>User password for basic authentication</li> </ul>
-customheaders <string>	<ul style="list-style-type: none"> <li>key1:val1 key2:val2 ...</li> </ul>
-post=<int>	<ul style="list-style-type: none"> <li>{1 0}</li> <li>Default: 0</li> <li>0 results in a GET request.</li> <li>1 results in a POST request.</li> </ul> <p> Example</p> <pre>-customheaders 'Content-Type: application/x-www-form-urlencoded' -post=1 -requestbody 'myvar=value'</pre>
-proxy <string>	<ul style="list-style-type: none"> <li>Proxy server connection</li> </ul>
-proxyusername <string>	<ul style="list-style-type: none"> <li>Proxy user name with basic authentication</li> </ul>
-proxyuserpwd <string>	<ul style="list-style-type: none"> <li>Proxy user password with basic authentication</li> </ul>
-requestbody <string>	<ul style="list-style-type: none"> <li>Body of the request</li> </ul>

rest.exe: Flags	
	<p><b>i</b> You can only use this flag a POST request (-post=1).</p> <p><b>Example</b></p> <pre>-customheaders 'Content-Type: application/x-www-form-urlencoded' -post=1 -requestbody 'myvar=value'</pre>
-timeout <integer>	<ul style="list-style-type: none"> <li>▪ Sensor timeout in seconds</li> <li>▪ Default: 10</li> </ul>
-tlsignore=<int>	<ul style="list-style-type: none"> <li>▪ {1 0}</li> <li>▪ Default: 0</li> <li>▪ 1 accepts self-signed certificates on HTTPS connections</li> </ul>
-template	<ul style="list-style-type: none"> <li>▪ Returns the discovered template if you use channelDiscovery.</li> </ul>

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Response Time	<p>The response time</p> <p><b>i</b> This channel is the primary channel by default.</p>
[Value]	<p>The values that a REST API returns in several channels</p> <p><b>■</b> For more information about the return value format, see section <a href="#">Custom Sensors</a>.</p>

## 7.8.153 REST Custom v2 Sensor (BETA)

The REST Custom v2 sensor queries a JavaScript Object Notation (JSON) or Extensible Markup Language (XML) Representational State Transfer (REST) application programming interface (API) endpoint and maps the JSON or XML result to sensor values.

**BETA** This sensor is in beta status. The operating methods and the available settings are still subject to change. Do not expect that all functions work properly, or that this sensor works as expected at all.

REST Custom v2 Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: REST Aangepast v2
- French: REST personnalisé v2
- German: REST (Benutzerdefiniert) v2
- Japanese: REST カスタム v2
- Portuguese: REST (customizado) v2
- Russian: Специальные настройки REST v2
- Simplified Chinese: REST 自定义 v2
- Spanish: REST (personalizado) v2

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Enabled Beta Sensors experimental feature	This sensor requires that the Beta Sensors <a href="#">experimental feature</a> is enabled.  ■ For more information, see the Knowledge Base: <a href="#">What are beta sensors and how can I use them?</a>
JSONPath and XPath version	This sensor supports JSONPath and XPath <a href="#">1.0</a> .
Smart URL replacement	This sensor supports <a href="#">smart URL replacement</a> <sup>1747</sup> .
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">very low</a> performance impact.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Credentials	You can define <a href="#">credentials for REST API</a> in settings that are higher in the <a href="#">object hierarchy</a> .
Multi-platform probe	You can add this sensor to a multi-platform probe.

## Limitations

- Strings that contain angled brackets (< and >) cannot be mapped manually. This affects the following settings: Channel #x Strings mapped to the 'Up' status, Channel #x Strings mapped to the 'Warning' status, and Channel #x Strings mapped to the 'Down' status. We are already working on a solution.

## Add Sensor

Setting	Description
Channel #2 - #10	You can define up to 10 channels. You must define at least one channel, so you see all available settings for <a href="#">Channel #1</a> . Specify how to handle all other possible channels:  ❗ It is not possible to enable or disable channels after sensor creation.
Channel #x JSONPath/XPath	Enter the JSONPath or XPath of the JSON or XML result that you want to monitor.  JSONPath example:

Setting	Description
	<pre>\$.store.book[0].year</pre> <p>XPath example:</p> <pre>/store/book[1]/year</pre>
Channel #x Name	<p>Enter a name for the channel. Enter a string. For example, <b>Total</b>.</p> <p><b>i</b> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Channel #x Unit	<p>Enter the unit for the value that this sensor monitors. For example, <b>#</b>.</p> <p><b>i</b> You can change this value later in the <a href="#">channel settings</a> of this sensor.</p>

### Basic Sensor Settings

Basic Sensor Settings

The sensor has the following [default tags](#) that are automatically predefined in the sensor's settings when you add the sensor:

- rest

■ For more information about basic sensor settings, see section [Sensor Settings](#) <sup>667</sup>.

## REST Specific

**REST Specific**

Request URL ⓘ

Request Method ⓘ  GET (default)  
 POST

Custom Headers ⓘ

Timeout (Sec.) ⓘ

Content Type ⓘ  JSON (default)  
 XML

Custom Sensor Message ⓘ

REST Specific

Setting	Description
Request URL	<p>Enter the URL of the JSON or XML REST API endpoint that you want to request.</p> <p>Example URL:</p> <pre>https://:1616/api/health?token=%restbearertoken&amp;name=%restusername&amp;refresh=true</pre> <p><b>i</b> You can use the following placeholders in this field: <code>%restusername</code>, <code>%restpassword</code>, <code>%restbearertoken</code>, <code>%restplaceholder1</code>, <code>%restplaceholder2</code>, <code>%restplaceholder3</code>, <code>%restplaceholder4</code>, and <code>%restplaceholder5</code>. You can define these placeholders in the <a href="#">credentials for REST API</a> in settings that are higher in the <a href="#">object hierarchy</a>.</p> <p><b>■</b> PRTG uses a smart URL replacement with which you can use the parent device's IP address or Domain Name System (DNS) name setting as part of the URL. For more information, see section <a href="#">Smart URL Replacement</a><sup>[1747]</sup>.</p> <p><b>i</b> If you enter <code>127.0.0.1</code> as IP address of the parent device, PRTG requests the following URL:</p> <pre>https://127.0.0.1:1616/api/health?token=%restbearertoken&amp;name=%restusername&amp;refresh=true</pre>
Request Method	<p>Select the HTTP request method that the sensor uses to request the REST API:</p> <ul style="list-style-type: none"> <li>▪ GET (default): Use the GET method to request the REST API.</li> <li>▪ POST: Use the POST method to request the REST API.</li> </ul>

Setting	Description
POST Body	<p>This setting is only visible if you select POST above.</p> <p>Enter the data part for the POST request.</p> <p><b>i</b> You can use the following placeholders in this field: <a href="#">%restusername</a>, <a href="#">%restpassword</a>, <a href="#">%restbearertoken</a>, <a href="#">%restplaceholder1</a>, <a href="#">%restplaceholder2</a>, <a href="#">%restplaceholder3</a>, <a href="#">%restplaceholder4</a>, and <a href="#">%restplaceholder5</a>. You can define these placeholders in the <a href="#">credentials for REST API</a> in settings that are higher in the <a href="#">object hierarchy</a>.</p>
Custom Headers	<p>Enter a list of custom HTTP headers with their respective values that you want to transmit to the target URL. The syntax of a header-value pair is <a href="#">header1:value1</a>.</p> <p>Custom header example:</p> <pre data-bbox="486 896 1353 1025">host:host1.example.com User-Agent:PRTG sensor 0.1 X-API-Key: %restplaceholder1</pre> <p><b>i</b> If you enter more than one header-value pair, enter each pair in one line:  header1:value1  header2:value2  header3:value3</p> <p><b>i</b> Make sure that the HTTP header statement is valid. Otherwise, the sensor request cannot be successful.</p> <p><b>i</b> You can use the following placeholders in this field: <a href="#">%restusername</a>, <a href="#">%restpassword</a>, <a href="#">%restbearertoken</a>, <a href="#">%restplaceholder1</a>, <a href="#">%restplaceholder2</a>, <a href="#">%restplaceholder3</a>, <a href="#">%restplaceholder4</a>, and <a href="#">%restplaceholder5</a>. You can define these placeholders in the <a href="#">credentials for REST API</a> in settings that are higher in the <a href="#">object hierarchy</a>.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer. The maximum timeout value is <b>900</b> seconds (15 minutes).</p> <p><b>i</b> If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
Content Type	<p>Select the type of the content that the sensor queries:</p> <ul style="list-style-type: none"> <li>▪ JSON (default)</li> <li>▪ XML</li> </ul>
Custom Sensor Message	<p>Enter the JSONPath or XPath from which you want to receive a string that the sensor shows as the permanent sensor message.</p>

Setting	Description
	<p>JSONPath example:</p> <pre>\$.store.book[0].title</pre> <p>XPath example:</p> <pre>/store/book[1]/title</pre>

## Channel Settings

**Channel Settings**

Channel #1 ⓘ `$.store.book[0].price`

JSONPath/XPath

Channel #1 Type ⓘ *Absolute (float)*

Channel Settings

Setting	Description
Channel #x JSONPath/XPath	<p>Enter the JSONPath or XPath of the JSON or XML result that you want to monitor.</p> <p>JSONPath example:</p> <pre>\$.store.book[0].year</pre> <p>XPath example:</p> <pre>/store/book[1]/year</pre>
Channel #x Name	<p>Enter a name for the channel. Enter a string. For example, <b>Total</b>. PRTG dynamically generates channels with this name as the identifier.</p> <p><span style="font-size: small;">ⓘ</span> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({}), PRTG replaces them with braces ({}), PRTG replaces them with braces ({}), PRTG replaces them with braces ({}). For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Channel #x Value Type	<p>Select the value type that the channel displays:</p> <ul style="list-style-type: none"> <li>▪ Absolute (integer): Integer64 values with or without an operational sign, such as <b>10</b> or <b>120</b> or <b>-12</b> or <b>120</b>.</li> <li>▪ Absolute (float): Double values, such as <b>-5.80</b> or <b>8.23</b>.</li> </ul> <p><span style="font-size: small;">ⓘ</span> If you select Absolute (float), the sensor automatically shows all decimal places of the received value in the channel. You can define how many decimal places of the channel's data that you want to display in graphs and tables in the <a href="#">channel settings</a>.</p>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Delta (counter): Counter values. The sensor calculates the difference between the last and the current value. Enter an integer. The sensor additionally divides the delta value by a time period to indicate a speed value.               <ul style="list-style-type: none"> <li>ⓘ This mode only works if the difference between the last and the current value is positive and increases with each scanning interval. This mode does not support negative values and decreasing values.</li> </ul> </li> <li>▪ Status (string): The sensor shows a status depending on how you map the returned strings and shows the returned strings as sensor message.</li> <li>▪ Lookup: The sensors shows a status depending on how you define values in a <a href="#">custom lookup file</a>.</li> <li>ⓘ Absolute (integer) and Absolute (float) support the extraction of numerical values from a received string. The sensor parses the numerical value from the beginning of the string until it encounters the first element that is not part of a numerical value, for example a letter. The sensor ignores whitespace characters.</li> <li>ⓘ You cannot change this value after sensor creation.</li> </ul>
Channel #x Unit	<p>This setting is only visible if you select Absolute (integer), Absolute (float), or Delta (counter) as Channel #x Value Type.</p> <p>Select the unit that the channel displays:</p> <ul style="list-style-type: none"> <li>▪ Custom (default)</li> <li>▪ Percent</li> <li>▪ Percent (CPU)</li> <li>▪ Temperature (celsius)</li> <li>▪ Time (milliseconds)</li> <li>▪ Time (hours)</li> <li>▪ Time (seconds)</li> <li>▪ Bytes (memory)</li> <li>▪ Bytes (disk)</li> <li>▪ Bytes (file)</li> <li>▪ Bytes (bandwidth)</li> <li>▪ Bytes per second (disk)</li> <li>▪ Bytes per second (network)</li> </ul> <p>ⓘ You cannot change this value after sensor creation.</p>

Setting	Description
Channel #x Custom Unit	<p>This setting is only visible if you select Custom (default) as Channel #x Unit.</p> <p>Enter the custom unit of the value of this channel. Enter a string.</p>
Channel #x Strings mapped to the 'Up' status	<p>This setting is only visible if you select Status (string) as Channel #x Value Type.</p> <p>Enter the strings that the sensor maps to the Up status in a comma-separated list.</p> <p><b>i</b> If a string contains a comma, you must put the string in quotation marks. For example, to map the string <code>Friday,2nd</code> enter <code>"Friday,2nd"</code>. If a string contains quotation marks, you must escape the quotation marks using a backslash (<code>\</code>) and put the string in quotation marks. For example, to map the string <code>Friday "2nd"</code> enter <code>"Friday \"2nd\""</code>.</p>
Channel #x Strings mapped to the 'Warning' status	<p>This setting is only visible if you select Status (string) as Channel #x Value Type.</p> <p>Enter the strings that the sensor maps to the Warning status in a comma-separated list.</p> <p><b>i</b> If a string contains a comma, you must put the string in quotation marks. For example, to map the string <code>Friday,2nd</code> enter <code>"Friday,2nd"</code>. If a string contains quotation marks, you must escape the quotation marks using a backslash (<code>\</code>) and put the string in quotation marks. For example, to map the string <code>Friday "2nd"</code> enter <code>"Friday \"2nd\""</code>.</p>
Channel #x Strings mapped to the 'Down' status	<p>This setting is only visible if you select Status (string) as Channel #x Value Type.</p> <p>Enter the strings that the sensor maps to the Down status in a comma-separated list.</p> <p><b>i</b> If a string contains a comma, you must put the string in quotation marks. For example, to map the string <code>Friday,2nd</code> enter <code>"Friday,2nd"</code>. If a string contains quotation marks, you must escape the quotation marks using a backslash (<code>\</code>) and put the string in quotation marks. For example, to map the string <code>Friday "2nd"</code> enter <code>"Friday \"2nd\""</code>.</p>
Channel #x Handling of Unknown Strings	<p>This setting is only visible if you select Status (string) as Channel #x Value Type.</p> <p>Select the status to which the sensor maps all unknown strings in the returned result that are not manually mapped to the Up, the Warning, or the Down status:</p> <ul style="list-style-type: none"> <li>▪ 'Up' status: Map all unknown strings to the Up status.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>'Warning' status: Map all unknown strings to the Warning status.</li> <li>'Down' status (default): Map all unknown strings to the Down status.</li> </ul>
Channel #x Lookup ID	<p>This setting is only visible if you select <b>Lookup as Channel #x Value Type</b>.</p> <p>Enter the ID of the lookup you wish to use. You can find the ID in the <a href="#">ValueLookup</a> parameter in the lookup file.</p> <p><input type="checkbox"/> For more information, see section <a href="#">Define Lookups</a>.</p> <p> You cannot change this value after sensor creation.</p>
Channel #2 - #10	<p>You can define up to 10 channels. You must define at least one channel, so you see all available settings for <b>Channel #1</b>. Specify how to handle all other possible channels:</p> <ul style="list-style-type: none"> <li>Disable: Do not create this channel.</li> <li>Enable: Create this channel.</li> </ul> <p> It is not possible to enable or disable channels after sensor creation.</p>

## Sensor Display

**Sensor Display**

Primary Channel  Downtime

---

Graph Type   Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>Show channels independently (default): Show a graph for each channel.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.                             <ul style="list-style-type: none"> <li> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Debug Options

**Debug Options**

Result Handling 

Discard result (default)  
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>Discard result (default): Do not store the sensor result.</li> <li>Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## JSONPath

The REST Custom v2 sensor uses [JSONPath](#) to assign values from the returned JSON to channels. With JSONPath, you provide the path to the value in the JSON source that you want to monitor in a channel.

ⓘ The JSONPath implementation that PRTG uses for the REST Custom v2 sensor might differ from other JSONPath implementations. To test simple JSONPath expressions and calculations, you can use [JSONPath Online Evaluator - jsonpath.com](https://jsonpath.com), for example. Note that this tool might not work properly with complex JSONPath expressions that PRTG supports.

 Example

To demonstrate the practical usage of JSONPath, we use this JSON example that a REST query might have returned as reference in this section.

```
{
  "devices": [
    {
      "firmware": {
        "id": "0.7",
        "date": "2017-05-18T17:11:43.7049944Z",
        "channel": "beta"
      },
      "networks": {
        "a": {
          "rx_bytes": 35985021,
          "rx_packets": 176791,
          "rx_errors": 0,
          "rx_dropped": 476,
          "tx_bytes": 7229493,
          "tx_packets": 35518,
          "tx_errors": 0,
          "tx_dropped": 1
        },
        "b": {
          "rx_bytes": 40085321,
          "tx_bytes": 55294975
        }
      }
    },
    {
      "networks": {
        "a": {
          "rx_bytes": 63685865,
          "tx_bytes": 7229472
        }
      }
    }
  ]
}
```

REST Custom v2 Sensor: JSONPath	
Root	The dollar sign (\$) matches the root element of the JSON data.
Child	<p>You can match a child with <code>.&lt;key&gt;</code> or <code>[&lt;key&gt;]</code>.</p> <ul style="list-style-type: none"> <li><code>.&lt;key&gt;</code> must only contain letters, numbers, and underscore (<code>_</code>). Hyphens (<code>-</code>) must be escaped with quotation marks.</li> <li><code>[&lt;key&gt;]</code> must only contain a number or a quoted string.</li> </ul> <p> Example</p> <p>This expression matches 35985021 in the example above:</p> <pre>\$.devices.0.networks.a.rx_bytes</pre> <p>You get the same result with this expression:</p> <pre>["\$devices"][0]["networks"]["a"]["rx_bytes"]</pre> <p>If an element contains a hyphen (<code>-</code>), the <code>.&lt;key&gt;</code> notation does not work. Use the <code>[&lt;key&gt;]</code> notation in this case:</p> <pre>["\$data"][0]["system-stats"]["temps"]["Board (CPU)"]</pre>
Wildcard	<p>To match multiple values, you can use the asterisk symbol (<code>*</code>).</p> <ul style="list-style-type: none"> <li><code>.*</code></li> <li><code>[*]</code></li> </ul> <p> Example</p> <p>This expression matches 35985021 and 40085321 in the example above:</p> <pre>\$.devices[0].networks.*.rx_bytes</pre>
Recursive Descent	<p>You can match all subitems of a node with two dots (<code>..</code>).</p> <p> Example</p> <p>This expression matches 7229493 and 55294975 and 7229472 in the example above:</p> <pre>\$...tx_bytes</pre>
Union	<p>You can match multiple children with <code>[&lt;key1&gt;,&lt;key2&gt;,&lt;...&gt;]</code>.</p> <p> Example</p> <p>This expression matches 35985021 and 7229493 in the example above:</p> <pre>\$.devices.0.networks.a["rx_bytes","tx_bytes"]</pre>
Slice	<p>You can match multiple children of an array with <code>[&lt;begin&gt;:&lt;end&gt;]</code> or <code>[&lt;begin&gt;:&lt;end&gt;:&lt;step&gt;]</code>.</p>

REST Custom v2 Sensor: JSONPath	
	<ul style="list-style-type: none"> <li>By default, <b>begin</b>, <b>end</b>, and <b>step</b> are either integers or empty.</li> <li>The default approach is to go step by step from the first array element to the last element.</li> <li><b>Step</b> can also be a negative integer to go through the array in reversed order.</li> </ul> <p> Example</p> <p>This expression matches 63685865 and 7229472 in the example above:</p> <pre>\$.devices[-1:].networks.a[rx_bytes,tx_bytes]</pre>
Current	<p>The @ symbol matches the current element.</p> <p> Example</p> <p>This expression matches 63685865 and 7229472 in the example above:</p> <pre>\$.devices[(@.length-1)].networks.a.rx_bytes</pre>
Filter	<p>You can filter matches with [?(&lt;expression&gt;)].</p> <p> Example</p> <p>This expression matches 35985021 in the example above because the first device is the only one with a beta channel:</p> <pre>\$.devices[?(@.firmware.channel=="beta")].networks.a.rx_bytes</pre>
Constant	<ul style="list-style-type: none"> <li>Numeric constants as 64-bit floating point: 12345.678</li> <li>String constants with double quotation marks ("): "switch"</li> <li>Boolean constants: true and false <ul style="list-style-type: none"> <li> If the JSONPath points to a boolean, the sensor translates true as 1 and false as 0.</li> </ul> </li> </ul>
Functions	<p>You can use functions on top level or in filters.</p> <p>This expression returns the number items in the element devices in the example above:</p> <pre>length(\$.devices)</pre> <p> For more information about functions, see <a href="#">JsonCons JSONPath   Functions</a>.</p>
Operator	<ul style="list-style-type: none"> <li>Parentheses control the order of evaluation: (&lt;expression&gt;)</li> <li>Arrays with brackets: [&lt;expression&gt;, &lt;expression&gt;, ...]</li> <li>Objects: {&lt;expression&gt;:&lt;expression&gt;, &lt;expression&gt;:&lt;expression&gt;, ...}</li> </ul>

① For more information about JSONPath, see [JsonCons JSONPath](#).

## REST Custom v2 Sensor: XPath

### Example

To demonstrate the practical usage of XPath, we use this XML example that a REST query might have returned as reference in this section.

```
<?xml version="1.0" encoding="UTF-8" ?>
<root>
  <devices>
    <firmware>
      <id type="major">0</id>
      <id type="minor">7</id>
      <date>2017-05-18T17:11:43.7049944Z</date>
      <channel>beta</channel>
    </firmware>
    <networks>
      <a>
        <rx_bytes>35985021</rx_bytes>
        <rx_packets>176791</rx_packets>
        <rx_errors>0</rx_errors>
        <rx_dropped>476</rx_dropped>
        <tx_bytes>7229493</tx_bytes>
        <tx_packets>35518</tx_packets>
        <tx_errors>0</tx_errors>
        <tx_dropped>1</tx_dropped>
      </a>
      <b>
        <rx_bytes>40085321</rx_bytes>
        <tx_bytes>55294975</tx_bytes>
      </b>
    </networks>
  </devices>
  <devices>
    <networks>
      <a>
        <rx_bytes>63685865</rx_bytes>
        <tx_bytes>7229472</tx_bytes>
      </a>
    </networks>
  </devices>
</root>
```

REST Custom v2 Sensor: XPath	
Root	The slash symbol (/) matches the root element of the XML data.
Child	<p>You can match a child by its name with /&lt;key&gt; or [&lt;key&gt;] or by its index with [&lt;index&gt;].</p> <ul style="list-style-type: none"> <li>▪ /&lt;key&gt; must only contain letters, numbers, and underscore (_). Hyphens (-) must be escaped with quotation marks.</li> <li>▪ [&lt;key&gt;] must only contain a number or a quoted string.</li> <li>▪ [&lt;index&gt;] must only contain a number.</li> </ul> <p> Example</p> <p>This expression matches 35985021 in the example above:</p> <pre>/root/devices[1]/networks/a/rx_bytes</pre> <p>This expression matches major in the example above:</p> <pre>/root/devices[1]/firmware/id[1]/@type</pre>
Wildcard	<p>To match multiple values, you can use the asterisk symbol (*).</p> <ul style="list-style-type: none"> <li>▪ /*</li> <li>▪ /@*</li> <li>▪ [*]</li> <li>▪ [@*]</li> </ul> <p> Example</p> <p>This expression matches 35985021 and 40085321 in the example above:</p> <pre>/root/devices[1]/networks/*/rx_bytes</pre>
Recursive Descent	<p>You can match all subitems of a node with two slashes (//).</p> <p> Example</p> <p>This expression matches 7229493 and 55294975 and 7229472 in the example above:</p> <pre>//tx_bytes</pre>
Union	<p>You can match multiple queries by combining them with the vertical bar symbol ( ).</p> <p> Example</p> <p>This expression matches 35985021 and 7229493 in the example above:</p> <pre>/root/devices[1]/networks/a/rx_bytes   /root/devices[1]/networks/a/tx_bytes</pre>

REST Custom v2 Sensor: XPath	
Filter	<p>You can filter matches with [&lt;expression&gt;].</p> <p> <b>Example</b></p> <p>This expression matches 35985021 in the example above because the first device is the only one with a beta channel:</p> <pre>/root/devices[firmware/channel='beta']/networks/a/rx_bytes</pre> <p>This expression matches 0 in the example above:</p> <pre>/root/devices[1]/firmware[1]/id[@type='major']</pre>
Constant	<ul style="list-style-type: none"> <li>▪ Numeric constants as 64-bit floating point: 12345.678</li> <li>▪ String constants with double quotation marks ("): "switch"</li> <li>▪ Boolean constants: true and false <ul style="list-style-type: none"> <li>ⓘ If the XPath points to a boolean, the sensor translates true as 1 and false as 0.</li> </ul> </li> </ul>
Functions	<p>You can use functions on top level or in filters.</p> <p>This expression returns the number of items in the devices element in the example above:</p> <pre>count(/root/devices[position() &lt; 3])</pre> <p>ⓘ For more information about functions, see <a href="#">XML Path Language (Core Function Library)</a>.</p>
Operator	<ul style="list-style-type: none"> <li>▪ Parentheses control the order of evaluation: (&lt;expression&gt;)</li> </ul>

ⓘ For more information about XPath, see [XML Path Language \(XPath\)](#).

## Calculating Channel Values

The REST Custom v2 sensor supports the following arithmetic:

- Addition (+)
- Subtraction (-)
- Multiplication (\*)
- Division (div, /)
- Equal (=)
- Not equal (!=)

 Examples

XML	JSON
<pre>&lt;root&gt;   &lt;one&gt;1&lt;/one&gt;   &lt;two value_int="2"&gt;2&lt;/two&gt;   &lt;two_point5&gt;2.5&lt;/two_point5&gt;   &lt;four&gt;4&lt;/four&gt; &lt;/root&gt;</pre>	<pre>{   "root": {     "one": 1,     "two": 2,     "two_string": "2",     "two_point5": 2.5,     "four": 4   } }</pre>

XML	JSON	Description	Result (XML)	Result (JSON)
/root/one + /root/two	<code>eval(\$.root.one + \$.root.two)</code>	Addition of the numbers	3	3
n/a	<code>eval(\$.root.one + to_number(\$.root.two_string))</code>	Addition of a number and a string	n/a	3
/root/one + /root/two/@value_int	n/a	Addition of a number and an attribute value	3	n/a
/root/four div /root/two	<code>eval(\$.root.four / \$.root.two)</code>	Division of two integers. The expected result is an integer	2	2
/root/one div /root/two	<code>eval(\$.root.one / \$.root.two)</code>	Division of two integers, the expected result is a floating-point number	0.5	0

XML	JSON	Description	Result (XML)	Result (JSON)
n/a	<code>eval(\$.root.one / \$.root.two * 1.0)</code>	Division of two integers with a floating point number as result	n/a	0.5
<code>/root/one div /root/two_point5</code>	<code>eval(\$.root.one / \$root.two_point5)</code>	Division of a float and an integer	0.4	0.4
<code>/root/one = /root/two</code>	<code>eval(\$.root.one == \$.root.two)</code>	If entries are equal	0 (false)	0 (false)

## Smart URL Replacement

Instead of entering a complete address in the Request URL field of the REST Custom v2 sensor, you can only enter the protocol followed by a colon and three forward slashes (this means that you can enter either <http://> or <https://>, or even a simple forward slash / as the equivalent for <http://>). PRTG automatically fills in the parent device's IP Address/DNS Name in front of the third forward slash.

Whether this results in a valid URL or not depends on the IP address or Domain Name System (DNS) name of the parent device. In combination with cloning devices, you can use smart URL replacement to create many similar devices.

For example, if you create a device with the DNS name [www.example.com](http://www.example.com) and you add a REST Custom v2 sensor to it, you can provide values in the following ways:

- If you enter <https://> in the Request URL field, PRTG automatically creates the URL <https://www.example.com/>
- If you enter [/help](http://www.example.com/help) in the Request URL field, PRTG automatically creates the URL <http://www.example.com/help>
- It is also possible to provide a port number in the Request URL field. It is taken over by the device's DNS name and is internally added, for example, <https://:1616/>

 Smart URL replacement does not work for sensors that run on the probe device.

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
HTTP Status	<p>The HTTP status that the requested URL returns</p> <ul style="list-style-type: none"> <li>▪ Up status: Continue, Switching Protocols, Processing, OK, Created, Accepted, Non-Authoritative Information, No Content, Reset Content, Partial Content, Multi-Status, Already Reported, IM Used</li> <li>▪ Warning status: Multiple Choices, Moved Permanently, Found, See Other, Not Modified, Use Proxy, Switch Proxy (deprecated), Temporary Redirect, Permanent Redirect,</li> <li>▪ Down status: Bad Request, Unauthorized, Payment Required, Forbidden, Not Found, Method Not Allowed, Not Acceptable, Proxy Authentication Required, Request Time-out, Conflict, Gone, Length Required, Precondition Failed, Request Entity Too Large, Request URL Too Long, Unsupported Media Type, Requested Range Not Satisfiable, Expectation Failed, I'm a teapot, Policy Not Fulfilled, There are too many connections from your internet address, Unprocessable Entity, Locked, Failed Dependency, Unordered Collection, Upgrade Required, Precondition Required, Too Many Requests, Request Header Fields Too Large, No Response, The request should be retried after doing the appropriate action, Unavailable For Legal Reasons, Internal Server Error, Not Implemented, Bad Gateway, Service Unavailable, Gateway Time-out, HTTP Version not supported, Variant Also Negotiates[13], Insufficient Storage, Loop Detected, Bandwidth Limit Exceeded, Not Extended</li> <li>▪ Unknown status: Unknown</li> </ul> <p><b>i</b> This channel is the primary channel by default.</p>
[Value]	The values that a REST API returns in several channels

## 7.8.154 Script v2 Sensor

The Script v2 sensor runs a Python script (.py) on the probe system.

**i** The return result of this sensor must comply with the provided JavaScript Object Notation (JSON) schema. For more information, see the [Remarks](#) below.

Script v2 Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: Script v2
- French: Script v2
- German: Skript v2
- Japanese: スクリプト v2
- Portuguese: Script v2
- Russian: Скрипт v2
- Simplified Chinese: Script v2
- Spanish: Script v2

## Remarks

Consider the following [remarks](#) <sup>(1751)</sup> and requirements for this sensor:

Remark	Description
Python	This sensor requires that Python is installed for the Windows user account that the probe runs under.
File storage	This sensor requires that you store the script file on the probe system. In a cluster, copy the file to every cluster node.   You must store the script file in the \Custom Sensors\scripts subfolder of the <a href="#">PRTG program directory</a> of the probe system on Windows systems or in the /opt/paessler/share/scripts directory of the probe system on Linux systems.
Channel IDs	This sensor supports the channel IDs <a href="#">10 to 2,147,483,647</a> .
IPv6	This sensor supports IPv6.
Channels	This sensor supports up to <a href="#">50 channels</a> .
Placeholders	You can define placeholders in <a href="#">credentials for script sensors</a> settings that are higher in the <a href="#">object hierarchy</a> .
Performance impact	This sensor has a <a href="#">medium</a> performance impact.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Parameters	This sensor invokes all scripts with the <code>-E</code> parameter as a security measure. This parameter ignores all python* environmental variables when starting the script.
Example scripts	This sensor comes with example scripts. For more information, see the Knowledge Base: <a href="#">I want to use the Script v2 sensor example scripts. What do I need to know?</a>
JSON schema	For more information about the JSON schema that this sensor uses, see the Knowledge Base: <a href="#">Where can I find the JSON schema against which the Script v2 sensor validates my script output?</a>
Scanning interval	<ul style="list-style-type: none"> <li>▪ The minimum scanning interval of this sensor is <a href="#">30 seconds</a>.</li> <li>▪ The recommended scanning interval of this sensor is <a href="#">1 minute</a>.</li> </ul>

Remark	Description
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.
Multi-platform probe	You can add this sensor to a multi-platform probe.

## 7.8.155 Sensor Factory Sensor

The Sensor Factory sensor monitors entire business processes that involve several components. You can create a customized sensor with channels based on data from other sensors ("source sensors").

**i** If you want to create only a cumulated sensor status based on specific source sensors, we recommend that you use the [Business Process](#)<sup>[740]</sup> sensor.

Sensor Factory Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[1768]</sup>.

### Sensor in Other Languages

- Dutch: Sensor Fabriek
- French: Capteur combiné
- German: Formelsensor
- Japanese: センサーファクトリ
- Portuguese: Sensor de fórmula
- Russian: Фабрика сенсоров
- Simplified Chinese: 传感器出厂
- Spanish: Sensor combinado

### Remarks

Consider the following [remarks](#)<sup>[1757]</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor can have a very high impact on the performance of the PRTG core server system. We recommend that you use no more than 50 of this sensor per PRTG core server.
Channels	This sensor does not officially support more than <a href="#">50 channels</a> .
Channel definitions	This sensor does not support <a href="#">channel definitions</a> that refer to channels of Sensor Factory sensors.
Reports	Uptime or downtime data for this sensor is not available in <a href="#">reports</a> .
Scanning interval	Make sure that the <a href="#">scanning interval</a> of this sensor is equal to or greater than the scanning interval of the source sensors to avoid incorrect sensor behavior. For example, "no data" messages or erratic changes of the sensor state can be a result of an invalid scanning interval.
Flow sensors	This sensor might not work with <a href="#">flow sensors</a> . Sensors that use <a href="#">active flow timeout</a> , for example <a href="#">NetFlow and jFlow sensors</a> , are not supported by this sensor.
Knowledge Base	Knowledge Base: <a href="#">How can I monitor the overall status of the business process "email"?</a>

This is because the Sensor Factory sensor should only show this status if it cannot calculate values.</li> </ul> </li> <li>▪ Use custom formula: Define the status of the Sensor Factory sensor by adding a Status Definition below.</li> </ul>
Status Definition	<p>This setting is only visible if you select Use custom formula <a href="#">above</a>.</p>

Setting	Description
	<p>Define when the sensor switches to the Down status. You can use the <a href="#">status()</a> function in combination with Boolean operations. For advanced users, it is also possible to calculate a status value.</p> <p> For more information, see section <a href="#">Define Sensor Status: status() Function</a> <sup>1767</sup>.</p>
If a Source Sensor Has No Data	<p>Choose how this Sensor Factory sensor reacts if a source sensor referred to in the channel definition does not provide any data (for example, because it is set to the Paused status or does not exist):</p> <ul style="list-style-type: none"> <li>▪ Do not calculate the channels that use the sensor (default): For defined channels that use one or more sensors that deliver no data, no data is shown.</li> <li>▪ Calculate the channels and use zero as source value: If a source sensor that you use in a channel definition does not deliver any data, zero values are filled in instead. The Sensor Factory sensor calculates the channel value and shows it using these zero values.</li> </ul> <p> If a sensor in the channel of a Sensor Factory sensor has no data, the Sensor Factory sensor always shows the Warning status, no matter which of the above options you select.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.                             <ul style="list-style-type: none"> <li> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Define Channels

The channels of a Sensor Factory sensor are controlled by the Channel Definition text field. Using a special syntax, you can refer to other sensors' channels, calculate values, and add horizontal lines. You can define Sensor Factory channels using data from any other sensor's channels on your PRTG core server.

 Make sure that no channel definitions refer to channels of Sensor Factory sensors.

### Example

You see a definition of two Sensor Factory sensor channels. Both use the `channel()` function that collects data from the channels of other sensors in your monitoring and displays them:

```
#1:Local Probe Health
channel(1001,0)
#2:Local Traffic Out[kbit]
channel(1004,1)
```

The first channel of the Sensor Factory sensor (#1) collects data from the Health channel (ID 0) of the Probe Health sensor (ID 1001) running on the probe device. The second channel (#2) collects data from the Traffic Out channel (ID 1) of a traffic sensor (ID 1004) measuring the system's local network card. Both channels are shown together in the Sensor Factory sensor's data tables and graphs.

The basic syntax for a Sensor Factory sensor channel definition looks like this:

```
#<id>:<name>[<unit>]
<formula>
```

For each channel, one section is used. A section begins with the number sign (#). Function names in formulas are not case-sensitive.

The parameters include the following:

- <id> is the ID of the Sensor Factory sensor's channel. It must be a unique number that is greater than 0.
- <name> is the name of the Sensor Factory sensor's channel (displayed in graphs and tables).
- [<unit>] is an optional unit description for the Sensor Factory sensor's channel (for example, bytes). If you do not provide a unit, the Sensor Factory sensor automatically selects a suitable unit string (recommended).
- <formula> contains the formula to calculate the Sensor Factory sensor's channel. For the formula, you can use the following functions: [channel\(\)](#)<sup>[1762]</sup>, [min\(\)](#)<sup>[1763]</sup>, [max\(\)](#)<sup>[1763]</sup>, [avg\(\)](#)<sup>[1764]</sup>, or [percent\(\)](#)<sup>[1764]</sup>.

## Define Channels: channel() Function

The channel() function allows the Sensor Factory sensor to read the data from a channel of a source sensor. The syntax is:

```
channel(<sensorId>,<channelId>)
```

The parameters include the following:

- <sensorId> is the ID of the source sensor. It is displayed on the sensor's Overview tab.
- <channelId> is the ID of the channel of the source sensor. It is displayed in the respective field of the [channel settings](#).

### Example

```
channel(2001,2)
```

This function reads the data from channel ID 2 of the source sensor with the ID 2001.

```
#1:Sample
channel(2001,2)
```

This full channel definition reads the data from channel ID 2 of the source sensor with the ID 2001 and displays it in the first Sensor Factory sensor channel (#1), without any additional calculations.

## Define Channels: Formula Calculations

Within a formula, the following elements are allowed to perform calculations with the values that are returned by one or more functions.

- Basic operations: + (add), - (subtract), \* (multiply), / (divide)  
Example:  $3 + 5 * 2$
- Parentheses: ()  
Example:  $3 * (2 + 6)$
- Compare: = (equal), <> (not equal), > (greater), < (less), >= (greater or equal), <= (less or equal)  
If the comparison resolves to true, the value is **10,000**. If false, the value is **0**. For delta sensors, the speed is compared.

 Example

You see a Sensor Factory sensor channel definition with calculation.

```
#1:Traffic Total x Minus Traffic Out y
( channel(2001,-1) - channel(1004,1) ) * 2
```

This full channel definition results in a Sensor Factory sensor that shows a calculation with values from two channels (channel IDs **-1** and **1**) of two traffic sensors (sensor IDs **2001** and **1004**). The returned values are subtracted and then multiplied by two.

Channels can be gauge values (for example, ping **ms**) or delta values (for example, traffic **kbit/s**). Not all combinations are allowed in a formula.

 When performing percentage calculation, use the [percent\(\) Function](#)<sup>1764</sup> to make sure you obtain the expected values.

There are calculations you **cannot** do:

- You cannot add or subtract a delta from a gauge channel (and vice versa).
- You cannot multiply two delta channels.
- You cannot compare a delta with a gauge channel.
- You cannot use a channel of (another) Sensor Factory sensor channel in the formula.

## Define Channels: min() and max() Functions

The min() and max() functions return the minimum or maximum of two values. The syntax is:

```
min(<a> , <b> )
max(<a> , <b> )
```

Values for <a> and <b> are either numbers or [channel\(\)](#)<sup>1762</sup> functions.

 Examples

```
min(10,5)
```

This function returns 5, because this is the smaller value out of 10 and 5.

```
min( channel(2001,1),channel(2002,1) )
```

This function returns the minimum of the values of channel 1 of the source sensor with ID 2001 and channel 1 of the source sensor with ID 2002.

### Define Channels: avg() Function

The avg() function returns the average of the two values. This equals:  $(a+b) / 2$ . The syntax is:

```
avg(<a>,<b>)
```

Values for <a> and <b> are either numbers or [channel\(\)](#)<sup>[1762]</sup> functions.

 Examples

```
avg(20,10)
```

This function returns 15:  $(20+10) / 2 = 15$ .

```
avg( channel(2001,1),channel(2002,1) )
```

This function returns the average of channel 1 of the source sensor with ID 2001 and channel 1 of the source sensor with ID 2002.

### Define Channels: percent() Function

The percent() function calculates the percent value of two specified values, for example, a channel and a fixed value. The syntax is:

```
percent(<source>,<maximum>,<unit>)
```

The parameters include the following:

- <source> is the value the percent is calculated for. This is usually a [channel\(\)](#)<sup>[1762]</sup> function.
- <maximum> is the limit value used for the percent calculation.
- <unit> is an optional unit the maximum is provided in. You can use constants with this function (see [Define Channels: Constants](#)<sup>[1766]</sup> below for a list). This can be used for absolute values (for example, [Ping sensors](#)<sup>[1594]</sup>) or calculated delta values (for example, traffic sensors). If no unit is provided, 1 is used.
  - ① The sensor adds the unit string % automatically.

PRTG calculates:  $\text{<source> / <maximum> * <unit> * 100}$

 Examples

```
#1:Usage Traffic In
percent(channel(2001,0),100,kilobit)
#2:Usage Traffic Out
percent(channel(2001,1),100,kilobit)
```

This full channel definition results in a Sensor Factory sensor that shows two channels of a traffic sensor (sensor ID [2001](#)): Traffic in (channel ID [0](#)) and traffic out (channel ID [1](#)). The Sensor Factory sensor displays the values % of maximum bandwidth (100 kilobit/second).

```
#1:Ping %
percent(channel(2002,0),200)
```

This full channel definition results in a Sensor Factory sensor that shows the Ping Time channel (channel ID [0](#)) of a Ping sensor (sensor ID [2002](#)). The sensor displays the values as a percentage of 200 ms.

## Define Channels: Horizontal Lines

You can add lines to the graph using a formula without the channel() function. Use a fixed value instead. The syntax is:

```
#<id>:<name>[<unit>]
<value>
```

The parameters include the following:

- **<id>** is the ID of the Sensor Factory sensor's channel and must be a unique number greater than 1. Although the Sensor Factory sensor does not show a horizontal line as a channel, the ID has to be unique.
- **<name>** is the name of the Sensor Factory sensor's channel. PRTG does not display this name in graphs and tables, but you can use it as a comment to describe the nature of the line.
- **[<unit>]** is an optional unit description (for example, [kbit/s](#)). If you do not provide a unit, PRTG automatically applies the line to the scale of the first Sensor Factory sensor's channel. If your Sensor Factory sensor uses different units, provide a unit to make sure the line is added for the right scale. Enter the unit exactly as shown in your graph's legend. If you enter a unit that does not yet exist in your graph, a new scale is added automatically.
- **<value>** contains a number defining where the line is shown in the graph.

### Examples

```
#5:Line at 100ms [ms]
100
```

This channel definition results in a graph that shows a horizontal line at the value of 100 on the ms scale.

```
#6:Line at 2 Mbit/s [kbit/s]
2000
```

This channel definition results in a graph that shows a horizontal line at the value of 2000 on the kbit/s scale.

```
#1:Ping Time
channel(2002,0)
#2:Line at 120ms [ms]
120
```

This full channel definition results in a Sensor Factory sensor that shows the Ping Time channel (channel ID 0) of a Ping sensor (sensor ID 2002). Additionally, the sensor graphs show a horizontal line at 120 ms.

## Define Channels: Constants

The following constants are defined and can be used in calculations:

- one = 1
- kilo = 1000
- mega = 1000 \* kilo
- giga = 1000 \* mega
- tera = 1000 \* giga
- byte = 1
- kilobyte = 1024
- megabyte = 1024 \* kilobyte
- gigabyte = 1024 \* megabyte
- terabyte = 1024 \* gigabyte
- bit = 1/8
- kilobit = kilo / 8
- megabit = mega / 8
- gigabit = giga / 8
- terabit = tera / 8

## Define Sensor Status: status() Function

You can control the status of a Sensor Factory sensor via the Status Definition text field if you enable the custom formula option in the [sensor settings](#)<sup>1758</sup>. Using a special syntax, you can define when the Sensor Factory sensor changes to the Down status. In all other cases, the sensor is in the Up status. The syntax is:

```
status(sensorID) <boolean> status(sensorID)
```

The parameters include the following:

- <sensorid> is the ID of the source sensor that you want to check the status of. It is displayed on the sensor's Overview tab.
- <boolean> is one of the Boolean operators AND, OR, or NOT. If the resulting expression is **true**, the Sensor Factory sensor changes to the Down status.

### Examples

```
status(2031) AND status(2044)
```

This changes the Sensor Factory sensor to the Down status if both source sensors, with IDs **2031** and **2044**, are in the Down status. Otherwise the Sensor Factory sensor shows the Up status.

```
status(2031) OR status(2044)
```

This changes the Sensor Factory sensor to the Down status if at least one of the source sensors with ID **2031** or ID **2044** is in the Down status. Otherwise the Sensor Factory sensor shows the Up status.

```
status(2031) AND NOT status(2044)
```

This changes the Sensor Factory sensor to the Down status if the source sensor with ID **2031** is in the Down status, but the source sensor with ID **2044** is **not** in the Down status. Otherwise the Sensor Factory sensor shows the Up status.

**i** A status() function with NOT has to be connected with AND or OR if it is combined with other status() functions:

```
status(sensorID) AND NOT status(sensorID)
status(sensorID) OR NOT status(sensorID)
```

```
( status(2031) AND status(2044) ) OR status(2051)
```

This changes the Sensor Factory sensor to the Down status if both the source sensor with ID **2031** and the source sensor with ID **2044** are in the Down status, or if the source sensor with ID **2051** is in the Down status. Otherwise the Sensor Factory sensor shows the Up status.

Additionally, the following elements are allowed to perform calculations and comparisons with the values that are returned by the status functions:

- Basic operations: + (add), - (subtract), \* (multiply), / (divide)  
Example: **3 + 5 \* 2**

- Parentheses: ( )  
Example:  $3 * (2 + 6)$
- Compare: = (equal), <> (not equal), > (greater), < (less), >= (greater or equal), <= (less or equal)  
If the comparison resolves to true, the value is 10,000. If false, the value is 0. For delta sensors, the speed is compared.

Internally, the status() function returns the Downtime channel of the source sensor in hundreds of percent (10,000 = 100%).

- true corresponds to a value of 10,000, which is the Down status.
- false corresponds to a value of 0, which is the Up status.

If you understand this, you can use more complex formulas.

 Example

```
( status(1031) + status(1032) + status(1033) + status(1034) ) >= 20000
```

This changes the Sensor Factory sensor to the Down status if at least any two of the source sensors with IDs 1031, 1032, 1033, or 1034 are in the Down status. Otherwise the Sensor Factory sensor shows the Up status.

 You can also use the status() function in [channel definitions](#). Using this functionality, it is possible, for example, to display the numeric status value of source sensors in a Sensor Factory sensor channel.

## Using Sensor Factory Sensors in a Cluster

If you run PRTG in a [failover cluster](#), note the following:

- If you add a Sensor Factory sensor underneath the [cluster probe](#), and in the Sensor Factory formula you refer to a channel of a source sensor running on the cluster probe as well, the Sensor Factory sensor shows the data of all cluster nodes for this channel.
- If you add a Sensor Factory sensor underneath the [local probe](#), and in the Sensor Factory formula you refer to a channel of a sensor running on the cluster probe, the Sensor Factory sensor only shows data of the primary master node for this channel.

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
[Custom]	The monitoring results from other sensors or devices. Samples for usage are: <ul style="list-style-type: none"> <li>▪ Show single channels of one or more sensors in one graph.</li> </ul>

Channel	Description
	<ul style="list-style-type: none"> <li>▪ Use the data from single channels of one or more sensors to calculate new values (for example, you can subtract, multiply, and divide).</li> <li>▪ Create graphs with data from other sensors' channels and add horizontal lines at specific vertical positions.</li> </ul>
Downtime	<p>In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status</p> <p> The Sensor Factory sensor does not show values in the Downtime channel because they cannot be calculated for this sensor.</p>

sFlow Sensor

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

1770

## Sensor in Other Languages

- Dutch: sFlow
- French: sFlow
- German: sFlow
- Japanese: sFlow
- Portuguese: sFlow
- Russian: sFlow
- Simplified Chinese: sFlow
- Spanish: sFlow

## Remarks

Consider the following [remarks](#)<sup>[1771]</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a very high performance impact. We recommend that you use no more than <b>50</b> of this sensor on each probe.
sFlow	This sensor requires that the sFlow v5 export is enabled on the target system. The target system must send the flow data stream to the IP address of the probe system.
Cluster probe	This sensor does not support cluster probes. You can only set it up on local probes or remote probes.
IPv4	This sensor only supports IPv4.
RAW data	This sensor accepts RAW data only. The stream must be sent via IPv4.
Limitations	This sensor has several <a href="#">limitations</a> <sup>[1772]</sup> .
Clone sensor	If you clone this sensor to the <b>same</b> probe, PRTG keeps the <a href="#">selected IP addresses</a> <sup>[1773]</sup> on which it listens for Flow (NetFlow, jFlow, sFlow, IPFIX) packets. If you clone this sensor to a <b>different</b> probe, PRTG selects <b>all</b> available IP addresses by default.
Knowledge Base	<ul style="list-style-type: none"> <li>▪ Knowledge Base: <a href="#">How can I change the default groups and channels for flow and Packet Sniffer sensors?</a></li> <li>▪ Knowledge Base: <a href="#">Where is the volume line in graphs?</a></li> </ul>

Remark	Description
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Limitations

There are some limitations that you should consider before you use this sensor:

- This sensor only supports sFlow v5 datagrams.
- This sensor only supports IPv4 flows.
- This sensor only supports the "raw packet header" format.
- This sensor only supports the "Flow sample" and "Extended flow" formats. It cannot process "Counter" formats.
- This sensor only processes samples where the source ID matches the ifIndex of the input interface (avoiding double-counted traffic) and ascending sequence numbers.
- This sensor only supports sample packets of the Ethernet type "IP" (with optional VLAN tag)
- This sensor only supports sampled packets of the types TCP and UDP.

✂ We recommend that you use [sFlow Tester](#) for debugging.

## Basic Sensor Settings

**Note** You can change the default configuration for groups and channels. This way, you do not have to customize this setting each time that you add this sensor type. For details, see the Knowledge Base: [How can I change the default groups and channels for xFlow and Packet Sniffer sensors?](#)

Channel Configuration

Setting	Description
Channel Selection	<p>Define the categories that the sensor accounts the traffic to:</p> <ul style="list-style-type: none"> <li>Web: Internet web traffic.</li> <li>File Transfer: Traffic from FTP.</li> <li>Mail: Internet mail traffic.</li> <li>Chat: Traffic from chat and instant messaging.</li> <li>Remote Control: Traffic from remote control applications such as RDP, SSH, Telnet, and Virtual Network Computing (VNC).</li> <li>Infrastructure: Traffic from network services such as DHCP, DNS, Ident, ICMP, and SNMP.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ NetBIOS: Traffic from NetBIOS communication.</li> <li>▪ Citrix: Traffic from Citrix applications.</li> <li>▪ Other Protocols: Traffic from various other protocols via UDP and TCP.</li> </ul> <p>For each group, you can select how many channels the sensor uses, that is, how detailed the sensor divides the traffic:</p> <ul style="list-style-type: none"> <li>▪ No (✘): Do not account traffic of this group in its own channel. The sensor accounts all traffic of this group to the default channel named Other.</li> <li>▪ Yes (✔): Count all traffic of this group and summarize it in one channel.</li> <li>▪ Detail (🔍): Count all traffic of this group and further divide it into different channels. The traffic appears in several channels that you can see in the Content column. <ul style="list-style-type: none"> <li>ⓘ Extensive use of this option can cause load problems on the probe system. We recommend that you set specific, well-chosen filters for the data that you really want to analyze.</li> </ul> </li> </ul> <p><span style="color: #0070C0;">■</span> You can change the default configuration for groups and channels. For more information, see the Knowledge Base: <a href="#">How can I change the default groups and channels for flow and Packet Sniffer sensors?</a></p>

## Filtering

■ For more information, see section [Filter Rules](#) .

**Filtering**

**Filters** *To include and exclude specific traffic, you can define filter rules based on the following format guidelines:*

- field[filter]

*Fields:*

IP, Port, SourceIP, SourcePort, DestinationIP, DestinationPort, Protocol (values TCP, UDP, ICMP, OSPFIGP or any number), ToS, DSCP

*Additional IPFIX fields:*

Interface, ASI, InboundInterface, OutboundInterface, SourceASI, DestinationASI, MAC, SourceMAC, DestinationMAC, Mask, SourceMask, DestinationMask ('Masks' represent subnet masks in the form of a single number ('number of contiguous bits')), NextHop (IP Address), VLAN, SourceVLAN, DestinationVLAN ('VLANs' represent a VLAN identifier)

Include Filter ⓘ

Exclude Filter ⓘ

Filtering

Setting	Description
Include Filter	Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special <a href="#">syntax</a> .
Exclude Filter	First, the sensor considers the filters in Include Filter. From this subset, you can explicitly exclude traffic, using the same syntax.

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Primary Toplist

Primary Toplist

Primary Toplist ⓘ
Top Connections

Primary Toplist

Setting	Description
Primary Toplist	<p>Define which Toplist is the primary Toplist of the sensor:</p> <ul style="list-style-type: none"> <li>▪ Top Talkers</li> <li>▪ Top Connections</li> <li>▪ Top Protocols</li> <li>▪ <a href="#">[Any custom Toplists you add]</a></li> </ul> <p>ⓘ PRTG shows the primary Toplist in maps when you add a Toplist object.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Toplists

For all Flow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

■ For more information, see section [Toplists](#).

## Filter Rules

■ For more information, see section [Filter Rules for Flow, IPFIX, and Packet Sniffer Sensors](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Chat	The traffic from chat and instant messaging (IRC, AIM)
Citrix	The traffic from Citrix applications
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
FTP/P2P	The traffic from file transfer (FTP/P2P)
Infrastructure	The traffic from network services (DHCP, DNS, Ident, ICMP, SNMP)
Mail	The internet mail traffic (IMAP, POP3, SMTP)
NetBIOS	The traffic from NetBIOS communication
Other	The traffic from various other protocols (UDP, TCP)
Remote Control	The traffic from remote control applications (RDP, SSH, Telnet, Virtual Network Computing (VNC))
Total	The total traffic <span>ⓘ</span> This channel is the primary channel by default.
Various	The traffic from various other sources
WWW	The traffic from the web (HTTP, HTTPS)

## Remarks

Consider the following [remarks](#)<sup>1781</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a very high performance impact. We recommend that you use no more than <b>50</b> of this sensor on each probe.
sFlow	This sensor requires that the sFlow v5 export is enabled on the target system. The target system must send the flow data stream to the IP address of the probe system.
RAW data	This sensor accepts RAW data.
Limitations	This sensor has several <a href="#">limitations</a> <sup>1781</sup> .
Cluster probe	This sensor does not support cluster probes. You can only set it up on local probes or remote probes.
IPv4	This sensor only supports IPv4.
Channels	This sensor does not officially support more than <b>50 channels</b> .
Knowledge Base	Knowledge Base: <a href="#">Where is the volume line in graphs?</a>
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Limitations

There are some limitations that you should consider before you use this sensor:

- This sensor only supports sFlow v5 datagrams.
- This sensor only supports IPv4 flows.
- This sensor only supports the "raw packet header" format.
- This sensor only supports the "Flow sample" and "Extended flow" formats. It cannot process "Counter" formats.
- This sensor only processes samples where the source ID matches the ifIndex of the input interface (avoiding double-counted traffic) and ascending sequence numbers.
- This sensor only supports sample packets of the Ethernet type "IP" (with optional VLAN tag)
- This sensor only supports sampled packets of the types TCP and UDP.

✂ We recommend that you use [sFlow Tester](#) for debugging.

Stream Data Handling ⓘ

Discard stream data (default)

Store stream data only for the 'Other' channel

Store all stream data

sFlow v5 Specific Settings

Setting	Description
Receive Packets on UDP Port	<p>Enter the UDP port number on which the flow packets are received. It must match the UDP port number in the sFlow export options of the hardware router device. The default port is <b>6343</b>. Enter an integer.</p> <p><span style="color: red;">❗</span> When you configure the export, make sure that you select the appropriate sFlow v5 for this sensor</p>
Sender IP Address	<p>Enter the IP address of the sending device that you want to receive the sFlow from. Enter an IP address to only receive data from a specific device or leave the field empty to receive data from any device on the specified port.</p>
Receive Packets on IP Address	<p>Select the IP addresses on which PRTG listens to sFlow packets. The list of IP addresses is specific to your setup. To select an IP address, enable a check box in front of the respective line. The IP address that you select must match the IP address in the sFlow export options of the hardware router device.</p> <p><span style="color: red;">❗</span> When you configure the export, make sure that you select the appropriate sFlow v5 for this sensor</p> <p><span style="color: red;">❗</span> You can also select all items or cancel the selection by using the check box in the table header.</p>

Setting	Description
Channel Definition	<p>Enter a channel definition to divide the traffic into different channels. Enter each definition in one line. The sensor accounts all traffic that you do not define a channel for to the default channel Other.</p> <ul style="list-style-type: none"> <li><span style="color: #0070C0;">■</span> For more information, see section <a href="#">Channel Definitions for Flow, IPFIX and Packet Sniffer Sensors</a>.</li> <li><span style="color: #C00000;">i</span> Extensive use of many filters can cause load problems on the probe system. We recommend that you define specific, well-chosen filters for the data that you really want to analyze. We recommend that you do not use more than 20 channels in graphs and tables, and not more than 100 channels in total. For performance reasons, we recommend that you add several sensors with fewer channels each.</li> </ul>
Stream Data Handling	<p>Define what PRTG does with the stream and packet data:</p> <ul style="list-style-type: none"> <li>▪ Discard stream data (default): Do not store the stream and packet data.</li> <li>▪ Store stream data only for the 'Other' channel: Only store stream and packet data that is not otherwise filtered and is therefore accounted to the default Other channel. PRTG stores this data in the \StreamLog subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Streams Sensor [ID] (1).csv. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> <li>▪ Store all stream data: Store all stream and packet data. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <ul style="list-style-type: none"> <li><span style="color: #C00000;">i</span> Use with caution. It can create huge data files. We recommend that you only use this setting for a short time.</li> </ul>

## Filtering

■ For more information, see section [Filter Rules](#) 1787.

**Filtering**

**Filters** To include and exclude specific traffic, you can define filter rules based on the following format guidelines:

- field[filter]

**Fields:**

IP, Port, SourceIP, SourcePort, DestinationIP, DestinationPort, Protocol (values TCP, UDP, ICMP, OSPFIGP or any number), ToS, DSCP

**Additional IPFIX fields:**

Interface, ASI, InboundInterface, OutboundInterface, SourceASI, DestinationASI, MAC, SourceMAC, DestinationMAC, Mask, SourceMask, DestinationMask ('Masks' represent subnet masks in the form of a single number ('number of contiguous bits')), NextHop (IP Address), VLAN, SourceVLAN, DestinationVLAN ('VLANs' represent a VLAN identifier)

Include Filter ⓘ

Exclude Filter ⓘ

Filtering

Setting	Description
Include Filter	Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special <a href="#">syntax</a> .
Exclude Filter	First, the sensor considers the filters in Include Filter. From this subset, you can explicitly exclude traffic, using the same syntax.

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.  ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.
Graph Type	Define how this sensor shows different channels:

Setting	Description
	<ul style="list-style-type: none"> <li>Show channels independently (default): Show a graph for each channel.</li> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.                             <ul style="list-style-type: none"> <li> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Primary Toplist

**Primary Toplist** Primary Toplist ⓘ Top Connections

Primary Toplist

Setting	Description
Primary Toplist	<p>Define which Toplist is the primary Toplist of the sensor:</p> <ul style="list-style-type: none"> <li>Top Talkers</li> <li>Top Connections</li> <li>Top Protocols</li> <li><a href="#">[Any custom Toplists you add]</a></li> </ul> <p> PRTG shows the primary Toplist in maps when you add a Toplist object.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Toplists

For all Flow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

■ For more information, see section [Toplists](#).

## Filter Rules

■ For more information, see section [Filter Rules for Flow, IPFIX, and Packet Sniffer Sensors](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
[Custom]	The traffic by type according to the channel definition
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Other	All traffic for which no channel is defined
Total	The total traffic ⓘ This channel is the primary channel by default.

SSH Port Inheritance ⓘ  Inherit port from parent device (default)  
 Do not inherit port (enter a custom SSH port)

SSH Engine ⓘ  Inherit from parent device (default)  
 Default  
 Compatibility mode (deprecated)

Result Handling ⓘ  Discard result (default)  
 Store result  
 Store result in case of error

SSH Specific

Setting	Description
Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time that the sensor waits to establish a connection to the host. Keep this value as low as possible. Enter an integer. The maximum timeout value is <b>900</b> seconds (15 minutes).</p> <p> ⓘ Make sure that the connection timeout is a value that is higher than the shell timeout to avoid potential errors.</p>
Shell Timeout (Sec.)	<p>Define a timeout in seconds for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (for example, <a href="#">cat /proc/loadavg</a>). The maximum value is 300 seconds (5 minutes). Enter an integer.</p> <p> ⓘ Make sure that the shell timeout is a value that is lower than the connection timeout to avoid potential errors.</p>
SSH Port Inheritance	<p>Define which port this sensor uses for the SSH connection:</p> <ul style="list-style-type: none"> <li>▪ Inherit port from parent device (default): Use the port number as defined in the <a href="#">Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems</a> section of the parent device settings.</li> <li>▪ Do not inherit port (enter a custom SSH port): Define a custom port number below and do not use the port number from the parent device settings.</li> </ul>

Setting	Description
Custom SSH Port	<p>This setting is only visible if you select Do not inherit port (enter a custom SSH port) <a href="#">above</a>.</p> <p>Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Enter an integer.</p>
SSH Engine	<p>Select the SSH engine that you want to use to <a href="#">access data with this SSH sensor</a>:</p> <ul style="list-style-type: none"> <li>▪ Inherit from parent device (default): Use the SSH engine that you defined in the parent device settings or higher up in the <a href="#">object hierarchy</a>. If you have not changed the SSH engine, this is the recommended option.</li> <li>▪ Default: This is the default SSH engine. It provides the best performance and security. It is set by default in objects that are higher up in the hierarchy, so usually you can keep the Inherit from parent device (default) option.</li> <li>▪ Compatibility mode (deprecated): Use this only if the default SSH engine does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions. It is deprecated. We will remove this legacy mode soon, so try to get your SSH sensors to run with the default SSH engine.</li> </ul> <p> We strongly recommend that you use the default SSH engine.</p> <p> The option you select here overrides the selection of the SSH engine in a higher object: a parent device, group, probe, or root.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> <li>▪ Store result in case of error: Store the last sensor result only if the sensor shows the Down status.</li> </ul> <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

Monitoring

Setting	Description
Email Handling	<p>Define the monitoring approach when connecting to the SMTP server:</p> <ul style="list-style-type: none"> <li>▪ Do not send an email (default): Do not send an email, only connect to the SMTP server.</li> <li>▪ Send an email: Send an email through the SMTP server. If there is an error when sending the email, this triggers an error message and the sensor changes to the Down status.</li> </ul>
From	<p><a href="#">This setting is only visible if you select Send an email above.</a></p> <p>Specify the address of the sender of the email. Enter a valid email address.</p>
To	<p><a href="#">This setting is only visible if you select Send an email above.</a></p> <p>Specify the address that PRTG sends the email to. Enter a valid email address.</p> <p> ⓘ If you define more than one recipient, separate the individual email addresses with commas.</p>
Subject	<p><a href="#">This setting is only visible if you select Send an email above.</a></p> <p>Specify the subject that the email contains. Enter a string or leave the field empty.</p>
Content	<p><a href="#">This setting is only visible if you select Send an email above.</a></p> <p>Specify the body that the email contains. Enter a string or leave the field empty.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel **ⓘ** Downtime

---

Graph Type **ⓘ**  Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking <b>⌵</b> below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select Stack channels on top of each other above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Response Time	The response time  This channel is the primary channel by default.

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

## 7.8.162 SMTP&IMAP Round Trip Sensor

The SMTP&IMAP Round Trip sensor monitors the time it takes for an email to reach an Internet Message Access Protocol (IMAP) mailbox using the Simple Mail Transfer Protocol (SMTP). It sends an email via the parent device (an SMTP server) and then scans a dedicated IMAP mailbox until the email arrives.

**i** The SMTP&IMAP Round Trip sensor automatically deletes these emails from the mailbox as soon as PRTG retrieves them. The emails only remain in the mailbox if a timeout or a restart of the PRTG core server occurs during sensor runtime.

SMTP&IMAP Round Trip Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: SMTP & IMAP Round Trip
- French: SMTP & IMAP aller-retour
- German: SMTP&IMAP-Übermittlung
- Japanese: SMTP & IMAP ラウンドトリップ
- Portuguese: Ida e volta SMTP&IMAP
- Russian: Цикл SMTP&IMAP
- Simplified Chinese: SMTP 和 IMAP 往返
- Spanish: Ida y vuelta SMTP&IMAP

## Remarks

Consider the following [remarks](#)<sup>[1811]</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
Parent device	This sensor requires that the parent device is an SMTP server.
SRP ciphers	This sensor does not support Secure Remote Password (SRP) ciphers.
Microsoft 365 mailboxes	This sensor does not support Microsoft 365 mailboxes. If you want to monitor a Microsoft 365 mailbox, use the <a href="#">Microsoft 365 Mailbox</a> <sup>[1252]</sup> sensor.
IPv4	This sensor only supports IPv4.
Dedicated email accounts	Use dedicated email accounts with this sensor. Make sure that each sensor uses its own email accounts.

If no secure connection is possible, no communication takes place.</p>

## Step 2: Check an IMAP Mailbox until Email Arrives

ⓘ In this step, you configure how to receive the emails that the sensor sends.

## Step 2: Check an IMAP Mailbox until Email Arrives

IP Address/DNS Name ⓘ	www.example.com
Mailbox ⓘ	INBOX
Port ⓘ	993
Connection Interval (Sec.) ⓘ	10
Maximum Trip Time (Sec.) ⓘ	300
User Name ⓘ	johnqpublic
Password ⓘ	.....
Search Method ⓘ	<input checked="" type="radio"/> Search for the email directly (default) <input type="radio"/> Search through all available emails

Step 2: Check an IMAP Mailbox until Email Arrives

Setting	Description
IP Address/DNS Name	Specify the IMAP server. Enter a valid IP address or Domain Name System (DNS) name.
Mailbox	Specify the IMAP mailbox that you want to check. Enter the IMAP mailbox or folder name, for example <b>INBOX</b> .  ⓘ The IMAP mailbox or folder name must <b>not</b> match the sender of the email in the From field. Otherwise, the sensor might incorrectly interpret unsuccessful round trips as successful.
Port	Specify the port that the sensor uses for the IMAP connection. The default port for unsecure connections is <b>143</b> and the default port for secure connections is <b>993</b> . The actual setting depends on the server you connect to.. Enter an integer.  ⓘ We recommend that you use the default value. ⓘ If the connection is unsuccessful, try a different port number.
Connection Interval (Sec.)	Enter the number of seconds the sensor waits between two connections to the IMAP server. PRTG repeatedly checks the mailbox in this scanning interval until the email arrives. Enter an integer.

Setting	Description
Maximum Trip Time (Sec.)	Enter the maximum number of seconds an email can take to arrive in the IMAP mailbox. PRTG continuously checks the mailbox in this scanning interval until the email arrives. If it does not arrive within the maximum trip time, the sensor shows an error message. Enter an integer.
User Name	Enter a user name for IMAP authentication. Enter a string.
Password	Enter a password for IMAP authentication. Enter a string.   The password must <b>not</b> contain spaces, percent signs (%), or the character combination !*.
Search Method	Define how to search for the round trip email in the mailbox: <ul style="list-style-type: none"> <li>▪ Search for the email directly (default): Send a <b>SEARCH</b> command to directly find the round trip email on the IMAP server.</li> <li>▪ Search through all available emails: Search through all available emails in the mailbox locally to find the round trip email. This might take some time if you have many emails in your mailbox.</li> </ul>

Setting	Description
IP Address/DNS Name	Specify the POP3 server. Enter a valid IP address or Domain Name System (DNS) name.
Port	<p>Specify the port that the sensor uses for the POP3 connection. The default port for unsecure connections is <b>110</b> and the default port for secure connections is <b>995</b>. The actual setting depends on the server you connect to. Enter an integer.</p> <p><b>i</b> We recommend that you use the default value.</p> <p><b>i</b> If the connection is unsuccessful, try a different port number.</p>
Connection Interval (Sec.)	Enter the number of seconds the sensor waits between two connections to the POP3 server. PRTG continuously checks the mailbox in this scanning interval until the email arrives. Enter an integer.
Maximum Trip Time (Sec.)	Enter the maximum number of seconds an email can take to arrive in the POP3 mailbox. PRTG continuously checks the mailbox in the interval that you specify above until the email arrives. If it does not arrive within the maximum trip time, the sensor triggers an error message. Enter an integer.
POP3 Authentication Method	<p>Select the authentication method for the POP3 connection:</p> <ul style="list-style-type: none"> <li>▪ Without login (default): Only monitor the connection to the POP3 server.</li> <li>▪ User name and password: Log in to the POP3 server with user name and password. <ul style="list-style-type: none"> <li><b>i</b> This is a simple login. It is not secure.</li> </ul> </li> <li>▪ 128-bit MD5 hash value (APOP): Send the password in an encrypted form using APOP. <ul style="list-style-type: none"> <li><b>i</b> The POP3 server that you connect to must support this option.</li> </ul> </li> </ul>
User Name	<p><b>This setting is only visible if you select User name and password or 128-bit MD5 hash value (APOP) above.</b></p> <p>Enter a user name for POP3 authentication. Enter a string.</p>
Password	<p><b>This setting is only visible if you select User name and password or 128-bit MD5 hash value (APOP) above.</b></p> <p>Enter a user name for POP3 authentication. Enter a string.</p>

## Connection Security

**Connection Security**

POP3 Specific ⓘ

Use transport-level security if available using StartTLS  
 Use transport-level security if available  
 Enforce transport-level security using StartTLS  
 Enforce transport-level security (default)

Connection Security

Setting	Description
Transport-Level Security	<p>Define how the sensor handles the security of the connection:</p> <ul style="list-style-type: none"> <li>▪ Use transport-level security if available using StartTLS: Try to connect to the server via a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection and StartTLS. If the server does not support this, the sensor tries to connect without connection security.</li> <li>▪ Use transport-level security if available: Try to connect to the server via an SSL/TLS-secured connection. If the server does not support this, the sensor tries to connect without connection security.</li> <li>▪ Enforce transport-level security using StartTLS: Try to connect to the server via an SSL/TLS-secured connection and StartTLS. If the server does not support this, the sensor shows the Down <a href="#">status</a>.</li> <li>▪ Enforce transport-level security (default): Try to connect to the server via an SSL/TLS-secured connection. If the server does not support this, the sensor shows the Down status.</li> </ul> <p>ⓘ If the sensor connects to a server via StartTLS, the connection is first established without connection security. After the connection has been established, the sensor sends a certain command (<a href="#">StartTLS</a>) over the unsecured connection to negotiate a secure connection via SSL/TLS.</p> <p>ⓘ If the sensor does <b>not</b> use StartTLS, the negotiation of a secure connection happens immediately (implicitly) so that no commands are sent in unencrypted plain text. If no secure connection is possible, no communication takes place.</p>

## Debug Options

**Debug Options**

Result Handling ⓘ

Discard result (default)  
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p>ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select Stack channels on top of each other above.</b></p>

Setting	Description
	Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Response Time (POP3)	The response time of the POP3 server
Response Time (SMTP)	The response time of the SMTP server
Total	The sum of the response time of the SMTP server and the POP3 server  This channel is the primary channel by default.

## 7.8.165 SNMP Buffalo TS System Health Sensor

The SNMP Buffalo TS System Health sensor monitors the system health of a Buffalo TeraStation network-attached storage (NAS) via the Simple Network Management Protocol (SNMP).

**i** This sensor supports the following TeraStation systems: [3000](#), [3010](#), [3020](#), [5000](#), [5010](#), [6000](#), and [7000](#) series.

**i** Run an [auto-discovery](#) with the device template Buffalo TeraStation NAS to automatically create [SNMP Custom Table sensors](#)<sup>[1917]</sup> with additional useful information about the TeraStation, for example, array status, disk smart status, disk status, and Internet Small Computer System Interface (iSCSI) status. This device template also creates [SNMP sensors](#) for traffic, memory, and load average on the TeraStation.

SNMP Buffalo TS System Health Sensor

**■** For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[1837]</sup>.

### Sensor in Other Languages

- Dutch: SNMP Buffalo TS Systeemstatus
- French: Buffalo TS état du système (SNMP)
- German: SNMP Buffalo TS System Health

We strongly recommend that you only change it if the Paessler support team explicitly asks you to do so. Wrong usage can result in incorrect monitoring data.</p>
Sensor Behavior	<p>Define the <a href="#">sensor status</a> if no active connection is available:</p> <ul style="list-style-type: none"> <li>▪ Show down status if no connection is active (default): Set the sensor to the Down status if no connection is active.</li> <li>▪ Show warning status if no connection is active: Set the sensor to the Warning status if no connection is active.</li> <li>▪ Stay in up status if no connection is active: Stay in the Up status if no connection is active.</li> </ul>
IKE Version Handling	<p>Select the engine for the Internet Key Exchange (IKE) version handling:</p> <ul style="list-style-type: none"> <li>▪ IKEv1 (default): Select this option if the tunnel on the device uses IKEv1.</li> <li>▪ IKEv1 and IKEv2: Select this option if the tunnel on the device uses IKEv1 or IKEv2.</li> </ul> <p><b>i</b> The IKEv1 and IKEv2 option is in beta status and might not work properly.</p>

## Sensor Display

**Sensor Display**

Primary Channel **i** Downtime

---

Graph Type **i**  Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking <b>+</b> below a channel gauge on the sensor's Overview tab.</p>

Setting	Description
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>Show channels independently (default): Show a graph for each channel.</li> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> <li> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Total	The total traffic
Traffic In	<p>The incoming traffic</p> <p> This channel is the primary channel by default.</p>
Traffic Out	The outgoing traffic

## OID Settings

OID Settings	
Channel #1 Name ⓘ	1
Channel #1 OID ⓘ	1.3.6.1.2.1.1.3.0
Channel #1 Value Type ⓘ	Absolute (unsigned integer, for example "10", "120")
Channel #1 Unit ⓘ	Count
Channel #2 ⓘ	Disable

OID Settings

Setting	Description
Channel #x Name	Enter a name for the channel in which the sensor shows the results at the OID. Enter a string.
Channel #x OID	<p>Enter the OID of the SNMP object from which you want to receive numeric data.</p> <p>ⓘ Most OIDs begin with <a href="#">1.3.6.1</a>. However, OIDs that start with <a href="#">1.0</a>, or <a href="#">1.1</a>, or <a href="#">1.2</a> are also allowed. If you want to entirely disable the validation of your entry, add the string <a href="#">norfccheck:</a> to the beginning of the OID, for example, <a href="#">norfccheck:2.0.0.0.1</a>.</p>
Channel #x Value Type	<p>Select the expected numeric type of the results at the OID:</p> <ul style="list-style-type: none"> <li>▪ Absolute (unsigned integer): Integers without an operational sign, such as <a href="#">10</a> or <a href="#">120</a>.</li> <li>▪ Absolute (signed integer): Integers with an operational sign, such as <a href="#">-12</a> or <a href="#">120</a>.</li> <li>▪ Absolute (float): Float values, such as <a href="#">-5.80</a> or <a href="#">8.23</a>.</li> <li>▪ Delta (counter): Counter values. PRTG calculates the difference between the last and the current value. PRTG additionally divides the delta value by a time period to indicate a speed value.</li> </ul> <p>ⓘ This mode only works if the difference between the last and the current value is positive and increases with each scanning interval. This mode does not support negative values and decreasing values.</p> <p>ⓘ Absolute (float) and Delta (counter) are not compatible with the unit Lookup.</p> <p>ⓘ You cannot change this value after sensor creation.</p>
Channel #x Unit	Define the unit of the numeric data that this sensor receives from the OID:

Setting	Description
	<ul style="list-style-type: none"> <li>▪ BytesBandwidth</li> <li>▪ BytesMemory</li> <li>▪ BytesDisk</li> <li>▪ Temperature</li> <li>▪ Percent</li> <li>▪ TimeResponse</li> <li>▪ TimeSeconds</li> <li>▪ TimeHours</li> <li>▪ Count</li> <li>▪ CPU</li> <li>▪ BytesFile</li> <li>▪ SpeedDisk</li> <li>▪ SpeedNet</li> <li>▪ Custom</li> <li>▪ Lookup</li> </ul> <p> For more information about the available units, see section <a href="#">Custom Sensors</a>.</p> <p> To use <a href="#">lookups</a> with this channel, select Lookup and define the lookup file in Channel #x Lookup. Do not use Custom if you use lookups with this sensor.</p> <p> You cannot use the unit Lookup if you select the value type Delta (counter) or Absolute (float). You are not able to create the sensor in this case.</p>
Channel #x Custom Unit	<p><a href="#">This setting is only visible if you select Custom above.</a></p> <p>Define a unit for the channel value. Enter a string.</p>
Channel #x Lookup	<p><a href="#">This setting is only visible if you select Lookup above.</a></p> <p>Select a <a href="#">lookup</a> file that you want to use with this channel.</p>
Channel #2 - #10	<p>You can define up to 10 channels. You must define at least one channel, so you see all available settings for <a href="#">Channel #1</a>. Specify how to handle all other possible channels:</p> <ul style="list-style-type: none"> <li>▪ Disable: Do not create this channel.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Enable: Create this channel.</li> </ul> <p><b>i</b> It is not possible to enable or disable channels after sensor creation.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
[Value]	The numeric value for a specified OID (up to 10 OIDs are possible) that refers to a specific SNMP device

## 7.8.179 SNMP Custom String Sensor

The SNMP Custom String sensor monitors a string returned by a specific object identifier (OID) via the Simple Network Management Protocol (SNMP). It can check for keywords. If you want to set limits to the channel value, you can also extract a numeric value contained in the string.

- ❶ In the sensor message, the sensor shows the string that you [search](#) for and the reason for the Warning or Down [status](#).
- ❷ The [SNMP Library](#) sensor automatically creates SNMP Custom String sensors when the Management Information Base (MIB) file that you import contains string values.

SNMP Custom String Sensor

- For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

## Extended Processing

**Extended Processing**

**Interpret Result As** **i**

String (default)

Bytes in hexadecimal notation

Bytes in decimal notation

**Numeric Value Extraction** **i**

Do not use extraction (default)

Use a regular expression for extraction

Extended Processing

Setting	Description
Interpret Result As	<p>Define the type of the received string:</p> <ul style="list-style-type: none"> <li>▪ String (default): Handle the result as a common string.</li> <li>▪ Bytes in hexadecimal notation: Handle the result as bytes in hexadecimal notation. For example, select this option if you monitor MAC addresses.</li> <li>▪ Bytes in decimal notation: Handle the result as bytes in decimal notation. For example, select this option if you monitor IP addresses.</li> </ul>
Numeric Value Extraction	<p>Define if you want to filter out a numeric value from the received string:</p> <ul style="list-style-type: none"> <li>▪ Do not use extraction (default): Do not extract a float value. Use the result as a string value.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>Use a regular expression for extraction: Use a regular expression (regex) to identify a numeric value in the string and to convert it to a float value to use it, for example, with channel limits. Define below. See also the <a href="#">example</a><sup>[1908]</sup>. <ul style="list-style-type: none"> <li>For more information, see section <a href="#">Channel Settings</a>.</li> </ul> </li> </ul>
Regular Expression	<p><b>This setting is only visible if you select</b> Use a regular expression for extraction <a href="#">above</a>.</p> <p>Enter a regular expression to identify the numeric value that you want to extract from the string returned by the SNMP object at the specified OID. You can use capturing groups.</p> <p><b>i</b> Make sure that the expression only returns numbers, including the decimal and thousands separators.</p> <p><b>i</b> PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more information, see section <a href="#">Regular Expressions</a>.</p>
Index of Capturing Group	<p><b>This setting is only visible if you select</b> Use a regular expression for extraction <a href="#">above</a>.</p> <p>If your regex uses capturing groups, specify which one captures the number. Enter an integer or leave the field empty.</p>
Decimal Separator	<p><b>This setting is only visible if you select</b> Use a regular expression for extraction <a href="#">above</a>.</p> <p>Define the character for the decimal separator of the number. Enter a string or leave the field empty.</p>
Thousands Separator	<p><b>This setting is only visible if you select</b> Use a regular expression for extraction <a href="#">above</a>.</p> <p>Define the character for the thousands separator of the number. Enter a string or leave the field empty.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Number Extraction with Regular Expression

 If you want to extract a number in the response string via a regex, note that the index for captures in this sensor is based on 1 (not on 0). Furthermore, capturing groups are not automatically created. The example below illustrates this issue.

Consider the following string as returned by a request for CPU usage:

```
5 Sec (3.49%), 1 Min (3.555%), 5 Min (3.90%)
```

Assuming you would like to filter for the number **3.555**, this is the percentage in the second parentheses. Enter the following regex in the Regular Expression field:

```
(\d+\.\d+).*?(\d+\.\d+).*?(\d+\.\d+)
```

As Index of Capturing Group, enter **3**. This extracts the desired number **3.555**.

The index must be 3 in this case because the capturing groups here are the following:

- Group 1 contains **3.49%**, **1 Min (3.555)**, **5 Min (3.90)**
- Group 2 contains **3.49**
- Group 3 contains **3.555**
- Group 4 contains **3.90**

Keep this note about index and capturing groups in mind when using number extraction.

- i** It is not possible to match an empty string with the PRTG regex sensor search.
- i** PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more information, see section [Regular Expressions](#).

## Channel List

- i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Extracted Value	The value extracted from the string (optional)
Response Time	The response time <b>i</b> This channel is the primary channel by default.

## 7.8.180 SNMP Custom String Lookup Sensor

The SNMP Custom String Lookup sensor monitors a string that a specific object identifier (OID) returns via the Simple Network Management Protocol (SNMP). It can map the string directly to a [sensor status](#) by using a [defined lookup file](#).

**i** Basically, this sensor does a "reverse lookup". You need to define all potential return strings in the lookup file as text values, each in one lookup entry. Graphs and data tables show the value to which the string is mapped, usually an integer ([lookup type](#) SingleInt). For more information, see section [Example](#)<sup>1914</sup>.

SNMP Custom String Lookup Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>1913</sup>.

### Sensor in Other Languages

- Dutch: SNMP Aangepaste Tekst Lookup
- French: Recherche chaînes personnalisée (SNMP)
- German: SNMP-Zeichenfolge mit Lookup
- Japanese: SNMP カスタム文字列のルックアップ
- Portuguese: Pesquisa da sequência de caracteres (customizado) (SNMP)
- Russian: Подстановка пользовательской строки по SNMP
- Simplified Chinese: SNMP 自定义字符串查询
- Spanish: Búsqueda de cadena (personalizado) (SNMP)

### Remarks

Consider the following [remarks](#)<sup>1911</sup> and requirements for this sensor:

Remark	Description
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <b>very low</b> performance impact.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Localhost	It might not work to query data from a probe device via SNMP (querying <a href="#">localhost</a> , <a href="#">127.0.0.1</a> , or <a href="#">::1</a> ). <a href="#">Add this device</a> with the IP address that it has in your network and create the sensor on this device instead.
Knowledge Base	Knowledge Base: <a href="#">How do I find out which OID I need for an SNMP Custom sensor?</a>

## Add Sensor

Setting	Description
Channel Name	<p>Enter a name for the channel in which the sensor shows the results for the OID. Enter a string.</p> <p><b>i</b> You can change this value later in the <a href="#">channel settings</a> of this sensor.</p>

## Sensor Display

### Sensor Display

**Primary Channel** ⓘ Downtime

---

**Graph Type** ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Example

 You must provide all possible return strings for this sensor in one lookup file. For example, consider an OID that can return one of the three strings [Good](#), [Deficient](#), or [Bad](#). Then you must [define a lookup file](#) for this sensor that contains all these possible string values as text, each text value in one lookup entry:

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="mylookupfile" desiredValue="0"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="PaeValueLookup.xsd">
  <Lookups>
    <SingleInt state="OK" value="0">
      Good
    </SingleInt>
    <SingleInt state="Warning" value="1">
      Deficient
    </SingleInt>
    <SingleInt state="Error" value="2">
      Bad
    </SingleInt>
  </Lookups>
</ValueLookup>
```

If a retrieved string matches one of the text values, the sensor maps it into the defined integer ("reverse lookup") that is shown, for example, in data graphs. Depending on the integer, the sensor shows the respective status and converts the integer back to the original string to show it as a channel value. If the OID returns a string that the lookup definition does not contain, the sensor shows the Down status with a corresponding error message.

For example, you create an SNMP Custom String Lookup sensor, apply the example lookup definition from above (store it into the \lookups\custom subfolder of the PRTG program directory), and the specified OID returns the string **Good**. Then the sensor maps the string **Good** to the integer **0** that is shown in the live graph of the sensor, for example. According to the status definition `state="OK"`, the sensor status is Up in this case. The integer **0** is converted back to the string **Good**, which is shown as the channel value.

**i** The string match is not case-sensitive.

**i** Use the lookup type `SingleInt` for this sensor. `BitFields` and ranges are not supported.

**■** If you [imported an SNMP library](#) (this is an `.oidlib` file) that contains [lookups](#) (you can see this in section [Lookup](#) in the MIB Importer), you can define your own sensor states for returning values. Use the lookupname of the imported SNMP library as id parameter in a custom lookup definition. This overrides the lookups that an `.oidlib` file might contain with your own status definitions. See section [Define Lookups](#) for details about this mechanism.

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
[Value]	The retrieved string value and its status, as defined in the corresponding lookup file   This channel is the primary channel by default.

## 7.8.181 SNMP Custom Table Sensor

The SNMP Custom Table sensor monitors entries from a table that is provided via the Simple Network Management Protocol (SNMP). You can create one new sensor per table row. For each sensor, you can define up to ten channels. Each channel shows the value of one defined table column.

- ❶ The [SNMP Library](#)<sup>[2058]</sup> sensor automatically creates SNMP Custom Table sensors when the Management Information Base (MIB) file that you import contains tables.

SNMP Custom Table Sensor

- For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[1923]</sup>.

### Sensor in Other Languages

- Dutch: SNMP Aangepaste Tabel
- French: Table personnalisée (SNMP)
- German: SNMP (Benutzerdef. Tabelle)
- Japanese: SNMP カスタムテーブル
- Portuguese: Tabela (customizada) (SNMP)
- Russian: Нестандартная таблица SNMP
- Simplified Chinese: SNMP 自定义表
- Spanish: Tabla (personalizado) (SNMP)

### Remarks

Consider the following [remarks](#)<sup>[1917]</sup> and requirements for this sensor:

Remark	Description
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <b>low</b> performance impact.
Lookups	This sensor can use <a href="#">lookups</a> <sup>1920</sup> . Select Lookup as Channel #x Unit and define the lookup file in Channel #x Lookup.
Localhost	It might not work to query data from a probe device via SNMP (querying <a href="#">localhost</a> , <a href="#">127.0.0.1</a> , or <a href="#">::1</a> ). <a href="#">Add this device</a> with the IP address that it has in your network and create the sensor on this device instead.
Knowledge Base	<ul style="list-style-type: none"> <li>Knowledge Base: <a href="#">How do I find out which OID I need for an SNMP Custom sensor?</a></li> <li>Knowledge Base: <a href="#">What can I monitor with the SNMP Custom Table sensor?</a></li> </ul>

### Add Sensor

Setting	Description
Table	The sensor shows you the table that the OID returns. Select the table rows that contain the data that you want to monitor. PRTG creates one sensor for each table row that you select.

## SNMP Table

SNMP Table
Table OID ⓘ **1.3.6.1.2.1.1.3.0**

SNMP Table

Setting	Description
Table OID	<p>Enter the object identifier (OID) of the SNMP table that you want to monitor. The OID must directly point to an object that represents an SNMP table. PRTG creates one SNMP Custom Table sensor for each table row that you select.</p> <ul style="list-style-type: none"> <li>ⓘ If you do not enter an OID, you cannot proceed with channel creation.</li> <li>ⓘ You cannot change this value after sensor creation.</li> </ul>

## Table Specific

Table Specific

Identifier ⓘ **196608**

---

Identification Column ⓘ *table\_index*

---

Channel #1 Name ⓘ CPU Load (1 min average)

---

Channel #1 Column ⓘ hrProcessorLoad

---

Channel #1 Value Type ⓘ *Absolute (signed integer, for example "-12", "120")*

---

Channel #1 Unit ⓘ Percent

---

Channel #2 ⓘ *Disable*

Table Specific

Setting	Description
Identifier	This is the value of the column that you selected as the Identification Column during sensor creation. PRTG also displays it in the sensor name to distinguish it from other sensors you created for the same table with other table rows.
Identification Column	Define the identification column for the sensors that you want to create. The sensors use this column to uniquely identify each table row.

Setting	Description
	<ul style="list-style-type: none"> <li><span style="color: red;">i</span> We recommend that you use a unique identification column because it allows the sensors to keep track of changing indexes.</li> <li><span style="color: red;">i</span> The value of the column that you select as identification column replaces the <a href="#">[rowidentifier]</a> in the sensor name. This lets you distinguish sensors that you create for the same SNMP table.</li> <li><span style="color: red;">i</span> After sensor creation, this setting shows the table column that you chose as identification column.</li> </ul>
Channel #x Name	Enter a name for the channel in which the sensor shows the desired result. Enter a string.
Channel #x Column	Select the table column that, together with the table row, points to the value that you want to monitor in this channel. You can choose between the available columns of the table that you monitor.
Channel #x Value Type	<p>Select the expected numeric type of the results at the OID:</p> <ul style="list-style-type: none"> <li>▪ Absolute (unsigned integer): Integers without an operational sign, such as <a href="#">10</a> or <a href="#">120</a>.</li> <li>▪ Absolute (signed integer): Integers with an operational sign, such as <a href="#">-12</a> or <a href="#">120</a>.</li> <li>▪ Absolute (float): Float values, such as <a href="#">-5.80</a> or <a href="#">8.23</a>.</li> <li>▪ Delta (counter): Counter values. PRTG calculates the difference between the last and the current value. PRTG additionally divides the delta value by a time period to indicate a speed value.</li> </ul> <ul style="list-style-type: none"> <li><span style="color: red;">i</span> This mode only works if the difference between the last and the current value is positive and increases with each scanning interval. This mode does not support negative values and decreasing values.</li> <li><span style="color: red;">i</span> Absolute (float) and Delta (counter) are not compatible with the unit Lookup.</li> <li><span style="color: red;">i</span> See <a href="#">below</a> <sup>[1919]</sup> for other channel settings that you can also change after sensor creation.</li> <li><span style="color: red;">i</span> This sensor monitors numeric values only. Make sure that you do not select columns that return strings because they lead to the <a href="#">Down status</a>. For example, if you monitor an ifTable, we recommend that you do not select an ifDescr column because this results in an error.</li> <li><span style="color: red;">i</span> You cannot change this value after sensor creation.</li> </ul>
Channel #x Unit	<p>Define the unit of the data that this sensor receives in this channel:</p> <ul style="list-style-type: none"> <li>▪ BytesBandwidth</li> <li>▪ BytesMemory</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ BytesDisk</li> <li>▪ Temperature</li> <li>▪ Percent</li> <li>▪ TimeResponse</li> <li>▪ TimeSeconds</li> <li>▪ TimeHours</li> <li>▪ Count</li> <li>▪ CPU</li> <li>▪ BytesFile</li> <li>▪ SpeedDisk</li> <li>▪ SpeedNet</li> <li>▪ Custom</li> <li>▪ Lookup</li> </ul> <p> For more information about the available units, see section <a href="#">Custom Sensors</a>.</p> <p> To use <a href="#">lookups</a> with this channel, select Lookup and define the lookup file in Channel #x Lookup. Do not use Custom if you use lookups with this sensor.</p> <p> You cannot use the unit Lookup if you select the value type Delta (counter) or Absolute (float). You are not able to create the sensor in this case.</p>
Channel #x Custom Unit	<p><a href="#">This setting is only visible if you select Custom above.</a></p> <p>Define a unit for the channel value. Enter a string.</p>
Channel #x Lookup	<p><a href="#">This setting is only visible if you select Lookup above.</a></p> <p>Select a <a href="#">lookup</a> file that you want to use with this channel.</p>
Channel #2 - #10	<p>You can define up to 10 channels. You must define at least one channel, so you see all available settings for <a href="#">Channel #1</a>. Specify how to handle all other possible channels:</p> <ul style="list-style-type: none"> <li>▪ Disable: Do not create this channel.</li> <li>▪ Enable: Create this channel.</li> </ul>

Setting	Description
	<p><b>i</b> It is not possible to enable or disable channels after sensor creation.</p> <p><b>i</b> All channels that you define during the creation of an SNMP Custom Table sensor are the same for all sensors for each table row.</p>

## Sensor Display

**Sensor Display**

Primary Channel **i** Downtime

---

Graph Type **i**  Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking <b>⌵</b> below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select Stack channels on top of each other above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
[Value]	The returned numeric values in up to ten channels per table row

## 7.8.182 SNMP Custom v2 Sensor (BETA)

The SNMP Custom v2 sensor monitors a single parameter that is returned by a specific object identifier (OID) or Abstract Syntax Notation One (ASN.1) Management Information Base (MIB) via the Simple Network Management Protocol (SNMP).

**BETA** This sensor is in beta status. The operating methods and the available settings are still subject to change. Do not expect that all functions work properly, or that this sensor works as expected at all.

SNMP Custom v2 Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>1923</sup>.

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.                             <ul style="list-style-type: none"> <li> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Average Read Latency	The average read latency
Average Write Latency	The average write latency
Data Read	The data read speed
Data Written	The data write speed
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status

Channel	Description
Fan Power Cooling Module [#] Fan [#]	The power of the cooling module fan
Member Health Status	The member health status <ul style="list-style-type: none"> <li>Up status: Normal</li> <li>Warning status: Warning</li> <li>Down status: Critical, Unknown</li> </ul>
Member Status	The member status <ul style="list-style-type: none"> <li>Up status: Online</li> <li>Warning status: Vacated, Vacating</li> <li>Down status: Offline</li> </ul> <p><b>i</b> This channel is the primary channel by default.</p>
Number of Spares	The number of spare drives <p><b>i</b> This channel has a default limit:</p> <ul style="list-style-type: none"> <li>Lower warning limit: 1</li> </ul>
Power Supply Power Cooling Module [#]	The power supply cooling module status <ul style="list-style-type: none"> <li>Up status: On and Operating</li> <li>Down status: Failed or No Data, No AC Power</li> </ul>
RAID Status	The RAID status <ul style="list-style-type: none"> <li>Up status: Expanding, Mirroring, Ok, Verifying</li> <li>Warning status: Degraded, Reconstructing</li> <li>Down status: Catastrophic Loss, Failed</li> </ul>
Storage Free %	The free storage (%)
Temperature Control Module [#] [Module]	The control module temperature

## 7.8.186 SNMP Dell Hardware Sensor

The SNMP Dell Hardware sensor monitors performance counters on a Dell hardware device via the Simple Network Management Protocol (SNMP).

- ❶ The data that you can monitor with this sensor depends on the available performance counters on the target system.
- ❶ The SNMP Dell Hardware sensor does not appear as a running sensor, instead it is created as an [SNMP Custom Advanced](#)<sup>[1996]</sup> sensor or an [SNMP Custom Table](#)<sup>[1917]</sup> sensor with up to 10 channels per category.

SNMP Dell Hardware Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[1949]</sup>.

### Sensor in Other Languages

- Dutch: SNMP Dell Hardware

## 7.8.191 SNMP Fujitsu System Health v2 Sensor

The SNMP Fujitsu System Health v2 sensor monitors the status of a Fujitsu PRIMERGY server via the integrated Remote Management Controller (iRMC) and Simple Network Management Protocol (SNMP). The sensor might also work on other Fujitsu devices that have an iRMC available like PRIMEQUEST servers, some storage systems of the ETERNUS product line, and CELSIUS workstations in racks.

SNMP Fujitsu System Health v2 Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[197]</sup>.

### Sensor in Other Languages

- Dutch: SNMP Fujitsu Systeemstatus v2
- French: Fujitsu état du système v2 (SNMP)

- Japanese: SNMP Fujitsu システム正常性 v2
- Portuguese: Saúde do sistema Fujitsu (SNMP) v2
- Russian: Работоспособность системы Fujitsu по SNMP, версия 2
- Simplified Chinese: SNMP Fujitsu 系统健康状况版本 2
- Spanish: Salud de sistema Fujitsu (SNMP) v2

## Remarks

Consider the following [remarks](#)<sup>[1973]</sup> and requirements for this sensor:

Remark	Description
SNMP	This sensor requires SNMP to be enabled in the iRMC via ServerView.
Parent device	Use an iRMC interface as the parent device for this sensor.
SNMP v1	This sensor does not support SNMP v1.
iRMC S5	As of iRMC S5, additional counters for physical disks and logical disks are supported.
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">low</a> performance impact.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.

## 7.8.194 SNMP HPE BladeSystem Blade Sensor

The SNMP HPE BladeSystem Blade sensor monitors the status of an HPE BladeSystem via the Simple Network Management Protocol (SNMP).

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: SNMP HPE BladeSystem Blade
- French: HPE BladeSystem serveur blade (SNMP)
- German: SNMP HPE BladeSystem Blade
- Japanese: SNMP HPE BladeSystem ブレード
- Portuguese: Blade HPE BladeSystem (SNMP)
- Russian: Блейд-модуль HPE BladeSystem по SNMP
- Simplified Chinese: SNMP HPE BladeSystem 刀片
- Spanish: Blade HPE BladeSystem (SNMP)

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Parent device	This sensor requires that the IP address or Domain Name System (DNS) name in the settings of the parent device points to the HPE BladeSystem Enclosure hosting the Onboard Administrator.
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <b>low</b> performance impact.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.

### Basic Sensor Settings

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Alignment Errors	The number of alignment errors
Bad Frames Received	The number of bad frames received

Channel	Description
Bad Frames Transmitted	The number of bad frames transmitted
Carrier Sense Errors	The number of carrier sense errors
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Excessive Collisions	The number of excessive collisions
FCS Errors	The number of FCS errors
Frames Too Long	The number of frames that are too long
Good Frames Received	The number of good frames received
Good Frames Transmitted	The number of good frames transmitted
Late Collisions	The number of late collisions
Total	The total traffic
Traffic In	The incoming traffic <b>i</b> This channel is the primary channel by default.
Traffic Out	The outgoing traffic

## 7.8.199 SNMP HPE ProLiant Physical Disk Sensor

The SNMP HPE ProLiant Physical Disk sensor monitors a physical disk in an HPE server via the Simple Network Management Protocol (SNMP).

SNMP HPE ProLiant Physical Disk Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) [2014].

### Sensor in Other Languages

- Dutch: SNMP HPE ProLiant Fysieke Schijf
- French: HPE ProLiant disque physique (SNMP)
- German: SNMP HPE ProLiant Physikalischer Datenträger
- Japanese: SNMP HPE ProLiant 物理ディスク
- Portuguese: Disco físico HPE ProLiant (SNMP)
- Russian: Физический диск HPE ProLiant по SNMP
- Simplified Chinese: SNMP HPE ProLiant 物理磁盘
- Spanish: Disco físico HPE ProLiant (SNMP)

## Remarks

Consider the following [remarks](#) <sup>[2012]</sup> and requirements for this sensor:

Remark	Description
HPE system management tools	<p>For Gen10 servers: This sensor requires <a href="#">HPE Agentless Management</a> and the <a href="#">HPE Agentless Management Service</a> on the target system.</p> <p>For Gen10 servers: Use the HPE Integrated Lights Out (iLO) interface as the parent device.</p> <p>For Gen9 servers or earlier: This sensor requires <a href="#">HPE Insight Management Agents</a> and <a href="#">HPE Insight Management WBEM Providers</a> on the target system.</p> <p><b>i</b> For Gen9 servers or earlier, this sensor requires a specific HPE system management tool to be installed on the target system to report data via SNMP: <a href="#">HPE Insight Management Agents</a>. To receive SNMP data from redundant array of independent disks (RAID) controllers, the sensor also requires <a href="#">HPE Insight Management Agents</a>. For Gen10 servers, this sensor no longer requires HPE system management tools. Instead, the sensor requires the <a href="#">HPE Agentless Management Service</a> to be installed on the target system.</p> <p><b>■</b> For more information and download links, see the Knowledge Base: <a href="#">Monitor HP ProLiant via SNMP?</a></p> <p>For Gen9 servers or earlier, some of the HPE object identifiers (OID) that <b>i</b> this sensor uses are only accessible via the iLO interface. If this sensor throws an error that it cannot find "such device types", create a device that points to the address of the HPE iLO interface (if available) and add the sensor to this device. We recommend that you use the <a href="#">Agentless Management</a> feature with configured SNMP. You can set this up in the iLO configuration interface under Administration   Management   SNMP Settings. For Gen10 servers, use the HPE iLO interface as parent device for this sensor.</p>
iLO versions	This sensor supports iLO as of iLO 3. We recommend that you use at least iLO 4.
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">low</a> performance impact.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
"Limited Monitoring" mode	The sensor only shows Disk Status and no other channels if it runs in "Limited Monitoring" mode. For more information, see the Knowledge Base: <a href="#">SNMP HPE ProLiant Physical Disk sensor not showing all information</a> .

**Size** ⓘ *1024 MB*

IBM System X Physical Memory Settings

Setting	Description
Name	The name of the memory module that this sensor monitors.
Caption	The caption of the memory module that this sensor monitors.
Serial Number	The serial number of the memory module that this sensor monitors.
Size	The size of the memory module that this sensor monitors.

## Sensor Display

**Sensor Display**

**Primary Channel** ⓘ *Downtime*

**Graph Type** ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.  ⓘ You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.
Graph Type	Define how this sensor shows different channels:  ▪ Show channels independently (default): Show a graph for each channel.

Setting	Description
	<ul style="list-style-type: none"> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.                             <ul style="list-style-type: none"> <li> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Controller Condition	<p>The memory controller condition</p> <ul style="list-style-type: none"> <li>Up status: Completed, In Service, Ok, Power Mode</li> <li>Warning status: Dormant, Predictive Failure, Starting, Stressed</li> <li>Down status: Aborted, Degraded, Error, Lost Communication, No Contact, Non-Recoverable Error, Other, Stopped, Stopping, Supporting Entity In Error, Unknown</li> </ul> <p> This channel is the primary channel by default.</p>
Downtime	<p>In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status</p>

Channel	Description
Power	The power status <ul style="list-style-type: none"><li>▪ Up status: On</li><li>▪ Down status: Off</li></ul>

My SNMP sensors don't work. What can I do?

- <https://kb.paessler.com/en/topic/46863>

## 7.8.209 SNMP Library Sensor

The SNMP Library sensor uses a Management Information Base (MIB) file to create sensors that monitor a device via the Simple Network Management Protocol (SNMP).

- ❶ The content of the MIB file determines which data types are available for monitoring. When you create the sensor, it provides a list of counters that the target device returns based on every object identifier (OID) in the MIB file.
- ❷ The SNMP Library sensor does not appear as a running sensor. It uses the meta-scan facility of the probe to find or to match OIDs from the MIB file. It is useful because you do not need to manually enter OIDs.

To monitor SNMP-capable devices and to add sensors via the SNMP Library sensor, download the manufacturer's MIB files for the target device, convert the MIB files to the [OID library](#) format, and [import](#) them into PRTG. PRTG also provides [precompiled .oidlib files](#) that contain the OIDs of SNMP counters for the most common network devices.

For more information, see the Knowledge Base: [How do SNMP, MIBs and OIDs work?](#)

SNMP Custom Advanced Sensor Created by SNMP Library Sensor

## Sensor in Other Languages

- Dutch: SNMP Bibliotheek

- German: SNMP-Bibliothek
- Japanese: SNMP ライブラリ
- Portuguese: Biblioteca (SNMP)
- Russian: Библиотека SNMP
- Simplified Chinese: SNMP 库
- Spanish: Biblioteca (SNMP)

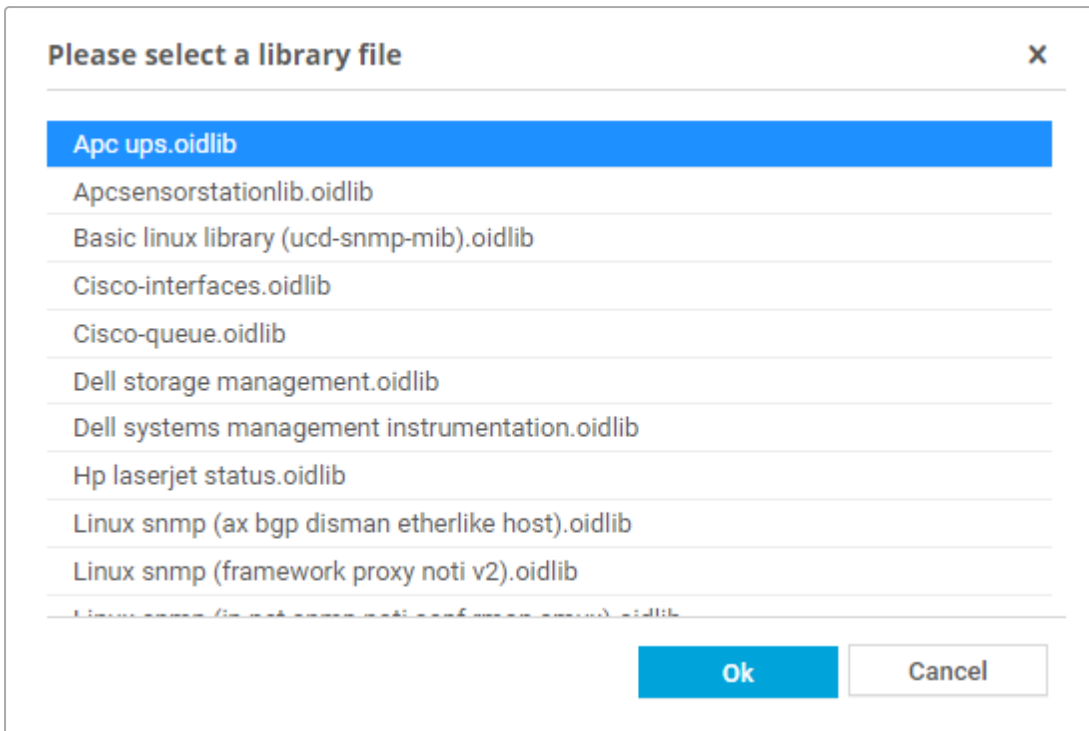

## Remarks

Consider the following [remarks](#) <sup>2059</sup> and requirements for this sensor:

Remark	Description
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">very low</a> performance impact.
Knowledge Base	<ul style="list-style-type: none"> <li>▪ Knowledge Base: <a href="#">How do SNMP, MIBs and OIDs work?</a></li> <li>▪ Knowledge Base: <a href="#">How can I import my MIB files into PRTG?</a></li> <li>▪ Knowledge Base: <a href="#">Can't find a sensor for my device in PRTG but I believe it supports SNMP. How to proceed?</a></li> </ul>
PRTG Hosted Monitor	 To import MIB files into PRTG Hosted Monitor, see section <a href="#">Manage a PRTG Hosted Monitor Subscription</a> .

## Add Sensor

PRTG shows a list of [.oidlib](#) files that are available on the system. This list contains all library files in the `\snmplibs` subfolder of the [PRTG program directory](#). It contains both the default PRTG library files and your own library files.

List of SNMP Library Files

The library file names in the list indicate their purpose. Select a library file that is suitable for the target device (for example, choose an MIB file that you imported) and confirm via Ok.

**i** If the library file not suitable for the target device, this results in the error message [The scan for available monitoring items has failed on this device: No such object \(SNMP error # 222\)](#). If you see this message, click Cancel and try to add the sensor with a different library file.

The SNMP Library sensor takes a list of OIDs that you import from an MIB file into an `.oidlib` file and tests the OIDs against the target device to find the OIDs that the target device supports. This discovery process is the [meta-scan](#). If the sensor finds counters for the target device, the sensor settings open with a list of all available monitoring items. The list of SNMP table values sequentially presents row values to help you find the values you are interested in.

**i** You can also use the search to find the desired group or category. The search matches individual strings, so if your string has a space in it, put the search string in double quotation marks ("").

Select the counters that you want to monitor and click Save. PRTG creates sensors based on the OID types of the selected counters.

### Add Sensor Settings

Setting	Description
Library	The path to the <code>.oidlib</code> file that this sensor uses.

Setting	Description
Category	<p>Select the parameters that you want to monitor. The list is specific to your setup. The list contains all counters that are available in the <code>.oidlib</code> file that match the target device.</p> <p>Depending on the type of the selected entries, PRTG creates the following sensors:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">SNMP Custom Advanced</a><sup>[1896]</sup>: For up to 10 channels for 10 OIDs each. For example, 22 selected single values result in 3 sensors: 2 sensors with 10 channels and 1 sensor with 2 channels.</li> <li>▪ <a href="#">SNMP Custom String</a><sup>[1902]</sup>: For each selected entry that returns a string value.</li> <li>▪ <a href="#">SNMP Custom Table</a><sup>[1917]</sup>: For up to 10 channels for 10 columns per row. The channels represent the values in the columns of the same row.</li> </ul> <p><b>i</b> Once you create a custom SNMP sensor, you can create a <a href="#">device template</a> from it and prepare it for distribution. For example, you can refine the template with better name templates.</p>

## Basic Sensor Settings

Basic Sensor Settings

The sensor has the following [default tags](#) that are automatically predefined in the sensor's settings when you add the sensor:

- snmplibrarysensor

■ For more information about basic sensor settings, see section [Sensor Settings](#)<sup>[667]</sup>.

## Sensor Specific

The available sensor settings depend on the sensor that the SNMP Library sensor creates. For more information about settings, see the sections of these sensors:

- [SNMP Custom Advanced](#)<sup>[1898]</sup>
- [SNMP Custom String](#)<sup>[1904]</sup>

- [SNMP Custom Table](#) 

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

- For more information, see section [Inheritance of Settings](#).

## Import MIB Files

✂ Additionally, you can create your own `.oidlib` files by importing the device manufacturers' MIB files with the free [MIB Importer](#) tool. You can convert your MIB files and save the `.oidlib` file results to the `\snmplibs` subfolder of the [PRTG program directory](#).

■ For more information about the MIB Importer, see the Knowledge Base: [How can I import my MIB files into PRTG?](#)

If the `.oidlib` files that you import contain [lookups](#) (you can see this in section [Lookup](#) in the MIB Importer), you can define your own sensor states for the values that the lookups return. Add an SNMP Library sensor with this `.oidlib` file. PRTG then creates a lookup definition file using the lookupname of the chosen library as id parameter.

ⓘ PRTG adds the lookups without status definitions, so the sensor shows the Warning [status](#) by default. You must edit the corresponding lookup files to get reliable alarms. Override the lookup definition with your own custom lookup. For more information, see section [Define Lookups](#).

☁ To import MIB files into PRTG Hosted Monitor, see section [Manage a PRTG Hosted Monitor Subscription](#).

## Default .oidlib Files Overview

PRTG comes with the following `.oidlib` files.

ⓘ The `.oidlib` files might not support all devices or parameters.

.oidlib File	Description
APC UPS.oidlib	Monitors uninterruptible power supplies (UPSs) from APC American Power Conversion Corp.
APCSensorstationlib.oidlib	Monitors alarm status, communication status, humidity, and temperature as shown by an APC sensor station.
Basic Linux Library (UCD-SNMP-MIB).oidlib	Monitors basic system parameters on Linux systems, such as memory, disk and swap, CPU, and more.
cisco-interfaces.oidlib	Monitors Cisco-specific parameters, for example, the number of present network interfaces on a system, several states of an interface (admin, oper, speed, type, errors, discards, etc.), and more.
cisco-queue.oidlib	Monitors queues on a Cisco interface, for example, queue depth and its maximum, discarded messages from the queue, the number of the queue within the queue set, and more.

.oidlib File	Description
Dell Storage Management.oidlib	Monitors Dell storage devices. Possible parameters include disk arrays, battery and power supply, fan and temperature, virtual disk, and more.
Dell Systems Management Instrumentation.oidlib	Monitors the hardware of Dell systems. Possible parameters include ACPower and battery, alerts, base board, BIOS, Baseboard Management Controller (BMC), chassis, COO, cooling, event log, firmware, integrated development environment (IDE), keyboard, memory, port, network, processor, Small Computer System Interface (SCSI), system, temperature, USB, universally unique identifier (UUID), and more.
HP LaserJet Status.oidlib	Monitors toner, paper, and jam status of an HP LaserJet printer.
Linux SNMP (AXBGP DisMan EtherLike Host).oidlib	Monitors different aspects of Linux systems.  ⓘ This file might detect a very large number of interfaces. It might take a few seconds until the selection table appears.
Linux SNMP (Framework Proxy Noti v2).oidlib	Monitors different aspects of Linux systems.  ⓘ This file might detect a very large number of interfaces. It might take a few seconds until the selection table appears.
Linux SNMP (IP Net SNMP Noti OSPF RMON SMUX).oidlib	Monitors different aspects of Linux systems.  ⓘ This file might detect a very large number of interfaces. It might take a few seconds until the selection table appears.
Linux SNMP (Source TCP UCD UDP).oidlib	Monitors different aspects of Linux systems.  ⓘ This file might detect a very large number of interfaces. It might take a few seconds until the selection table appears.
Paessler Common OID Library.oidlib	Monitors many common hardware devices. It is used for several sensors and is encrypted.
SNMP Informant std.oidlib	Monitors logical disks, processor, memory, and network interface on Windows systems.

## 7.8.210 SNMP Linux Disk Free Sensor

The SNMP Linux Disk Free sensor monitors the free space on disks of a Linux/Unix system via the Simple Network Management Protocol (SNMP).

SNMP Linux Disk Free Sensor

The free space that this sensor returns shows the disk space that is not yet used. Not all of this space might be available for use because a part of this space might be reserved by the system, for example, for redundancy purposes. For more information, see the Knowledge Base: [Why do SSH Disk Free and SNMP Linux Disk Free show different values for my target Linux system?](#)

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

■ For more information about basic sensor settings, see section [Sensor Settings](#)<sup>667</sup>.

## Set Limits Checked for ALL Disks

In this section, you can set limits that are valid for all channels and all drives. With limits, you can define when the sensor shows the Warning or Down [status](#), depending on the data provided by all drives that this sensor monitors. If you want to individually define limits for separate channels, use the limit settings in the [channel settings](#).

**i** All limits that you define here are valid in addition to the limits in the particular channel settings. The limits are valid simultaneously, so the first limit that is breached applies.

**Set Limits Checked For ALL Disks**

*Use the channel settings to set separate error limits or warning limits for each disk.*

Percentage Limit Check **i**  Only use the limits in the settings of the percentage channels  
 Use the limits of both the sensor and the channel settings (default)

Upper Error Limit **i** \_\_\_\_\_

Upper Warning Limit **i** \_\_\_\_\_

Lower Warning Limit **i** 25

Lower Error Limit **i** 10

Size Limit Check **i**  Only use the limits in the settings of the byte size channels (default)  
 Use the limits of both the sensor and the channel settings

Alarm on Missing/Removed Disk **i**  Deactivate alarm (default)  
 Activate alarm

Set Limits Checked for ALL Disks

Setting	Description
Percentage Limit Check	<p>By default, the sensor enables percentage limits with a lower warning limit and a lower error limit. Enable or disable a limit check for the free space in percentage channels of all drives:</p> <ul style="list-style-type: none"> <li>▪ Only use the limits in the settings of the percentage channels: Do not define sensor limits that are valid for all percentage channels. The sensor only uses the limits that you define in the settings of the particular "free space in percent" channels to determine the status.</li> <li>▪ Use the limits of both the sensor and the channel settings (default): Define sensor limits that are valid for all percentage channels. Additional fields appear below. The sensor shows the Warning or the Down status when free space limits are above or below the limits.</li> </ul>
Upper Error Limit	<p><b>This setting is only visible if you select</b> Use the limits of both the sensor and the channel settings (default) <b>above.</b></p> <p>Specify an upper limit in percent for the Down status. If the free disk space of one of your drives exceeds this value, the sensor changes to the Down status. Enter an integer or leave the field empty.</p> <p><b>i</b> The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p>

Setting	Description
Upper Warning Limit	<p><b>This setting is only visible if you select</b> Use the limits of both the sensor and the channel settings (default) <a href="#">above</a>.</p> <p>Specify an upper limit in percent for the Warning status. If the free disk space of one of your drives exceeds this value, the sensor changes to the Warning status. Enter an integer or leave the field empty.</p> <p> The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p>
Lower Warning Limit	<p><b>This setting is only visible if you select</b> Use the limits of both the sensor and the channel settings (default) <a href="#">above</a>.</p> <p>Specify a lower limit in percent for the Warning status. If the free disk space of one of your drives falls below this value, the sensor changes to the Warning status. ## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Available Memory	The available memory
Available Memory %	The available memory (%)

Channel	Description
	<p><b>i</b> This channel has default limits:</p> <ul style="list-style-type: none"> <li>▪ Lower error limit: 5%</li> <li>▪ Lower warning limit: 10%</li> </ul>
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Free Physical Memory	The free physical memory
Free Physical Memory %	<p>The free physical memory (%)</p> <p><b>i</b> This channel is the primary channel by default.</p> <p><b>i</b> This channel has default limits:</p> <ul style="list-style-type: none"> <li>▪ Lower error limit: 10%</li> <li>▪ Lower warning limit: 20%</li> </ul>
Free Swap Space	The free swap memory
Free Swap Space %	<p>The free swap memory (%)</p> <p><b>i</b> This channel has default limits:</p> <ul style="list-style-type: none"> <li>▪ Lower error limit: 10%</li> <li>▪ Lower warning limit: 20%</li> </ul>
Total Free Memory	The total free memory (physical memory plus swap)
Total Free Memory %	<p>The total free memory (%) (physical memory plus swap)</p> <p><b>i</b> This channel has default limits:</p> <ul style="list-style-type: none"> <li>▪ Lower error limit: 10%</li> <li>▪ Lower warning limit: 20%</li> </ul>

## 7.8.219 SNMP NetApp Logical Unit Sensor

The SNMP NetApp Logical Unit sensor monitors the input/output operations per second (IOPS) on a logical unit of a NetApp storage system via the Simple Network Management Protocol (SNMP).

SNMP NetApp Logical Unit Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[2112]</sup>.

### Sensor in Other Languages

- Dutch: SNMP NetApp Logical Unit
- French: NetApp unité logique (SNMP)
- German: SNMP NetApp Logische Einheit
- Japanese: SNMP NetApp 論理ユニット
- Portuguese: Unidade lógica NetApp (SNMP)
- Russian: Логический блок NetApp по SNMP
- Simplified Chinese: SNMP NetApp 逻辑单元
- Spanish: Unidad lógica NetApp (SNMP)

## Remarks

Consider the following [remarks](#)<sup>[2110]</sup> and requirements for this sensor:

Remark	Description
NetApp versions	This sensor only supports NetApp versions up to 8.2.
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <b>low</b> performance impact.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
NetApp LUN	If you use NetApp cDOT 8.3 or NetApp ONTAP as of version 9.0, we recommend that you use the <a href="#">NetApp LUN</a> <sup>[1403]</sup> sensor.

NetApp Logical Unit Settings

Setting	Description
Logical Unit	The name of the logical unit that this sensor monitors.
Alignment Monitoring	Select if the sensor checks the alignment of the logical unit: <ul style="list-style-type: none"> <li>Do not check alignment (default)</li> <li>Check alignment (if available)</li> </ul> <p> ⓘ You cannot change this value after sensor creation.</p>
Volume	The volume that this sensor monitors.
Comment	Comments for the logical unit that this sensor monitors.

## Sensor Display

**Sensor Display**

**Primary Channel** ⓘ Downtime

**Graph Type** ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.

Setting	Description
	<p><b>i</b> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>Show channels independently (default): Show a graph for each channel.</li> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.           <ul style="list-style-type: none"> <li><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Data Read	The data read speed
Data Written	The data write speed
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status

Channel	Description
Errors	The number of errors
Ops	The total number of operations <span>ⓘ</span> This channel is the primary channel by default.
Other Ops	The number of other operations
Read Ops	The number of disk read operations
Status	The logical unit status <ul style="list-style-type: none"> <li>▪ Up status: Online</li> <li>▪ Down status: Offline</li> </ul>
Write Ops	The number of disk write operations

## 7.8.225 SNMP Printer Sensor

The SNMP Printer sensor monitors various types of printers via the Simple Network Management Protocol (SNMP).

- ① The sensor supports the following printers, among others: [HP OfficeJet](#) printers, [HP LaserJet](#) printers, [RICOH SP 5200](#), [SP 3410](#), [SP C242DN](#), [MP C3003](#), and [MP C2503](#).
- ① The sensor also shows the printer status as the sensor message.

SNMP Printer Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[214]</sup>.

### Sensor in Other Languages

- Dutch: SNMP Printer
- French: Imprimante (SNMP)
- German: SNMP Drucker
- Japanese: SNMP プリンター
- Portuguese: Impressora (SNMP)
- Russian: Принтер по SNMP
- Simplified Chinese: SNMP 打印机
- Spanish: Impresora (SNMP)

## Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Printers	This sensor supports the following printers, among others: <a href="#">HP OfficeJet printers</a> , <a href="#">HP LaserJet printers</a> , <a href="#">RICOH SP 5200</a> , <a href="#">SP 3410</a> , <a href="#">SP C242DN</a> , <a href="#">MP C3003</a> , and <a href="#">MP C2503</a> .
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">very low</a> performance impact.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Channels	We recommend that you do not rename channels of the sensor. Renaming a channel creates a new empty channel.

## Basic Sensor Settings

## 7.8.230 SNMP RMON Sensor

The SNMP RMON sensor monitors traffic on a device using the Remote Monitoring (RMON) standard via the Simple Network Management Protocol (SNMP).

**i** You can create it on an SNMP-compatible device that provides traffic data via RMON. Depending on the data that the device returns, PRTG displays traffic data for each port in different channels, which allows a detailed analysis. If available, the sensor queries 64-bit counters.

SNMP RMON Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: SNMP RMON
- French: RMON (SNMP)
- German: SNMP RMON
- Japanese: SNMP RMON
- Portuguese: RMON (SNMP)
- Russian: RMON no SNMP
- Simplified Chinese: SNMP RMON

- Spanish: RMON (SNMP)

## Remarks

Consider the following [remarks](#) <sup>[2161]</sup> and requirements for this sensor:

Remark	Description
Localhost	It might not work to query data from a probe device via SNMP (querying <a href="#">localhost</a> , <a href="#">127.0.0.1</a> , or <a href="#">::1</a> ). <a href="#">Add this device</a> with the IP address that it has in your network and create the sensor on this device instead.
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">very low</a> performance impact.
Port name templates	You can define the displayed sensor name with port name templates in the <a href="#">SNMP compatibility options</a> of the parent device.
Knowledge Base	<ul style="list-style-type: none"> <li>▪ Knowledge Base: <a href="#">What value does the Transmitted channel of an RMON sensor show?</a></li> <li>▪ Knowledge Base: <a href="#">Automatically update port name and number for SNMP Traffic sensors when the device changes them</a></li> <li>▪ Knowledge Base: <a href="#">Where is the volume line in graphs?</a></li> </ul>

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Broadcast Packets	The number of broadcast packets
Collisions	The number of collisions
CRC Errors	The number of CRC errors
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Drop Events	The number of drop events
Fragments	The number of fragments
Jabbers	The number of jabbers
Multicast Packets	The number of multicast packets

Channel	Description
Oversize Packets	The number of oversize packets
Packets	The number of packets
Packets <= 64 Byte	The number of packets with less than or equal to 64 bytes
Packets 65 - 127 Bytes	The number of packets with 65 - 127 bytes
Packets 128 - 255 Bytes	The number of packets with 128 - 255 bytes
Packets 256 - 511 Bytes	The number of packets with 256 - 511 bytes
Packets 512 - 1023 Bytes	The number of packets with 512 - 1023 bytes
Packets 1024 - 1518 Bytes	The number of packets with 1024 - 1518 bytes
Transmitted	The transmitted bytes <b>i</b> This channel is the primary channel by default.
Undersize Packets	The number of undersize packets

This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status

Channel	Description
System Uptime	The uptime  This channel is the primary channel by default.

## 7.8.237 SNMP Traffic Sensor

The SNMP Traffic sensor monitors traffic on a device via the Simple Network Management Protocol (SNMP).

**i** You can create the sensor on a device that provides traffic data.

SNMP TrafficSensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: SNMP Verkeer
- French: Trafic (SNMP)
- German: SNMP Datenverkehr
- Japanese: SNMP トラフィック
- Portuguese: Tráfego (SNMP)
- Russian: Трафик по SNMP
- Simplified Chinese: SNMP 流量
- Spanish: Tráfico (SNMP)

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
SNMP v2c or SNMP v3	We recommend that you select SNMP v2c (most common) or SNMP v3 in the <a href="#">credentials for SNMP devices</a> of the parent device (if supported by the target device). SNMP v1 does not support 64-bit counters, which might result in invalid data. For more information, see the Knowledge Base: <a href="#">SNMP Traffic sensor suddenly drops at 610Mbps</a>
Localhost	It might not work to query data from a probe device via SNMP (querying <a href="#">localhost</a> , <a href="#">127.0.0.1</a> , or <a href="#">::1</a> ). <a href="#">Add this device</a> with the IP address that it has in your network and create the sensor on this device instead.
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">very low</a> performance impact.
Port name templates	You can define the displayed sensor name with port name templates in the <a href="#">SNMP compatibility options</a> of the parent device.
Auto-discovery	The <a href="#">auto-discovery</a> always creates SNMP Traffic sensors for all interfaces whose SNMP traffic counters are above 0. As a result, every interface that has had traffic since the last restart of the target system is added, even if it is currently disconnected or disabled. For more information, see the Knowledge Base: <a href="#">How does auto-discovery with SNMP Traffic sensors work?</a>
Knowledge Base	<ul style="list-style-type: none"> <li>▪ Knowledge Base: <a href="#">Automatically update port name and number for SNMP Traffic sensors when the device changes them</a></li> <li>▪ Knowledge Base: <a href="#">Where is the volume line in graphs?</a></li> </ul>

## Add Sensor

Setting	Description
Name for Traffic In Channel	<p>For the standard channel Traffic In, enter the channel name. The sensor shows it in graphs and tables.</p> <p><b>i</b> You can change this description in the <a href="#">channel settings</a> later.</p>
Name for Traffic Out Channel	<p>For the standard channel Traffic Out, enter the channel name. The sensor shows it in graphs and tables.</p> <p><b>i</b> You can change this description in the <a href="#">channel settings</a> later.</p>

Setting	Description
Name for Traffic Total Channel	For the standard channel Traffic Total, enter the channel name. The sensor shows it in graphs and tables.  ⓘ You can change this description in the <a href="#">channel settings</a> later.

## Basic Sensor Settings

However, there is an advanced procedure to do so.</p>

## Debug Options

Debug Options

**Result Handling** ⓘ

Discard result (default)

Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result: Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p>ⓘ If you select Store result, the sensor writes the standard error (stderr) streams in clear text to the last sensor result file. Do not return sensitive information via the scripts that you run with this sensor.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Broadcasts In	The number of incoming broadcast packets
Broadcasts Out	The number of outgoing broadcast packets
Discards In	The number of incoming discards

Channel	Description
Discards Out	The number of outgoing discards
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Errors In	The number of incoming errors
Errors Out	The number of outgoing errors
Multicasts In	The number of incoming multicast packets
Multicasts Out	The number of outgoing multicast packets
Non-Unicasts In	The number of incoming non-unicast packets
Non-Unicasts Out	The number of outgoing non-unicast packets
Traffic In	The incoming traffic
Traffic Out	The outgoing traffic
Traffic Total	The total traffic  This channel is the primary channel by default.
Unicasts In	The number of incoming unicast packets
Unicasts Out	The number of outgoing unicast packets
Unknown Protocols In	The number of incoming, unknown protocols

## 7.8.239 SNMP Trap Receiver Sensor

The SNMP Trap Receiver sensor receives and analyzes Simple Network Management Protocol (SNMP) traps.

**i** The sensor can also show the actual trap messages.

SNMP Trap Receiver Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: SNMP Trap-ontvanger
- French: Récepteur de Trap (SNMP)
- German: SNMP-Trap-Empfänger
- Japanese: SNMP トラップレシーバー
- Portuguese: Receptor de trap SNMP
- Russian: Приемник ловушек SNMP
- Simplified Chinese: SNMP 陷阱接收程序
- Spanish: Receptor de trap SNMP

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a very high performance impact. We recommend that you use no more than <b>50</b> of this sensor on each probe.
SNMP v3 traps	This sensor does not support SNMP v3 traps. Use SNMP v1 or v2c.
UDP	This sensor only supports the User Datagram Protocol (UDP).
Probe device	<p>Add this sensor to the probe device to receive all messages of the remote probe system.</p> <p><b>i</b> If you add the sensor to a device other than a probe device, the IP address or Domain Name System (DNS) name of the parent device must match the proper sender. For example, if you want to receive messages from a storage area network (SAN), you might need to add a device with the IP address of a specific array member that sends the messages. Providing a DNS name that points to the IP address of a whole group might not work for SANs.</p>
Specific device	Add this sensor to a specific device to directly receive all messages from this device. This is faster than using source filters.
IPv6	This sensor supports IPv6.
Placeholders	You can use <a href="#">placeholders</a> in email <a href="#">notification templates</a> to see messages when you receive email notifications.
Sensor states	The <a href="#">sensor states</a> of this sensor persist for one scanning interval only. After showing the Warning or the Down status, and if there is no warning or error message in the next scanning interval, the sensor shows the Up status again. For more information on a workaround, see the Knowledge Base: <a href="#">How can I configure sensors using speed limits to keep the status for more than one interval?</a>
Filter options	You can use the filter options to define which types of messages the sensor considers for monitoring, and which messages it categorizes as warnings or errors.
MIB file	<p>In PRTG Network Monitor, you can copy the Management Information Base (MIB) file for your traps to the \MIB subfolder of the <a href="#">PRTG program directory</a> to translate the object identifiers (OID) for the traps into readable messages. For more information, see the Knowledge Base: <a href="#">How can I show the name of a received OID in PRTG?</a></p> <p> To import MIB files into PRTG Hosted Monitor, see section <a href="#">Manage a PRTG Hosted Monitor Subscription</a>.</p>

Remark	Description
Cluster probe	This sensor does not support cluster probes. You can only set it up on local probes or remote probes.
Knowledge Base	Knowledge Base: <a href="#">How do I test an SNMP Trap Receiver sensor?</a>
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

SNMP Trap Specific

Setting	Description
Port	Enter the number of the port on which the sensor listens for SNMP traps. The default port is <b>162</b> . Enter an integer.

Setting	Description
	<b>i</b> We recommend that you use the default value.
Purge Messages After	Define for how long PRTG stores received trap messages for analysis. Choose a period of time from the dropdown list.

## Filter

For more information, see section [Filter Rules](#) <sup>2213</sup>.

**Filter**

*Filters are formulas using AND, OR, NOT, brackets, and the following fields:*

Field	Parameters	Examples
source[ip]	Enter a UDP source IP, IP range, or IP hostmask	source[10.0.23.50] source[10.0.23.10-50] source[10.0.23.10/24]
agent[ip]	Enter the IP of the object that generates the trap (V1 only)	agent[10.0.0.1]
enterprise[oid]	Enter the OID of the object that generates the trap (V1 only)	enterprise[1.3.6.1.4.1.2.6.182.1.2.31.1.0]
bindings[text]	Enter a substring to match on all OIDs and values in the bindings	bindings[ERROR] bindings[1.3.6.1.4.1.2.6.182] bindings[\"port blocked\"]
bindings[oid,value]	Enter an OID and a substring (comma separated) to match a value in the defined OID	bindings[1.3.6.1.4.1.2.6.182.1.2.71.1.0,...]
bindings[oid,value,mode]	Enter an OID, a substring, and a mode (comma separated) to match a value in the bindings. Mode can be <ul style="list-style-type: none"> <li>• <i>substring</i></li> <li>• <i>exact</i></li> <li>• <i>equal, greater, greaterorequal, less, lessorequal</i></li> </ul>	bindings[1.3.6.1.4.1.2.6.182.1.2.71.1.0,...] bindings[1.3.6.1.4.1.2.6.182.1.2.71.1.0,...]
gentrap[number]	Enter a number or range of the generic trap type	gentrap[6] gentrap[2-4]
spectrap[number]	Enter a number or range of the specific trap code	spectrap[0] spectrap[1-2]
version[number]	Enter the SNMP version (1 or 2)	version[1] version[2]

**Include Filter** ⓘ any //

---

**Exclude Filter** ⓘ //

---

**Warning Filter** ⓘ //

---

**Error Filter** ⓘ //

Filter

Setting	Description
Include Filter	Define if you want to filter traps. If you leave this field empty or use the keyword <b>any</b> , the sensor processes all data. To include only specific types of traps, define filters using a special syntax.
Exclude Filter	Define which types of traps the sensor discards and does not process. To exclude specific types of traps, define filters using a special syntax.
Warning Filter	<p>Define which types of traps count for the Warnings channel. To categorize received traps as warning messages, define filters using a special syntax.</p> <p><b>i</b> The sensor collects messages until a scanning interval ends. As long as the scanning interval is running, no status change happens. By default, the sensor changes to the Warning <b>status</b> after a scanning interval finishes and there was at least one warning message (and no error message) during this scanning interval. The sensor shows the Warning status at least until the succeeding scanning interval finishes. If the sensor does not receive any warning or error message in this scanning interval, its status changes to the Up status again with the start of the next scanning interval.</p>
Error Filter	<p>Define which types of traps count for the Errors channel. To categorize received traps as error messages, define filters using a special syntax.</p> <p><b>i</b> The sensor collects messages until a scanning interval ends. As long as the scanning interval is running, no status change happens. By default, the sensor changes to the Down status after a scanning interval finishes and there was at least one error message during this scanning interval. The sensor shows the Down status at least until the succeeding scanning interval finishes. If the sensor does not receive any warning or error message in this scanning interval, its status changes to the Up status again with the start of the next scanning interval.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Debug Options

**Debug Options**

Result Handling **i**  Discard result (default)  
 Store result

Debug Options

Setting	Description
Result Handling	Define what PRTG does with the sensor result:

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\debug subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is UDP Debug Port [Port]_[Date].log. This setting is for debugging purposes. <ul style="list-style-type: none"> <li>ⓘ Use with caution. We recommend that you only use this setting for a short time because it can create huge data files.</li> </ul> </li> </ul>

## Filter Rules

Filter rules are used for the include, exclude, warning, and error definition fields of the SNMP Trap Receiver sensor. They are based on the following format:

```
field[filter]
```

You can use include and exclude filters to define which traps to monitor or use warning and error filters to define how to categorize received traps. Provide these filters in the sensor settings as formulas. Formulas are fields that you can combine with boolean operators ([AND](#), [OR](#), [NOT](#)) and brackets.

Field	Parameter	Examples
source[ip]	Enter an IP address where the UDPs come from. <a href="#">IP masks and ranges</a> are also possible.	source[10.0.23.50], source[10.0.23.10-50], source[10.0.23.10/24]
agent[ip]	Enter an IP address that specifies the object that creates the SNMP trap.  ⓘ agent[ip] only supports v1.	agent[10.0.0.1]
enterprise[oid]	Enter an OID that specifies the object that originates the trap.  ⓘ enterprise[oid] only supports v1.	enterprise[1.3.6.1.4.1.2.6.182.1.2.31.1.0]
bindings[text]	Enter a substring to match all OIDs and values in the bindings.	bindings[ERROR], bindings[1.3.6.1.4.1.2.6.182.1.2.31.1.0], bindings["port blocked"]  ⓘ It is not necessary to use quotation marks (") to find strings. If the string contains quotation marks that you want to include in the filter, you need to escape them with quotation marks.
bindings [oid,value]	Enter an OID and a substring to match a value in the specified OID. Separate the OID and the value with a comma.	bindings[1.3.6.1.4.1.2.6.182.1.2.31.1.0,error]

Field	Parameter	Examples
bindings [oid ,value,mode]	Enter an OID, a substring, and a mode to match a value in the specified OID. Separate the OID, the value, and the mode with a comma. The mode can be: <ul style="list-style-type: none"> <li>▪ substring (default): This mode works like bindings[oid,value].</li> <li>▪ exact: This mode enforces an exact match of a value.</li> <li>▪ equal, greater, greaterorequal, less, or lessorequal: This interprets and compares values as numbers. <ul style="list-style-type: none"> <li>❗ This mode only supports integers without extra characters and without thousands separators.</li> <li>❗ It also supports hex format.</li> </ul> </li> </ul>	bindings[1.3.6.1.4.1.2.6.182.1.2.31.1.0,error,exact] bindings[1.3.6.1.4.1.2.6.182.1.2.31.1.0,10,equal]
gentrap [number]	Enter a number that specifies the generic trap type. <ul style="list-style-type: none"> <li>❗ You can also enter ranges.</li> </ul>	gentrap[3], gentrap[2-6]
spectrap [number]	Enter a number that defines the specific trap code. <ul style="list-style-type: none"> <li>❗ You can also enter ranges.</li> </ul>	spectrap[4], spectrap[0-3]
version[number]	Enter a number (1 or 2) that specifies the SNMP version.	version[1], version[2]
community [text]	Enter a community string for an exact, case-sensitive match.	community[public], community[private]

## Messages Tab: Review and Analyze Traps

PRTG stores received traps as common files in the \Trap Database subfolder of the PRTG data directory. To review and analyze all received messages, you can directly access the most recent data in a [table list](#) in the PRTG web interface. You can access this list via the sensor's Overview tab.

❗ PRTG only shows received traps in the table on the Overview tab after an (automatic) page refresh following a sensor scan. The default value for [auto refresh](#) is 30 seconds.

For more details and further filter options, click the Messages tab of the SNMP Trap Receiver sensor. You see all received messages in a table list. At the top, you have display filter options to drill down into the data for specific events of your interest. The filters are the same as those that are available in the sensor settings, but you can define them without using formulas. Provide the desired parameters and PRTG automatically loads the filtered list.

❗ PRTG automatically applies boolean operators to the filters in the following manner: parameters across all columns are combined with **AND**, and parameters within a single column are combined with **OR**.

❗ The parameters that you enter in the filters must **exactly** match the parameters in the message. They are case-sensitive.

❗ You can automatically add a filter by clicking the content of a column.

### Advanced Filter Settings

You can open advanced filter settings by clicking  in the Filter row. The Advanced Filter appears in a popup window. In the text field, you can define a filter using the syntax as described in section [Filter Rules](#) <sup>2213</sup>.

If you provided filter parameters on the Messages tab, the advanced filter already includes them as a corresponding formula with the correct syntax. You can adjust this filter to your needs. You can also copy the automatically created and manually adjusted formula for usage in the filter fields of the sensor settings.

## Channel List

-  Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Drops	The number of dropped packets on the SNMP trap collector port  This channel has a default limit: <ul style="list-style-type: none"> <li>Upper warning limit: <a href="#">0.00000001</a></li> </ul>
Errors	The number of messages categorized as "error"  This channel has a default limit: <ul style="list-style-type: none"> <li>Upper error limit: <a href="#">0.00000001</a></li> </ul>
Messages	The overall number of received traps  This channel is the primary channel by default.
Warnings	The number of messages categorized as "warning"  This channel has a default limit: <ul style="list-style-type: none"> <li>Upper warning limit: <a href="#">0.00000001</a></li> </ul>

## 7.8.245 SSH Disk Free Sensor

The SSH Disk Free sensor monitors the free space on disks of a Linux/Unix system using Secure Shell (SSH).

- ❶ The free space that this sensor returns shows the available disk space of the volume, minus a reserve defined for this volume (for example, for redundancy purposes). So, this sensor shows the disk space that is actually available for use. You can define the size of the reserved disk space with `tune2fs`. For more information, see the Knowledge Base: [Why do SSH Disk Free and SNMP Linux Disk Free show different values for my target Linux system?](#)

SSH Disk Free Sensor

- For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) [2248].

### Sensor in Other Languages

- Dutch: SSH Disk vrij
- French: Espace disponible disque (SSH)
- German: SSH Laufwerkskapazität
- Japanese: SSH ディスク空き容量
- Portuguese: Disco livre (SSH)
- Russian: Свободное пространство диска по SSH
- Simplified Chinese: SSH 磁盘可用空间
- Spanish: Espacio libre en disco (SSH)

## Remarks

Consider the following [remarks](#)<sup>[2241]</sup> and requirements for this sensor:

Remark	Description
Credentials	This sensor requires credentials for Linux/Solaris/macOS (SSH/WBEM) systems in the settings of the parent device.
Distributions	This sensor does not support all Linux/Unix and macOS distributions.
Performance impact	This sensor has a <a href="#">medium</a> performance impact.
IPv4	This sensor only supports IPv4.
Add Sensor dialog	You can select up to 100 disks in the Add Sensor dialog. If you select more disks, you cannot create the sensor. Add the sensor multiple times to monitor more than 100 disks with several sensors.
Knowledge Base	<ul style="list-style-type: none"> <li>Knowledge Base: <a href="#">Which encryption algorithms do PRTG SSH sensors support?</a></li> <li>Knowledge Base: <a href="#">SSH and SFTP sensors in Unknown status</a></li> </ul>

 Store result in case of error

SSH Specific

Setting	Description
Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time that the sensor waits to establish a connection to the host. Keep this value as low as possible. Enter an integer. The maximum timeout value is <b>900</b> seconds (15 minutes).</p> <p>ⓘ Make sure that the connection timeout is a value that is higher than the shell timeout to avoid potential errors.</p>
Shell Timeout (Sec.)	<p>Define a timeout in seconds for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (for example, <a href="#">cat /proc/loadavg</a>). The maximum value is 300 seconds (5 minutes). Enter an integer.</p> <p>ⓘ Make sure that the shell timeout is a value that is lower than the connection timeout to avoid potential errors.</p>
SSH Port Inheritance	<p>Define which port this sensor uses for the SSH connection:</p> <ul style="list-style-type: none"> <li>▪ Inherit port from parent device (default): Use the port number as defined in the <a href="#">Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems</a> section of the parent device settings.</li> <li>▪ Do not inherit port (enter a custom SSH port): Define a custom port number below and do not use the port number from the parent device settings.</li> </ul>

Setting	Description
Custom SSH Port	<p>This setting is only visible if you select Do not inherit port (enter a custom SSH port) <a href="#">above</a>.</p> <p>Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Enter an integer.</p>
SSH Engine	<p>Select the SSH engine that you want to use to <a href="#">access data with this SSH sensor</a>:</p> <ul style="list-style-type: none"> <li>▪ Inherit from parent device (default): Use the SSH engine that you defined in the parent device settings or higher up in the <a href="#">object hierarchy</a>. If you have not changed the SSH engine, this is the recommended option.</li> <li>▪ Default: This is the default SSH engine. It provides the best performance and security. It is set by default in objects that are higher up in the hierarchy, so usually you can keep the Inherit from parent device (default) option.</li> <li>▪ Compatibility mode (deprecated): Use this only if the default SSH engine does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions. It is deprecated. We will remove this legacy mode soon, so try to get your SSH sensors to run with the default SSH engine.</li> </ul> <p> We strongly recommend that you use the default SSH engine.</p> <p> The option you select here overrides the selection of the SSH engine in a higher object: a parent device, group, probe, or root.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID] (SSHv2).txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> <li>▪ Store result in case of error: Store the last sensor result only if the sensor shows the Down status.</li> </ul> <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Set Limits Checked for ALL Disks

In this section, you can set limits that are valid for all channels and all drives. By entering limits, you can define when the sensor shows the Warning or the Down [status](#), depending on the data provided by all drives that this sensor monitors. If you want to individually define limits for separate channels, use the limit settings in the [channel settings](#).

**i** All limits that you define here are valid in addition to the limits defined in the particular Channel settings. The limits are valid simultaneously, so the first limit that is breached applies.

**Set Limits Checked For ALL Disks** Use the channel settings to set separate error limits or warning limits for each disk.

Percentage Limit Check ?  Only use the limits in the settings of the percentage channels  
 Use the limits of both the sensor and the channel settings (default)

Upper Error Limit ?

Upper Warning Limit ?

Lower Warning Limit ?

Lower Error Limit ?

Size Limit Check ?  Only use the limits in the settings of the byte size channels (default)  
 Use the limits of both the sensor and the channel settings

Alarm on Missing/Removed Disk ?  Deactivate alarm (default)  
 Activate alarm

Set Limits Checked for ALL Disks

Setting	Description
Percentage Limit Check	<p>By default, the sensor enables percentage limits with a lower warning limit and a lower error limit. Enable or disable a limit check for the free space in percentage channels of all drives:</p> <ul style="list-style-type: none"> <li>Only use the limits in the settings of the percentage channels: Do not define sensor limits that are valid for all percentage channels. The sensor only uses the limits that you define in the settings of the particular "free space in percent" channels to determine the status.</li> <li>Use the limits of both the sensor and the channel settings (default): Define sensor limits that are valid for all percentage channels. Additional fields appear below. The sensor shows the Warning or the Down status when free space limits are above or below the limits.</li> </ul>
Upper Error Limit	<p><b>This setting is only visible if you select Use the limits of both the sensor and the channel settings (default) above.</b></p> <p>Specify an upper limit in percent for the Down status. If the free disk space of one of your drives exceeds this value, the sensor changes to the Down status. Enter an integer or leave the field empty.</p>

Setting	Description
	<p> The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p>
Upper Warning Limit	<p><b>This setting is only visible if you select</b> Use the limits of both the sensor and the channel settings (default) <a href="#">above</a>.</p> <p>Specify an upper limit in percent for the Warning status. If the free disk space of one of your drives exceeds this value, the sensor changes to the Warning status. Enter an integer or leave the field empty.</p> <p> The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p>
Lower Warning Limit	<p><b>This setting is only visible if you select</b> Use the limits of both the sensor and the channel settings (default) <a href="#">above</a>.</p> <p>Specify a lower limit in percent for the Warning status. If the free disk space of one of your drives falls below this value, the sensor changes to the Warning status. Enter an integer or leave the field empty.</p> <p> The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p>
Lower Error Limit	<p><b>This setting is only visible if you select</b> Use the limits of both the sensor and the channel settings (default) <a href="#">above</a>.</p> <p>Specify a lower limit in percent for the Down status. If the free disk space of one of your drives falls below this value, the sensor changes to the Down status. Enter an integer or leave the field empty.</p> <p> The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p>
Size Limit Check	<p>Enable or disable a limit check for the free bytes channels of all drives:</p> <ul style="list-style-type: none"> <li>▪ Only use the limits in the settings of the byte size channels (default): Do not define sensor limits that are valid for all byte size channels. The sensor only uses limits that you define in the settings of the particular free space in bytes channels to determine the status.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Use the limits of both the sensor and the channel settings: Define limits for the sensor that are valid for all byte size channels. Additional fields appear below. The sensor shows the Warning or Down status when free space limits are above or below the value.</li> </ul> <p><b>i</b> By default, byte size limits are not enabled for drives.</p>
Upper Error Limit	<p><b>This setting is only visible if you select</b> Use the limits of both the sensor and the channel settings <b>above</b>.</p> <p>Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (the default unit is <b>MB</b>). If the free disk space of one of your drives exceeds this value, the sensor changes to the Down status. Enter an integer or leave the field empty.</p> <p><b>i</b> The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p>
Upper Warning Limit	<p><b>This setting is only visible if you select</b> Use the limits of both the sensor and the channel settings <b>above</b>.</p> <p>Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (the default unit is <b>MB</b>). If the free disk space of one of your drives exceeds this value, the sensor changes to the Warning status. Enter an integer or leave the field empty.</p> <p><b>i</b> The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p>
Lower Warning Limit	<p><b>This setting is only visible if you select</b> Use the limits of both the sensor and the channel settings <b>above</b>.</p> <p>Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (the default unit is <b>MB</b>). If the free disk space of one of your drives falls below this value, the sensor changes to the Warning status. Enter an integer or leave the field empty.</p> <p><b>i</b> The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p>
Lower Error Limit	<p><b>This setting is only visible if you select</b> Use the limits of both the sensor and the channel settings <b>above</b>.</p>

Setting	Description
	<p>Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (the default unit is <a href="#">MB</a>). If the free disk space of one of your drives falls below this value, the sensor changes to the Down status. Enter an integer or leave the field empty.</p> <p><b>i</b> The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p>
Alarm on Missing/Removed Disk	<p>If a monitored disk is removed or not found, the sensor sets the values to zero. Select the alarm approach in this case:</p> <ul style="list-style-type: none"> <li>▪ Deactivate alarm (default): Do not send an alert for a removed disk.</li> <li>▪ Activate alarm: Send an alert if a monitored disk is removed or not found.</li> </ul>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ 
 Show channels independently (default)
   
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>

Setting	Description
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other above.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Free Bytes [ <a href="#">Mounted Partition</a> ]	The free space
Free Space [ <a href="#">Mounted Partition</a> ]	The free space (%)
Total	The total space

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Free INodes [ <a href="#">Mount</a> ]	<p>The free index nodes for the mount (%)</p> <p><b>i</b> UNIX file systems only allow a limited number of index nodes. If the limit is exceeded, no more data can be stored, although free space might still be available. This sensor informs you before one of your drives runs out of INodes.</p>

- Spanish: Gabinete SAN (SSH)

### Remarks

Consider the following [remarks](#)<sup>2278</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
Credentials	This sensor requires <a href="#">credentials for Linux/Solaris/macOS (SSH/WBEM) systems</a> in the settings of the parent device.
SAN support	This sensor does not support every SAN, even if it provides a CLI. This sensor only works with specific devices, for example, the <a href="#">HPE P2000</a> .
Scanning interval	If the controller of the target system breaks down, increase the scanning interval to discharge the controller and try again.
Firmware update	After a firmware update of the target system, this sensor might show incorrect channel values. Add this sensor anew in this case.
IPv4	This sensor only supports IPv4.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Device status	Sometimes the devices you monitor with this sensor return status values that are not officially documented so that the shown sensor status in PRTG differs from the "real" device status. For more information, see the Knowledge Base: <a href="#">Why does my SSH SAN sensor show a wrong status?</a>

## 7.8.253 SSH SAN System Health Sensor

The SSH SAN System Health sensor monitors the system health of a storage area network (SAN) via Secure Shell (SSH).

**i** The SAN must provide a command-line interface (CLI) for this purpose.

SSH SAN System Health Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[230]</sup>.

### Sensor in Other Languages

- Dutch: SSH SAN Systeemstatus
- French: SAN état du système (SSH)
- German: SSH SAN Systemzustand
- Japanese: SSH SAN システムの正常性
- Portuguese: Saúde do sistema SAN (SSH)
- Russian: Работоспособность системы SAN по SSH
- Simplified Chinese: SSH SAN 系统健康状况
- Spanish: Salud de sistema SAN (SSH)

### Remarks

Consider the following [remarks](#)<sup>[229]</sup> and requirements for this sensor:

Remark	Description
Credentials	This sensor requires <a href="#">credentials for Linux/Solaris/macOS (SSH/WBEM) systems</a> in the settings of the parent device.
SAN support	This sensor does not support every SAN, even if it provides a CLI. This sensor only works with specific devices, for example, the <a href="#">HPE P2000</a> .
Scanning interval	If the controller of the target system breaks down, increase the scanning interval to discharge the controller and try again.
Firmware update	After a firmware update of the target system, this sensor might show incorrect channel values. Add this sensor anew in this case.
Performance impact	This sensor has a <a href="#">medium</a> performance impact.
IPv4	This sensor only supports IPv4.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Device status	Sometimes the devices you monitor with this sensor return status values that are not officially documented so that the shown sensor status in PRTG differs from the "real" device status. For more information, see the Knowledge Base: <a href="#">Why does my SSH SAN sensor show a wrong status?</a>
Knowledge Base	Knowledge Base: <a href="#">Which encryption algorithms do PRTG SSH sensors support?</a>

## Basic Sensor Settings

### Basic Sensor Settings

**Sensor Name** ⓘ Example Name

---

**Tags** ⓘ exampletag ✕ ⊕

---

**Priority** ⓘ ★★☆☆☆

Basic Sensor Settings

The sensor has the following [default tags](#) that are automatically predefined in the sensor's settings when you add the sensor:

- sshsan
- sshsansystemhealth

- systemhealth

■ For more information about basic sensor settings, see section [Sensor Settings](#) <sup>667</sup>.

## SSH SAN Specific

SSH SAN Specific
Metric ⓘ Metric1

Monitoring Mode ⓘ

- Automatic detection
- Firmware before June 2015
- Firmware as of June 2015

SSH SAN Specific

Setting	Description
Metric	The metric that this sensor monitors.
Monitoring Mode	<p>Define how the sensor requests data from the target device:</p> <ul style="list-style-type: none"> <li>▪ Automatic detection: Automatically detect the firmware version and use the appropriate mode. We recommend that you use this option and only explicitly define the firmware date if errors occur.</li> <li>▪ Firmware before June 2015: Use the mode that is appropriate for firmware versions before June 2015.</li> <li>▪ Firmware as of June 2015: Use the mode that is appropriate for firmware versions as of June 2015.</li> </ul> <p>ⓘ The required mode depends on the firmware version of the target device. The sensor automatically detects the firmware version and uses the appropriate mode in most cases. If errors occur, explicitly define the firmware version.</p> <p>ⓘ We recommend that you use the default value.</p>

## SSH Specific

**SSH Specific**

Connection Timeout (Sec.) ⓘ 60

---

Shell Timeout (Sec.) ⓘ 10

SSH Port Inheritance ⓘ  Inherit port from parent device (default)  
 Do not inherit port (enter a custom SSH port)

SSH Engine ⓘ  Inherit from parent device (default)  
 Default  
 Compatibility mode (deprecated)

Result Handling ⓘ  Discard result (default)  
 Store result  
 Store result in case of error

SSH Specific

Setting	Description
Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time that the sensor waits to establish a connection to the host. Keep this value as low as possible. Enter an integer.</p> <p> ⓘ This sensor has a fixed timeout of 300 seconds. If you change the value, it does not have an effect on the timeout.</p> <p> ⓘ Make sure that the connection timeout is a value that is higher than the shell timeout to avoid potential errors.</p>
Shell Timeout (Sec.)	<p>Define a timeout in seconds for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (for example, <code>cat /proc/loadavg</code>). The maximum value is 300 seconds (5 minutes). Enter an integer.</p> <p> ⓘ This sensor has a fixed timeout of 300 seconds. If you change the value, it does not have an effect on the timeout.</p> <p> ⓘ Make sure that the shell timeout is a value that is lower than the connection timeout to avoid potential errors.</p>
SSH Port Inheritance	<p>Define which port this sensor uses for the SSH connection:</p> <ul style="list-style-type: none"> <li>▪ Inherit port from parent device (default): Use the port number as defined in the <a href="#">Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems</a> section of the parent device settings.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>Do not inherit port (enter a custom SSH port): Define a custom port number below and do not use the port number from the parent device settings.</li> </ul>
Custom SSH Port	<p>This setting is only visible if you select Do not inherit port (enter a custom SSH port) <a href="#">above</a>.</p> <p>Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Enter an integer.</p>
SSH Engine	<p>Select the SSH engine that you want to use to <a href="#">access data with this SSH sensor</a>:</p> <ul style="list-style-type: none"> <li>Inherit from parent device (default): Use the SSH engine that you defined in the parent device settings or higher up in the <a href="#">object hierarchy</a>. If you have not changed the SSH engine, this is the recommended option.</li> <li>Default: This is the default SSH engine. It provides the best performance and security. It is set by default in objects that are higher up in the hierarchy, so usually you can keep the Inherit from parent device (default) option.</li> <li>Compatibility mode (deprecated): Use this only if the default SSH engine does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions. It is deprecated. We will remove this legacy mode soon, so try to get your SSH sensors to run with the default SSH engine.</li> </ul> <p> We strongly recommend that you use the default SSH engine.</p> <p> The option you select here overrides the selection of the SSH engine in a higher object: a parent device, group, probe, or root.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>Discard result (default): Do not store the sensor result.</li> <li>Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID] (SSHv2).txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> <li>Store result in case of error: Store the last sensor result only if the sensor shows the Down status.</li> </ul> <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select Stack channels on top of each other above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Capacitor Cell [#] Voltage [Controller]	The capacitor cell voltage
Capacitor Cell [#] Voltage [Controller] Status	<p>The capacitor cell voltage status</p> <ul style="list-style-type: none"> <li>▪ Up status: Ok</li> <li>▪ Warning status: Warning</li> <li>▪ Down status: Error, Unavailable, Unknown, Unrecoverable</li> <li>▪ Unknown status: Not Installed, Unsupported</li> </ul>

## 7.8.254 SSH Script Sensor

The SSH Script sensor connects to a Linux/Unix system via Secure Shell (SSH) and executes a script file that is located on the target system. This option is available as part of the PRTG API.

SSH Script Sensor

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[2312]</sup>.

### Sensor in Other Languages

- Dutch: SSH Script
- French: Script (SSH)
- German: SSH-Skript
- Japanese: SSH スクリプト
- Portuguese: Script (SSH)
- Russian: Скрипт SSH
- Simplified Chinese: SSH 脚本
- Spanish: Script (SSH)

### Remarks

Consider the following [remarks](#)<sup>[2304]</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a very high performance impact. We recommend that you use no more than <b>50</b> of this sensor on each probe.
File storage	For security reasons, this sensor requires that you store your script file in the /var/prtg/scripts directory on the target system. Make sure that the script has executable rights. If the script is not available or was deleted from the directory, you get the error message <a href="#">Script not found (237)</a> .
Credentials	This sensor requires credentials for Linux/Solaris/macOS (SSH/WBEM) systems in the settings of the parent device.
Distributions	This sensor does not support all Linux/Unix and macOS distributions.
IPv4	This sensor only supports IPv4.
Return format	For more information about the return value format, see the <a href="#">PRTG Manual: Custom Sensors</a> .
Knowledge Base	<ul style="list-style-type: none"> <li>▪ Knowledge Base: <a href="#">Which encryption algorithms do PRTG SSH sensors support?</a></li> <li>▪ Knowledge Base: <a href="#">SSH and SFTP sensors in Unknown status</a></li> </ul>

## Add Sensor

Setting	Description
Channel Name	<p>Enter a name for the channel. Enter a string. This is for display purposes only.</p> <p><b>i</b> You can change this value later in the <a href="#">channel settings</a> of this sensor.</p>

**Placeholder 1** ⓘ

Credentials for Script Sensors

Setting	Description
Placeholder 1 Description	Enter a description for Placeholder 1, for example information about the purpose or content of the placeholder.
Placeholder 1	Enter a value for the placeholder. PRTG inserts the value for the script execution if you add <code>%scriptplaceholder1</code> in the argument list. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 2 Description	Enter a description for Placeholder 2, for example information about the purpose or content of the placeholder.

Setting	Description
Placeholder 2	Enter a value for the placeholder. PRTG inserts the value for the script execution if you add <code>%scriptplaceholder2</code> in the argument list. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 3 Description	Enter a description for Placeholder 3, for example information about the purpose or content of the placeholder.
Placeholder 3	Enter a value for the placeholder. PRTG inserts the value for the script execution if you add <code>%scriptplaceholder3</code> in the argument list. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 4 Description	Enter a description for Placeholder 4, for example information about the purpose or content of the placeholder.
Placeholder 4	Enter a value for the placeholder. PRTG inserts the value for the script execution if you add <code>%scriptplaceholder4</code> in the argument list. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 5 Description	Enter a description for Placeholder 5, for example information about the purpose or content of the placeholder.
Placeholder 5	Enter a value for the placeholder. PRTG inserts the value for the script execution if you add <code>%scriptplaceholder5</code> in the argument list. PRTG does not display the value in the sensor log or the sensor's settings.

## Sensor Settings

**Sensor Settings**

The sensor executes the script on the parent device. The working directory for the script is the parent directory on the target Linux/Unix system.

Script

Character Encoding  UTF-8 (default)  ASCII

Parameters

Mutex Name

Unit String

Value Type

If Value Changes  Ignore (default)  Trigger 'change' notification

Sensor Settings

Setting	Description
Script	<p>Select a script file from the dropdown list. It shows all script files that are available in the /var/prtg/scripts directory on the target Linux/Unix system. For a script file to appear in this list, store the target file in this directory.</p> <ul style="list-style-type: none"> <li> Make sure that the script has executable rights.</li> <li> To show the expected sensor value and <a href="#">status</a>, your file must use the correct format for the returned values. In this case, it is <a href="#">exitcode:value:message</a> to standard output <a href="#">stdout</a>. The exit code determines the sensor status.</li> <li> For more information on how to create custom sensors and for the return format, see section <a href="#">Custom Sensors</a>.</li> <li> For more information and an example script, see the Knowledge Base: <a href="#">Is there a shell script example for the SSH Script sensor?</a></li> <li> You cannot change this value after sensor creation.</li> </ul>
Character Encoding	<p>Define the character encoding that you use in your script to correctly display the sensor message:</p> <ul style="list-style-type: none"> <li>▪ UTF-8 (default)</li> <li>▪ ASCII</li> </ul>
Parameters	<p>If your script file catches command-line parameters, define them here. You can also use placeholders. Enter a string or leave the field empty.</p> <ul style="list-style-type: none"> <li> For a full list of all placeholders, see section <a href="#">Custom Sensors</a>.</li> <li> You need to escape special characters and whitespaces in your parameters and surround them with double quotation marks ("). See section <a href="#">Escape Special Characters and Whitespaces in Parameters</a> for details.</li> <li> In SSH scripts, you can use alphanumeric characters and the special characters ".", "_", "-", "=", and "/" outside of quoted strings.</li> </ul>
Mutex Name	<p>Define a mutual exclusion (mutex) name for the process. Enter a string or leave the field empty.</p> <ul style="list-style-type: none"> <li> PRTG runs all custom script sensors that have the same mutex name serially (not simultaneously). This is useful if you use a lot of sensors and want to avoid high resource usage caused by processes that run running at the same time.</li> <li> See the Knowledge Base: <a href="#">What is the Mutex Name in the EXE/Script sensor settings?</a></li> </ul>
Unit String	<p>Define a unit for the channel value. Enter a string. This is for display purposes only and is the default unit for a new channel. You can change the unit after sensor creation in the sensor's channel settings.</p>

Setting	Description
Value Type	<p>Define the type of the values that your executable or script file returns:</p> <ul style="list-style-type: none"> <li>▪ Integer: An integer is expected as return value. If the script returns a float, PRTG displays the value 0.</li> <li>▪ Float: A float is expected as return value, with a dot (.) between the predecimal position and the decimal places. <ul style="list-style-type: none"> <li>ⓘ The sensor also displays integers unless they produce a buffer overflow.</li> </ul> </li> <li>▪ Counter: Your script returns an integer that increases. PRTG shows the difference between the values of two sensor scans. <ul style="list-style-type: none"> <li>ⓘ A counter <b>must</b> return an integer. It does not support float values.</li> </ul> </li> </ul> <p>ⓘ The sensor does not support string values.</p> <p>ⓘ You cannot change this value after sensor creation.</p>
If Value Changes	<p>Define what the sensor does when its value changes:</p> <ul style="list-style-type: none"> <li>▪ Ignore (default): Do nothing.</li> <li>▪ Trigger 'change' notification: Send an internal message that indicates a change. <ul style="list-style-type: none"> <li>ⓘ In combination with a <a href="#">change trigger</a>, you can use this to <a href="#">trigger a notification</a> if a change occurs.</li> </ul> </li> </ul>

If you have not changed the SSH engine, this is the recommended option.</li> <li>▪ Default: This is the default SSH engine. It provides the best performance and security. It is set by default in objects that are higher up in the hierarchy, so usually you can keep the Inherit from parent device (default) option.</li> <li>▪ Compatibility mode (deprecated): Use this only if the default SSH engine does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions. It is deprecated. We will remove this legacy mode soon, so try to get your SSH sensors to run with the default SSH engine.</li> </ul> <p><b>i</b> We strongly recommend that you use the default SSH engine.</p>

Setting	Description
	<p> The option you select here overrides the selection of the SSH engine in a higher object: a parent device, group, probe, or root.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID] (SSHv2).txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> <li>▪ Store result in case of error: Store the last sensor result only if the sensor shows the Down status.</li> </ul> <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel  Downtime

---

Graph Type   Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.                             <ul style="list-style-type: none"> <li> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Execution Time	<p>The execution time</p> <p> This channel is the primary channel by default.</p>
[Value]	<p>The value that the script file returns in one channel</p> <p> For more information about the return value format, see section <a href="#">Custom Sensors</a>.</p>

Credentials for Script Sensors

Setting	Description
Placeholder 1 Description	Enter a description for Placeholder 1, for example information about the purpose or content of the placeholder.
Placeholder 1	Enter a value for the placeholder. PRTG inserts the value for the script execution if you add <code>%scriptplaceholder1</code> in the argument list. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 2 Description	Enter a description for Placeholder 2, for example information about the purpose or content of the placeholder.
Placeholder 2	Enter a value for the placeholder. PRTG inserts the value for the script execution if you add <code>%scriptplaceholder2</code> in the argument list. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 3 Description	Enter a description for Placeholder 3, for example information about the purpose or content of the placeholder.
Placeholder 3	Enter a value for the placeholder. PRTG inserts the value for the script execution if you add <code>%scriptplaceholder3</code> in the argument list. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 4 Description	Enter a description for Placeholder 4, for example information about the purpose or content of the placeholder.
Placeholder 4	Enter a value for the placeholder. PRTG inserts the value for the script execution if you add <code>%scriptplaceholder4</code> in the argument list. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 5 Description	Enter a description for Placeholder 5, for example information about the purpose or content of the placeholder.

Setting	Description
Placeholder 5	Enter a value for the placeholder. PRTG inserts the value for the script execution if you add <code>%scriptplaceholder5</code> in the argument list. PRTG does not display the value in the sensor log or the sensor's settings.

## Sensor Settings

**Sensor Settings**

**Important:** The script is executed on the device the sensor is created on. The working directory for the script is the script's parent directory on the target Linux/Unix system.

Script

Parameters

Mutex Name

Sensor Settings

Setting	Description
Script	<p>Select a script file from the dropdown list. It shows all script files that are available in the <code>/var/prtg/scriptsxml</code> directory on the target Linux/Unix system. For a script file to appear in this list, store the target file in this directory.</p> <ul style="list-style-type: none"> <li><span style="color: red;">❗</span> Make sure that the script has executable rights.</li> <li><span style="color: red;">❗</span> To show the expected sensor value and <a href="#">status</a>, your files must return the expected XML or JSON format to standard output <code>stdout</code>. The values and message must be embedded in the XML or JSON.</li> <li><span style="color: blue;">■</span> For more information on how to create custom sensors and for the return format, see section <a href="#">Custom Sensors</a>.</li> <li><span style="color: gray;">❗</span> You cannot change this value after sensor creation.</li> </ul>
Parameters	<p>If your script file catches command-line parameters, define them here. You can also use placeholders. Enter a string or leave the field empty.</p> <ul style="list-style-type: none"> <li><span style="color: blue;">■</span> For a full list of all placeholders, see section <a href="#">Custom Sensors</a>.</li> <li><span style="color: red;">❗</span> You need to escape special characters and whitespaces in your parameters and surround them with double quotation marks (<code>"</code>). See section <a href="#">Escape Special Characters and Whitespaces in Parameters</a> for details.</li> <li><span style="color: gray;">❗</span> In SSH scripts, you can use alphanumeric characters and the special characters <code>.", "_", "-", "=", and "/"</code> outside of quoted strings.</li> </ul>
Mutex Name	Define a mutual exclusion (mutex) name for the process. Enter a string or leave the field empty.

Setting	Description
	<p><b>i</b> PRTG runs all custom script sensors that have the same mutex name serially (not simultaneously). This is useful if you use a lot of sensors and want to avoid high resource usage caused by processes that run running at the same time.</p> <p><b>■</b> See the Knowledge Base: <a href="#">What is the Mutex Name in the EXE/Script sensor settings?</a></p>

## SSH Specific

**SSH Specific**

Connection Timeout (Sec.) **i**

---

Shell Timeout (Sec.) **i**

---

SSH Port Inheritance **i**  Inherit port from parent device (default)  
 Do not inherit port (enter a custom SSH port)

SSH Engine **i**  Inherit from parent device (default)  
 Default  
 Compatibility mode (deprecated)

Result Handling **i**  Discard result (default)  
 Store result  
 Store result in case of error

SSH Specific

Setting	Description
Connection Timeout (Sec.)	<p>Define a timeout in seconds for the connection. This is the time that the sensor waits to establish a connection to the host. Keep this value as low as possible. Enter an integer.</p> <p><b>i</b> Make sure that the connection timeout is a value that is higher than the shell timeout to avoid potential errors.</p>
Shell Timeout (Sec.)	<p>Define a timeout in seconds for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (for example, <code>cat /proc/loadavg</code>). The maximum value is 300 seconds (5 minutes). Enter an integer.</p> <p><b>i</b> Make sure that the shell timeout is a value that is lower than the connection timeout to avoid potential errors.</p>

Setting	Description
SSH Port Inheritance	<p>Define which port this sensor uses for the SSH connection:</p> <ul style="list-style-type: none"> <li>▪ Inherit port from parent device (default): Use the port number as defined in the <a href="#">Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems</a> section of the parent device settings.</li> <li>▪ Do not inherit port (enter a custom SSH port): Define a custom port number below and do not use the port number from the parent device settings.</li> </ul>
Custom SSH Port	<p><b>This setting is only visible if you select</b> Do not inherit port (enter a custom SSH port) <b>above</b>.</p> <p>Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Enter an integer.</p>
SSH Engine	<p>Select the SSH engine that you want to use to <a href="#">access data with this SSH sensor</a>:</p> <ul style="list-style-type: none"> <li>▪ Inherit from parent device (default): Use the SSH engine that you defined in the parent device settings or higher up in the <a href="#">object hierarchy</a>. If you have not changed the SSH engine, this is the recommended option.</li> <li>▪ Default: This is the default SSH engine. It provides the best performance and security. It is set by default in objects that are higher up in the hierarchy, so usually you can keep the Inherit from parent device (default) option.</li> <li>▪ Compatibility mode (deprecated): Use this only if the default SSH engine does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions. It is deprecated. We will remove this legacy mode soon, so try to get your SSH sensors to run with the default SSH engine.</li> </ul> <p><b>i</b> We strongly recommend that you use the default SSH engine.</p> <p><b>i</b> The option you select here overrides the selection of the SSH engine in a higher object: a parent device, group, probe, or root.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID] (SSHv2).txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> <li>▪ Store result in case of error: Store the last sensor result only if the sensor shows the Down status.</li> </ul>

Setting	Description
	<p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p>ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select Stack channels on top of each other above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Execution Time	The execution time
[Value]	The values that the script file returns in several channels ■ For more information about the return value format, see section <a href="#">Custom Sensors</a> .

## 7.8.256 SSL Certificate Sensor

The SSL Certificate sensor monitors the certificate of a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection.

- ❶ The sensor also shows the certificate common name and the certificate thumbprint in the sensor message.

SSL Certificate Sensor

- For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[2323]</sup>.

### Sensor in Other Languages

- Dutch: SSL Certificaat
- French: SSL certificat
- German: SSL-Zertifikat
- Japanese: SSL 証明書
- Portuguese: Certificado SSL
- Russian: Сертификат SSL
- Simplified Chinese: SSL 证书
- Spanish: Certificado SSL

## Remarks

Consider the following [remarks](#)<sup>[2324]</sup> and requirements for this sensor:

Remark	Description
DNS name	Enter the Domain Name System (DNS) name in the <a href="#">settings of the parent device</a> exactly as it is written in your certificate. You can also use <a href="#">wildcards</a> <sup>[2328]</sup> .
Revocation status	To check the revocation status of a certificate, the sensor uses WinHTTP to auto-detect the proxy server to use. You can also manually define a server. If you do not define a proxy server, PRTG uses the default WinHTTP proxy settings. For more information, see the Knowledge Base: <a href="#">How can I configure the WinHTTP proxy settings for the SSL Certificate sensor?</a>
Limits	This sensor has predefined <a href="#">limits</a> for several metrics.
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">very low</a> performance impact.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.

## Basic Sensor Settings

### Basic Sensor Settings

**Sensor Name** ⓘ

**Tags** ⓘ  x +

**Priority** ⓘ  ★★☆☆☆

Basic Sensor Settings

The sensor has the following [default tags](#) that are automatically predefined in the sensor's settings when you add the sensor:

- certificate
- ssl
- sslcertificate

■ For more information about basic sensor settings, see section [Sensor Settings](#)<sup>[667]</sup>.

## SSL Certificate Specific

SSL Certificate Specific

Port

Virtual Host (SNI Domain)

Certificate Name Validation  Do not compare common name (CN) with device address or SNI (default)  
 Compare and show down status if common name (CN) and address/SNI do not match  
 Compare and show down status if common name (CN)/alternative names (SAN) and address/SNI do not match

SSL Certificate Specific

Setting	Description
Port	Enter the number of the port to which this sensor connects. Enter an integer. The default port is <a href="#">443</a> .
Virtual Host (SNI Domain)	<p>Define the host name that the sensor tries to query if your server has multiple certificates on the same IP address and port combination. Enter a string.</p> <p><b>i</b> In the case of virtual hosting, you must identify the specific certificate for a specific domain while all domains use the same IP address, you can use SNI, which is an extension of TLS.</p> <p><b>i</b> If you select a Certificate Name Validation option below, the sensor compares the common name and optionally alternative names with the SNI. Leave this field empty to validate the common name with the host address of the parent device.</p>
Certificate Name Validation	<p>Define if you want the sensor to validate the certificate name:</p> <ul style="list-style-type: none"> <li>▪ Do not compare common name (CN) with device address or SNI (default): Do not check if the certificate name is valid by comparing it with the address of the parent device or the defined SNI.</li> <li>▪ Compare and show down status if common name (CN) and address/SNI do not match: Check the common name to validate the certificate name. If you define an SNI above, the sensor compares the common name with the SNI. If you do not define an SNI, the sensor uses the host address of the parent device. If the common name and the checked address/SNI do not match, the sensor shows the <a href="#">Down status</a>.</li> <li>▪ Compare and show down status if common name (CN)/alternative names (SAN) and address/SNI do not match: Check the common name and the <a href="#">Subject Alternative Names (SAN)</a> to validate the certificate. If you define an SNI domain above, the sensor compares the common name and alternative names with the SNI. If you do not define an SNI, the sensor uses the host address of the parent device. If the common name or alternative names and the checked address/SNI do not match, the sensor shows the Down status.</li> </ul>

## Connection Specific

**Connection Specific**

Use SOCKS Proxy (v5 only) ⓘ   
  Do not use SOCKS proxy (default)   
  Use SOCKS proxy

Connection Specific

Setting	Description
Use SOCKS Proxy (v5 only)	<p>Define if the sensor uses a SOCKS proxy server for the sensor connection:</p> <ul style="list-style-type: none"> <li>▪ Do not use SOCKS proxy(default): Directly connect to the target host without using a SOCKS proxy.</li> <li>▪ Use SOCKS proxy: Connect using <b>SOCKS5</b>. Provide data for the SOCKS connection below.               <ul style="list-style-type: none"> <li>ⓘ Other SOCKS versions are not supported.</li> </ul> </li> </ul> <p>ⓘ This sensor only supports SOCKS5 proxies. It does not support HTTP proxies.</p>
Server	<p><i>This setting is only visible if you select Use SOCKS proxy above.</i></p> <p>Enter the IP address or host name of the proxy server that the sensor uses for connection.</p>
Port	<p><i>This setting is only visible if you select Use SOCKS proxy above.</i></p> <p>Enter the port number of the proxy server that the sensor uses for connection.</p>
User Name	<p><i>This setting is only visible if you select Use SOCKS proxy above.</i></p> <p>If the proxy server requires authentication, enter a user name.</p>
Password	<p><i>This setting is only visible if you select Use SOCKS proxy above.</i></p> <p>If the proxy server requires authentication, enter the password for the user you specified above.</p>

## Debug Options

**Debug Options**

**Result Handling** ⓘ

Discard result (default)  
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result to the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].Data.txt, Result of Sensor [ID] (Certificate 0 in Certificate Chain).cer, Result of Sensor [ID] (Certificate 1 in Certificate Chain).cer, Result of Sensor [ID] (Certificate 2 in Certificate Chain).cer, Result of Sensor [ID] (Certificate Chain).txt, and Result of Sensor [ID] (Certificate).cer. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

ⓘ You can use the debug option to get a log file with information about the certificate chain. Additionally, certificates in the certificate chain are stored in the log folder (.cer files). This can help you, for example, if you have issues with the Root Authority Trusted channel of this sensor.

## Sensor Display

**Sensor Display**

**Primary Channel** ⓘ Downtime

**Graph Type** ⓘ

Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are

Setting	Description
	<p>available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Using Wildcards

You can use wildcards in the IP Address/DNS Name in the [device settings](#). Wildcards that apply to only one level of the domain name are supported.

Example	Result
<a href="#">*.wildcard.com</a> for <a href="#">www.wildcard.com</a>	Works
<a href="#">api.wildcard.com</a> for <a href="#">api.wildcard.com</a>	Works

Example	Result
contoso.com for contoso.com	Works
*.subapi.subapi2.wildcard.com for de.subapi.subapi2.wildcard.com	Works
*. *.wildcard.com for www.de.wildcard.com	Not supported
*.wildcard.com for de.subapi.wildcard.com	Doesn't work
www.contoso.com for contoso.com	Doesn't work
subapi.*.wildcard.com for subapi.dns.wildcard.com	Doesn't work

## Channel List

- i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Common Name Check	<p>If the common name or subject-alternative names match the host address or SNI (if you select a Certificate Name Validation option)</p> <ul style="list-style-type: none"> <li>▪ Up status: CN/SAN Match, Disabled, Matches Device Address, Matches SNI</li> <li>▪ Down status: CN/SAN Do Not Match SNI, Does Not Match Device Address, Does Not Match SNI</li> </ul>
Days to Expiration	<p>The days to expiration with a predefined lower warning limit (28 days) and lower error limit (7 days)</p> <p><b>i</b> This channel is the primary channel by default.</p> <p><b>i</b> This channel has default limits:</p> <ul style="list-style-type: none"> <li>▪ Lower error limit: <b>7</b></li> <li>▪ Lower warning limit: <b>28</b></li> </ul>

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Public Key Length	<p>The public key length</p> <ul style="list-style-type: none"> <li>▪ Up status: <ul style="list-style-type: none"> <li>▫ RSA keys: For 2048-bit keys (<b>good</b> security) and longer (<b>perfect</b> security)</li> <li>▫ ECC keys: For 128-bit and 192-bit keys (<b>good</b> security) and longer (<b>perfect</b> security)</li> </ul> </li> <li>▪ Warning status: For <b>weak</b> security</li> <li>▪ Down status: For shorter keys (<b>unsecure</b>)</li> <li>▪ Unknown status: Unknown</li> </ul>
Revoked	<p>If the certificate has been revoked</p> <ul style="list-style-type: none"> <li>▪ Up status: No</li> <li>▪ Warning status: Unable To Check Revocation Status</li> <li>▪ Down status: Yes</li> </ul>
Root Authority Trusted	<p>If the certificate is trusted as root authority</p> <ul style="list-style-type: none"> <li>▪ Up status: Yes</li> <li>▪ Warning status: No</li> </ul>

## 7.8.257 SSL Security Check Sensor

The SSL Security Check sensor monitors Secure Sockets Layer (SSL)/Transport Layer Security (TLS) connectivity to the port of a device. It tries to connect to the specified TCP/IP port number of a device with different SSL/TLS versions and shows if the device supports a particular protocol.

SSL Security Check Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: SSL Security Check
- French: SSL vérification de sécurité
- German: SSL-Sicherheitsüberprüfung

## 7.8.258 Syslog Receiver Sensor

The Syslog Receiver sensor receives and analyzes Syslog messages.

Syslog Receiver Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: Syslog ontvanger
- French: Récepteur Syslog
- German: Syslog-Empfänger
- Japanese: Syslog レシーバー
- Portuguese: Receptor de Syslog
- Russian: Приемник Syslog
- Simplified Chinese: Syslog 接收程序
- Spanish: Receptor de Syslog

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a very high performance impact. We recommend that you use no more than <b>50</b> of this sensor on each probe.

Remark	Description
UDP	This sensor only supports the User Datagram Protocol (UDP).
Cluster probe	This sensor does not support cluster probes. You can only set it up on local probes or remote probes.
IPv6	This sensor supports IPv6.
Probe device	<p>Add this sensor to the probe device to receive all messages of the remote probe system.</p> <p> If you add the sensor to a device other than a probe device, the IP address or Domain Name System (DNS) name of the parent device must match the proper sender. For example, if you want to receive messages from a storage area network (SAN), you might need to add a device with the IP address of a specific array member that sends the messages. Providing a DNS name that points to the IP address of a whole group might not work for SANs.</p>
Filter options	You can use the filter options to define which types of messages the sensor considers for monitoring, and which messages it categorizes as warnings or errors.
Specific device	Add this sensor to a specific device to directly receive all messages from this device. This is faster than using source filters.
Placeholders	You can use <a href="#">placeholders</a> in email <a href="#">notification templates</a> to see messages when you receive email notifications.
Sensor states	The <a href="#">sensor states</a> of this sensor persist for one scanning interval only. After showing the Warning or the Down status, and if there is no warning or error message in the next scanning interval, the sensor shows the Up status again. For more information on a workaround, see the Knowledge Base: <a href="#">How can I configure sensors using speed limits to keep the status for more than one interval?</a>
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Basic Sensor Settings

### Basic Sensor Settings

**Sensor Name** ⓘ Example Name

---

**Tags** ⓘ exampletag ✕ +

---

**Priority** ⓘ ★★☆☆☆

Basic Sensor Settings

The sensor has the following [default tags](#) that are automatically predefined in the sensor's settings when you add the sensor:

- syslogsensor

■ For more information about basic sensor settings, see section [Sensor Settings](#)<sup>[667]</sup>.

## Syslog Specific

### Syslog Specific

**Port** ⓘ 514

---

**Purge Messages After** ⓘ 32 days (default)

Syslog Specific

Setting	Description
Port	Enter the number of the port on which the sensor listens for Syslog messages. The default port is <a href="#">514</a> . Enter an integer.  ⓘ We recommend that you use the default value.
Purge Messages After	Define how long PRTG stores received Syslog messages for analysis. Select a period of time from the dropdown list.

## Filter

■ For more information, see section [Filter Rules](#)<sup>[2343]</sup>.

**Filter**

*Filters are formulas using AND, OR, NOT, brackets and the following fields:*

Field	Parameters	Examples
source[ip]	Enter a UDP source IP, IP range, or IP hostmask	source[10.0.23.50], source[10.0.23.10-50], source[10.0.23.10/24]
facility[number]	Enter a number or range of the facility code, between 0 and 23	facility[2], facility[5-7]
severity[number]	Enter a single number or range of the severity code, between 0 (Emergency) and 7 (Debug)	severity[4], severity[1-3]
hostname[text]	Enter the hostname string to match (exact, case sensitive)	hostname[www.paessler.com]
tag[text]	Enter the tag string to match (exact, case sensitive)	tag[su]
appname[text]	Enter the app name string to match (exact, case sensitive)	appname[myproc]
procid[text]	Enter the process ID string to match (exact, case sensitive)	procid[8710]
msgid[text]	Enter the message ID string to match (exact, case sensitive)	msgid[ID47]
message[parttext]	Enter a substring to match the message field (partial, case insensitive)	message[Error]
data[parttext] data[id,param] data[id,param,value]	Enter a substring to match on structured data as displayed in the table (partial, case sensitive); or enter an ID and a parameter (comma separated) to check if the parameter exists in the ID element; or enter an ID, a parameter, and a value (comma separated) to match on a structured data value (RFC 5424)	data[exampleSDID@32473], data[exampleSDID@32473, eventSource], data[exampleSDID@32473, eventSource,Application]

Include Filter ⓘ severity[0-6]

Exclude Filter ⓘ

Warning Filter ⓘ severity[4]

Error Filter ⓘ severity[0-3]

Filter

Setting	Description
Include Filter	Define if you want to filter Syslog messages. If you leave this field empty or use the keyword <b>any</b> , the sensor processes all data. To only include specific types of messages, define filters using a special syntax.
Exclude Filter	Define which types of Syslog messages the sensor discards and does not process. To exclude specific types of messages, define filters using a special syntax.
Warning Filter	Define which types of Syslog messages count for the Warnings channel. To categorize received messages as warning messages, define filters using a special syntax.

Setting	Description
	<p><b>i</b> The sensor collects messages until a scanning interval ends. As long as the scanning interval is running, the sensor does not change its status. By default, the sensor changes to the Warning <a href="#">status</a> after a scanning interval finishes and there was at least one warning message (and no error message) during this scanning interval. The sensor shows the Warning at least until the succeeding scanning interval finishes. If the sensor does not receive any warning or error message in this scanning interval, its status changes to the Up status again with the start of the next scanning interval.</p>
Error Filter	<p>Define which types of Syslog messages count for the Errors channel. To categorize received messages as error messages, define filters using a special syntax.</p> <p><b>i</b> The sensor collects messages until a scanning interval ends. As long as the scanning interval is running, the sensor does not change its status. By default, the sensor changes to the Down status after a scanning interval finishes and there was at least one error message during this scanning interval. The sensor shows the Down status at least until the succeeding scanning interval finishes. If the sensor does not receive any warning or error message in this scanning interval, its status changes to the Up status again with the start of the next scanning interval.</p>

## Sensor Display

**Sensor Display**

Primary Channel **ⓘ** Downtime

---

Graph Type **ⓘ**  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking <b>⚙</b> below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.                             <ul style="list-style-type: none"> <li> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p><b>This setting is only visible if you select Stack channels on top of each other above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

### Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

### Debug Options

**Debug Options**

Result Handling 

Discard result (default)  
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>Discard result (default): Do not store the sensor result.</li> <li>Store result: Store the last sensor result in the \Logs\debug subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is UDP Debug Port [Port]_[Date].log. This setting is for debugging purposes.                             <ul style="list-style-type: none"> <li> Use with caution. We recommend that you only use this setting for a short time because it can create huge data files.</li> </ul> </li> </ul>

## Filter Rules

Filter rules are used for the include, exclude, warning, and error definition fields of the Syslog Receiver sensor. They are based on the following format:

```
field[filter]
```

You can use various filters suitable to your needs. Include and exclude filters define which messages to monitor. Warning and error filters define how to categorize received messages. Provide these filters in the sensor settings as formulas. Formulas are fields that you can combine with boolean operators ([AND](#), [OR](#), [NOT](#)) and brackets.

Field	Parameter	Example
source[ip]	Enter an IP address where the messages come from. IP masks and ranges are also possible.	<ul style="list-style-type: none"> <li>▪ source[10.0.23.50]</li> <li>▪ source[10.0.23.10-50]</li> <li>▪ source[10.0.23.10/24]</li> </ul>
facility[number]	Enter any number or range from 0 to 23 specifying the program type that sends the message.	<ul style="list-style-type: none"> <li>▪ facility[2]</li> <li>▪ facility[5-7]</li> <li>▪ facility[5] OR facility[6]</li> </ul>
severity[number]	Enter any number or range from 0 (emergency) to 7 (debug) specifying the message type.	<ul style="list-style-type: none"> <li>▪ severity[4]</li> <li>▪ severity[1-3]</li> <li>▪ severity[1] AND severity[2]</li> </ul>
hostname[text]	Enter any string that specifies the hostname of a device in the message.	<ul style="list-style-type: none"> <li>▪ hostname[www.example.com]</li> </ul>
tag[text]	Enter any string that specifies the tag of a program or process in the message.	<ul style="list-style-type: none"> <li>▪ tag[su]</li> </ul>
appname[text]	Enter any string that specifies the appname part of the message.	<ul style="list-style-type: none"> <li>▪ appname[myproc]</li> <li>▪ appname[demo] AND msgid[m42]</li> </ul>
procid[text]	Enter any string that specifies the process identifier part of the message.	<ul style="list-style-type: none"> <li>▪ procid[1860]</li> </ul>
msgid[text]	Enter any string that specifies the message identifier part of the message.	<ul style="list-style-type: none"> <li>▪ msgid[ID47]</li> </ul>
message[parttext]	Enter any string that specifies the message part of the message. (Any substring matches. This value is not case-sensitive.)	<ul style="list-style-type: none"> <li>▪ message[Error]</li> </ul>

Field	Parameter	Example
data [id,param,value]	This checks the SD-ID block of the message's structured data for a parameter matching the specified value.	▪ data[exampleSDID@12345,eventSource,Application]
data[parttext]	This checks if the specified substring matches structured data as displayed in the corresponding table.	▪ data[exampleSDID@1234]
data[id,param]	This checks if the parameter exists in the specified ID element.	▪ data[exampleSDID@1234,eventSource]

- ❗ String parameters (except the substring in message) must **exactly** match the particular parts of the message. They are case-sensitive.

## Messages Tab: Review and Analyze Syslog Messages

PRTG stores received Syslog messages as common files in the \Syslog Database subfolder of the PRTG data directory. To review and analyze all received messages, you can directly access the most recent data in a [table list](#) on the PRTG web interface. You can access this list via the sensor's Overview tab.

- ❗ Received Syslog messages are only shown in the table on the Overview tab after an (automatic) page refresh following a sensor scan. The default value for [auto refresh](#) is 30 seconds.

For more details and further filter options, click the Messages tab of the Syslog Receiver sensor. You see all received messages in a table list. On the top, you have display filter options to drill down into the data for specific events of your interest. The filters are the same as those available in the sensor settings, but you can define them without using formulas. Provide the desired parameters and PRTG automatically loads the filtered list.

- ❗ You can automatically add a filter by clicking the content of a column.

### Advanced Filter Settings

You can open advanced filter settings by clicking  in the Filter row. The Advanced Filter appears in a popup window. In the text field, you can define a filter using the syntax as specified in section [Filter Rules](#) <sup>2343</sup>.

If you provided filter parameters on the Messages tab, the advanced filter already includes them as a corresponding formula with the correct syntax. You can adjust this filter to your needs. You can also copy the automatically created and manually adjusted formula for usage in the filter fields of the sensor settings.

### Channel List

- ❗ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Drops	The number of dropped packets on the syslog port ⓘ This channel has a default limit: <ul style="list-style-type: none"> <li>▪ Upper warning limit: <a href="#">0.00000001</a></li> </ul>
Errors	The number of messages categorized as "error" ⓘ This channel has a default limit: <ul style="list-style-type: none"> <li>▪ Upper error limit: <a href="#">0.00000001</a></li> </ul>
Messages	The number of received Syslog messages ⓘ This channel is the primary channel by default.
Warnings	The number of messages categorized as "warning" ⓘ This channel has a default limit: <ul style="list-style-type: none"> <li>▪ Upper warning limit: <a href="#">0.00000001</a></li> </ul>

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Available	The response time  This channel is the primary channel by default.
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status

## 7.8.262 Traceroute Hop Count Sensor

The Traceroute Hop Count sensor traces the number of hops from the probe system to the IP Address/DNS Name of the parent device.

**i** If the number of hops (the route) changes, you can additionally define a different [sensor status](#).

Traceroute Hop Count Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: Traceroute Hop Count
- French: Compteur de hop Traceroute
- German: Traceroute Hop-Anzahl
- Japanese: Traceroute ホップ数
- Portuguese: Contagem de hops em traceroute
- Russian: Кол-во переходов трассировки маршрута
- Simplified Chinese: Traceroute 跳跃计数
- Spanish: Recuento de saltos traceroute

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node. If the sensor shows the error PE087, additionally install .NET 3.5 on the probe system.</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
Windows Server	We recommend Windows Server 2016 on the probe system for best performance of this sensor.
IPv6	This sensor supports IPv6.

### Basic Sensor Settings

## 7.8.265 VMware Datastore (SOAP) Sensor

The VMware Datastore (SOAP) sensor monitors the disk usage of a VMware datastore using the Simple Object Access Protocol (SOAP).

VMware Datastore (SOAP) Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[2379]</sup>.

### Sensor in Other Languages

- Dutch: VMware Datastore (SOAP)
- French: VMware Datastore (SOAP)
- German: VMware Datastore (SOAP)
- Japanese: VMware Datastore( SOAP)
- Portuguese: Armazenamento de dados VMware (SOAP)
- Russian: Хранилище данных VMware (SOAP)
- Simplified Chinese: VMware 数据存储 (SOAP)
- Spanish: Almacén de datos VMware (SOAP)

### Remarks

Consider the following [remarks](#)<sup>[2379]</sup> and requirements for this sensor:

Remark	Description
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node.</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
Windows Server	We recommend Windows Server 2016 on the probe system for best performance of this sensor.
Parent device	This sensor requires that the parent device is a VMware ESXi server as of version 5.2 or vCenter.
Credentials	This sensor requires credentials for VMware/XenServer in the settings of the parent device. Enter a user with sufficient access rights to obtain statistics (read-only usually works).
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">very low</a> performance impact.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Limits	This sensor has predefined <a href="#">limits</a> for several metrics.
Knowledge Base	<ul style="list-style-type: none"> <li>▪ Knowledge Base: <a href="#">I cannot add VMware sensors because of "wrong" password although it is correct. What can I do?</a></li> <li>▪ Knowledge Base: <a href="#">Why are my VMware sensors not working after upgrading to VCSA 6.5 U1?</a></li> </ul>

## Settings on VMware Host System

If you set up this sensor on different probes (for example, when using [remote probes](#) or when running a [failover cluster](#)), you might need to change the settings of your VMware host so that it accepts more incoming connections. Otherwise, you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

 For more information, see the Knowledge Base: [How can I increase the connection limit on VMware systems? PE121.](#)

## Basic Sensor Settings

Store result

Datstore Settings

Setting	Description
Managed Object Identifier (MOID)	The managed object identifier (MOID) of the datastore that this sensor monitors.
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p>

Setting	Description
	<p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel **ⓘ** Downtime

---

Graph Type **ⓘ**
 Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking <b>⌵</b> below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select Stack channels on top of each other above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click **🔒** under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

❗ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Accessible	The accessibility of the datastore <ul style="list-style-type: none"> <li>▪ Up status: Yes</li> <li>▪ Down status: No</li> </ul>
Available Capacity	The available capacity (the physically or virtually available size of the datastore)
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Free Bytes	The free space (the disk space that is not used by VMs. Used disk space can be either thick-provisioned or used by thin-provisioned virtual disks)
Free Space	The free space (%) (the disk space that is not used by VMs. Used disk space can be either thick-provisioned or used by thin-provisioned virtual disks) <p>❗ This channel is the primary channel by default.</p>
Total Provisioned	The total provisioned disk space (%) (the sum of all potentially used disk space of thin-provisioned and thick-provisioned VM hard drives, that is, the uncommitted bytes plus used bytes)
Uncommitted Bytes	The uncommitted bytes (the disk space that is provisioned for thin-provisioned VMs but not used yet)

### Remarks

Consider the following [remarks](#)<sup>[2381]</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
Enabled CIM Interface on ESXi Host	This sensor requires that the CIM interface is enabled on the ESXi host. As of ESXi 6.5, you must manually enable CIM.  ■ For more information, see the Knowledge Base: <a href="#">How do I enable the CIM interface on VMware ESXi 6.5?</a>
Windows Server	We recommend Windows Server 2016 on the probe system for best performance of this sensor.
Credentials	This sensor requires credentials for Linux/Solaris/macOS (SSH/WBEM) systems in the settings of the parent device.
Parent device	This sensor requires that the parent device is a VMware ESXi server as of version 5.2.
IPv4	This sensor only supports IPv4.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Knowledge Base	Knowledge Base: <a href="#">Why are my VMware sensors not working after upgrading to VCSA 6.5 U1?</a>

## Basic Sensor Settings

### Basic Sensor Settings

**Sensor Name** ⓘ Example Name

---

**Tags** ⓘ exampletag ✕ +

---

**Priority** ⓘ ★★★★★

Basic Sensor Settings

The sensor has the following [default tags](#) that are automatically predefined in the sensor's settings when you add the sensor:

- esxshealthsensor

■ For more information about basic sensor settings, see section [Sensor Settings](#) <sup>667</sup>.

## ESXi Server Elements

**ESXi Server Elements**

Hardware Element <sup>ⓘ</sup> *Power Supply 1 Current 1*

This sensor monitors the health of an element as reported by the ESXi server. The sensor can automatically change to a Warning status when the ESXi server returns Degraded/Warning for this particular element. It can change to a Down status when the server reports any of the following errors: Minor / Major / Critical / Non recoverable.

Automatic Sensor Status <sup>ⓘ</sup>

- Set sensor to warning or down status (default)
- Report the current reading

Result Handling <sup>ⓘ</sup>

- Discard result (default)
- Store result

ESXi Server Elements

Setting	Description
Hardware Element	The hardware element that this sensor monitors.
Automatic Sensor Status	<p>Define if the sensor changes its <a href="#">status</a> depending on the health status reading:</p> <ul style="list-style-type: none"> <li>▪ Set sensor to warning or down status (default): Set the sensor to the Warning or the Down status when the server returns respective values. The sensor also changes to the Down status if the connection to the server fails.</li> <li>▪ Report the current reading: Never change the sensor's status dependent on the values returned by the server. The sensor only changes to the Down status if the connection to the server fails.</li> </ul>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Current	The current
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Healthstate	The health status <ul style="list-style-type: none"> <li>▪ Up status: OK Unknown</li> <li>▪ Warning status: Degraded, Minor</li> <li>▪ Down status: Critical, Major, Non Recoverable Error</li> </ul>
Power	The average host power usage
Rotational Speed	The fan RPM
Temperature	The temperature

## 7.8.267 VMware Host Hardware Status (SOAP) Sensor

The VMware Host Hardware Status (SOAP) sensor monitors the hardware status of a VMware host server using the Simple Object Access Protocol (SOAP). It gives you a general status overview of the host.

**i** The sensor also shows any states other than **normal** in the sensor message.

VMware Host Hardware Status (SOAP) Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: VMware Host Hardware Status (SOAP)
- French: VMware statut du matériel du serveur hôte (SOAP)
- German: VMware Hostserver Hardware-Zustand (SOAP)
- Japanese: VMware ホストハードウェアの状態 (SOAP)
- Portuguese: Status do hardware de host VMware (SOAP)
- Russian: Состояние аппаратных средств узла VMware (SOAP)
- Simplified Chinese: VMware 主机硬件状态 (SOAP)
- Spanish: Estado de hardware host VMware (SOAP)

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node.</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
Windows Server	We recommend Windows Server 2016 on the probe system for best performance of this sensor.
Credentials	This sensor requires credentials for VMware/XenServer in the settings of the parent device. Enter a user with sufficient access rights to obtain statistics (read-only usually works).
Parent device	This sensor requires that the parent device is a VMware ESXi server as of version 5.2. We recommend that you do not use this sensor on your vCenter. Reliable hardware information can only be provided when this sensor is created on your physical host server as parent device.
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">medium</a> performance impact.
Sensors	This sensor only shows items that report an actual state, so you might see more "sensors" in your vSphere client than the number of states available in the channels of this sensor
Knowledge Base	<ul style="list-style-type: none"> <li>▪ Knowledge Base: <a href="#">I cannot add VMware sensors because of "wrong" password although it is correct. What can I do?</a></li> <li>▪ Knowledge Base: <a href="#">Why are my VMware sensors not working after upgrading to VCSA 6.5 U1?</a></li> </ul>

## Settings on VMware Host System

If you set up this sensor on different probes (for example, when using [remote probes](#) or when running a [failover cluster](#)), you might need to change the settings of your VMware host so that it accepts more incoming connections. Otherwise, you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

 For more information, see the Knowledge Base: [How can I increase the connection limit on VMware systems? PE121.](#)

## Basic Sensor Settings

### Basic Sensor Settings

**Sensor Name** ⓘ

Stack Unit	<p><b>This setting is only visible if you select Stack channels on top of each other above.</b></p>

Setting	Description
	Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
CPU Ready (Percent)	The CPU readiness (%)
CPU Usage	The CPU usage  This channel is the primary channel by default.
Datastore Total Read Latency	The datastore total read latency
Datastore Total Write Latency	The datastore total write latency
Disk Read	The disk read speed
Disk Usage	The disk usage
Disk Write	The disk write speed
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status

Channel	Description
Memory Active	The active memory
Memory Consumed	The consumed memory
Memory Consumed (Percent)	The memory consumed (%)
Network Received	The received bytes
Network Transmitted	The transmitted bytes
Network Usage	The total network usage
Power	The average host power usage

## 7.8.270 Windows CPU Load Sensor

The Windows CPU Load sensor monitors the CPU load on a system via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#) of the parent device.

Windows CPU Load Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[2408]</sup>.

### Sensor in Other Languages

- Dutch: Windows Processor Belasting
- French: Windows charge CPU
- German: Windows CPU-Last
- Japanese: Windows CPU 負荷
- Portuguese: Carga de CPU Windows
- Russian: Загрузка ЦП Windows
- Simplified Chinese: Windows CPU 负载
- Spanish: Carga de CPU Windows

### Remarks

Consider the following [remarks](#)<sup>[2404]</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
Windows version	This sensor requires <a href="#">at least Windows Server 2008 R2</a> on the probe system (on every cluster node, if on a cluster probe).   <b>WoW64</b> must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.
Remote Registry Windows service	This sensor requires that the <a href="#">Remote Registry</a> Windows service runs on the target system.   If this service does not run, a connection via performance counters is not possible. However, WMI connections might still work.   To enable the service, log in to the respective system and open the services manager (for example, via <code>services.msc</code> ). In the list, find the respective service and set its Start Type to Automatic.
WoW64	This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
Credentials	This sensor requires credentials for Windows systems.   We recommend that you use Windows domain credentials. If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target system.  Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.
IPv6	This sensor supports IPv6.
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Hybrid Approach: Performance Counters and WMI

 By default, this sensor uses WMI to request monitoring data. You can change the default behavior to a [hybrid approach](#) in the Windows Compatibility Options of the parent [device's settings](#) on which you create this sensor: if you choose this option, the sensor first tries to query data via [Windows performance counters](#) and uses WMI as a fallback if performance counters are not available. When running in fallback mode, the sensor tries to connect via performance counters again after 24 hours.

**i** Sensors that use the WMI protocol have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.

**i** For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#).

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Alternative WMI Query

**Alternative WMI Query**

WMI sensors use the most efficient and accurate WMI queries possible. However, different Windows versions and even different patch levels on the target systems can lead to changes in some WMI classes. These changes often result in errors like *class not valid* or *invalid data*. If these errors persist, try the option *Use the alternative WMI query method*.

Query Method <sup>?</sup>  Use the default WMI query method (default)  
 Use the alternative WMI query method

Alternative WMI Query

Setting	Description
Query Method	<p>Select the method that the sensor uses to query via WMI:</p> <ul style="list-style-type: none"> <li>▪ Use the default WMI query method (default): Use the standard method to query WMI. We recommend that you use this option.</li> <li>▪ Use the alternative WMI query method: Use an alternative method to query WMI for better compatibility if WMI sensors return errors such as <a href="#">class not valid</a> or <a href="#">invalid data</a>.</li> </ul>

## Sensor Display

## 7.8.272 Windows MSMQ Queue Length Sensor

The Windows MSMQ Queue Length sensor reads the number of messages in a Microsoft message queue of the parent device.

Windows MSMQ Queue Length Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[2418]</sup>.

### Sensor in Other Languages

- Dutch: Windows MSMQ wachtrijlengte
- French: Windows MSMQ longueur de la file d'attente
- German: Windows MSMQ Queue-Länge
- Japanese: Windows MSMQ キュー長
- Portuguese: Comprimento da fila MSMQ Windows
- Russian: Длина очереди Windows MSMQ
- Simplified Chinese: Windows MSMQ 队列长度
- Spanish: Longitud de cola MSMQ Windows

### Remarks

Consider the following [remarks](#)<sup>[2414]</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
MSMQ service	<p>This sensor requires that the <a href="#">Microsoft Message Queuing (MSMQ)</a> service runs on both the probe system and the target system. Depending on your Windows version, you might first need to install the <a href="#">MSMQ Server</a>.</p> <p><b>i</b> To enable the service, log in to the respective system and open the services manager (for example, via <code>services.msc</code>). In the list, find the respective service and set its Start Type to Automatic.</p> <p><b>i</b> When installing MSMQ Server, make sure that you install it including the <a href="#">Directory Service</a>. Depending on your Windows installation, this might have a different name, such as:</p> <ul style="list-style-type: none"> <li>▫ MSMQ Active Directory Domain Service Integration</li> <li>▫ Directory Service Integration</li> <li>▫ Active Directory Integration</li> </ul> <p><b>■</b> For more information, see the Knowledge Base: <a href="#">How do I activate Message Queuing in my Windows installation?</a></p>
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node. If the sensor shows the error PE087, additionally install .NET 3.5 on the probe system.</p> <p><b>i</b> If the framework is missing, you cannot create this sensor.</p> <p><b>■</b> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
Windows Server	We recommend Windows Server 2016 on the probe system for best performance of this sensor.
Credentials	<p>This sensor requires credentials for Windows systems.</p> <p><b>i</b> We recommend that you use Windows domain credentials. If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target system. Otherwise, the sensor cannot correctly connect.</p>
Subqueues	This sensor cannot monitor subqueues.
Add Sensor dialog	If no message queues are available in the Add Sensor dialog, you see a corresponding message.
IPv6	This sensor supports IPv6.

Remark	Description
Knowledge Base	Knowledge Base: <a href="#">How do I activate Message Queuing in my Windows installation?</a>
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## 7.8.273 Windows Network Card Sensor

The Windows Network Card sensor monitors the bandwidth usage and traffic of a network interface via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#) of the parent device.

Windows Network Card Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[2424]</sup>.

### Sensor in Other Languages

- Dutch: Windows Netwerkkkaart
- French: Windows carte réseau
- German: Windows Netzwerkadapter
- Japanese: Windows ネットワークカード
- Portuguese: Adaptador de rede Windows
- Russian: Сетевой адаптер Windows

- Simplified Chinese: Windows 网卡
- Spanish: Tarjeta de red Windows

## Remarks

Consider the following [remarks](#) <sup>[2421]</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
Windows version	<p>This sensor requires <a href="#">at least Windows Server 2008 R2</a> on the probe system to work with Windows performance counters.</p> <p><b>i</b> WoW64 must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.</p> <p><b>i</b> This sensor requires at least Windows Server 2008 R2 or Windows 7 to monitor 64-bit counters of the class <a href="#">Network Adapter</a> (virtual network interfaces). On older target systems, the sensor can only monitor 32-bit counters of the class <a href="#">Network Interface</a> (the physical interface) and shows fewer channels.</p>
Remote Registry Windows service	<p>This sensor requires that the <a href="#">Remote Registry</a> Windows service runs on the target system.</p> <p><b>i</b> If this service does not run, a connection via performance counters is not possible. However, WMI connections might still work.</p> <p><b>i</b> To enable the service, log in to the respective system and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p>
WoW64	This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
Credentials	<p>This sensor requires credentials for Windows systems.</p> <p><b>i</b> We recommend that you use Windows domain credentials. If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target system.</p> <p>Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.</p>
Teamed network adapters	This sensor supports teamed network adapters ("network interface card (NIC) teaming") on Windows Server 2016.

Remark	Description
IPv6	This sensor supports IPv6.
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Hybrid Approach: Performance Counters and WMI

**i** By default, this sensor uses WMI to request monitoring data. You can change the default behavior to a [hybrid approach](#) in the Windows Compatibility Options of the parent [device's settings](#) on which you create this sensor: if you choose this option, the sensor first tries to query data via [Windows performance counters](#) and uses WMI as a fallback if performance counters are not available. When running in fallback mode, the sensor tries to connect via performance counters again after 24 hours.

**i** Sensors that use the WMI protocol have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.

**i** For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#).

This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> <li><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> <li>▪ Show in and out traffic as positive and negative area graph: Show channels for incoming and outgoing traffic as positive and negative area graph. This visualizes your traffic in a clear way. <ul style="list-style-type: none"> <li><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the channel settings). Manual scaling is not possible if you choose this option.</li> <li><b>i</b> You cannot show a positive/negative graph for a channel if you choose to display its data in percent of maximum (available in the channel settings).</li> </ul> </li> </ul>
Stack Unit	<p><b>This setting is only visible if you select Stack channels on top of each other above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Discards In	The number of incoming discards
Discards Out	The number of outgoing discards
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Errors In	The number of incoming errors
Errors Out	The number of outgoing errors
Non-Unicast In	The number of incoming non-unicast packets
Non-Unicast Out	The number of outgoing non-unicast packets
Packets	The total number of packets
Packets Received	The number of packets received
Packets Sent	The number of packets sent
Total	The total traffic <b>i</b> This channel is the primary channel by default.
Traffic In	The incoming traffic
Traffic Out	The outgoing traffic
Unicast In	The number of incoming unicast packets
Unicast Out	The number of outgoing unicast packets
Unknown Protocols In	The number of unknown protocols

## 7.8.274 Windows Pagefile Sensor

The Windows Pagefile sensor monitors the Windows pagefile usage via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#) of the parent device.

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: Windows Wisselbestand
- French: Windows fichier d'échange
- German: Windows Auslagerungsdatei
- Japanese: Windows ページファイル
- Portuguese: Arquivo de Paginação (Pagefile) Windows
- Russian: Файл подкачки Windows
- Simplified Chinese: Windows 页面文件
- Spanish: Archivo de página Windows

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
Windows version	<p>This sensor requires <a href="#">at least Windows Server 2008 R2</a> on the probe system (on every cluster node, if on a cluster probe).</p> <ul style="list-style-type: none"> <li> <b>WoW64</b> must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.</li> <li> This sensor does not work with Windows 2000 because the respective WMI class does not exist on this operating system.</li> </ul>
Remote Registry Windows service	<p>This sensor requires that the <a href="#">Remote Registry</a> Windows service runs on the target system.</p> <ul style="list-style-type: none"> <li> If this service does not run, a connection via performance counters is not possible. However, WMI connections might still work.</li> <li> To enable the service, log in to the respective system and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</li> </ul>
WoW64	This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
Credentials	<p>This sensor requires credentials for Windows systems.</p> <ul style="list-style-type: none"> <li> We recommend that you use Windows domain credentials. If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target system.</li> </ul> <p>Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.</p>
IPv6	This sensor supports IPv6.
Limits	This sensor has predefined <a href="#">limits</a> for several metrics.
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Hybrid Approach: Performance Counters and WMI

**i** By default, this sensor uses WMI to request monitoring data. You can change the default behavior to a [hybrid approach](#) in the Windows Compatibility Options of the parent [device's settings](#) on which you create this sensor: if you choose this option, the sensor first tries to query data via [Windows performance counters](#) and uses WMI as a fallback if performance counters are not available. When running in fallback mode, the sensor tries to connect via performance counters again after 24 hours.

**i** Sensors that use the WMI protocol have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.

**i** For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#).

## Remarks

Consider the following [remarks](#)<sup>[2433]</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <b>high</b> performance impact. We recommend that you use no more than <b>200</b> of this sensor on each probe.
Windows version	This sensor requires <b>at least Windows Server 2008 R2</b> on the probe system (on every cluster node, if on a cluster probe).   WoW64 must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.
Remote Registry Windows service	This sensor requires that the <b>Remote Registry</b> Windows service runs on the target system.   If this service does not run, a connection via performance counters is not possible. However, WMI connections might still work.   To enable the service, log in to the respective system and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.
WoW64	This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
Credentials	This sensor requires credentials for Windows systems.   We recommend that you use Windows domain credentials. If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target system.  Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.
IPv6	This sensor supports IPv6.
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Hybrid Approach: Performance Counters and WMI

- i** By default, this sensor uses WMI to request monitoring data. You can change the default behavior to a [hybrid approach](#) in the Windows Compatibility Options of the parent [device's settings](#) on which you create this sensor: if you choose this option, the sensor first tries to query data via [Windows performance counters](#) and uses WMI as a fallback if performance counters are not available. When running in fallback mode, the sensor tries to connect via performance counters again after 24 hours.
- i** Sensors that use the WMI protocol have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.
- i** For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Avg. Bytes Per Read	The average number of bytes per read
Avg. Bytes Per Transfer	The average number of bytes per transfer
Avg. Bytes Per Write	The average number of bytes per write
Avg. Queue	The average number of items in the queue
Avg. Read Queue	The average number of items in the read queue
Avg. Read Time	The average read time

Channel	Description
Avg. Transfer Time	The average transfer time
Avg. Write Queue	The average number of items in the write queue
Avg. Write Time	The average write time
Current Queue	The current number of items in the queue
Disk IOs	The number of disk I/O operations
Disk Read	The disk read speed
Disk Read IOs	The number of disk read I/O operations
Disk Read Time %	The disk read time (%) <b>i</b> This channel is the primary channel by default.
Disk Time %	The disk time (%)
Disk Transfer	The disk transfer speed
Disk Write	The disk write speed
Disk Write IOs	The number of disk write I/O operations
Disk Write Time %	The disk write time (%)
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Idle Time %	The idle time (%)
Split IOs	The number of split I/O operations

## 7.8.276 Windows Print Queue Sensor

The Windows Print Queue sensor reads the print queue on the parent device and returns the number of jobs in the print queue. It can monitor queues for all printers that are locally installed.

- ❶ You can use this sensor to monitor all print queues on your Windows print server and to retrieve information about all available jobs that are in the queue longer than defined.
- ❷ Additionally, this sensor can change to a defined status if there is a printer problem. See section [Sensor Settings](#) <sup>[2441]</sup> for available parameters.

Windows Print Queue Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) <sup>[2448]</sup>.

### Sensor in Other Languages

- Dutch: Windows Print Queue
- French: Windows file d'attente d'impression
- German: Windows Druckwarteschlange
- Japanese: Windows プリントキュー
- Portuguese: Fila de impressão Windows
- Russian: Очередь печати Windows
- Simplified Chinese: Windows 打印队列
- Spanish: Cola de impresión Windows

### Remarks

Consider the following [remarks](#) <sup>[2439]</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
Print Spooler Windows service	This sensor requires that the <a href="#">Print Spooler</a> Windows service runs on the target device and the probe system.   To enable the service, log in to the respective system and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.
.NET 4.7.2 or later	This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node. If the sensor shows the error PE087, additionally install .NET 3.5 on the probe system.   If the framework is missing, you cannot create this sensor.   For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a>
Windows Server	We recommend Windows Server 2016 on the probe system for best performance of this sensor.
Credentials	This sensor requires credentials for Windows systems.   We recommend that you use Windows domain credentials. If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target system.  Otherwise, the sensor cannot correctly connect.
IPv6	This sensor supports IPv6.
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

 You can add a [change trigger](#) to this sensor to get a notification when the number of jobs in the queue changes.

### Sensor Display

**Sensor Display**

**Primary Channel** ⓘ Downtime

---

**Graph Type** ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status

Channel	Description
Execution Time	The execution time
Jobs	The number of jobs in the queue  This channel is the primary channel by default.

## 7.8.277 Windows Process Sensor

The Windows Process sensor monitors a Windows process via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#) of the parent device.

Windows Process Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: Windows Proces
- French: Windows processus
- German: Windows Prozess
- Japanese: Windows プロセス
- Portuguese: Processo Windows
- Russian: Процесс Windows
- Simplified Chinese: Windows 进程
- Spanish: Proceso Windows

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
Windows version	This sensor requires <a href="#">at least Windows Server 2008 R2</a> on the probe system (on every cluster node, if on a cluster probe).   <b>WoW64</b> must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.
Remote Registry Windows service	This sensor requires that the <a href="#">Remote Registry</a> Windows service runs on the target system.   If this service does not run, a connection via performance counters is not possible. However, WMI connections might still work.   To enable the service, log in to the respective system and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.
WoW64	This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
Credentials	This sensor requires credentials for Windows systems.   We recommend that you use Windows domain credentials. If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target system.  Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.
Performance counters	The sensor cannot show values above 4 GB for 64-bit processes if you use performance counters.
IPv6	This sensor supports IPv6.
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Hybrid Approach: Performance Counters and WMI

**i** By default, this sensor uses WMI to request monitoring data. You can change the default behavior to a [hybrid approach](#) in the Windows Compatibility Options of the parent [device's settings](#) on which you create this sensor: if you choose this option, the sensor first tries to query data via [Windows performance counters](#) and uses WMI as a fallback if performance counters are not available. When running in fallback mode, the sensor tries to connect via performance counters again after 24 hours.

**i** Sensors that use the WMI protocol have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.

**i** For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#).

## Basic Sensor Settings

The screenshot shows the 'Basic Sensor Settings' configuration window. It includes the following elements:

- Sensor Name:** A text input field containing 'Example Name'.
- Tags:** A list of tags with 'exampletag' currently selected. There are 'x' and '+' icons for removing and adding tags.
- Priority:** A star rating system showing 5 stars.

Basic Sensor Settings

The sensor has the following [default tags](#) that are automatically predefined in the sensor's settings when you add the sensor:

- wmiprocesssensor

**■** For more information about basic sensor settings, see section [Sensor Settings](#) <sup>667</sup>.

## Windows Process Monitor

The screenshot shows the 'Windows Process Monitor' configuration window. It includes the following element:

- Executable:** A text input field containing 'firefox'.

Windows Process Monitor

Setting	Description
Executable	<p>Enter the name of the process that you want to monitor. Provide the name of an executable file without the <code>.exe</code> extension (for example, enter <a href="#">firefox</a> to monitor <code>firefox.exe</code>).</p> <p><b>i</b> The sensor shows the Down <a href="#">status</a> if the process is not active on the target device.</p>

## Debug Options

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
CPU Usage (Average per Instance)	<p>The average CPU usage (%) (if multiple instances are running)</p> <p> For this value, the summed up CPU usage value is divided by the number of all instances. It shows the average CPU usage of a single instance of the process on one CPU.</p>
CPU Usage (Total)	<p>The total CPU usage (%)</p> <p> For this value of a process, all CPU usage values are summed up. The total is divided by the number of all CPUs and the maximum value is <b>100%</b>. This corresponds to the CPU usage of all instances of this specific process.</p>

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Handles	The number of handles
Instances	The number of instances
Private Bytes	The private bytes
Threads	The number of threads
Working Set	The working set  This channel is the primary channel by default.

Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
System Uptime	The uptime  This channel is the primary channel by default.

- <https://kb.paessler.com/en/topic/47263>

## 7.8.281 Windows Updates Status (PowerShell) Sensor

The Windows Updates Status (PowerShell) sensor monitors the status of Windows updates on a computer and counts the available and installed Windows updates that are either from Microsoft or from the local Windows Server Update Services (WSUS) server.

- ❶ You can find the updates that the sensor considers in the [Server Manager \(WSUS\)](#) under Roles | Windows Server Update Services | Update Services | Computers | Reports.

Windows Updates Status (PowerShell) Sensor

- For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[2474]</sup>.

### Sensor in Other Languages

- Dutch: Windows Updates Status (PowerShell)

- French: Windows statut des mises à jour (PowerShell)
- German: Windows Updates Status (PowerShell)
- Japanese: Windows アップデートステータス( PowerShell)
- Portuguese: Status de atualizações do Windows (PowerShell)
- Russian: Статус обновления Windows (PowerShell)
- Simplified Chinese: Windows 更新状态 (PowerShell)
- Spanish: Estado de actualizaciones Windows (PowerShell)

## Remarks

Consider the following [remarks](#)<sup>2470</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a very high performance impact. We recommend that you use no more than <b>50</b> of this sensor on each probe.
Remote PowerShell	<p>This sensor requires that <a href="#">Remote PowerShell</a> is enabled on the target system and <a href="#">PowerShell 3.0</a> on both the probe system and the target system.</p> <p><b>i</b> Also make sure that you have at least <a href="#">PowerShell 3.0</a> installed on both the probe system and the target system. If you receive an error message regarding issues with the WinRM connection, make sure that remote commands have been enabled in PowerShell. For more information, see the Knowledge Base: <a href="#">How do I enable and use remote commands in Windows PowerShell?</a></p>
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node.</p> <p><b>i</b> If the framework is missing, you cannot create this sensor.</p> <p><b>■</b> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
Credentials	This sensor requires credentials for Windows systems.
Scanning interval	<p>This sensor has a fixed minimum scanning interval for performance reasons. You cannot use a shorter scanning interval. Consequently, shorter scanning intervals in the <a href="#">Monitoring</a> settings are not available for this sensor.</p> <ul style="list-style-type: none"> <li>▪ The minimum scanning interval of this sensor is <b>1 hour</b>.</li> <li>▪ The recommended scanning interval of this sensor is <b>12 hours</b>. We recommend this scanning interval to limit the load on the server that this sensor monitors.</li> </ul>

Remark	Description
IPv6	This sensor supports IPv6.
Limits	This sensor has predefined <a href="#">limits</a> for several metrics.
Initial data	In certain cases, it might take some time until the sensor receives data for the first time.
Time Since Last Update channel	If the sensor cannot determine any values for the Time Since Last Update channel (for example, because the list of updates is empty), it shows the value <b>-1s</b> and changes to the Warning <a href="#">status</a> .
Roaming Profiles	When monitoring a <a href="#">Remote Desktop Server (RDS) system</a> with the option Roaming Profiles enabled, this sensor creates a temporary user profile folder for each scanning interval. To minimize this effect, we recommend that you set the sensor's scanning interval to at least 7 days.
Severity	This sensor displays the severity member <a href="#">Unspecified</a> as <b>None</b> . If the severity member is missing, this sensor displays it as <b>None</b> .
Knowledge Base	Knowledge Base: <a href="#">Where can I find more information about PowerShell sensors?</a>
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## 7.8.282 WMI Battery Sensor

The WMI Battery sensor monitors the available capacity and the state of connected batteries or uninterruptible power supplies (UPSs) of a Windows-based device via Windows Management Instrumentation (WMI).

WMI Battery Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: WMI batterij
- French: Batterie (WMI)
- German: WMI Batterie
- Japanese: WMI バッテリー
- Portuguese: Bateria (WMI)
- Russian: Аккумулятор WMI
- Simplified Chinese: WMI 电池
- Spanish: Batería (WMI)

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. Stay below 200 WMI sensors per <a href="#">probe</a> . Above this number, consider using multiple <a href="#">remote probes</a> for load balancing.
WoW64	This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
Credentials	This sensor requires credentials for Windows systems.
IPv6	This sensor supports IPv6.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Limits	This sensor has predefined <a href="#">limits</a> for several metrics.
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

 Store result

Custom Query Specific

Setting	Description
Namespace	Enter the WMI namespace for the query. .
WQL File	Select a .wql file. The sensor executes it with every scanning interval.

Setting	Description
	<p>The list contains WQL scripts that are available in the \Custom Sensors\WMI WQL scripts subfolder of the <a href="#">PRTG program directory</a> on the probe system. Store your script there. If used on a cluster probe, you must store the file on all cluster nodes.</p> <p><b>i</b> If the WQL query returns integers or floats, use the <a href="#">WMI Custom</a> <small>2482</small> sensor to not only show the returned value in the sensor message, but to also monitor the value in a channel.</p> <p><b>i</b> You cannot change this value after sensor creation.</p>
Placeholder <#PH1>	In your WQL script, you can use up to three placeholders to which you can assign a value in this field. Enter a string for variable <#PH1> or leave the field empty.
Placeholder <#PH2>	In your WQL script, you can use up to three placeholders to which you can assign a value in this field. Enter a string for variable <#PH2> or leave the field empty.
Placeholder <#PH3>	In your WQL script, you can use up to three placeholders to which you can assign a value in this field. Enter a string for variable <#PH3> or leave the field empty.
Unit String	Enter a unit for the data that the sensor receives from your script. This is for display purposes only. The unit is displayed in graphs and tables. Enter a string.
If Value Changes	<p>Define what the sensor does when its value changes:</p> <ul style="list-style-type: none"> <li>▪ Ignore (default): Do nothing.</li> <li>▪ Trigger 'change' notification: Send an internal message that indicates a change. <ul style="list-style-type: none"> <li><b>i</b> In combination with a <a href="#">change trigger</a>, you can use this to <a href="#">trigger a notification</a> if a change occurs.</li> </ul> </li> </ul>
Response Must Include (Down Status if Not Included)	<p>Define the search string that must be part of the data that is received from the WMI object. You can enter a simple string in plain text or a <a href="#">regular expression</a>.</p> <p><b>i</b> The search string must be case-sensitive.</p> <p><b>i</b> If the data does <b>not</b> include the search pattern, the sensor shows the Down status.</p>
Response Must Not Include (Down Status if Included)	<p>Define the search string that must <b>not</b> be part of the data that is received from the WMI object. You can enter a simple string in plain text or a regular expression.</p>

Setting	Description
	<ul style="list-style-type: none"> <li> The search string must be case-sensitive.</li> <li> If the data does include the search pattern, the sensor shows the Down status.</li> </ul>
Search Method	<p>Define the method with which you want to provide the search string:</p> <ul style="list-style-type: none"> <li>▪ Simple string search (default): Search for a simple string in plain text.</li> </ul> <p> The characters <code>*</code> and <code>?</code> work as placeholders. <code>*</code> stands for no number or any number of characters and <code>?</code> stands for exactly one character. You cannot change this behavior. The literal search for these characters is only possible with a regex.</p> <ul style="list-style-type: none"> <li>▪ Regular expression: Search with a regular expression (regex).</li> </ul> <p> PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more information, see section <a href="#">Regular Expressions</a>.</p>
Maximum String Length	<p>Define the maximum allowed length of the string that is received from the WMI object. If it is longer than this value, the sensor shows the Down status. Enter an integer or leave the field empty.</p>
Numeric Value Extraction	<p>Define if you want to filter out a numeric value from the string received from the WMI object:</p> <ul style="list-style-type: none"> <li>▪ Do not use extraction (default): Do not extract a float value. Use the result as a string value.</li> <li>▪ Use a regular expression for extraction: Use a regex to identify a numeric value in the string and convert it to a float value. Define below. <ul style="list-style-type: none"> <li> See also the <a href="#">example</a> <sup>2494</sup>.</li> </ul> </li> </ul> <p> You can convert this into a float value to use it with <a href="#">channel limits</a>.</p>
Regular Expression	<p><b>This setting is only visible if you select</b> Use a regular expression for extraction <a href="#">above</a>.</p> <p>Enter a regex to identify the numeric value you want to extract from the string returned by the WMI object. You can use capturing groups here.</p> <ul style="list-style-type: none"> <li> Make sure that the expression returns numbers only (including decimal and thousands separators). The result is further refined by the settings below.</li> <li> PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more information, see section <a href="#">Regular Expressions</a>.</li> </ul>

Setting	Description
Index of Capturing Group	<p><b>This setting is only visible if you select</b> Use a regular expression for extraction <a href="#">above</a>.</p> <p>If your regex uses capturing groups, specify which one captures the number. Enter an integer or leave the field empty.</p>
Decimal Separator	<p><b>This setting is only visible if you select</b> Use a regular expression for extraction <a href="#">above</a>.</p> <p>Define the character for the decimal separator of the number. Enter a string or leave the field empty.</p>
Thousands Separator	<p><b>This setting is only visible if you select</b> Use a regular expression for extraction <a href="#">above</a>.</p> <p>Define the character for the thousands separator of the number. Enter a string or leave the field empty.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> </ul> <p>Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</p> <p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p>

Setting	Description
	<p><b>i</b> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>Show channels independently (default): Show a graph for each channel.</li> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> <li><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Number Extraction with Regular Expression

 If you want to extract a number in the response string via a regex, note that the index for captures in this sensor is based on 1 (not on 0). Furthermore, capturing groups are not automatically created. The example below illustrates this issue.

Consider the following string as returned by a request for CPU usage:

```
5 Sec (3.49%), 1 Min (3.555%), 5 Min (3.90%)
```

Assuming you would like to filter for the number [3.555](#), this is the percentage in the second parentheses. Enter the following regex in the Regular Expression field:

```
(\d+\.\d+).*?(\d+\.\d+).*?(\d+\.\d+)
```

As Index of Capturing Group, enter [3](#). This extracts the desired number [3.555](#).

The index must be 3 in this case because the capturing groups here are the following:

- Group 1 contains [3.49%](#), [1 Min \(3.555\)](#), [5 Min \(3.90\)](#)

- Group 2 contains [3.49](#)
- Group 3 contains [3.555](#)
- Group 4 contains [3.90](#)

Keep this note about index and capturing groups in mind when using number extraction.

- ❗ It is not possible to match an empty string with the PRTG regex sensor search.
- ❗ PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more information, see section [Regular Expressions](#).

## Channel List

- ❗ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Response Time	The response time ❗ This channel is the primary channel by default.

The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status

Channel	Description
New Records	The number of new records  This channel is the primary channel by default.

## 7.8.287 WMI Exchange Server Sensor

The WMI Exchange Server sensor monitors a Microsoft Exchange Server as of version 2016 via Windows Management Instrumentation (WMI).

You might be able to monitor aspects regarding:

- SMTP Server: Queue Lengths
- MExchangeIS Mailbox: Queue Sizes, Delivery Times, Operations, Messages
- MExchangeIS Public: Queue Sizes, Delivery Times, Operations, Messages
- MExchangeIS: Packets, Operations, Clients, Latency, Requests, Users
- MExchange RPC Client Access: Active User Count, User Count, Connection Count
- MExchange OWA: Current Unique Users, Average Response Time

**i** Depending on your Exchange server version, not all counters might be available.

WMI Exchange Server Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: WMI Exchange Server
- French: Exchange serveur (WMI)
- German: WMI Exchange-Server
- Japanese: WMI Exchange サーバー
- Portuguese: Servidor Exchange (WMI)
- Russian: WMI Exchange Server

- Simplified Chinese: WMI Exchange 服务器
- Spanish: Servidor Exchange (WMI)

## Remarks

Consider the following [remarks](#)<sup>[2511]</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. Stay below 200 WMI sensors per <a href="#">probe</a> . Above this number, consider using multiple <a href="#">remote probes</a> for load balancing.
WoW64	This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
Credentials	This sensor requires credentials for Windows systems.
IPv6	This sensor supports IPv6.
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Active Mailbox Delivery Queue Length	The number of items in the active mailbox delivery queue
Active Non-SMTP Delivery Queue Length	The number of items in the non-SMTP delivery queue
Active Remote Delivery Queue Length	The number of items in the active remote delivery queue
Aggregate Delivery Queue Length (All Queues)	The number of items in the aggregate delivery queue (all queues)
Aggregate Shadow Queue Length	The number of items in the aggregate shadow queue
Categorizer Job Availability	The categorizer job availability
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Items Completed Delivery Per Second	The number of items with completed delivery
Items Completed Delivery Total	The number of items with completed delivery in total
Items Deleted By Admin Total	The number of items deleted by the admin in total

Channel	Description
Items Queued For Delivery Expired Total	The number of items expired queued for delivery in total
Items Queued for Delivery Per Second	The number of items queued for delivery
Items Queued For Delivery Total	The number of items queued for delivery in total
Items Resubmitted Total	The number of items resubmitted in total
Largest Delivery Queue Length	The largest number of items in the delivery queue
Messages Completed Delivery Per Second	The number of messages with completed delivery
Messages Completed Delivery Total	The number of messages with completed delivery in total
Messages Completing Categorization	The number of messages completing categorization
Messages Deferred Due To Local Loop	The number of messages deferred due to local loop
Messages Deferred During Categorization	The number of messages deferred during categorization
Messages Queued For Delivery	The number of messages queued for delivery
Messages Queued for Delivery Per Second	The number of messages queued for delivery per second
Messages Queued For Delivery Total	The number of messages queued for delivery in total
Messages Submitted Per Second	The number of messages submitted
Messages Submitted Total	The number of messages submitted in total

Channel	Description
Poison Queue Length	The number of items in the poison queue
Retry Mailbox Delivery Queue Length	The number of items in the retry mailbox delivery queue
Retry Non-SMTP Delivery Queue Length	The number of items in the retry non-SMTP delivery queue
Retry Remote Delivery Queue Length	The number of items in the retry remote delivery queue
Shadow Queue Auto Discards Total	The number of auto discards in the shadow queue in total
Submission Queue Items Expired Total	The number of items expired in the submission queue in total
Submission Queue Length	The number of items in the submission queue
Unreachable Queue Length	The number of items in the unreachable queue

Drive Selection

Setting	Description
Drives	The drives that this sensor monitors. This is either <a href="#">All</a> or a specific drive letter.

## Set Limits Checked for ALL Disks

In this section, you can set limits that are valid for all channels and all drives. By entering limits, you can define when the sensor shows the Warning or the Down [status](#), depending on the data provided by all drives that this sensor monitors. If you want to individually define limits for separate channels, use the limit settings in the [channel settings](#).

**i** All limits that you define here are valid in addition to the limits defined in the particular channel settings. The limits are valid simultaneously, so the first limit that is breached applies.

**Set Limits Checked For ALL Disks** Use the channel settings to set separate error limits or warning limits for each disk.

Percentage Limit Check ?  Only use the limits in the settings of the percentage channels  
 Use the limits of both the sensor and the channel settings (default)

Upper Error Limit ?

Upper Warning Limit ?

Lower Warning Limit ?

Lower Error Limit ?

Size Limit Check ?  Only use the limits in the settings of the byte size channels (default)  
 Use the limits of both the sensor and the channel settings

Alarm on Missing/Removed Disk ?  Deactivate alarm (default)  
 Activate alarm

Set Limits Checked for ALL Disks

Setting	Description
Percentage Limit Check	<p>By default, the sensor enables percentage limits with a lower warning limit and a lower error limit. Enable or disable a limit check for the free space in percentage channels of all drives:</p> <ul style="list-style-type: none"> <li>▪ Only use the limits in the settings of the percentage channels: Do not define sensor limits that are valid for all percentage channels. The sensor only uses the limits that you define in the settings of the particular "free space in percent" channels to determine the status.</li> <li>▪ Use the limits of both the sensor and the channel settings (default): Define sensor limits that are valid for all percentage channels. Additional fields appear below. The sensor shows the Warning or the Down status when free space limits are above or below the limits.</li> </ul>

Setting	Description
Upper Error Limit	<p><b>This setting is only visible if you select</b> Use the limits of both the sensor and the channel settings (default) <a href="#">above</a>.</p> <p>Specify an upper limit in percent for the Down status. If the free disk space of one of your drives exceeds this value, the sensor changes to the Down status. Enter an integer or leave the field empty.</p> <p> The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p>
Upper Warning Limit	<p><b>This setting is only visible if you select</b> Use the limits of both the sensor and the channel settings (default) <a href="#">above</a>.</p> <p>Specify an upper limit in percent for the Warning status. If the free disk space of one of your drives exceeds this value, the sensor changes to the Warning status. Enter an integer or leave the field empty.</p> <p> The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p>
Lower Warning Limit	<p><b>This setting is only visible if you select</b> Use the limits of both the sensor and the channel settings (default) <a href="#">above</a>.</p> <p>Specify a lower limit in percent for the Warning status. If the free disk space of one of your drives falls below this value, the sensor changes to the Warning status. Enter an integer or leave the field empty.</p> <p> The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p>
Lower Error Limit	<p>Specify a lower limit in percent for the Down status. If the free disk space of one of your drives falls below this value, the sensor changes to the Down status. Enter an integer or leave the field empty.</p> <p> The limits that you set here are valid for all channels of this sensor. You can additionally set individual limits for each channel in the channel settings. Both the limits that you set here and in the channel settings are valid simultaneously.</p>
Size Limit Check	<p>Enable or disable a limit check for the free bytes channels of all drives:</p>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Only use the limits in the settings of the byte size channels (default): Do not define sensor limits that are valid for all byte size channels. The sensor only uses limits that you define in the settings of the particular free space in bytes channels to determine the status.</li> <li>▪ Use the limits of both the sensor and the channel settings: Define limits for the sensor that are valid for all byte size channels. Additional fields appear below. The sensor shows the Warning or Down status when free space limits are above or below the value.</li> </ul> <p><b>i</b> By default, byte size limits are not enabled for drives.</p>
Upper Error Limit	<p><b>This setting is only visible if you select</b> Use the limits of both the sensor and the channel settings <a href="#">above</a>.</p> <p>Specify an upper limit. ## 7.8.291 WMI HDD Health Sensor

The WMI HDD Health sensor connects to the parent device via Windows Management Instrumentation (WMI) and monitors the health of integrated development environment (IDE) disk drives on the target system using Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.).

WMI HDD Health Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) [2539].

### Sensor in Other Languages

- Dutch: WMI HDD Status
- French: État du disque dur (WMI)
- German: WMI Laufwerkszustand
- Japanese: WMI HDD 正常性
- Portuguese: Funcionamento do HDD (WMI)
- Russian: Работоспособность жесткого диска WMI

- Simplified Chinese: WMI 硬盘健康状况
- Spanish: Salud HDD (WMI)

## Remarks

Consider the following [remarks](#) <sup>[2536]</sup> and requirements for this sensor:

Remark	Description
Windows version	This sensor requires at least Windows 7 on the target system that holds the hard disk drives you want to monitor. The sensor might not work reliably if the target system runs on Windows 2003, Windows XP, or Windows Vista. Because of a known bug in those systems, the sensor might not detect available hard disk drives.
WoW64	This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
Credentials	This sensor requires credentials for Windows systems.
IPv4	This sensor only supports IPv4.
Performance impact	This sensor has a <b>medium</b> performance impact.
Sensor values	The values that this sensor shows can vary depending on how a vendor handles S.M.A.R.T. values. See the respective vendor's documentation for more information.
Add Sensor dialog	The items in the list in the Add Sensor dialog are specific to the parent device.
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Setting	Description
	Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

The channel names indicate the ID of the S.M.A.R.T. attribute, followed by a colon, and the typical meaning of the channel. The sensor can also show other attributes that the target device returns, but some channels have the name Unknown Channel. This happens if PRTG cannot match the ID of a found attribute with an internally defined channel name.

 Some vendors do not agree on attribute definitions and define meanings other than the common ones.

Every attribute of a disk assumes a value. PRTG shows these attributes as channels with their last, minimum, and maximum value. These channel values change over time and indicate the disk health. Higher values correspond to a better health. The disk's attributes come with a threshold, defined by the manufacturer of the drive. If a channel value is lower than this threshold, the sensor automatically shows the Warning [status](#). This indicates that the S.M.A.R.T. status of the HDD might break soon.

 For some attributes, there are no thresholds defined and because of this, they cannot be categorized for a status other than the Up status. You can define [lookups](#) and use them with affected channels to get the desired status for a return value.

Channel	Description
Average Erase Count And Maximum Erase Count	The average erase count and the maximum erase count
Command Timeout	The command timeout count

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Erase Fail Count	The erase fail count
G-Sense Error Rate	The G-sense error rate count
Hardware ECC Recovered	The hardware ECC recovered count
Power Cycle Count	The power cycle count
Power Loss Protection Failure	The power loss protection failure count
Power-On Hours	The power-on hours count
Program Fail Count Total	The program fail count total
Read Error Rate	The read error rate count  This channel is the primary channel by default.
Read Error Retry Rate	The read error retry rate count
Reallocated Sectors Count	The reallocated sectors count
Reported Uncorrectable Errors	The reported uncorrectable errors count
SATA Downshift Error Count	The SATA downshift error count
Soft ECC Correction	The soft ECC correction count
Soft Read Error Rate	The soft read error rate count
SSD Erase Fail Count	The SSD erase fail count
SSD Life Left	The SSD life left count

Channel	Description
SSD Program Fail Count	The SSD program fail count
Unexpected Power Loss Count	The unexpected power loss count
Unknown Channel	PRTG cannot match the ID of a found attribute with an internally defined channel name
Unused Reserved Block Count Total	The total unused reserved block count
Used Reserved Block Count Total	The total used reserved block count
Temperature Celsius	The temperature
Total LBAs Read	The total LBAs read
Total LBAs Written	The total LBAs written
Wear Range Delta	The wear range delta

## 7.8.292 WMI Logical Disk I/O Sensor

The WMI Logical Disk I/O sensor monitors the disk usage of a logical disk or mount point on a Windows system via Windows Management Instrumentation (WMI).

**i** The sensor shows performance data of counters that monitor logical partitions of a hard drive. The system monitor identifies logical disk instances by their identifier, such as C:, and the sensor reads the logical disk object in the system monitor and returns the values.

WMI Logical Disk I/O Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

## 7.8.294 WMI Microsoft SQL Server 2005 Sensor (Deprecated)

### Important Notice

This sensor is deprecated.

Monitoring of Microsoft SQL Server 2005 using PRTG is discontinued. Microsoft SQL Server 2005 cannot be monitored with PRTG anymore with the latest updates of SQL Server 2005. The reason for this is a software update delivered by Microsoft in August 2012. The following updates cause this issue:

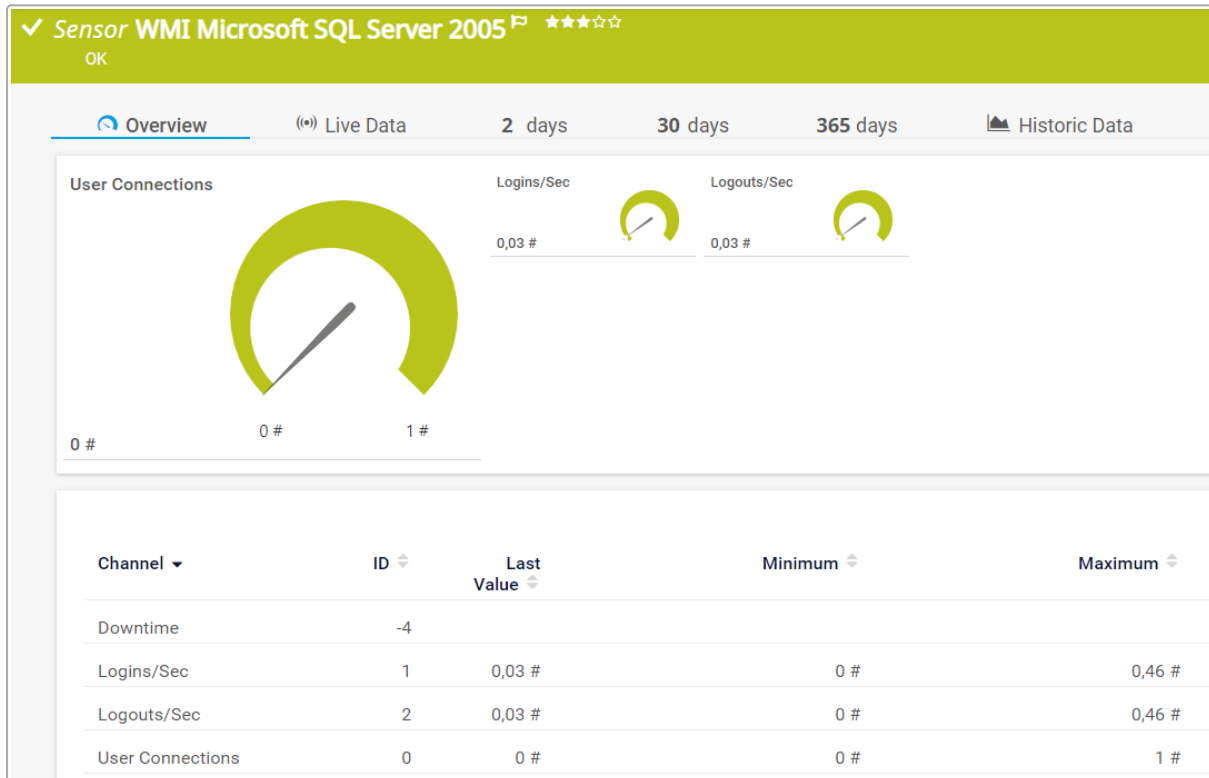

- Security Update for SQL Server 2005 Service Pack 4 (KB2716429)
- Security Update for SQL Server 2005 Service Pack 4 (KB2716427)

We have made reasonable effort to fix this from our side but we were unable to do so. We do not have instructions to circumvent this issue at this time. Please ask the vendor to fix this.

### More

Knowledge Base: [Why does my WMI Microsoft SQL Server 2005 sensor not work anymore?](#)

The WMI Microsoft SQL Server 2005 sensor monitors the performance of a Microsoft SQL Server via Windows Management Instrumentation (WMI).

SQL Server Settings

Setting	Description
Service	The service that this sensor monitors. <span style="font-size: 1.2em;">ⓘ</span> The service name is provided as returned by the SQL server.
Name	The name of the server instance that this sensor monitors. <span style="font-size: 1.2em;">ⓘ</span> The display name is provided as returned by the SQL server.
Naming Method	Select whether PRTG automatically selects the name of the WMI class used for monitoring:

Setting	Description
	<ul style="list-style-type: none"> <li>Automatically determine the WMI class name (default): Automatically select WMI class. We recommend this setting.</li> <li>Manually enter the WMI class name: Manually enter a WMI class name. Select this option if your server instance returns an error code in automatic mode.</li> </ul>
WMI Class	<p><b>This setting is only visible if you select</b> Manually enter the WMI class name <a href="#">above</a>.</p> <p>Enter the WMI class name that the sensor uses to monitor the server instance.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>Discard result (default): Do not store the sensor result.</li> <li>Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## SQL Counter Specific

SQL Counter Specific

Performance Counters i
General Statistics

SQL Counter Specific

Setting	Description
Performance Counters	<p>You see a list of different groups of performance counters that the sensor can monitor for the instances that you selected above. Every sensor that PRTG creates for the server instances monitors the performance counters you select here.</p> <ul style="list-style-type: none"> <li>General Statistics: Read general performance counters. This shows the number of user connections and the number of logins and logouts per second.</li> <li>Access Methods: Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second).</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ <b>Buffer Manager:</b> Read buffer manager counters. This shows the buffer cache hit ratio in percent and the number of database pages and stolen pages.</li> <li>▪ <b>Memory Manager:</b> Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb).</li> <li>▪ <b>Locks:</b> Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time.</li> <li>▪ <b>SQL Statistics:</b> Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second).</li> </ul> <p>Depending on your selection, PRTG creates a sensor with the specified channels.</p> <p><b>i</b> To monitor more than one of the listed groups of performance counters, add the sensor several times for the respective instances.</p> <p><b>i</b> After sensor creation, this setting shows the performance counter that this sensor monitors.</p>

## Sensor Display

**Sensor Display**

**Primary Channel** ⓘ Downtime

---

**Graph Type** ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking ⓘ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ <b>Show channels independently (default):</b> Show a graph for each channel.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.                             <ul style="list-style-type: none"> <li> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Average Wait Time	The average amount of wait time for each lock request that resulted in a wait
Batch Requests/Sec	The number of Transact-SQL command batches received. This statistic is affected by all constraints (such as input/output, number of users, cache size, or complexity of requests). High batch requests mean good throughput.
Buffer Cache Hit Ratio	The percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little.

Channel	Description
	Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.
Connection Memory (KB)	The total amount of dynamic memory the server is using for maintaining connections
Database Pages	The number of pages in the buffer pool with database content
Number of Deadlocks/Sec	The number of lock requests that resulted in a deadlock
Full Scans/Sec	The number of unrestricted full scans. These can be either base-table or full-index scans.
Lock Requests/Sec	The number of new locks and lock conversions requested from the lock manager
Logins/Sec	The total number of logins started
Logouts/Sec	The total number of logout operations started
Optimizer Memory (KB)	The total amount of dynamic memory the server is using for query optimization
Page Life Expectancy	The number of seconds a page stays in the buffer pool without references
Page Splits/Sec	The number of page splits that occur as the result of overflowing index pages
SQL Cache Memory (KB)	The total amount of dynamic memory the server is using for the dynamic SQL cache
SQL Compilations/Sec	The number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles because of recompiles. After the SQL Server user activity is stable, this value reaches a steady state.
SQL Recompilations/Sec	The number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.
Stolen Pages	The number of pages used for miscellaneous server purposes (including procedure cache)

Channel	Description
Table Lock Escalations/Sec	The number of times that locks on a table were escalated
Target Server Memory (KB)	The total amount of dynamic memory the server can consume
Total Server Memory (KB)	The total amount of dynamic memory that the server is using
User Connections	The number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.

SQL Server Settings

Setting	Description
Service	The service that this sensor monitors. ⓘ The service name is provided as returned by the SQL server.
Name	The name of the server instance that this sensor monitors. ⓘ The display name is provided as returned by the SQL server.
Naming Method	Select whether PRTG automatically selects the name of the WMI class used for monitoring: <ul style="list-style-type: none"> <li>▪ Automatically determine the WMI class name (default): Automatically select WMI class. We recommend this setting.</li> <li>▪ Manually enter the WMI class name: Manually enter a WMI class name. Select this option if your server instance returns an error code in automatic mode.</li> </ul>
WMI Class	<b>This setting is only visible if you select Manually enter the WMI class name above.</b>  Enter the WMI class name that the sensor uses to monitor the server instance.
Result Handling	Define what PRTG does with the sensor result: <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul>

Setting	Description
	<p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

### SQL Counter Specific

**SQL Counter Specific** Performance Counters **i** *General Statistics*

SQL Counter Specific

Setting	Description
Performance Counters	<p>You see a list of different groups of performance counters that the sensor can monitor for the instances that you selected above. Every sensor that PRTG creates for the server instances monitors the performance counters you select here.</p> <ul style="list-style-type: none"> <li>▪ <b>General Statistics:</b> Read general performance counters. This shows the number of user connections and the number of logins and logouts per second.</li> <li>▪ <b>Access Methods:</b> Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second).</li> <li>▪ <b>Buffer Manager:</b> Read buffer manager counters. This shows the buffer cache hit ratio in percent and the number of database pages and stolen pages.</li> <li>▪ <b>Memory Manager:</b> Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb).</li> <li>▪ <b>Locks:</b> Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time.</li> <li>▪ <b>SQL Statistics:</b> Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second).</li> </ul> <p>Depending on your selection, PRTG creates a sensor with the specified channels.</p> <p><b>i</b> To monitor more than one of the listed groups of performance counters, add the sensor several times for the respective instances.</p> <p><b>i</b> After sensor creation, this setting shows the performance counter that this sensor monitors.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Average Wait Time	The average amount of wait time for each lock request that resulted in a wait
Batch Requests/Sec	The number of Transact-SQL command batches received. This statistic is affected by all constraints (such as input/output, number of users, cache size, or complexity of requests). High batch requests mean good throughput.
Buffer Cache Hit Ratio	<p>The percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little.</p> <p>Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.</p>
Connection Memory (KB)	The total amount of dynamic memory the server is using for maintaining connections
Database Pages	The number of pages in the buffer pool with database content
Number of Deadlocks/Sec	The number of lock requests that resulted in a deadlock
Full Scans/Sec	The number of unrestricted full scans. These can be either base-table or full-index scans.
Lock Requests/Sec	The number of new locks and lock conversions requested from the lock manager
Logins/Sec	The total number of logins started
Logouts/Sec	The total number of logout operations started
Optimizer Memory (KB)	The total amount of dynamic memory the server is using for query optimization
Page Life Expectancy	The number of seconds a page stays in the buffer pool without references
Page Splits/Sec	The number of page splits that occur as the result of overflowing index pages

Channel	Description
SQL Cache Memory (KB)	The total amount of dynamic memory the server is using for the dynamic SQL cache
SQL Compilations/Sec	The number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles because of recompiles. After the SQL Server user activity is stable, this value reaches a steady state.
SQL Recompilations/Sec	The number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.
Stolen Pages	The number of pages used for miscellaneous server purposes (including procedure cache)
Table Lock Escalations/Sec	The number of times that locks on a table were escalated
Target Server Memory (KB)	The total amount of dynamic memory the server can consume
Total Server Memory (KB)	The total amount of dynamic memory that the server is using
User Connections	The number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.

## 7.8.298 WMI Microsoft SQL Server 2016 Sensor

The WMI Microsoft SQL Server 2016 sensor monitors the performance of a Microsoft SQL Server via Windows Management Instrumentation (WMI).

WMI Microsoft SQL Server 2016 Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[2587]</sup>.

### Sensor in Other Languages

- Dutch: WMI Microsoft SQL Server 2016
- French: Microsoft SQL serveur 2016 (WMI)
- German: WMI Microsoft SQL Server 2016
- Japanese: WMI Microsoft SQL Server 2016
- Portuguese: Microsoft SQL Server 2016 (WMI)
- Russian: WMI Microsoft SQL Server 2016
- Simplified Chinese: WMI Microsoft SQL Server 2016
- Spanish: Microsoft SQL Server 2016 (WMI)

### Remarks

Consider the following [remarks](#)<sup>[2582]</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. Stay below 200 WMI sensors per <a href="#">probe</a> . Above this number, consider using multiple <a href="#">remote probes</a> for load balancing.
WoW64	This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
Credentials	This sensor requires credentials for Windows systems.
Target system	You can only add this sensor to a target system that runs a Microsoft SQL database.
IPv6	This sensor supports IPv6.
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

### Basic Sensor Settings

Naming Method	Select whether PRTG automatically selects the name of the WMI class used for monitoring: <ul style="list-style-type: none"> <li>▪ Automatically determine the WMI class name (default): Automatically select WMI class. We recommend this setting.</li> <li>▪ Manually enter the WMI class name: Manually enter a WMI class name. Select this option if your server instance returns an error code in automatic mode.</li> </ul>
WMI Class	<b>This setting is only visible if you select Manually enter the WMI class name above.</b>  Enter the WMI class name that the sensor uses to monitor the server instance.
Result Handling	Define what PRTG does with the sensor result: <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul>

Setting	Description
	<p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

### SQL Counter Specific

**SQL Counter Specific** Performance Counters **i** *General Statistics*

SQL Counter Specific

Setting	Description
Performance Counters	<p>You see a list of different groups of performance counters that the sensor can monitor for the instances that you selected above. Every sensor that PRTG creates for the server instances monitors the performance counters you select here.</p> <ul style="list-style-type: none"> <li>▪ <b>General Statistics:</b> Read general performance counters. This shows the number of user connections and the number of logins and logouts per second.</li> <li>▪ <b>Access Methods:</b> Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second).</li> <li>▪ <b>Buffer Manager:</b> Read buffer manager counters. This shows the buffer cache hit ratio in percent and the number of database pages and stolen pages.</li> <li>▪ <b>Memory Manager:</b> Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb).</li> <li>▪ <b>Locks:</b> Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time.</li> <li>▪ <b>SQL Statistics:</b> Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second).</li> </ul> <p>Depending on your selection, PRTG creates a sensor with the specified channels.</p> <p><b>i</b> To monitor more than one of the listed groups of performance counters, add the sensor several times for the respective instances.</p> <p><b>i</b> After sensor creation, this setting shows the performance counter that this sensor monitors.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Average Wait Time	The average amount of wait time for each lock request that resulted in a wait
Batch Requests/Sec	The number of Transact-SQL command batches received. This statistic is affected by all constraints (such as input/output, number of users, cache size, or complexity of requests). High batch requests mean good throughput.
Buffer Cache Hit Ratio	<p>The percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little.</p> <p>Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.</p>
Connection Memory (KB)	The total amount of dynamic memory the server is using for maintaining connections
Database Pages	The number of pages in the buffer pool with database content
Number of Deadlocks/Sec	The number of lock requests that resulted in a deadlock
Full Scans/Sec	The number of unrestricted full scans. These can be either base-table or full-index scans.
Lock Requests/Sec	The number of new locks and lock conversions requested from the lock manager
Logins/Sec	The total number of logins started
Logouts/Sec	The total number of logout operations started
Optimizer Memory (KB)	The total amount of dynamic memory the server is using for query optimization
Page Life Expectancy	The number of seconds a page stays in the buffer pool without references
Page Splits/Sec	The number of page splits that occur as the result of overflowing index pages

Channel	Description
SQL Cache Memory (KB)	The total amount of dynamic memory the server is using for the dynamic SQL cache
SQL Compilations/Sec	The number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles because of recompiles. After the SQL Server user activity is stable, this value reaches a steady state.
SQL Recompilations/Sec	The number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.
Stolen Pages	The number of pages used for miscellaneous server purposes (including procedure cache)
Table Lock Escalations/Sec	The number of times that locks on a table were escalated
Target Server Memory (KB)	The total amount of dynamic memory the server can consume
Total Server Memory (KB)	The total amount of dynamic memory that the server is using
User Connections	The number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.

## 7.8.301 WMI Remote Ping Sensor

The WMI Remote Ping sensor remotely connects to a Windows system via Windows Management Instrumentation (WMI) and performs an Internet Control Message Protocol (ICMP) echo request ("ping") from this device to a specified target.

WMI Remote Ping Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: WMI Remote Ping
- French: Ping distant (WMI)
- German: WMI Remote Ping
- Japanese: WMI リモート Ping 実行
- Portuguese: Ping remoto (WMI)
- Russian: Удаленный пинг по WMI
- Simplified Chinese: WMI 远程 Ping
- Spanish: Ping remoto (WMI)

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. Stay below 200 WMI sensors per <a href="#">probe</a> . Above this number, consider using multiple <a href="#">remote probes</a> for load balancing.
WoW64	This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
Credentials	This sensor requires credentials for Windows systems.
IPv6	This sensor supports IPv6.
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## 7.8.302 WMI Security Center Sensor

The WMI Security Center sensor monitors the security status of a Windows client system via Windows Management Instrumentation (WMI). It can monitor all security products that are controlled by Windows Security Center / Windows Action Center.

WMI Security Center Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: WMI Security Center
- French: Centre de sécurité (WMI)
- German: WMI Sicherheits-Center
- Japanese: WMI セキュリティーセンター
- Portuguese: Centro de segurança (WMI)
- Russian: Центр безопасности WMI
- Simplified Chinese: WMI 安全中心
- Spanish: Centro de seguridad (WMI)

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. Stay below 200 WMI sensors per <a href="#">probe</a> . Above this number, consider using multiple <a href="#">remote probes</a> for load balancing.
WoW64	This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
Windows version	This sensor requires at least Windows Vista on the target system.  This sensor does not run on Windows Server operating systems because the Windows Security Center / Windows Action Center is only available on client Windows versions.
Credentials	This sensor requires credentials for Windows systems.
IPv6	This sensor supports IPv6.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Add Sensor

### WMI Security Center Specific

Setting	Description
Security Center Product	Select the security center products that you want to monitor. PRTG creates one sensor for each product that you select.  You see a list showing the Name and Type of all security products that the sensor finds in the Windows Security Center on the target device. If there are no products, you see a corresponding message.

## 7.8.303 WMI Service Sensor

The WMI Service sensor monitors a Windows service via Windows Management Instrumentation (WMI).

**i** After creation, the sensor shows the Down [status](#) if the service does not run.

WMI Service Sensor

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[2617]</sup>.

### Sensor in Other Languages

- Dutch: WMI Service
- French: Service (WMI)
- German: WMI Dienst
- Japanese: WMI サービス
- Portuguese: Serviço (WMI)
- Russian: Служба WMI
- Simplified Chinese: WMI 服务
- Spanish: Servicio (WMI)

### Remarks

Consider the following [remarks](#)<sup>[2613]</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. Stay below 200 WMI sensors per <a href="#">probe</a> . Above this number, consider using multiple <a href="#">remote probes</a> for load balancing.
WoW64	This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
Credentials	This sensor requires credentials for Windows systems.
IPv6	This sensor supports IPv6.
Add Sensor dialog	The name and description of the service in the Add Sensor dialog appear in the language of the device's Windows installation.
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Basic Sensor Settings

### Basic Sensor Settings

TypeID	The typeID of the shared resource that this sensor monitors.

### Trigger Down Status on Following Conditions

Select under which conditions the sensor shows the Down status. As long as the share returns **OK**, the sensor status shows the Up status. Enable the check box in front of the respective line to select a Down condition. Select none, one, or several of the following conditions.

ⓘ If the sensor is in the Down status, it does not record any data in any of its channels.

### Trigger Down Status on Following Conditions

- Error <sup>?</sup>  Alert on this condition <sup>?</sup>
- Degraded <sup>?</sup>  Alert on this condition <sup>?</sup>
- Unknown <sup>?</sup>  Alert on this condition <sup>?</sup>
- Pred Fail <sup>?</sup>  Alert on this condition <sup>?</sup>
- Starting <sup>?</sup>  Alert on this condition <sup>?</sup>
- Stopping <sup>?</sup>  Alert on this condition <sup>?</sup>
- Service <sup>?</sup>  Alert on this condition <sup>?</sup>
- Stressed <sup>?</sup>  Alert on this condition <sup>?</sup>
- Nonrecover <sup>?</sup>  Alert on this condition <sup>?</sup>
- NoContact <sup>?</sup>  Alert on this condition <sup>?</sup>
- LostComm <sup>?</sup>  Alert on this condition <sup>?</sup>

Trigger Down Status on Following Conditions

Condition	Description
Error	Set the sensor to the Down status if the share returns an <b>error</b> status. A share in this status is not operational.  <sup>?</sup> This condition is enabled by default.
Degraded	Set the sensor to the Down status if the share returns a <b>degraded</b> status. A share in this status is still operational.  <sup>?</sup> This condition is enabled by default.
Unknown	Set the sensor to the Down status if the share returns an <b>unknown</b> status.

Condition	Description
Pred Fail	<p>Set the sensor to the Down status if the share returns a <b>predicted fail</b> status. This indicates that an element works properly but predicts a failure (for example, a SMART-enabled hard drive). A share in this status is still operational.</p> <p><b>i</b> This condition is enabled by default.</p>
Starting	<p>Set the sensor to the Down status if the share returns a <b>starting</b> status. A share in this status is not operational.</p>
Stopping	<p>Set the sensor to the Down status if the share returns a <b>stopping</b> status. A share in this status is not operational.</p>
Service	<p>Set the sensor to the Down status if the share returns a <b>service</b> status. This can apply during disk mirror-resilvering, reloading a user permissions list, or other administrative work on the device that this sensor monitors. Not all such work is done online, but the managed element is neither OK nor has one of the other states. A share in this status is not operational.</p>
Stressed	<p>Set the sensor to the Down status if the share returns a <b>stressed</b> status.</p>
Nonrecover	<p>Set the sensor to the Down status if the share returns a <b>non recover</b> status.</p> <p><b>i</b> This condition is enabled by default.</p>
NoContact	<p>Set the sensor to the Down status if the share returns a <b>no contact</b> status.</p> <p><b>i</b> This condition is enabled by default.</p>
LostComm	<p>Set the sensor to the Down status if the share returns a <b>lost communication</b> status.</p> <p><b>i</b> This condition is enabled by default.</p>

## Debug Options

**Debug Options**

**Result Handling** **i**
 Discard result (default)  
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel **i** Downtime

---

Graph Type **i**  Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking <b>⚙</b> below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p>

Setting	Description
	Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Available	The availability of the share  This channel is the primary channel by default.
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status

Consider the following [remarks](#)<sup>[2646]</sup> and requirements for this sensor:

Remark	Description
WoW64	This sensor requires WoW64 (Windows 32-bit on Windows 64-bit) for target systems that run Windows Server 2016.
Credentials	This sensor requires credentials for Windows systems.
IPv4	This sensor only supports IPv4.
Performance impact	This sensor has a <b>low</b> performance impact.
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

### Basic Sensor Settings

**Priority** ⓘ ★★★★★

Basic Sensor Settings

The sensor has the following **default tags** that are automatically predefined in the sensor's settings when you add the sensor:

- wmiutctimesensor

■ For more information about basic sensor settings, see section [Sensor Settings](#) <sup>667</sup>.

### Debug Options

#### Debug Options

**Result Handling** ⓘ

Discard result (default)

Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel **i** Downtime

---

Graph Type **i**  Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking <b>⌵</b> below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p>

Setting	Description
	Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Difference	The time difference between the PRTG core server system time and the target device
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
UTC Time	The UTC time of the target device  This channel is the primary channel by default.

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Bytes In All Heaps	The CLR memory bytes in all heaps
Bytes Total/Sec	The total number of bytes per second
Committed	The committed bytes
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Excepts	The number of thrown CLR exceptions

Channel	Description
Free Physical Memory	The free physical memory
Packets Outbound Errors	The number of outbound packet errors
Queue Length	The CPU queue length
Total Visible Memory	The total visible memory
User Time	The CPU user time (%)

## 7.8.311 WMI Volume Sensor

The WMI Volume sensor monitors the free disk space on a drive, logical volume, or mount point via Windows Management Instrumentation (WMI).

- i The sensor does not support disk drive management.
- i The sensor monitors an area of storage on a hard disk. It can monitor local volumes that are formatted, unformatted, mounted, or offline. A volume is formatted by using a file system such as file allocation table (FAT) or New Technology File System (NTFS), and might have a drive letter assigned to it. One hard disk can have multiple volumes, and volumes can span multiple physical disks.

WMI Volume Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

## 7.8.312 WSUS Statistics Sensor

The WSUS Statistics sensor monitors various statistics on a Windows Server Update Services (WSUS) server via Windows Management Instrumentation (WMI).

WSUS Statistics Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: WSUS Statistieken
- French: WSUS statistiques
- German: WSUS-Statistiken
- Japanese: WSUS 統計情報
- Portuguese: Estatísticas WSUS
- Russian: Статистика WSUS
- Simplified Chinese: WSUS 统计

- Spanish: Estadísticas WSUS

## Remarks

Consider the following [remarks](#) <sup>2662</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
WSUS 3.0 Administration Console	This sensor requires the Microsoft <a href="#">WSUS 3.0 Administration Console</a> on the probe system. In a cluster, it must be installed on every cluster node.
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node. If the sensor shows the error PE087, additionally install .NET 3.5 on the probe system.</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
Windows Server	We recommend Windows Server 2016 on the probe system for best performance of this sensor.
Credentials	<p>This sensor requires credentials for Windows systems.</p> <p> We recommend that you use Windows domain credentials. If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target system. Otherwise, the sensor cannot correctly connect.</p>
IPv6	This sensor supports IPv6.
Knowledge Base	Knowledge Base: <a href="#">Can I encrypt connections to my WSUS server?</a>

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Approved Updates	The number of approved updates
Computers Having Update Errors	The number of computers that have update errors
Computers Needing Updates	The number of computers that need updates
Computers Not Synchronized for 7 Days	The number of computers that have not synchronized for seven days
Computers Registered	The number of computers that are registered

Channel	Description
Computers Up To Date	The number of computers that are up to date
Declined Updates	The number of updates that were declined
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Expired Updates	The number of updates that are expired
Not Approved Critical Or Security Updates	The number of critical or security updates that were not approved
Not Approved Updates	The number of updates that were not approved
Total Updates	The total number of updates
Unapproved, Needed Updates	The number of updates that are unapproved but needed
Updates Needed By Computers	The number of updates that computers need
Updates Needing Files	The number of updates that need files
Updates Up To Date	The number of updates that are up to date
Updates With Client Errors	The number of updates that have client errors
Updates With Server Errors	The number of updates that have server errors
Updates With Stale Update Approvals	The number of updates that have stale update approvals
WSUS Infrastructure Updates Not Approved For Install	The number of WSUS infrastructure updates that were not approved for installation

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

## 7.9 Additional Sensor Types (Custom Sensors)

You can create and use your own custom sensors in PRTG to extend the standard sensor set. You can create your own sensors by using Windows Management Instrumentation Query Language (WQL), visual basic scripting, PowerShell, batch scripting, Structured Query Language (SQL) queries, by compiling an .exe file, by running Python scripts, or by translating JavaScript Object Notation (JSON) and Extensible Markup Language (XML) responses of a Representational State Transfer (REST) application programming interface (API) into sensor values.

☁ You cannot use custom sensors on hosted probes in PRTG Hosted Monitor (except SSH sensors). If you want to use custom sensors, add them to a remote probe device.

### Basics

For a general introduction, see the sections about EXE/Script sensors and section [Custom Sensors](#)<sup>[8213]</sup>, which contain details about the necessary return format for these sensors.

ⓘ WMI Custom sensors allow you to execute WQL requests. Additionally, some types of SQL sensors execute script files with SQL queries.

### Custom Sensors in PRTG

After you install PRTG, you can find a selection of custom EXE/Script, Python, and WMI WQL script sensors in the [PRTG program directory](#)<sup>[8213]</sup>, as well as scripts with SQL queries for specific database sensors, REST configuration files in the JSON template (\*.template) format for the REST Custom sensor, and .hl7 message files for the HL7 sensor. Many of the files are sample projects that you can edit and improve for your needs.

Subfolder of the PRTG Program Directory	Custom Sensors
\Custom Sensors\EXE	<p>The following custom sensors are available by default:</p> <ul style="list-style-type: none"> <li>▪ Demo Batchfile - Returns 200.bat</li> <li>▪ Demo Batchfile - Set sensorstate to error.bat</li> <li>▪ Demo Batchfile - Set sensorstate to warning.bat</li> <li>▪ Demo Cmd - Returns 200.cmd</li> <li>▪ Demo EXE - Returns a random integer.exe</li> <li>▪ Demo EXE - Returns number of files in folder (parameter).exe</li> <li>▪ Demo EXE - Returns user of process.exe</li> <li>▪ Demo Powershell Script - Available MB via WMI.ps1</li> <li>▪ Demo Powershell Script - InterruptsPerSec via WMI.ps1</li> <li>▪ Demo Powershell Script - Powershell Version.ps1</li> <li>▪ Demo Powershell Script - Returns a fixed integer.ps1</li> <li>▪ Demo Powershell Script - Returns a random integer.ps1</li> </ul>

<p>Subfolder of the PRTG Program Directory</p>	<p>Custom Sensors</p>
	<ul style="list-style-type: none"> <li>▪ Demo Powershell Script - Returns Random Integer and Warnings.ps1</li> <li>▪ Demo VBScript - InterruptsPerSec via WMI.vbs</li> <li>▪ Demo VBScript - Multiplies two integers(2 parameters).vbs</li> <li>▪ Demo VBScript - Returns a fixed float value.vbs</li> <li>▪ Demo VBScript - Returns a fixed integer.vbs</li> <li>▪ Demo VBScript - Returns a random value.vbs</li> <li>▪ Demo VBScript - Returns number of svchost processes.vbs</li> <li>▪ Demo VBScript - Returns user of process.vbs</li> <li>▪ Demo VBScript - Returns warning depending on number of svchost processes.vbs</li> <li>▪ Demo VBScript - Timezone via WMI.vbs</li> <li>▪ Demo VBScript - UTCTime via WMI.vbs</li> <li>▪ Load_Test_CPU_1_Mio_Primes.exe</li> <li>▪ Load_Test_CPU_10_Mio_Primes.exe</li> <li>▪ Load_Test_Disk_Write_Read_1000_files.exe</li> <li>▪ Load_Test_Disk_Write_Read_10000_files.exe</li> <li>▪ Load_Test_Memory_Allocate_And_Free_400MB.exe</li> </ul> <p>To create a new sensor based on one of these files, create a new EXE/Script sensor and choose the respective file from the EXE/Script list in the sensor settings.</p> <p><b>i</b> We recommend that you not edit the demo files. Create your own new files and make sure to give them unique names that do not start with <a href="#">Demo</a>, for example.</p>
<p>\\Custom Sensors\\EXEXML</p>	<p>The following custom sensor is available by default:</p> <ul style="list-style-type: none"> <li>▪ Demo Batchfile - Returns static values in four channels.bat</li> </ul> <p>To create a new sensor based on one of these files, create a new EXE/Script Advanced sensor and choose the respective file from the EXE/Script list in the sensor settings.</p>
<p>\\Custom Sensors\\hl7</p>	<p>The following custom sensors are available by default:</p> <ul style="list-style-type: none"> <li>▪ ADT_A08.hl7</li> <li>▪ ORM_O01.hl7</li> </ul>

Subfolder of the PRTG Program Directory	Custom Sensors
	<p>Each file contains an HL7 message that is conform to the HL7 message format. To create a new sensor based on one of these files, create a new HL7 sensor and choose the respective file from the HL7 Messages list in the sensor settings. You can override certain message headers in the files via the sensor settings.</p>
\Custom Sensors\python	<p>The following custom sensor is available by default:</p> <ul style="list-style-type: none"> <li>▪ sensor_example.py</li> </ul> <p>This Python example script only returns fixed values in two channels to demonstrate the usage. To create a new sensor based on this file, create a new Python Script Advanced sensor and choose the file from the Script list in the sensor settings.</p>
\Custom Sensors\rest	<p>The following custom sensors are available by default:</p> <ul style="list-style-type: none"> <li>▪ kemp.loadbalancer.template: maps values returned by the RESTful API of a KEMP load balancer to channels, for example, CPU usage, memory usage, traffic</li> <li>▪ prtg-sensor-stats.template: maps values returned by the PRTG API to channels that show the count of each sensor status on the local probe</li> <li>▪ windows.docker.container.stats.template: maps values returned by the Docker Engine API to channels, for example, CPU usage, memory usage, traffic, input/output (I/O)</li> <li>▪ wunderground.template: maps values returned by the Weather Underground API to channels, for example, temperature, dew point, pressure, wind speed, wind direction</li> </ul> <p>To create a new sensor based on one of these files, create a new REST Custom sensor on the device that provides the REST API and choose the file from the REST Configuration list in the sensor settings.</p>
\Custom Sensors\scripts\examples\python	<p>The following example scripts are available by default:</p> <ul style="list-style-type: none"> <li>▪ dice_roll.py</li> <li>▪ dropbox_space_free.py</li> <li>▪ hybrid_parameters_ping.py</li> <li>▪ remote_ssh_linux_network.py</li> <li>▪ remote_ssh_linux_system_load.py</li> </ul> <p>To use the example scripts, copy them to the \Custom Sensors\scripts subfolder of the PRTG program directory. To create a new sensor based on one of these files, create a new Script v2 sensor and choose one or more Python scripts from the list in the script specific settings. PRTG creates one sensor for each script that you select.</p>

Subfolder of the PRTG Program Directory	Custom Sensors
\Custom Sensors\sql\[dbms]	<p>The following custom sensor is available by default:</p> <ul style="list-style-type: none"> <li>▪ Demo Serveruptime.sql</li> </ul> <p>You can find this demo SQL query script in each subfolder for each supported <a href="#">database management system (DBMS)</a>: \adosql, \mssql, \mysql, \oracle, \postgresql</p> <p>To create a new sensor that uses one of the scripts in the dbms folders, create the according sensor (<a href="#">see above for supported sensors</a><sup>2676</sup>) and choose the respective file from the SQL Query File list in the sensor settings.</p>
\Custom Sensors\WMI WQL scripts	<p>The following custom sensors are available by default:</p> <ul style="list-style-type: none"> <li>▪ Demo WQL Script - Get Win32LogicalDiscFreeMB.wql</li> <li>▪ Demo WQL Script - Get Win32OsBuildnumber.wql</li> <li>▪ Demo WQL Script - Get Win32PercentProcessorIdleTime.wql</li> <li>▪ Demo WQL Script - Get Win32PercentProcessorTime.wql</li> </ul> <p>To create a new sensor based on one of these files, create a new WMI Custom sensor and choose the respective file from the WQL File list in the sensor settings.</p>

## Download Custom Sensors

Good resources to find custom sensors that other users and we from Paessler share are the [PRTG Sensor Hub](#) and our Knowledge Base. In the Knowledge Base, search for the tag [custom-script-exe](#) to find a lot of custom sensors.

## 7.10 Channel Settings

A sensor has one or more channels in which it handles the actual monitoring data. In the channel settings, you can define how to display the data from the sensor's different channels displayed in graphs, gauges, and tables. Additionally, the channel data can determine the [sensor status](#). Use the limit settings to define desired sensor states for values.

On the sensor's Overview tab, click  below a gauge to change the channel's settings. Click  below a gauge to make this channel the primary channel of the selected sensor.

You can also open the settings of a channel by clicking  in the channels data table.

**i** For [lookup](#) channels, we recommend that you stay below 120 lookup values to get expressive gauges. For non-primary lookup channels, the upper limit is around 40 lookup values.

The Gear Icon of an SNMP Traffic Total Channel to Open Channel Settings

The available options are nearly the same for all sensors. An exception applies to the Downtime channel, which PRTG automatically calculates and which does not offer all settings. Channels with [absolute](#) values additionally have an option to define the Value Mode. Custom channels have a Lookups and Limits setting to distinguish between alerting by lookups or numeric limits.

You can choose a different channel via the dropdown list at the top of the channel settings list.

Channel Settings for a Disk Sensor

## Edit Channel

Setting	Description
Name	<p>Enter a name for the channel. The name appears in graphs and tables.</p> <p> ⓘ You can automatically add the sensor's ID to the name by using the placeholder <code>[#id]</code>.</p> <p> ⓘ You cannot edit the name for script sensors after sensor creation.</p>

Setting	Description
	<p><b>i</b> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Unit	<p><b>This setting is only visible for custom sensors.</b></p> <p>Enter the unit for the values that this sensor returns. Enter a string.</p> <p><b>i</b> PRTG uses the unit string for display purposes and shows it in graphs, data tables, and gauges.</p>
Scaling Multiplication	<p><b>This setting is only visible for channels with a custom unit.</b></p> <p>If you want to multiply the received raw data by a certain value, enter the multiplier. Otherwise, use the default value <b>1</b> to not change the received value. Enter an integer.</p> <p>For example, the following sensors provide the scaling factor for received values with custom units in their settings:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">Sensor Factory</a> sensor (you can use multiplication and division in the channel definition)</li> <li>▪ <a href="#">SNMP APC Hardware</a> sensor</li> <li>▪ <a href="#">SNMP Custom</a> sensor</li> <li>▪ <a href="#">SNMP Dell Hardware</a> sensor</li> <li>▪ <a href="#">WMI Custom</a> sensor</li> </ul> <p><b>i</b> If the channel uses lookups, the scaling factor does not modify the values that are defined in the lookups. Any applied lookup always uses the raw value as it is retrieved from the target device. If you use a scaling factor for such a channel, you notice the scaling in data graphs, but the channel value appears unmodified in data tables.</p>
Scaling Division	<p><b>This setting is only visible for channels with a custom unit.</b></p> <p>If you want to divide the received raw data by a certain value, enter the divisor here. Otherwise, use the default value <b>1</b> to not change the received value. Enter an integer.</p> <p>For example, the following sensors provide the scaling factor for received values with custom units in their settings:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">Sensor Factory</a> sensor (you can use multiplication and division in the channel definition)</li> <li>▪ <a href="#">SNMP APC Hardware</a> sensor</li> <li>▪ <a href="#">SNMP Custom</a> sensor</li> <li>▪ <a href="#">SNMP Dell Hardware</a> sensor</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ <a href="#">WMI Custom</a> sensor</li> </ul> <p><b>i</b> If the channel uses lookups, the scaling factor does not modify the values that are defined in the lookups. Any applied lookup always uses the raw value as it is retrieved from the target device. If you use a scaling factor for such a channel, you notice the scaling in data graphs, but the channel value appears unmodified in data tables.</p>
ID	<p>Shows the ID of the channel. PRTG uses it for unique identification. For example, you need the ID for Sensor Factory sensors.</p> <p>There are a few special, fixed channel IDs.</p> <ul style="list-style-type: none"> <li>▪ <b>-1</b> is for sum channels of traffic sensors (for example, of the <a href="#">SNMP Traffic</a> sensor).</li> <li>▪ <b>-4</b> is for the Downtime channel (you can use it, for example, for an uptime percentage calculation in a Sensor Factory sensor).</li> <li>▪ <b>-2</b> (coverage) and <b>-3</b> (error) are internally used.</li> </ul> <p><b>i</b> This setting is for your information only. You cannot change it.</p>
Limits	<p><b>This setting is not available for custom channels.</b></p> <p>Define if you want to set limits for this channel:</p> <ul style="list-style-type: none"> <li>▪ <b>Disable limits:</b> Do not use the channel data to define the sensor status.</li> <li>▪ <b>Enable alerting based on limits:</b> Define limits for the numeric values that are returned by the device. The sensor of which this channel is a part of shows the Warning status or the Down status when limits fall below the defined value or when limits are exceeded.</li> </ul> <p><b>i</b> The channel can affect the <a href="#">status of the sensor</a> that it is a part of. By setting limits, you can define when the sensor shows the Warning status or the Down status, depending on the channel data. For example, you can use limits to set a traffic sensor (that is usually never in the Down status) to show the Down status when the monitored values reach critical limits.</p> <p><b>i</b> Enable alerting based on limits is not available for the Downtime channel.</p> <p><b>i</b> You can show limits in graphs (highlighted in yellow or red) if you select exactly one channel with a limit in a graph.</p>
Lookups and Limits	<p><b>This setting is only available for custom channels.</b></p> <p>Define when the sensor shows the Down status and alerts you, either based on the lookup definition or based on limits for returned values:</p>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Enable alerting based on lookups: Use the lookup definition of the channel to define the sensor status. Make sure that the channel uses a proper Lookup if you use this option. Select the lookup file either in the channel settings or in the sensor settings, depending on the sensor. If you do not want to use the channel data to define the sensor status, select None as Lookup.</li> <li>▪ Enable alerting based on limits: Define limits for numeric values returned by the device. The sensor of which this channel is a part of shows the Warning status or the Down status when limits fall below the defined value or when limits are exceeded.</li> </ul> <p><b>i</b> Only the option you choose applies. If you choose limit-based alerting, errors and warnings that you have defined in the lookup file do not apply.</p>
Lookup	<p>This setting is only visible for custom sensors and if you select lookups-based alerting.</p> <p>Select the lookup file that you want to use with this channel.</p> <p><b>i</b> Do not use this option for sensors that provide the unit Lookup in the sensor settings. The channel setting is overwritten with the next sensor scan. Define the lookup file that you want to use with this channel on the Settings tab of the sensor. Select the option Lookup for the setting Channel #x Unit (where x is the number of the channel) and define the desired lookup file under Channel #x Lookup. See section <a href="#">Define Lookups</a> for affected sensors.</p> <p><b>i</b> If you choose None, alerting by lookups and limits is disabled and channels do not appear as lookups. If you want to keep the lookup representation without alerting, define the states accordingly in the lookup file.</p>
Upper Error Limit ([unit])	<p>This setting is only visible if you select Enable alerting based on limits above.</p> <p>Specify an upper limit for the Down status. If the channel values exceed this value, the sensor shows the Down status. Enter a valid number into at least one of the limit fields.</p> <p><b>i</b> The value that you enter here must match the type of value that the device returns, either an integer or a float. See also <a href="#">Absolute Values and Delta Values for Limits</a>.</p> <p><b>i</b> While a sensor shows the Down status because of a limit, it still receives data in its channels.</p>
Upper Warning Limit ([unit])	<p>This setting is only visible if you select Enable alerting based on limits above.</p>

Setting	Description
	<p>Specify an upper limit for the Warning status. If the channel values exceed this value, the sensor shows the Warning status. Enter a valid number into at least one of the limit fields.</p> <p><b>i</b> The value that you enter here must match the type of value that the device returns, either an integer or a float. See also <a href="#">Absolute Values and Delta Values for Limits</a> <sup>2690</sup>.</p>
Lower Warning Limit ([unit])	<p><b>This setting is only visible if you select</b> Enable alerting based on limits above.</p> <p>Specify a lower limit for the Warning status. If the channel values fall below this value, the sensor shows the Warning status. Enter a valid number into at least one of the limit fields.</p> <p><b>i</b> The value that you enter here must match the type of value that the device returns, either an integer or a float. See also <a href="#">Absolute Values and Delta Values for Limits</a> <sup>2690</sup>.</p>
Lower Error Limit ([unit])	<p><b>This setting is only visible if you select</b> Enable alerting based on limits above.</p> <p>Specify a lower limit for the Down status. If the channel values fall below this value, the sensor shows the Down status. Enter a valid number into at least one of the limit fields.</p> <p><b>i</b> The value that you enter here must match the type of value that the device returns, either an integer or a float. See also <a href="#">Absolute Values and Delta Values for Limits</a> <sup>2690</sup>.</p> <p><b>i</b> While a sensor shows the Down status because of a limit, it still receives data in its channels.</p>
Error Limit Message	<p><b>This setting is only visible if you select</b> Enable alerting based on limits above.</p> <p>Enter an additional message. PRTG adds it to the sensor message when the sensor shows the Down status. Enter a string or leave the field empty.</p>
Warning Limit Message	<p><b>This setting is only visible if you select</b> Enable alerting based on limits above.</p> <p>Enter an additional message. PRTG adds it to the sensor message when the sensor shows the Warning status. Enter a string or leave the field empty.</p>
Graph Rendering	Select if you want to show this channel in data graphs:

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Show in graphs: Sensor graphs contain the data of this channel.</li> <li>▪ Hide in graphs: Sensor graphs do not contain data of this channel.</li> </ul> <p><b>i</b> If you choose to hide this channel in graphs, it also does not appear in the graphs of <a href="#">reports</a><sup>[2754]</sup> or <a href="#">maps</a><sup>[2776]</sup>.</p> <p><b>■</b> For more information about data graphs, see the Knowledge Base: <a href="#">What options do I have to review my monitoring data in detail?</a></p>
Table Rendering	<p>Select if you want to show this channel in data tables:</p> <ul style="list-style-type: none"> <li>▪ Show in tables: Sensor data tables contain the data of this channel.</li> <li>▪ Hide in tables: Sensor data tables do not contain the data of this channel. This option hides the gauge as well, but the channel is still available in the data table of the sensor's Overview tab.</li> </ul> <p><b>i</b> If you choose to hide this channel in data tables, PRTG also does not use it for the calculation of the Total channel of a sensor. It also does not appear in data tables of a report.</p> <p><b>■</b> For more information about data tables, see the Knowledge Base: <a href="#">What options do I have to review my monitoring data in detail?</a></p>
Line Color	<p>Select the color of the channel display in graphs:</p> <ul style="list-style-type: none"> <li>▪ Automatic: PRTG automatically sets the color of this channel in graphs.</li> <li>▪ Manual: Individually define the color of this channel. You can enter the desired color code below.</li> </ul>
Color (#rrggbb)	<p><b>This setting is only visible if you select Manual above.</b></p> <p>Enter a color in hexadecimal notation as in .html and .css files, or choose a color from the visual color selector. The field with the hexadecimal color value automatically changes to the color you select.</p>
Line Width	<p>Enter the width of the channel line in graphs. Enter an integer in pixels. The maximum line width is <b>25</b>, but we recommend that you only use values between <b>1</b> and <b>7</b> to get optimal results.</p>
Data	<p>This setting is available for most channels. Define how to display data:</p> <ul style="list-style-type: none"> <li>▪ Display actual values in <b>[unit]</b>: Display the values in the shown unit.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Display in percent of maximum: Calculate and show percent values based on a maximum value. Enter a maximum below.               <ul style="list-style-type: none"> <li>❗ If you choose this option, you cannot display the data of traffic sensors as a positive and negative area graph.</li> <li>❗ If you choose this option, values in the Limits section are counted as percent values.</li> </ul> </li> </ul>
Maximum ([unit])	<p><b>This setting is only visible if you select</b> Display in percent of maximum above.</p> <p>Enter a value to use as the maximum. Consider the unit. PRTG calculates all percent values based on this value. Enter an integer.</p>
Value Mode	<p><b>This setting is only available for channels that return</b> absolute values.</p> <p>Define which value type you want to display in historic data graphs and tables:</p> <ul style="list-style-type: none"> <li>▪ Average: The channel shows average values.</li> <li>▪ Minimum: The channel shows the minimum values.</li> <li>▪ Maximum: The channel shows the maximum values.</li> </ul> <p>❗ This setting is not available for sensors that show difference values, such as traffic channels.</p> <p>■ For more information about value modes, see the Knowledge Base: <a href="#">What is the Value Mode in channel settings?</a></p>
Decimal Places	<p>Define how many decimal places of the channel's data that you want to display in graphs and tables:</p> <ul style="list-style-type: none"> <li>▪ Automatic: PRTG automatically defines how many decimal places to use for optimal viewing results.               <ul style="list-style-type: none"> <li>❗ PRTG rounds values between 10 and -10 to two decimal places. It rounds values that are very close to an integer to the integer, for example, it rounds 3.001 to 3.</li> </ul> </li> <li>▪ All: Display all available decimal places.</li> <li>▪ Custom: Manually define the number of decimal places. If you choose this option, an additional field appears. Enter an integer.</li> </ul>
Spike Filter	<p>You can use a spike filter to correct faulty monitoring data. Sometimes, sensors report values that are enormously high or far too low. This can be because of an error in data transmission, or because of incompatibilities of the physical device you are monitoring. This can make graphs unreadable. A spike filter can compensate for these flaws.</p> <p>Define if you want to filter incoming data:</p>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ <b>Disable filtering:</b> Display all data as it is received. Do not filter out spikes.</li> <li>▪ <b>Enable filtering:</b> Enable a filter to remove spike values. PRTG disregards values that are above and below a certain limit in the monitoring data for graphs and tables. Additional fields appear below. <ul style="list-style-type: none"> <li>ⓘ This does not change monitoring data itself but only the presentation of the data. This setting is valid for all data of this channel, including historic data.</li> </ul> </li> </ul> <p>ⓘ Use the spike filter with care. For overflow values in SNMP sensors, check the <a href="#">SNMP Compatibility Options</a> before.</p> <p>ⓘ The spike filter option is not available for the channel Downtime.</p>
Spike Filter Max. Value ([unit])	<p>This setting is only visible if you select <a href="#">Enable filtering</a> above.</p> <p>Enter the maximum value to show in the channel data. PRTG disregards all data above this value in graphs and tables. Enter an integer or leave the field empty.</p>
Spike Filter Min. Value ([unit])	<p>This setting is only visible if you select <a href="#">Enable filtering</a> above.</p> <p>Enter the minimum value to show in the channel data. PRTG disregards all data below this value in graphs and tables. Enter an integer or leave the field empty.</p>
Vertical Axis Scaling	<p>Define how to display the vertical axis for the channel in graphs:</p> <ul style="list-style-type: none"> <li>▪ <b>Automatic scaling:</b> PRTG automatically uses the optimum scaling. Usually the scaling ranges from the minimum to the maximum value. PRTG uses one single scale for each unit label only.</li> <li>▪ <b>Manual scaling:</b> Manually define the scaling. Additional fields appear below. If you define manual axis scaling, it can make low values better visible in your graph, but it might result in a graph with multiple vertical axes for the same unit label.</li> </ul> <p>ⓘ PRTG ignores settings for this option if you select <a href="#">Stack channels on top of each other</a> under Graph Type on the sensor's Settings tab.</p>
Vertical Axis Maximum ([unit])	<p>This setting is only visible if you select <a href="#">Manual scaling</a> above.</p> <p>Enter the maximum value to use on the vertical axis for the channel. Enter an integer.</p>
Vertical Axis Minimum ([unit])	<p>This setting is only visible if you select <a href="#">Manual scaling</a> above.</p>

Setting	Description
	Enter the minimum value to use on the vertical axis for the channel. Enter an integer.

**i** Click OK to save your settings and to close the settings window. Click Apply to save the changed settings while the Edit Channel window remains open, for example if you want to change the settings of other channels of the current sensor as well. You can select a different channel via the dropdown list above the settings. You can close the settings window without saving by clicking Cancel.

**i** If you change any settings and either click Cancel or select a different channel via the dropdown list, PRTG asks you to confirm this step. Click Save to apply the changes or click Discard Changes to ignore the changes. PRTG closes the window or shows the settings of the selected channel respectively.

#### Absolute Values and Delta Values for Limits

The value type that you need to configure for limits depends on the type of data that the channel delivers:

Value Type	Description
Absolute values	For channels that measure absolute values, for example, for free disk space, you must set limits with absolute values like <a href="#">20</a> .
Delta values	For channels that measure delta values, that is, measurements per second (x.xx/sec), you must set delta values according to the formula <a href="#">number of errors/scanning interval in seconds</a> .

For example, you have an SNMP Traffic sensor and want to receive an alert when the sensor reports errors:

- Set the sensor to the Warning status when [1](#) error occurs.
- Set the sensor to the Down status when [30](#) errors occur.

The following screenshot shows how to configure the limits for delta channels. You could set the following limits for the channel Errors In with a standard scanning interval of 60 seconds:

### Edit Channel "Errors in"

**Name** ⓘ  
Errors in

---

**ID** ⓘ  
10

**Limits** ⓘ  
 Disable limits  
 Enable alerting based on limits

**Upper Error Limit (#/s)** ⓘ  
0.5

---

**Upper Warning Limit (#/s)** ⓘ  
0.1

---

**Lower Warning Limit (#/s)** ⓘ

---

**Lower Error Limit (#/s)** ⓘ

 Hide from Graphs

**Table Rendering** ⓘ  
 Show in Tables

---

**Apply** **Ok** **Cancel**

Setting Channel Limits with Delta Values

Because this channel uses per second (delta) measurements, the sensor reports a single error that occurs over a standard 60-second scanning interval as 0.016 # per second. So the warning limit for one single error within a scanning interval is 0.1 (errors/sec). To get an alert when there are 30 errors within a scanning interval, the limit needs to be 0.5 (errors/sec).

- ❗ If no new errors occur in the next scanning interval, the sensor shows the Up status again. To make sure that you do not miss any notifications for this sensor, set a notification trigger with 0 seconds.

## Channel List Status

Under the channel gauge view on a sensor overview page, there is a channel list showing the active channels of a sensor listed alphabetically and data from each channel. The Downtime channel never shows any values. Sensors in the Paused status display **No data** in place of all data values or remain blank, regardless of whether there is historic data available. The data values are displayed again when the sensor is no longer paused.

Channel ▾	ID ↕	Last Value ↕	Minimum ↕	Maximum ↕
-----------	------	--------------	-----------	-----------

Channel List

Table Header	Description
Channel	The name of the channel.
ID	The ID of the channel.  ❗ This setting is for your information only. You cannot change it.
Last Value	The most recent value of the channel recorded by the sensor.
Minimum	The lowest historic value recorded by the sensor.
Maximum	The highest historic value recorded by the sensor.

The Minimum and Maximum values remain the same until one of two events take place:

- The value is replaced by another value that is less than or greater than the original, respectively.
- A PRTG cache recalculation is prompted, refreshing all values.

These values are cached and are not affected by [historic data purges](#)<sup>[2899]</sup>, making it possible to have a minimum or maximum value that is no longer recorded in the historic data.

## 7.11 Notification Triggers Settings

You can use changes in a sensor's status or in the sensor's data to trigger notifications.

The screenshot shows the 'Notification Triggers' tab for a sensor. The interface includes a navigation bar with options like Overview, Live Data, and Settings. The main content area is divided into three sections:

- Notification Triggers:** A table with columns for Type, Rule, and Actions. It lists three triggers based on sensor state (Down for at least 900 seconds, Down for at least 3600 seconds, and no longer Down).
- Notification triggers that can be inherited from parent objects:** Radio buttons to select inheritance options. Below is a table of inherited triggers from the 'Root' object.
- Notification triggers that are defined in libraries:** A section indicating that no triggers are currently defined in libraries.

Notification Triggers Tab

Although sensors activate notification triggers, you can set notification triggers in the settings of objects that are higher in the [object hierarchy](#)<sup>[132]</sup>. This allows you to use the [inheritance of settings](#)<sup>[136]</sup> to define notification triggers for multiple sensors. Objects that inherit notification triggers show them on the Notification Triggers tab.

■ For more information, see section [Triggers That Can Be Inherited from Parent Objects](#)<sup>[2703]</sup>.

You can also define notification triggers in [libraries](#)<sup>[2738]</sup>. If a sensor is in a library that has notification triggers, the sensor shows them on the Notification Triggers tab.

■ For more information, see section [Triggers That Are Defined in Libraries](#)<sup>[2704]</sup>.

ⓘ You can also directly edit notification templates on the Notification Triggers tab. To do so, click  next to name of a notification template.

### Note

You must take the following four steps to set up and use notifications:

1. Check and set up the [notification delivery](#)<sup>[2877]</sup> settings if you use PRTG Network Monitor. These settings define how PRTG sends messages.
2. Check and set up [notification contacts](#)<sup>[2842]</sup> for the user accounts. These contacts define the recipients to which PRTG sends notifications.

3. Check and set up several [notification templates](#)<sup>[2808]</sup>. These templates define the notification methods and their content.

**i** You can also check or edit notification templates via the Notification Triggers tab. For more information, see section [Notification Triggers Settings](#)<sup>[2693]</sup>.

4. Check and set up [notification triggers settings](#)<sup>[2693]</sup> for objects. These triggers define when PRTG sends notifications.

**i** Usually, there are three successive attempts to deliver a notification. If all of these attempts fail, the notification is lost. To never miss a notification, we recommend that you always set up at least two notifications with different notification methods for a notification trigger, for example, one email notification and one SMS notification. If delivery via email fails, PRTG can still notify you via smartphone as a fallback. For example, use the latency setting of a [state trigger](#)<sup>[2694]</sup> to choose a notification with a different notification method than in the first trigger condition, or set up a second trigger with a different notification method for the corresponding object.

■ For a detailed step-by-step guide, see the Paessler website: [How to set up notifications via the PRTG web interface](#).

■ Custom notification scripts are also available in the [PRTG Sensor Hub](#).

## Notification Triggers

Select the Notification Triggers tab of an object to add or edit notification triggers. You can set up one or more of the following notification triggers:

- [State Trigger](#)<sup>[2694]</sup>
- [Speed Trigger](#)<sup>[2696]</sup>
- [Volume Trigger](#)<sup>[2699]</sup>
- [Threshold Trigger](#)<sup>[2700]</sup>
- [Change Trigger](#)<sup>[2702]</sup>

Different options are available for every notification trigger. You see the Type of notification trigger and the notification Rule that the sensor executes once it activates a notification trigger.

**i** Which notification triggers are available on the Notification Triggers tab depends on the kind of object you select.

## State Trigger

The state trigger performs a notification when a sensor changes its status. Hover over  and select Add State Trigger from the menu to add a new state trigger or click  next to a state trigger to change it.

State Trigger      When sensor state is Down      for at least 60 seconds, perform no notification

When sensor state is Down for at least 300 seconds, perform no notification and repeat every 0 minutes

When sensor state is no longer Down, perform no notification

Add State Trigger

**i** PRTG includes a state trigger for the [root group](#)<sup>132</sup> by default. This notification trigger performs the notification Email and push notification to admin if any sensor is in the Down [status](#)<sup>181</sup> for at least 10 minutes.

Setting	Description
When sensor status is [...]	<p>Select the status that triggers a notification:</p> <ul style="list-style-type: none"> <li>▪ Down: Trigger a notification if a sensor changes to the Down status.</li> <li>▪ Warning: Trigger a notification if a sensor changes to the Warning status.</li> <li>▪ Unusual: Trigger a notification if a sensor changes to the Unusual status.</li> <li>▪ Down (Partial): Trigger a notification if a sensor changes to the Down (Partial) status. This status is only possible in a <a href="#">failover cluster</a><sup>128</sup>.</li> <li>▪ Up: Trigger a notification if a sensor changes to the Up status.</li> <li>▪ Unknown: Trigger a notification if a sensor changes to the Unknown status.</li> </ul>
for at least [...] seconds,	<p>Enter the time in seconds that PRTG waits before it sends a notification (<a href="#">latency</a>). This can avoid false alarms if, for example, a sensor changes to the Down status for only a few seconds. Enter an integer.</p> <p><b>i</b> Do not define a latency that is shorter than the scanning interval of a sensor that uses this trigger. The notification trigger might not work as expected in this case.</p>
perform [...]	<p>Select the notification that PRTG sends if the sensor is in the selected status <a href="#">and</a> if the defined latency is over. You see all notification templates that you have defined under Setup   Account Settings   Notification Templates. Use the search box to filter for notification templates. You can also select no notification to not send a notification in this case.</p> <p><b>i</b> You can also directly create and use new notification templates by clicking  in the dropdown list.</p>
When sensor status is [...] for at least [...] seconds	<p>Enter the escalation latency in seconds that PRTG waits before it sends an escalation notification. Use this to automatically escalate a notification if a problem exists for a longer time. Enter an integer.</p> <p><b>i</b> PRTG automatically fills in the selected status.</p>
perform [...]	<p>Select the notification that PRTG sends if the sensor is still in the selected status <a href="#">and</a> if the defined escalation latency is over. You see all notification templates that you have defined under Setup   Account Settings   Notification Templates. Use the search box to filter for notification templates. You can also select no notification to not send a notification in this case.</p>

Setting	Description
	<p><b>i</b> Select a notification with a different delivery method than in the first trigger condition to make sure that you receive a notification in case the first notification could not be sent.</p> <p><b>i</b> You can also directly create and use new notification templates by clicking  in the dropdown list.</p>
and repeat every [...] minutes	<p>Enter the interval in minutes after which PRTG sends the escalation notification again. Enter an integer.</p> <p><b>i</b> If you enter 0, PRTG does not send the escalation notification again.</p>
When sensor status is no longer [...], perform [...]	<p>Select the notification that PRTG sends if the sensor is <b>no longer</b> in the selected status <b>and</b> if the defined latency is over. You see all notification templates that you have defined under Setup   Account Settings   Notification Templates. Use the search box to filter for notification templates. You can also select no notification to not send a notification in this case.</p> <p><b>i</b> PRTG automatically fills in the selected status.</p> <p><b>i</b> You can also directly create and use new notification templates by clicking  in the dropdown list.</p>

Click  to save your settings or click  to undo your changes.

## Speed Trigger

The speed trigger performs a notification if the speed that a sensor monitors changes. Hover over  and select Add Speed Trigger from the menu to add a new speed trigger or click  next to a speed trigger to change it.

Speed Trigger    When **Other**  channel is **Above**  **0** **bit**  / **second**  for at least **60** seconds, perform **no notification**

When condition clears, perform **no notification**

[Add Speed Trigger](#)

Setting	Description
When [...] channel	<p>Select the <b>channel</b>  whose data PRTG uses for the speed comparison. At root, probe, group, or device level or in libraries, the following channels are available:</p> <ul style="list-style-type: none"> <li>Primary: Use the data of the primary channel of the sensor for the comparison.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Total: Use the data of the Total channel of the sensor for the comparison.</li> <li>▪ Traffic In: Use the data of the Traffic In channel of the sensor for the speed comparison.</li> <li>▪ Traffic Out: Use the data of the Traffic Out channel of the sensor for the speed comparison.</li> </ul> <p>At sensor level, the available channels depend on the type of sensor you select.</p> <p> If you set notification triggers at root, probe, group, or device level and you want to know which sensors the notification triggers apply to, see section <a href="#">Available Sensor Types</a><sup>[3232]</sup>.</p>
is [...]	<p>Select the condition that triggers the notification:</p> <ul style="list-style-type: none"> <li>▪ Above: Trigger the notification if the value of the selected channel exceeds a defined value.</li> <li>▪ Below: Trigger the notification if the value of the selected channel falls below a defined value.</li> <li>▪ Equal to: Trigger the notification if the value of the selected channel is the same as a defined value.</li> <li>▪ Not equal to: Trigger the notification if the value of the selected channel is different than a defined value.</li> </ul>
[value]	<p>Enter the value to which PRTG compares the channel data. Enter an integer.</p>
[scale]	<p>Select the unit for the [value]:</p> <ul style="list-style-type: none"> <li>▪ bit</li> <li>▪ kbit</li> <li>▪ Mbit</li> <li>▪ Gbit</li> <li>▪ Tbit</li> <li>▪ Byte</li> <li>▪ KB</li> <li>▪ MB</li> <li>▪ GB</li> <li>▪ TB</li> </ul> <p> The available units depend on the type of sensor you select.</p>

Setting	Description
	<p> [scale] and [time] define the unit for [value]. If the channel data has a different unit, PRTG internally converts the values.</p>
[time]	<p>Select the time for the scale to create a scale per time unit:</p> <ul style="list-style-type: none"> <li>▪ second</li> <li>▪ minute</li> <li>▪ hour</li> <li>▪ day</li> </ul> <p> [scale] and [time] define the unit for [value]. If the channel data has a different unit, PRTG internally converts the values.</p>
for at least [...] seconds,	<p>Enter the time in seconds that PRTG waits before it sends a notification (<a href="#">latency</a>). This can avoid false alarms if, for example, a sensor changes to the Down status for only a few seconds.. Enter an integer.</p> <p> Do not define a latency that is shorter than the scanning interval of a sensor that uses this trigger. The notification trigger might not work as expected in this case.</p>
perform [...]	<p>Select the notification that PRTG sends if the defined [value], [scale], and [time] are true <b>and</b> the defined latency is over. You see all notification templates that you have defined under Setup   Account Settings   Notification Templates. Use the search box to filter for notification templates. You can also select no notification to not send a notification in this case.</p> <p> You can also directly create and use new notification templates by clicking  in the dropdown list.</p>
When condition clears, perform [...]	<p>Select the notification that PRTG sends if the defined [value], [scale], and [time] are <b>no longer</b> true <b>and</b> the defined latency is over. You see all notification templates that you have defined under Setup   Account Settings   Notification Templates. Use the search box to filter for notification templates. You can also select no notification to not send a notification in this case.</p> <p> You can also directly create and use new notification templates by clicking  in the dropdown list.</p>

Click  to save your settings or click  to undo your changes.

## Volume Trigger

The volume trigger performs a notification if a sensor reaches a certain volume in a specific time. Hover over  and select Add Volume Trigger from the menu to add a new volume trigger or click  next to a volume trigger to change it.

Volume Trigger    When Other ▾ channel reaches 0    Byte ▾ per Hour ▾, perform no notification ▾

Add Volume Trigger

Setting	Description
When [...] channel	<p>Select the channel whose data PRTG uses for the volume comparison. At root, probe, group, or device level or in libraries, the following channels are available:</p> <ul style="list-style-type: none"> <li>▪ Primary: Use the data of the primary channel of the sensor for the comparison.</li> <li>▪ Total: Use the data of the Total channel of the sensor for the comparison.</li> <li>▪ Traffic In: Use the data of the Traffic In channel of the sensor for the speed comparison.</li> <li>▪ Traffic Out: Use the data of the Traffic Out channel of the sensor for the speed comparison.</li> </ul> <p>At sensor level, the available channels depend on the type of sensor you select.</p> <p> If you set notification triggers at root, probe, group, or device level and you want to know which sensors the notification triggers apply to, see section <a href="#">Available Sensor Types</a> <sup>[3232]</sup>.</p>
reaches [value]	Enter the value to which PRTG compares the channel data. Enter an integer.
[scale]	<p>Select the unit for the [value]:</p> <ul style="list-style-type: none"> <li>▪ Byte</li> <li>▪ KB</li> <li>▪ MB</li> <li>▪ GB</li> <li>▪ TB</li> </ul> <p> [scale] and [time] define the unit for [value]. If the channel data has a different unit, PRTG internally converts the values.</p>
per [time],	Select the time for the scale to create a scale per time unit:

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Hour</li> <li>▪ Day</li> <li>▪ Week</li> <li>▪ Month</li> </ul> <p><b>i</b> [scale] and [time] define the unit for [value]. If the channel data has a different unit, PRTG internally converts the values.</p>
perform [...]	<p>Select the notification that PRTG sends if the defined [value], [scale], and [time] are true. You see all notification templates that you have defined under Setup   Account Settings   Notification Templates. Use the search box to filter for notification templates. You can also select no notification to not send a notification in this case.</p> <p><b>i</b> You can also directly create and use new notification templates by clicking  in the dropdown list.</p>

Click  to save your settings or click  to undo your changes.

## Threshold Trigger

The threshold trigger performs a notification if a sensor reaches specific values. Hover over  and select Add Threshold Trigger from the menu to add a new threshold trigger, or click  next to a threshold trigger to change it.

Threshold Trigger    When Last Sync Result (#)    v channel is Above    v 0    for at least 60 seconds, perform no notification v

When condition clears, perform no notification v

Add Threshold Trigger

Setting	Description
When [...] channel	<p>Select the channel whose data PRTG uses for the threshold comparison. At root, probe, group, or device level or in libraries, the following channels are available:</p> <ul style="list-style-type: none"> <li>▪ Primary: Use the data of the primary channel of the sensor for the comparison.</li> <li>▪ Total: Use the data of the Total channel of the sensor for the comparison.</li> </ul> <p>At sensor level, the available channels depend on the type of sensor you select.</p>

Setting	Description
	<p> The threshold trigger for a Total channel that you define at group or device level or in libraries only applies to the Total channel of traffic sensors. This channel has the ID <b>-1</b>. The threshold trigger works with the Total channel of the following sensors:</p> <ul style="list-style-type: none"> <li>▪ IPFIX</li> <li>▪ IPFIX (Custom)</li> <li>▪ jFlow v5</li> <li>▪ jFlow v5 (Custom)</li> <li>▪ NetFlow v5</li> <li>▪ NetFlow v5 (Custom)</li> <li>▪ NetFlow v9</li> <li>▪ NetFlow v9 (Custom)</li> <li>▪ Packet Sniffer</li> <li>▪ Packet Sniffer (Custom)</li> <li>▪ sFlow</li> <li>▪ sFlow (Custom)</li> <li>▪ SMTP&amp;IMAP Round Trip</li> <li>▪ SMTP&amp;POP3 Round Trip</li> <li>▪ SNMP Traffic (channel Traffic Total)</li> <li>▪ Windows Network Card</li> </ul> <p> If you set notification triggers at root, probe, group, or device level and you want to know which sensors the notification triggers apply to, see section <a href="#">Available Sensor Types</a> <small>[3232]</small>.</p>
is [...]	<p>Select the condition that triggers the notification:</p> <ul style="list-style-type: none"> <li>▪ Above: Trigger the notification if the value of the selected channel exceeds a defined value.</li> <li>▪ Below: Trigger the notification if the value of the selected channel falls below a defined value.</li> <li>▪ Equal to: Trigger the notification if the value of the selected channel is the same as a defined value.</li> <li>▪ Not equal to: Trigger the notification if the value of the selected channel is different than a defined value.</li> </ul>
[value]	<p>Enter the value to which PRTG compares the channel data. Enter values in the smallest (base) unit that is possible, for example, in <a href="#">bytes</a>, <a href="#">milliseconds</a>, or <a href="#">percent</a>. Enter an integer.</p>

Setting	Description
for at least [...] seconds,	<p>Enter the time in seconds that PRTG waits before it sends a notification (<b>latency</b>). This can avoid false alarms if, for example, a sensor changes to the Down status for only a few seconds. Enter an integer.</p> <p><b>i</b> Do not define a latency that is shorter than the scanning interval of a sensor that uses this trigger. The notification trigger might not work as expected in this case.</p>
perform [...]	<p>Select the notification that PRTG sends if the defined channel condition is true <b>and</b> the defined latency is over. You see all notification templates that you have defined under Setup   Account Settings   Notification Templates. Use the search box to filter for notification templates. You can also select no notification to not send a notification in this case.</p> <p><b>i</b> You can also directly create and use new notification templates by clicking <b>+</b> in the dropdown list.</p>
When condition clears, perform [...]	<p>Select the notification that PRTG sends if the defined channel condition is <b>no longer</b> true <b>and</b> the defined latency is over. You see all notification templates that you have defined under Setup   Account Settings   Notification Templates. Use the search box to filter for notification templates. You can also select no notification to not send a notification in this case.</p> <p><b>i</b> You can also directly create and use new notification templates by clicking <b>+</b> in the dropdown list.</p>

Click  to save your settings or click  to undo your changes.

## Change Trigger

**i** Before you set up a change trigger, make sure that you select Trigger 'change' notification in the sensor's settings, otherwise PRTG never sends the notification.

**If Content Changes** **i**     Ignore changes

Trigger 'change' notification

Trigger 'Change' Notification

The change trigger performs a notification if a compatible sensor's value changes. Hover over  and select Add Change Trigger from the menu to add a new change trigger, or click  next to a change trigger to change it.

Change Trigger    When sensor changes, perform **no notification** ▼

Add Change Trigger

Setting	Description
When sensor changes, perform [...]	<p>Select the notification that PRTG sends if a compatible sensor triggers a 'change' notification. You can enable this option in the <a href="#">settings</a> of compatible sensors. You see all notification templates that you have defined under Setup   Account Settings   Notification Templates. Use the search box to filter for notification templates. You can also select no notification to not send a notification in this case.</p> <p><b>i</b> You can also directly create and use new notification templates by clicking  in the dropdown list.</p>

Click  to save your settings or click  to undo your changes.

### Triggers That Can Be Inherited from Parent Objects

You see a list of all notification triggers that the selected object inherits from parent objects. The list is empty and shows the message [\(no triggers defined\)](#) if you have not set any notification triggers for objects that are higher in the [object hierarchy](#) <sup>132</sup>.

Notification triggers that can be inherited from parent objects

Inherit all notification triggers from parent objects and use the notification triggers defined above  
 Only use the notification triggers defined above

Type ^	Rule	Inherited from
State Trigger	When sensor state is Down for at least 600 seconds, perform @ ► Email and push notification to admin (paused) 	 Root
	When sensor state is Down for at least 900 seconds, perform no notification and repeat every 0 minutes	
	When sensor state is no longer Down, perform @ ► Email and push notification to admin (paused) 	

Trigger Inheritance

Setting	Description
Trigger Inheritance	<p>Select the notification triggers that you want to use for the selected object:</p> <ul style="list-style-type: none"> <li>▪ Inherit all triggers from parent objects and use the triggers defined above: Use the inherited notification triggers in section Triggers that can be inherited from parent objects <b>and</b> use the specific triggers for this object in section Notification Triggers. To change settings of the inherited notification triggers, click the name of the monitoring object in the column Inherited from to open its Overview tab and then open the Notification Triggers tab.</li> <li>▪ Only use the triggers defined above: Do not use the inherited notification triggers in section Triggers that can be inherited from parent objects. Only use the triggers that you define for this object in section Notification Triggers.</li> </ul> <p><b>i</b> This setting is valid for all notification triggers that you see here. It is not possible to select only some of the notification triggers.</p>

Setting	Description
	<p><b>i</b> You can also click a notification template to edit its settings or click the object under Inherited from to go to the object's Overview tab.</p>

## Triggers That Are Defined in Libraries

You see a list of all notification triggers that are set in libraries <sup>2738</sup> that contain the selected sensor. The list is empty and shows the message **(no triggers defined)** if you have not set any notification triggers in libraries that contain the selected sensor.

Notification triggers that are defined in libraries

Type <sup>▲</sup>	Rule	Inherited from
State Trigger	When sensor state is Down for at least 60 seconds, perform no notification When sensor state is Down for at least 300 seconds, perform no notification and repeat every 0 minutes When sensor state is no longer Down, perform no notification	All disk space sensors

If you want to change these notification triggers, remove the sensor from the library or edit the notification triggers on the library's Notification Triggers tab.

Triggers in Libraries

Click a notification template to change its settings. Click a library in the column Inherited from to view the library.

**i** You cannot disable notification trigger usage from a library here. If you do not want to use notification triggers from a library for the selected sensor, open the library and remove the sensor from it or edit the notification triggers on the Notification Triggers <sup>2749</sup> tab of the library.

## 8.1 Toplists

Packet Sniffer sensors and Flow (NetFlow, jFlow, sFlow, IPFIX) sensors not only measure the total bandwidth usage, but also break down traffic by IP address, port, protocol, and other parameters. This way, PRTG can tell which IP address, connection, or protocol uses the most bandwidth. PRTG shows the results in [Toplists](#).

Toplist Top Protocols for a Packet Sniffer Sensor

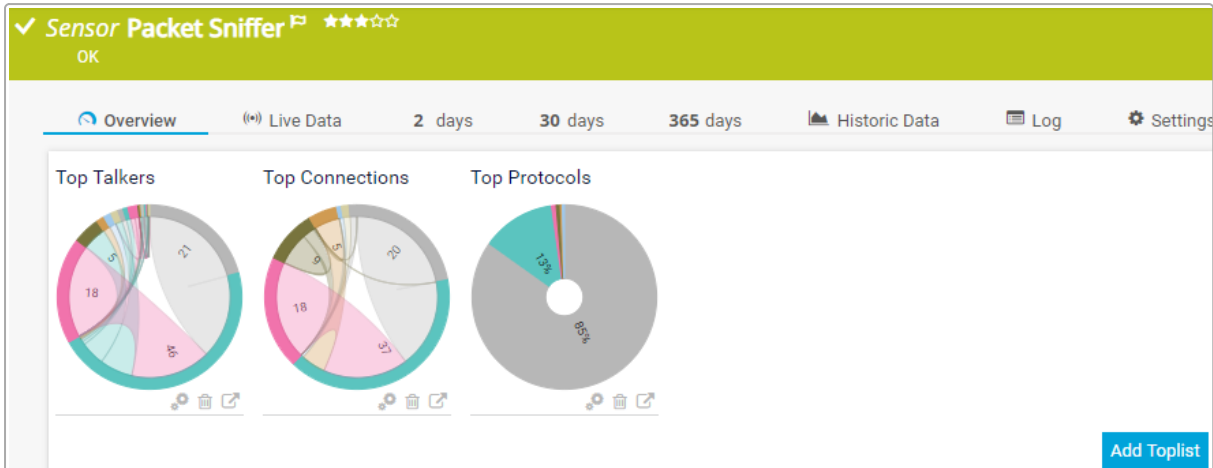

### Toplist Storage

PRTG looks at all network packets and collects the bandwidth information for all IP addresses, ports, and protocols. This creates a huge amount of analysis data. To reduce the amount of data that is actually stored, PRTG only stores the top 100 entries of each Toplist in the database at the end of a specified Toplist period by default.

### Toplist Overview

Toplists are only available for [Flow and Packet Sniffer sensors](#) <sup>[3232]</sup>. PRTG displays Toplist on the sensor's Overview tab.

■ For more information about the Overview tab, see the Knowledge Base: [What options do I have to review my monitoring data in detail?](#)

Toplist Overview for a Packet Sniffer Sensor

By default, there are three preconfigured Toplists:

Toplist	Description
Top Talkers	Shows bandwidth usage by IP address.
Top Connections	Shows bandwidth usage by connection.
Top Protocols	Shows bandwidth usage by protocol.

### Working with Toplists

- Click one of the Toplist names on the sensor's Overview tab or click  below a Toplist to view a distribution chart and a list of source IP addresses and destination IP addresses, source ports and destination ports, protocols, or kinds of traffic in different channels, for example. What kind of information is available depends on the selected Toplist.
  - Click an entry in the Toplist periods list on the left side to view data for a specific time period. The default value is 15 minutes. You can also manually define the start and end time of the Toplist period that you want to view. Use the date time picker to enter the date and time. Additionally, several [table list options](#) <sup>[218]</sup> are available.
  - Click Print This Toplist to view a printer-friendly version of your Toplist and use the print dialog of your browser to print the Toplist.
  - Click Sensor Overview to return to the selected sensor's Overview tab. For a quick selection of other Toplists of the selected sensor, click one of the Toplist tiles at the top of the page.

Toplist Tiles

- Click Add Toplist on the sensor's Overview tab to create a new Toplist. The available options are the same as when you [edit](#) <sup>[2709]</sup> a Toplist.

- Click  below a Toplist on the sensor's Overview tab and confirm with Delete to delete the Toplist.

## Edit Toplists

Click  below a Toplist on the sensor's Overview tab to modify a Toplist.

Setting	Description
Name	<p>Enter a name to identify the Toplist.</p> <p> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Toplist Type	<p>Select the type of Toplist:</p> <ul style="list-style-type: none"> <li>▪ Top Talkers (IP address): Shows bandwidth usage by IP address.</li> <li>▪ Top Connections: Shows bandwidth usage by connection.</li> <li>▪ Top Protocols: Shows bandwidth usage by protocol.</li> <li>▪ Custom: Create your own Toplist by selecting one or more Toplist fields.</li> </ul>
Toplist Fields	<p><a href="#">This setting is only visible if you select Custom above.</a></p> <p>Select the fields that you want to add to the Toplist by enabling the check box in front of the respective field name. The available options depend on the sensor. They are different for Packet Sniffer, NetFlow v5, NetFlow v9, IPFIX, and sFlow sensors.</p> <p> For performance reasons, only select the fields that you really need to monitor.</p> <p> For more information, see section <a href="#">Performance Considerations</a> <sup>2710</sup>.</p>
Toplist Period (Minutes)	<p>Define the time span that a Toplist period covers in minutes. Enter an integer. When a Toplist period is finished, PRTG stores the top results and starts a new Toplist period.</p> <p> To avoid load problems on the probe system, do not set this time period too long. The default value is 15 minutes.</p> <p> For more information, see section <a href="#">Performance Considerations</a> <sup>2710</sup>.</p>
Top Count	<p>Define the length of your Toplist. PRTG stores only this number of entries for each Toplist period. Enter an integer.</p> <p> To avoid load problems on the probe system, set this value as low as possible. The default setting is 100 to store the top 100 entries for each Toplist period.</p>

Setting	Description
	<p>■ For more information, see section <a href="#">Performance Considerations</a> <small>2710</small>.</p>
Reverse DNS Lookup	<p>Define if you want to do a reverse Domain Name System (DNS) lookup for IP addresses that are stored in the Toplist:</p> <ul style="list-style-type: none"> <li>▪ Reverse DNS lookup for IP addresses: Determine the domain name that is associated with an IP address and show it in the Toplist.</li> <li>▪ No reverse DNS lookup: Only show IP addresses. Select this option to increase performance.</li> </ul>
Data Transfer	<p>Define how the probe sends the Toplist data set to the PRTG core server:</p> <ul style="list-style-type: none"> <li>▪ According to scanning interval (default): Send data in the scanning interval defined in the settings of the sensor for which you create this Toplist. <ul style="list-style-type: none"> <li>ⓘ This setting can create a lot of bandwidth usage and CPU load if you have many Packet Sniffer sensors, complex traffic, or long Toplists.</li> </ul> </li> <li>▪ At end of Toplist period: Send data once a Toplist period is finished. <ul style="list-style-type: none"> <li>ⓘ This setting creates less bandwidth usage and CPU load, but you cannot see the data of the <b>current</b> Toplist in the PRTG web interface. You can only see Toplists with finished time periods.</li> </ul> </li> </ul> <p>■ For more information, see section <a href="#">Performance Considerations</a> <small>2710</small>.</p>
Memory Limit (MB)	<p>Define the maximum amount of memory (in megabytes) that the probe uses to collect the different connection information. Every Toplist adds its amount of used memory to the probe's memory consumption. Increase this value if the number of captured connections is not sufficient. Enter an integer.</p>

ⓘ Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

## Performance Considerations

If you create Toplists for data lines with considerable usage (for example, steady bandwidth over 10 megabits per second) or if the traffic is very diverse (for example, many IP addresses or ports with only little traffic each), consider the following aspects:

- The probe gathers all information that is needed for the Toplist in RAM during each Toplist period. By default, only the top 100 entries are transferred to the PRTG core server. Depending on the Toplist type and the traffic patterns, the required memory can consume many megabytes.
- Define Toplist periods that are as short as possible to minimize memory usage. This is especially important when the traffic is highly diverse.

- Memory requirements can grow almost exponentially with each Toplist field that you use in the Toplist definition (depending on the traffic pattern). Avoid complex Toplists for high and diverse traffic. For example, the Toplist Top Connections with 5 Toplist fields needs a lot more memory than the Toplist Top Talkers with 1 Toplist field.
- If you notice a high bandwidth usage between the PRTG core server and the probe, try the At end of Toplist period option in the [Toplist settings](#)<sup>[2709]</sup>.
- If you get [Data incomplete, memory limit was exceeded](#) messages, try to increase the memory limit in the Toplist settings but keep an eye on the memory usage of the probe process.
- To increase the performance of a Toplist, disable the reverse DNS lookup setting.

## Notes

- When you work with Toplists, be aware that privacy issues can come up for certain configurations of this feature. Using Toplists, you can track all single connections of an individual system to the outside world and you must make sure that it is legal for you to configure PRTG like this.
- Keep in mind that Toplists can be viewed in the PRTG web interface. You might not want to show lists of domains that are used in your network to others, so restrict [access rights](#)<sup>[145]</sup> to sensors that have Toplists.
- Toplist charts, for example for top connections, are not meant to be used for detailed analysis. Instead, they should indicate if there is an uncommon, bigger change in this Toplist.

## More

### KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

What options do I have to review my monitoring data in detail?

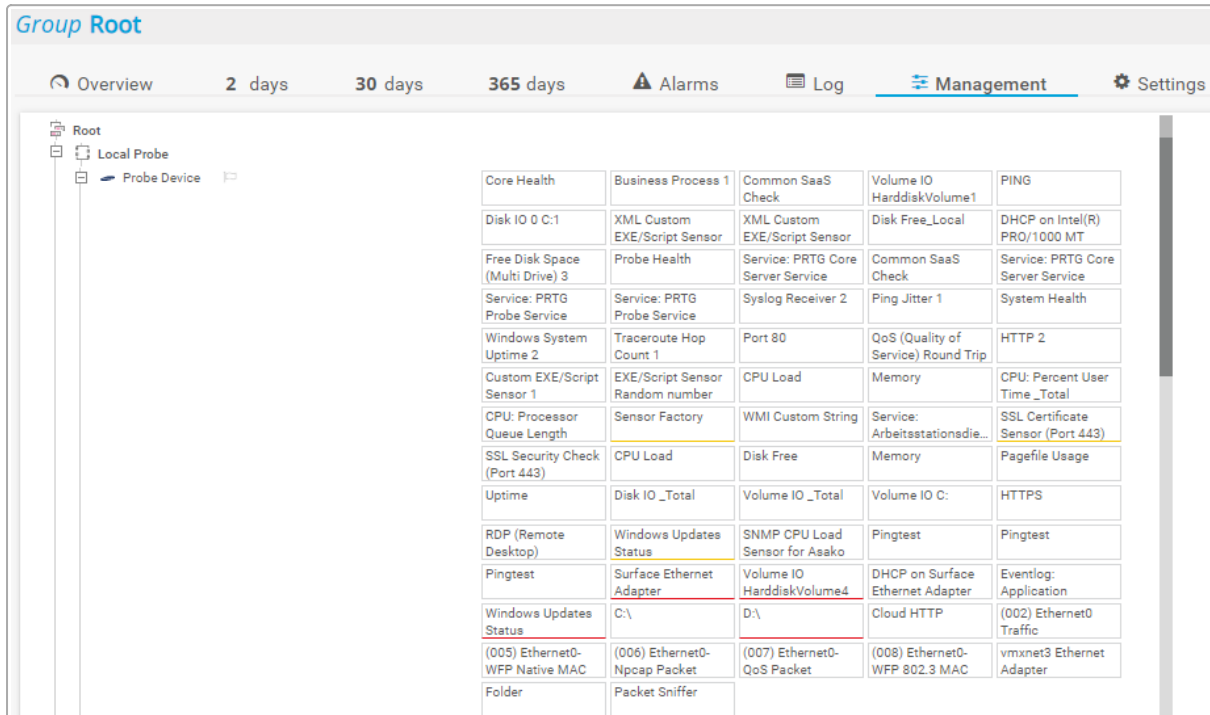

- <https://kb.paessler.com/en/topic/90007>

## 8.2 Move Objects

There are several options for moving objects in the device tree or for moving objects from one probe or group to a different probe or group.

### Probes or Groups: Management Tab

The Management tab is available when you view probes or groups. After you click this tab, you can directly move devices and sensors in the device tree via drag-and-drop.

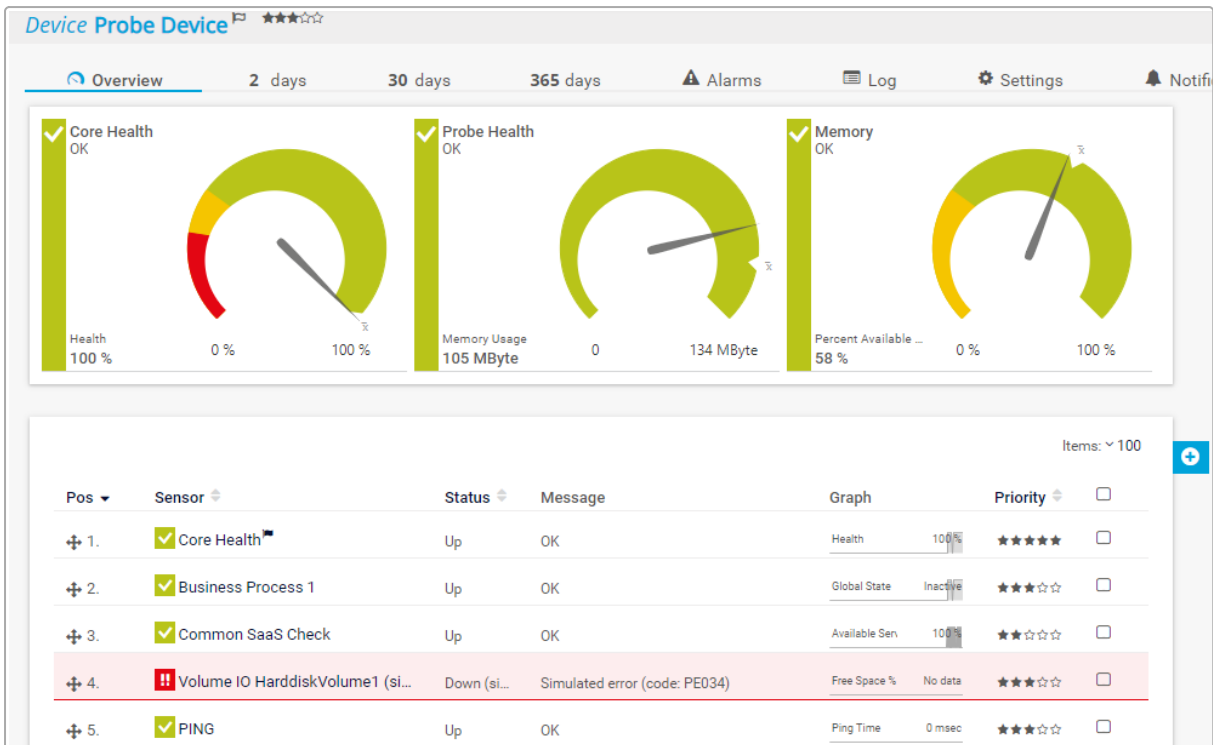

Move Objects on a Probe or Group

**i** If it is not possible to move an object, PRTG automatically starts a [clone](#) process.

**■** For more information, see section [Manage Device Tree](#).

### Devices: Overview Tab

When you view the Overview tab of a device, you see a list of all sensors on the device.

Move Sensors on a Device

Click the column headers Pos, Sensor, Status, or Priority to sort the sensor list. To change a sensor's position, click **+** at the beginning of the row, drag the sensor to the new position, and drop it.

### Context Menu: Move Option

Right-click any object in the device tree to show its [context menu](#). Hover over Move to open the Move menu. The following actions are available:

Move Context Menu

- Top: Move the object to the top of the parent object.
- Up: Move the object one entry up.
- Down: Move the object one entry down.
- Bottom: Move the object to the bottom of the parent object.
- Open the Management [tab](#) of the object. This setting is only available for probes and groups.

## 8.3 Clone Object

If you want to duplicate an object with the same settings, you can clone it. Cloning is available for groups, devices, and sensors.

### Rules

The following rules for cloning apply:

- The new object takes over all settings of the original object. This means, for example, that an [auto-discovery](#)<sup>[254]</sup> starts automatically on a cloned device if this setting is enabled on the original device.
- A cloned device contains all objects of the original device, regardless of whether they produce working sensors or not. This often depends on the settings of the cloned device.  
① This behavior is different from [creating a device template](#)<sup>[2725]</sup>.
- Cloned sensors initially show the Paused [status](#)<sup>[227]</sup> to give you the chance to change any settings before monitoring starts. Check the settings and [resume](#)<sup>[227]</sup> monitoring.
- You cannot clone [fixed](#) objects such as the root group, a probe device, or PRTG system-internal sensors.
- The [user account](#)<sup>[2901]</sup> that clones an object must have at least [read access](#)<sup>[145]</sup> to this object and all objects underneath in the [object hierarchy](#)<sup>[132]</sup>. The user group to which this user account belongs must have the [permission](#)<sup>[2914]</sup> to create all sensors that run on the device or group that they want to clone.

### Clone an Object

Right-click an object in the device tree and select Clone from the [context menu](#)<sup>[229]</sup> to open an assistant.

① If you want to clone a [sensor](#), a faster way is to manage the [manage device tree](#)<sup>[418]</sup>.

## Duplicate Sensors by Cloning

To duplicate a sensor by creating a clone of the sensor, select a parent device and enter a new name for the sensor.

**Note:** After you clone a sensor, PRTG sets the new sensor to the **Paused** status so that you can edit the sensor's settings before you actually start monitoring.

## Clone Object Settings

[Object] To Be Cloned

Several fields show information about the object that you want to clone. The available information varies depending on whether you clone a group, a device, or a sensor.

Name for New [Object]

Enter information for the new object as described below.

Field	Description
New [Object] Name	<p>Enter a name for the new object to identify it later, for example, in the device tree or in table lists. By default, PRTG uses the old name with the prefix <a href="#">Clone of</a>.</p> <p><b>i</b> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({}). For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
New IP Address/DNS Name	<p><a href="#">This setting is only available when you clone a device.</a></p> <p>Enter the IP address or Domain Name System (DNS) name for the new device.</p>
Service URL	<p><a href="#">This setting is only available when you clone a device.</a></p> <p>Specify a URL that you want to open directly when you select Device Tools   Go to Service URL from the context menu of the device. For example, you can configure this option to call the address <a href="http://www.example.com/service.html">http://www.example.com/service.html</a>. Enter a valid URL or leave the field empty.</p>

Parent [Object] for New [Object]

Use the [object selector](#)<sup>[222]</sup> to select the object to which you want to add the cloned object. If you clone a group or a device, select a group. If you clone a sensor, select a device.

Click Continue to clone the object.

## Results

After you clone an object, you can see the following:

- If you clone a sensor, the Overview tab of the new sensor opens.
- For more information about the Overview tab, see the Knowledge Base: [What options do I have to review my monitoring data in detail?](#)
- If you clone a group or a device, you stay on the same page.
- Cloned sensors initially show the Paused [status](#)<sup>[227]</sup> to give you the chance to change any settings before monitoring starts. Check the settings and [resume](#)<sup>[227]</sup> monitoring.

- <https://kb.paessler.com/en/topic/61108>

## 8.4 Multi-Edit

[Table lists](#) <sup>[218]</sup> offer the multi-edit feature. With this, you can bulk edit the properties of many objects. Multi-edit is also available on the Management tab of probes or groups when you hold down the Ctrl key to select multiple objects. See also section [Manage Device Tree](#) <sup>[418]</sup>.

**i** You cannot change every setting with multi-edit. PRTG only displays settings that all selected objects have in common.

Log Entries					
Date Time	Parent	Type	Object	Status	Message
05/10/2023 14:08:58	Probe Device	Local Folder (BETA)	Local Folder	Up	0 #

### Multi-Edit in Table Lists

In a table list, you can select several objects by enabling the check boxes on the right. You can also select all objects on the page at once by enabling the check box in the table header.

**i** Selecting all objects via the check box in the table header does not select all objects across multiple pages. It only selects all objects on the first page in most cases.

Sensors									
Sensor	Probe Group Device	Status	Last Value	Message	Graph	Priority	Fav.	Perf. Impact	<input type="checkbox"/>

Example of a Table List with Some Selected Objects

Use the Items option in the upper-right corner to view more items per page.

When you select one or more objects, the multi-edit menu appears in which different functions are available. The available menu options depend on the selected objects. For sensor lists, for example, some frequently used functions are Pause (⏸), Resume (▶), Scan Now (🔄), Delete (🗑), or Settings (⚙). Click a button to apply the respective function to all selected objects.

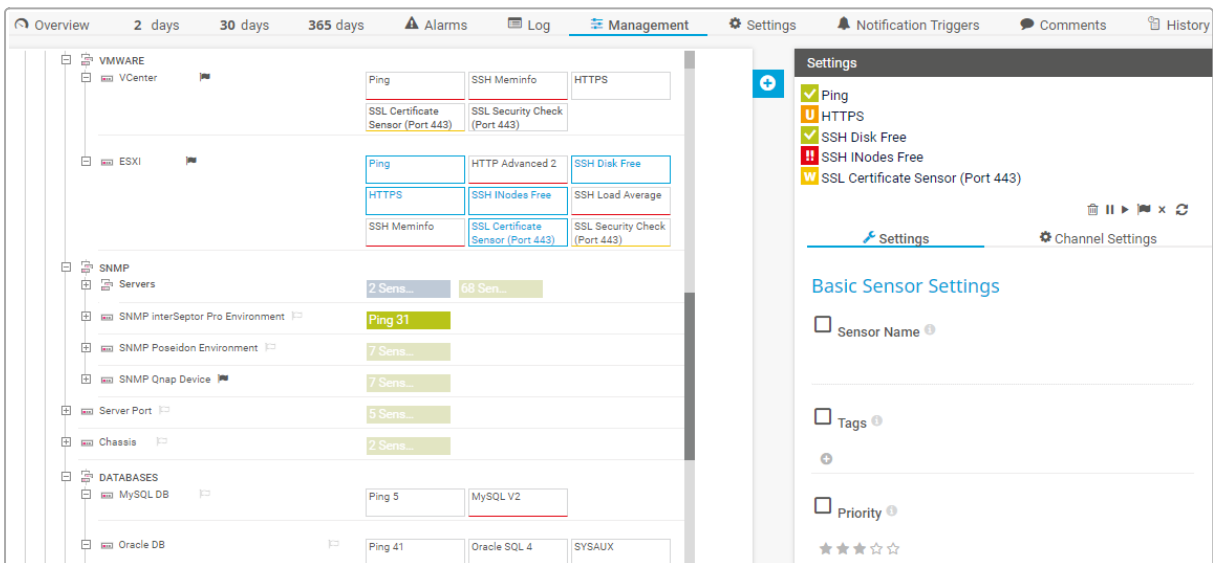

Multi-Edit Menu

### Multi-Edit on the Management Tab

The Management tab is available for probes and groups.

You can use multi-edit for object settings:

- Hold down the Ctrl key and select multiple objects of the same type, for example, multiple groups, devices, or sensors.
- In the dialog that appears, select the properties that you want to edit, change the respective settings, and click Save. The changes are applied to all selected objects.

Multi-Edit on the Management Tab

## Edit Object Settings

Click  in the multi-edit menu to open the Edit Multiple Objects dialog. This dialog shows most of the settings that the selected objects have in common. For example, you can edit the name, tags, priority, scanning interval, or access rights. The available options depend on the selected objects.

### Editing 2 Objects ✕

#### Edit Multiple Objects

Here you can edit one or more settings for selected objects of the same type, for example, groups, devices, or sensors. Enable the check box next to the settings that you want to change for all selected objects and enter or select a new value.

You are editing 2 objects (Show all objects):

## 8.5 Create Device Template

To add a specific device several times, you can create a device template from this device. When you create a device template, PRTG saves information for nearly all sensors on this device to a template file that you can later use in combination with the [auto-discovery](#) (restrictions apply for a few sensors). Custom device templates are also available in the [PRTG Sensor Hub](#).

In the device template, PRTG saves all relevant [sensor settings](#) except for settings that you set on other objects, such as [schedules](#), [notification triggers](#), and [access rights](#). PRTG automatically sets these settings to inherited settings.

To create a device template, right-click a device in your device tree. From the [context menu](#), select Create Device Template to open the Create Device Template dialog.

**Create Device Template for Probe Device**
✕

### Create Device Template

To create a device template that you can use for auto-discovery, you have to provide a template name in clear text. PRTG uses this name in the template list in the auto-discovery assistant. A device template contains an entry for every sensor of the selected device. This entry includes all relevant sensor settings except settings that refer to other objects like schedules, triggers, or access rights. PRTG reverts these settings to inherited settings when you create a sensor via a device template.

**Note:** There are sensors that you cannot save in a device template. For a list of these sensors, see the [PRTG Manual: Create Device Template](#).

### Enter Template Name

Template Name ⓘ

You can exclude sensors from the device template. Enable the check box in front of a sensor that you want to exclude.

**Note:** Sensors that you cannot save in a device template do not appear in this list.

**Note:** Sensors that dynamically scan for available monitoring items when you add the sensor to a device do not appear in this list. PRTG automatically includes these sensors in the device template if they support the device template functionality. You cannot exclude these sensors from the device template.

Create Device Template Assistant

## Template Settings

Setting	Description
Template Name	<p>Enter a display name to identify the device template.</p> <p><b>i</b> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Exclude Sensors	<p>Enable the check box in front of the sensors that you want to exclude from the device template.</p> <p><b>i</b> Sensors that you cannot save in device templates do not appear in this list.</p> <p><b>i</b> Sensors that dynamically scan for available monitoring items when you add the sensor to a device do not appear in this list. PRTG automatically includes these sensors in the device template if they support the device template functionality. You cannot exclude these sensors from the device template.</p>

**i** Click OK to save your settings. If you close the dialog without saving, all changes to the settings are lost.

**i** Device templates only save the sensors on the device and the sensors' settings including the [channel settings](#)<sup>[26831]</sup>. They do not save the device itself or the device's settings. To successfully create a device template, you must add sensors to the device (either [manually](#)<sup>[414]</sup> or via the auto-discovery) and the sensors must be [device template capable](#)<sup>[2727]</sup>.

After you save your device template file, you see a message where you can review the sensors that the new device template contains. Click OK to finish. PRTG stores the device template in the \devicetemplates subfolder of the [PRTG program directory](#)<sup>[3213]</sup>. Your device template file contains all sensors of the original device, including the sensors' settings.

Before the next auto-discovery, choose the Auto-discovery with specific device templates setting and select the name of your new device template from the list. PRTG then tries to discover the stored sensors. If the physical device answers to a sensor request, the sensor is added to the respective device in PRTG.

**■** For more information, see section [Auto-Discovery](#)<sup>[254]</sup>.

## Restrictions

There are a few settings that you cannot save in a device template so PRTG uses the default settings:

- The Dependency Type setting Master sensor for parent in the Schedules, Dependencies, and Maintenance Window section,
- The Result Handling setting Store result because this setting is only intended for debugging purposes,
- Settings in the Access Rights section to avoid security flaws, and

- Notification triggers settings that you set on other objects, for example, a device or group. PRTG saves, however, notification triggers settings that you set directly on a sensor.
- ⓘ In general, you cannot save all sensor settings and channel settings (for example, channel limits of dynamically created channels) of sensors that dynamically scan for available monitoring items when you add the sensor.

Furthermore, because of internal restrictions, PRTG does not save every sensor in a device template.

- For an overview list of all sensors, including their device template capability see section [Available Sensor Types](#) <sup>B232</sup>.

## Device Template Updates

Once a device template is created, it is not possible to add additional sensors to it via the PRTG web interface. If you want to create a device template with an extended set of sensors, you need to create a new template.

- ⓘ When you save a new device template, PRTG updates all internal sensor IDs in this template. Because of this, PRTG creates all sensors that the new device template contains anew on the device to which you apply the template, even if the same sensors have already been created on this device with a different device template.

- ⓘ You cannot delete device templates via the PRTG web interface.

- ☁ You cannot edit device template files in PRTG Hosted Monitor but you can upload the updated device template again. For more information, see section [Manage a PRTG Hosted Monitor Subscription](#).

## Device Template Filtering

You can include and exclude sensors from existing device templates. For more information, see the Knowledge Base: [How can I include and exclude sensors from device templates?](#)

## More

### ■ KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

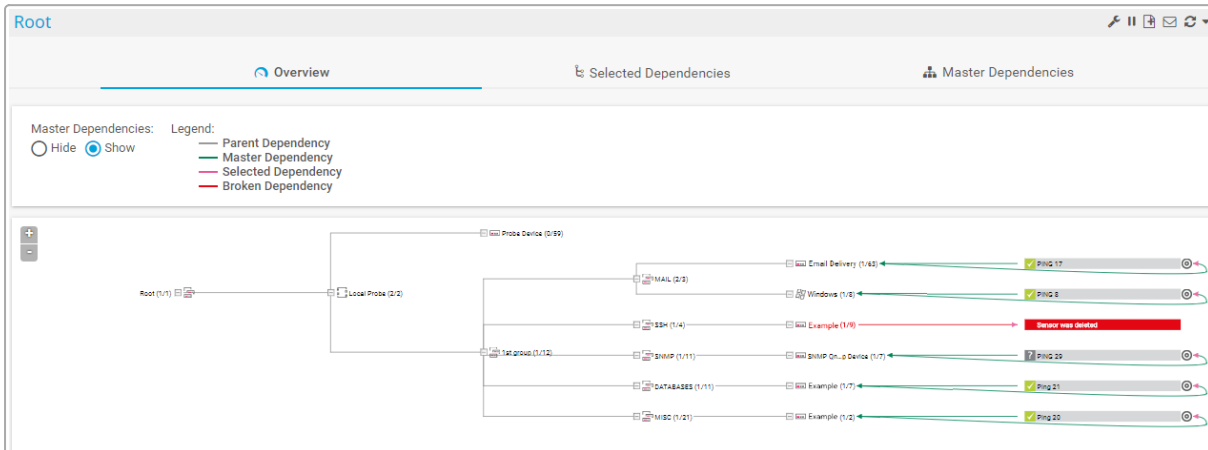

How can I include and exclude sensors from device templates?

- <https://kb.paessler.com/en/topic/89025>

## 8.6 Show Dependencies

The [Dependencies](#) <sup>140</sup> feature gives an overview of the dependencies that are configured for the objects in your setup.

To see an object's dependencies, select Devices | Dependencies from the [main menu bar](#) <sup>238</sup>.

Dependencies Graph View

Tab	Description
Overview	Shows the <a href="#">dependencies graph</a> <sup>2728</sup> . This is a visualization of device, group, and sensor dependencies. <b>i</b> To show the dependencies graph, you need to access the PRTG web interface as an administrator.
Selected Dependencies	Shows a table list of manually set dependencies (see the Dependency setting in section Schedules, Dependencies, and Maintenance Window in any object's settings).
Master Dependencies	Shows a table list of master dependencies.

### Dependencies Graph

The Overview [tab](#) <sup>170</sup> shows the device tree in the dependencies graph view. The lines in the dependencies graph symbolize dependencies between the monitoring objects in the device tree. Additionally, PRTG uses different [line colors](#) <sup>2729</sup> for the dependencies. You can also view the dependencies in different table lists on the Selected Dependencies tab or the Master Dependencies tab.

**i** To show the dependencies graph, you need to access the PRTG web interface as an administrator.

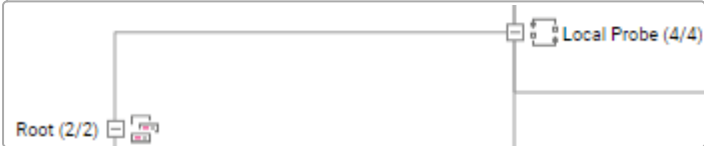

The following actions are available:

- Enable the Show or Hide option to show or hide master dependencies. Hide is enabled by default to only show parent dependencies, selected dependencies, and broken dependencies.
  - ⓘ For technical reasons, the Show and Hide radio buttons are not available in Internet Explorer. Use Google Chrome 75 or Mozilla Firefox 67 instead.
- Click  or  in the upper-left corner to zoom in or out of the dependencies graph.
- Click probe and group nodes to show the respective dependencies.
- Click device or sensor nodes to open the corresponding Overview tab.
- Click  or  to expand or collapse probe and group nodes.
- The numbers in parentheses indicate how many child nodes of an object are shown.

### Legend of Dependencies Graph

The line's colors show the kind and source of a dependency. This represents the Dependency Type as defined in the Schedules, Dependencies, and Maintenance Window settings of a [probe](#)<sup>[514]</sup>, [group](#)<sup>[588]</sup>, [device](#)<sup>[659]</sup>, or [sensor](#).

ⓘ You can also find the legend for the line colors in the graph header bar.

Color	Description
Gray	<p>Gray lines show a dependency by inheritance (Use parent (default) setting). The source of the dependency is the parent object on the left end of the line, for example, <a href="#">Root</a> is the parent of <a href="#">Local Probe</a>.</p>  <p style="text-align: center;">Gray Line for Parent Dependency</p>
Green	<p>Green lines show a master dependency for a device (Master sensor for parent setting). The sensor that is set as the master points to the dependent device with a green arrow head at the line's end. The arrow head from the dependent device to its master sensor is pink.</p>  <p style="text-align: center;">Green Line for Master Dependency</p>
Pink	<p>Pink lines show a dependency that you set manually (Select a sensor setting). The source of the dependency points to the dependant with a pink arrow at the line's end.</p>  <p style="text-align: center;">Pink Line for Selected Dependency</p>

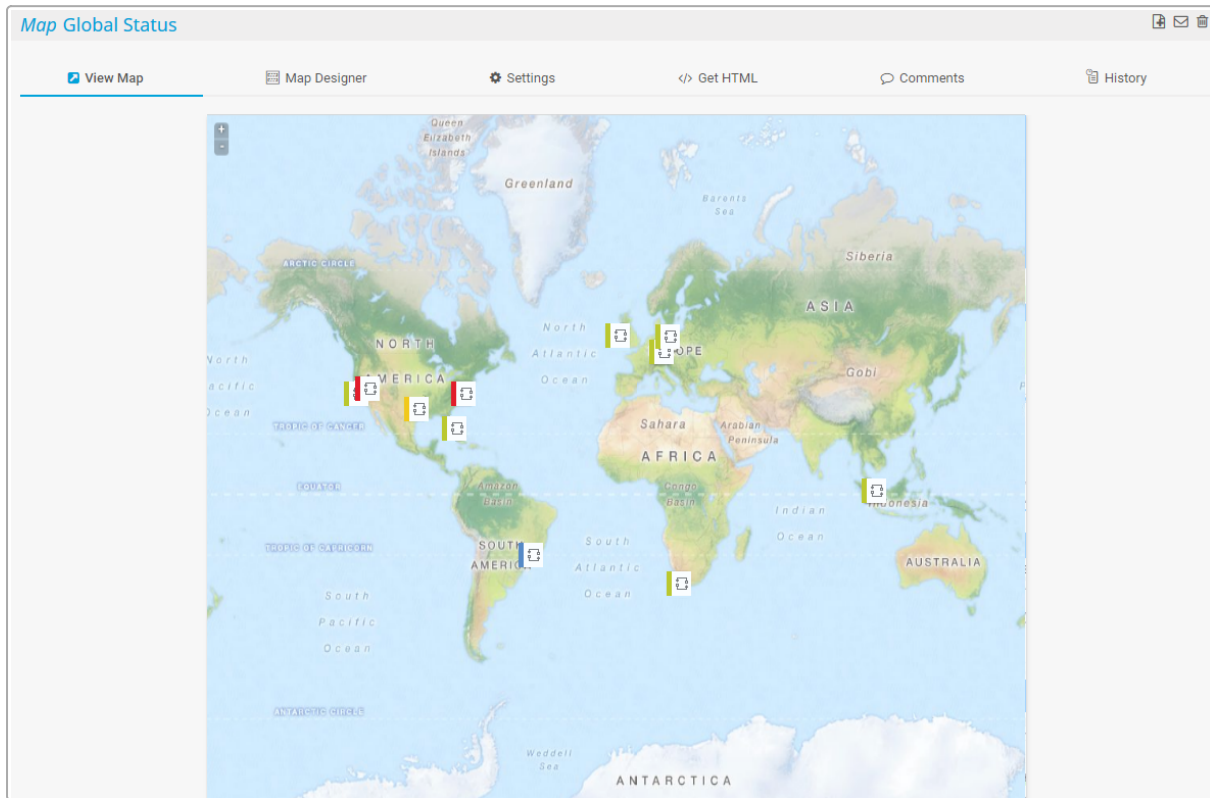

Color	Description
Red	<p>Red lines indicate broken dependencies, for example, if the master sensor is not available.</p>  <p>Red Line for Broken Dependency</p>

## 8.7 Geo Maps

With the [Geo Maps](#) feature, you can visualize geographical information about monitored objects that are located at different sites worldwide on one page. You can display the location of probes, groups, and devices in a geographical map on the Overview tab of an object or in [Maps](#)<sup>[2776]</sup>.

■ For more information about the Overview tab, see the Knowledge Base: [What options do I have to review my monitoring data in detail?](#)

Global Status of a Network in a Geographical Map

### Prerequisites

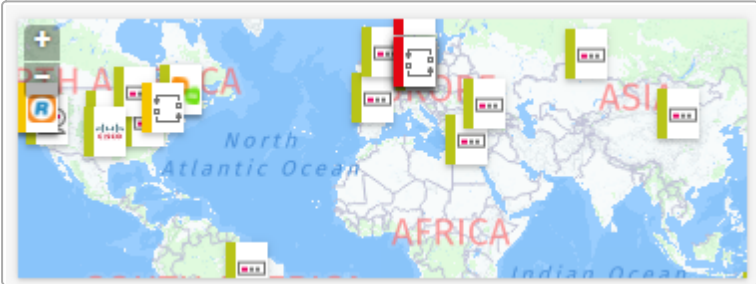

To use geographical maps and view them in the PRTG web interface, make sure that your PRTG core server has access to the internet to obtain map tiles. If a proxy is mandatory in your network, configure the according proxy settings.

■ For more information, see section [Core & Probes](#)<sup>[2888]</sup>.

■ For more information about map tile server domains, see the Knowledge Base: [Which domains and ports does the Geo Maps feature use?](#)

### Geo Maps Concepts

The Geo Maps feature works as follows:

Concept	Description
Location information	<p>Enter Location (for Geo Maps) information, for example, a city name, an address, or coordinates, for each probe, group, or device in the <a href="#">object's settings</a> [201]. The PRTG core server resolves your location specification to global geographical coordinates with the help of an external map service provider. PRTG uses this information to query a geographical map that shows your objects.</p> <p><b>i</b> You can use the first line of the location information field to <a href="#">label</a> [2732] your locations.</p>
Geo Maps settings	<p>Select a map service provider and the type of map that you want to view in the <a href="#">User Interface</a> [2659] settings in section Geo Maps. You can also disable the integration of Geo Maps there.</p> <p>PRTG connects to the specified maps service provider to get map tiles. These map tiles provide the geographical background map. PRTG then marks defined locations with a corresponding location marker that consists of an object icon and the object's <a href="#">status color</a> [2734].</p>  <p>Object Marker for a Group</p>
Geographical maps display	<p>You can display geographical maps in the device tree on an object's Overview tab. PRTG automatically adjusts the zoom level of a geographical map so that it can show all locations of a selected object.</p>  <p>Geographical Map on an Object's Overview Tab</p> <p>You can also add geographical maps to Maps. To do so, open the <a href="#">Map Designer</a> [2780] and click Geo Maps in the properties menu on the right.</p>

## Location Labels

You can define your own labels for locations of objects. To do so, enter the desired label in the [first line](#) of the Location (for Geo Maps) field in an object's settings and provide the geo coordinates of the location in the [second line](#). The object appears with the defined label in geographical maps. It is also possible to define the same label for different locations as long as the coordinates differ from each other.

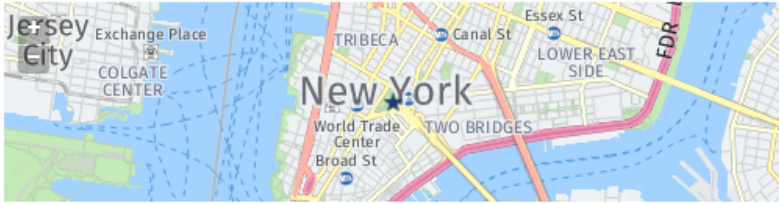

For example, enter the following information:

Big Apple  
40.712778,-74.005833

**Location**

inherit from

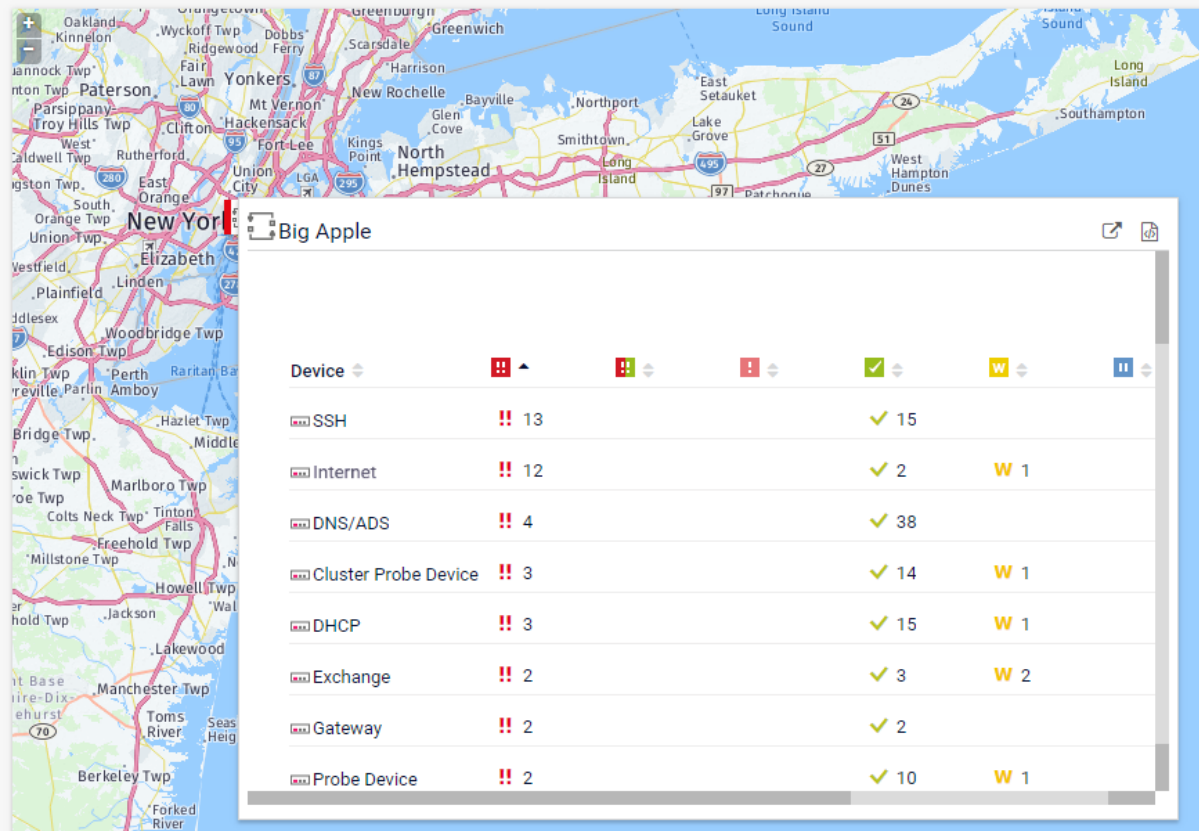

**Location (for Geo Maps) <sup>1</sup>**

Location New York with Geo Coordinates and Label Big Apple

The location **New York** appears on the geographical map with the label **Big Apple**:

**Geo Map for Root**

Device	!!	!	✓	W	
SSH	13		15		
Internet	12		2	1	
DNS/ADS	4		38		
Cluster Probe Device	3		14	1	
DHCP	3		15	1	
Exchange	2		3	2	
Gateway	2		2		
Probe Device	2		10	1	

Location New York with Label Big Apple

## Status Color of Location Markers

The location markers use different colors to show the overall monitoring status at this location.

 For an overview of the colors and their states, see section [Sensor States](#) <sup>181</sup>.

## 8.8 Notifications

PRTG uses notifications to send you an alert, for example, whenever PRTG discovers a defined [sensor status](#) <sup>[181]</sup> or when channels breach specific limits. You can define an unlimited number of notifications using one or more [notification methods](#) <sup>[2735]</sup>. PRTG sends notifications to a user's [notification contacts](#) <sup>[2842]</sup> that you can define for each user account.

▶ For more information, see the video tutorial: [Notifications](#).

### Overview

PRTG sends a notification when a defined event triggers it. The following events can trigger notifications:

Event	Examples
Sensor status change	<ul style="list-style-type: none"> <li>A sensor changes from the Up status to the Down or the Warning status because responses are slow.</li> <li>A sensor changes to the Unusual status.</li> </ul>
Sensor value threshold breach	<ul style="list-style-type: none"> <li>A sensor shows a request time that is higher than 1,000 ms for more than 30 minutes.</li> <li>Free disk space is below 10%.</li> </ul>
Speed threshold breach	A traffic sensor shows more than 1 Mbit/s for more than 5 minutes.
Volume threshold breach	A traffic sensor shows more than 1 GB transferred in 24 hours.
Sensor value change	A specific value changes, for example, when the sensor monitors files on a hard disk drive.

### Notification Methods

A notification can use one or more of the following notification methods:

- [Send Email](#) <sup>[2815]</sup>
- [Add Entry to Event Log](#) <sup>[2818]</sup>
- [Send SMS/Pager Message](#) <sup>[2819]</sup>
- [Execute HTTP Action](#) <sup>[2821]</sup>
- [Execute Program](#) <sup>[2823]</sup>
- [Send Syslog Message](#) <sup>[2824]</sup>
- [Send SNMP Trap](#) <sup>[2825]</sup>

- [Send Amazon Simple Notification Service Message](#) 
  - [Assign Ticket](#) 
  - [Send Push Notification](#) 
  - [Send Microsoft Teams Message](#) 
  - [Send Slack Message](#) 
  - [Send MQTT Publish Notification](#) 
  - [Send OPC UA Notification](#) 
- For more information, see section [Notification Templates](#) .

## Placeholders

Notifications can contain valuable sensor information that you can define via placeholders, for example:

- Last error message
- Last successful or failed request
- Total downtime
- Total uptime
- Recent sensor history
- A direct link to the PRTG web interface

■ For available placeholders, see section [Placeholders for Notifications](#) .

## Notifications Setup

You must take the following four steps to set up and use notifications:

1. Check and set up the [notification delivery](#)  settings if you use PRTG Network Monitor. These settings define how PRTG sends messages.
2. Check and set up [notification contacts](#)  for the user accounts. These contacts define the recipients to which PRTG sends notifications.
3. Check and set up several [notification templates](#) . These templates define the notification methods and their content.
  - ① You can also check or edit notification templates via the Notification Triggers tab. For more information, see section [Notification Triggers Settings](#) .
4. Check and set up [notification triggers settings](#)  for objects. These triggers define when PRTG sends notifications.

① Usually, there are three successive attempts to deliver a notification. If all of these attempts fail, the notification is lost. To never miss a notification, we recommend that you always set up at least two notifications with different notification methods for a notification trigger, for example, one email notification and one SMS notification. If delivery via email fails, PRTG can still notify you via smartphone as a fallback. For example, use the latency setting of a [state trigger](#)  to choose a notification with a different notification method than in the first trigger condition, or set up a second trigger with a different notification method for the corresponding object.

- For a detailed step-by-step guide, see the Paessler website: [How to set up notifications via the PRTG web interface](#).
- Custom notification scripts are also available in the [PRTG Sensor Hub](#).

## 8.9 Libraries

With the **Libraries** feature, you can create additional, customized views of your device tree.

▶ For more information, see the video tutorial: [Libraries in PRTG](#)

Example of a Library

In this section:

- [Introduction](#) <sup>2738</sup>
- [Preconfigured Libraries](#) <sup>2739</sup>
- [Libraries Menu](#) <sup>2739</sup>
- [Libraries List](#) <sup>2740</sup>
- [Working with Libraries](#) <sup>2740</sup>

### Introduction

With libraries, you can create custom device tree views of your network's status and monitoring data. PRTG updates these views in the same interval as your device tree. The library views display the same monitoring data, but arranged the way you want, for example, based on target groups or a specific use case. For example, you can create a library that contains an overview of all your bandwidth monitoring sensors, regardless of the device that they run on.

The Libraries feature includes the following options:

- Create libraries that contain library nodes with objects from your entire configuration.
- Show data from different probes in one library.
- Show different branches of your device tree right next to each other.
- Arrange sensors in a tree-like view regardless of the device that they run on.

- Filter your entire device tree or parts of it by sensor type, status, or tag, and only show matching sensors.

## Preconfigured Libraries

PRTG provides several preconfigured libraries that you can also edit or delete.

- ① Preconfigured libraries are only visible to administrators.

Object ▾	Security Context ⓘ	<input type="checkbox"/>
All bandwidth sensors	PRTG System Administrator	<input type="checkbox"/>
All CPU load sensors	PRTG System Administrator	<input type="checkbox"/>
All diskspace sensors	PRTG System Administrator	<input type="checkbox"/>
All memory sensors	PRTG System Administrator	<input type="checkbox"/>
All sensors grouped by state	PRTG System Administrator	<input type="checkbox"/>
All VMware sensors	PRTG System Administrator	<input type="checkbox"/>
Sensors grouped by priority	PRTG System Administrator	<input type="checkbox"/>

Preconfigured Libraries

The following libraries are automatically created when you install PRTG for the first time. Some of these libraries are initially empty, but as you add more sensors, PRTG automatically fills them according to the filter settings defined for the library nodes:

- All bandwidth sensors
- All CPU load sensors
- All diskspace sensors
- All memory sensors
- All sensors grouped by state
- All VMware sensors
- Sensors grouped by priority

- ① Sensors that you add to libraries do not count against the maximum number of sensors of your license.

## Libraries Menu

Click Libraries in the [main menu bar](#) <sup>[240]</sup> to open an overview list of all libraries. Hover over Libraries to show other options.

Option	Description
All	Open the Libraries list where you can view or add custom device tree views of your network status and monitoring data.
Add Library	Open a dialog to create a new library.
Select Library	Open a library. Hover over Select Library to show more options. Follow the alphabetical menu path that is specific to your setup to view your libraries. Click a library to open it.

## Libraries List

In the All view, you see a list of all libraries. Enable the check box next to a library and use the quick action buttons:

- Used by (👤): Show which objects use this library.
- Clone (📄): Create a [clone](#)<sup>[2714]</sup> of this library.
- Delete (🗑️): Delete this library.
- Settings (⚙️): Open this library and change the [settings](#)<sup>[2744]</sup> of the library and its library nodes.

To add a new library, hover over  and select Add Library from the menu.

■ See also sections [Working with Table Lists](#)<sup>[218]</sup> and [Multi-Edit](#)<sup>[2718]</sup>.

## Working with Libraries

For more information on how to work with libraries, see the following sections:

- [Library Management](#)<sup>[2741]</sup>
- [Libraries and Node Settings](#)<sup>[2744]</sup>
- [Library Context Menus](#)<sup>[2751]</sup>

## More

### ■ PAESSLER WEBSITE

How to use libraries in PRTG in 4 steps

- <https://www.paessler.com/support/how-to/libraries>

### ▶ VIDEO TUTORIAL

Libraries in PRTG

- <https://www.paessler.com/support/videos-and-webinars/videos/libraries>

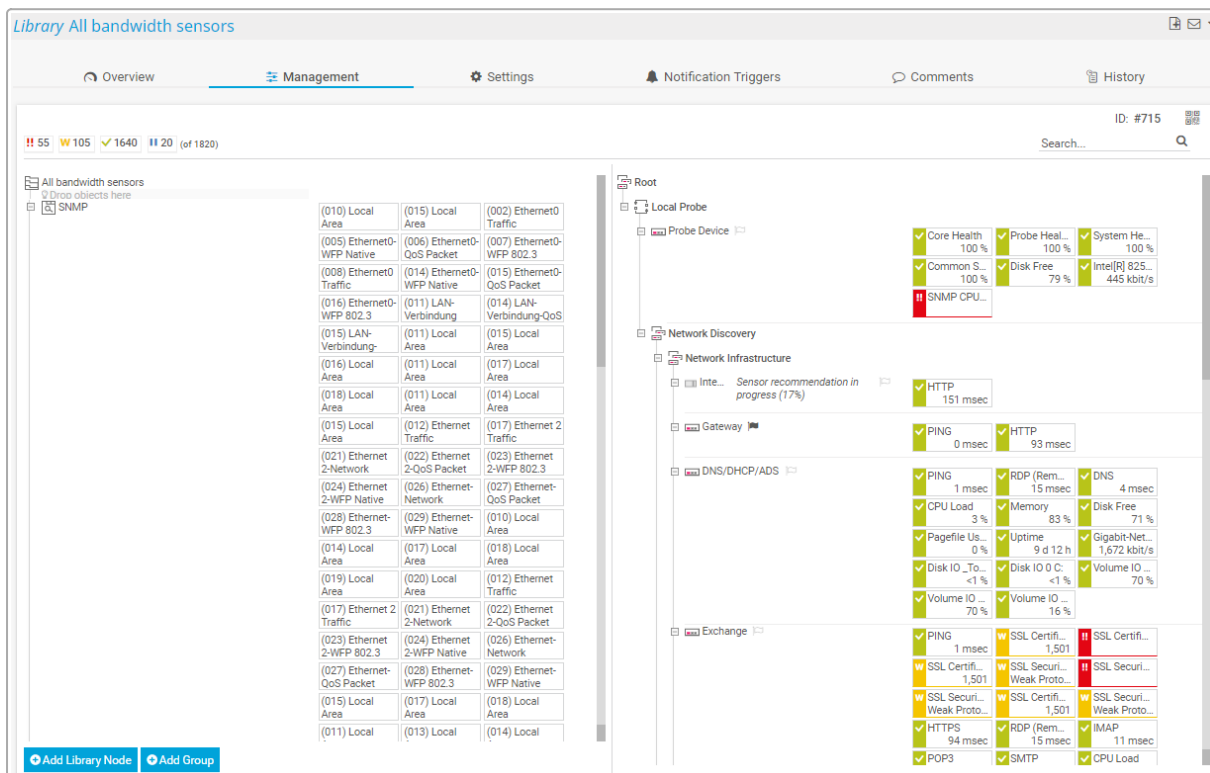

## 8.9.1 Library Management

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

You can manage your libraries by adding and editing library nodes and by defining which objects you want to see on a library node.

Click the Management tab. You see a split screen:

- On the left side, you can see your library. If you create a new library, it is empty in the beginning.
- On the right side, you see your device tree.

Bandwidth Library in Management Mode

### Add and Change Library Nodes

From the device tree on the right side, drag objects and drop them on the library on the left side. Each dropped object is immediately added as a new library node. Repeat this procedure as often as you wish until you have added all desired items to the library.

**i** Library nodes can contain up to 1,000 sensors. However, if you add single sensors to the library via the Management tab, there can only be one sensor in one library node.

Click Add Library Node or Add Group in the bottom-left corner of the split screen to create nested library nodes.

Drag and drop library nodes to change their position. If you want to change the monitoring object that is associated with a library node, you can change the Linked Object in the library node's settings.

## Set Library Node Display Settings

Right-click the name of a library node and select Edit | Settings from the [context menu](#) to change the Library Node Display Settings. In the dialog that appears, you can change the name of the library and its tags, as well as the linked object, the library node view, and filters. These settings are available for each library node.

Edit Library Node Display Settings

You can either show the Linked Object as a subtree of your device tree including probes, groups, and devices, or you can view all sensors underneath the Linked Object.

- When you select Show a subtree of the device tree (default), the library node called **My Sub Tree**, for example, looks like a branch in your device tree.

Library with One Node that Shows a Branch of the Device Tree

- When you select Show a collection of filtered sensors, PRTG only shows the sensors that are underneath the Linked Object in the device tree without probes, groups, and devices. You can additionally filter for certain sensor types, states, and tags. PRTG then only shows matching sensors. In the example screenshot, you can see the library node **My Sub Tree** where only bandwidth sensors are shown.

Library with One Node that Only Shows a Collection of Bandwidth Sensors

For more information, see section [Libraries and Node Settings](#) <sup>[2744]</sup>.

## Context Menu

You can right-click any object on a library's Overview tab or Management tab to open its context menu.

For more information, see section [Library Context Menus](#) <sup>[2751]</sup>.

## 8.9.2 Libraries and Node Settings

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

Use the library tabs to access all functionalities and settings of a library.

### Overview

Click the Overview tab to show the status of your library.

### Management

Click the Management tab to edit the contents of your library, for example, to add items to the library via drag-and-drop.

**■** For more information, see section [Library Management](#)<sup>[2741]</sup>.

### Library Node Settings

To change the settings of a library node, go to a library's Overview tab and click the name of a library node. You can also open the library node settings on the Management tab via the library node's [context menu](#)<sup>[2751]</sup>.

**i** You can only change the settings of a library node if it already contains monitoring objects like groups, devices, or sensors.

### Basic Library Node Settings

Setting	Description
Library Node Name	<p>Enter a name to identify the library node.</p> <p><b>i</b> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Security Context	<p>Define the security context for the Overview tab of the library. Select a user account from the dropdown list to define which objects are visible. All users with access to the library can only see the objects that the selected user account has the rights to view.</p> <p><b>i</b> Only sensors that are visible in the library trigger a <a href="#">notification</a><sup>[2735]</sup>.</p>

Setting	Description
	<p><b>i</b> Basically, the security context defines the minimum access rights to objects like libraries, reports, or maps, that a user account has. If the security context of an object is <a href="#">PRTG System Administrator</a>, for example, every user sees all objects in a library, in a report, or on a map, no matter what the particular user access rights are.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically <a href="#">inherited</a><sup>[138]</sup>.</p> <p><b>i</b> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (&lt;&gt;).</p> <p><b>i</b> For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

### Library Node Display Settings

Setting	Description
Linked Object	<p>Click  and use the <a href="#">object selector</a><sup>[222]</sup> to change the object in the device tree that the library node references.</p>
Library Node View	<p>Select how you want to view the objects that PRTG shows underneath the library node:</p> <ul style="list-style-type: none"> <li>Show a subtree of the device tree (default): View all objects underneath the linked object as you can see them in the device tree, including probes, groups, and devices.</li> <li>Show a collection of filtered sensors: Only view the sensors underneath the linked object without probes, groups, and devices. You can use filters to show only specific sensors.</li> </ul> <p><b>i</b> The library node can show up to 1,000 sensors. PRTG discards further sensors.</p>
Filter by Sensor Type	<p><b>This setting is only visible if you select</b> Show a collection of filtered sensors <a href="#">above</a>.</p> <p>Select if you want to filter the displayed sensors by specific sensor types:</p> <ul style="list-style-type: none"> <li>Show all sensor types (default): Do not filter by sensor types.</li> <li>Show only specific sensor types: Filter the displayed sensors by specific sensor types.</li> </ul>

Setting	Description
	<p><b>i</b> PRTG applies this filter in real time. If the configuration underneath the linked object changes, the library node accordingly shows matching sensors.</p>
<p>Sensor Types</p>	<p><b>This setting is only visible if you select</b> Show only specific sensor types <a href="#">above</a>.</p> <p>You can see a list of all sensor types. PRTG displays sensors that are in use in bold print.</p> <p>Enable the check box in front of a sensor type that you want to include in the library node view.</p> <p><b>i</b> You can also select all items or cancel the selection by using the check box in the table header.</p> <p><b>i</b> PRTG applies this filter in real time. If the configuration underneath the linked object changes, the library node accordingly shows matching sensors.</p> <p><b>i</b> You cannot filter for sensor types that are defined in mini probes.</p>
<p>Filter by Sensor Status</p>	<p><b>This setting is only visible if you select</b> Show a collection of filtered sensors <a href="#">above</a>.</p> <p>Select if you want to filter the displayed sensors by specific sensor states:</p> <ul style="list-style-type: none"> <li>▪ Show all sensor states: Do not filter by sensor status.</li> <li>▪ Show only sensors in specific states: Filter the displayed sensors by specific sensor states.</li> </ul>
<p>Sensor States</p>	<p><b>This setting is only visible if you select</b> Show only sensors in specific states <a href="#">above</a>.</p> <p>You can see a list of all sensor states. Enable the check box in front of a sensor status to include all sensors that show this status in the library node view:</p> <ul style="list-style-type: none"> <li>▪ Unknown</li> <li>▪ Up</li> <li>▪ Warning</li> <li>▪ Down</li> <li>▪ Paused by user</li> <li>▪ Unusual</li> <li>▪ Down (Acknowledged)</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Down (Partial)</li> </ul> <p><b>i</b> You can also select all items or cancel the selection by using the check box in the table header.</p> <p><b>i</b> PRTG applies this filter in real time. If the configuration underneath the linked object changes, the library node accordingly shows matching sensors.</p>
Filter by Tag	<p><b>This setting is only visible if you select</b> Show a collection of filtered sensors <a href="#">above</a>.</p> <p>Select if you want to filter the displayed sensors by specific tags:</p> <ul style="list-style-type: none"> <li>▪ Show all tags: Do not filter by tag.</li> <li>▪ Show only sensors with specific tags: Filter the displayed sensors by specific tags.</li> </ul>
Tags	<p><b>This setting is only visible if you select</b> Show only sensors with specific tags <a href="#">above</a>.</p> <p>Enter one or more tags for sensors that you want to include in the library node view. You can also use the plus sign (+) or the minus sign (-) to categorize tags as <b>must have</b> or <b>must not have</b>, for example, <b>+snmp;-wmi</b> (must have the tag <b>snmp</b> and must not have the tag <b>wmi</b>).</p> <p><b>i</b> The tag of a sensor can also be inherited from a parent object.</p> <p><b>i</b> For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p><b>i</b> PRTG applies this filter in real time. If the configuration underneath the linked object changes, the library node accordingly shows matching sensors.</p>
Filter by Priority	<p><b>This setting is only visible if you select</b> Show a collection of filtered sensors <a href="#">above</a>.</p> <p>Select if you want to filter the displayed sensors by specific <a href="#">priorities</a> <sup>224</sup>:</p> <ul style="list-style-type: none"> <li>▪ Show all priorities: Do not filter by priority.</li> <li>▪ Show only sensors with specific priorities: Filter the displayed sensors by specific priorities.</li> </ul> <p><b>i</b> PRTG ignores the priority settings of a parent object. It only regards the priority setting of the sensor itself.</p>
Priorities	<p><b>This setting is only visible if you select</b> Show only sensors with specific priorities <a href="#">above</a>.</p>

Setting	Description
	<p>You can see a list of all available priorities. Enable the check box in front of a priority to include all sensors that have this priority in the library node view:</p> <ul style="list-style-type: none"> <li>▪ ***** (highest priority)</li> <li>▪ ****</li> <li>▪ ***</li> <li>▪ **</li> <li>▪ * (lowest priority)</li> </ul> <p><b>i</b> PRTG applies this filter in real time. If the configuration underneath the linked object changes, the library node accordingly shows matching sensors.</p>

**i** Click OK to save your settings. If you close the dialog without saving, all changes to the settings are lost.

**i** After you apply filters, it might take several seconds for the changes to become visible. This is because of internal filter processes that run in the background.

## Settings

Click the Settings tab to open a library's general settings.

### Basic Library Node Settings

Setting	Description
Library Node Name	<p>Enter a name to identify the library.</p> <p><b>i</b> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Security Context	<p>Define the security context for the Overview tab of the library. Select a user account from the dropdown list to define which objects are visible. All users with access to the library can only see the objects that the selected user account has the rights to view.</p> <p><b>i</b> Only sensors that are visible in the library trigger a <a href="#">notification</a><sup>2735</sup>.</p> <p><b>i</b> Basically, the security context defines the minimum access rights to objects like libraries, reports, or maps, that a user account has. If the security context of an object is <a href="#">PRTG System Administrator</a>, for example, every user sees all objects in a library, in a report, or on a map, no matter what the particular user access rights are.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically <a href="#">inherited</a><sup>138</sup>.</p> <p><b>i</b> For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

## Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the object. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> <li>▪ No access: Users in this user group cannot see or edit the object. The object does not show up in lists.</li> <li>▪ Read access: Users in this user group can see the object and view its settings.</li> <li>▪ Write access: Users in this user group can see the object and view and edit its settings. However, they cannot edit the object's access rights settings.</li> <li>▪ Full access: Users in this user group can see the object, view and edit its settings, and edit its access rights settings.</li> </ul> <p><b>i</b> You can create new user groups in the <a href="#">User Groups</a><sup>2912</sup> settings.</p>

**i** When you give access rights to a user group, all user group members can see the objects in the respective library.

**i** Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

## Notification Triggers

You can define notification triggers for any kind of library, also for dynamic libraries that can change with every scanning interval, for example, when you filter a library by sensor status or priority.

## Comments

On the Comments tab, you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

## History

On the History tab, all changes in the settings of an object are logged with a time stamp, the name of the user who made the change, and a message. The history log retains the last 100 entries.

## Delete

You can delete the entire library at any time. Right-click a library's name and select Delete from the context menu.

## More

### ■ KNOWLEDGE BASE

What security features does PRTG include?

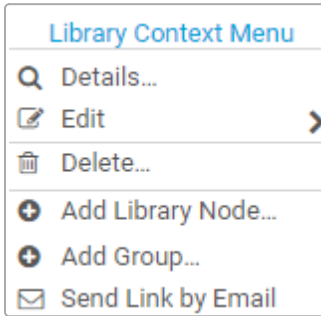

- <https://kb.paessler.com/en/topic/61108>

### 8.9.3 Library Context Menus

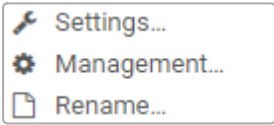

Right-click a library or a library node on a library's Overview tab or Management tab to show its context menu.

#### Library Context Menu

The Library Context Menu contains actions for your libraries.

Library Context Menu

Action	Description
Details	<p>Show the Overview tab of the object.</p> <p>■ For more information about the Overview tab, see the Knowledge Base: <a href="#">What options do I have to review my monitoring data in detail?</a></p>
Edit	<p>Hover over Edit to show the Edit menu. The following actions are available:</p>  <p>Edit Context Menu</p> <ul style="list-style-type: none"> <li>▪ Settings: Open a dialog to edit the <a href="#">library settings</a><sup>[2748]</sup>.</li> <li>▪ Management: Open the Management <a href="#">tab</a><sup>[2741]</sup> of the library.</li> <li>▪ Rename: Open a dialog to edit the name of the object.</li> </ul>
Delete	<p>Delete the object. PRTG asks for confirmation before it actually deletes an object.</p>
Add Library Node	<p>Add a new library node to the library.</p>
Add Group	<p>Add a group to the library to create nested library nodes.</p>

Action	Description
Send Link by Email	Send a link to the object by email. Click to create a new email with your system's standard email client. The email contains a direct link to the Overview tab of the object.

## Library Node Menu

The Library Node Menu contains actions for your library nodes.

Action	Description
Details	Show the Overview tab of the object.  ■ For more information about the Overview tab, see the Knowledge Base: <a href="#">What options do I have to review my monitoring data in detail?</a>
Edit	Hover over Edit to show the Edit menu. The following actions are available: <ul style="list-style-type: none"> <li>▪ Settings: Open a dialog to edit the <a href="#">library node settings</a> .</li> <li>▪ Rename: Open a dialog to edit the name of the object.</li> </ul>
Delete from Library	Delete the object. PRTG asks for confirmation before it actually deletes an object.
Move	Hover over Move to open the Move menu. The following actions are available: <div style="border: 1px solid gray; padding: 5px; margin: 10px 0;"> <ul style="list-style-type: none"> <li> Top</li> <li> Up</li> <li> Down</li> <li> Bottom</li> </ul> </div> <p style="text-align: center; margin: 0;">Move Context Menu</p> <ul style="list-style-type: none"> <li>▪ Top: Move the library node to the top of the library.</li> </ul>

Action	Description
	<ul style="list-style-type: none"><li>▪ Up Move the library node one entry up.</li><li>▪ Down: Move the library node one entry down.</li><li>▪ Bottom Move the library node to the bottom of the library.</li></ul>
Send Link by Email	Send a link to the object by email. Click to create a new email with your system's standard email client. The email contains a direct link to the Overview tab of the object.

## More

### KNOWLEDGE BASE

What options do I have to review my monitoring data in detail?

- <https://kb.paessler.com/en/topic/90007>

## 8.10 Reports

With the [Reports](#) feature, you can view and analyze historic monitoring results for a specific period of time or for your system configuration. You can create reports for all sensors or only for specific sensors.

Example of a Report

**i** The report above shows the report data for devices on a local probe. You can see graphs for the preceding week and data tables with numeric results.

In this section:

- [Introduction](#) <sup>[2755]</sup>
- [Reports Menu](#) <sup>[2755]</sup>
- [Reports List](#) <sup>[2756]</sup>
- [Configuration Reports](#) <sup>[2757]</sup>

- [Automatic Averaging](#)<sup>[2757]</sup>

## Introduction

You can generate reports on demand or via schedules in HTML and PDF format, as well as in comma-separated values (CSV) and Extensible Markup Language (XML) format. Furthermore, you can create reports for a single sensor or for a whole range of sensors. It is also possible to [create HTML reports of your system configuration](#)<sup>[2757]</sup>.

Report templates define the overall look of your report and in which detail the report shows monitoring data.

## Preconfigured Reports

PRTG provides several preconfigured reports that you can also edit or delete:

- Summary report for all sensors
- Top 100 Busy/Idle Processor Sensors
- Top 100 Fastest/Slowest HTTP Sensors
- Top 100 Fastest/Slowest Ping Sensors
- Top 100 Free/Full Disk Space Sensors
- Top 100 Most/Least Used Bandwidth Sensors
- Top 100 Most/Least Used Memory Sensors
- Top 100 Uptime/Downtime Report

## Reports Menu

Click Reports in the [main menu bar](#)<sup>[245]</sup> to open an overview list of all reports about monitoring data. Hover over Reports to show other options.

Option	Description
All	Open the Reports list where you can view or add reports about your monitoring data.
Add Report	Open a dialog to create a new report.
Select Report	Hover over Select Report to show a list of your reports about monitoring data. Click a report to open it.
Configuration Reports	Hover over Configuration Reports to see the available <a href="#">configuration reports</a> <sup>[2757]</sup> . Select an item to create reports for maps, reports, users and user groups, and system configuration to document changes to the configuration.

## Reports List

In the All view, you see a list of all reports about monitoring data.

Reports					
Object ▾	Template ▾	Security Context ▾	Period ▾	Schedule ▾	
<input checked="" type="checkbox"/> Summary report for all sensors	List of sensors (with 1 h graph)	PRTG System Admi...	Day	None	
<input checked="" type="checkbox"/> Top 100 Busy/Idle Processor Sensors	Top 100 highest and lowest (5 ...	PRTG System Admi...	Day	None	
<input checked="" type="checkbox"/> Top 100 Fastest/Slowest HTTP Sensors	Top 100 highest and lowest (5 ...	PRTG System Admi...	Day	None	
<input checked="" type="checkbox"/> Top 100 Fastest/Slowest Ping Sensors	Top 100 highest and lowest (5 ...	PRTG System Admi...	Day	None	
<input checked="" type="checkbox"/> Top 100 Free/Full Disk Space Sensors	Top 100 highest and lowest (5 ...	PRTG System Admi...	Day	None	
<input checked="" type="checkbox"/> Top 100 Most/Least Used Bandwidth S...	Top 100 highest and lowest (5 ...	PRTG System Admi...	Day	None	
<input checked="" type="checkbox"/> Top 100 Most/Least Used Memory Sen...	Top 100 highest and lowest (5 ...	PRTG System Admi...	Day	None	
<input checked="" type="checkbox"/> Top 100 Uptime/Downtime Report	Top 100 uptime and downtime...	PRTG System Admi...	Day	None	

List of Reports

Section	Description
Object	Shows the name of the report.
Template	Shows the name of the template that this report uses.
Security Context	Shows the user account that PRTG uses to run the report. This user account defines which objects are visible in the report. For more information, see section <a href="#">Report Settings</a> <sup>2764</sup> .
Period	Shows the time span that the report covers.
Schedule	Shows if you set a schedule to automatically run the report in a regular interval. For more information, see section <a href="#">Report Settings</a> <sup>2764</sup> .
Email	Shows the email address to which PRTG automatically sends the report if you set a schedule <b>and</b> entered an email address in the report settings.
Status	Shows the status of the report.

Section	Description
Next Run	Shows the date and time at which PRTG runs the report the next time if you set a schedule in the report settings.
Last Run	Shows the date and time at which PRTG ran the report the last time if you set a schedule in the report settings.
# Sensors in Last Run	Shows the number of sensors whose data was included when PRTG last ran the report.

Click the name of a report about monitoring data to open the Run Now tab.

**i** You can only run configuration reports via the main menu bar.

Enable the check box next to a report and use the quick action buttons:

- Clone (clone<sup>[2714]</sup> of this report.
- Delete (settings<sup>[2764]</sup>.

To add a new report, hover over  and select Add Report from the menu.

 See also sections [Working with Table Lists](#)<sup>[218]</sup> and [Multi-Edit](#)<sup>[2718]</sup>.

## Configuration Reports

Configuration reports show the PRTG configuration. They are available for Maps, Reports, Users & User Groups, and System Configuration. PRTG directly displays a configuration report in a new browser window as an HTML page. You can use configuration reports, for example, to file and document changes to the PRTG configuration.

Configuration reports contain the same information as you can see on the [Maps](#)<sup>[2776]</sup> overview, the [Reports](#)<sup>[2754]</sup> overview, and on the [User Accounts](#)<sup>[2901]</sup> and [User Groups](#)<sup>[2912]</sup> tabs of the system administration settings. The configuration report System Configuration includes the system administration settings of the [User Interface](#)<sup>[2855]</sup>, [Monitoring](#)<sup>[2869]</sup>, [Notification Delivery](#)<sup>[2877]</sup>, [Core & Probes](#)<sup>[2887]</sup>, and [Cluster](#)<sup>[2923]</sup> tabs.

**i** Configuration reports are interactive. You can click available links to go to the corresponding pages in the PRTG web interface.

## Automatic Averaging

For performance reasons, PRTG automatically averages monitoring data when it calculates data for large periods of time.

Period of Time in Report	Minimum Level of Detail (Averaging Interval)
Up to 40 days	Any
40 to 500 days	60 minutes/1 hour or longer

**i** Reports for periods that are longer than 500 days are not possible. If you enter a longer period, PRTG automatically shortens it to 365 days.

**i** In some cases, the generated report might contain a period of time that differs from the defined start and end date for the report because of internal averaging processes. When averaging intervals are longer than 1 hour and do not equal 24 hours, and when they are combined with specific periods of time, the resulting data points might be asynchronous to the periods of time. Consider this behavior particularly if you use [application programming interface \(API\) calls](#) <sup>3084</sup> to generate reports.

## More

**■** PAESSLER WEBSITE

How to set up reports in PRTG in 5 easy steps

- <https://www.paessler.com/support/how-to/reports>

## 8.10.1 Run Reports

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

### Run Now

On the Run Now tab, you can immediately run a report with the settings that you defined before.

**i** When you set up or run a report, also keep in mind the [remarks for reports](#) <sup>2762</sup>.

Run Report on Demand

### Report Period

Setting	Description
Period	<p>Define the time span that the report covers:</p> <ul style="list-style-type: none"> <li>Current period: This week [date range]: Use monitoring data of the current period. The actual time span depends on the report period that you define in the <a href="#">report settings</a> <sup>2764</sup>. It can be today, this week, this month, or this year.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Previous period: Last week [<a href="#">date range</a>]: Use monitoring data of the previous period. The actual time span depends on the report period that you define in the report settings. It can be yesterday, last week, last month, or last year.</li> <li>▪ Select a predefined date range: Use monitoring data of a predefined period other than the current or the previous period. Select from a list of date ranges below.</li> <li>▪ Define a custom date range: Use monitoring data of a custom period. Set the start and end date below or choose from several quick range buttons.</li> </ul>
Date Range	<p><a href="#">This setting is only visible if you select</a> Select a predefined date range <a href="#">above</a>.</p> <p>From the list, select a date range for which PRTG generates the report. The shown time spans depend on the available monitoring data and on the report period that you define in the report settings. It can be days, weeks, months, or years.</p>
Start Date	<p><a href="#">This setting is only visible if you select</a> Define a custom date range <a href="#">above</a>.</p> <p>Set the start date of the time span for which PRTG generates the report. Use the date time picker to enter the date and time. Make sure that you define a valid period.</p>
End Date	<p><a href="#">This setting is only visible if you select</a> Define a custom date range <a href="#">above</a>.</p> <p>Set the end date of the time span for which PRTG generates the report. Use the date time picker to enter the date and time. Make sure that you define a valid period.</p>
Quick Range	<p><a href="#">This setting is only visible if you select</a> Define a custom date range <a href="#">above</a>.</p> <p>Use the buttons to quickly set the start and end dates for the report:</p> <ul style="list-style-type: none"> <li>▪ Today</li> <li>▪ Yesterday</li> <li>▪ Last Week (Mo-Su)</li> <li>▪ Last Week (Su-Sa)</li> <li>▪ Last Month</li> <li>▪ 2 Months</li> <li>▪ 6 Months</li> <li>▪ 12 Months</li> </ul>

Setting	Description
	<p><b>i</b> PRTG sets the <a href="#">date range</a> <sup>[220]</sup> to the last matching period. It starts at 00:00 and ends at 00:00 of the following day.</p>

## Report Processing

**i** This section is not visible for read-only users.

Setting	Description
File Format and Delivery	<p>Define how you want to view the report:</p> <ul style="list-style-type: none"> <li>▪ View report as HTML: Directly view the report in a new browser window or tab.</li> <li>▪ Create and store .pdf and data files: Create a .pdf file and, depending on the <a href="#">Data Files</a> <sup>[2772]</sup> setting, create data files of the report and store it. You find the stored report files on the Stored Reports tab. You also receive a ToDo ticket. By default, PRTG sends out a notification email to administrators in this case.</li> <li>▪ Create and store .pdf and data files and send them by email: Create a .pdf file and, depending on the Data Files setting, create data files of the report, store the files, and send them via email to the email address that you define below. You can find the stored report files on the Stored Reports tab.</li> </ul> <p><b>i</b> PRTG only generates .csv and .xml data files for report templates that include data tables.</p> <p><b>i</b> To create .pdf files, make sure that the print spooler service runs on the PRTG core server system.</p> <p><b>i</b> Some special characters, for example, 4-byte unicode characters, might not be displayed correctly in PDF reports. As a workaround, we recommend that you generate an HTML report and save it as a .pdf file.</p> <p><b>i</b> If you generate reports with Internet Explorer 11, we recommend that you use one of the PDF options for optimal results.</p>
Target Email Address	<p><b>This setting is only visible if you select</b> Create and store .pdf and data files and send them by email <b>above</b>.</p> <p>Enter one or more valid email addresses to which PRTG sends the report. Use commas to separate email addresses.</p> <p><b>i</b> PRTG sends an email to all recipients. All recipients appear in the To field of the email.</p>

Setting	Description
	<p><b>i</b> You can change the configuration for outgoing emails in the <a href="#">Notification Delivery</a> settings.</p>
File Compression	<p>This setting is only visible if you select Create and store .pdf and data files and send them by email above.</p> <p>Define if PRTG compresses the attached report files before it sends them:</p> <ul style="list-style-type: none"> <li>▪ Send files without compression: PRTG sends the report files by email in their original size.</li> <li>▪ Compress files in a .zip file: PRTG compresses the report files to a .zip file before they are sent by email.</li> </ul>

Click Run Report to start the report generation. Depending on the number of selected sensors, this might take a while. If it takes a long time to generate HTML reports, consider using one of the PDF options.

## Remarks for Reports

- Any sensor graph in your report only shows channels that you select via the Show in graphs option in the [channel settings](#).
- Reports show statistics for the uptime (the Up and Down [states](#) in percent) and for requests (Good and Failed in percent). PRTG rounds values between 5% and 95%, as well as 100% and 0%, to whole numbers without decimal places. Other values are shown with 3 decimal places.
- Because PRTG rounds values, the statistics in the report section Sensor Status History can differ from the values in the report section Uptime Stats by a few seconds.
- PRTG limits data reporting to 5 requests per minute.
- Reports cannot show uptime or downtime data for the [Sensor Factory](#) sensor.
- Create reports that include an appropriate amount of data. Reports might not work as expected if PRTG has to process too many sensors with short scanning intervals. Adjust your report size and the time span that the report covers, if necessary.

## Stored Reports

On the Stored Reports tab, you can view all PDF reports and data files that you created and stored.

Click a name to open the report. PRTG stores reports until they are deleted according to the [data purging settings](#) of your PRTG configuration.

## Other Tabs

For all other tabs, see section [Report Settings](#).

- [Comments](#)<sup>[2775]</sup>

### Settings

Click the Settings tab to open the settings of a report.

**i** When you set up or run a report, also keep in mind the [remarks for reports](#)<sup>[2762]</sup>.

### Basic Report Settings

Setting	Description
Report Name	<p>Enter a name to identify the report. PRTG uses the name in <a href="#">reports lists</a><sup>[245]</sup> and as the title of generated reports.</p> <p><b>i</b> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically <a href="#">inherited</a><sup>[138]</sup>.</p>

Setting	Description
	<ul style="list-style-type: none"> <li data-bbox="488 387 1294 454">❗ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (&lt;&gt;).</li> <li data-bbox="488 488 1294 555">❗ For performance reasons, it can take some minutes until you can filter for new tags that you added.</li> </ul>
Report Template	<p data-bbox="488 613 1342 707">Templates define the overall look of your report and in which detail the report shows monitoring data. PRTG includes several preconfigured report templates. Select a template for the report from the dropdown list:</p> <ul style="list-style-type: none"> <li data-bbox="488 730 1342 857">▪ Graph with data table (data files available): Create a report with graphs and data tables. Choose from different intervals. Reports that use one of these templates also generate .csv and .xml files if you select the respective setting in the Data Files section.</li> <li data-bbox="488 880 1342 1008">▪ Data table only (data files available): Create a report with data tables. Choose from different intervals. Reports that use one of these templates also generate .csv and .xml files if you select the respective setting in the Data Files section.</li> <li data-bbox="488 1030 1342 1124">▪ Graph only (data files not available): Create a report with graphs. Choose from different intervals. Reports that use one of these templates cannot generate .csv or .xml files.</li> <li data-bbox="488 1146 1342 1240">▪ List of sensors (data files not available): Create a report in a compact sensor list style. The list is available with and without graphs. Reports that use one of these templates cannot generate .csv or .xml files.</li> <li data-bbox="488 1263 1342 1391">▪ Top 100 highest and lowest (data files not available): Create a report with up to 100 objects with the highest and lowest average values. Choose from different intervals. Reports that use one of these templates cannot generate .csv or .xml files.</li> <li data-bbox="488 1413 1342 1541">▪ Top 10 uptime and downtime (data files not available): Create a report with up to 10 objects with the highest uptime and downtime for each object. You can choose between data in percent and hours. Reports that use one of these templates cannot generate .csv or .xml files.</li> <li data-bbox="488 1563 1342 1691">▪ Top 100 uptime and downtime (data files not available): Create a report with up to 100 objects with the highest uptime and downtime for each object. You can choose between data in percent and hours. Reports that use one of these templates cannot generate .csv or .xml files.</li> </ul> <p data-bbox="488 1713 1318 1736">❗ PRTG <a href="#">automatically averages</a><sup>27571</sup> monitoring data within an interval.</p>
Security Context	<p data-bbox="488 1800 1326 1957">Define the security context that the report uses for access to monitoring data. Select a user account from the dropdown list to define which objects are visible in the report. The report only contains objects that the selected user has the <a href="#">access rights</a><sup>1451</sup> to view. By default, the security context is the user account that creates the report.</p>

Setting	Description
	<p><b>i</b> Basically, the security context defines the minimum access rights to objects like libraries, reports, or maps, that a user account has. If the security context of an object is <a href="#">PRTG System Administrator</a>, for example, every user sees all objects in a library, in a report, or on a map, no matter what the particular user access rights are.</p>
Time Zone	Select a time zone from the dropdown list. PRTG uses this time zone for all date-specific settings in the report.
Page Format	<p>Define the page size in which PRTG creates .pdf files:</p> <ul style="list-style-type: none"> <li>▪ None: Do not specify a page format. PRTG automatically sets a size.</li> <li>▪ DIN A4: Use the German DIN A4 format.</li> <li>▪ DIN A3: Use the DIN A3 format.</li> <li>▪ DIN A2: Use the DIN A2 format.</li> <li>▪ Legal: Use the North American legal page format.</li> <li>▪ Letter: Use the North American letter page format.</li> <li>▪ Ledger: Use the North American ledger page format.</li> </ul>
Page Orientation	<p>Define the page orientation for the data in PDF reports:</p> <ul style="list-style-type: none"> <li>▪ Portrait: Use the portrait orientation.</li> <li>▪ Landscape: Use the landscape orientation to show data tables of sensors with many channels. Other parts of the report remain in the portrait orientation and do not resize to the landscape orientation.</li> </ul>

## Included Sensors

Setting	Description
Cluster Node	<p><a href="#">This setting is only visible if you run PRTG in a failover cluster</a><sup>[128]</sup>.</p> <p>Select the cluster node from which the report takes monitoring data from the dropdown list. The available options are specific to your configuration.</p> <p>By default, the master node is set. Select All cluster nodes to create a report that includes data from all of your cluster nodes.</p> <p><b>i</b> A report for all cluster nodes only includes data for the primary channels. Be careful with big reports for all cluster nodes because the report generation might significantly slow down your monitoring.</p>

Setting	Description
	<p><b>i</b> If you select a failover node, report and data files do not show data from the local probe or from a remote probe and might be empty or show 0 values.</p> <p><b>i</b> You can generate .csv and .xml data files only for a single failover node. If you select the option All cluster nodes, the report does not create data files.</p>
Sensors by Tag	<p>Select the sensors that you want to include in the report by tag. Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically <a href="#">inherited</a><sup>[138]</sup>. The report covers all sensors that have at least one of the tags. You can also leave the field empty.</p> <p>You can also use the plus sign (+) or the minus sign (-) to categorize tags as <b>must have</b> or <b>must not have</b>, for example, <b>+snmp -wmi</b> (must have the tag <b>snmp</b> and must not have the tag <b>wmi</b>).</p> <p><b>i</b> For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p><b>i</b> The report automatically includes all channels of sensors that you add by tag, unless you run a cluster and select All cluster nodes in the Cluster Node setting above.</p> <p><b>i</b> If you want to manually select the sensors to include in the report, save your settings and go to the <a href="#">Select Sensors Manually</a><sup>[2774]</sup> tab.</p>
Filter Included Sensors by Tag	<p>Filter the included sensors further. Use this option, for example, if you manually add entire probes, groups, or devices to the report and do not want to include all sensors that have these objects as their parent objects. PRTG then only includes the sensors in the report that have at least one of the tags that you enter here.</p> <p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically <a href="#">inherited</a><sup>[138]</sup>. You can also leave the field empty.</p> <p>You can also use the plus sign (+) or the minus sign (-) to categorize tags as <b>must have</b> or <b>must not have</b>, for example, <b>+snmp -wmi</b> (must have the tag <b>snmp</b> and must not have the tag <b>wmi</b>).</p> <p><b>i</b> For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

## Report Schedule

Setting	Description
Schedule	<p>Define the time at which you want to automatically run the report:</p> <ul style="list-style-type: none"> <li>▪ No schedule (default): Only use the options on the Run Now tab to manually start the report generation.</li> <li>▪ Every full hour: Run the report every 60 minutes.</li> <li>▪ Every day at a specific hour: Run the report every 24 hours. Specify the exact time below.</li> <li>▪ Every specific day of the week: Run the report every 7 days. Specify the exact time below.</li> <li>▪ Every specific day of the month: Run the report on a specific day every month. Specify the exact time below.</li> <li>▪ First day after the quarter: Run the report on the first day after the end of the quarter. This means, for example, on April 1st for the first quarter of the year (January 1st - March 31st).</li> <li>▪ Every specific date: Run the report on a specific date every year. Specify the exact date below.</li> </ul>
Specific Hour	<p><a href="#">This setting is only visible if you select</a> Every day at a specific hour <a href="#">above</a>.</p> <p>From the list, select the hour at which you want to run the report.</p>
Specify Day	<p><a href="#">This setting is only visible if you select</a> Every specific day of the week <a href="#">above</a>.</p> <p>From the list, select a day of the week or a day of the month for which you want to run the report.</p> <p><b>i</b> If you select Last, the report always runs on the last day of the month, regardless of how many days the month has. If you select a date that does not exist in every month, for example, <b>30th</b>, PRTG automatically runs the report on the last day of the month.</p>
Specific Date	<p><a href="#">This setting is only visible if you select</a> Every specific date <a href="#">above</a>.</p> <p>Enter a valid date in the format <b>DD.MM.</b>, for example, <b>31.12</b>. The report runs on this date every year.</p>
Report Handling	<p><a href="#">This setting is only visible if you select one of the schedule options above</a>.</p> <p>Define what you want to do with a finished report:</p>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Store report and send it by email: Create a .pdf file and, depending on the Data Files setting, create data files of the report, store the files, and send them via email to the email address that you define below. You can find the stored report files on the Stored Reports tab.</li> <li>▪ Store report (default): Create a .pdf file and, depending on the <a href="#">Data Files</a> setting, create data files of the report and store it. You find the stored report files on the Stored Reports tab. You also receive a ToDo ticket. By default, PRTG sends out a notification email to administrators in this case.</li> <li>▪ Send report by email: Create a .pdf file and, depending on the Data Files setting, create data files of the report and send them via email to the email address that you define below. PRTG does not permanently store the report files.</li> </ul> <ul style="list-style-type: none"> <li>ⓘ PRTG only generates .csv and .xml data files for report templates that include data tables.</li> <li>ⓘ To create .pdf files, make sure that the print spooler service runs on the PRTG core server system.</li> <li>ⓘ Some special characters, for example, 4-byte unicode characters, might not be displayed correctly in PDF reports. As a workaround, we recommend that you generate an HTML report and save it as a .pdf file.</li> </ul>
<p>Target Email Address</p>	<p><a href="#">This setting is only visible if you select one of the email options above.</a></p> <p>Enter one or more valid email addresses to which PRTG sends the report. Use commas to separate email addresses.</p> <ul style="list-style-type: none"> <li>ⓘ PRTG sends an email to all recipients. All recipients appear in the To field of the email.</li> <li>ⓘ You can change the configuration for outgoing emails in the <a href="#">Notification Delivery</a> settings.</li> </ul>
<p>Email to User Group</p>	<p><a href="#">This setting is only visible if you select one of the email options above.</a></p> <p>From the list, select a user group to which you send an email with the report. All members of this group receive the email. You can edit user groups in the <a href="#">User Groups</a> settings.</p> <ul style="list-style-type: none"> <li>ⓘ If you define both individual email addresses and select a user group, PRTG sends the report to the individual email addresses as well as to the members of the selected user group.</li> <li>ⓘ PRTG sends an email to all recipients. All recipients appear in the To field of the email.</li> </ul>

Setting	Description
File Compression	<p>This setting is only visible if you select one of the email options above.</p> <p>Define if PRTG compresses the attached report files before it sends them:</p> <ul style="list-style-type: none"> <li>▪ Disable (default): PRTG sends the report files by email in their original size.</li> <li>▪ Enable: PRTG compresses the report files to a .zip file before they are sent by email.</li> </ul>

## Report Period

Setting	Description
Report Period Type	<p>Define the type of period for which you want to create the report:</p> <ul style="list-style-type: none"> <li>▪ Current period: Use monitoring data of the current period.</li> <li>▪ Previous period: Use monitoring data of the previous period.</li> </ul> <p> This setting works in combination with the Period setting below. For example, Previous period means <a href="#">yesterday</a> if you select the Day option.</p>
Period	<p>Define the period that the report covers:</p> <ul style="list-style-type: none"> <li>▪ Day</li> <li>▪ Week</li> <li>▪ Month</li> <li>▪ Quarter of year</li> <li>▪ Year</li> </ul>
Day Period	<p>This setting is only visible if you select Day above.</p> <p>From the list, select the hours at which a day starts and ends. The default setting is 0:00-23:59.</p>
Week Period	<p>This setting is only visible if you select Week above.</p> <p>From the list, select the days of the week when the week starts and ends:</p> <ul style="list-style-type: none"> <li>▪ Monday-Sunday: A reported week starts on the Monday and ends on the Sunday of the week.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ <a href="#">[Day-Day]</a>: A reported week starts on the <a href="#">[Day]</a> of the week and ends on the <a href="#">[Day]</a> of the following week.</li> </ul>
Month Period	<p><a href="#">This setting is only visible if you select Month above.</a></p> <p>From the list, select the days of the month when the month starts and ends:</p> <ul style="list-style-type: none"> <li>▪ first-last day: A reported month starts on the first day and ends on the last day of the month.</li> <li>▪ <a href="#">[15.-14.]</a>: A reported month starts on the 15th of the month and ends on the 14th of the following month.</li> </ul>
Year Period	<p><a href="#">This setting is only visible if you select Year above.</a></p> <p>From the list, select when the year starts and ends:</p> <ul style="list-style-type: none"> <li>▪ 1/1-12/31: A reported year starts on January 1st and ends on December 31st.</li> <li>▪ 7/1-6/30: A reported year starts on July 1st and ends on June 30th the following year.</li> </ul>
Report Schedule	<p>From the list, select a specific time span for which you want to generate the report. The report only includes monitoring data for specific hours or weekdays within the defined period.</p> <p>Select None to include all available monitoring data in the report, or choose a schedule, for example Weekdays, to exclude all weekends from the report. The available schedules depend on your configuration.</p> <p> For more information, see section <a href="#">Schedules</a> .</p>

## Percentile Handling

Setting	Description
Percentile Results	<p>Define if you want to include an additional <a href="#">percentile calculation</a>  of your data in the report:</p> <ul style="list-style-type: none"> <li>▪ Do not show percentiles: PRTG does not use a percentile formula to calculate your monitoring results. It only shows the standard values.</li> <li>▪ Show percentiles: PRTG displays an overview table with the percentiles of <a href="#">each</a> channel for the whole report period, and the percentiles of the <a href="#">primary</a> channel in the table for each scanning interval.</li> </ul>

Setting	Description
	<p><b>i</b> Percentiles are not available for all report templates. If a template does not support percentiles, they do not show up in the report, even if you enable this setting.</p> <p><b>i</b> Percentiles are also not available for a cluster if you select All cluster nodes in the Cluster Node setting in section Included Sensors. Select a failover node to include percentiles.</p>
Percentile Type	<p><b>This setting is only visible if you select Show percentiles above.</b></p> <p>Enter the percentile type that you want PRTG to use for the calculation. If you choose, for example, to calculate the 95th percentile, enter <b>95</b> here and 5% of peak values are discarded. Enter an integer.</p>
Percentile Averaging Interval	<p><b>This setting is only visible if you select Show percentiles above.</b></p> <p>Enter a value to define the averaging interval on which PRTG bases the percentile calculation. The default value is <b>300</b> seconds (5 minutes). This means that PRTG takes 5-minute averages as basic values for the percentile calculation. Enter an integer.</p>
Percentile Mode	<p><b>This setting is only visible if you select Show percentiles above.</b></p> <p>Select the mode for percentile calculation:</p> <ul style="list-style-type: none"> <li>▪ Discrete: PRTG takes discrete values to calculate percentile results.</li> <li>▪ Continuous: PRTG interpolates between discrete values and bases the calculation on interpolated values.</li> </ul>

## Data Files

Setting	Description
Files in CSV / XML Format	<p>Define if you want to generate .csv and .xml files for data tables in the report in addition to the .pdf file:</p> <ul style="list-style-type: none"> <li>▪ Do not include data files: PRTG does not generate .csv or .xml files for the report. It only creates a .pdf file.</li> <li>▪ Include only .csv files: PRTG generates and stores .csv files in addition to the .pdf file. The data files are only generated if the report uses a report template that includes data tables.</li> <li>▪ Include only .xml files: PRTG generates and stores .xml files in addition to the .pdf file. The data files are only generated if the report uses a report template that includes data tables.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Include all data files: PRTG generates and stores .csv and .xml files in addition to the .pdf file. The data files are only generated if the report uses a report template that includes data tables.</li> </ul> <p><b>i</b> If you run PRTG in a cluster, the report does not generate data files if you select All cluster nodes in the Cluster Node setting. Select a failover node to get data files.</p>

### Report Comments

Setting	Description
Introductory Comment	Enter a custom text that the report displays at the top of the first page. Enter a string or leave the field empty.
Final Comment	Enter a custom text that the report displays below the last data table or graph on the last page. Enter a string or leave the field empty.

### Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the object. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> <li>▪ No access: Users in this user group cannot see or edit the object. The object does not show up in lists.</li> <li>▪ Read access: Users in this user group can see the object and view its settings.</li> <li>▪ Write access: Users in this user group can see the object and view and edit its settings. However, they cannot edit the object's access rights settings.</li> <li>▪ Full access: Users in this user group can see the object, view and edit its settings, and edit its access rights settings.</li> </ul> <p><b>i</b> You can create new user groups in the <a href="#">User Groups</a> settings.</p>

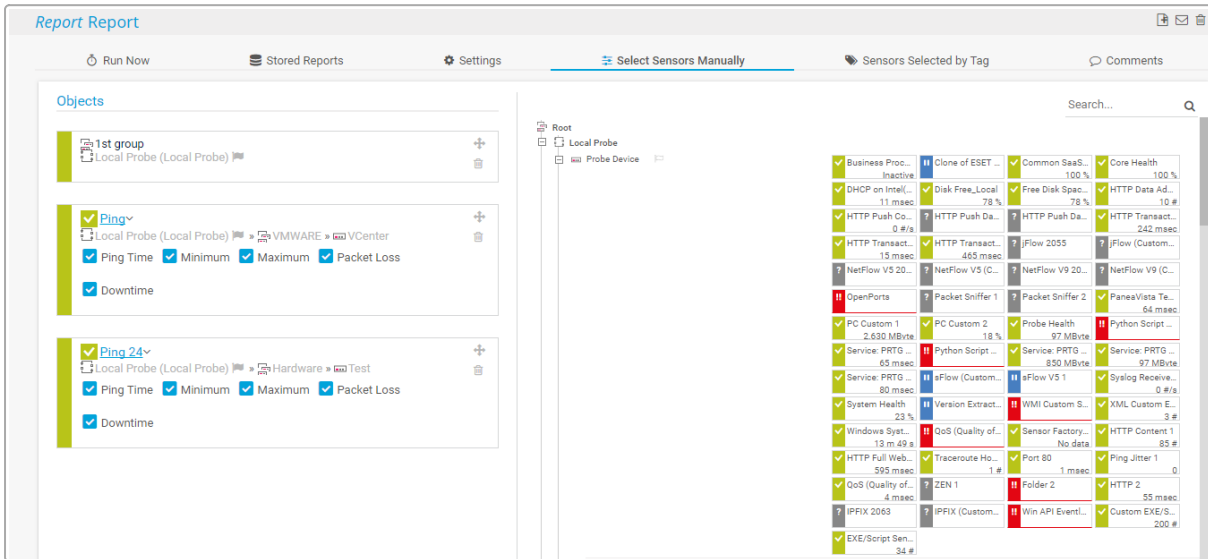

**i** Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

## Select Sensors Manually

Click the Select Sensors Manually tab to manually add sensors that you want to include in the report.

You see a split screen: On the left side, there is a list of objects that the report already contains, and on the right side, you see your device tree. You can add objects to the report via drag-and-drop.

**i** You can also add a report via the [context menu](#) of an object. In this case, the selected object is automatically included in the report.

Select Sensors Manually Tab

The following actions are available:

Action	Description
Add items	<p>From the device tree on the right side, drag objects and drop them onto the list on the left side. You can add entire probes, groups, devices, or single sensors. PRTG adds each dropped object as a new list item.</p> <p><b>i</b> The objects you drop on the left side are always added to the end of the list, you cannot directly add objects in a different order.</p>
Select channels	<p>If you add a sensor to the selection, you can specify the channels that the report includes. By default, PRTG selects all channels. To exclude a channel from the report, disable the check box in front of a channel name.</p> <p><b>i</b> If you run PRTG in a cluster, you can only choose between single channels if you select a specific Cluster Node in the report settings. If you select All cluster nodes, the report contains only the <b>primary</b> channel of each sensor.</p>

Action	Description
Change order	You can change the order of list items on the left side via drag-and-drop. Click  in the upper-right corner of a selected object, drag it to the desired position, and drop it there.
Remove	To remove any objects from the report, click  next to the respective list item, or select several list items while holding down the Ctrl key, then click  .

 PRTG automatically saves your selection. There is no undo function.

 The final report includes both manually selected sensors and sensors selected by tag.

## Sensors Selected by Tag

Click the Sensors Selected by Tag tab to view all sensors that you added to the report by tag in section Included Sensors of the report settings. This is for your information only, you cannot change sensors here.

To edit the sensor selection, go to the Settings tab of the report and change the tags that the report uses to include sensors. Additionally, you can also exclude sensors with specific tags there.

For sensors that you add by tag, PRTG automatically includes all channels in the report unless you use a cluster and select All cluster nodes in the Cluster Node setting of the report. In this case, the report only includes the [primary](#) channel of each sensor.

 The final report includes both manually selected sensors and sensors selected by tag.

## Comments

On the Comments tab, you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

## 8.11 Maps

With the [Maps](#) feature, you can create dashboards with monitoring information in a customizable layout. You can also make live data overviews publicly available.

Example of a Map

In this section:

- [Introduction](#)<sup>[2776]</sup>
- [Maps Menu](#)<sup>[2777]</sup>
- [Maps List](#)<sup>[2777]</sup>
- [Home Menu](#)<sup>[2778]</sup>
- [Working with Maps](#)<sup>[2778]</sup>

### Introduction

There are a lot of different options for the implementation of maps:

- Create network maps with status icons for each device.
- Create views of your network that can be shown on network operations center screens.
- Create network overviews that you can publish on the intranet for colleagues or the management.
- Create custom views of the most important sensors in your monitoring setup.
- Create Top 10 lists of the sensors of a specific group or device.

### Map Technology

In technical terms, a map is a common HTML web page. A map can consist of the following elements:

- Map items including device icons, sensor status icons, graphs, data tables, sensor lists, connection lines, geographical maps, or custom HTML code.
- An optional background image in JPG, PNG, or GIF format, for example, your company logo or a graphical view of your network.

### Preconfigured Map

PRTG provides the preconfigured map [Sample Dashboard](#) that you can also edit or delete. The map is only visible to administrators. Define a lower [priority](#)<sup>[224]</sup> for the map to not show it under Home in the [main menu bar](#)<sup>[237]</sup>.

## Maps Menu

Click Maps in the main menu bar to open an overview list of all maps. Hover over Maps to show other options.

Option	Description
All	Open the Maps list where you can view or add custom views of your network status and monitoring data.
Add Map	Open a dialog to create a new map.
Select Map	Hover over Select Map to show a list of your maps. Click a map to open it.

## Maps List

In the All view, you see a list of all maps. Click the name of a map to view it. Enable the check box next to a map and use the quick action buttons:

- Map Rotation (Rotate<sup>[2797]</sup> between maps.
- Clone (clone<sup>[2714]</sup> of this map.
- Delete (settings<sup>[2792]</sup>.

Hover over  and select Add Map from the menu to add a new map.

You can also define the priority of a map. Maps with a 5-star priority ( ★★★★★ ) appear in the main menu bar under Home so that you can directly select them. PRTG can show up to 10 entries in the Home menu.

 For more information, see section [Home Menu](#)<sup>[2778]</sup>.

 See also sections [Working with Table Lists](#)<sup>[218]</sup> and [Multi-Edit](#)<sup>[2718]</sup>.

## Home Menu

You can add any map to the Home menu in the main menu bar of the PRTG web interface. This way, you can gain quick access to your most important maps.

**i** If you open a map via the Home menu, it appears as a dashboard without the tabs that are available when you open a map via the Maps menu. Furthermore, in contrast to a map that you open via a URL, the map is embedded in the PRTG web interface with the global header area and page footer.

You can define whether a map appears in the Home menu via the priority setting:

Add Map to Home Menu

1. Open the Maps overview via the main menu bar (1).
2. In the overview list, look for the map that you want to add to the Home menu (2).
3. In the Priority column, select ★★★★★ for the desired map (3).

The map appears in the Home menu (4). To immediately see the change, manually refresh the page with **F5**.

- i** You can include up to 10 map entries in the Home menu.
- i** Every map with a 5-star priority (★★★★★) appears as a menu item under Home.
- i** PRTG provides a sample dashboard in the Home menu by default. You can remove the sample dashboard and other dashboards from the menu by changing their priority to ★★★☆☆ or lower.

## Working with Maps

For more information on how to work with maps and on how to make the maps available to other people, see the following sections:

- [Map Designer](#)<sup>2780</sup>
- [Maps Settings](#)<sup>2792</sup>
- [Map Rotation](#)<sup>2797</sup>

## More

### ■ PAESSLER WEBSITE

How to create dashboards in PRTG with the Maps feature in 5 steps

- <https://www.paessler.com/support/how-to/map-designer>

## 8.11.1 Map Designer

 This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

With the [Map Designer](#) feature, you can create custom web pages as maps, or dashboards, that represent your network.

In this section:

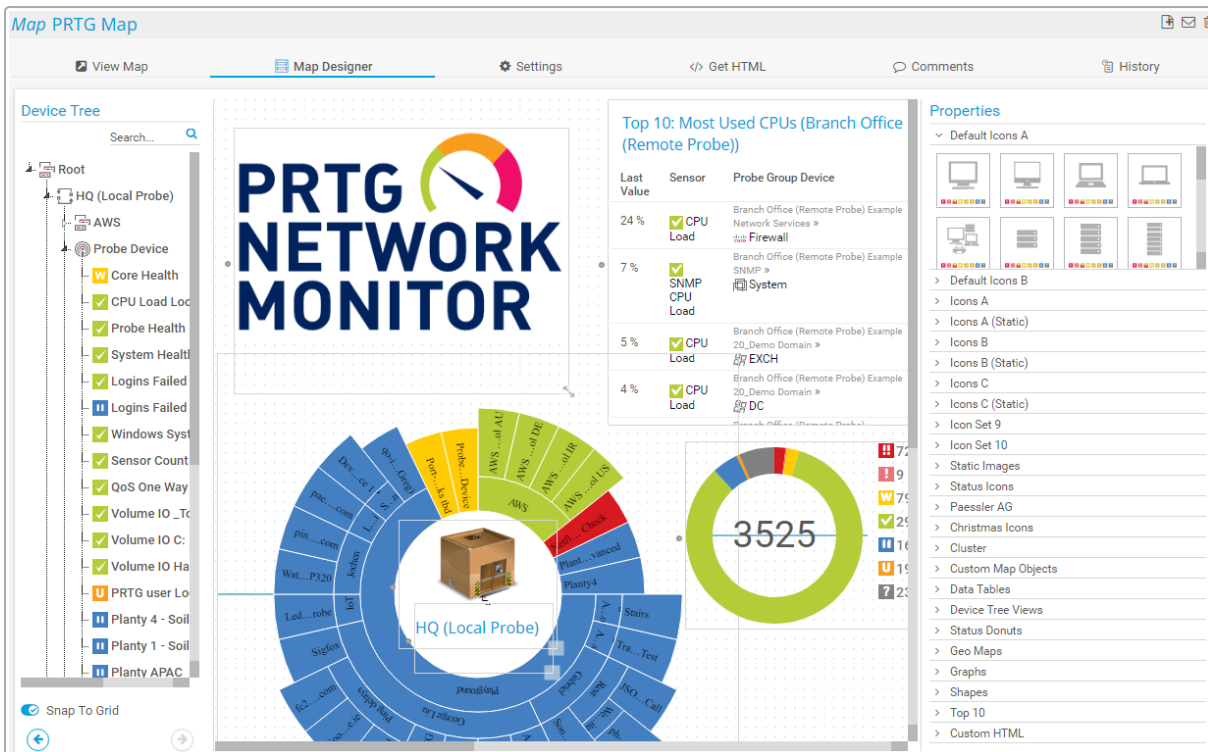

- [Browser Compatibility](#)  2780
- [Basic Design Concept](#)  2780
- [Device Tree Section](#)  2781
- [Properties Section](#)  2783
- [Properties Object Types](#)  2784
- [Edit Map Items](#)  2786
- [Draw Connection Lines Between Items](#)  2789
- [Snap To Grid](#)  2791
- [Undo and Redo](#)  2791

### Browser Compatibility

Because of the map designer's extensive scripting capability, it is important that you use a compatible browser when you edit maps. We recommend that you use Google Chrome 75. You can also use Mozilla Firefox 67 or Microsoft Edge 79. The map designer is **not** fully compatible with earlier versions of Internet Explorer or Opera browsers.

### Basic Design Concept

Click the Map Designer tab to open the map editor. It might take a few moments to load. Here, you can add or change map items to create your individual map.

Map Designer General Layout

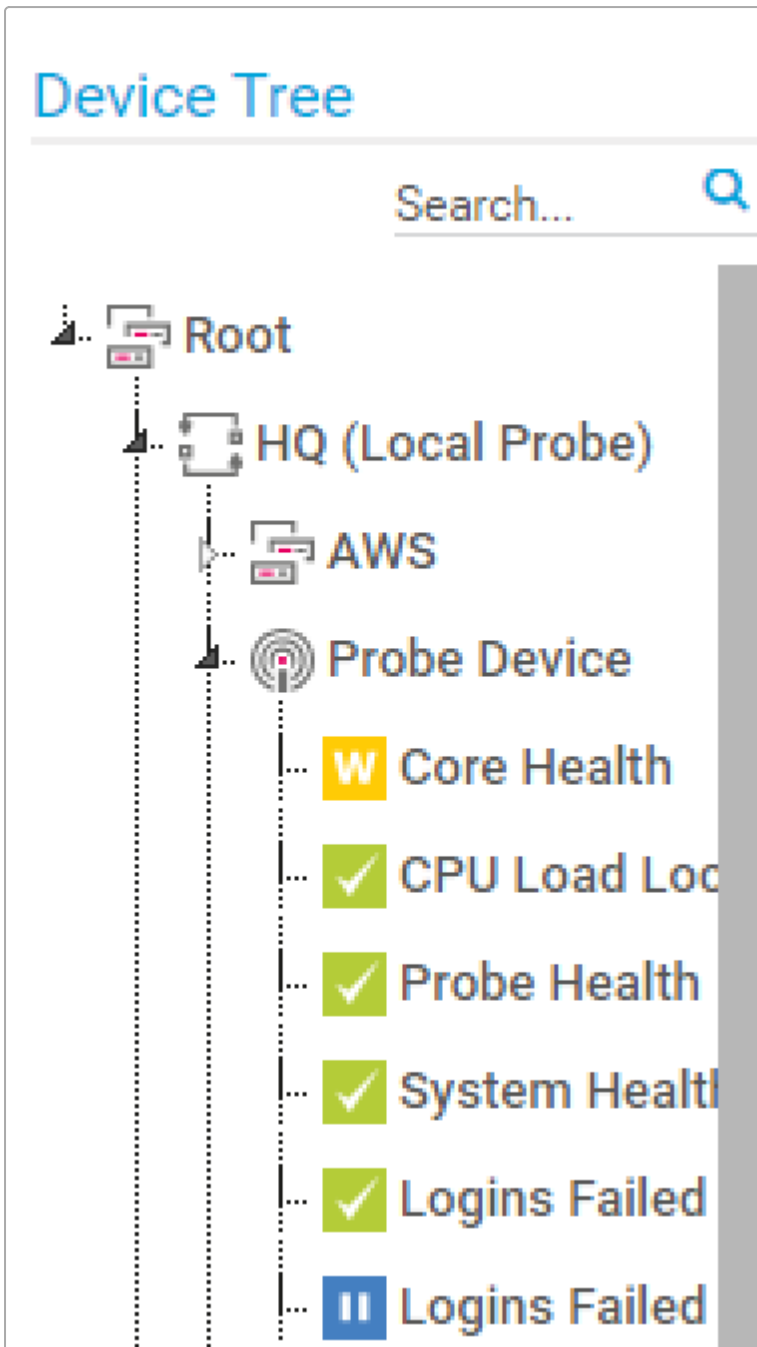

The map designer consists of three main sections:

- The Device Tree section on the left side. Here you can select the object whose data you want to show on the map.
- The map design area in the middle that has the size in pixels that you specified in the [map settings](#) [2793].
- The Properties section on the right side. Here you can define how a map item is displayed, for example, as an icon or a data table.

Drag and drop any object from either side onto the map, or double-click an object. You always see all changes immediately.

## Device Tree Section

Use the Device Tree section to select the object whose data you want to show on the map. This can be a probe, a group, a device, or a single sensor.

Device Tree Section in the Map Designer

The following actions are available:

Action	Description
Find an object	<p>To find the desired object, you have the following options:</p> <ul style="list-style-type: none"> <li>Click <b>▶</b> at the beginning of a line to expand objects in the device tree and show objects below probes, groups, and devices. Click <b>▲</b> to collapse the object again.</li> </ul>

Action	Description
	<ul style="list-style-type: none"> <li>Enter a few characters into the Search box to search for names or parts of names of objects in your configuration. You immediately get the search results. Click <b>x</b> to clear your search.</li> </ul>
Drag-and-drop	<p>You can always drag any object from the device tree onto a free area of the map to create a new map item.</p> <p>If you drag the object onto an existing map item, the displayed device tree object is replaced while the property and size stay the same.</p>
Double-click	<p>Double-click an object in the device tree to add a new map item.</p> <p>If you select a map item and double-click an object in the device tree, the map designer replaces the map item.</p>
Change size	<p>You can adapt the size of the Device Tree section. Drag the right border to the left to make the section smaller. To enlarge the section, drag the right border to the right.</p>

## Properties Section

Use the Properties section to define how to display the map item, for example, as an icon, a map, a table, or a graph. Select the appearance of a map item from different categories.

Properties
> Default Icons A
> Default Icons B
> Icons A
> Icons A (Static)
> Icons B
> Icons B (Static)
> Icons C
> Icons C (Static)
> Static Images
> Status Icons
> Cluster
> Data Tables
> Device Tree Views
> Status Donuts
> Geo Maps
> Graphs
> Shapes
> Top 10 Lists
> Custom HTML

Properties Section in the Map Designer

The following actions are available:

- Hover over an object to get a live preview of it, if available.
- Drag an object onto a free area of the map to create a new map item. If you drag the object onto an existing map item, the property is replaced while the device tree object attributes and size stay the same.
- Double-click an object to add it to the map, or select an existing map item and double-click an object to replace the map item.

**i** If a specific Properties object is not available for a selected Device Tree object, you see a corresponding note in the live preview of the Properties object.

## Properties Object Types

Many different object types are available. Click one of the categories to show all available types.

Object Type	Description
Default Icons A, Default Icons B	Choose from various icons that represent typical network devices in the style of the PRTG web interface. Default icons from category A also display object data. You can see the object name and a sensor overview for the object. This indicates how many sensors show a specific status. For some sensors, a mini graph is shown as well.
Icons A, Icons B, Icons C	Choose from various icons that represent typical network devices. Icons from this category also display object data. You can see the object name and a sensor overview for the object. This indicates how many sensors show a specific status. For some sensors, a mini graph is shown as well.
Icons A (Static), Icons B (Static), Icons C (Static)	Choose from the same icons as in the category described above. Here, only the icon is displayed without additional object data.
Static Images	<p>Choose from various free or public domain geographical maps from different sources.</p> <ul style="list-style-type: none"> <li> Use the category Geo Maps if you want to show geographical maps that include monitoring locations.</li> <li> The items in this category are independent from the selected objects in the device tree.</li> </ul>
Status Icons	<p>Choose from various sensor status icons in different styles. You can see the object name and a sensor overview for the object. This indicates how many sensors show a specific status. For some sensors, a mini graph is shown as well. Additionally, you can add traffic lights or the QR code of an object to your map. A map item for an audible alert that plays a sound when the number of alarms of the monitored object is &gt; 0 is also available.</p> <ul style="list-style-type: none"> <li> Your browser must support playing embedded sounds for the status icon that includes an audible alert.</li> <li> For more information, see the Knowledge Base: <a href="#">Which audible notifications are available in the PRTG web interface and in the PRTG app for desktop?</a></li> <li> If you experience issues with audible notifications in Google Chrome, see the Knowledge Base: <a href="#">Why are audible alerts in public maps not working in Chrome?</a></li> </ul>
Cluster	<p>These map items are only available if you run PRTG in a <a href="#">failover cluster</a><sup>128</sup>. Choose between a map and a status table.</p> <ul style="list-style-type: none"> <li> The Map item does not scale automatically. You need to manually enlarge the item in the map design area.</li> </ul>

Object Type	Description
	<p><b>i</b> If you do not have a cluster, you only see white boxes instead of map previews.</p>
Data Tables	Choose from various <a href="#">table lists</a> <sup>[218]</sup> that show sensors for the selected object. You can also choose from several lists that only show sensors in a specific status.
Device Tree Views	Choose from various <a href="#">device tree views</a> <sup>[174]</sup> , including gauges for the selected object.
Status Donuts	Choose from various status donuts that either show all alarms or all sensor states for the selected object. These are the same status donuts that you see on the Welcome <a href="#">page</a> <sup>[157]</sup> .
Geo Maps	<p>These map items are only available if you enable the <a href="#">Geo Maps</a><sup>[2731]</sup> feature and enter location information in the selected device tree object's settings. Choose between a globe and a geographical map.</p> <p><b>i</b> If the Geo Maps feature is disabled, you only see white boxes instead of map previews.</p>
Graphs	Choose from various graph styles that differ in font size and detail. You can also select graphs that include a legend or sensor states.
Shapes	<p>Choose from various geometrical shapes.</p> <p><b>i</b> The items in this category are independent from the selected objects in the device tree.</p>
Top 10 Lists	<p>Choose from various tables that show the top 10 sensors in specific categories like the highest bandwidth usage or the best availability.</p> <p><b>i</b> The items in this category are independent from the selected objects in the device tree.</p>
Custom HTML	<p>Use this property, for example, to add <a href="#">custom text</a><sup>[2789]</sup>, external images, or applets to your map.</p> <p>Drag the item to the map design area and select it to <a href="#">edit</a><sup>[2786]</sup> it. You can then copy your custom code into the HTML Before and HTML After fields.</p>

## Edit Map Items

### Properties Section

Click a map item to select it. You can then edit its attributes in the upper part of the Properties section.

### Properties

Edit Map Items in the Properties Section

Property	Description
Top Left	<p>Enter position values to directly position the item on the map. Enter a positive integer.</p> <p><b>i</b> You can also use the mouse to move a map item.</p>
Width Height	<p>Enter size values to give the item a predefined size. Enter a positive integer.</p> <p><b>i</b> You can also use the mouse to resize a map item.</p>
Layer	<p>Enter a layer value that defines if an item appears in front of or behind a different item if the items overlap. The item with the higher value appears in front. Enter a positive integer.</p> <p><b>i</b> You can also use the <a href="#">context buttons</a> <sup>[2788]</sup> of a map item to bring it an item to the front (⬆) or send it back one layer (⬇).</p>
External Link	<p>Enter the address of any web page. If you click the map item while you view the map, PRTG opens the web page in a browser window. Enter the full URL of an external website, for example, <a href="https://www.paessler.com">https://www.paessler.com</a>, or the address of a subpage of your PRTG installation, for example, <a href="#">devices.htm</a>.</p> <p><b>i</b> To make a map interactive, you need to define a suitable <a href="#">public access</a> <sup>[2794]</sup> setting for the map.</p>

Property	Description
HTML Before HTML After	Enter custom HTML code to embed an object in the map. Any HTML code you enter in these fields is added before or after the map item and your HTML object is inserted into the map. For example, you can enter <code>&lt;img src="https://media.paessler.com/common/img/logoclaim_r1.gif"&gt;</code> to insert an image of a Paessler logo.

**i** Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

### Context Buttons

Hover over a map item to show its context buttons.

Edit Map Items via Context Buttons

Context Button	Description
Bring to front	Move this item one layer to the front. This is useful when you add several items to a map that overlap each other.
Send to back	Move the item one layer to the back. This is useful when you add several items to a map that overlap each other.
Delete	Delete the item. <b>i</b> The item is immediately deleted without notice. You cannot undo this action. <b>i</b> You can also select the item and press the Delete key on your keyboard.
Drop Connections	Delete all <a href="#">connection lines</a> <small>(2789)</small> to the item.

## Cursor Keys

Select a map item and use the cursor keys to move the item one pixel at a time. Hold down the Shift key in combination with the cursor keys to move the object 10 pixels at a time.

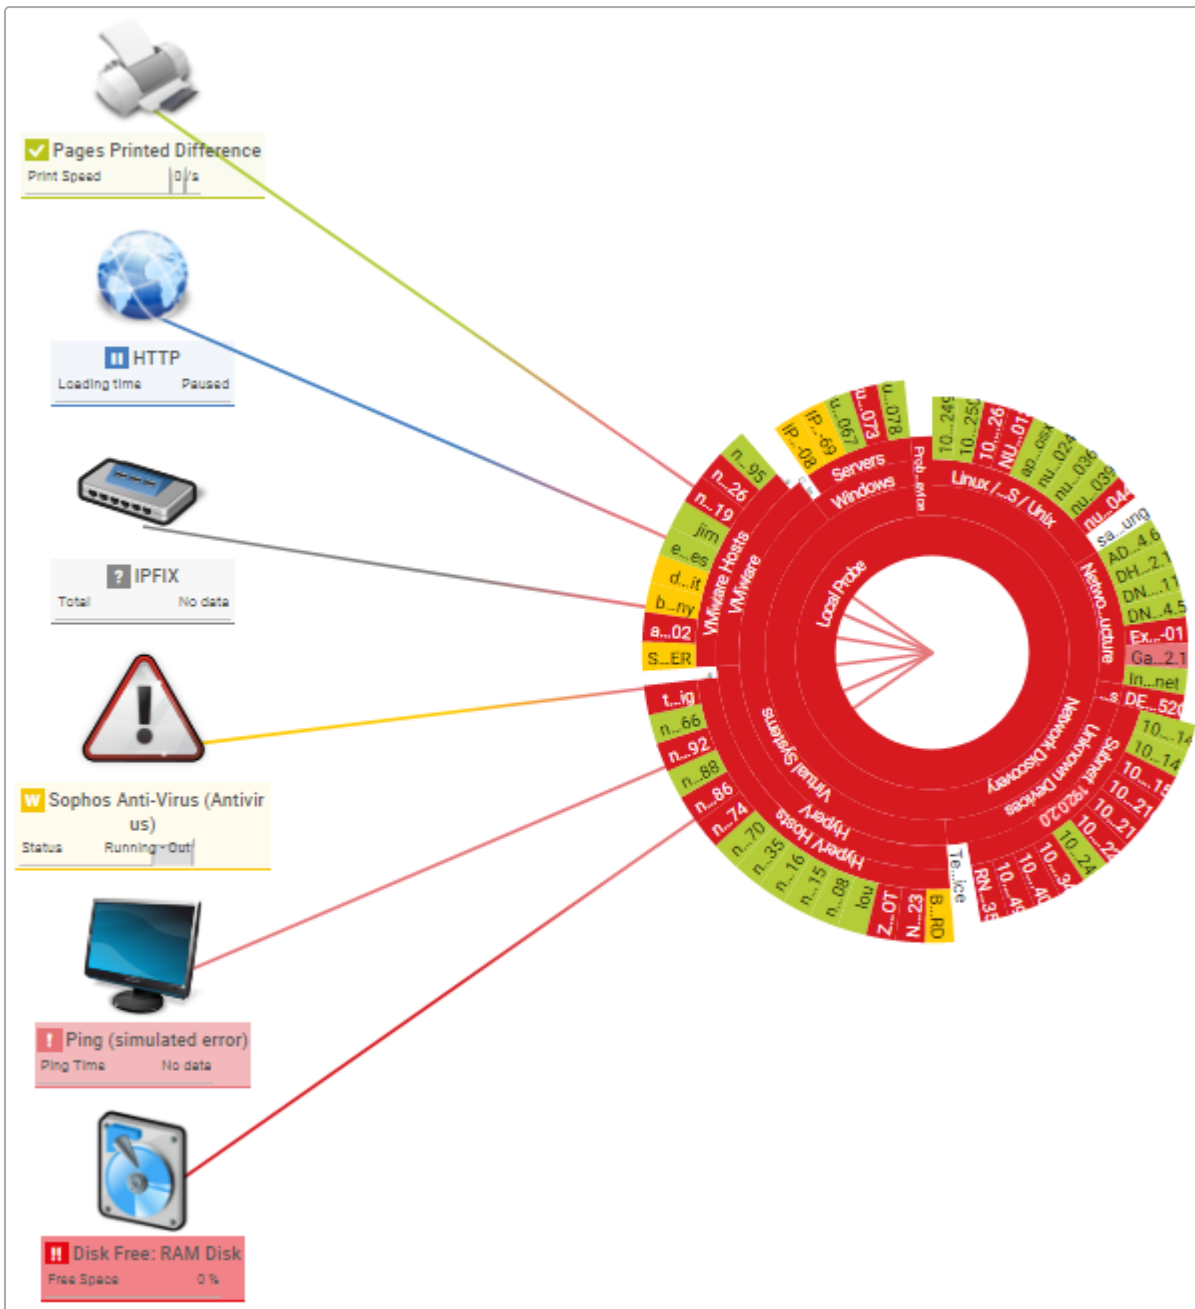

## Add Custom Text

You can add custom text with individual styling to your map with the Custom HTML Element.

■ For more information, see the Knowledge Base: [How to add text to a map?](#)

## Draw Connection Lines Between Items

You can draw connection lines between any map items via drag-and-drop to indicate, for example, network connections or a logical coherence between two items.

Map with Connection Lines

- Click the gray handle to the left of an item and drag it onto the item with which you want to create a connection to create a connection line.
  - Hover over a connection line and click ✂ to delete it.
- ⓘ The map designer dynamically colors the lines between items depending on the [status](#) <sup>181</sup> of the linked objects. A line is red, for example, if the linked objects both show the Down status. Connection lines can also have two colors. For example, if one linked object shows the Down status and the second linked object shows the Warning status, one half of the line is red and the other half is yellow.

## Snap To Grid

With the Snap To Grid setting, you can define how map items are positioned when you add or remove them via drag-and-drop.

Click  at the bottom of the Device Tree section to enable Snap To Grid so that you can only place items aligned with the grid. Click  to disable Snap To Grid to place map objects freely.

## Undo and Redo

You can undo previous changes to the map and its items by clicking  (Ctrl+Z) at the bottom of the Device Tree section. To redo actions, click  (Ctrl+Y). You can undo and redo up to 50 changes when you work on a map. Because PRTG saves changes persistently in your configuration, you can even revert changes at a later point in time.

 Both buttons are only available if they can apply, otherwise they are grayed out.

## 8.11.2 Maps Settings

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

Use the maps tabs to access all functionalities and settings of a map.

### Settings

Click the Settings tab to open the general settings of a map.

**i** In the Add Map dialog, not all of these settings are available. You can change the settings later via the Settings tab.

### Basic Map Settings

Setting	Description
Map Name	<p>Enter a name to identify the map.</p> <p><b>i</b> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically <a href="#">inherited</a><sup>[138]</sup>.</p> <p><b>i</b> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (&lt;&gt;).</p> <p><b>i</b> For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>
Security Context and Color Mode	<p>Define the security context that the map uses for access to monitoring data. Select a user account from the dropdown list to define which objects are visible on the map. The map only contains objects that the selected user has the <a href="#">access rights</a><sup>[145]</sup> to view. By default, the security context is the user account that creates the map.</p> <p><b>i</b> Basically, the security context defines the minimum access rights to objects like libraries, reports, or maps, that a user account has. If the security context of an object is <a href="#">PRTG System Administrator</a>, for example, every user sees all objects in a library, in a report, or on a map, no matter what the particular user access rights are.</p>

Setting	Description
	<p><b>i</b> This setting also affects the <a href="#">color mode</a> (2805) of <a href="#">public maps</a> (2794). PRTG takes the color mode setting of the security context user account.</p>
Time Zone	Define the time zone that the map uses for all date-related settings. Select a time zone from the dropdown list.
Filter by Tag	<p>This setting applies to table map objects. Enter one or more tags separated by a space or comma to include sensors in map data tables. Only sensors that have one of the specified tags appear in the tables, including sensors that <a href="#">inherit</a> (136) tags from parent objects. Enter a string or leave the field empty.</p> <p><b>i</b> For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p><b>i</b> For some map objects, for example for sunburst and treemap objects, the tag filter applies only to probes, groups, and devices. If you only enter tags of sensors, these map objects do not appear on the map. Filtering sunburst and treemap objects with multiple tags might not work properly and is not officially supported.</p> <p><b>i</b> Use this setting with caution because it affects all tables of the map.</p>

## Map Layout

Setting	Description
Map Width	Define the width of the map in pixels. Enter an integer.
Map Height	Define the height of the map in pixels. Enter an integer.
Automatic Scaling	<p>Define if you want the map to automatically adapt to your screen size:</p> <ul style="list-style-type: none"> <li>▪ Scale map view to fit browser size: The size of the map automatically adapts to the size of your screen. We recommend that you use this option if you display the map on different screens with different resolutions. <ul style="list-style-type: none"> <li><b>i</b> This setting does not apply to the map designer.</li> </ul> </li> <li>▪ Do not automatically scale map view: The map always uses the specified width and height settings.</li> </ul>
Background Image	<p>Define if you want to use a background image for the map:</p> <ul style="list-style-type: none"> <li>▪ Use a background image: Use a custom background image, for example, your company logo.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>Do not use a background image: Use a background that shows the color that you define in the Background Color setting.</li> </ul>
Custom Image	<p>This setting is only visible if you select Use a background image <a href="#">above</a>.</p> <p>Click Select File and select an image from your system or network.</p> <p><b>i</b> PRTG only supports images in JPG, PNG, and GIF format. The file size must be smaller than <b>20 MB</b>.</p>
Background Color	<p>Select a background color for this map. Either enter a hex color code or choose a color from the color selector. The hex color code field always displays the defined color.</p>

## Map Access

Setting	Description
Public Access	<p>Define who can view the map:</p> <ul style="list-style-type: none"> <li>No public access: Do not allow public access to the map. Users who want to view the map first need to log in to PRTG. They also need sufficient access rights to the map.</li> <li>Allow public access: Allow access to the map via a unique URL. The URL contains a secret key that you can change. The map is an interactive public map.</li> <li>Allow public access but disable all links except for Geo Maps: Allow access to the map via a unique URL. The URL contains a secret key that you can change. If you select this option, all links on the map are disabled so that you get a non-interactive public map. <ul style="list-style-type: none"> <li><b>i</b> It is not possible to disable the links in map objects that contain an embedded <a href="#">geographical map</a><sup>[2731]</sup>. As a workaround, place an empty, transparent square object over the Geo Map object and link it to an unrelated URL.</li> <li><b>i</b> PRTG displays maps with public access in the color mode defined for the security context user account.</li> </ul> </li> </ul>
Secret Key	<p>This setting is only visible if you select Allow public access or Allow public access but disable all links except for Geo Maps <a href="#">above</a>.</p> <p>The secret key is automatically generated. It is part of the public URL for the map. You can also enter a customized string.</p>

Setting	Description
	<p><b>i</b> We recommend that you use the default value.</p> <p><b>■</b> For more information on public access, see section <a href="#">Get HTML</a><sup>2795</sup>.</p> <p><b>i</b> The characters comma (,) and colon (:) are not allowed in the secret key field.</p>

## Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the object. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> <li>▪ No access: Users in this user group cannot see or edit the object. The object does not show up in lists.</li> <li>▪ Read access: Users in this user group can see the object and view its settings.</li> <li>▪ Write access: Users in this user group can see the object and view and edit its settings. However, they cannot edit the object's access rights settings.</li> <li>▪ Full access: Users in this user group can see the object, view and edit its settings, and edit its access rights settings.</li> </ul> <p><b>i</b> You can create new user groups in the <a href="#">User Groups</a><sup>2912</sup> settings.</p>

**i** Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

## Get HTML

Your map is a standard HTML page. You can make it available to other people via a unique URL. Depending on the map's Public Access [setting](#)<sup>2794</sup>, a visitor needs to provide login credentials for PRTG to view the map, or they immediately see the map.

You have different options to link to the map:

- Option 1: Link To The Map With Required Login  
A user who wants to view the map via the shown URL first needs to log in to PRTG.
  - i** In the URL, PRTG usually specifies the IP address under which the page is reachable. If a network address translation (NAT) is set in your firewall, or if you want to use a domain name or a name from a dynamic Domain Name System (DNS) service for public access, customize the URL according to your needs.

- Option 2: Link To The Map Without A Login  
People who want to view the map via the shown URL do not need login credentials. Allow public access to the map to make it available to the public.
- ⓘ In the URL, PRTG usually specifies the IP address under which the page is reachable. If a NAT is set in your firewall, or if you want to use a domain name or a name from a dynamic DNS service for public access, customize the URL according to your needs.
- Option 3: Show the Map on Other Webpages via an Iframe  
Here you can find the HTML code to embed an [iframe](#) in your web page. It includes a URL for direct access to the map. Allow public access to the map to make it available to the public.
- ⓘ In the URL, PRTG usually specifies the IP address under which the page is reachable. If a NAT is set in your firewall, or if you want to use a domain name or a name from a dynamic DNS service for public access, customize the URL according to your needs.

## Comments

On the Comments tab, you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

## History

On the History tab, all changes in the settings of an object are logged with a time stamp, the name of the user who made the change, and a message. The history log retains the last 100 entries.

## Delete

You can delete a map at any time. To do so, click  in the upper-right corner of the screen.

## More

### KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

### 8.11.3 Map Rotation

With the [Map Rotation](#) feature, you can rotate between several maps on one page. This is similar to a slide show.

#### Map Rotation Setup

To configure your custom map rotation, take the following steps:

Object	Security Context	Public Access	Priority	
Magic Map	PRTG System Administrator	No	★★★★☆	<input checked="" type="checkbox"/>
Map	PRTG System Administrator	No	★★★★☆	<input type="checkbox"/>
Map 1	PRTG System Administrator	Yes	★★★★☆	<input checked="" type="checkbox"/>
Map 2	PRTG System Administrator	No	★★★★★	<input type="checkbox"/>
Map 3	PRTG System Administrator	No	★★★★☆	<input checked="" type="checkbox"/>
Global Status	PRTG System Administrator	No	★★★★☆	<input type="checkbox"/>
My Map	PRTG System Administrator	No	★★★★☆	<input type="checkbox"/>
Sample Dashboard	PRTG System Administrator	No	★★★★☆	<input type="checkbox"/>

Map Rotation Setup

1. Open the Maps overview from the main menu bar.
2. Select the maps that you want to rotate by enabling the check box next to the respective maps. The [multi-edit](#) menu appears.
3. Click .
4. PRTG now rotates the selected maps on a new page in a specific interval.
5. You can change the interval until a new map appears. Hover over  in the lower-right corner and choose from 10s, 30s, 60s (seconds), 10m (minutes), and Refresh (now).

 To view the maps that you specified for the map rotation, you need login credentials for PRTG.

#### Public Map Rotation

You can also set up a [public](#) map rotation that you can use without login credentials. For this purpose, you need to create a custom URL that includes the map IDs and the maps' secret keys:

1. In the Public Access [settings](#) of all maps that you want to include in the map rotation, select Allow public access. The Secret Key setting appears.
2. Note the secret keys of all maps that you want to include in the map rotation.
3. Find the map IDs and note them as well. To find the ID of a map, open the map with your browser. The map ID is included in the URL of the map as the value of the parameter `id`. In the URL <https://<yourprtgserver>/map.htm?id=2124>, for example, the number 2124 is the needed ID.

4. Create the public map rotation URL. The complete URL has the following format:

[https://yourprtgserver/public/mapshow.htm?  
ids=mapid1:secretkey1,mapid2:secretkey2,mapid3:secretkey3](https://yourprtgserver/public/mapshow.htm?ids=mapid1:secretkey1,mapid2:secretkey2,mapid3:secretkey3).

-  Make sure that you connect each map ID and the respective secret key with a colon, and that you separate each `mapid:secretkey` token from the next `mapid:secretkey` token with a comma.

This is an example URL for the public rotation of two maps with the map IDs 9507 and 9358:

[https://prtg.example.com/public/mapshow.htm?ids=9507:4049BEA1-B89C-4B5D-ACC4-  
3C8E00566EB8,9358:718D3CE1-DF00-4B92-AE8A-E0253B912C37](https://prtg.example.com/public/mapshow.htm?ids=9507:4049BEA1-B89C-4B5D-ACC4-3C8E00566EB8,9358:718D3CE1-DF00-4B92-AE8A-E0253B912C37)

5. Open the URL in your browser to start the public map rotation.
6. You can change the interval until a new map appears. Hover over  in the lower-right corner and choose from 10s, 30s, 60s (seconds), 10m (minutes), and Refresh (now).

## 8.12 Setup

In the setup settings of the PRTG web interface, you can define almost all system settings for PRTG. However, you need to define some of the machine-oriented settings via two Windows administration tools (see section [Others](#) <sup>[2800]</sup> below).

Click Setup in the [main menu bar](#) <sup>[249]</sup> to show the available options.

 Some setup options are only available for PRTG Network Monitor (marked with ) , so you cannot use these with PRTG Hosted Monitor.

 Some setup options are only available for PRTG Hosted Monitor (marked with ) , so you cannot use these with PRTG Network Monitor.

## Others

There are some settings that you need to make in the [PRTG Administration Tool](#)  3040.

- For more information, see sections [PRTG Administration Tool on PRTG Core Server Systems](#)  3041 and [PRTG Administration Tool on Remote Probe Systems](#)  3067.

## 8.12.1 Account Settings

To open the account settings of the user, select Setup | Account Settings from the [main menu bar](#) . Select the various tabs to change the different settings.

In this section:

- [My Account](#) 
- [Notification Templates](#) 
- [Notification Contacts](#) 
- [Schedules](#) 
- [API Keys](#) 

### 8.12.1.1 My Account

On the My Account tab, you can define and edit settings for the user account. All settings are specific to the user account.

 This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

 If 15 minutes (900) seconds have passed since your last credential-based login and you open a setup page from a different setup page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

In this section:

- [PRTG App Login](#) 
- [User Account Settings](#) 
- [API Access](#) 
- [Account Settings](#) 
- [Group Membership](#) 
- [PRTG Web Interface](#) 
- [Ticket System](#)

**Home Page URL** i /welcome.htm

**Time Zone** i (UTC+01:00) Amsterdam, Berlin, Bern, Rom, Stockholm, Wien

**Date Format** i Use System Settings

**Color Mode** i  Light (default)  
 Dark

PRTG Web Interface

Setting	Description
Automatic Refresh	<p>Define if you want PRTG to automatically reload web pages in the PRTG web interface for the user:</p> <ul style="list-style-type: none"> <li>Automatically refresh pages (default): PRTG automatically refreshes single page elements on web pages in the PRTG web interface.</li> <li>Do not automatically refresh pages: PRTG does not automatically refresh single page elements on web pages in the PRTG web interface.</li> </ul>
Refresh Interval (Sec.)	<p><b>This setting is only visible if you select</b> Automatically refresh pages (default) <b>above.</b></p> <p>Enter the number of seconds that PRTG waits between two refreshes. We recommend that you use 30 seconds or more. The minimum value is 20 seconds. The maximum value is 600 seconds.</p>

Setting	Description
	<p> Shorter refresh intervals create more CPU load on the probe system. If you experience load issues while using the PRTG web interface (or <a href="#">maps</a><sup>[2776]</sup>), set a longer refresh interval.</p>
Audible Alarms	<p>Define whether PRTG plays an audible alarm on web pages in the PRTG web interface when there is a new <a href="#">alarm</a><sup>[2801]</sup>:</p> <ul style="list-style-type: none"> <li>▪ Do not play audible alarms (default): PRTG does not play sound files on any web pages.</li> <li>▪ Play audible alarms on dashboard pages only: When there is a new alarm, PRTG plays a predefined sound on <a href="#">dashboard</a><sup>[237]</sup> pages only. The sound is played with every refresh of the dashboard page if there is at least one new alarm.</li> <li>▪ Play audible alarms on all pages: When there is a new alarm, PRTG plays a predefined sound on all web pages. PRTG plays the sound with every page refresh if there is at least one new alarm.</li> </ul> <p> PRTG only plays audible alarms if the New Alarms value in the <a href="#">global header area</a><sup>[168]</sup> of the PRTG web interface is greater than 0 after a page refresh. PRTG does not consider the number of old alarms.</p> <p> For more information, see the Knowledge Base: <a href="#">Which audible notifications are available in the PRTG web interface and in the PRTG app for desktop?</a> and <a href="#">Why are audible alerts in public maps not working in Chrome?</a></p>
Home Page URL	<p>Define the user's default home page in the PRTG web interface. This is the page that the user sees after logging in or when selecting <a href="#">Home</a><sup>[237]</sup> from the main menu. Enter a PRTG-internal web page.</p>
Time Zone	<p>Define the time zone for the user account. Depending on the time zone that you select, PRTG shows the local time zone of the user account in all data tables and graph legends.</p> <p> PRTG receives the Coordinated Universal Time (UTC) from the system time of the PRTG core server for this purpose.</p> <p> If you get a warning message about differing time zones, see the Knowledge Base: <a href="#">Why do I get a warning message when time zones differ?</a></p>
Date Format	<p>Select the date format for the user:</p> <ul style="list-style-type: none"> <li>▪ Use default settings: Use the date format of the PRTG core server system.</li> <li>▪ DD.MM.YYYY HH:MM:SS (24h)</li> <li>▪ DD.MM.YYYY HH:MM:SS (A.M./P.M.)</li> <li>▪ MM/DD/YYYY HH:MM:SS (24h)</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ MM/DD/YYYY HH:MM:SS (A.M./P.M.)</li> <li>▪ YYYY-MM-DD HH:MM:SS (24h)</li> <li>▪ YYYY-MM-DD HH:MM:SS (A.M./P.M.)</li> </ul> <p><b>i</b> This setting takes effect after the next login.</p>
Color Mode	<p>Select a color mode for the PRTG web interface:</p> <ul style="list-style-type: none"> <li>▪ Light (default)</li> <li>▪ Dark</li> </ul>

## Ticket System

**Ticket System**

Email Notifications **i**

Receive an email when a ticket changes (default)  
 Do not receive any emails from the ticket system

Ticket System

Setting	Description
Email Notifications	<p>Define if the user receives emails from the ticket system:</p> <ul style="list-style-type: none"> <li>▪ Receive an email when a ticket changes (default): The user receives an email each time a ticket is assigned to the user or to the user group they are a member of, or if a ticket is changed.             <ul style="list-style-type: none"> <li><b>i</b> If the user edits tickets that are assigned to them or the user group they are a member of, or if they assign a ticket to themselves or their user group, they do not get an email.</li> </ul> </li> <li>▪ Do not receive any emails from the ticket system: The user does not receive any emails from the ticket system.</li> </ul>

**i** Save your settings. If you leave the page, all changes to the settings are lost.

## Others

There are some settings that you must define in the [PRTG Administration Tool](#)<sup>30401</sup>. For more information, see sections:

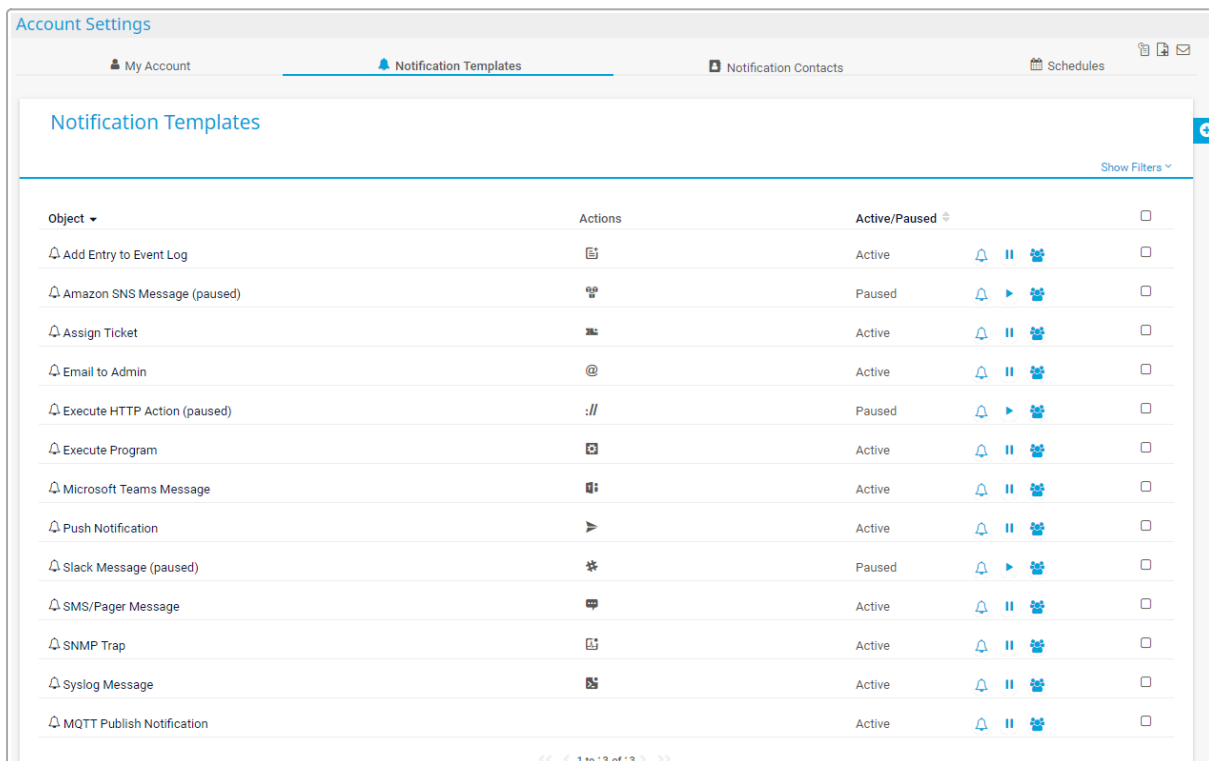

- [PRTG Administration Tool on PRTG Core Server Systems](#)<sup>30411</sup>
- [PRTG Administration Tool on Remote Probe Systems](#)<sup>30671</sup>

### 8.12.1.2 Notification Templates

On the Notification Templates tab, you can define and edit user account-specific notifications. You can use notification templates to trigger notifications for specific [sensor states](#)<sup>1811</sup> and values.

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

**☁** If 15 minutes (900) seconds have passed since your last credential-based login and you open a setup page from a different setup page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

Notification Templates Tab

In this section:

- [Note](#) 
- [Overview](#) 
- [Notification Template Settings](#) 
- [Basic Settings](#) 
- [Notification Summarization](#) 
- [Access Rights](#) 
- [Notification Methods](#) 

## Note

You must take the following four steps to set up and use notifications:

1. Check and set up the [notification delivery](#)  settings if you use PRTG Network Monitor. These settings define how PRTG sends messages.
2. Check and set up [notification contacts](#)  for the user accounts. These contacts define the recipients to which PRTG sends notifications.
3. Check and set up several [notification templates](#) . These templates define the notification methods and their content.
  - ❶ You can also check or edit notification templates via the Notification Triggers tab. For more information, see section [Notification Triggers Settings](#) .
4. Check and set up [notification triggers settings](#)  for objects. These triggers define when PRTG sends notifications.

❶ Usually, there are three successive attempts to deliver a notification. If all of these attempts fail, the notification is lost. To never miss a notification, we recommend that you always set up at least two notifications with different notification methods for a notification trigger, for example, one email notification and one SMS notification. If delivery via email fails, PRTG can still notify you via smartphone as a fallback. For example, use the latency setting of a [state trigger](#)  to choose a notification with a different notification method than in the first trigger condition, or set up a second trigger with a different notification method for the corresponding object.

■ For a detailed step-by-step guide, see the Paessler website: [How to set up notifications via the PRTG web interface](#).

■ Custom notification scripts are also available in the [PRTG Sensor Hub](#).

## Overview

Click the Notification Templates tab to show a list of all notification templates, what actions they perform, and their status (active or paused). To edit a notification template, enable the check box next to the notification template and choose from the following options.

Option	Description
Send test notification (  )	Triggers the notification immediately for testing purposes.  <b>i</b> When you test notifications, PRTG does not resolve the placeholders, but rather sends the original variables instead.
Used by (  )	Show all objects that trigger the notification.
Pause (  )	Pauses the notification.  <b>i</b> If you manually <a href="#">pause</a> <sup>[227]</sup> a notification, PRTG does not send messages when this notification is triggered.
Resume (  )	Resumes the notification.
Clone (  )	Creates a clone of the notification.
Delete (  )	Deletes the notification.  <b>i</b> You cannot delete predefined notifications.
Settings (  )	Opens the <a href="#">settings</a> <sup>[2810]</sup> of a notification template.

**i** You can also use the quick action buttons Send test notification (  ), Used by (  ), Pause (  ) or Resume (  ) next to the status of a notification template.

 See also sections [Working with Table Lists](#)<sup>[218]</sup> and [Multi-Edit](#)<sup>[2718]</sup>.

## Notification Template Settings

Hover over  and select Add Notification Template from the menu to add a new notification template. You can also click the name of a notification template to edit it.

**i** When a user with administrative rights creates a new object, only other users with administrative rights can view or edit the new object by default. When a read/write user creates a new object, all members of the read/write user's primary group can view and edit the new object as well. This behavior applies to [libraries](#)<sup>[2738]</sup>, [maps](#)<sup>[2778]</sup>, [reports](#)<sup>[2754]</sup>, [notification templates](#)<sup>[2808]</sup>, and [schedules](#)<sup>[2846]</sup>. For more information, see section [Access Rights Management](#)<sup>[145]</sup>.

## Basic Settings

**Basic Settings**

Template Name ⓘ Notification Template

---

Tags ⓘ +

---

Status ⓘ  Started (default)  
 Paused

---

Schedule ⓘ None

---

Notification Handling during Scheduled Pause ⓘ  Collect notifications and send them when reactivated  
 Discard notifications during paused status

Basic Settings

Setting	Description
Template Name	<p>Enter a name to identify the notification template.</p> <p> ⓘ If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically <a href="#">inherited</a><sup>138</sup>.</p> <p> ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>
Status	<p>Select the status of the notification template:</p> <ul style="list-style-type: none"> <li>▪ Started (default): PRTG executes the notifications that are defined in the notification template whenever it is triggered.</li> <li>▪ Paused: PRTG does not execute any notifications that are defined in the notification template.</li> </ul>
Schedule	<p>Define if you want to use a schedule to activate a notification template only during specific time spans:</p> <ul style="list-style-type: none"> <li>▪ None</li> <li>▪ Saturdays</li> <li>▪ Sundays</li> <li>▪ Weekdays</li> <li>▪ Weekdays Eight-To-Eight (08:00 - 20:00)</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Weekdays Nights (17:00 - 09:00)</li> <li>▪ Weekdays Nights (20:00 - 08:00)</li> <li>▪ Weekdays Nine-To-Five (09:00 - 17:00)</li> <li>▪ Weekends</li> </ul> <p><b>i</b> Use this setting to pause notifications, for example, during regular maintenance periods or system restarts.</p> <p><b>i</b> The overall status of the notification template must be Started (default) to apply any schedule settings.</p> <p><b>■</b> For more information, see section <a href="#">Schedules</a> <small>2846</small>.</p>
Notification Handling during Scheduled Pause	<p>Define how PRTG handles notifications that are triggered during a <a href="#">scheduled</a> pause:</p> <ul style="list-style-type: none"> <li>▪ Collect notifications and send them when reactivated: PRTG collects all notifications that are triggered during a scheduled pause and sends them all out once the paused status ends.</li> <li>▪ Discard notifications during paused status: PRTG discards all notifications that are triggered during a scheduled pause.</li> </ul> <p><b>i</b> If you manually pause a notification, PRTG never collects notifications that are triggered while the notification is paused.</p>

## Notification Summarization

**Notification Summarization**

**Method** i

Always notify immediately, never summarize  
 Send first down message immediately, then summarize  
 Send first down and up message immediately, then summarize  
 Send all down messages immediately, summarize the others  
 Send all down and up messages immediately, summarize the others  
 Always summarize messages, regardless of type

**Subject for Summarized Email or SNS Messages** i [%sitename] %summarycount Summarized Notifications

**Time Span for Summarizing Messages (in Minutes)** i 1

Notification Summarization

Setting	Description
Method	<p>Define if and how PRTG collects and summarizes several notifications into one or more messages with a maximum of 1,000 characters:</p> <ul style="list-style-type: none"> <li>▪ Always notify immediately, never summarize: PRTG always sends out one notification for each notification trigger that it receives as soon as possible, for example, immediately.</li> <li>▪ Send first down message immediately, then summarize: When PRTG receives several down triggers, it sends the first notification immediately, then it continues to summarize notification triggers into one message, regardless of the sensor status.</li> <li>▪ Send first down and up message immediately, then summarize: When PRTG receives several down or up triggers, it sends each first notification immediately, then it continues to summarize notification triggers into one message, regardless of the sensor status.</li> <li>▪ Send all down messages immediately, summarize the others: When PRTG receives several down triggers, it sends out one notification for each trigger that it receives, but it summarizes notifications for all non-down triggers into one message.</li> <li>▪ Send all down and up messages immediately, summarize the others: When PRTG receives several down or <b>up</b> triggers, it sends out one notification for each trigger that it receives, but it summarizes the notifications for all non-down and non-up triggers into one message.</li> <li>▪ Always summarize notifications, regardless of type: When PRTG receives several notification triggers, it summarizes the notifications, regardless of the kind of notification trigger that it receives. <ul style="list-style-type: none"> <li>ⓘ The maximum number of notifications (see below) still applies.</li> <li>ⓘ Regardless of the option that you choose, PRTG never summarizes notifications of the types Send Slack Message, Send Microsoft Teams Message, Execute HTTP Action, Execute Program, and Assign Ticket because it always sends them immediately. PRTG can summarize the messages of all other notification types.</li> <li>ⓘ 'first down' and 'first up' messages refer to the notification trigger condition and the clear condition respectively. You can also define warning or unusual states as notification trigger conditions or even thresholds or other triggers notification summarizations. The <b>condition clear</b> triggers, if applicable, are defined in the respective notification trigger conditions as well. The notification triggers all qualify as 'first down' or 'first up' messages.</li> <li>ⓘ PRTG collects up to 25 single notifications for one summarization and sends out the message as soon as this number is reached (or when the gathering time passes). If PRTG receives more than 25 notifications within the defined time span, you receive more than one message with up to 25 entries each. For example, if PRTG collects 74 notifications, this results in 3 summarized messages with 25, 25, and 24 collected notifications.</li> </ul> </li> </ul>

Setting	Description
Subject for Summarized Email or SNS Messages	<p>Define a subject that PRTG includes when it sends summarized notifications. The default subject is [%sitename%] %summarycount Summarized Notifications.</p> <p><b>i</b> PRTG only uses the subject for the notification methods Send Email and Send Amazon Simple Notification Service Message.</p> <p><b>■</b> You can use placeholders. For more information, see section <a href="#">Placeholders for Notifications</a> <sup>3325</sup>.</p>
Time Span for Summarizing Messages (in Minutes)	<p>Define a time span in minutes to define how long PRTG collects notifications for summarization. Enter an integer.</p> <p><b>i</b> If you enter a long time span, for example, 60 minutes, PRTG collects notifications for one hour before it sends them out summarized unless other features (see above) require an earlier message dispatch.</p>

## Access Rights

Access Rights	
User Group Access <sup>1</sup>	Rights
<div style="text-align: right;">User Group</div>	
RO User Group	No access
PRTG Users Group	No access

Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the notification template. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> <li>▪ No access: Users in this user group cannot see or edit the notification template. The object does not show up in lists.</li> <li>▪ Read access: Users in this user group can see the notification template and view its settings.</li> <li>▪ Write access: Users in this user group can see the notification template and view and edit its settings. However, they cannot edit its access rights settings.</li> <li>▪ Full access: Users in this user group can see the notification template, view and edit its settings, and edit its access rights settings.</li> </ul> <p><b>i</b> You can create new user groups in the <a href="#">User Groups</a> <sup>2912</sup> settings.</p>

## Notification Methods

With the following settings, you can add one or more methods for how PRTG sends out a notification message. You can choose one method or combine several methods. Whenever the notification is triggered, PRTG sends out messages or performs actions for all configured methods at once.

To select a notification method, click  in front of it. You can then see and set the options as described in this section. The following notification methods are available:

 Some notification types are only available for PRTG Network Monitor (marked with ). You cannot use these with PRTG Hosted Monitor.

- [Send Email](#)  
- [Add Entry to Event Log](#)  
- [Send SMS/Pager Message](#)  
- [Execute HTTP Action](#)  
- [Execute Program](#)  
- [Send Syslog Message](#)  
- [Send SNMP Trap](#)  
- [Send Amazon Simple Notification Service Message](#)  
- [Assign Ticket](#)  
- [Send Push Notification](#)  
- [Send Microsoft Teams Message](#)  
- [Send Slack Message](#)  
- [Send MQTT Publish Notification](#)  
- [Send OPC UA Notification](#)  

## Send Email @

 This notification method uses notification contacts to deliver the email notifications. Set up notification contacts in advance in the [notification contacts](#)  settings.

Send Email

Sender <sup>?</sup>  Default  
 Custom

Send to User, Send to User Group, and Send to Email Address all work simultaneously. Every user, user group, or email address that you define here all receive the email notifications.

Send Email

Setting	Description
Sender	<p>Define which sender email address and sender name appear in the <b>FROM</b> part of the email notifications:</p> <ul style="list-style-type: none"> <li>▪ Default: Use the default sender email address and sender name from the <a href="#">notification delivery</a> <sup>2878</sup> settings.</li> <li>▪ Custom: Enter a custom sender email address and sender name.</li> </ul>
Sender Email Address	<p><b>This setting is only visible if you select Custom above.</b></p> <p>Enter an email address to use as the sender of the email notifications.</p> <p><sup>i</sup> If you enter a custom sender email address, it overrides the email address in the <a href="#">notification delivery</a> <sup>2879</sup> settings.</p> <p><sup>i</sup> The outgoing Simple Mail Transfer Protocol (SMTP) server in the notification delivery settings must allow the email address so that it can deliver email notifications.</p>
Sender Name	<p><b>This setting is only visible if you select Custom above.</b></p> <p>Enter a sender name to use as the sender of the email notifications.</p> <p><sup>i</sup> If you enter a custom sender name, it overrides the sender name in the <a href="#">notification delivery</a> <sup>2879</sup> settings.</p>

Setting	Description
Send to User	<p>Select a user account to send the email notifications to. PRTG sends the email notifications to every active email <a href="#">notification contact</a><sup>[2844]</sup> for this user account. Leave None to not use this option.</p> <ul style="list-style-type: none"> <li><span data-bbox="395 495 427 528">i</span> Read/write users can send notifications to any user that is a member of the same user group as the read/write user.</li> <li><span data-bbox="395 577 427 611">i</span> Send to User, Send to User Group, and Send to Email Address all work simultaneously. Because of this, you can define more than one user as a recipient of this notification. PRTG sends the email notifications to the active email <a href="#">notification contacts</a><sup>[2844]</sup> of the user that you select, to the active email notification contacts of all members of the user group that you select, and to all email addresses that you enter under Send to Email Address.</li> </ul>
Send to User Group	<p>Select a user group to send the email notifications to all members of this user group. PRTG sends the email notifications to every active email <a href="#">notification contact</a><sup>[2844]</sup> of every user in the user group. Leave None to not use this option.</p> <ul style="list-style-type: none"> <li><span data-bbox="395 934 427 967">i</span> If you select a user group and a specific member of this user group as recipients, the user only receives <b>one</b> single email. This also applies if you enter an individual email address under Send to Email Address that is already defined as an email notification contact of the selected user.</li> <li><span data-bbox="395 1081 427 1115">i</span> If you define individual email addresses under Send to Email Address, define a specific user account under Send to User, and define a user group here, PRTG sends the message to the individual email addresses, to the individual user, as well as to the members of the selected user group. In all cases, PRTG sends <b>one</b> message with all recipients in the <b>To</b> part of the email.</li> <li><span data-bbox="395 1261 427 1294">i</span> Read/write users can send email notifications to all user groups that they are members of.</li> <li><span data-bbox="395 1344 427 1377">i</span> Send to User, Send to User Group, and Send to Email Address all work simultaneously. Because of this, you can define more than one user as a recipient of this notification. PRTG sends the email notifications to the active email <a href="#">notification contacts</a><sup>[2844]</sup> of the user that you select, to the active email notification contacts of all members of the user group that you select, and to all email addresses that you enter under Send to Email Address.</li> </ul>
Send to Email Address	<p>Enter one or more email addresses to which PRTG sends the email notifications. If you enter more than one email address, separate them with commas. Leave this field empty to only send email notifications to the email notification contacts of the user or to the members of the user group you choose above.</p> <ul style="list-style-type: none"> <li><span data-bbox="395 1731 427 1765">i</span> We recommend that you use Send to User and/or Send to User Group instead because you can then manage the notification contacts of users.</li> <li><span data-bbox="395 1814 427 1848">i</span> Send to User, Send to User Group, and Send to Email Address all work simultaneously. Because of this, you can define more than one user as a recipient of this notification. PRTG sends the email notifications to the active email <a href="#">notification contacts</a><sup>[2844]</sup> of the user that you select, to the active email notification contacts of all members of the user group that you select, and to all email addresses that you enter under Send to Email Address.</li> </ul>

Setting	Description
Subject	<p>Enter the subject of the email notifications. The default subject is [%sitename] %device %name %status %down (%message).</p> <p> You can use placeholders. For more information, see section <a href="#">Placeholders for Notifications</a> <sup>3325</sup>.</p>
Format	<p>Define the kind of email that PRTG sends when the notification is triggered:</p> <ul style="list-style-type: none"> <li>▪ HTML: PRTG uses the default HTML email template for the message part of the email.</li> </ul> <p> Make sure that your email client can show HTML emails, otherwise you cannot read emails from PRTG.</p> <ul style="list-style-type: none"> <li>▪ Text: PRTG uses the default plain text email template for the message part of the email.</li> <li>▪ Custom text: PRTG uses custom plain text for the message part of the email. Define a custom text below.</li> </ul>
Custom Text	<p><a href="#">This setting is only visible if you select Custom text above.</a></p> <p>Enter the desired message for this email notification in plain text format. You can use placeholders here.</p> <p> For more information, see section <a href="#">Placeholders for Notifications</a> <sup>3325</sup>.</p>
Priority	<p>Define the priority that PRTG sets for the email:</p> <ul style="list-style-type: none"> <li>▪ Very High</li> <li>▪ High</li> <li>▪ Medium</li> <li>▪ Low</li> <li>▪ Very Low</li> </ul> <p> Most email clients can show this priority flag.</p>
HTTP Version	<p>Define the HTTP version that PRTG uses to send the email:</p> <ul style="list-style-type: none"> <li>▪ HTTP 1.1 (default): Use HTTP version 1.1.</li> <li>▪ HTTP 1.0: Use HTTP version 1.0.</li> </ul>

Add Entry to Event Log 

 This option is not available in PRTG Hosted Monitor.

Add Entry to Event Log

Log File   Application  
 PRTG Network Monitor

Event Type  Error

Message  [%sitename] %device %name %status %down (%message)

Add Entry to Event Log

Setting	Description
Log File	<p>Define the log file to which PRTG adds an event:</p> <ul style="list-style-type: none"> <li>Application: PRTG adds an entry to the <a href="#">Application</a> log file under <a href="#">Windows Logs</a> in the event log</li> <li>PRTG Network Monitor: PRTG adds an entry to the <a href="#">PRTG Network Monitor</a> log file under <a href="#">Applications and Services Logs</a> in the event log.</li> </ul>
Event Source	<p><a href="#">This setting is only visible if you select Application above.</a></p> <p>Enter the source for the event. This is usually the name of the application.</p>
Event Type	<p>Select the type of the event:</p> <ul style="list-style-type: none"> <li>Error: An event that indicates a significant problem such as loss of data or loss of functionality. For example, if a service fails to load during startup, an Error event is logged.</li> <li>Warning: An event that is not necessarily significant, but might indicate a possible future problem. For example, when disk space is low, a Warning event is logged.</li> <li>Information: An event that describes the successful operation of an application, driver, or service. For example, when a network driver loads successfully, it might be appropriate to log an Information event.</li> </ul>
Message	<p>Define the message that PRTG writes in the event log. The default message is <a href="#">[%sitename] %device %name %status %down (%message)</a>.</p> <p> To reset this field to the default value, enter only an asterisk (*).</p> <p> You can use placeholders. For more information, see section <a href="#">Placeholders for Notifications</a> .</p>

## Send SMS/Pager Message

 You must first set up this notification method in the [Notification Delivery](#)  settings.

 This notification method uses notification contacts to deliver the SMS/pager messages. Set up notification contacts in advance in the [notification contacts](#)  settings.

This notification method uses the central proxy settings that you define for the PRTG core server. For more information, see section [Core & Probes](#) (section Proxy Configuration).

**Send SMS/Pager Message**

Send to User, Send to User Group, and Send to Number all work simultaneously. Every user, user group, or number that you define here all receive the notifications.

Send to User

Send to User Group

Send to Phone Number

Message

HTTP Version  HTTP 1.1 (default)  
 HTTP 1.0

Send SMS/Pager Message

Setting	Description
Send to User	Select a user account from the dropdown list. PRTG sends the SMS/pager message to every <a href="#">SMS notification contact</a> for the user account. Leave None to not use this option.
Send to User Group	Select a user group from the dropdown list. PRTG sends the SMS/pager message to every SMS notification contact for every member of the <a href="#">user group</a> .  <p><b>i</b> If you select a user group and a specific member of this user group as recipients at the same time, this user receives the SMS/pager message only once. This also applies if you enter an individual phone number below that is already defined as an SMS notification contact for the selected user.</p>
Send to Phone Number	Enter a phone number to send the SMS/pager message to. If you enter more than one phone number, use commas as separators.  <p><b>i</b> The format depends on the SMS provider. Usually, you use a plus sign (+), followed by the country code and the number. For example, <a href="#">+1555012345</a>.</p> <p><b>i</b> Make sure that the number format meets the requirements of the SMS provider or the hardware that you use in combination with an application programming interface (API) call. Sometimes, a plus sign is not required. The wrong format might result in undelivered messages.</p> <p><b>i</b> We recommend that you use Send to User and/or Send to User Group instead because you can then manage the notification contacts of users.</p>
Message	Define the SMS/pager message. The default message is <a href="#">[%sitename] %device %name %status %down (%message)</a> .  <p><b>i</b> To reset this field to the default value, enter only an asterisk (*).</p>

Setting	Description
	<p> You can use placeholders. For more information, see section <a href="#">Placeholders for Notifications</a> <sup>[3325]</sup>.</p>
HTTP Version	<p>Define the HTTP version that PRTG uses to send the SMS/pager message:</p> <ul style="list-style-type: none"> <li>▪ HTTP 1.1 (default): Use HTTP version 1.1.</li> <li>▪ HTTP 1.0: Use HTTP version 1.0.</li> </ul>

## Execute HTTP Action: //

-  Regardless of the Notification Summarization method that you use, PRTG always sends notifications of the type Execute HTTP Action immediately. PRTG never summarizes them.
-  This notification method uses the central proxy settings that you define for the PRTG core server. For more information, see section [Core & Probes](#) <sup>[2888]</sup> (section Proxy Configuration).
-  For more information, see section [Custom Notifications](#) <sup>[3151]</sup>. You can find ready-to-use custom notifications in the [PRTG Sensor Hub](#), see [below](#) <sup>[2841]</sup>.

Execute HTTP Action

URL  www.example.com

SNI Handling 

Do not send SNI (default)

Send SNI

HTTP Method 

GET (default)

POST

PUT

PATCH

Execute HTTP Action

Setting	Description
URL	<p>Enter the URL that PRTG sends the request to.</p> <p> HTTP notifications work with or without Secure Sockets Layer (SSL).</p> <p> You can use placeholders. For more information, see section <a href="#">Placeholders for Notifications</a> <sup>[3325]</sup>.</p>

Setting	Description
SNI Handling	<p>Define if PRTG sends the Server Name Indication (SNI) extension to the Transport Layer Security (TLS) protocol along with the HTTP request:</p> <ul style="list-style-type: none"> <li>▪ Do not send SNI (default): PRTG does not send the SNI when it executes the HTTP action.</li> <li>▪ Send SNI: PRTG sends the SNI when it calls the target URL. Specify the SNI below.</li> </ul>
SNI Name	<p><a href="#">This setting is only visible if you select Send SNI above.</a></p> <p>Enter the SNI name that the endpoint configuration requires. Usually, this is the fully qualified domain name (FQDN) of the virtual host.</p>
HTTP Method	<p>Select the HTTP method that the notification uses:</p> <ul style="list-style-type: none"> <li>▪ GET (default): Use the GET method.</li> <li>▪ POST: Use the POST method.</li> <li>▪ PUT: Use the PUT method.</li> <li>▪ PATCH: Use the PATCH method.</li> </ul>
Payload	<p><a href="#">This setting is only visible if you select POST, PUT, or PATCH above.</a></p> <p>Enter a payload. The payload is the data that PRTG transmits to the URL.</p> <ul style="list-style-type: none"> <li> You cannot use Extensible Markup Language (XML) or JavaScript Object Notation (JSON).</li> <li> Only the content type <a href="#">application/x-www-form-urlencoded</a> is supported.</li> <li> You can use line breaks.</li> <li> You can use placeholders. For more information, see section <a href="#">Placeholders for Notifications</a> <sup>[3325]</sup>.</li> </ul>
HTTP Version	<p><a href="#">This setting is only visible if you select POST above.</a></p> <p>Select the HTTP version that PRTG uses to execute the HTTP action:</p> <ul style="list-style-type: none"> <li>▪ HTTP 1.1 (default): Use HTTP version 1.1.</li> <li>▪ HTTP 1.0: Use HTTP version 1.0.</li> </ul> <p> Make sure that the target supports the HTTP version that you select.</p>

## Execute Program

-  Regardless of the Notification Summarization method that you use, PRTG always sends notifications of the type Execute Program immediately. PRTG never summarizes them.
-  To remotely run PowerShell scripts, make sure that you set the according Execution Policy. For more information, see the Knowledge Base: [PowerShell 32 bit and 64 bit and Execution Policy](#)

 For more information, see section [Custom Notifications](#)<sup>[315]</sup>. You can find ready-to-use custom notifications in the [PRTG Sensor Hub](#), see [below](#)<sup>[284]</sup>.

 This option is not available in PRTG Hosted Monitor.

 **Execute Program**

Executable File 

Parameters 

Domain or Computer Name 

User Name 

Password 

Timeout (Sec.) 

Execute Program

Setting	Description
Executable File	<p>Select an executable file from the list. PRTG runs it every time the notification is triggered.</p> <ul style="list-style-type: none"> <li> You see the files that are in the corresponding \Notifications\EXE subfolder of the <a href="#">PRTG program directory</a><sup>[321]</sup>. For files to appear in this list, store them as .bat, .cmd, .exe, .com, .ps1, or .vbs.</li> <li> In a cluster, copy the files to every cluster node. This makes sure that PRTG can execute the notification even when the master node fails. If your custom notification executes an external program, install it on all cluster nodes as well.</li> </ul>
Parameters	<p>Enter the parameters that the notification passes to the executable. For example, if you use a batch file that contains a %1 variable, you can provide a value for this variable. The default parameters are <a href="#">[%sitename] %device %name %status %down (%message)</a>.</p> <ul style="list-style-type: none"> <li> You can use placeholders. For more information, see section <a href="#">Placeholders for Notifications</a><sup>[332]</sup>.</li> </ul>

Setting	Description
	<p> You need to escape special characters and whitespaces in your parameters and surround them with double quotation marks ("). See section <a href="#">Escape Special Characters and Whitespaces in Parameters</a> <sup>3312</sup> for details.</p>
Domain or Computer Name	Enter a Windows authority if you want to use a different security context for the program than the security context of the PRTG core server.
User Name	Enter the user name for Windows access.
Password	Enter the password for Windows access.
Timeout (Sec.)	Enter a timeout in seconds. After this time passes, PRTG stops the process if it is still running. Enter an integer.

## Send Syslog Message

 This option is not available in PRTG Hosted Monitor.

 **Send Syslog Message**

Host/IP Address  192.0.2.0

Syslog Port  514

Facility  User-level messages

Encoding   ANSI  
 UTF-8 (default)

Message  [%sitename] %device %name %status %down (%message)

Send Syslog Message

Setting	Description
Host/IP Address	<p>Define the IP address or the Domain Name System (DNS) name of the system that runs the syslog server.</p> <p> You can receive and analyze syslog messages with the <a href="#">Syslog Receiver</a> sensor.</p>
Syslog Port	<p>Enter the port that PRTG sends the syslog messages to. The default port is 514.</p> <p> You can only use the User Datagram Protocol (UDP).</p>

Setting	Description
Facility	<p>Define the facility of the syslog messages:</p> <ul style="list-style-type: none"> <li>User-level messages</li> <li>Local use <a href="#">0-7</a></li> </ul>
Encoding	<p>Define the encoding of the syslog messages that PRTG sends to the syslog receiver:</p> <ul style="list-style-type: none"> <li>ANSI</li> <li>UTF-8</li> </ul> <p> Make sure that the syslog receiver supports the encoding that you select.</p>
Message	<p>Define the syslog message. The default message is <code>[%sitename] %device %name %status %down (%message)</code>.</p> <p> To reset this field to the default value, enter only an asterisk (*).</p> <p> You can use placeholders. For more information, see section <a href="#">Placeholders for Notifications</a> <sup>3325</sup>.</p>

### Syslog Message Severity Status

 Depending on the status of the sensor that triggers the syslog notification, PRTG automatically sets the Severity level of the syslog messages.

Status	Severity level
 Up	Notice (5)
 Warning	Warning (4)
 Down	Error (3)

### Send SNMP Trap

 For more information about the object identifiers (OID) that PRTG uses in the content of the Simple Network Management Protocol (SNMP) traps, see the Knowledge Base: [Is it possible to send SNMP traps using PRTG?](#)

 This option is not available in PRTG Hosted Monitor.

Send SNMP Trap

Host/IP Address ⓘ

SNMP Port ⓘ

Community String ⓘ

Custom Trap Code ⓘ

Message ID ⓘ

Message ⓘ

Agent IP ⓘ

Include Sensor ID ⓘ

Do not include sensor ID (default)
  Include sensor ID

Send SNMP Trap

Setting	Description
Host/IP Address	Define the IP address or DNS name of the system that runs the trap receiver. ⓘ You can receive and analyze SNMP trap messages with the <a href="#">SNMP Trap Receiver</a> sensor.
SNMP Port	Enter the port on which PRTG sends trap messages. The default port is <a href="#">162</a> .
Community String	Enter the community string of the device. The default community string is <a href="#">public</a> . Enter a string or leave the field empty.
Custom Trap Code	Enter a code to identify the purpose of the trap. The default trap code is <a href="#">0</a> . Enter an integer.
Message ID	Enter an ID to identify the origin of the trap. Enter an integer. PRTG sends it on the OID <a href="#">1.3.6.1.4.1.32446.1.1.1</a> .
Message	Define the trap message. ⓘ To reset this field to the default value, enter only an asterisk (*). ■ You can use placeholders. For more information, see section <a href="#">Placeholders for Notifications</a> <sup>[3325]</sup> .
Agent IP	Define the IP address of the agent. Leave this field empty to use the IP address of the PRTG web server.

Setting	Description
Include Sensor ID	<p>Define if PRTG should include the sensor ID of the sensor that triggers the notification:</p> <ul style="list-style-type: none"> <li>Do not include sensor ID (default): Do not include the sensor ID with the notification message.</li> <li>Include sensor ID: Include the sensor ID with the notification message. PRTG sends it on the OID <a href="#">1.3.6.1.4.1.32446.1.1.5</a>.</li> </ul>

### Send Amazon Simple Notification Service Message

 **Send Amazon Simple Notification Service Message**

AWS Access Key ID ?

AWS Secret Access Key ?

Location ?

Amazon Resource Name ?

This field is required.

Subject ?

Message ?

Send Amazon Simple Notification Service Message

Setting	Description
AWS Access Key ID	Enter your access key ID from <a href="https://aws.amazon.com">aws.amazon.com</a> . Enter a string.
AWS Secret Access Key	Enter your secret access key from <a href="https://aws.amazon.com">aws.amazon.com</a> . Enter a string.
Location	<p>Define the location of your Amazon service:</p> <ul style="list-style-type: none"> <li>Africa (Cape Town)</li> <li>Asia Pacific (Hong Kong)</li> <li>Asia Pacific (Mumbai)</li> <li>Asia Pacific (Osaka)</li> <li>Asia Pacific (Seoul)</li> <li>Asia Pacific (Singapore)</li> <li>Asia Pacific (Sydney)</li> </ul>

2827

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Asia Pacific (Tokyo)</li> <li>▪ Canada (Central)</li> <li>▪ China (Beijing)</li> <li>▪ China (Ningxia)</li> <li>▪ Europe (Frankfurt)</li> <li>▪ Europe (Stockholm)</li> <li>▪ Europe (Milan)</li> <li>▪ Europe (Ireland)</li> <li>▪ Europe (London)</li> <li>▪ Europe (Paris)</li> <li>▪ Middle East (Bahrain)</li> <li>▪ South America (São Paulo)</li> <li>▪ US East (Northern Virginia)</li> <li>▪ US East (Ohio)</li> <li>▪ US West (Northern California)</li> <li>▪ US West (Oregon)</li> </ul>
Amazon Resource Name	Enter the Amazon resource name. Enter a string.
Subject	<p>Enter the subject of the Amazon Simple Notification Service (SNS) message. Enter a string.</p> <p> The maximum length for the subject is <b>202</b> characters. PRTG ignores characters that exceed this length.</p>
Message	<p>Define the SNS message. The default SNS message is <code>[%sitename] %device %name %status %down (%message)</code>.</p> <p> To reset this field to the default value, enter only an asterisk (*).</p> <p> You can use placeholders. For more information, see section <a href="#">Placeholders for Notifications</a> <sup>[3325]</sup>.</p> <p> PRTG only sends the message if you use email-based notifications delivered by Amazon SNS. For SMS delivery, PRTG only sends the subject and ignores the message because of SMS size restrictions.</p>

## Assign Ticket

 Regardless of the Notification Summarization method that you use, PRTG always sends notifications of the type Assign Ticket immediately. PRTG never summarizes them.

For more information about the ticket system, see section [Tickets](#)<sup>[213]</sup>.

Assign Ticket

Assign to User Group or User <sup>i</sup>

To user group  
 To user

User Group <sup>i</sup> PRTG Administrators

Subject <sup>i</sup> %device %name %status %down (%message)

Content <sup>i</sup> Sensor: %name  
Status: %status %down

Date/Time: %datetime (%timezone)

When Condition Clears <sup>i</sup>

Close the notification ticket (recommended)  
 Do not close the notification ticket

Assign Ticket

Setting	Description
Assign to User Group or User	Specify whether to assign the <a href="#">notification ticket</a> <sup>[213]</sup> to a user group or to a single user: <ul style="list-style-type: none"> <li>To user group: Assign the notification ticket to a user group.</li> <li>To user: Assign the notification ticket to a single user.</li> </ul>
User Group	Select the user group to which PRTG assigns the notification ticket. <p><sup>i</sup> Read/write users can assign tickets to all user groups that they are a member of as well as to administrators and individual users that are members of the same user group as the read/write user.</p>
User	Select the user to which PRTG assigns the notification ticket. <p><sup>i</sup> Read/write users can assign tickets to all user groups that they are a member of as well as to administrators and individual users that are members of the same user group as the read/write user.</p>
Subject	Enter the subject of the notification ticket. The default subject is <code>%device %name %status %down (%message)</code> . <p> You can use placeholders. For more information, see section <a href="#">Placeholders for Notifications</a><sup>[325]</sup>.</p>
Content	Enter the message of the notification ticket. The default message is <p>Sensor: %name Status: %status %down</p>

Setting	Description
	<p>Date/Time: %datetime (%timezone)                      Last Result: %lastvalue                      Last Message: %message</p> <p>Probe: %probe                      Group: %group                      Device: %device (%host)</p> <p>Last Scan: %lastcheck                      Last Up: %lastup                      Last Down: %lastdown                      Uptime: %uptime                      Downtime: %downtime                      Cumulated since: %cumsince                      Location: %location</p> <p><b>i</b> To reset this field to the default value, enter only an asterisk (*).</p> <p><b>■</b> You can use placeholders. For more information, see section <a href="#">Placeholders for Notifications</a> <sup>[3325]</sup>.</p>
When Condition Clears	<p>Define how PRTG handles the notification ticket when the defined trigger condition clears:</p> <ul style="list-style-type: none"> <li>▪ Close the notification ticket (recommended): Automatically close the notification ticket if the trigger condition is not met anymore.</li> <li>▪ Do not close the notification ticket: Do not close the notification ticket after the condition clears.</li> </ul>

## Send Push Notification

**■** Push notifications only work with the apps [PRTG for Android](#) <sup>[2969]</sup> and [PRTG for iOS](#) <sup>[2988]</sup>. You must activate push notifications in the settings of the app first. For more information about the setup, see the Knowledge Base: [How can I use push notifications with PRTG?](#)

**i** This notification method uses notification contacts to deliver push notifications. Set up notification contacts in advance in the [notification contacts](#) <sup>[2844]</sup> settings.

**i** The PRTG core server needs to communicate with the PRTG Cloud on port 443 to send push notifications. It uses <https://api.prtgcloud.com:443>, which is the same as for the [Cloud HTTP v2](#) sensor, the [Cloud Ping v2](#) sensor, and [support tickets](#) <sup>[2977]</sup>.

**i** Send to User and Send to User Group both work simultaneously. Because of this, you can define more than one user as a recipient of push notifications. PRTG sends push notifications to the active [push notification contacts](#) <sup>[2844]</sup> of the user that you select, and to the active push notification contacts of all members of the user group that you select.

 **Send Push Notification**

Send to User and Send to User Group both work simultaneously. This means that every push device of the user or user group receives the push notifications.

Note: The PRTG core server must be able to reach the PRTG Cloud on TCP port 443 to send push notifications.

Send to User  PRTG System Administrator

Send to User Group  None

Message  [%sitename] %device %name %status %down (%message)

HTTP Version   HTTP 1.1 (default)  
 HTTP 1.0

Send Push Notification

Setting	Description
Send to User	<p>Select the user that PRTG sends push notifications to. PRTG sends the push notifications to each active push notification contact of the user. Leave None to not use this option.</p> <p> You can edit push notification contacts of a user in the <a href="#">Notification Contacts</a> <sup>2844</sup> settings and also activate push notifications in the Android or iOS app with the user.</p>
Send to User Group	<p>Select the user group that PRTG sends push notifications to. PRTG sends the push notifications to each active push notification contact of every member of the group. Leave None to not use this option.</p> <p> If you select a user group and a specific member of the group as recipients at the same time, the user receives the text message only one time.</p> <p> You can edit user groups in the <a href="#">User Groups</a> <sup>2912</sup> settings and push notification contacts in the <a href="#">Notification Contacts</a> <sup>2844</sup> settings.</p>
Message	<p>Define the message of the push notification. The default message is [%sitename] %device %name %status %down (%message).</p> <p> To reset this field to the default value, enter only an asterisk (*).</p> <p> You can use placeholders. For more information, see section <a href="#">Placeholders for Notifications</a> <sup>3325</sup>.</p>
HTTP Version	<p>Define the HTTP version that PRTG uses to send the push notification:</p> <ul style="list-style-type: none"> <li>HTTP 1.1 (default): Use HTTP version 1.1.</li> <li>HTTP 1.0: Use HTTP version 1.0.</li> </ul>

## Send Microsoft Teams Message

 Regardless of the Notification Summarization method you use, PRTG always sends notifications of the type Send Microsoft Teams Message immediately. PRTG never summarizes them.

**Send Microsoft Teams Message**

CA Certificate	<p>Paste the certificate authority (CA) certificate for the verification of the MQTT broker.</p> <p> The certificate must be in Privacy-Enhanced Mail (PEM) format.</p>
Client Authentication	<p>This setting is only visible if you select Use transport-level security above.</p> <p>Select if you want to use a certificate for client authentication:</p> <ul style="list-style-type: none"> <li>Disable (default): Do not use a certificate for client authentication.</li> <li>Enable: Use a certificate for client authentication.</li> </ul>
Client Certificate	<p>Paste the certificate that you created for authenticating the sensor against the MQTT broker.</p> <p> The certificate must be in PEM format.</p>
Client Key	<p>Enter the client key for access to the MQTT broker.</p> <p> The client key must be in PEM format and it must be encrypted using the Client Key Password.</p>
Client Key Password	<p>Enter the password for the client key certificate.</p>
MQTT Topic	<p>Enter the topic for the MQTT publish notifications. The default topic is <a href="#">PRTG/%sitename/notifications</a>.</p> <p> MQTT clients that are subscribed to this topic receive the MQTT publish notifications.</p>
ClientID	<p>Enter the ClientID for the connection to the MQTT broker (server). The default ClientID is <a href="#">PRTG - %sitename</a>.</p>
Message	<p>Define the message of the MQTT publish notifications. The default message is <a href="#">PRTG - [%sitename] %device %name %status %down (%message)</a>.</p>

Setting	Description
	<p> To reset this field to the default value, enter only an asterisk (*).</p> <p> You can use placeholders. For more information, see section <a href="#">Placeholders for Notifications</a> <sup>[3325]</sup>.</p>

## Send OPC UA Notification

Send OPC UA Notification

Note: This notification method is neither intended to control any processes or machines nor is it intended for real-time alerting. We recommend that you use OPC UA notifications for notification purposes only.

OPC UA Server <sup>ⓘ</sup>

Port <sup>ⓘ</sup>

Server Path <sup>ⓘ</sup>

Node ID <sup>ⓘ</sup>

Timeout (Sec.) <sup>ⓘ</sup>

Security Mode <sup>ⓘ</sup>  None (default)  
 Sign  
 Sign & Encrypt

Authentication Method <sup>ⓘ</sup>  Anonymous (default)  
 User name and password

Data Type <sup>ⓘ</sup>  Boolean  
 Int64  
 Double

Boolean <sup>ⓘ</sup>  True (default)  
 False

Send OPC UA Notification

Setting	Description
OPC UA Server	Enter the address for the connection to the OPC Unified Architecture (OPC UA) server.
Port	Enter the port for the connection to the OPC UA server. The default port for secure connections is 4843. The default port for unsecure connections is 4840.
Server Path	Enter the path of the OPC UA server endpoint if you run more than one server under the same IP address or DNS name.
NodeID	Enter the NodeID for the OPC UA notification. PRTG writes the data that you define below to the specified NodeID.
Timeout (Sec.)	Enter a timeout in seconds for the request.

Setting	Description
Security Mode	<p>Select if you want to use encryption:</p> <ul style="list-style-type: none"> <li>▪ None (default): Do not use encryption.</li> <li>▪ Sign: Sign messages between the sensor and the OPC UA server.</li> <li>▪ Sign &amp; Encrypt: Sign and encrypt messages between the sensor and the OPC UA server.</li> </ul>
Security Policy	<p><a href="#">This setting is only visible if you select Sign or Sign &amp; Encrypt above.</a></p> <p>Select if you want to use a security policy and define which policy you want to use:</p> <ul style="list-style-type: none"> <li>▪ None (default): Do not use a security policy.</li> <li>▪ Basic256Sha256: Use the Basic256Sha256 security policy.</li> <li>▪ Basic256: Use the Basic256 security policy.</li> </ul>
Client Certificate	<p><a href="#">This setting is only visible if you select Sign or Sign &amp; Encrypt above.</a></p> <p>Enter the certificate that you created for authenticating the sensor against the OPC UA server.</p> <p> The certificate must meet the following requirements:</p> <ul style="list-style-type: none"> <li>▪ The key size must be 2048-bit or 4096-bit.</li> <li>▪ The secure hash algorithm must be <a href="#">SHA256</a>.</li> <li>▪ DataEncipherment must be part of the KeyUsage certificate extension.</li> <li>▪ A uniform resource indicator (URI) must be set in subjectAltName.</li> <li>▪ The certificate must be in Privacy-Enhanced Mail (PEM) format.</li> </ul>
Client Key	<p><a href="#">This setting is only visible if you select Sign or Sign &amp; Encrypt above.</a></p> <p>Enter the client key for access to the OPC UA server.</p> <p> The client key must be in PEM format and it must be encrypted using the Client Key Password.</p>
Client Key Password	<p><a href="#">This setting is only visible if you select Sign or Sign &amp; Encrypt above.</a></p> <p>Enter the password for the client key.</p>
Authentication Method	<p>Select if you want to connect without credentials or define credentials for access to the OPC UA server:</p> <ul style="list-style-type: none"> <li>▪ Anonymous (default): Connect without credentials.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ User name and password: Define credentials for the connection.</li> <li>ⓘ Most OPC UA servers do not support User name and password authentication without a client certificate. To use User name and password authentication, select Sign or Sign &amp; Encrypt under Security Mode and Basic256Sha256 or Basic256 under Security Policy and enter the Client Certificate, Client Key, and Client Key Password that you want to use.</li> <li>ⓘ If you select None (default) under Security Mode and use User name and password authentication, PRTG sends the unencrypted password to the OPC UA server.</li> <li>ⓘ Most OPC UA servers do not support User name and password authentication without a client certificate. To use User name and password authentication, select Sign or Sign &amp; Encrypt under Security Mode and Basic256Sha256 or Basic256 under Security Policy and enter the Client Certificate, Client Key, and Client Key Password that you want to use.</li> </ul>

Password	<p>This setting is only visible if you select User name and password <a href="#">above</a>.</p> <p>Enter the password for access to the OPC UA server.</p>
Data Type	<p>Select the type of the data that PRTG sends:</p> <ul style="list-style-type: none"> <li>▪ Boolean: PRTG sends a Boolean.</li> <li>▪ Int64: PRTG sends a 64-bit integer.</li> <li>▪ Double: PRTG sends a double value.</li> </ul>
Boolean	<p>This setting is only visible if you select Boolean <a href="#">above</a>.</p> <p>Select the Boolean value that PRTG sends:</p> <ul style="list-style-type: none"> <li>▪ True (default)</li> <li>▪ False</li> </ul> <p>ⓘ If you select Boolean as Data Type, the data type on the OPC UA server must be Boolean.</p>
Int64	<p>This setting is only visible if you select Int64 <a href="#">above</a>.</p> <p>Enter the 64-bit integer that PRTG sends.</p>

Setting	Description
	<p><b>i</b> If you select Int64 as Data Type, the data type on the OPC UA server must be Int64.</p>
Double	<p>This setting is only visible if you select Double above.</p> <p>Enter the double value that PRTG sends.</p> <p><b>i</b> If you select Double as Data Type, the data type on the OPC UA server must be Double.</p>

- i** Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

## PRTG Sensor Hub Notifications

In addition to the standard notifications, you can also create custom notifications. To do so, write a script or a program and use it with an Execute Program notification or an Execute HTTP Action notification. There are also many free scripts, plugins, and add-ons for PRTG in the [PRTG Sensor Hub](#).

## Others

- For information about the Comments and History tabs, see section [Object Settings](#)<sup>201</sup>.

### 8.12.1.3 Notification Contacts

On the Notification Contacts tab, you can define and change the notification contacts of the user account.

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

**☁** If 15 minutes (900) seconds have passed since your last credential-based login and you open a setup page from a different setup page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

Description	Recipient	Type	Status
Primary Email Address	johnpublic@example.com	Email	Active
Email Admin	admin@example.com	Email	Active
SMS Admin Mobile	+491234567890	SMS	Active

Notification Contacts Tab

Notification contacts are unique for each user account. This means that every user can individually define how they want to receive [notifications](#) from PRTG. Recipients of notifications are email addresses, phone numbers, push devices (with [PRTG for Android](#) or [PRTG for iOS](#)), and users of certain instant messaging services.

The [notification methods](#) Send Email, Send SMS/Pager Message, and Send Push Notification let you define a user who receives notifications for every **active** notification contact. If you select a user group, PRTG sends the notifications to **all active** notification contacts of **all** users that are in the user group. To exclude notification contacts from the notification delivery, use the Pause button to deactivate them.

In this section:

- [Note](#)
- [Notification Contacts Overview](#)
- [Notification Contacts Settings](#)
- [Add Email Contact](#)
- [Add SMS Contact](#)

## Note

You must take the following four steps to set up and use notifications:

1. Check and set up the [notification delivery](#) [2877] settings if you use PRTG Network Monitor. These settings define how PRTG sends messages.
2. Check and set up [notification contacts](#) [2842] for the user accounts. These contacts define the recipients to which PRTG sends notifications.
3. Check and set up several [notification templates](#) [2808]. These templates define the notification methods and their content.
  - ❗ You can also check or edit notification templates via the Notification Triggers tab. For more information, see section [Notification Triggers Settings](#) [2693].
4. Check and set up [notification triggers settings](#) [2693] for objects. These triggers define when PRTG sends notifications.

❗ Usually, there are three successive attempts to deliver a notification. If all of these attempts fail, the notification is lost. To never miss a notification, we recommend that you always set up at least two notifications with different notification methods for a notification trigger, for example, one email notification and one SMS notification. If delivery via email fails, PRTG can still notify you via smartphone as a fallback. For example, use the latency setting of a [state trigger](#) [2694] to choose a notification with a different notification method than in the first trigger condition, or set up a second trigger with a different notification method for the corresponding object.

■ For a detailed step-by-step guide, see the Paessler website: [How to set up notifications via the PRTG web interface](#).

■ Custom notification scripts are also available in the [PRTG Sensor Hub](#).

## Notification Contacts Overview

Click the Notification Contacts tab to show a list of all notification contacts for the user account. You have the following options:

Option	Description
Pause (⏸)	Pauses the notification contact. If a notification contact is <a href="#">paused</a> [227], PRTG does not send any messages to the contact when a notification for this user is triggered.
Resume (▶)	Resumes the notification contact. When a notification for this user is triggered, PRTG sends a message to this user.
Edit (✎)	Open the <a href="#">settings of the notification contact</a> [2844] and change its description and recipient. <ul style="list-style-type: none"> <li>❗ This is not possible for predefined notification contacts, for example, for <a href="#">Primary Email Address</a>. You can change the primary email address under <a href="#">My Account</a> [2801].</li> </ul>

Option	Description
Delete (🗑️)	Delete the notification contact.  ⓘ This is not possible for predefined notification contacts, for example, for <a href="#">Primary Email Address</a> .

## Notification Contacts Settings

Hover over  and select Add Email Contact or Add SMS Contact from the menu to add a new notification contact. You can also click the  next to a notification contact to edit it.

ⓘ PRTG automatically adds push contacts for the corresponding user when you install a PRTG app for iOS or Android on your smartphone or tablet, connect to PRTG, and activate push notifications. You cannot manually add push contacts. If your mobile device actively rejects push notifications for a push contact, for example, because you deactivate push on the target device or reset it, PRTG automatically pauses the push contact. The affected user account receives a [ToDo ticket](#) <sup>[213]</sup> in this case.

## Add Email Contact

Setting	Description
Description	Enter a description to identify the email contact.  ⓘ If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a>

Setting	Description
Recipient	<p>Enter a valid email address for the email contact.</p> <p>■ For the contact type <b>Push</b>, this field shows a unique token that you cannot change. PRTG uses this token to send push notifications through the cloud. For more information, see the Knowledge Base: <a href="#">How can I use push notifications with PRTG?</a></p>
Type	<p>Shows the type of the notification contact.</p> <p>ⓘ This setting is for your information only. You cannot change it.</p> <p>ⓘ If you want to use a different contact type, create a new contact with Add Email Contact or Add SMS Contact, or activate push notifications in your PRTG for iOS or Android app.</p>

Click OK to save your settings, or click Cancel to close the dialog box without changes to the notification contact.

### Add SMS Contact

Setting	Description
Description	<p>Enter a description to identify the SMS contact.</p> <p>ⓘ If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Recipient	<p>Enter a valid phone number for the SMS contact. The format of the phone number depends on the SMS provider. You can use a plus sign (+) or 00, followed by the country code and the number. For example, <b>+1555012345</b> or <b>001555012345</b>.</p> <p>ⓘ Make sure that the number format meets the requirements of your SMS provider or the hardware that you use in combination with an application programming interface (API) call. Sometimes a preceding plus sign is not required. The wrong format might result in undelivered messages.</p> <p>■ For the contact type <b>Push</b>, this field shows a unique token that you cannot change. PRTG uses this token to send push notifications through the cloud. For more information, see the Knowledge Base: <a href="#">How can I use push notifications with PRTG?</a></p>
Contact Type	<p>Shows the type of the notification contact.</p> <p>ⓘ This setting is for your information only. You cannot change it.</p>

Setting	Description
	<p><b>i</b> If you want to use a different contact type, create a new contact with Add Email Contact or Add SMS Contact, or activate push notifications in your PRTG for iOS or Android app.</p>

Click OK to save your settings, or click Cancel to close the dialog box without changes to the notification contact.

#### 8.12.1.4 Schedules

On the Schedules tab, you can define or change schedules for the user account. You can use schedules to [pause](#)<sup>[227]</sup> monitoring and notifications for certain time periods with the period lists option. Also, you can activate monitoring and notifications at certain times with the time table option. You can also use schedules to define the time periods that PRTG covers when you create [reports](#)<sup>[2754]</sup>.

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

**☁** If 15 minutes (900) seconds have passed since your last credential-based login and you open a setup page from a different setup page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

Schedules Settings

In this section:

- [Schedules Settings](#) <sup>2847</sup>
- [Basic Settings](#) <sup>2848</sup>
- [Access Rights](#) <sup>2850</sup>
- [Schedules and Time Zones](#) <sup>2850</sup>
- [Period Definition Syntax](#) <sup>2851</sup>
- [Others](#) <sup>2851</sup>

## Schedules Settings

**i** When a user with administrative rights creates a new object, only other users with administrative rights can view or edit the new object by default. When a read/write user creates a new object, all members of the read/write user's primary group can view and edit the new object as well. This behavior applies to [libraries](#) <sup>2738</sup>, [maps](#) <sup>2776</sup>, [reports](#) <sup>2754</sup>, [notification templates](#) <sup>2808</sup>, and [schedules](#) <sup>2846</sup>. For more information, see section [Access Rights Management](#) <sup>145</sup>.

Click the Schedules tab to show a list of all schedules. To edit a schedule, enable the check box next to a schedule and choose from the following options:

Option	Description
Used by 	Shows a list of objects that use this schedule.
Delete 	Deletes the schedule. <b>i</b> This is not possible for predefined schedules.
Settings 	Opens the settings of the schedule.

See also sections [Working with Table Lists](#)<sup>[218]</sup> and [Multi-Edit](#)<sup>[2718]</sup>.

Hover over  and select Add Schedule from the menu. You can also click the name of a schedule to edit it.

Edit Schedule Time Table

Setting	Description
Schedule Name	Enter a name to identify the schedule.  ⓘ If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically <a href="#">inherited</a><sup>[138]</sup>.</p> <p> For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p> For more information, see section <a href="#">Tags</a><sup>[138]</sup>.</p>
Selection Method	<p>Select the method that you want to use to define a schedule:</p> <ul style="list-style-type: none"> <li>▪ Use weekday/hour time table (default): Select specific days of the week or specific hours in which the schedule is <b>active</b>. This means that monitoring objects, notifications, and reports are not <b>paused</b>.</li> <li>▪ Use list of period definitions: Enter a list of period definitions in which the schedule is <b>inactive</b>. This means that monitoring objects, notifications, and reports are <b>paused</b>.</li> </ul>
Time Table (active time slots)	<p><b>This setting is only visible if you select Use weekday/hour time table (default) above.</b></p> <p>Enable or disable check boxes or use buttons to define the schedule:</p> <ul style="list-style-type: none"> <li>▪ Weekday buttons (  ): Use the weekday buttons Mo, Tu, We, Th, Fr, Sa, and Su to define the days of the week in which the schedule is active. For example, click the Mo button to set the schedule to active for <b>all hours every Monday</b>. This enables all check boxes under the Mo column.</li> <li>▪ Hour buttons (  ): Use the hour buttons 0:00 - 23:00 to define the hours of the day in which the schedule is active. For example, if the 0:00 button is blue, click it to set the schedule to active for the hour <b>0:00 of all days</b> of the week. If the 0:00 button is white, click it to set the schedule to inactive for the hour <b>0:00 of all days</b> of the week.</li> <li>▪ All off button (  ): Use the All off button to disable all check boxes, and to deselect all weekday buttons and hour buttons.</li> <li>▪ All on button (  ): Use the All on button to enable all check boxes, and to select all weekday buttons and hour buttons.</li> </ul> <p> For more information, see <a href="#">Schedules and Time Zones</a><sup>[2850]</sup> below.</p>
Period List (inactive time slots)	<p><b>This setting is only visible if you select Use list of period definitions above.</b></p> <p>Enter the date and time periods in which the schedule is <b>inactive</b>. The periods must have the following format:</p>

Setting	Description
	<p><a href="#">ww:hh:mm-ww:hh:mm</a></p> <p> Make sure that you enter each period exactly in this format. Otherwise you receive an error message. Go back to the schedule and correct the period in this case. For details and examples, see <a href="#">Period Definition Syntax</a> <sup>2851</sup> below.</p> <p> For more information, see <a href="#">Schedules and Time Zones</a> <sup>2850</sup> below.</p>

## Access Rights

Setting	Description
User Group Access	<p>Define the user groups that have access to the object. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> <li>▪ No access: Users in this user group cannot see or edit the object. The object does not show up in lists.</li> <li>▪ Read access: Users in this user group can see the object and view its settings.</li> <li>▪ Write access: Users in this user group can see the object and view and edit its settings. However, they cannot edit the object's access rights settings.</li> <li>▪ Full access: Users in this user group can see the object, view and edit its settings, and edit its access rights settings.</li> </ul> <p> You can create new user groups in the <a href="#">User Groups</a> <sup>2912</sup> settings.</p>

 Click OK to save your settings. If you close the dialog without saving, all changes to the settings are lost.

## Schedules and Time Zones

-  Schedules use the time zone of the PRTG core server system. This might be different from other time displays in PRTG that are saved in UTC.
- If you select Use weekday/hour time table (default), PRTG converts the time in which the schedule is active to the time zone of [the user account](#) <sup>2909</sup>. This means that the schedule applies according to the time that the user account shows.
  - If you select Use list of period definitions, PRTG does **not** adjust the time in which the schedule is inactive to the time zone of the user account. The schedule applies according to the time on the PRTG core server system in this case. Because of this, you encounter time shifts for schedules if there are changes to the time zone on the server or because of daylight saving and standard time changes.

## Period Definition Syntax

Define one or more periods of time during which the object that uses this schedule is **inactive**. In each line, enter one range in the format `ww:hh:mm-ww:hh:mm`. The following values are possible:

- **ww**: mo, tu, we, th, fr, sa, su.
- **hh**: Enter the hour in the 24-hour format. For example, a number between 00 and 23.  
❗ You must use the 24-hour format. You cannot use A.M./P.M.
- **mm**: Enter the minute. For example, a number between 00 and 59.

### Example

This example shows a schedule that pauses an object during the weekend as well as on Wednesday evenings.

```
fr:19:30-mo:06:05
we:18:45-we:23:00
```

Any object that uses this schedule is inactive (paused) from Friday, 7:30 P.M. to Monday, 6:05 A.M. as well as on Wednesday from 6:45 P.M. to 11 P.M. It is active during the other times.

## Others

- For information about the comments and history tabs, see section [Object Settings](#)<sup>[201]</sup>.

## More

### KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

## Others

There are some settings that you must define in the [PRTG Administration Tool](#)<sup>[3040]</sup>. For more information, see sections:

- [PRTG Administration Tool on PRTG Core Server Systems](#)<sup>[3041]</sup>
- [PRTG Administration Tool on Remote Probe Systems](#)<sup>[3067]</sup>

### 8.12.1.5 API Keys

On the API Keys tab, you can add, edit, and delete API keys that are specific to the user account.

❗ This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

☁ If 15 minutes (900) seconds have passed since your last credential-based login and you open a setup page from a different setup page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

## API Keys Overview

Click the API Keys tab to show a list of all API keys for the user account. You have the following options:

Option	Description
Edit (✎)	Open the <a href="#">settings of the API key</a> <sup>[2854]</sup> and change its name, description, and access level.
Delete (🗑)	Delete the API key.   You can select and delete multiple API keys at once using <a href="#">multi-edit</a> <sup>[2718]</sup> .

## Add API Key

Hover over  and select Add API Key from the menu to add a new API key.

Add New API Key

Add New API Key

Here you can add, modify, and delete API keys. With API keys, you can authenticate with the PRTG API without a user name and password.

We recommend the following best practices:

- Give API keys the least possible access level that you can work with
- Use separate API keys for different integrations and applications
- Store your API keys in a safe place to prevent unauthorized access
- Rotate your API keys regularly to prevent abuse in case they are leaked or exposed
- Delete unused API keys immediately

For more information, see the [PRTG Manual: API Keys](#)

### 8.12.2.1 User Interface

On the User Interface tab, you can define global settings regarding the PRTG web interface, PRTG web server settings and performance, Geo Maps, and graph settings.

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

**☁** If 15 minutes (900) seconds have passed since your last credential-based login and you open a setup page from a different setup page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

## PRTG Web Interface

**PRTG Web Interface**

Site Name ⓘ PRTG Network Monitor

---

DNS Name ⓘ

---

Language ⓘ English

---

Graph Type ⓘ  Display area graphs (default)  
 Display line graphs

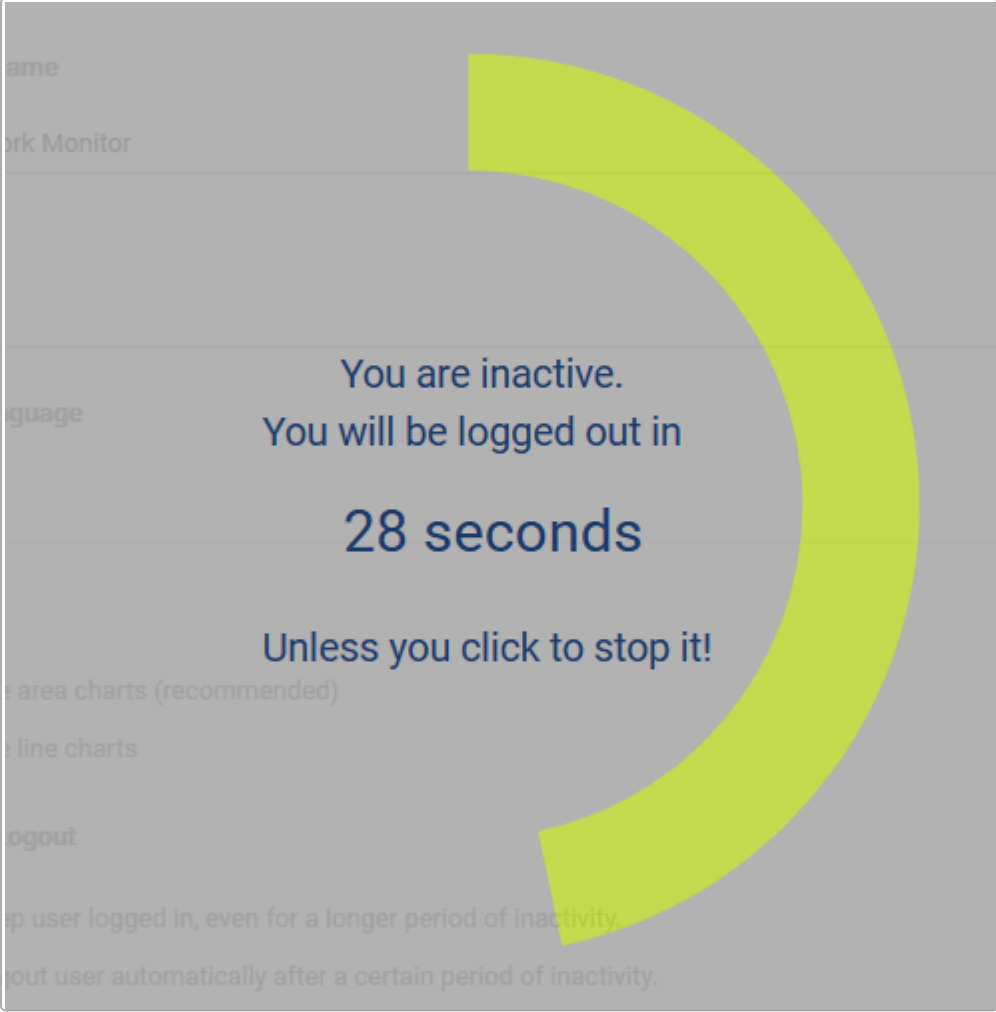

Automatic Logout ⓘ  Do not log out users after a period of inactivity  
 Log out users after a period of inactivity

Google Analytics Tracking ID ⓘ

PRTG Web Interface

Setting	Description
Site Name	<p>In the PRTG web interface, you can see the site name on the <a href="#">Login</a><sup>[153]</sup> screen and in the title bar of the browser window. PRTG also uses the site name in notification emails by default. Enter a string.</p> <p> ⓘ If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
DNS Name	<p>Enter a Domain Name System (DNS) name if the PRTG web interface is also reachable via the DNS name. PRTG also uses the DNS name in notification emails to generate links by default. Enter a string.</p> <p> ⓘ Do not use the special characters " and \ in the DNS name.</p> <p> ⓘ In a cluster, only the master node uses the DNS name that you enter. You cannot enter a DNS name for a failover node.</p> <p> ☁ This option is not available in PRTG Hosted Monitor.</p>
Language	<p>Select the language. The default language is English.</p> <p> ⓘ This setting defines the language of the PRTG web interface and the <a href="#">PRTG Administration Tool</a><sup>[8040]</sup>.</p> <p>List of available languages:</p> <ul style="list-style-type: none"> <li>▪ Deutsch (German)</li> <li>▪ English</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Español (Spanish)</li> <li>▪ Français (French)</li> <li>▪ Nederlands (Dutch)</li> <li>▪ Português (Portuguese)</li> <li>▪ Русский (Russian)</li> <li>▪ 日本語 (Japanese)</li> <li>▪ 简体中文 (Simplified Chinese)</li> </ul> <p><b>i</b> If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After you click Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, the <a href="#">PRTG app for desktop</a><sup>[2984]</sup>, or the <a href="#">PRTG Apps for Mobile Network Monitoring</a><sup>[2988]</sup> are disconnected and reconnected.</p>
Graph Type	<p>Select how PRTG displays graphs in the PRTG web interface and in <a href="#">reports</a><sup>[2754]</sup>:</p> <ul style="list-style-type: none"> <li>▪ Display area graphs (recommended): Display series of data points connected by straight lines. Areas between axis and lines are shaded.</li> <li>▪ Display line graphs: Display series of data points connected by straight lines.</li> </ul> <p><b>i</b> We recommend that you use area charts for better visibility.</p> <p><b>i</b> PRTG automatically displays graphs that contain data from more than one cluster node as line graphs.</p>
Automatic Logout	<p>Define if PRTG automatically logs inactive users out of the PRTG web interface:</p> <ul style="list-style-type: none"> <li>▪ Do not log out users after a period of inactivity: Do not log out users even if they are inactive for a longer period of time.</li> <li>▪ Log out users after a period of inactivity: Log out users if they are inactive for a certain period of time for security reasons.</li> </ul>
Period of Inactivity	<p><b>This setting is only visible if you select Log out users after a period of inactivity above.</b></p> <p>Specify the period of inactivity in minutes after which PRTG automatically logs out users. Enter an integer.</p> <p><b>i</b> PRTG redirects users to the <a href="#">Login</a><sup>[153]</sup> screen after this period of inactivity.</p> <p><b>i</b> If the value you enter is greater than <b>1 minute</b>, a logout countdown appears 1 minute before PRTG logs out users. If the value is 1 minute, users see the logout countdown <b>30 seconds</b> before PRTG logs them out. Click in the browser window to stop the countdown and to stay logged in to the PRTG web interface.</p>

Setting	Description
	 <p style="text-align: center;">Logout Countdown</p>
<p>Google Analytics Tracking ID</p>	<p>Enter your <a href="#">Google Analytics Tracking ID</a> to track the usage of pages in the PRTG web interface with Google Analytics. Enter a string or leave the field empty. The string looks like this <code>UA-xxxxxx-xx</code>, for example.</p> <p><b>i</b> You need a Google Analytics account for this feature. Create a tracking ID within the Google Analytics portal and enter it here. PRTG then dynamically integrates it into the PRTG web interface.</p> <p><b>■</b> For more information, see the Knowledge Base: <a href="#">How can I integrate Google Analytics into PRTG?</a></p> <p><b>☁</b> This option is not available in PRTG Hosted Monitor.</p>

## Geo Maps

**Geo Maps**

**Service Provider** ?

Disable Geo Maps integration

Default

HERE Maps

Google Maps

**Map Type** ?

Standard (default)

Satellite

Geo Maps

Setting	Description
Service Provider	<p>Select if and how you want to enable the Geo Maps feature. If you enable the feature, PRTG uses the first line of the <a href="#">location setting</a><sup>422</sup> of an object to show it on a geographical map. Choose a map provider:</p> <ul style="list-style-type: none"> <li>▪ <b>Disable Geo Maps integration:</b> Disable the Geo Maps feature and do not show geographical maps in the PRTG web interface.</li> <li>▪ <b>Default:</b> Use the default option HERE Maps to show geographical maps.</li> <li>▪ <b>HERE Maps:</b> Use HERE Maps to show geographical maps.</li> <li>▪ <b>Google Maps:</b> Use Google Maps to show geographical maps. Sign up for a Google Maps API key to use this service.</li> </ul> <p><span style="color: #0070C0;">■</span> For more information about the different map providers, see the Knowledge Base: <a href="#">Which provider should I use for the Geo Maps feature of PRTG?</a></p>
Map Type	<p>The options that are available depend on the map provider that you select above. Default, HERE Maps, and Google Maps all have the following options:</p> <ul style="list-style-type: none"> <li>▪ <b>Standard (default):</b> Show geographical maps in a standard map view.</li> <li>▪ <b>Satellite:</b> Show geographical maps in a satellite view.</li> </ul> <p>In addition to these options, Google Maps also has the following options:</p> <ul style="list-style-type: none"> <li>▪ <b>Terrain:</b> Show geographical maps in a terrain view.</li> <li>▪ <b>Hybrid (satellite and standard map):</b> Show geographical maps in a hybrid view.</li> </ul>
Google Maps Static API Key	<p><span style="color: #0070C0;">This setting is only visible if you select Google Maps above.</span></p> <p>Enter your Google Maps Static API key.</p>

Setting	Description
	<p>■ For more information on how to get a Google API key, see the Knowledge Base: <a href="#">How do I get a Google Maps API key for use in PRTG?</a></p>

## PRTG Web Server

### PRTG Web Server

**Performance Handling** ⓘ  Do not limit features or delay display (default)  
 Limit features and delay display

**IP Address for PRTG Web Server** ⓘ  Localhost, 127.0.0.1 (PRTG is not accessible from other computers)  
 All IP addresses available on the PRTG core server system (default)  
 Specify IP addresses

**TCP Port for PRTG Web Server** ⓘ  Secure HTTPS server (default port 443, recommended, mandatory for internet access)  
 Unsecure HTTP server (default port 80)  
 Custom configuration

**Connection Security** ⓘ  High security (TLS 1.3, TLS 1.2)  
 Default security (TLS 1.3, TLS 1.2) (recommended)  
 Weakened security (TLS 1.3, TLS 1.2, TLS 1.1, TLS 1.0)

**Import Your Own Certificate** *Tip: You can install your own trusted SSL certificate for PRTG to avoid web browser warnings when you connect to the PRTG web interface. To ease the certificate import, we recommend that you use the PRTG Certificate Importer. For more information about this freeware tool, refer to [our webpage](#) where you can also directly download the PRTG Certificate Importer.*

**Active IP Address/Port Combination(s)** ⓘ

IP Address:Port
10.49.196.180:443
10.49.196.180:80
127.0.0.1:443
127.0.0.1:80
127.0.0.1:8085

PRTG Web Server

Setting	Description
Performance Handling	<p>Select if you want to enable performance improvements for the PRTG web interface:</p> <ul style="list-style-type: none"> <li>▪ Do not limit features or delay display (recommended): Provide full functionality and show all menu items and live data. <ul style="list-style-type: none"> <li>ⓘ We recommend that you use this option.</li> </ul> </li> <li>▪ Limit features and delay display: Improve the reaction time and speed of the PRTG web interface by delaying the display of monitoring data and hiding some features.</li> </ul> <p> For more information on how to speed up the PRTG web interface, see the Knowledge Base: <a href="#">How can I speed up PRTG—especially for large installations?</a></p>
IP Address for PRTG Web Server	<p>The PRTG web server provides access via the PRTG web interface and the <a href="#">PRTG app for desktop</a><sup>2984</sup>. Once you specify an IP address, you use it to log in to the PRTG web interface in your browser. Specify on which IP address the PRTG web server runs:</p> <ul style="list-style-type: none"> <li>▪ Localhost, 127.0.0.1 (PRTG is not accessible from other computers): Use <a href="#">127.0.0.1</a> only. The PRTG web interface and the PRTG app for desktop are only accessible from the PRTG core server system. <ul style="list-style-type: none"> <li>ⓘ Either the selected port or at least one port in the range from <a href="#">8080</a> to <a href="#">8089</a> must be available on <a href="#">127.0.0.1</a>.</li> <li>ⓘ If you run PRTG on localhost, do not use the DNS name <a href="#">http://localhost</a> to log in to the PRTG web server. This might considerably slow down the PRTG web interface. Use your local IP address or <a href="#">http://127.0.0.1</a> instead.</li> </ul> </li> <li>▪ All IP addresses available on the PRTG core server system (recommended): Use all IP addresses that are available on the PRTG core server system and enable access to the PRTG web server for all of these IP addresses. <ul style="list-style-type: none"> <li>ⓘ The selected Transmission Control Protocol (TCP) port for the PRTG web server must be available on all selected IP addresses.</li> </ul> </li> <li>▪ Specify IP addresses: Select specific IP addresses on which the PRTG web server runs. The list is specific to your setup. Enable check boxes in front of every IP address that you want the PRTG web server to be available at. You can also select all IP addresses by clicking the Select all IP addresses button or deselect all addresses by clicking the Deselect all IP addresses button. <ul style="list-style-type: none"> <li>ⓘ Either the selected port or at least one port in the range from <a href="#">8080</a> to <a href="#">8089</a> must be available on the specified IP address.</li> <li>ⓘ Regardless of the setting that you select, one port in the range from <a href="#">8080</a> to <a href="#">8180</a> must be available on the specified IP address so that PRTG can create reports. The report engine tries to connect to the PRTG core server on one of these ports.</li> </ul> </li> </ul>

Setting	Description
	<p><b>i</b> If PRTG does not find a network card on startup, it switches this setting to Localhost, 127.0.0.1 (PRTG is not accessible from other computers). This setting remains even if a network card is available later on. If you disable or remove the network card on the PRTG core server system, check this setting.</p> <p><b>i</b> If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After you click Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, the <a href="#">PRTG app for desktop</a><sup>[2984]</sup>, or the <a href="#">PRTG Apps for Mobile Network Monitoring</a><sup>[2985]</sup> are disconnected and reconnected.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
<p>TCP Port for PRTG Web Server</p>	<p>Specify how the PRTG web server accepts incoming web page requests:</p> <ul style="list-style-type: none"> <li>▪ Secure HTTPS server (port 443, recommended, mandatory for internet access): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured HTTPS connection on port 443. <ul style="list-style-type: none"> <li><b>i</b> This setting is required if you want to access the PRTG web interface via the internet.</li> <li><b>i</b> Although the connection is secure, you see an SSL certificate warning in your browser when you log in to the PRTG web interface because the default certificate is unknown to your browser. For more information, see the Knowledge Base: <a href="#">Why does my browser show an SSL certificate warning when I open the PRTG web interface?</a>. You can install a different SSL certificate for PRTG. For more information, see the Paessler website: <a href="#">How to use your own SSL certificate with the PRTG web server</a>.</li> <li><b>i</b> If port 80 is available, PRTG reserves it as well. If port 80 is not available, PRTG tries port 8080 as fallback. If this port is also not available, PRTG searches from port 8081 upwards for a free port. PRTG sends a <a href="#">ticket</a><sup>[213]</sup> that shows you the currently used port number and switches back to port 80 as soon as it is available again. When users try to connect on port 80 via HTTP, they are redirected to port 443 via HTTPS. You can change this behavior via a registry setting. If port 443 is not available, PRTG tries port 8443 as fallback. If this port is also not available, PRTG searches from port 8444 upwards for a free port. PRTG sends a ticket that shows you the currently used port number and switches back to port 443 as soon as it is available again.</li> </ul> </li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Unsecure HTTP server (default port 80, not recommended): Use the PRTG web server without SSL/TLS on port 80.               <ul style="list-style-type: none"> <li>ⓘ This setting is not recommended for WAN connections.</li> <li>ⓘ If you use the PRTG web server via the internet without connection security, attackers could potentially spy on credentials that you enter in PRTG. We strongly recommend that you use this option only in a LAN.</li> </ul> </li> <li>▪ Custom configuration: Specify a custom port for the PRTG web server and the security of the connection. This option is intended for systems that already have a web server on the standard port.               <ul style="list-style-type: none"> <li>ⓘ If PRTG always uses a fallback port after a server restart, check for other programs that use the same port as PRTG. For example, the Microsoft Microsoft Internet Information Services (IIS) web server also uses port 80 (port 443 for secure connections) by default and blocks it. We recommend that you disable such programs and services on startup.</li> <li>ⓘ If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After you click Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, the <a href="#">PRTG app for desktop</a><sup>[2984]</sup>, or the <a href="#">PRTG Apps for Mobile Network Monitoring</a><sup>[2988]</sup> are disconnected and reconnected.</li> </ul> </li> </ul> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
PRTG Web Server Port	<p>This setting is only visible if you select Custom configuration above.</p> <p>Enter the TCP port number (between 1 and 65535) that you want the PRTG web server to run on. Enter an integer.</p> <ul style="list-style-type: none"> <li>ⓘ If you use a secure connection and port 80 is free, PRTG also reserves it. When users try to connect on port 80 via HTTP, they are redirected to the custom port via HTTPS. You can change this behavior via a registry setting.</li> <li>ⓘ If the port that you define for secure connections is not available, PRTG tries port 8443 as fallback. If this port is also not available, PRTG searches from port 8444 upwards for a free port. PRTG sends a <a href="#">ticket</a><sup>[213]</sup> that shows you the currently used port and switches back to the original port as soon as it is available again.</li> <li>ⓘ If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After you click Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, the <a href="#">PRTG app for desktop</a><sup>[2984]</sup>, or the <a href="#">PRTG Apps for Mobile Network Monitoring</a><sup>[2988]</sup> are disconnected and reconnected.</li> </ul>

Setting	Description
	<p>☁ This option is not available in PRTG Hosted Monitor.</p>
<p>PRTG Web Server Security</p>	<p><a href="#">This setting is only visible if you select Custom configuration above.</a></p> <p>Specify if you want to use connection security:</p> <ul style="list-style-type: none"> <li>▪ Use HTTPS (secured with SSL/TLS): Use an SSL/TLS secured HTTPS connection on the port that you define as PRTG Web Server Port. <ul style="list-style-type: none"> <li>ⓘ Although the connection is secure, you see an SSL certificate warning in your browser when you log in to the PRTG web interface, because the default certificate is unknown to your browser. You can install a different SSL certificate for PRTG later. For more information, see the Paessler website: <a href="#">How to use your own SSL certificate with the PRTG web server.</a></li> </ul> </li> <li>▪ Do not use connection security: Use the PRTG web server without SSL/TLS on the port that you define as PRTG Web Server Port. <ul style="list-style-type: none"> <li>ⓘ We recommend that you do not use this setting for WAN connections.</li> <li>ⓘ If you use the PRTG web server without connection security on the internet, attackers could potentially spy on credentials that you enter in PRTG. We strongly recommend that you use this setting in a LAN only.</li> <li>ⓘ If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After you click Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, the <a href="#">PRTG app for desktop</a><sup>[2984]</sup>, or the <a href="#">PRTG Apps for Mobile Network Monitoring</a><sup>[2985]</sup> are disconnected and reconnected.</li> </ul> </li> </ul> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
<p>Connection Security</p>	<p>Specify the security level to use for connections to and from the PRTG web server:</p> <ul style="list-style-type: none"> <li>▪ High security (TLS 1.3, TLS 1.2): Only accept high security connections from clients like web browsers, apps, the PRTG app for desktop, or API clients. <ul style="list-style-type: none"> <li>ⓘ These clients must support modern forward secrecy cipher suites.</li> </ul> </li> <li>▪ Default security (TLS 1.3, TLS 1.2) (recommended): Only accept high security connections from clients like web browsers, apps, the PRTG app for desktop, or API clients. <ul style="list-style-type: none"> <li>ⓘ These clients must support modern forward secrecy cipher suites.</li> </ul> </li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Weakened security (TLS 1.3, TLS 1.2, TLS 1.1, TLS 1.0): If you have clients that do not support High security (TLS 1.3, TLS 1.2) or Default security (TLS 1.3, TLS 1.2) (recommended), temporarily use this setting so that they can connect. This setting accepts TLS 1.3, TLS 1.2, TLS 1.1 and TLS 1.0 connections.               <ul style="list-style-type: none"> <li>ⓘ This might be necessary, for example, for older browsers, browsers that run on old network components, or some default browsers on Android systems.</li> <li>ⓘ We strongly recommend that you update your clients and then use Default security (TLS 1.3, TLS 1.2) (recommended) or High security (TLS 1.3, TLS 1.2).</li> <li>ⓘ If you set a registry key in previous PRTG versions to override the Secure Sockets Layer (SSL)/Transport Layer Security (TLS) version and cipher suites of PRTG web server connections or probe connections, High security (TLS 1.3, TLS 1.2) overrides the registry setting and only TLS 1.3 and TLS 1.2 are allowed. If you select Default security (TLS 1.3, TLS 1.2) (recommended), the <a href="#">registry value overrides this setting</a> and the connection security that you defined in the registry applies.</li> <li>ⓘ PRTG displays the SSL/TLS versions and cipher suites that are used for connections to and from the PRTG web server under <a href="#">Setup   PRTG Status</a><sup>[2935]</sup>.</li> <li>ⓘ If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After you click Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, the <a href="#">PRTG app for desktop</a><sup>[2984]</sup>, or the <a href="#">PRTG Apps for Mobile Network Monitoring</a><sup>[2988]</sup> are disconnected and reconnected.</li> </ul> </li> </ul> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
<p>Active IP Address/Port Combinations</p>	<p>Shows all active combinations of the IP addresses and ports on which the PRTG web server listens for web requests.</p> <ul style="list-style-type: none"> <li>ⓘ This setting is for your information only. You cannot change it.</li> <li>ⓘ PRTG internally uses port 8085 for report generation.</li> </ul> <p>☁ This option is not available in PRTG Hosted Monitor.</p>

## Graph Settings

PRTG shows several graphs on the Overview tabs and x Days tabs of objects in the PRTG web interface. PRTG keeps these in RAM for fast graph display. The longer the time frames and the shorter the intervals are, the more memory PRTG uses for this. You can adapt the details for all four graphs. This setting also changes the caption of the graphs and tabs in the PRTG web interface and the PRTG app for desktop.

**i** If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After you click Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, the [PRTG app for desktop](#)<sup>[2984]</sup>, or the [PRTG Apps for Mobile Network Monitoring](#)<sup>[2988]</sup> are disconnected and reconnected.

**Graph Settings**

*The RAM usage of PRTG depends on the memory that it requires to store the data for group, device, and sensor graphs. This is necessary for fast graph display. You can reduce the memory requirement by using shorter time frames with longer intervals. Select the period and the average interval to use for the graphs and tables.*

*Note: If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. Afterwards, PRTG recalculates the data cache. During recalculation, the graphs might show incomplete data.*

Live Graph <b>i</b>	120 values (= 2 hours with a scanning interval of 1 minute)	▼
Graph 1 <b>i</b>	2 days with averages of 5 minutes	▼
Graph 2 <b>i</b>	60 days with averages of 6 hours	▼
Graph 3 <b>i</b>	365 days with averages of 1 day	▼

Graph Settings

Setting	Description
Live Graph	<p><b>i</b> The live graph is only available for sensors.</p> <p>The live graph does not have a fixed time span but you can define how many values to display. The actual time span that the live graph covers depends on the scanning interval of the sensor that you view. PRTG automatically calculates the time span. The default is <b>120 Values</b>. This results in a graph that covers a time span of two hours if a sensor has a 1-minute scanning interval. Other scanning intervals result in graphs that cover different time spans.</p> <p>Define how many values the graph displays:</p> <ul style="list-style-type: none"> <li>▪ 60 values: Cover a time span of one hour if a sensor has a scanning interval of one minute.</li> </ul> <p><b>i</b> This setting uses the least amount of RAM. We recommend this setting for installations with 10,000 sensors or more.</p> <ul style="list-style-type: none"> <li>▪ 120 values: Cover a time span of two hours if a sensor has a scanning interval of one minute.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ 240 values: Cover a time span of four hours if a sensor has a scanning interval of one minute.</li> <li>▪ 480 values: Cover a time span of eight hours if a sensor has a scanning interval of one minute.</li> <li>▪ 960 values: Cover a time span of 16 hours if sensor has a scanning interval of one minute.</li> </ul> <p><b>i</b> This setting uses the most amount of RAM.</p>
Graph 1	<p>By default, this is the 2 days graph in the PRTG web interface. You can change it to have more or less detail. PRTG averages the monitoring results of the actual scanning intervals of the sensors.</p> <p>Define how many values the graph displays:</p> <ul style="list-style-type: none"> <li>▪ 1 day with averages of 1 minute: Cover a time span of one day with averages of one minute. This results in 1440 values.</li> <li>▪ 1 day with averages of 5 minutes: Cover a time span of one day with averages of five minutes. This results in 288 values.</li> <li>▪ 1 day with averages of 15 minutes: Cover a time span of one day with averages of 15 minutes. This results in 96 values.</li> </ul> <p><b>i</b> This setting uses the least amount of RAM. We recommend this setting for installations with 10,000 sensors or more.</p> <ul style="list-style-type: none"> <li>▪ 2 days with averages of 1 minute : Cover a time span of two days with averages of one minute. This results in 2880 values.</li> </ul> <p><b>i</b> This setting uses the most amount of RAM.</p> <ul style="list-style-type: none"> <li>▪ 2 days with averages of 5 minutes: Cover a time span of two days with averages of five minutes. This results in 576 values.</li> <li>▪ 2 days with averages of 15 minutes: Cover a time span of two days with averages of 15 minutes. This results in 192 values.</li> <li>▪ 4 days with averages of 1 hour: Cover a time span of two days with averages of one hour. This results in 96 values.</li> </ul> <p><b>i</b> This setting uses the least amount of RAM. We recommend this setting for installations with 10,000 sensors or more.</p>
Graph 2	<p>By default, this is the 30 days graph in the PRTG web interface. You can change it to have more or less detail.</p> <p>Define how many values the graph displays:</p> <ul style="list-style-type: none"> <li>▪ 10 days with averages of 1 hour: Cover a time span of 10 days with averages of one hour. This results in 240 values.</li> <li>▪ 20 days with averages of 1 hour: Cover a time span of 20 days with averages of one hour. This results in 480 values.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ 30 days with averages of 1 hour: Cover a time span of 30 days with averages of one hour. This results in 720 values.</li> <li>▪ 30 days with averages of 6 hours: Cover a time span of 30 days with averages of six hours. This results in 120 values.</li> <li>ⓘ This setting uses the least amount of RAM. We recommend this setting for installations with 10,000 sensors or more.</li> <li>▪ 40 days with averages of 1 hour: Cover a time span of 40 days with averages of one hour. This results in 960 values.</li> <li>▪ 40 days with averages of 6 hours: Cover a time span of 40 days with averages of six hours. This results in 160 values.</li> <li>▪ 60 days with averages of 1 hour: Cover a time span of 60 days with averages of one hour. This results in 1440 values.</li> <li>ⓘ This setting uses the most amount of RAM.</li> <li>▪ 60 days with 6 hour averages of 6 hours: Cover a time span of 60 days with averages of six hours. This results in 240 values.</li> </ul>
Graph 3	<p>By default, this is the 365 days graph in the PRTG web interface. You can change it to more or less detail by choosing a time span covered and a monitoring interval average associated with it.</p> <p>Define how many values the graph displays:</p> <ul style="list-style-type: none"> <li>▪ 100 days with averages of 1 day: Cover a time span of 100 days with averages of one day. This results in 100 values.</li> <li>ⓘ This setting uses the least amount of RAM. We recommend this setting for installations with 10,000 sensors or more.</li> <li>▪ 200 days with averages of 1 day: Cover a time span of 200 days with averages of one day. This results in 200 values.</li> <li>▪ 365 days with averages of 1 day: Cover a time span of 365 days with averages of one day. This results in 365 values.</li> <li>▪ 400 days with averages of 1 day: Cover a time span of 400 days with averages of one day. This results in 400 values.</li> <li>▪ 750 days with averages of 1 day: Cover a time span of 750 days with averages of one day. This results in 750 values.</li> <li>ⓘ This setting uses the most amount of RAM.</li> </ul>

ⓘ Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

There are some settings that you must define in the [PRTG Administration Tool](#)<sup>[3040]</sup>. For more information, see sections:

- [PRTG Administration Tool on PRTG Core Server Systems](#)<sup>[3041]</sup>
- [PRTG Administration Tool on Remote Probe Systems](#)<sup>[3067]</sup>

### 8.12.2.2 Monitoring

On the Monitoring tab, you can define global settings for scanning intervals, unusual and similar sensors detection, auto-discovery, and uptime threshold.

 This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

 If 15 minutes (900) seconds have passed since your last credential-based login and you open a setup page from a different setup page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

In this section:

- [Scanning Intervals](#)<sup>[2870]</sup>
- [Unusual Detection](#)<sup>[2871]</sup>
- [Similar Sensors Detection](#)<sup>[2873]</sup>
- [Recommended Sensors Detection](#)<sup>[2874]</sup>
- [Auto-Discovery](#)<sup>[2875]</sup>
- [Experimental Features](#)<sup>[2876]</sup>
- [Uptime Threshold](#)<sup>[2876]</sup>

## Scanning Intervals

☁ This option is not available in PRTG Hosted Monitor.

### Scanning Intervals

**Available Intervals** ⓘ

30s

1m

5m

10m

Scanning Intervals

Setting	Description
Available Intervals	<p>Define the scanning intervals available in the dropdown list of <a href="#">every object's settings</a><sup>[201]</sup>. In the text field, enter one value in each line. Use <b>s</b>, <b>m</b>, <b>h</b>, and <b>d</b> to define seconds, minutes, hours, and days. By default, the following scanning intervals are available:</p> <ul style="list-style-type: none"> <li>▪ 30s: 30 seconds</li> <li>▪ 1m: 60 seconds</li> <li>▪ 5m: 5 minutes</li> <li>▪ 10m: 10 minutes</li> <li>▪ 15m: 15 minutes</li> <li>▪ 30m: 30 minutes</li> <li>▪ 1h: 1 hour</li> <li>▪ 4h: 4 hours</li> <li>▪ 6h: 6 hours</li> <li>▪ 12h: 12 hours</li> <li>▪ 1d: 24 hours</li> </ul>

Setting	Description
	<p> We recommend that you do not use scanning intervals that are below <b>10</b> seconds to prevent system overload. Scanning intervals that are below 10 seconds are not officially supported. The maximum supported scanning interval is <b>10</b> days.</p> <p> PRTG might convert values that you enter to a more readable equivalent of the values. For example, if you enter <b>24h</b> (24 hours), PRTG displays this as <b>1d</b> (one day) in the dropdown list in the object settings.</p> <p> Valid values are positive integers followed by <b>s</b>, <b>m</b>, <b>h</b>, and <b>d</b>. You can also define specific points in time to indicate when PRTG executes scanning actions. Enter up to 50 concrete Coordinated Universal Time (UTC) points in time according to the formula <b>@ UTC hh:mm , hh:mm</b>. You do not need to use a space before and/or after the comma. However, PRTG always saves the entries with a space both before and after the comma.</p> <p> Your local time might be different from the UTC time.</p> <p> For more information on how to set specific points in time as a scanning time for sensors, see the Knowledge Base: <a href="#">Can I set a sensor to run at a specific time?</a></p>

## Unusual Detection

The Unusual Detection feature sets sensors to the Unusual [status](#)<sup>[181]</sup> when there are values that are not typical for the time span in which they are measured. PRTG compares the current average values to the historic monitoring results for this purpose. If the current values show a big difference to the values that are normally retrieved by a sensor, this sensor indicates this with the Unusual status.

You can define the granularity of the unusual detection, that is, how big the difference must be to cause the Unusual status. If you disable the unusual detection by setting both settings to Never, sensors never show the Unusual status.

-  You can enable and disable unusual detection for specific devices, groups, and probes in the respective [object settings](#)<sup>[455]</sup>.
-  Unusual detection requires sensor data from at least four weeks (28 to 34 days) to have enough data available for comparison. If less data is available, PRTG cannot calculate the Unusual status.

**Unusual Detection**

Show Unusual Status When  24h average is <20% or >500% of weekday average (default)

---

Show Unusual Status When  Hourly average is <20% or >500% of hour-of-day average (default)

---

Log Unusual Events   Do not log unusual events

Log and display unusual events on a sensor's Log tab

Unusual Detection

Setting	Description
Show Unusual When	<p>Define when a sensor shows the Unusual status by comparing the day of the week:</p> <ul style="list-style-type: none"> <li>▪ Never: Disable unusual detection for weekday average.</li> <li>▪ 24h average is &lt;80% or &gt;120% of weekday average: Show the Unusual status when the average of the values measured on the day before is either lower than 80% or higher than 120% than usual on the same weekday.</li> <li>▪ 24h average is &lt;50% or &gt;200% of weekday average: Show the Unusual status when the average of the values measured on the day before is either lower than 50% or higher than 200% than usual on the same weekday.</li> <li>▪ 24h average is &lt;20% or &gt;500% of weekday average (recommended): Show the Unusual status when the average of the values measured on the day before is either lower than 20% or higher than 500% than usual on the same weekday.</li> <li>▪ 24h average is &lt;10% or &gt;1,000% of weekday average: Show the Unusual status when the average of the values measured on the day before is either lower than 10% or higher than 1,000% than usual on the same weekday.</li> <li>▪ 24h average is &lt;1% or &gt;10,000% of weekday average: Show the Unusual status when the average of the values measured on the day before is either lower than 1% or higher than 10,000% than usual on the same weekday.</li> </ul> <p><b>i</b> If you enable this unusual detection, the average of the values that were measured on the day before is compared to the average of the same day of the week in previous weeks.</p> <p>For example, consider a traffic sensor that usually measures 100 MB of average traffic on a weekday. If you choose the first option, the sensor shows the Unusual status if the average from the day before is lower than 80 MB or higher than 120 MB.</p>
Show Unusual When	<p>Define when a sensor shows the Unusual status by comparing the hour of the day:</p> <ul style="list-style-type: none"> <li>▪ Never: Disable unusual detection for hour-of-day average.</li> <li>▪ Hourly average is &lt;80% or &gt;120% of hour-of-day average: Show the Unusual status when the average of the values measured in the hour before is either lower than 80% or higher than 120% than usual in this hour of this weekday.</li> <li>▪ Hourly average is &lt;50% or &gt;200% of hour-of-day average: Show the Unusual status when the average of the values measured in the hour before is either lower than 50% or higher than 200% than usual in this hour of this weekday.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Hourly average is &lt;20% or &gt;500% of hour-of-day average (recommended): Show the Unusual status when the average of the values measured in the hour before is either lower than 20% or higher than 500% than usual in this hour of this weekday.</li> <li>▪ Hourly average is &lt;10% or &gt;1,000% of hour-of-day average: Show the Unusual status when the average of the values measured in the hour before is either lower than 10% or higher than 1,000% than usual in this hour of this weekday.</li> <li>▪ Hourly average is &lt;1% or &gt;10,000% of hour-of-day average: Show the Unusual status when the average of the values measured in the hour before is either lower than 1% or higher than 10,000% than usual in this hour of this weekday.</li> </ul> <p><b>i</b> If you enable this unusual detection, the average of the values that were measured in the hour before is compared to the average of the same hour on the same day of the week in previous weeks.</p> <p>Consider a traffic sensor that usually measures 10 MB average traffic within an hour. If you choose the first option, the sensor would show the Unusual status if the average from the hour before is below 8 MB or above 12 MB.</p>
Log Unusual Events	<p>Define if you also want to record unusual events and display them on the Log tab of a sensor that shows the Unusual status:</p> <ul style="list-style-type: none"> <li>▪ Do not log unusual events</li> <li>▪ Log and display unusual events on a sensor's Log tab</li> </ul>

## Similar Sensors Detection

The Similar Sensors Detection feature enables PRTG to analyze sensor data for similarities. The detection runs in the background with low priority. The recommended setting for the analysis depth is to let PRTG automatically decide how many channels it analyzes. However, you can also override this setting.

**i** Similar sensors analysis requires sensor data from at least seven days to have enough data for comparison. If not enough data is available, PRTG does not display data in the Similar Sensors Overview or in the Similar Sensors section on a sensor's Overview tab. For more information, see section [Similar Sensors](#)<sup>[195]</sup>.

**i** When similar sensors analysis is turned off or if your PRTG installation exceeds 1,000 sensors and you select Manage automatically based on sensor count (default), PRTG does not show the Similar Sensors Overview in the [main menu bar](#)<sup>[241]</sup>.

**Similar Sensors Detection**

Analysis Depth ⓘ

- Manage automatically based on sensor count (default)
- Analyze only primary channels
- Analyze all channels (higher CPU load)
- Disable detection of similar sensors

Similar Sensors Detection

Setting	Description
Analysis Depth	<p>Define the number of channels that PRTG analyzes to detect similarities between sensors, or disable the analysis. The analysis depth depends on the total number of sensors you have:</p> <ul style="list-style-type: none"> <li>▪ <b>Manage automatically based on sensor count (default):</b> Analyze all channels for up to 500 sensors and only the primary channels for up to 1,000 sensors. For more than 1,000 sensors, PRTG disables the analysis. <ul style="list-style-type: none"> <li>☑ This is the default setting in PRTG Network Monitor.</li> </ul> </li> <li>▪ <b>Analyze only primary channels:</b> Only analyze the primary channels. <ul style="list-style-type: none"> <li>ⓘ Be aware of potentially high CPU load on the PRTG core server system if your PRTG installation has more than 1,000 sensors.</li> </ul> </li> <li>▪ <b>Analyze all channels (higher CPU load):</b> Analyze all channels. <ul style="list-style-type: none"> <li>ⓘ Be aware of potentially high CPU load on the PRTG core server system if your PRTG installation has more than 500 sensors.</li> </ul> </li> <li>▪ <b>Disable detection of similar sensors:</b> Do not detect similarities. Select this option if you are not interested in the analysis results or if you want to keep the CPU load on the PRTG core server system to a minimum. <ul style="list-style-type: none"> <li>☁ This is the default setting in PRTG Hosted Monitor.</li> </ul> </li> </ul>

## Recommended Sensors Detection

The Recommended Sensors Detection feature enables PRTG to analyze devices in your network and to suggest sensors that are missing for a complete monitoring setup. The analysis runs with low priority in the background when you add a new device, when the last analysis was executed more than 30 days ago, or when you [manually start](#)<sup>[198]</sup> it.

■ See section [Recommended Sensors](#)<sup>[197]</sup> for more information, for example, on [SNMP settings](#)<sup>[198]</sup>, on the [results](#)<sup>[198]</sup> you get and on how to [add the suggested sensors](#)<sup>[199]</sup>.

☁ This option is not available in PRTG Hosted Monitor.

**Recommended Sensors Detection**

Detection Handling ⓘ

- Manage automatically based on sensor count (default)
- Always show recommended sensors
- Disable sensor recommendation

Recommended Sensors Detection

Setting	Description
Detection Handling	<p>Define if you want PRTG to analyze your devices and to recommend useful sensors:</p> <ul style="list-style-type: none"> <li>Manage automatically based on sensor count (default): Run the detection engine for installations with up to 5,000 sensors. If you exceed this threshold, PRTG disables the detection engine for performance reasons. <ul style="list-style-type: none"> <li><b>i</b> We recommend that you select this option so that you do not miss any important monitoring data about your network, without risking running into performance issues.</li> </ul> </li> <li>Always show recommended sensors: Always analyze your devices even if your installation exceeds 5,000 sensors and if you never want to miss any suggestion to complete your monitoring. <ul style="list-style-type: none"> <li><b>i</b> If you select this option, keep it in mind in case you encounter performance issues.</li> </ul> </li> <li>Disable sensor recommendations: Never recommend sensors. Select this option if you have performance issues with PRTG or if you do not want to see this information on devices' Overview tabs. Moreover, you do not see the option Recommend Now in <a href="#">device context menus</a><sup>[229]</sup> or on Overview tabs anymore.</li> </ul> <p><b>■</b> For more information about the Overview tab, see the Knowledge Base: <a href="#">What options do I have to review my monitoring data in detail?</a></p>

## Auto-Discovery

Auto-Discovery

Run Auto-Discovery At 04:00

Auto-Discovery

Setting	Description
Run Auto-Discovery At	<p>Define the time when PRTG automatically runs an <a href="#">auto-discovery</a><sup>[254]</sup> in your network if you configured a daily or weekly schedule in the <a href="#">auto-discovery group settings</a><sup>[267]</sup>. Select a full hour.</p> <ul style="list-style-type: none"> <li>00:00 - 23:00</li> </ul> <p><b>i</b> We recommend that you choose a time when there is little user activity in your network because auto-discoveries can produce a certain amount of load.</p>

## Experimental Features

**Experimental Features**

You can enable or disable experimental features here. Do not expect that all functions work properly, or that experimental features work as expected at all. Be aware that experimental features can be removed from PRTG at any time.

Beta Sensors ⓘ

Disable (default)

Enable

PowerShell Security Enhancement ⓘ

Enable (default)

Disable

Experimental Features

**i** The operating methods of the experimental features might change at any time. Do not expect that all functions work properly, or that the experimental features work as expected at all. Be aware that Paessler might remove these features at any time.

Setting	Description
Beta Sensors	<p>Select if you want to enable or disable sensors in beta status:</p> <ul style="list-style-type: none"> <li>▪ <b>Disable (default):</b> Disable sensors in beta status.</li> <li>▪ <b>Enable:</b> Enable sensors in beta status. <ul style="list-style-type: none"> <li><b>i</b> Beta sensors then become available in the <a href="#">Add Sensor</a> dialog.</li> <li><b>i</b> If you disable beta sensors, existing beta sensors change to the Unknown status.</li> </ul> </li> </ul>
PowerShell Security Enhancement	<p>Select if you want to improve PowerShell security by hiding command-line parameters in the process explorer and the event log:</p> <ul style="list-style-type: none"> <li>▪ <b>Enable (default):</b> Enable PowerShell security enhancement. <ul style="list-style-type: none"> <li><b>i</b> If you enable PowerShell Security Enhancement, PowerShell scripts that use the <a href="#">write-host</a> cmdlet to provide their output to PRTG do not work anymore. Custom scripts only work if you use the <a href="#">write-output</a> cmdlet.</li> <li><b>i</b> Enabling this feature can also improve the performance of PowerShell sensors.</li> </ul> </li> <li>▪ <b>Disable:</b> Disable PowerShell security enhancement.</li> </ul>

## Uptime Threshold

**Uptime Threshold**

Minimum Uptime ⓘ 99.99 %

Uptime Threshold

Setting	Description
Minimum Uptime	<p>Define which uptime in percent PRTG regards as 100 percent. This setting affects the colors that you see next to sensor icons in reports.</p> <ul style="list-style-type: none"> <li>▪ 90 % - 99.999 %</li> </ul>

**i** Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

## More

### ■ KNOWLEDGE BASE

How can I speed up PRTG—especially for large installations?

- <https://kb.paessler.com/en/topic/2733>

Can I set a sensor to run at a specific time?

- <https://kb.paessler.com/en/topic/3723>

## Others

There are some settings that you must define in the [PRTG Administration Tool](#)<sup>[3040]</sup>. For more information, see sections:

- [PRTG Administration Tool on PRTG Core Server Systems](#)<sup>[3041]</sup>
- [PRTG Administration Tool on Remote Probe Systems](#)<sup>[3067]</sup>

### 8.12.2.3 Notification Delivery

On the Notification Delivery tab, you can define and test global settings for notification delivery. If you do not want to use a specific notification method, leave the respective fields empty.

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

 If 15 minutes (900) seconds have passed since your last credential-based login and you open a setup page from a different setup page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

In this section:

- [Note](#)<sup>[2878]</sup>
- [SMTP Delivery](#)<sup>[2878]</sup>
- [SMS Delivery](#)<sup>[2883]</sup>

## Note

You must take the following four steps to set up and use notifications:

1. Check and set up the [notification delivery](#) settings if you use PRTG Network Monitor. These settings define how PRTG sends messages.
2. Check and set up [notification contacts](#) for the user accounts. These contacts define the recipients to which PRTG sends notifications.
3. Check and set up several [notification templates](#). These templates define the notification methods and their content.
  - ⓘ You can also check or edit notification templates via the Notification Triggers tab. For more information, see section [Notification Triggers Settings](#).
4. Check and set up [notification triggers settings](#) for objects. These triggers define when PRTG sends notifications.

ⓘ Usually, there are three successive attempts to deliver a notification. If all of these attempts fail, the notification is lost. To never miss a notification, we recommend that you always set up at least two notifications with different notification methods for a notification trigger, for example, one email notification and one SMS notification. If delivery via email fails, PRTG can still notify you via smartphone as a fallback. For example, use the latency setting of a [state trigger](#) to choose a notification with a different notification method than in the first trigger condition, or set up a second trigger with a different notification method for the corresponding object.

■ For a detailed step-by-step guide, see the Paessler website: [How to set up notifications via the PRTG web interface](#).

■ Custom notification scripts are also available in the [PRTG Sensor Hub](#).

## SMTP Delivery

**SMTP Delivery**

Delivery Mechanism ⓘ

Use direct delivery with the built-in email server (default)

Use one SMTP relay server (recommended in LANs/NATs)

Use two SMTP relay servers (primary and fallback server)

Test SMTP Settings Test SMTP Settings

SMTP Delivery

Setting	Description
Delivery Mechanism	Define how PRTG sends emails via the Simple Mail Transfer Protocol (SMTP):

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Use direct delivery with the built-in email server (default): Use the built-in SMTP relay server. This server manages its own email queue. For each email, it looks up the target SMTP server via the MX record of the target domain, and sends the email.</li> <li>▪ Use one SMTP relay server (recommended in LANs/NATs): Set up your own SMTP relay server to send emails. Enter data below.</li> <li>▪ Use two SMTP relay servers (primary and fallback server): Set up two SMTP relay servers with one as the primary relay server and one as the fallback relay server. Enter data below.</li> </ul> <p><b>i</b> If you monitor the IT infrastructure in your network address translation (NAT) or LAN, use your own LAN-based relay server to ensure faster delivery of notification emails.</p> <p><b>☁</b> This option is not available in PRTG Hosted Monitor. PRTG Hosted Monitor uses sendgrid for email notifications. For more information, see the Paessler website: <a href="#">FAQ – PRTG Hosted Monitor</a>.</p>
Sender Email Address	<p>Enter an email address to use as the sender of all email notifications. This setting is global and applies to all email notifications by default.</p> <p><b>i</b> You can override the sender email in the settings of individual <a href="#">notification templates</a> <small>28151</small>.</p>
Sender Name	<p>Enter a name to use as the sender of all email notifications. This setting is global and applies to all email notifications by default.</p> <p><b>i</b> You can override the sender name in the settings of individual notification templates.</p> <p><b>i</b> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
HELO Ident	<p>Enter a server name for the HELO part of the mail protocol.</p> <p><b>i</b> For some mail servers, the HELO identifier must be the valid principal host domain name for the client host. For more information, see <a href="#">SMTP RFC 2821</a>.</p> <p><b>i</b> The HELO identifier must be a unique name.</p> <p><b>i</b> Only ASCII characters are allowed.</p> <p><b>i</b> We recommend that you use the Domain Name System (DNS) name of the PRTG core server system.</p> <p><b>☁</b> This option is not available in PRTG Hosted Monitor.</p>

Setting	Description
SMTP Relay Server	<p><b>This setting is only visible if you select</b> Use one SMTP relay server (recommended in LANs/NATs) <b>or</b> Use two SMTP relay servers (primary and fallback server) <a href="#">above</a>.</p> <p>Enter the IP address or DNS name of the SMTP relay server.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
SMTP Relay Port	<p><b>This setting is only visible if you select</b> Use one SMTP relay server (recommended in LANs/NATs) <b>or</b> Use two SMTP relay servers (primary and fallback server) <a href="#">above</a>.</p> <p>Enter the port for the connection to the SMTP server. The default port is <a href="#">25</a>.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
SMTP Relay Authentication	<p><b>This setting is only visible if you select</b> Use one SMTP relay server (recommended in LANs/NATs) <b>or</b> Use two SMTP relay servers (primary and fallback server) <a href="#">above</a>.</p> <p>Select the kind of authentication that the SMTP server requires:</p> <ul style="list-style-type: none"> <li>▪ Use no authentication (default): Use SMTP without authentication.</li> <li>▪ Use standard SMTP authentication: Use standard authentication.</li> <li>▪ Use SASL authentication: Use secure authentication via Simple Authentication and Security Layer (SASL).</li> </ul> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
SMTP Relay User Name	<p><b>This setting is only visible if you select</b> Use standard SMTP authentication <b>or</b> Use SASL authentication <a href="#">above</a>.</p> <p>Enter a valid user name.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
SMTP Relay Password	<p><b>This setting is only visible if you select</b> Use standard SMTP authentication <b>or</b> Use SASL authentication <a href="#">above</a>.</p> <p>Enter a valid password.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>

Setting	Description
<p>Connection Security</p>	<p><b>This setting is only visible if you select</b> Use one SMTP relay server (recommended in LANs/NATs) <b>or</b> Use two SMTP relay servers (primary and fallback server) <b>above</b>.</p> <p>Define the connection security for SMTP connections:</p> <ul style="list-style-type: none"> <li>▪ Use SSL/TLS if the server supports it (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection.</li> <li>▪ Do not use connection security: Use an unsecure connection with plain text transfer.</li> </ul> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
<p>SSL/TLS Method</p>	<p><b>This setting is only visible if you select</b> Use one SMTP relay server (recommended in LANs/NATs) <b>and</b> Use SSL/TLS if the server supports it (default) <b>above</b>.</p> <p>Select the SSL or TLS version that the SMTP server supports:</p> <ul style="list-style-type: none"> <li>▪ Auto-Negotiate (TLS 1.0 or higher)</li> <li>▪ SSLv3</li> <li>▪ TLS 1.0</li> <li>▪ TLS 1.1</li> <li>▪ TLS 1.2</li> <li>▪ TLS 1.3</li> </ul> <p>ⓘ If you select Auto-Negotiate (TLS 1.0 or higher), PRTG uses the highest available TLS level supported by the SMTP endpoint.</p> <p>ⓘ This is only relevant for secure connections. If you do not get a connection, try a different setting.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
<p>SMTP Relay Server (Fallback)</p>	<p><b>This setting is only visible if you select</b> Use two SMTP relay servers (primary and fallback server) <b>above</b>.</p> <p>Enter the IP address or DNS name of the fallback SMTP relay server.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
<p>SMTP Relay Port (Fallback)</p>	<p><b>This setting is only visible if you select</b> Use two SMTP relay servers (primary and fallback server) <b>above</b>.</p>

Setting	Description
	<p>Enter the port for the connection to the fallback SMTP server. The default port is <a href="#">25</a>.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
<p>SMTP Relay Authentication (Fallback)</p>	<p><a href="#">This setting is only visible if you select Use two SMTP relay servers (primary and fallback server) above.</a></p> <p>Select the kind of authentication that the fallback SMTP server requires:</p> <ul style="list-style-type: none"> <li>▪ Use no authentication (default): Use SMTP without authentication.</li> <li>▪ Use standard SMTP authentication: Use standard authentication.</li> <li>▪ Use SASL authentication: Use secure authentication via Simple Authentication and Security Layer (SASL).</li> </ul> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
<p>SMTP Relay User Name (Fallback)</p>	<p><a href="#">This setting is only visible if you select Use two SMTP relay servers (primary and fallback server) and Use standard SMTP authentication or Use SASL authentication above.</a></p> <p>Enter a valid user name.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
<p>SMTP Relay Password (Fallback)</p>	<p><a href="#">This setting is only visible if you select Use two SMTP relay servers (primary and fallback server) and Use standard SMTP authentication or Use SASL authentication above.</a></p> <p>Enter a valid password.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
<p>Connection Security (Fallback)</p>	<p><a href="#">This setting is only visible if you select Use two SMTP relay servers (primary and fallback server) above.</a></p> <p>Define the connection security for SMTP connections:</p> <ul style="list-style-type: none"> <li>▪ Use SSL/TLS if the server supports it (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection.</li> <li>▪ Do not use connection security: Use an unsecure connection with plain text transfer.</li> </ul>

Setting	Description
	☁ This option is not available in PRTG Hosted Monitor.
SSL/TLS Method (Fallback)	<p>This setting is only visible if you select Use two SMTP relay servers (primary and fallback server) and Use SSL/TLS if the server supports it (default) above.</p> <p>Select the SSL or TLS version that the SMTP server supports:</p> <ul style="list-style-type: none"> <li>▪ Auto-Negotiate (TLS 1.0 or higher)</li> <li>▪ SSLv3</li> <li>▪ TLS 1.0</li> <li>▪ TLS 1.1</li> <li>▪ TLS 1.2</li> <li>▪ TLS 1.3</li> </ul> <p>ⓘ If you select Auto-Negotiate (TLS 1.0 or higher), PRTG uses the highest available TLS level supported by the SMTP endpoint.</p> <p>ⓘ This is only relevant for secure connections. If you do not get a connection, try a different setting.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
Test SMTP Settings	<p>Click Test SMTP Settings to test your SMTP notification delivery configuration.</p> <ul style="list-style-type: none"> <li>▪ Email Address: Enter an email address to send the test email notification to.</li> <li>▪ Subject: Enter a subject for the test email notification.</li> </ul>

## SMS Delivery

- ⓘ Your PRTG Network Monitor license or PRTG Hosted Monitor subscription does not include the cost for SMS delivery. Refer to the pricing information of the service provider that you plan to use to find out more about their pricing.
- ⓘ Although PRTG has built-in support for the application programming interface (API) of some SMS providers, we cannot officially provide support for them. If you have technical questions about SMS delivery beyond PRTG, contact your SMS provider directly.
- ⓘ Instead of using a preconfigured provider, you can use a custom URL that enables you to use extended parameters. This is also an alternative to using providers for which we offer preconfigured options.

**i** You need an internet connection to send text messages via the HTTP API.

**■** For information about sending SMS via separate hardware using third-party software, see the Knowledge Base: [How can I send SMS text message notifications via a modem or a mobile phone with PRTG?](#)

**SMS Delivery**

Configuration Mode **i**

Disable SMS delivery (default)  
 Select an SMS provider from a list of providers  
 Enter a custom URL for a provider not listed

SMS Delivery

Setting	Description
Configuration Mode	Define a mode for the SMS delivery configuration: <ul style="list-style-type: none"> <li>▪ Disable SMS delivery (default): Do not use SMS delivery.</li> <li>▪ Select an SMS provider from a list of providers: Select a provider from a list below.</li> <li>▪ Enter a custom URL for a provider not listed: Use a different provider and manually enter the custom URL below.</li> </ul>
Service Provider	<p><b>This setting is only visible if you select</b> Select an SMS provider from a list of providers <b>above</b>.</p> <p>Select a service provider from the list:</p> <ul style="list-style-type: none"> <li>▪ BulkSMS All regions (except South Africa): Enter a User Name and Password below.               <ul style="list-style-type: none"> <li>▫ URL: <code>https://www.bulksms.co.uk:443/eapi/submission/send_sms/2/2.0</code></li> <li>▫ Port: 443</li> </ul> </li> <li>▪ BulkSMS South Africa: Enter a User Name and Password below.               <ul style="list-style-type: none"> <li>▫ URL: <code>https://bulksms.2way.co.za:443/eapi/submission/send_sms/2/2.0</code></li> <li>▫ Port: 443</li> </ul> </li> <li>▪ Agile Telecom: Enter a User Name and Password below.               <ul style="list-style-type: none"> <li>▫ URL: <code>http://agiletelecom.com/sms hurricane3.0.asp</code></li> <li>▫ Port: 80</li> </ul> </li> <li>▪ Esendex: Enter a User Name, Password, and Account below.               <ul style="list-style-type: none"> <li>▫ URL: <code>https://www.esendex.com/secure/messenger/formpost/SendSMS.aspx</code></li> </ul> </li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▫ Port: 443</li> </ul> <p><b>i</b> Some providers might require a port configuration in your firewall. Use the respective port from the list above.</p>
User Name	<p><b>This setting is only visible if you select</b> Select an SMS provider from a list of providers <a href="#">above</a>.</p> <p>Enter a user name for the service provider account.</p>
Password	<p><b>This setting is only visible if you select</b> Select an SMS provider from a list of providers <a href="#">above</a>.</p> <p>Enter a password for the service provider account.</p>
Account	<p><b>This setting is only visible if you select</b> Select an SMS provider from a list of providers <a href="#">and Esendex above</a>.</p> <p>Enter the account number or the API ID to connect your account if your provider asks you to register, for example <a href="#">EX0000000</a>. Enter a string or leave the field empty.</p>
Custom URL	<p><b>This setting is only visible if you select</b> Enter a custom URL for a provider not listed <a href="#">above</a>.</p> <p>From the documentation of your SMS provider, enter the service URL that it uses to send SMS messages.</p> <p>Use the following placeholders for the recipient phone number and the text message:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">%SMSNUMBER</a></li> <li>▪ <a href="#">%SMSTEXT</a></li> </ul> <p><b>i</b> Use the <a href="#">GET</a> method to request the custom URL. <a href="#">POST</a> requests are not supported.</p>
HTTP Authentication	<p><b>This setting is only visible if you select</b> Enter a custom URL for a provider not listed <a href="#">above</a>.</p> <p>Select if PRTG uses HTTP basic authentication when it calls the custom URL of the SMS provider:</p> <ul style="list-style-type: none"> <li>▪ Do not use HTTP basic authentication (default)</li> <li>▪ Use HTTP basic authentication</li> </ul> <p><b>i</b> HTTP basic authentication is necessary if the custom URL looks like this <a href="#">https://[username]:[password]@my.custom.sms.provider/</a>.</p>

Setting	Description
Custom SNI	<p><b>This setting is only visible if you select</b> Enter a custom URL for a provider not listed <a href="#">above</a>.</p> <p>Define if PRTG sends the Server Name Indication (SNI) extension to the Transport Layer Security (TLS) protocol along with the HTTP request:</p> <ul style="list-style-type: none"> <li>▪ Do not send SNI (default): PRTG does not send the SNI when it executes the HTTP action.</li> <li>▪ Send SNI: PRTG sends the SNI when it calls the target URL. Specify the SNI below.</li> </ul>
Encoding for SMS	<p><b>This setting is only visible if you select</b> Enter a custom URL for a provider not listed <a href="#">above</a>.</p> <p>Define the encoding of the URL string that PRTG sends to the SMS provider:</p> <ul style="list-style-type: none"> <li>▪ ANSI local system code page (default)</li> <li>▪ UTF-8</li> <li>▪ UTF-16</li> </ul>
Virtual Host (SNI)	Enter the SNI name that the endpoint configuration requires. Usually, this is the fully qualified domain name (FQDN) of the virtual host.
Maximum Length of Text	<p>Some SMS providers do not allow SMS messages that exceed a certain amount of characters. PRTG restricts the number of characters according to the length specified in this field. A value of 0 means that PRTG sends the entire SMS.</p> <p><b>i</b> The use of some special characters, especially ones that are not in the GSM-7 alphabet, might cause the message to be cut off after 70 characters and the special characters might not display properly. The exact results depend on which SMS provider you use.</p>
Test SMS Settings	<p>Click Test SMS Settings to test your SMS notification delivery configuration.</p> <ul style="list-style-type: none"> <li>▪ Number: Enter a phone number to send the test SMS notification to.</li> <li>▪ Message: Enter a message for the test SMS notification.</li> </ul>

**i** The notification methods Send SMS/Pager Message and Execute HTTP Action use the central proxy settings of the PRTG core server. For more information, see section [Core & Probes](#) <sup>2888</sup> (section Proxy Configuration).

**i** Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

## 8.12.2.4 Core & Probes

On the Core & Probes tab, you can define settings for the PRTG core server as well as for probe connections if you use remote probes or mini probes.

 If you cannot save changes to Core & Probes settings because you get an **Error (Bad Request)** with the message **Active Directory Domain not accessible**, make sure that you provide the correct access type for your domain in section **Active Directory Integration**<sup>28971</sup>. For example, change Use the PRTG core server service account (usually Local System) (default) to Use explicit credentials and provide correct credentials for the domain. PRTG automatically sets the access type to Use the PRTG core server service account (usually Local System) (default) by default, so you might need to change this.

 If 15 minutes (900) seconds have passed since your last credential-based login and you open a setup page from a different setup page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

**PRTG MultiBoard File Transfer** ⓘ

Disable (default)

Enable

Probe Connection Settings

Setting	Description
Probe Connection IP Addresses	<p>Define how the PRTG core server handles incoming connections from probes:</p> <ul style="list-style-type: none"> <li>Local probe only, 127.0.0.1: Only accept local probe connections. The PRTG core server does not allow the use of <a href="#">remote probes</a> [3196].</li> </ul> <p> This is the default setting in PRTG Network Monitor.</p>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ All IP addresses available on this computer: Accept incoming connections from remote probes, no matter on which IP address of the PRTG core server they come in.               <ul style="list-style-type: none"> <li>☁ This is the default setting in PRTG Hosted Monitor.                   <ul style="list-style-type: none"> <li>▪ Specify IP addresses: Accept incoming connections from remote probes only on the selected IP address(es) of the PRTG core server. In the list, select the IP addresses by enabling a check box in front of the desired IP addresses.</li> </ul> </li> </ul> </li> <li>ⓘ You can also change this setting in the <a href="#">PRTG Administration Tool on PRTG Core Server Systems</a><sup>[6046]</sup>.</li> <li>ⓘ If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After you click Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, the <a href="#">PRTG app for desktop</a><sup>[2984]</sup>, or the <a href="#">PRTG Apps for Mobile Network Monitoring</a><sup>[2988]</sup> are disconnected and reconnected.</li> <li>☁ This option is not available in PRTG Hosted Monitor.</li> </ul>
Access Keys	<p>Enter a list of access keys for remote probe connections. Enter one access key per line.</p> <ul style="list-style-type: none"> <li>ⓘ Every remote probe and multi-platform probe that wants to connect to this PRTG installation has to use one of these keys.</li> <li>■ For more information on how to set an access key for a remote probe, see section <a href="#">PRTG Administration Tool</a><sup>[3067]</sup>.</li> </ul>
Allow IP Addresses	<p>Enter a list of remote probe IP addresses or Domain Name System (DNS) names that you want to allow to connect to the PRTG core server. Enter one IP address or DNS name per line. The following options are also possible:</p> <ul style="list-style-type: none"> <li>▪ [Empty]: An empty field does not allow any remote probes (only the local probe). Enter IP addresses or DNS names to allow remote probe connections.           <ul style="list-style-type: none"> <li>ⓘ We recommend that you use IP addresses instead of DNS names because DNS name resolution might be cached.</li> </ul> </li> <li>▪ any: Enter the word any to automatically allow all remote probe connections.           <ul style="list-style-type: none"> <li>☁ This is the default setting in PRTG Hosted Monitor.               <ul style="list-style-type: none"> <li>ⓘ We recommend that you only use this option in intranets in PRTG Network Monitor, not in PRTG Hosted Monitor.</li> </ul> </li> </ul> </li> <li>ⓘ PRTG always automatically allows the local probe (127.0.0.1). PRTG checks the list of allowed IP addresses before it checks the list of denied IP addresses.</li> </ul>

Setting	Description
	<p><b>i</b> If the IP address of a remote probe regularly changes (for example, because of an internet provider that dynamically assigns IP addresses), enter the potential IP address range for the remote probe or use any.</p> <p><b>■</b> You can use the PRTG syntax for IP address ranges. For more information, see section <a href="#">Define IP Address Ranges</a><sup>[180]</sup>.</p>
Deny IP Addresses	<p>Enter a list of remote probe IP addresses or DNS names that you do <b>not</b> want to allow to connect to the PRTG core server. Enter one IP address or DNS name per line.</p> <p><b>i</b> You can use Deny IP Addresses to explicitly deny connections from remote probes that you do not want to include in your setup either at all or for a certain time. You can also use it to allow access to an IP address range under Allow IP Addresses, but to deny access to a single IP address from the IP address range.</p> <p><b>■</b> You can use the PRTG syntax for IP address ranges. For more information, see section <a href="#">Define IP Address Ranges</a><sup>[180]</sup>.</p> <p><b>i</b> If you deny the IP address or DNS name of a remote probe, you must restart the PRTG core server to apply your changes.</p> <p><b>i</b> We recommend that you use IP addresses rather than DNS names because DNS name resolution might be cached.</p>
Deny GIDs	<p>Enter a list of global IDs (GID) Enter one GID per line. PRTG denies access to matching GIDs.</p> <p><b>i</b> If you remove a remote probe from the device tree or if you deny a remote probe after installation, PRTG automatically adds its GID to this list. The remote probe is no longer able to connect. Denying GIDs is more precise than denying IP addresses, where other remote probes at the same location could also be excluded.</p> <p><b>i</b> A GID is the ID that PRTG attributes to every probe that you include in your monitoring.</p>
Connection Security	<p>Specify the security level that the PRTG web server accepts for connections to and from the PRTG core server:</p> <ul style="list-style-type: none"> <li>▪ High security (TLS 1.3, TLS 1.2): Only accept high security connections from probes.</li> <li>▪ Default security (TLS 1.3, TLS 1.2) (recommended): Only accept high security connections from probes.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Weakened security (TLS 1.3, TLS 1.2, TLS 1.1, TLS 1.0): Additionally accept TLS 1.1-secured and TLS 1.0-secured connections from probes.               <ul style="list-style-type: none"> <li>❗ If you have probes that do not support TLS 1.3-secured or TLS 1.2-secured connections because you updated from an older PRTG version, you can use this setting to connect to and to <a href="#">update</a> older probes. After the update, we recommend that you change this setting to High security (TLS 1.3, TLS 1.2) or Default security (TLS 1.3, TLS 1.2) (recommended).</li> </ul> </li> <li>❗ If you set a registry key in previous PRTG versions to override the Secure Sockets Layer (SSL)/Transport Layer Security (TLS) version and cipher suites of PRTG web server connections or probe connections, High security (TLS 1.3, TLS 1.2) overrides the registry setting and only TLS 1.3 and TLS 1.2 are allowed. If you select Default security (TLS 1.3, TLS 1.2) (recommended), the <a href="#">registry value overrides this setting</a> and the connection security that you defined in the registry applies.</li> <li>❗ If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After you click Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, the <a href="#">PRTG app for desktop</a>, or the <a href="#">PRTG Apps for Mobile Network Monitoring</a> are disconnected and reconnected.</li> </ul> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
Mini Probes	<p>Define if you want to allow mini probe connections to the PRTG core server:</p> <ul style="list-style-type: none"> <li>▪ Do not allow mini probes: Mini probes cannot connect to the PRTG web server. You are not able to monitor with mini probes if you choose this option.</li> <li>▪ Allow mini probes to connect to the PRTG web server: Mini probes can connect to the PRTG web server and use the <a href="#">defined TCP port for the web server</a> for this purpose. The default port for secure connections is 443.</li> <li>▪ Allow mini probes to connect to an extra port: Mini probes can connect to the PRTG web server via a specific port. Use this if you do not want the whole PRTG web server to be reachable from other networks all the time only because of mini probes.               <ul style="list-style-type: none"> <li>❗ SSL/TLS must be enabled on the mini probe port.</li> </ul> </li> <li>❗ If you want to use mini probes, you need to configure the PRTG web server to accept connections from mini probes and select Secure HTTPS server (port 443, recommended, mandatory for internet access) in the <a href="#">PRTG web server settings</a>.</li> </ul> <p>■ For more information, see section <a href="#">Mini Probe API</a>. See also the Knowledge Base: <a href="#">Where can I find PRTG mini probes which are ready to use?</a></p>

Setting	Description
	<p> If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After you click Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, the <a href="#">PRTG app for desktop</a><sup>[2984]</sup>, or the <a href="#">PRTG Apps for Mobile Network Monitoring</a><sup>[2988]</sup> are disconnected and reconnected.</p> <p> This option is not available in PRTG Hosted Monitor.</p>
Mini Probe Port	<p><b>This setting is only visible if you select</b> Allow mini probes to connect to an extra port <a href="#">above</a>.</p> <p>Enter the number of the port for mini probe connections. Make sure that SSL is available on this port.</p> <p> If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After you click Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, the <a href="#">PRTG app for desktop</a><sup>[2984]</sup>, or the <a href="#">PRTG Apps for Mobile Network Monitoring</a><sup>[2988]</sup> are disconnected and reconnected.</p> <p> This option is not available in PRTG Hosted Monitor.</p>
PRTG MultiBoard File Transfer	<p>Select if you want to allow PRTG MultiBoard to access the PRTG data directories and PRTG program directories of the PRTG core servers connected to PRTG MultiBoard:</p> <ul style="list-style-type: none"> <li>▪ <b>Disable (default):</b> Do not allow PRTG MultiBoard to access, configure, and transfer PRTG files. You will not be able to use the Probe Transfer, Configuration Viewer, and Template Transfer features.</li> <li>▪ <b>Enable:</b> Allow PRTG MultiBoard to access, configure, and transfer PRTG files.</li> </ul> <p> PRTG MultiBoard requires access to the <a href="#">PRTG Configuration.dat</a> file for the Probe Transfer and Configuration Viewer features.</p>

Multi-Platform Probe Connection Settings

Setting	Description
Multi-Platform Probe Connections	<p>Define if you want to allow multi-platform probe connections to the PRTG core server:</p> <ul style="list-style-type: none"> <li>▪ Do not allow multi-platform probe connections (default): Multi-platform probes cannot connect to the PRTG core server. You are not able to monitor with multi-platform probes if you select this option.</li> <li>▪ Allow multi-platform probe connections: Allow multi-platform probes to connect to the PRTG core server. PRTG automatically creates a <a href="#">Multi-Platform Probe Connection Health (Autonomous) sensor</a> on your PRTG core server.</li> </ul> <p> ⓘ Multi-platform probes connect to the PRTG core server via a NATS server.</p> <p> ■ For more information, see the <a href="#">Multi-Platform Probe for PRTG</a> manual.</p> <p> ⓘ If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After you click Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, the <a href="#">PRTG app for desktop</a><sup>[2984]</sup>, or the <a href="#">PRTG Apps for Mobile Network Monitoring</a><sup>[2988]</sup> are disconnected and reconnected.</p>
NATS Connection Security	<p>This setting is only visible if you select Allow multi-platform probe connections above.</p>

Setting	Description
	<p>Define the connection security level between the PRTG core server and the NATS server.</p> <ul style="list-style-type: none"> <li>▪ TLS (default): Select Transport Layer Security (TLS) for an encrypted communication channel to the NATS server. This configures the NATS connection to use the <a href="#">tls://</a> schema.</li> <li>▪ Unsecure (not recommended): All data sent between the PRTG core server and the NATS server, including passwords and other sensitive information, will be transmitted in plain text. The NATS connection will use the unencrypted <a href="#">nats://</a> schema.</li> </ul>
<p>NATS Server Host</p>	<p><a href="#">This setting is only visible if you select</a> Allow multi-platform probe connections <a href="#">above</a>.</p> <p>Enter the host name and the port of the NATS server. An encrypted NATS server connection follows the format <a href="#">host name:port</a>. The default host is <a href="#">localhost:23561</a>.</p> <ul style="list-style-type: none"> <li>❗ Enter the host name as a fully qualified domain address name (FQDN) of the system that runs the NATS server.</li> <li>❗ The default port for this connection is <a href="#">23561</a>. The NATS server supports port numbers <a href="#">1 - 65535</a>.</li> </ul>
<p>NATS User Name</p>	<p><a href="#">This setting is only visible if you select</a> Allow multi-platform probe connections <a href="#">above</a>.</p> <p>Enter the user name for authentication against the NATS server. Enter a string.</p>
<p>NATS Password</p>	<p><a href="#">This setting is only visible if you select</a> Allow multi-platform probe connections <a href="#">above</a>.</p> <p>Enter the password for authentication against the NATS server. Enter a string.</p>
<p>NATS Server Certificate Authority Handling</p>	<p><a href="#">This setting is only visible if you select</a> TLS (default) <a href="#">above</a>.</p> <p>Define the CA certificate the NATS server uses:</p> <ul style="list-style-type: none"> <li>▪ Use system certificate store (default): Use the CA certificate from your system's certificate store.</li> <li>▪ Specify a certificate authority certificate file: Define a CA certificate file below. Use this setting if you created your own TLS certificate.</li> </ul> <p>■ For more information, see the Knowledge Base: <a href="#">How can I create a TLS certificate?</a></p>

Setting	Description
Certificate File Name	<p>This setting is only visible if you select Specify a certificate authority certificate file above.</p> <p>Select the CA certificate to use for TLS validation. This file must match the CA certificate used to install the NATS server.</p>
Connection Log Level	<p>Define the log severity level of the multi-platform probe connection that will appear in the log file:</p> <ul style="list-style-type: none"> <li>▪ Error: Log critical events.</li> <li>▪ Warning: Log unexpected events that might result in future errors.</li> <li>▪ Info (default): Log events that are significant to the normal operation of the the probe adapter.</li> <li>▪ Debug: Log detailed events that occur during the operation of the probe adapter. Useful for identifying issues.</li> <li>▪ Trace: Log all events of the probe adapter.</li> </ul> <p><b>i</b> The log level decreases in severity, with Error being the highest severity and Trace being the lowest. The log file will record all logs pertaining to the selected log severity level and all higher severity levels. For example, if you select Info (default), the log file will contain logs identified as Info, Warning, and Error. If you select Debug, the log file will contain logs identified as Error, Warning, Info, and Debug.</p> <p><b>i</b> You can find the log files in the <a href="#">PRTG data directory</a> <sup>3214</sup>: C:\ProgramData\Paessler\PRTG Network Monitor\Logs\probeadapter.</p> <p><b>i</b> We recommend that you only set your level to Debug or Trace when you are troubleshooting your setup due to the large amount of logs the probe adapter generates. Treat log files created at these log levels as confidential as some logs may contain sensitive information.</p>

## Active Directory Integration

 This option is not available in PRTG Hosted Monitor.

**Active Directory Integration**

Domain Name <sup>3</sup>

---

Domain Access <sup>3</sup>  Use domain name (default)  
 Specify domain controllers

LDAP Connection Security <sup>3</sup>  Use LDAP without connection security (default)  
 Use LDAP over SSL

Access Type <sup>3</sup>  Use the PRTG core server service account (usually Local System) (default)  
 Use explicit credentials

Active Directory Integration

Setting	Description
Domain Name	<p>To use the Microsoft Entra ID integration, enter the name of your local domain. Enter a string or leave the field empty.</p> <p> PRTG does not support trusted domains or AD subdomains. For more important notes about AD integration, see section <a href="#">Active Directory Integration</a><sup>[5082]</sup>, section Notes and Restrictions.</p>
Domain Access	<p>Define how PRTG performs <a href="#">Active Directory (AD)</a> queries:</p> <ul style="list-style-type: none"> <li>▪ Use domain name (default): Use the entry in the Domain Name field above.</li> <li>▪ Specify domain controllers: Use specific domain controllers. Specify the domain controllers below.</li> </ul>
Primary Domain Controller	<p><a href="#">This setting is only visible if you select Specify domain controllers above.</a></p> <p>Enter the DNS name of the primary domain controller.</p>
Backup Domain Controller (optional)	<p><a href="#">This setting is only visible if you select Specify domain controllers above.</a></p> <p>Optionally enter the DNS name of the backup domain controller or leave the field empty.</p>
LDAP Connection Security	<p>Define if you want to use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection to the LDAP server:</p> <ul style="list-style-type: none"> <li>▪ Use LDAP without connection security (default): Do not use an SSL/TLS-secured connection.</li> <li>▪ Use LDAP over SSL: Use an SSL/TLS-secured connection.</li> </ul>
Access Type	<p>Define which user account PRTG uses to configure AD access:</p> <ul style="list-style-type: none"> <li>▪ Use the PRTG core server service account (usually Local System) (default): Use the same Windows user account configured for the PRTG core server service. In a default installation, this is the "local system" Windows user account. If this account does not have the right to query all groups of your Active Directory, do not use this option.</li> <li>▪ Use explicit credentials: Define a user account that PRTG uses to authenticate against the Active Directory. This should be a user account with full access to all of your AD groups.</li> </ul> <p>PRTG uses this account to query the AD for available groups.</p>
User Name	<p><a href="#">This setting is only visible if you select Use explicit credentials above.</a></p> <p>Enter the Windows user account name that PRTG uses to authenticate for AD configuration.</p>

Setting	Description
Password	<p>This setting is only visible if you select Use explicit credentials above.</p> <p>Enter the password for the Windows user account that PRTG uses to authenticate for AD configuration.</p>

## Historic Data Purging

Data purging enables you to automatically delete unnecessary data to free up disk space and to improve system performance. You can define different time spans for several kinds of data.

■ For more information on storage locations, see section [Data Storage](#) <sup>[3213]</sup>.

☁ PRTG Hosted Monitor purges historic data using the default purging limits of PRTG Network Monitor except the configuration backups that are purged after 30 days. You cannot modify historic data purging limits in PRTG Hosted Monitor.

Historic Data Purging	
Log File Records ⓘ	30
PRTG Web Server Log Records ⓘ	30
Historic Sensor Data ⓘ	365
Toplist Records ⓘ	30
Closed Tickets ⓘ	365
Reports ⓘ	365
Configuration Auto-Backups ⓘ	365
Screenshots of HTTP Full Web Page Sensor ⓘ	10

Historic Data Purging

Setting	Description
Log File Records	<p>Define how long PRTG keeps records in the system log file <a href="#">Log Database.db</a>. Enter a value in days. PRTG automatically deletes all entries that are older than this value. This also affects the content of the <a href="#">Logs</a> tab of monitoring objects like sensors.</p> <ul style="list-style-type: none"> <li> Keep this value as low as possible to enhance system performance.</li> <li> The default value is 30 days.</li> </ul>
PRTG Web Server Log Records	<p>PRTG creates one PRTG web server log file every day. Define how many PRTG web server log files to keep. Enter a value in days. PRTG automatically deletes all PRTG web server log files that older than this value.</p> <ul style="list-style-type: none"> <li> The default value is 30 days.</li> </ul>
Historic Sensor Data	<p>Define for how long PRTG keeps historic sensor data for all sensors. Enter a value in days.</p> <ul style="list-style-type: none"> <li> Historic sensor data is the basis for reports on monitoring data. If you decrease this value, less historic monitoring data is available.</li> <li> Depending on the scanning intervals and the number of sensors in your setup, the file that contains this data can become large. For smaller installations up to 500 sensors, 365 is usually appropriate.</li> <li> The default value is 365 days.</li> <li> The maximum value is 9999 days.</li> </ul>
Toplist Records	<p>Define for how long PRTG keeps toplist records for <a href="#">Flow (NetFlow, jFlow, sFlow, IPFIX)</a> and <a href="#">Packet Sniffer</a> sensors. Enter a value in days. We recommend that you use 30 days here.</p> <ul style="list-style-type: none"> <li> Old toplist data is deleted automatically as soon as a limit of 2 GB is reached. The oldest data is deleted from the database first.</li> <li> The default value is 30 days.</li> </ul>
Closed Tickets	<p>Define for how long PRTG keeps tickets that are in the <a href="#">Closed</a> status. Enter a value in days.</p> <ul style="list-style-type: none"> <li> The default value is 365 days.</li> </ul>
Reports	<p>Define the maximum age for PDF reports. Enter a value in days. PRTG automatically deletes all reports that are older than this value.</p> <ul style="list-style-type: none"> <li> The default value is 365 days.</li> </ul>

Setting	Description
Configuration Auto-Backups	<p>Define the maximum age for daily configuration backups. Enter a value in days. PRTG automatically deletes all configuration backup files that are older than this value.</p> <p> The default value is <b>365</b> days.</p> <p> PRTG Hosted Monitor purges the configuration backups after <b>30</b> days.</p>
Screenshots of HTTP Full Web Page Sensor	<p>Define for how long PRTG keeps the screenshots of the <a href="#">HTTP Full Web Page</a> sensor (PhantomJS browser engine). Enter a value in days. PRTG automatically deletes screenshots that are older than this value with every sensor scan.</p> <p> The default value is <b>10</b> days.</p>

 Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

How can I create a TLS certificate?

- <https://kb.paessler.com/en/topic/91877>

## Others

There are some settings that you must define in the [PRTG Administration Tool](#)<sup>[3040]</sup>. For more information, see sections:

- [PRTG Administration Tool on PRTG Core Server Systems](#)<sup>[3041]</sup>
- [PRTG Administration Tool on Remote Probe Systems](#)<sup>[3067]</sup>

### 8.12.2.5 User Accounts

On the User Accounts tab, administrators can add new user accounts, edit user accounts, and define which user groups that users are members of.

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

**☁** If 15 minutes (900) seconds have passed since your last credential-based login and you open a setup page from a different setup page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

In this section:

- [User Accounts Overview](#) 
- [Add User Accounts](#) 
- [User Account Settings Tabs](#) 
- [Settings Tab](#) 
  - [User Account Settings](#) 
  - [API Access](#) 
  - [Account Settings](#) 
  - [Group Membership](#) 
  - [PRTG Web Interface](#) 
  - [Ticket System](#) 
- [Notification Contacts Tab](#) 
- [Comments Tab](#) 
- [History Tab](#) 
- [API Keys Tab](#) 

## User Accounts Overview

The User Accounts tab shows a list of all user accounts in this PRTG installation and various types of information about each user.

Column Header	Description
Object	Shows the name of the user account. Click the user account to open its <a href="#">settings</a>  .
Type	Shows the user type, for example, <a href="#">read-only user</a> .
Email	Shows the primary email address of the user account.
Primary Group	Shows the primary group of the user account. Click the user group name to open its <a href="#">settings</a>  .

Column Header	Description
Group Memberships	Shows all user groups that the user account belongs to.
Active/Paused	Shows the status of the user account. This can be <a href="#">active</a> or <a href="#">paused</a> .

For more information, see section [Working with Table Lists](#) <sup>[218]</sup>.

## Add User Accounts

You have several options to add user accounts:

-  To add a new user to PRTG Network Monitor, hover over  and select Add User from the menu. The options are almost the same as for editing users.
  -  To add a new user to PRTG Hosted Monitor, click Invite User. The options are almost the same as for editing users but PRTG Hosted Monitor automatically generates the initial account password. The new user can change it later. Click Send Invite to save your settings and to send the invitation per email to the defined primary email address.
  - To batch-add several users at once, hover over  and select Add Multiple Users from the menu. In the dialog box that appears, select a [user group](#) <sup>[2912]</sup> from the dropdown list and enter or paste a list of email addresses. Separate them by a space, comma, semicolon, or a new line. Click OK to confirm. For each email address, PRTG creates a new, local user account in the user group, using the email address as the value for Login Name, Display Name, and Primary Email Address. PRTG automatically generates a new password and sends it to the email address.
-  Access rights to device tree objects, libraries, maps, reports, or the ticket system are defined in user groups. Make sure that the user is a member of the correct user group with the required group access rights.
-  You cannot delete [predefined](#) objects such as the [PRTG System Administrator](#) user account, the [PRTG Users Group](#), or the [PRTG Administrators](#) group.

## User Account Settings Tabs

Click on a user account and select the various tabs to change the different settings.

## PRTG Web Interface

PRTG Web Interface

Automatic Refresh ?

Automatically refresh pages (default)

Do not automatically refresh pages

Refresh Interval (Sec.) ? 30

Audible Alarms ?

Do not play audible alarms (default)

Play audible alarms on dashboard pages only

Play audible alarms on all pages

Home Page URL ? /welcome.htm

Time Zone ? (UTC+01:00) Amsterdam, Berlin, Bern, Rom, Stockholm, Wien

Date Format ? Use System Settings

Color Mode ?

Light (default)

Dark

PRTG Web Interface

Setting	Description
Automatic Refresh	<p>Define if you want PRTG to automatically reload web pages in the PRTG web interface for the user:</p> <ul style="list-style-type: none"> <li>▪ Automatically refresh pages (default): PRTG automatically refreshes single page elements on web pages in the PRTG web interface.</li> <li>▪ Do not automatically refresh pages: PRTG does not automatically refresh single page elements on web pages in the PRTG web interface.</li> </ul>
Refresh Interval (Sec.)	<p><b>This setting is only visible if you select</b> <a href="#">Automatically refresh pages (default)</a> <b>above.</b></p> <p>Enter the number of seconds that PRTG waits between two refreshes. We recommend that you use <b>30</b> seconds or more. The minimum value is <b>20</b> seconds. The maximum value is <b>600</b> seconds.</p> <p><b>i</b> Shorter refresh intervals create more CPU load on the probe system. If you experience load issues while using the PRTG web interface (or <a href="#">maps</a><sup>[2776]</sup>), set a longer refresh interval.</p>
Audible Alarms	<p>Define whether PRTG plays an audible alarm on web pages in the PRTG web interface when there is a new <a href="#">alarm</a><sup>[2901]</sup>:</p> <ul style="list-style-type: none"> <li>▪ Do not play audible alarms (default): PRTG does not play sound files on any web pages.</li> <li>▪ Play audible alarms on dashboard pages only: When there is a new alarm, PRTG plays a predefined sound on <a href="#">dashboard</a><sup>[237]</sup> pages only. The sound is played with every refresh of the dashboard page if there is at least one new alarm.</li> <li>▪ Play audible alarms on all pages: When there is a new alarm, PRTG plays a predefined sound on all web pages. PRTG plays the sound with every page refresh if there is at least one new alarm.</li> </ul> <p><b>i</b> PRTG only plays audible alarms if the New Alarms value in the <a href="#">global header area</a><sup>[168]</sup> of the PRTG web interface is greater than 0 after a page refresh. PRTG does not consider the number of old alarms.</p> <p><b>■</b> For more information, see the Knowledge Base: <a href="#">Which audible notifications are available in the PRTG web interface and in the PRTG app for desktop?</a> and <a href="#">Why are audible alerts in public maps not working in Chrome?</a></p>
Home Page URL	<p>Define the user's default home page in the PRTG web interface. This is the page that the user sees after logging in or when selecting <a href="#">Home</a><sup>[237]</sup> from the main menu. Enter a PRTG-internal web page.</p>
Time Zone	<p>Define the time zone for the user account. Depending on the time zone that you select, PRTG shows the local time zone of the user account in all data tables and graph legends.</p>

Setting	Description
	<p><b>i</b> PRTG receives the Coordinated Universal Time (UTC) from the system time of the PRTG core server for this purpose.</p> <p><b>■</b> If you get a warning message about differing time zones, see the Knowledge Base: <a href="#">Why do I get a warning message when time zones differ?</a></p>
Date Format	<p>Select the date format for the user:</p> <ul style="list-style-type: none"> <li>▪ Use default settings: Use the date format of the PRTG core server system.</li> <li>▪ DD.MM.YYYY HH:MM:SS (24h)</li> <li>▪ DD.MM.YYYY HH:MM:SS (A.M./P.M.)</li> <li>▪ MM/DD/YYYY HH:MM:SS (24h)</li> <li>▪ MM/DD/YYYY HH:MM:SS (A.M./P.M.)</li> <li>▪ YYYY-MM-DD HH:MM:SS (24h)</li> <li>▪ YYYY-MM-DD HH:MM:SS (A.M./P.M.)</li> </ul> <p><b>i</b> This setting takes effect after the next login.</p>
Color Mode	<p>Select a color mode for the PRTG web interface:</p> <ul style="list-style-type: none"> <li>▪ Light (default)</li> <li>▪ Dark</li> </ul>

## Ticket System

**Ticket System**

Email Notifications **i**
 Receive an email when a ticket changes (default)
  Do not receive any emails from the ticket system

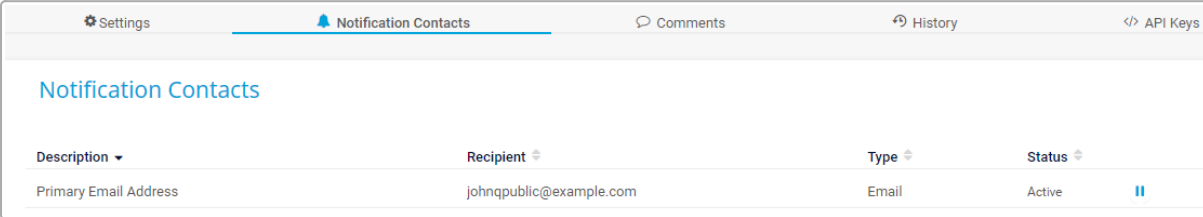

Ticket System

Setting	Description
Email Notifications	<p>Define if the user receives emails from the ticket system:</p> <ul style="list-style-type: none"> <li>▪ Receive an email when a ticket changes (default): The user receives an email each time a ticket is assigned to the user or to the user group they are a member of, or if a ticket is changed.</li> </ul> <p><b>i</b> If the user edits tickets that are assigned to them or the user group they are a member of, or if they assign a ticket to themselves or their user group, they do not get an email.</p>

Setting	Description
	<ul style="list-style-type: none"> <li>Do not receive any emails from the ticket system: The user does not receive any emails from the ticket system.</li> </ul>

 Save your settings. If you leave the page, all changes to the settings are lost.

## Notification Contacts Tab

Description	Recipient	Type	Status
Primary Email Address	johnqpublic@example.com	Email	Active

Notification Contacts

The Notification Contacts tab shows a list of all notification contacts of the selected user account.

Setting	Description
Description	Shows the description for the email contact.
Recipient	Shows the email address for the email contact.
Type	Shows the type of the notification contact.

 You can add new notification contacts under Setup | Account Settings | [Notification Contacts](#)<sup>2842</sup>.

## Comments Tab

On the Comments tab, you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

## History Tab

On the History tab, all changes in the settings of an object are logged with a time stamp, the name of the user who made the change, and a message. The history log retains the last 100 entries.

## API Keys Tab

On the API Keys tab, you can add, edit, and delete API keys that are specific to the user account. For more information, see section [API Keys](#)<sup>2851</sup>.

## More

### ■ KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

Which audible notifications are available in the PRTG web interface and in the PRTG app for desktop?

- <https://kb.paessler.com/en/topic/26303>

Why are audible alerts in public maps not working in Chrome?

- <https://kb.paessler.com/en/topic/83142>

Why do I get a warning message when time zones differ?

- <https://kb.paessler.com/en/topic/81306>

## Others

There are some settings that you must define in the [PRTG Administration Tool](#)<sup>[3040]</sup>. For more information, see sections:

- [PRTG Administration Tool on PRTG Core Server Systems](#)<sup>[3041]</sup>
- [PRTG Administration Tool on Remote Probe Systems](#)<sup>[3067]</sup>

### 8.12.2.6 User Groups

On the User Groups tab, you can define access rights for monitoring objects, libraries, maps, and reports at user group level. This means that group membership determines what a user can do and which monitoring objects, libraries, maps, or reports they can see. This does not apply to read-only users, who always have only read access, no matter what access rights the user group they belong to has. You can define group access rights for each object in the object's settings.

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

**☁** If 15 minutes (900) seconds have passed since your last credential-based login and you open a setup page from a different setup page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

## User Groups Overview

The User Groups tab shows a list of all user groups in this PRTG installation and various types of information about each user group.

Column Header	Description
Object	Shows the name of the user group. Click the user group to open its

Column Header	Description
	<a href="#">settings</a> <sup>[2914]</sup>
Type	Shows the user group type, for example, a <a href="#">PRTG user group</a> , an <a href="#">Active Directory group</a> , or a <a href="#">single sign-on (SSO) group</a> .
Members	Shows all users that are a member of this user group.
Primary Group	Shows all users that have this user group as their primary group. Click the user group name to open its <a href="#">settings</a> <sup>[2914]</sup> .
Active Directory Group	Shows the Active Directory group that the user group is connected to.
SSO Claim	Shows the access claim for the SSO group that the user group is connected to.

## Add User Groups

- To add a new user group to PRTG Network Monitor or to PRTG Hosted Monitor, hover over  and select Add User Group from the menu. The options are almost the same as for editing user groups.
- For each user group you create, PRTG automatically adds a new [group in the device tree](#)<sup>[133]</sup> with the name [\[group\\_name\] home](#).
- For each user group you create, PRTG automatically adds a new [email notification](#)<sup>[2815]</sup> to the [notification templates](#)<sup>[2808]</sup>. It has the name [Email to all members of group \[group\\_name\]](#). The new user group automatically has [read access](#)<sup>[145]</sup> to the new notification template.
- By default, there are no [access rights](#)<sup>[145]</sup> defined on objects for a newly created user group. Initially, users in this user group do not see any objects in the device tree except the automatically created [\[group\\_name\] home](#) group for which they have write access. This does not apply if the new user group is an administrator group. Edit the [settings](#)<sup>[201]</sup> of objects in your device tree, libraries, maps, or reports, and set access rights for the new user group in the Access Rights section.
  - ① The easiest way to set access rights is in the [root group settings](#)<sup>[420]</sup> and to use the [inheritance of settings](#)<sup>[136]</sup>.
  - ① The multi-edit option is not available for the [predefined](#) user groups [PRTG Administrators](#) and [PRTG Users Group](#).
  - ① You cannot delete [predefined](#) objects such as the [PRTG System Administrator](#) user account, the [PRTG Users Group](#), or the [PRTG Administrators](#) group.
  - ① If you want to delete an Active Directory group from PRTG, you must delete all users that are in the user group first. This is because the Active Directory users have this user group as their primary group, and user accounts must have a primary group.

## User Group Settings

**User Group Settings**

User Group Name ⓘ

---

Administrative Rights ⓘ  Give user group members administrative rights  
 Do not give user group members administrative rights (default)

Home Page URL ⓘ

---

Active Directory Integration ⓘ  Do not use Active Directory integration (default)  
 Use Active Directory integration

Sensor Creation Rights ⓘ  Allow user group members to create all sensors (default)  
 Allow user group members to create certain sensors only

Ticket System Access ⓘ  Allow user group members to use the ticket system (default)  
 Do not allow user group members to use the ticket system

User Group Settings

Setting	Description
User Group Name	Enter a name for the user group.  ⓘ If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a>
Administrative Rights	Define if the user group members have administrative rights: <ul style="list-style-type: none"> <li>▪ Give user group members administrative rights: Give administrative rights to all user group members.  ⓘ If you select this option, all user group members have full access to all device tree objects, libraries, maps, reports, and the ticket system. In addition, they can manage user accounts and user groups, and they can change the monitoring configuration of PRTG.</li> <li>▪ Do not give user group members administrative rights (default): Do not give the user group member administrative rights. Access to device tree objects, libraries, maps, and reports for user group members are defined in an object's settings.</li> </ul>
Home Page URL	Define the default home page for the user group members. This is the page that the user sees after logging in or when selecting <a href="#">Home</a> <sup>[237]</sup> from the main menu. Enter a PRTG-internal web page.  ⓘ This applies to new users that were either added via <a href="#">Active Directory Integration</a> <sup>[308]</sup> or using the <a href="#">Add Multiple Users option</a> <sup>[2903]</sup> .
Active Directory or Single Sign-On Integration	Define whether to connect this user group to external users:

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Do not use Active Directory integration (default): Do not connect this user group to a user group in your Active Directory or to a single sign-on integration. Use local user accounts instead.</li> <li>▪ Use Active Directory integration: Connect this user group to a user group in your Active Directory. <ul style="list-style-type: none"> <li>■ For more information, see section <a href="#">Active Directory Integration</a><sup>[3081]</sup>.</li> </ul> </li> <li>▪ Use single sign-on integration: Connect this user group to a single sign-on integration. <ul style="list-style-type: none"> <li>■ For more information, see the Knowledge Base: <a href="#">How to integrate Microsoft Entra ID into PRTG?</a></li> <li>■ For more information, see the Knowledge Base: <a href="#">How to integrate Okta SSO into PRTG?</a></li> </ul> </li> </ul> <p> You cannot change credentials for users that are members of an Active Directory group.</p> <p> This option is not available in PRTG Hosted Monitor.</p>
Active Directory Group	<p><a href="#">This setting is only visible if you select Use Active Directory integration above.</a></p> <p>Select the user group whose members can log in to PRTG using their Active Directory domain credentials. The according user accounts have the <a href="#">access rights</a><sup>[145]</sup> of the user group you just created.</p> <p> You need to configure a valid Active Directory domain in the <a href="#">Core &amp; Probes</a><sup>[2887]</sup> settings for user groups to appear in the dropdown list.</p> <p>■ For more information, see section <a href="#">Active Directory Integration</a><sup>[3081]</sup>.</p> <p> If your Active Directory contains more than 1,000 entries in total, PRTG displays an input field instead of a dropdown list. This is for performance reasons. In the input field, you can only enter the name of the user group in your Active Directory. PRTG then automatically adds the domain name prefix.</p> <p> PRTG caches the list of the user groups in your Active Directory for one hour. You can update this list earlier by manually clearing the cache via the <a href="#">Administrative Tools</a><sup>[2918]</sup> by clicking Go! in the Clear Caches section.</p> <p> This option is not available in PRTG Hosted Monitor.</p>
SSO Group Claim	<p><a href="#">This setting is only visible if you select Use single sign-on integration above.</a></p> <p>Enter the access claim for the SSO group, for example a scope name or an Azure group object ID.</p>

Setting	Description
	<p> This option is not available in PRTG Hosted Monitor.</p>
<p>User Type</p>	<p><a href="#">This setting is only visible if you select Use Active Directory integration above.</a></p> <p>Define the default user access rights for all new users in this user group:</p> <ul style="list-style-type: none"> <li>▪ Read/write user: Can only view monitoring results, libraries, maps, reports, and also edit the according settings. In addition, they can add and delete objects, libraries, maps, and reports. The user can acknowledge alarms, edit notification templates, notification contacts, and schedules.</li> <li>▪ Read-only user: Can only view monitoring results, libraries, maps, reports, and the according settings. The user can acknowledge alarms and change their own password if allowed. This is a good choice for public or semi-public logins.</li> </ul> <p> Read-only users cannot be members of groups with administrative rights.</p> <p> If a user logs in to PRTG for the first time using Active Directory credentials, PRTG automatically creates a new, local user account for this user with the user type that you define.</p>
<p>Acknowledge Alarms</p>	<p><a href="#">This setting is only visible if you select Read-only user above.</a></p> <p>Acknowledging an alarm is an action that requires write access. However, you can explicitly allow a read-only user to <a href="#">acknowledge alarms</a><sup>[203]</sup>:</p> <ul style="list-style-type: none"> <li>▪ Allow user group members to acknowledge alarms: Allow read-only user group members to acknowledge alarms.</li> <li>▪ Do not allow user group members to acknowledge alarms (default): Do not allow read-only user group members to acknowledge alarms.</li> </ul>
<p>Sensor Creation Rights</p>	<p>Define if user group members can create all sensors or only specific sensors:</p> <ul style="list-style-type: none"> <li>▪ Allow user group members to create all sensors (default): No restrictions for group members apply.</li> <li>▪ Allow user group members to create certain sensors only: Select the allowed sensors from the list of available sensors.</li> </ul>
<p>Allowed Sensors</p>	<p><a href="#">This setting is only visible if you select Allow user group members to create certain sensors only above.</a></p>

Setting	Description
	<p>A list of all available sensors is shown. Select the sensors that user group members can create by enabling check boxes in front of the respective sensor names.</p> <ul style="list-style-type: none"> <li><b>i</b> You can also select all items or cancel the selection by using the check box in the table header.</li> <li><b>i</b> PRTG displays sensors that are in use in bold print.</li> <li><b>i</b> This setting does not apply when a user group member runs an <a href="#">auto-discovery</a><sup>[254]</sup>. The auto-discovery adds all sensors that are defined in the used device templates. This setting does also not apply when a user group member adds <a href="#">recommended sensors</a><sup>[197]</sup>.</li> </ul>
Ticket System Access	<p>Define if user group members can use the <a href="#">ticket system</a><sup>[213]</sup>:</p> <ul style="list-style-type: none"> <li>▪ Allow user group members to use the ticket system (default): Users in this user group can read, create, assign, and modify tickets. <ul style="list-style-type: none"> <li><b>i</b> Group members that are read-only users never have access to the ticket system.</li> </ul> </li> <li>▪ Do not allow user group members to use the ticket system: The <a href="#">Tickets</a><sup>[247]</sup> menu item in the main menu bar is not visible to users in this user group.</li> </ul>

## Group Members

- <https://kb.paessler.com/en/topic/88527>

How to integrate Okta SSO into PRTG?

- <https://kb.paessler.com/en/topic/90482>

### Others

There are some settings that you must define in the [PRTG Administration Tool](#) ⓘ. For more information, see sections:

- [PRTG Administration Tool on PRTG Core Server Systems](#) ⓘ
- [PRTG Administration Tool on Remote Probe Systems](#) ⓘ

#### 8.12.2.7 Administrative Tools

On the Administrative Tools tab, you can start system-specific processes for debugging purposes.

ⓘ This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

☁ If 15 minutes (900) seconds have passed since your last credential-based login and you open a setup page from a different setup page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

## Administrative Tools For The PRTG Core Server

### Administrative Tools For The PRTG Core Server

**Create Configuration Snapshot**

Saves the current configuration as a .zip file in the \Configuration Auto-Backups subfolder of the PRTG data directory of your PRTG installation.

[Go!](#)

**Write Core Status File**

Creates a debug file on the PRTG core server system.

[Go!](#)

**Clear Caches**

Clears the internal caches of the PRTG web server for Geo Maps, the Active Directory integration, and the Active Directory group list.

[Go!](#)

**Load Lookups and File Lists**

Reloads the lookup files from the \lookups\custom subfolder of the PRTG program directory, and other file lists that are displayed in the PRTG web interface, for example, SNMP libraries, device icons, and report templates.

[Go!](#)

**Recalculate PRTG Graph Data Cache**

Deletes the data cache file and automatically recalculates it. If you apply recalculation, PRTG needs to restart the PRTG core server.

[Go!](#)

**Restart PRTG Core Server Service**

Restarts the PRTG core server service.

[Go!](#)

**Reload Logging Configuration**

Apply changes to the logging configuration to all PRTG modules.

[Go!](#)

Administrative Tools For The PRTG Core Server

Setting	Description
Create Configuration Snapshot	<p>Create a snapshot of the PRTG configuration. This action might take up to 100 seconds. Once it finishes, you can find a .zip file that contains a *.dat file in the \Configuration Auto-Backups subfolder of the <a href="#">PRTG data directory</a> <sup>[3214]</sup>.</p> <ul style="list-style-type: none"> <li><span style="color: #0070C0;">i</span> The name of the .zip file has the format <b>PRTG Configuration (Snapshot YYYY-MM-DD HH-MM-SS).zip</b>.</li> <li><span style="color: #0070C0;">i</span> If you run PRTG in a cluster, this action is executed on the cluster node you are logged in to.</li> </ul> <p><span style="color: #0070C0;">☁</span> This option is not available in PRTG Hosted Monitor.</p>
Write Core Status File	<p>Create status files of the PRTG core server. You can find the two text files in the \Logs\debug subfolder of the PRTG data directory. PRTG creates new files every time you click Go!.</p> <ul style="list-style-type: none"> <li><span style="color: #0070C0;">i</span> The files have the names <b>Core State (Global Debug Data).txt</b> and <b>Core State (Memory Debug Data).txt</b>.</li> <li><span style="color: #0070C0;">i</span> If you run PRTG in a cluster, this action is executed on the cluster node you are logged in to.</li> </ul> <p><span style="color: #0070C0;">☁</span> This option is not available in PRTG Hosted Monitor.</p>

Setting	Description
Clear Caches	<p>PRTG caches tiles for <a href="#">Geo Maps</a>, user data for <a href="#">Active Directory Integration</a>, and the <a href="#">Active Directory Group</a> list. Click Go! to delete the cache if you encounter broken Geo Maps tiles, if you changed a user's password in the Active Directory, or if you added groups in the Active Directory.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
Load Lookups and File Lists	<p>(Re)load the <a href="#">lookup files</a> from the \lookups\custom subfolder of the <a href="#">PRTG program directory</a>. In this subfolder, your customized lookup files are stored. If you have created a new lookup file or changed something in a lookup file, it might be necessary to load or to reload these files.</p> <p>With this option, you can also manually reload file lists in the PRTG web interface. If you have added new <a href="#">device icons</a>, <a href="#">device templates</a>, <a href="#">report templates</a>, .oidlib files for the <a href="#">SNMP Library</a> sensor, or language files to the PRTG program directory on the PRTG core server system while the server was running, reloading the file lists might be necessary to display new files in the PRTG web interface.</p> <p><b>i</b> Usually you do not need to reload file lists manually. A list is automatically reloaded when opening the according settings page with a latency of 10 seconds. If you save new device templates via the PRTG web interface, the template list is refreshed immediately.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
Recalculate PRTG Graph Data Cache	<p>PRTG constantly writes monitoring data to disk and keeps the graphs for your graph tabs in memory. If PRTG unexpectedly ends, the graph cache might become corrupted. In this case, graphs might be empty or show wrong data.</p> <p>If you experience graph display problems, a graph recalculation fixes the problem. Click Go! to delete the data cache file and to automatically recalculate it.</p> <p><b>i</b> If you apply the recalculation, PRTG needs to restart the PRTG core server. Because of this, all users of the PRTG web interface, the <a href="#">PRTG app for desktop</a>, or the <a href="#">PRTG apps for iOS or Android</a> are disconnected. After you click Go!, a dialog window appears that asks you to confirm the required restart. Click OK to trigger the restart.</p> <p><b>i</b> Directly after this action, your graphs are empty. PRTG successively refills them while the recalculation in the background progresses. Until the recalculation is finished, the performance of the PRTG web interface might be affected because of the high disk input/output (I/O) activity.</p>

Setting	Description
Restart PRTG Core Server Service	<p>Restart the PRTG core server service manually. Click Go! to restart it.</p> <p><b>i</b> If you restart the PRTG core server service, all users of the PRTG web interface, the PRTG app for desktop, or the PRTG apps for iOS or Android are disconnected. Clicking Go! immediately restarts the PRTG core server service.</p> <p><b>i</b> If you want to schedule an automatic restart of Windows services for both the PRTG core server service and the PRTG probe service, you can do this in the corresponding <a href="#">probe settings</a> .</p> <p> This option is not available in PRTG Hosted Monitor.</p>
Reload Logging Configuration	<p>For debugging reasons, it might be necessary to change the log levels of the PRTG core server. The Paessler support team takes you through the necessary steps that are required to change your logging configuration. The log level changes vary according to the PRTG installation, its setup, and the solution of an issue.</p> <p>To apply the changes, click Go!.</p>

## Administrative Tools For Probes

**Administrative Tools For Probes**

**Write Probe Status Files**

Creates a set of debug files on all probe systems.

**Restart All Probes**

Restarts all PRTG probe services. For disconnected probes, please use the PRTG Administration Tool on the respective probe system to start the PRTG probe service.

---

Probe #1 "Local Probe"

Connected From: 127.0.0.1:63007  
 Last Data: 06/10/2023 18:06:08 (0 sec ago) (W. Europe Standard Time)  
 .NET Framework Support: Installed: 4.7.2 or later

Administrative Tools For Probes

Setting	Description
Write Probe Status Files	<p>Create status files of all probes. PRTG writes status files for the local probe on the PRTG core server (in a cluster, on the cluster node you are logged in to) as well as for all classic remote probes. PRTG creates new files each time you click Go!.</p>

Setting	Description
	<p>On the respective systems, you find six text files in the \Logs\debug subfolder of the PRTG data directory. The files have the names <a href="#">Probe State (Global Debug Data).txt</a>, <a href="#">Probe State (Memory Debug Data).txt</a>, <a href="#">Probe State (Scheduler Debug Data).txt</a>, <a href="#">Probe State (Syslog).txt</a>, <a href="#">Probe State (Trap).txt</a>, and <a href="#">Probe State (xFlow Debug Data).txt</a>.</p> <p><b>i</b> This setting does not apply to any <a href="#">multi-platform probes</a> <sup>[3316]</sup>. For more information, see the <a href="#">Multi-Platform Probe for PRTG</a> manual.</p>
Restart All Probes	<p>Restart all probes as well as the local probe Windows service. If you have <a href="#">classic remote probes</a> <sup>[3190]</sup>, this restarts the probe Windows services on the remote probe systems as well. To restart single probes only, see below.</p> <p><b>i</b> You cannot restart disconnected probes here. Use the <a href="#">PRTG Administration Tool</a> <sup>[3040]</sup> on the probe system to start a disconnected probe on a Windows system. Restart disconnected probes on non-Windows systems directly from the probe system.</p> <p><b>i</b> If you run PRTG in a cluster, this action is executed on the cluster node you are logged in to. In this case, remote probes are only restarted if you are logged in to the primary master node. The cluster probe Windows service of failover nodes is not restarted if you execute this action on the primary master node. If you want to restart the cluster probe Windows service of a failover node, log in to the PRTG web interface of this failover node and click Go! there.</p> <p><b>i</b> This setting does not apply to any <a href="#">multi-platform probes</a> <sup>[3316]</sup>. For more information, see the <a href="#">Multi-Platform Probe for PRTG</a> manual.</p>
Probe [#Number] "[Name]"	<p>This section shows information about the connection status. If the probe is connected, the field shows the source IP address and port number that the probe uses. For the <a href="#">local probe</a>, the IP address is always 127.0.0.1. You also see information about the date when the last data packet was received from the probe.</p> <p>If you want to restart a single probe, click the corresponding Restart Probe button. Entries for every single probe follow.</p> <p><b>i</b> You cannot restart disconnected probes here. Use the <a href="#">PRTG Administration Tool</a> <sup>[3040]</sup> on the probe system to start a disconnected probe on a Windows system. Restart disconnected probes on non-Windows systems directly from the probe system.</p> <p><b>☁</b> This option is not available on the hosted probe of a PRTG Hosted Monitor instance.</p>

## Others

There are some settings that you must define in the [PRTG Administration Tool](#) <sup>[3040]</sup>. For more information, see sections:

- [PRTG Administration Tool on PRTG Core Server Systems](#) 
- [PRTG Administration Tool on Remote Probe Systems](#) 

### 8.12.2.8 Cluster

On the Cluster tab, you can change cluster-related settings. See the [cluster status](#)  to see if all cluster nodes are properly connected.

 This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

 If 15 minutes (900) seconds have passed since your last credential-based login and you open a setup page from a different setup page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

 This feature is not available in PRTG Hosted Monitor.

### Cluster Node Setup

Cluster Node Setup				
	Node Name	Node ID	Node Status	IP Addresses/DNS Names for Node-Node Connections
1	PRTG Network Monitor (	A1B2C3D4E5F6G7H8J9	Active	#2 ⇒ #1 192.0.2.0
2	Failover Node	11111111-2222-3333-4444-555555555555	<input checked="" type="radio"/> Active <input type="radio"/> Inactive	#1 ⇒ #2 192.0.2.1

Cluster Node Setup

Setting	Description
Node Name	<p>Enter the name of the cluster node. PRTG uses it for display purposes only.</p> <p> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
NodeID	<p>The ID is unique for every cluster node.</p> <p> We recommend that you use the default value.</p>
Node Status	<p>Set the state for each failover node:</p> <ul style="list-style-type: none"> <li>▪ Active: Set the failover node to active.</li> <li>▪ Inactive: Set the failover node to inactive. PRTG disables it in the cluster configuration. The failover node is no longer an active part of the cluster and it does not appear in the cluster status anymore.</li> </ul>

Setting	Description
	<p> This setting is not available for the master node of a cluster. The master node is always Active.</p>
<p>IP Addresses/DNS Names Used for Node-Node Connections</p>	<p>Define the IP addresses or Domain Name System (DNS) names that PRTG uses for the node-node connections. You can enter different values for every connection.</p> <p>For example, in the field #2 =&gt; #1, enter the address under which the master node is reachable from the second cluster node. Usually, this is the IP address or DNS name of the master node. Do this for all available cluster node connections, for example, if you have three cluster nodes, enter the address under which the second cluster node is reachable from the third cluster node in the field #3 =&gt; #2.</p> <p> For more information, see the Paessler website: <a href="#">How to set up a failover cluster in PRTG in 6 steps.</a></p> <p> If you use <a href="#">remote probes</a> outside your local network or outside your network address translation (NAT), make sure that the IP addresses or DNS names that you enter are valid for both the cluster nodes to reach each other and for remote probes to reach all cluster nodes individually. These addresses must not be private and must be reachable from the outside, otherwise the remote probes cannot connect.</p> <p> Multi-platform probes do not support clusters.</p>

 Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

 For more information on how to set a cluster node into Maintenance Mode, see section [Cluster Status](#).

 The entire setup process for a cluster requires several different steps. For more information and step-by-step guidance, see the Paessler website: [How to set up a failover cluster in PRTG in 6 steps.](#)

- [PRTG Administration Tool on PRTG Core Server Systems](#)<sup>[3041]</sup>
- [PRTG Administration Tool on Remote Probe Systems](#)<sup>[3067]</sup>

### 8.12.2.9 Single Sign-On

On the Single Sign-On tab, you can select a single sign-on (SSO) provider and configure other related settings.

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

 If 15 minutes (900) seconds have passed since your last credential-based login and you open a setup page from a different setup page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

## Requirements and Restrictions

SSO has the following requirements and restrictions.

 For more information, see also section [Notes](#)<sup>[2930]</sup>.

Requirement/Restriction	Description
SSO configuration	<p>You must first configure Microsoft Entra ID or Okta accordingly before you can integrate it into PRTG or PRTG Hosted Monitor for SSO. For example, you must register PRTG as an application.</p> <ul style="list-style-type: none"> <li>▪ For more information, see the Knowledge Base: <a href="#">How to integrate Microsoft Entra ID into PRTG?</a></li> <li>▪ For more information, see the Knowledge Base: <a href="#">How to integrate Microsoft Entra ID into PRTG Hosted Monitor?</a></li> <li>▪ For more information, see the Knowledge Base: <a href="#">How to integrate Okta SSO into PRTG?</a></li> </ul>
Freeware edition	<ul style="list-style-type: none"> <li>▪ SSO is not available for the <a href="#">freeware edition</a><sup>[20]</sup>.</li> </ul>
SSO users	<ul style="list-style-type: none"> <li>▪ Do not have access to the <a href="#">PRTG API</a><sup>[3084]</sup>.</li> <li>▪ Cannot log on to a failover node in a cluster.</li> <li>▪ Cannot change the Login Name in PRTG.</li> </ul>

Single Sign-On Settings

Setting	Description
SSO Login	Define if you want to enable login via SSO: <ul style="list-style-type: none"> <li>▪ Disable (default)</li> <li>▪ Enable</li> </ul>
Provider	<b>This setting is only visible if you select Enable above.</b> Select an SSO provider from the dropdown list: <ul style="list-style-type: none"> <li>▪ Microsoft Entra ID: Use Microsoft Entra ID as the SSO provider.</li> <li>▪ Okta: Use Okta as the SSO provider.</li> </ul>
Configuration Endpoint	<b>This setting is only visible if you select Enable above.</b>

Setting	Description
	<p>Enter the configuration endpoint URL.</p> <p><b>i</b> Click Load Configuration to automatically fill in the values for Authorization Endpoint, Token Endpoint, JSON Web Key Set (JWKS) URI, and Issuer. If this does not work, then manually enter the values.</p> <p>Microsoft Entra ID URL format example:</p> <pre>https://login.microsoftonline.com/&lt;tenant-ID&gt;/v2.0/.well-known/openid-configuration</pre> <p><b>i</b> Make sure to replace &lt;tenant-ID&gt; with the <a href="#">directory (tenant) ID</a> from Microsoft Entra ID.</p> <p>Okta URL format example:</p> <pre>https://&lt;your-Okta-domain&gt;/oauth2/&lt;authorization-server-ID&gt;/well-known/oauth-authorization-server</pre> <p><b>i</b> You can find the URL in the field <a href="#">Metadata URI</a> under Security   API in the Okta administrator console.</p>
<p>Authorization Endpoint</p>	<p><a href="#">This setting is only visible if you select Enable above.</a></p> <p>Enter the entire endpoint URL for authorization purposes, not only the server part.</p> <p>Microsoft Entra ID example:</p> <pre>https://login.microsoftonline.com/&lt;tenant-ID&gt;/oauth2/v2.0/authorize</pre> <p><b>i</b> Make sure to replace &lt;tenant-ID&gt; with the <a href="#">directory (tenant) ID</a> from Microsoft Entra ID.</p> <p>Okta example:</p> <pre>https://&lt;your-Okta-domain&gt;/oauth2/default/v1/authorize</pre> <p><b>i</b> Make sure to replace &lt;your-Okta-domain&gt; with the <a href="#">Okta domain</a> of your application from the Okta administrator console.</p>
<p>Token Endpoint</p>	<p><a href="#">This setting is only visible if you select Enable above.</a></p> <p>Enter the entire token endpoint URL, not only the server part.</p> <p>Microsoft Entra ID example:</p> <pre>https://login.microsoftonline.com/&lt;tenant-ID&gt;/oauth2/v2.0/token</pre> <p><b>i</b> Make sure to replace &lt;tenant-ID&gt; with the <a href="#">directory (tenant) ID</a> from Microsoft Entra ID.</p> <p>Okta example:</p>

Setting	Description
	<pre>https://&lt;your-Okta-domain&gt;/oauth2/default/v1/token</pre> <p><b>i</b> Make sure to replace &lt;your-Okta-domain&gt; with the <b>Okta domain</b> of your application from the Okta administrator console.</p>
<p>JSON Web Key Set (JWKS) URI</p>	<p><b>This setting is only visible if you select Enable above.</b></p> <p>Enter the URI of the JWKS, not only the server part.</p> <p>Microsoft Entra ID example:</p> <pre>https://login.microsoftonline.com/&lt;tenant-ID&gt;/discovery/v2.0/keys</pre> <p><b>i</b> Make sure to replace &lt;tenant-ID&gt; with the <b>directory (tenant) ID</b> from Microsoft Entra ID.</p> <p>Okta example:</p> <pre>https://&lt;your-Okta-domain&gt;/oauth2/default/v1/keys</pre> <p><b>i</b> Make sure to replace &lt;your-Okta-domain&gt; with the <b>Okta domain</b> of your application from the Okta administrator console.</p>
<p>Issuer</p>	<p><b>This setting is only visible if you select Enable above.</b></p> <p>Enter the SSO issuer.</p> <p>Microsoft Entra ID example:</p> <pre>https://login.microsoftonline.com/&lt;tenant-ID&gt;/v2.0</pre> <p><b>i</b> Make sure to replace &lt;tenant-ID&gt; with the <b>directory (tenant) ID</b> from Microsoft Entra ID.</p> <p>Okta example:</p> <pre>https://&lt;your-Okta-domain&gt;/oauth2/default</pre> <p><b>i</b> Make sure to replace &lt;your-Okta-domain&gt; with the <b>Okta domain</b> of your application from the Okta administrator console.</p>
<p>Scope</p>	<p><b>This setting is only visible if you select Enable above.</b></p> <p>Enter the scope for SSO.</p> <p>Microsoft Entra ID example:</p> <pre>openid profile offline_access email api://&lt;client-ID&gt;/&lt;scope-name&gt;</pre> <p><b>i</b> Make sure to replace &lt;client-ID&gt; with the <b>application (client) ID</b> from Microsoft Entra ID and the &lt;scope-name&gt; with a scope name.</p> <p>Okta example:</p> <pre>openid offline_access email profile</pre>

Setting	Description
Application (Client) ID	<p>This setting is only visible if you select <a href="#">Enable above</a>.</p> <p>Enter the <a href="#">application (client) ID</a> from Microsoft Entra ID or the <a href="#">Client ID</a> of your application from the Okta administrator console.</p>
Client Secret	<p>This setting is only visible if you select <a href="#">Enable above</a>.</p> <p>Enter the client secret to verify the integrity of the SSO token.</p>
Group Claim Retrieval	<p>This setting is only visible if you select <a href="#">Microsoft Entra ID above</a>.</p> <p>Select if you want to use an access token or GraphQL to retrieve the group claims from <a href="#">Microsoft Graph</a>:</p> <ul style="list-style-type: none"> <li>▪ Access token (default)</li> <li>▪ GraphQL</li> </ul> <p><b>i</b> If you select GraphQL to retrieve the group claims, PRTG automatically adds <a href="#">user.read</a> to the scope.</p> <p><b>i</b> If you select GraphQL and log in for the first time, a window opens and asks for the needed permissions. Click <a href="#">Accept</a> to grant the permissions.</p>
Endpoint Handling	<p>This setting is only visible if you select <a href="#">Enable above</a>.</p> <p>Define whether to select the callback from a list of callbacks or to manually enter a callback:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">Select from a list of endpoints (default)</a>: Select an endpoint from a list of available endpoints.</li> <li>▪ <a href="#">Manually enter a URL</a>: Manually enter an endpoint URL below. <ul style="list-style-type: none"> <li><b>i</b> You need to enter a manual callback if you access PRTG via a different DNS name. For example, if you access PRTG via <a href="#">myPRTG.example.com</a> but the actual DNS name of the PRTG core server is <a href="#">myPRTG.internal.example.com</a>, you need to enter a manual callback.</li> </ul> </li> </ul>
Available Callback URLs	<p>This setting is only visible if you select <a href="#">Enable and select Select from a list of endpoints (default) above</a>.</p> <p>This list shows the available callbacks of this PRTG instance. Select the callbacks that your users use to connect to PRTG.</p> <p><b>i</b> If you define an HTTPS endpoint in this field, you need to configure the HTTPS endpoint as a valid redirection URI in your SSO provider's settings.</p>

Setting	Description
External Callback URL	<p>This setting is only visible if you select <b>Enable</b> and select <b>Manually enter a URL</b> above.</p> <p>If you access PRTG via a different DNS name, define the HTTPS endpoint.</p> <p>This is necessary if the DNS name that you configured under <b>Setup   System Administration   User Interface</b> does not appear in the <b>Available Callback URLs</b> list. For example, if you access PRTG via <a href="#">myPRTG.example.com</a> but the actual DNS name of the PRTG core server is <a href="#">myPRTG.internal.example.com</a>, then enter <a href="#">myPRTG.example.com</a>. Also make sure to add the port used by PRTG for HTTPS and the endpoint in the URL, for example: <a href="#">myPRTG.example.com:PORT/cb</a>.</p> <p><b>i</b> If you define an HTTPS endpoint in this field, you need to configure the HTTPS endpoint as a valid redirection URI in your SSO provider's settings.</p>
Available Callback URLs (for reference)	<p>This setting is only visible if you select <b>Enable</b> and select <b>Manually enter a URL</b> above.</p> <p>This list shows the available callbacks URLs of this PRTG instance for reference purposes.</p>
Test Single Sign-On Authorization Endpoint	<p>Click <b>Test Single Sign-On Authorization Endpoint</b> to call the <a href="#">authorization</a> endpoint to check if starting the single sign-on process will succeed.</p> <p><b>i</b> In case of errors, check the answer from the endpoint.</p>

**i** Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

## Notes

- If you want to further improve the security for sign-in events, we recommend that you enable multi-factor authentication for Microsoft Entra ID or Okta.
  - For more information, see the Knowledge Base: [How can I enable Microsoft Entra ID multifactor authentication?](#)
  - For more information, see the Knowledge Base: [How can I enable Okta multi-factor authentication?](#)
- When an SSO user [logs in to the PRTG web interface](#)<sup>153</sup>, PRTG automatically creates a corresponding local account on the PRTG core server.

- By default, no access rights for monitoring objects, libraries, maps, or reports are set for the new user group in PRTG. This is why, initially, users in this user group do not see monitoring objects, libraries, maps, or reports. This does not apply if the new user group has administrative rights. Edit the monitoring [object's settings](#)<sup>[201]</sup> and the settings of libraries, maps, and reports, and set access rights for the newly created user group in the respective Access Rights section.
  - ❗ We recommend that you set these access rights in the [root group settings](#)<sup>[453]</sup> and use the [inheritance of settings](#)<sup>[136]</sup>.
- A local user account for an SSO user is only created if this SSO user has successfully logged in to PRTG. If you want to send [email notifications](#)<sup>[2815]</sup> to an SSO group in PRTG, using the option Send to User Group in the notification settings, a member of this SSO group must log in to PRTG at least once to receive email notifications. To avoid this, enter the email address of the SSO group in the Send to Email Address field in the notification settings and select None for the Send to User Group option.
- If you want to delete an SSO group from PRTG, you must delete all users that are in this user group first. This is because SSO users always have this user group set as their primary group, and user accounts cannot be without a primary group.
- If a license is not valid, is temporarily unavailable, or is being updated, SSO does not work during this time.

### 8.12.2.10 Maintainer Mode

Use the Maintainer Mode to pause and resume devices or check the status of devices without an active user session or user account.

## Maintainer Mode Settings

Maintainer Mode Settings

Maintainer Mode ?

Disable (default)

Enable

Maintainer Mode Settings

Setting	Description
Maintainer Mode	Define if you want to enable Maintainer Mode: <ul style="list-style-type: none"> <li>▪ Disable (default)</li> <li>▪ Enable</li> </ul>
Access Key	<p style="color: #0070C0;">This setting is only visible if you select Enable above.</p> <p>Shows the access key that you need for the API for authentication purposes.</p> <p><span style="font-size: 0.8em;">?</span> The access keys are URL friendly.</p>
Generate new access key	<p style="color: #0070C0;">This setting is only visible if you select Enable above.</p> <p>Enable the check box next to Generate new access key, click Save, and reload the page to generate a new access key.</p>

## Maintainer Mode API Endpoints and Parameters

You can execute the following actions by using the following endpoints:

### 1. Query Device Status

Endpoint	Parameter	Description
\api\public\maintainer_querydevicestatus.htm	NodeID	Use this parameter to define the object ID of the device of which you want to query the status. Enter an integer. <p><span style="font-size: 0.8em;">?</span> You can find the object ID in the info box on the Overview tab of the device.</p>
	accesskey	Use this parameter to define the access key that you need for the API for authentication purposes. Enter a string.

Example

```
https://yourserver/api/public/maintainer_querydevicestatus.htm?
nodeid=deviceID&accesskey=myaccesskey
```

2. Pause Device

Endpoint	Parameter	Description
\api\public\maintainer_pausedevice.htm	NodeID	Use this parameter to define the object ID of the device of which you want to query the status. Enter an integer.  <b>i</b> You can find the object ID in the info box on the Overview tab of the device.
	accesskey	Use this parameter to define the access key that you need for the API for authentication purposes. Enter a string.
	name	Use this parameter to define a name for the user that pauses the device. Enter a string.  <b>i</b> The name appears in the status on the Overview tab of the device.
	comment	Use this parameter to define a comment for the paused device. Enter a string.  <b>i</b> The comment appears in the status on the Overview tab of the device.

Example

```
https://yourserver/api/public/maintainer_pausedevice.htm?
nodeid=deviceID&accesskey=myaccesskey&name=myname&comment=mycomment
```

3. Resume Device

Endpoint	Parameter	Description
\api\public\maintainer_resumedevice.htm	NodeID	Use this parameter to define the object ID of the device of which you want to query the status. Enter an integer.  <b>i</b> You can find the object ID in the info box on the Overview tab of the device.

Endpoint	Parameter	Description
	accesskey	Use this parameter to define the access key that you need for the API for authentication purposes. Enter a string.
	name	Use this parameter to define a name for the user that resumes the device. Enter a string.   The name appears in the log on the Log tab of the device.

### Example

```
https://yourserver/api/public/maintainer_resumedevice.htm?
nodeid=deviceID&accesskey=myaccesskey&name=myname
```

### Others

There are some settings that you must define in the [PRTG Administration Tool](#)<sup>[3040]</sup>. For more information, see sections:

- [PRTG Administration Tool on PRTG Core Server Systems](#)<sup>[3041]</sup>
- [PRTG Administration Tool on Remote Probe Systems](#)<sup>[3067]</sup>

## 8.12.3 PRTG Status

To view the status of your PRTG installation, select Setup | PRTG Status from the [main menu bar](#)<sup>[249]</sup>. Select the various tabs to change the different settings.

In this section:

- [System Status](#)<sup>[2935]</sup>
- [Cluster Status](#)<sup>[2960]</sup>

### 8.12.3.1 System Status

On the System Status tab, you can view relevant system information. Furthermore, this page shows interesting usage statistics. Use the quick links for fast access to status information.

**i** You might need this data for debugging or when you contact the Paessler support team. They ask you in some cases to provide system status information to analyze any issues with PRTG.

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

**☁** If 15 minutes (900) seconds have passed since your last credential-based login and you open a setup page from a different setup page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

## Software Version and Server Information

This section shows information about the software version and the PRTG core server system.

Software Version And Server Information	
<b>PRTG Version</b>	PRTG Network Monitor 23.3.88.1421 x64
<b>Auto-Update Status</b>	Version 23.3.88.1421 successfully installed
<b>Operating System</b>	Microsoft Windows 10 Enterprise (10.0 Build 19045), 2 CPUs (Double x64 Model 106 Step 6), code page "Windows-1252", on VMware
<b>Server Time</b>	06/10/2023 18:28:49 (W. Europe Standard Time)
<b>Server CPU Load</b>	1%
<b>User Name</b>	PRTG System Administrator
<b>Active User Sessions</b>	PRTG System Administrator
<b>Browser</b>	Mozilla Firefox (Mozilla/5.0 (Windows NT 10.0; Win64; x64; rv:109.0) Gecko/20100101 Firefox/115.0)

Software Version and Server Information

Category	Description
PRTG Version	Shows the exact build version of the PRTG installation.
Auto-Update Status	Shows the latest auto-update message available from the <a href="#">auto-update</a>  . For example, the message indicates that an update was successfully installed.  ☁ This information is not displayed in PRTG Hosted Monitor.

Category	Description
Operating System	<p>Shows the exact Windows version, build, and service packs, the number and kind of CPUs, and the computer name of the PRTG core server system.</p> <ul style="list-style-type: none"> <li> If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.</li> <li> If you run PRTG on virtual systems, some of the information might not be available.</li> <li> This information is not displayed in PRTG Hosted Monitor.</li> </ul>
Server Time	<p>Shows the date and time of the PRTG core server system.</p> <ul style="list-style-type: none"> <li> If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.</li> </ul>
Server CPU Load	<p>Shows the CPU load of the PRTG core server system.</p> <ul style="list-style-type: none"> <li> If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.</li> </ul>
User Name	<p>Shows the <a href="#">user name</a>  of the user account that you are logged in to PRTG with.</p>
Active User Sessions	<p>Shows the user names of all user accounts that are logged in to PRTG.</p> <ul style="list-style-type: none"> <li> When a user account logs out, it takes up to 1 minute until the user name disappears.</li> </ul>
Browser	<p>Shows the name and user agent string of the browser that you are viewing this page with.</p>

## License Information

This section shows information about your license.

## License Information

License Status	Activation was successful
License Name	Example Organization
License Key	P10000-FFSEJ3-ZHGRD5-UR1CS9-U73FG2-G645F1-YVF1D0-H83234
System ID	SYSTEMID-AAAA1111-BBBB2222-3333CCCC-4444DDDD-5555EEEE
Customer ID	012345678
Licensed Edition	PRTG Network Monitor (next validation on 15/3/2024 at the latest)
Last Update	13/06/2024 11:06:54
Subscription until	07/05/2027 (1059 days left)
Number of Sensors	Unlimited

License Information

Setting	Description
License Status	<p>Shows the activation status of this PRTG installation. Usually, PRTG automatically completes the activation during installation or when you change your license information.</p> <p> If PRTG cannot directly connect to the internet, a manual activation is necessary.</p> <p> For more information, see section <a href="#">Activate the Product</a><sup>[104]</sup>.</p>
License Name	<p>Shows the owner of the <a href="#">license</a><sup>[102]</sup> that you use for this PRTG installation, for example <a href="#">ExampleOrganization</a>.</p> <p> The License Name, license key, and system ID make up your license information.</p> <p> You can find the label License Owner in some documents from the Paessler Portal. License Owner is the same as License Name. PRTG might ask you for this information during installation or when you <a href="#">change your license key</a><sup>[102]</sup>.</p>
License Key	<p>Shows the <a href="#">license</a><sup>[102]</sup> key that you use for this PRTG installation.</p> <p> The License Name, license key, and system ID make up your license information.</p>
System ID	<p>The system ID is a fixed value that is automatically assigned to a PRTG installation.</p> <p> The License Name, license key, and system ID make up your license information.</p>

Setting	Description
Customer ID	<p>This setting is only visible if you have a subscription license.</p> <p>Shows the customer ID of the license that you use for this PRTG installation.</p>
Customer ID	<p>This setting is only visible if you have a subscription license.</p> <p>Shows the customer ID of the license that you use for this PRTG installation.</p>
Licensed Edition	<p>Shows the license that you use for this PRTG installation. This determines how many sensors you can use in PRTG.</p> <p> PRTG regularly validates subscription licenses. You can see the next validation date here.</p>
Last Update	<p>Shows the date of the last update for this PRTG installation. We recommend that you use the <a href="#">auto-update</a><sup>2969</sup>.</p>
Subscription until / Maintenance until	<p>Shows the expiration date and the number of days that remain for your active maintenance or subscription. Manage your license at the <a href="#">Paessler Portal</a> for continued access to any available updates and to our premium email support.</p>
Number of Sensors	<p>Shows the number of sensors that you can use in PRTG. If you reach the limit, PRTG automatically sets each new sensor that you add to the Paused <a href="#">status</a><sup>181</sup>.</p> <p>Editions that allow an <b>unlimited</b> number of sensors do not restrict the number of possible sensors by license, so you can create sensors until you reach the <a href="#">performance limit</a><sup>27</sup>. This means that you can use about 10,000 sensors per PRTG core server. However, this number depends on the performance of the PRTG core server system, and sensors and scanning intervals.</p> <p> For more information, see section <a href="#">System Requirements</a><sup>22</sup>.</p>

## System Startup Log

This section shows the log information that was created during the last startup of the PRTG core server.

 If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.

System Startup Log

## System Warnings

This section shows if there are any warnings. Usually, you see [None](#).

### System Warnings

None

System Warnings

## Cluster Status

This setting is only visible if you have a [failover cluster](#)<sup>[128]</sup>. This section shows all of your cluster nodes.

## Cluster Status

**Node 1: PRTG Network Monitor Primary Node (Current Master)**  
⇒ Failover Node (192.0.2.1, Connected)

**Node 2: Failover Node Secondary Node (Failover Node)**  
⇒ PRTG Network Monitor (192.0.2.0, Connected)

Cluster Status

Category	Description
Node x	Shows the name and type of the cluster node (primary node or secondary node) and its status (current master node or failover node). It also shows all connections from this cluster node to the other cluster nodes.  ■ For more information, see section <a href="#">Cluster Status</a> <sup>2960</sup> .

## Local Status

This setting is only visible if you have a [failover cluster](#) <sup>128</sup>. This section shows information about the cluster node that you are logged in to.

## Local Status

Server State: PRTG Network Monitor: Current Master  
Cluster Messages:  
Number: 1943, NumberFast: 2, Received: 0, Init: 0, Tree: 0, Update: 0, Data: 0, File: 0, State: 0, Processed: 0, Broadcast: 1945, Broadcast Sent: 0

Local Status

Category	Description
Server State	Shows the name of the cluster node and its status (current master node or failover node).
Cluster Messages	Shows internal summary information about the cluster node and the communication between the cluster nodes. You might be asked about this by the Paessler support team.

## Cluster Connections

This setting is only visible if you have a [failover cluster](#)<sup>[128]</sup>. This section shows information about the connections between the cluster nodes.

### Cluster Connections

State of Local Node: Treeversion: 154926376807  
 Server Volume: 0 KB  
 State of cluster members:  
 Node: **PRTG Network Monitor**  
 State CRC: 1497873791

 Remote IP: 192.0.2.1

Message state of cluster members:  
**Failover Node {11111111-2222-3333-4444-5555555555}**  
 Connected  
 Connects: 1  
 Disconnects: 0  
 Sent: 11  
 Received: 0  
 Volume: 0  
 Buffer: 0

Cluster Connections

Category	Description
State of Local Node	Shows the treeversion and size of the server volume, both types of internal system information.
State of Cluster Members	Shows the name and IP address, a state cyclic redundancy check (CRC) code, the time stamp of the last "keep alive" signal, the size of the buffer, and the remote IP address of each cluster node.
Message State of Cluster Members	Shows the name and unique identifier, the connection state, and statistics about the cluster message system of each cluster node.

## PRTG Core Server System Memory

This section shows machine-oriented information regarding the memory usage of the PRTG core server system.

- ① If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.

## PRTG Core Server System Memory

Category	Description
Committed	The amount of memory that your system commits to the PRTG core server system.
Allocated	The amount of memory that the PRTG core server system is currently using.
Unused	The amount of allocated memory that the PRTG core server system is currently not using.
Free Physical	The amount of free memory that is currently available in the physical memory of the PRTG core server system.
Total Physical	The total amount of memory that is provided by the physical memory of the PRTG core server system.
Free Pagefile	The amount of free memory that is currently available in your system's pagefile(s).
Total Pagefile	The total amount of memory of your system's pagefile(s).
Free Virtual	The amount of free memory that is available in the virtual memory of the PRTG core server system.
Total Virtual	The total amount of memory of the virtual memory of the PRTG core server system.
Free Effective	The effective amount of free memory on your PRTG core server system. This corresponds to Free Pagefile.
Object Count	The number of PRTG-internal data structures, also known as tree nodes, for example, the number of sensors, users, and reports.
BaseInstance	The amount of memory that is used for the tree node <a href="#">Instance</a> .
BaseAccess	The amount of memory that is used for the tree node <a href="#">Access Rights</a> .
BaseHistory	The amount of memory that is used for the tree node <a href="#">History of Configuration Changes</a> .
BaseCurrent	The amount of memory that is used for the tree node <a href="#">Current Configuration Information</a> .
BaseData	The amount of memory that is used for the tree node <a href="#">Configuration Data</a> .

Category	Description
BaseChannel	The amount of memory that is used for the tree node <a href="#">Channel Settings</a> .
BaseTrigger	The amount of memory that is used for the tree node <a href="#">Trigger</a> .
BaseIDs	The amount of memory that is used for the tree node <a href="#">IDs</a> .
BaseLookup	The amount of memory that is used for the tree node <a href="#">Sensor Lookups</a> .
BaseCheck	The amount of memory that is used for the tree node <a href="#">Check Requests</a> .
BaseDeplist	The amount of memory that is used for the tree node <a href="#">Dependency List</a> .
Datasets	The amount of memory that is currently used for datasets, like for graphs.
State	The amount of memory that is currently used for user-specific datasets.
Interface	The amount of memory that is currently used for tree node-specific table objects.
IndexCache	The amount of memory that is currently used for the index dataset cache that is particularly important in a cluster.
TreeTotal	The total amount of memory that is used by the PRTG tree.
DatasetCache	The amount of memory that is currently used for the dataset cache, in particular regarding historic data. In parentheses, you see the number of datasets that are saved in the cache.
StorageSystem	The amount of memory space that is currently used for the storage system.
Sessions	The amount of memory that is currently used for sessions. A user can activate more than one session. In parentheses, you see the number of currently activated sessions.
StateObjects	The number of user-specific state objects that are found in the memory of the PRTG core server system.

## Thread Information

The section shows machine-oriented information regarding threads that are running on the PRTG core server system.

**i** If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.

Thread Information

## Activity History

This section shows how busy PRTG was for you in the past. The graphs indicate the number of activities in the last 365 days. Below the graphs, you see statistics about the past day.

Activity History

Category	Description
Sensor Scans	Shows how often all <a href="#">sensors</a> <sup>[134]</sup> refreshed their data in the past.
Sensor Status Changes	Shows how often the <a href="#">sensor states</a> <sup>[187]</sup> changed in the past.
Notifications Sent	Shows how many <a href="#">notifications</a> <sup>[2735]</sup> PRTG sent out in the past.
Reports Generated	Shows how many <a href="#">reports</a> <sup>[2754]</sup> PRTG created in the past.
Page Views	Shows how often pages in the PRTG web interface were opened in the past.
Sensors	Shows how many sensors existed in the past.

Category	Description
Devices	Shows how many <a href="#">devices</a> <sup>1341</sup> existed in the past.
Reports	Shows how many reports existed in the past.
Maps	Shows how many <a href="#">maps</a> <sup>2776</sup> existed in the past.

## Auto-Discovery Tasks

This section shows information on the [auto-discovery](#) <sup>254</sup>.

Auto-Discovery Tasks	
<b>Running Gateway/DHCP</b>	<b>1</b>

Auto-Discovery Tasks

Category	Description
Running	Shows the number of auto-discovery tasks that are running.  <b>i</b> A high number of auto-discovery tasks can negatively influence system performance.

## Background Tasks

This section shows information on background tasks.

Background Tasks	
<b>Historic Data</b>	done
<b>Toplist Buffer</b>	0
<b>Similar Sensors Detection</b>	status: currently suspended, setting: Manage automatically based on sensor count (recommended)
<b>Recommended Sensors Detection</b>	engine enabled, nothing to do

Background Tasks

Category	Description
Historic Data	Shows if PRTG is recalculating the historic data cache in the background. If so, you see the tasks to do until done. Usually, PRTG does this calculation after every PRTG core server restart.
Toplist Buffer	Shows the size of the Toplist buffer. When you use <a href="#">Flow (NetFlow, jFlow, sFlow, IPFIX)</a> <sup>[6011]</sup> or <a href="#">Packet Sniffer</a> <sup>[6009]</sup> sensors, PRTG stores Toplist data. The data stream received is buffered and written to the data directory of the PRTG core server system.   Depending on the number and size of the data stream as well as the hard disk and system performance of the PRTG core server system, the buffer size can rise. When the buffer size reaches <b>500</b> , PRTG drops Toplist data, which can lead to incorrect Toplist values for the sensors.
Similar Sensors Detection	Shows the status and the selected setting for the depth of the <a href="#">similar sensors</a> <sup>[192]</sup> analysis.
Recommended Sensors Detection	Shows the status of the detection engine and the tasks of the <a href="#">recommended sensors detection</a> <sup>[2874]</sup> .

## Database Objects

This section shows statistic information about your monitoring configuration. This information might be necessary when contacting the Paessler support team.

## Database Objects

Probes	4
Groups	584
Devices	903
Sensors	5217
Channels	24075
User Groups	10
Users	142
Notifications	32
Schedules	11
Maps	123
Libraries	21
Reports	41
Bitfield/Boolean/Integer/Range Lookups	1/241/3021/88
Requests/Second	16

Database Objects

Category	Description
Probes	Shows the total number of <a href="#">probes</a> <sup>[458]</sup> in the PRTG installation.
Groups	Shows the total number of <a href="#">groups</a> <sup>[526]</sup> in the PRTG installation.
Devices	Shows the total number of devices in the PRTG installation.
Sensors	Shows the total number of sensors in the PRTG installation.
Channels	Shows the total number of <a href="#">channels</a> <sup>[134]</sup> in the PRTG installation.
User Groups	Shows the total number of <a href="#">user groups</a> <sup>[2912]</sup> in the PRTG installation.
Users	Shows the total number of <a href="#">users</a> <sup>[2907]</sup> in the PRTG installation.
Notifications	Shows the total number of <a href="#">notifications</a> <sup>[2808]</sup> in the PRTG installation.

Category	Description
Schedules	Shows the total number of <a href="#">schedules</a> <sup>2846</sup> in the PRTG installation.
Maps	Shows the total number of created maps in the PRTG installation.
Libraries	Shows the total number of created <a href="#">libraries</a> <sup>2738</sup> in the PRTG installation.
Reports	Shows the total number of reports in the PRTG installation.
BitField/Boolean/Integer/Range Lookups	Shows the total number of used lookups by <a href="#">lookup type</a> <sup>6189</sup> .
Requests/Second	Shows a value that is calculated from the total number of sensors and the average scanning interval configured. This number indicates how many monitoring requests per second are sent from the probes to the devices in your network.  <i>i</i> There are no general guidelines on what a good value is here. This depends on the sensors that you use as well as on the performance of the probe system.

## Sensors Sorted by Impact on System Performance

This section shows all sensors that you use in your configuration in order of performance impact (from very low to very high). If the CPU load of the probe system is very high, you can see which sensors might be causing this issue. Consider the recommended number of sensors in the respective [sections](#) for sensors with a high or very high performance impact.

*i* In the list, internal short names are used for sensors instead of the official designations. You can find a list of all sensors and their internal IDs, among others, via [/sensorlist.htm](https://yourserver/sensorlist.htm), for example <https://yourserver/sensorlist.htm>.

*i* You can also see the performance impact of a sensor on the sensor's Overview tab or in the [Add Sensor](#) <sup>414</sup> dialog.

■ For an overview list of all sensors, including their performance impact, see section [Available Sensor Types](#) <sup>3232</sup>.

### Sensors Sorted By Impact On System Performance

<b>Very low</b>	1x clusterstate, 2x commonsaas, 2x corestate, 1x corestateautonomous, 6x dns, 100x ping, 2x probestate, 24x snmptraffic, 3x snmpuptime, 7x ssl, 7x sslcertificate, 2x systemstate
<b>Low</b>	16x http, 61x remotedesktop, 1x smtp, 3x snmpcpu, 3x snmpdiskfree, 6x snmpmemory
<b>Medium</b>	
<b>High</b>	3x wmiantivirus, 3x wmidiskhealth, 4x wmidiskspace, 12x wmiologicaldiskv2, 3x wmiimemory, 4x wminetwork, 3x wmilogfile, 6x wmiphysicaldiskv2, 3x wmiprocessor, 3x wmiuptime
<b>Very high</b>	3x lastwindowsupdate

Sensors Sorted by Impact on System Performance

### Sensors Sorted by Interval

Shows all sensors used in your configuration in order of scanning interval. Choose reasonable scanning intervals for sensors that can affect the system performance. See the respective [sections](#) for sensors for more information.

**i** In the list, internal short names are used for sensors instead of the official designations. You can find a list of all sensors and their internal IDs, among others, via </sensorlist.htm>, for example <https://yourserver/sensorlist.htm>.

### Sensors Sorted By Interval

<b>30 s</b>	100x ping
<b>60 s</b>	2x corestate, 2x probestate, 2x systemstate, 1x wmidiskspace, 4x wminetwork, 16x http, 7x sslcertificate, 7x ssl, 6x dns, 61x remotedesktop, 1x smtp, 24x snmptraffic, 3x snmpcpu, 3x snmpdiskfree, 3x snmpuptime, 6x snmpmemory, 3x wmiprocessor, 6x wmiphysicaldiskv2, 3x wmidiskhealth, 12x wmiologicaldiskv2, 3x wmiantivirus, 1x clusterstate, 1x corestateautonomous
<b>10 m</b>	3x wmidiskspace, 3x wmiimemory, 3x wmilogfile, 3x wmiuptime
<b>15 m</b>	2x commonsaas
<b>1 h</b>	3x lastwindowsupdate

Sensors Sorted by Interval

### Probes

This section lists all probes in your monitoring setup. If there are no remote probes, only the local probe or the hosted probe appears in the list, which always runs on the PRTG core server.

**i** If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to. Remote probes (if any) are only shown when you are logged in to the primary master node. When you are logged in to a failover node, the cluster probe on this cluster node appears as **local probe**.

## Probes

### Probe #1 "Local Probe"

connected from: 192.0.2.0:55909

Last Data: 06/10/2023 18:06:08 (0 sec ago) (W. Europe Standard Time)

.NET Framework Support: Installed: 4.7.2 or later

Probes

Category	Description
Probe #x "[Name]"	<p>Shows information about the connection status. If the probe is connected, the field shows the source IP address and port number used by the probe. For the <a href="#">local probe</a>, the IP address is always 127.0.0.1. You also see information about the date when the last data packet was received from the probe.</p> <p>If you want to restart a single probe, open the <a href="#">Administrative Tools</a>  settings.</p>

## System Settings

This sections shows information about system settings.

## System Settings

Web Server URL	https://10.242.8.177
Web Server IP Addresses	0.0.0.0
Web Server Ports	80,443
Web Server Port Usage	SSL
SSL/TLS Versions for Web Server	TLS 1.2
Web Server Ciphers	ECDH+AESGCM:DH+AESGCM:ECDH+AES256:DH+AES256!ADH!aN ULL!eNULL!LOW!3DES!MD5!EXP!PSK!SRP!DSS!RC4
SSL/TLS Versions for Probe Port	TLS 1.1, TLS 1.2
Probe Ciphers	ECDH+AESGCM:DH+AESGCM:ECDH+AES256:DH+AES256:ECDH+A ES128:DH+AES:ECDH+3DES:DH+3DES:RSA+AES:RSA+3DES:!ADH! AECDH:!MD5:!DSS
DH Parameters Size	1024
Incoming Probe Connection Binding	127.0.0.1:23560
Incoming Probe Connection IP Addresses	127.0.0.1
Incoming Probe Connection Port	23560
Probe Allow IP Addresses	
Probe Deny IP Addresses	
Data Path	C:\ProgramData\Paessler\PRTG Network Monitor\

System Settings

Category	Description
Web Server URL	Shows the URL to access the <a href="#">PRTG web interface</a> <sup>152</sup> .  <b>i</b> If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.
Web Server IP Addresses	Shows all IP addresses that the PRTG web server runs on.

Category	Description
	<p><b>i</b> If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.</p>
Web Server Ports	<p>Shows the ports that the PRTG web server runs on.</p> <p><b>i</b> If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.</p>
Web Server Port Usage	Shows the type of port used by the PRTG web server.
SSL/TLS Versions for Web Server	<p>Shows the Secure Sockets Layer (SSL)/Transport Layer Security (TLS) versions used for connections to and from the PRTG web server.</p> <p><b>i</b> This is only shown if you use an SSL/TLS-secured connection.</p>
Web Server Ciphers	<p>Shows the ciphers used by the PRTG web server.</p> <p><b>i</b> This is only shown if you use an SSL/TLS-secured connection.</p>
SSL/TLS Versions for Probe Port	Shows the SSL/TLS versions used for the probe port.
Probe Ciphers	Shows the ciphers used for the remote probe connection.
DH Parameters Size	<p>Shows the length of the Diffie-Hellman (DH) parameters.</p> <p><b>i</b> This is only shown if you use an SSL/TLS-secured connection.</p>
Incoming Probe Connection Binding	Shows a combination of the incoming probe connection IP address and the incoming probe connection port.
Incoming Probe Connection IP Addresses	<p>Shows a list of all IP addresses on which PRTG listens for incoming remote probe connections.</p> <p><b>i</b> This is the same information as in the <a href="#">Core &amp; Probes</a> settings. <b>0.0.0.0</b> means that the PRTG core server listens on all local network adapter IP addresses.</p>
Incoming Probe Connection Port	Shows the port number on which the PRTG listens for incoming remote probe connections. The default port is <b>23560</b> .
Probe Allow IP Addresses	Shows all source IP addresses that PRTG accepts for incoming remote probe connections.

Category	Description
	<p><b>i</b> This is the same information as in the <a href="#">Core &amp; Probes</a><sup>2891</sup> settings. <b>any</b> means that all remote probe connections are accepted, regardless of the IP address of the remote probe system.</p>
Probe Deny IP Addresses	<p>Shows all source IP addresses that PRTG denies for incoming remote probe connections.</p> <p><b>i</b> This is the same information as in the <a href="#">Core &amp; Probes</a><sup>2892</sup> settings. Denied IP addresses are superior to allowed IP addresses. If this field is empty, there are no denied IP addresses.</p> <p><b>i</b> PRTG automatically adds the IP address of a remote probe system to this list when you delete a remote probe from the <a href="#">device tree</a><sup>132</sup>.</p>
Data Path	<p>Shows the path where PRTG stores its configuration, monitoring database, etc.</p> <p><b>i</b> To change this setting, open the <a href="#">PRTG Administration Tool</a><sup>3047</sup> on the PRTG core server system (or of the respective cluster node, if applicable).</p> <p><b>i</b> If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.</p>

## Web Server Activity

This section shows statistics about the PRTG web server since the last startup. All values are reset when the PRTG core server is restarted.

- i** If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to.

## Web Server Activity

<b>Time Since Startup</b>	1 h 25 m
<b>Page Views</b>	8 (136/24h)
<b>Geo Maps(mapquest.roadmap)</b>	21 (356/24h)
<b>HTTP Requests</b>	203 (3439/24h)
<b>HTTP Requests &gt; 500 ms</b>	0 (0%)
<b>HTTP Requests &gt; 1000 ms</b>	1 (0%)
<b>HTTP Requests &gt; 5000 ms</b>	0 (0%)
<b>Slow Request Ratio</b>	0%

Web Server Activity

Category	Description
Time Since Startup	Shows the time that has passed since the PRTG web server was started.
Page Views	Shows the total number of page views on this PRTG core server.
Geo Maps	Shows the total number of geographical maps shown on this PRTG core server.
HTTP Requests	Shows the total number of HTTP requests to this PRTG core server.
HTTP Requests > 500 ms	Shows for how many (percent) of the HTTP requests above the page delivery took longer than 500 milliseconds (ms).
HTTP Requests > 1000 ms	Shows for how many (percent) of the HTTP requests above the page delivery took longer than 1,000 ms.
HTTP Requests > 5000 ms	Shows for how many (percent) of the HTTP requests above the page delivery took longer than 5,000 ms.
Slow Request Ratio	Shows a calculated number of the HTTP request values above. ⓘ The lower this number is, the faster the PRTG web interface is.
Failed Logins (Recent/Total)	Shows the number of recent failed logins and failed logins in total. ⓘ PRTG only shows this statistic when the number of failed logins is larger than 50.

## Synchronization

The PRTG core server holds the configuration of the entire monitoring setup and deploys it to the probes. This section shows statistics about the synchronization of the PRTG core server with the local probe and all connected remote probes (if any), since the last startup of the PRTG core server. All values are reset when the PRTG core server is restarted.

**i** If you run PRTG in a cluster, this shows information for the system of the cluster node you are logged in to. You must log in to the primary master node to see synchronization data for remote probe connections.

Synchronization	
<b>Last Synchronization with a Probe</b>	05.05.2021 09:54:41 (Nothing to do, Timing:187/171/46/2841/2887/12656)
<b>Probe/Core Message Count</b>	29745
<b>Raw Buffer Count</b>	0 (OK)
<b>Configuration Requests Sent</b>	258 of 258
<b>Configuration Requests Deleted</b>	0
<b>Configuration Requests with Response</b>	0

Synchronization

Category	Description
Last Synchronization with a Probe	Shows the time stamp of the last probe synchronization, and if there is still something to do.
Probe/Core Message Count	Shows the total number of messages sent between the PRTG core server and probes, as well as a calculated message speed value.
Raw Buffer Count	Shows the number of raw buffers and a corresponding status indicator.
Configuration Requests Sent	Shows the total number of configuration requests and the requests that still need to be sent.
Configuration Requests Deleted	Internal debug information. Usually, this value is 0.

Category	Description
Configuration Requests With Response	Internal debug information. Usually, this value is 0.

## More

### ■ KNOWLEDGE BASE

How can I speed up PRTG—especially for large installations?

- <https://kb.paessler.com/en/topic/2733>

## Others

There are some settings that you must define in the [PRTG Administration Tool](#)<sup>[3040]</sup>. For more information, see sections:

- [PRTG Administration Tool on PRTG Core Server Systems](#)<sup>[3041]</sup>
- [PRTG Administration Tool on Remote Probe Systems](#)<sup>[3067]</sup>

### 8.12.3.2 Cluster Status

On the Cluster Status tab, you can view all cluster nodes.

**i** This tab is only available if you run PRTG in a [failover cluster](#)<sup>[128]</sup>.

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

**☁** If 15 minutes (900) seconds have passed since your last credential-based login and you open a setup page from a different setup page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

**☁** This feature is not available in PRTG Hosted Monitor.

The following information is available:

- Cluster Status: Shows all connected cluster nodes
- Cluster Log: Shows all log entries for cluster connections

**Cluster Status**

Node 1: PRTG Network Monitor (10.0.10.34)  
Primary Node (Current Master)      Start Maintenance Mode

Connection To	IP	State
⇒ Node 10.0.10.35	10.0.10.35	Connected

Node 2: Node 10.0.10.35  
Secondary Node (Failover Node, Version: 104386)      Start Maintenance Mode

Connection To	IP	State
⇒ PRTG Network Monitor (10.0.10.34)	10.0.10.34	Connected

**Cluster Log**      Items: 50      Show Filters

Date Time	Object	Status	Message	Cluster Node
04/10/2023 09:04:03	Cluster Probe	Connection connected	Cluster: Connected to node	Node 10.0.10.35
04/10/2023 09:02:03	Cluster Probe	Cluster	Node 2 Connection 1 (10.0.10.35): TCP connected from	Node 10.0.10.35
04/10/2023 09:01:03	Cluster Probe	Connection connected	Cluster: Connected to node	PRTG Network Monitor (10.0.10.34)
04/10/2023 04:05:35	Cluster Probe	Cluster	Node 1 Connection 1 (10.0.10.34): TCP connected from	PRTG Network Monitor (10.0.10.34)

Cluster Status

Click the Start Maintenance Mode link to put a cluster node in maintenance mode. A cluster node in this mode is still connected to the cluster, but PRTG discards its monitoring results until you click the Stop Maintenance Mode link. You can use this to explicitly exclude a cluster node from monitoring if you know that the monitoring values are not accurate, for example, because you are reconfiguring the server. During maintenance, PRTG displays a cluster node with a transparent color in the overview graphic.

**i** On the Cluster Status tab, you do not see if your [remote probes are connected to failover nodes](#) <sup>[3210]</sup>. Connect to your failover nodes and explicitly check if remote probes are connected, for example, in the device tree of the PRTG web interface on a cluster node.

**■** For more information about cluster settings, see section [Cluster](#) <sup>[2923]</sup>.

## Others

There are some settings that you must define in the [PRTG Administration Tool](#) <sup>[3040]</sup>. For more information, see sections:

- [PRTG Administration Tool on PRTG Core Server Systems](#) <sup>[3041]</sup>
- [PRTG Administration Tool on Remote Probe Systems](#) <sup>[3067]</sup>

## 8.12.4 License Information

On the License Information tab, you can view information about your license and enter your license key.

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

**☁** If 15 minutes (900) seconds have passed since your last credential-based login and you open a setup page from a different setup page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

**☁** This option is not available in PRTG Hosted Monitor.

License Information

Setting	Description
License Status	<p>Shows the activation status of this PRTG installation. Usually, PRTG automatically completes the activation during installation or when you change your license information.</p> <p> If PRTG cannot directly connect to the internet, a manual activation is necessary.</p> <p> For more information, see section <a href="#">Activate the Product</a><sup>[104]</sup>.</p>
License Name	<p>Shows the owner of the <a href="#">license</a><sup>[102]</sup> that you use for this PRTG installation, for example <a href="#">ExampleOrganization</a>.</p> <p> The License Name, license key, and system ID make up your license information.</p> <p> You can find the label License Owner in some documents from the Paessler Portal. License Owner is the same as License Name. PRTG might ask you for this information during installation or when you <a href="#">change your license key</a><sup>[102]</sup>.</p>
License Key	<p>Shows the <a href="#">license</a><sup>[102]</sup> key that you use for this PRTG installation.</p> <p> The License Name, license key, and system ID make up your license information.</p>

Setting	Description
System ID	<p>The system ID is a fixed value that is automatically assigned to a PRTG installation.</p> <p> The License Name, license key, and system ID make up your license information.</p>
Customer ID	<p><b>This setting is only visible if you have a subscription license.</b></p> <p>Shows the customer ID of the license that you use for this PRTG installation.</p>
Licensed Edition	<p>Shows the license that you use for this PRTG installation. This determines how many sensors you can use in PRTG.</p> <p> PRTG regularly validates subscription licenses. You can see the next validation date here.</p>
Last Update	<p>Shows the date of the last update for this PRTG installation. We recommend that you use the <a href="#">auto-update</a><sup>[2969]</sup>.</p>
Subscription until / Maintenance until	<p>Shows the expiration date and the number of days that remain for your active maintenance or subscription. Manage your license at the <a href="#">Paessler Portal</a> for continued access to any available updates and to our premium email support.</p>
Number of Sensors	<p>Shows the number of sensors that you can use in PRTG. If you reach the limit, PRTG automatically sets each new sensor that you add to the Paused <a href="#">status</a><sup>[181]</sup>.</p> <p>Editions that allow an <b>unlimited</b> number of sensors do not restrict the number of possible sensors by license, so you can create sensors until you reach the <a href="#">performance limit</a><sup>[27]</sup>. This means that you can use about 10,000 sensors per PRTG core server. However, this number depends on the performance of the PRTG core server system, and sensors and scanning intervals.</p> <p> For more information, see section <a href="#">System Requirements</a><sup>[22]</sup>.</p> <p>To upgrade your license right now, click Need more sensors? Click here to upgrade! to visit the Paessler Portal.</p>

## Log

Click the Log tab to show a [table list](#)<sup>[218]</sup> of all system log entries with all messages and status changes regarding your license.

## Change and Update License Information

Use the following buttons to edit your license or refresh your maintenance information.

Button	Description
Manage License	Click to open the Paessler Portal and manage your PRTG Network Monitor license. This button is <b>only</b> visible to users of a commercial license.
Deactivate this License	<p>If you want to use the license of a PRTG installation on a different computer, click this button to deactivate the license. This is necessary, for example, when you move PRTG to a different computer, because a PRTG license can be active on only one computer at the same time. Once you have deactivated the license, the PRTG installation on this computer reverts to the <a href="#">freeware edition</a><sup>20</sup> after a grace period of 30 days.</p> <p> See also section <a href="#">Activate the Product</a><sup>104</sup>.</p>

## Update Your License Information

Click Change License Key or Refresh Information on the Status tab to update your license. Provide the necessary information and click Update License to complete the activation of your license.

**i** If you have any issues with license activation or updates, click Contact Support in the page footer to contact us directly via the [Paessler Help Desk](#). This requires internet access.

### Step 1: Choose Activation Type

Setting	Description
Activation Type	<p>Define how you want to validate and activate your license:</p> <ul style="list-style-type: none"> <li>▪ Automatic (online activation with optional HTTP proxy): Activate the license online. PRTG connects to the activation server and validates your license. The license is activated automatically. For automatic activation, the PRTG core server system must have internet access.</li> <li>▪ Manual (offline activation): Activate the license manually. Use this if the PRTG core server system has no access to the internet and cannot connect to activation.paessler.com. <ul style="list-style-type: none"> <li><b>i</b> This is the default selection if the PRTG core server system is offline.</li> </ul> </li> </ul>

### Step 2: Verify Your PRTG License

Setting	Description
License Key	Enter the license key that you received from Paessler GmbH. To avoid typing errors, copy and paste the License Key. It must exactly match your license key.
License Name	<p>If prompted, enter the License Name that you have received from Paessler GmbH. It must exactly match. To avoid typing errors, copy and paste the License Name.</p> <p><b>i</b> You can find the label License Owner in some documents from the Paessler Portal. License Owner is the same as License Name. PRTG might ask you for this information during installation or when you <a href="#">change your license key</a><sup>[102]</sup>.</p>
System ID	<p>This field shows the system ID, a fixed value assigned to your PRTG installation.</p> <p><b>i</b> This setting is for your information only. You cannot change it.</p>

For offline activation, click Save to File to write your license information into a text file.

### Step 3a: Activate Your PRTG

If you select the automatic activation type, you can now update your license. Define if you need an HTTP proxy for the HTTPS connection to the activation server and click Update License.

## Proxy Configuration

 This option is not available in PRTG Hosted Monitor.

Setting	Description
Proxy Server Handling	<p>Define if you want to use PRTG with a direct internet connection or if a proxy is necessary:</p> <ul style="list-style-type: none"> <li>▪ Do not use a proxy server (default): Do not use a proxy. Use this setting if a direct internet connection to the PRTG core server system is available.</li> <li>▪ Use a proxy server: Define proxy settings below. Use this setting if a proxy is mandatory in your network.</li> </ul> <p><b>i</b> We recommend that you use PRTG with a direct internet connection.</p> <p><b>i</b> The proxy settings are valid for <a href="#">auto-update</a><sup>[2963]</sup>, <a href="#">activating the product</a><sup>[104]</sup>, obtaining <a href="#">Geo Maps</a><sup>[2731]</sup> tiles, and for sending HTTP, push, and SMS text message <a href="#">notifications</a><sup>[2815]</sup>.</p>

Setting	Description
Server	<p>This setting is only visible if you select Use a proxy server <a href="#">above</a></p> <p>Enter the address of the proxy server that you use for outbound connections. Enter a valid address.</p>
Port	<p>This setting is only visible if you select Use a proxy server <a href="#">above</a></p> <p>Enter the port number of the proxy server that you use for outbound connections. Enter an integer.</p>
Proxy Authentication	<p>This setting is only visible if you select Use a proxy server <a href="#">above</a></p> <p>Determine whether the proxy server needs credentials or not:</p> <ul style="list-style-type: none"> <li>▪ Do not use authentication: Do not use credentials for proxy connections.</li> <li>▪ User name and password: Define credentials (user name and password) below. Use this setting if the proxy server requires credentials.</li> </ul>
User Name	<p>This setting is only visible if you select User name and password <a href="#">above</a>.</p> <p>Enter a user name for proxy authentication. Enter a string.</p>
Password	<p>This setting is only visible if you select User name and password <a href="#">above</a>.</p> <p>Enter a password for proxy authentication. Enter a string.</p>

### Step 3b: Request Activation Data

**i** The following step only applies to PRTG Network Monitor. If you use PRTG Enterprise Monitor, see the Paessler website: [How to use PRTG Enterprise Monitor in an offline environment in 5 steps](#).

If you select Manual (offline activation), you must request your activation data at <https://shop.paessler.com/service/licenseactivation/> using your license information. Open the activation page from a computer with internet access and provide your license information.

Generate the key file for your license and provide this data below.

### Step 4: Provide Activation Data

**i** This step is only necessary if you activate your license offline.

- Copy the content of the key file that you have generated on <https://shop.paessler.com/service/licenseactivation/>.

- Paste it into the Activation Data field. Alternatively, click Load from File if you have saved the key file with your activation data.
- Click Update License to complete the activation of your license.

## Others

There are some settings that you must define in the [PRTG Administration Tool](#)<sup>[3040]</sup>. For more information, see sections:

- [PRTG Administration Tool on PRTG Core Server Systems](#)<sup>[3041]</sup>
- [PRTG Administration Tool on Remote Probe Systems](#)<sup>[3067]</sup>

## 8.12.5 Auto-Update

In the Auto-Update settings, you can check the status of the auto-update, view logs, and edit settings. When a new version of PRTG is available on the Paessler website, PRTG automatically downloads the setup file if a direct internet connection is available. The [PRTG System Administrator](#) user then receives a [ToDo ticket](#)<sup>[213]</sup> with instructions to initiate the update installation.

**i** If you use the [freeware edition or trial edition](#)<sup>[20]</sup>, automatic software updates are available at any time. If you use a [commercial edition](#)<sup>[20]</sup>, you need to have an active subscription or active maintenance to receive updates.

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

**☁** If 15 minutes (900) seconds have passed since your last credential-based login and you open a setup page from a different setup page, PRTG asks you to enter your credentials again for security reasons. A dialog box appears. Enter your Login Name and Password and click OK to continue.

**☁** This option is not available in PRTG Hosted Monitor.

The screenshot shows the 'Auto-Update' settings page. At the top, there are three tabs: 'Status', 'Log', and 'Settings'. The 'Status' tab is selected. Below the tabs, there is a message box that says: 'Here you can automatically update your PRTG installation. If you are using the freeware or trial edition you can always update to the latest version for free. If you are using a commercial edition your license key must be covered by a valid maintenance contract in order to download updates. You can always prolong your maintenance at <https://shop.paessler.com>. You can deactivate automatic downloading in the [Settings tab](#).' Below this is a section titled 'Update Status For PRTG Network Monitor' with a table:

Remaining Maintenance Days	4655 (04/07/2036)
Latest Message from Auto-Update	
Currently Installed Version	23.3.88.1421+
Currently Selected Release Channel	Preview <a href="#">Select Other Release Channel</a>
Latest Version Available from Paessler	23.4.89.1500 <b>NEW!</b> <a href="#">Check For Latest Update and Download</a>
Latest Downloaded Version	

Auto-Update

Auto-update has the following tabs:

- **Status:** Click the Status tab to download and install updates.
- **Log:** Click the Log tab to show log information about the update status of PRTG, newest first. In the [table list](#)<sup>[218]</sup>, you can filter the items by using the [respective options](#)<sup>[218]</sup>.  
**■** For more information, see section [Logs](#)<sup>[210]</sup>.
- **Settings:** Click the Settings tab to configure the auto-update and release channel. See [Software Auto-Update](#)<sup>[2970]</sup> below.

## Using Auto-Update

If there is a new version available, you see detailed information about the available version. Read these notes carefully. You find a summary of current and past release notes below the update section. For more information about the release notes, see the Paessler website: [PRTG Release Notes and Version History](#).

To install the latest available version, click Install Update [version number]. PRTG asks you to confirm installation and license.

**i** Downloaded software versions are automatically saved in the \download subfolder of the [PRTG program directory](#). The [prtg.zip](#) that contains all necessary files is also cached in this subfolder.

## Manually Install an Interim Update

Not all available updates from Paessler are pushed to all customers but they are still available on the website. Sometimes the Paessler support team might ask you to update to the latest version.

In this case, click Check For Latest Update and Download. PRTG connects to the Paessler servers and downloads the setup file, regardless of the status of the update check. Then click Install Update [version number].

**i** To manually install an interim update, a direct internet connection is necessary on the PRTG core server system.

## Software Auto-Update

Software Auto-Update

When a New Version is Available **i**

Automatically download and install  
 Automatically download and alert the admin  
 Alert the admin only

Release Channel **i**

Stable: Updated about once per month (most conservative option, recommended)  
 Preview: Updated about once per month (thoroughly tested in our labs, do not use on production systems!)  
 Canary: Updated daily (for testing only, do not use on production systems!)

Software Auto-Update

Setting	Description
When a New Version is Available	Define what PRTG does when software updates are available: <ul style="list-style-type: none"> <li>Automatically download and install: Download and install any new version as soon as PRTG detects that a newer version is available. PRTG checks for a newer version once per day.</li> <li><b>i</b> The installation of a new version restarts the PRTG core server service and PRTG probe service and might also include a system restart.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Automatically download and alert the admin: Download any new version as soon as PRTG detects that a newer version is available. PRTG checks for a newer version once per day. After successful download, PRTG creates a <a href="#">ToDo ticket</a><sup>[213]</sup> for the <a href="#">PRTG System Administrator</a> user.</li> <li>▪ Alert the admin only: Do not download updates. Only create a ToDo ticket. You can still manually download updates via the <a href="#">auto-update</a><sup>[2970]</sup>.</li> </ul>
Installation Time	<p><b>This setting is only visible if you select</b> Automatically download and install above.</p> <p>Select the desired time for the installation of updates from the dropdown list. You can select As soon as the update is available to install updates at any time of the day.</p>
Release Channel	<p>Define the release channel that PRTG delivers updates in:</p> <ul style="list-style-type: none"> <li>▪ Stable: Updated about once every 8 weeks (most conservative option, default): Deliver updates in the Stable release channel. These are our best tested versions. <ul style="list-style-type: none"> <li>ⓘ Use these software versions for live environments that you depend on.</li> </ul> </li> <li>▪ Preview: Updated twice between stable releases (thoroughly tested in our labs, do not use on production systems): Deliver updates in the Preview release channel. Versions in this channel were thoroughly tested in our labs but might still contain limitations in certain monitoring configurations. <ul style="list-style-type: none"> <li>ⓘ Use this release channel if you are willing to take a little risk for the benefit of getting new features and bug fixes a little earlier.</li> <li>ⓘ We strongly recommend that you <b>not</b> use these software versions in live environments that you depend on.</li> </ul> </li> <li>▪ Canary: Updated daily (testing only, should not be used on production systems): Deliver updates in the Canary release channel. These versions are updated every night. <ul style="list-style-type: none"> <li>ⓘ Use with caution. Software versions in this channel have not been tested, might contain severe bugs, and are provided for testing purposes only.</li> <li>We strongly recommend that you <b>not</b> use these software versions in live environments that you depend on.</li> </ul> </li> </ul>

ⓘ Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

## Notes

There are a few things that we ask you to consider regarding automatic software updates:

- For automatic software updates to work, the PRTG core server system must have direct internet access. If a proxy connection is necessary, configure it in the [Core & Probes](#) settings.
  - For more information about the update servers, see the Knowledge Base: [Which servers does PRTG connect to for software auto-update, activation, etc.?](#)
- During installation, the PRTG core server system might restart without notice.
- PRTG automatically updates classic remote probes, which might cause short downtimes in the monitoring of remote locations. In rare cases, a manual update of classic remote probes is required after you update the PRTG core server. In these cases, you are notified in the device tree, and the monitoring of remote locations is interrupted until you perform the [manual update](#) on the remote probe system. If a probe system uses several network connections with different IP addresses, make sure that these IP addresses are included in the [list of allowed IP addresses](#). Otherwise, the remote probe on this system might be disconnected after an update.
- PRTG does not automatically update multi-platform probes. If you installed a multi-platform probe via the Paessler Linux package repository, your package manager notifies you when there is an update. Otherwise, manually update your multi-platform probes with the updated package. For more information, see the [Multi-Platform Probe for PRTG](#) manual.
- In a cluster, you only need to install the update on one cluster node. PRTG automatically deploys the new version to all other cluster nodes. This might cause a short amount of downtime for the monitoring on the cluster nodes, one after the other.
- If you run several individual PRTG core servers that are not in a cluster, you must initiate and confirm an update for each single PRTG core server.
- You can disable automatic downloading on the auto-update [Settings](#) tab. PRTG then only downloads updates when you click Check For Latest Update and Download.
- PRTG does not start auto-update downloads if less than 500 MB disk space is available on the PRTG core server system. If this is the case, you can check this on the [Log](#) tab.
- Virus scanners might potentially cause issues when downloading or installing software updates. To avoid such issues, we recommend that you make the appropriate exclusions for the PRTG program directory.

## Others

There are some settings that you must define in the [PRTG Administration Tool](#)<sup>[3040]</sup>. For more information, see sections:

- [PRTG Administration Tool on PRTG Core Server Systems](#)<sup>[3041]</sup>
- [PRTG Administration Tool on Remote Probe Systems](#)<sup>[3067]</sup>

## 8.12.6 Optional Downloads

To see optional downloads, select Setup | Optional Downloads from the [main menu bar](#)<sup>[249]</sup>. Click a tab to switch between different options.

In this section:

- [PRTG Apps](#)<sup>[2974]</sup>
- [PRTG MultiBoard](#)<sup>[2974]</sup>
- [Remote Probes](#)<sup>[2974]</sup>

### PRTG Apps

To monitor your network while on the go, use our free PRTG apps for smartphones and tablets. They run on iOS and Android.

■ For more information, see section [PRTG Apps for Mobile Network Monitoring](#)<sup>[2988]</sup>.

■ For more information about PRTG for iOS and PRTG for Android, see the Paessler website: [PRTG apps for iOS or Android](#).

### PRTG MultiBoard

Download PRTG MultiBoard to your system. You can run it on Windows, macOS, or Linux to manage one or several independent [PRTG core servers](#)<sup>[125]</sup> or PRTG Hosted Monitor instances with a native, cross-platform application.

■ For more information, see section [PRTG MultiBoard](#)<sup>[2984]</sup>.

### Remote Probes

With remote probes, you can extend your monitoring to distributed networks that are not directly reachable from your PRTG core server system. The version of the classic remote probe installer must match your version of PRTG, so it is a good idea to download it from here.

■ For more information, see section [Install a Remote Probe](#)<sup>[106]</sup>.

■ For more information about the Multi-platform probe, see : [Multi-Platform Probe for PRTG \(PDF\)](#).

Enter a Subject for Your Question/Feedback ⓘ

---

**This field is required.**

Contact Paessler Support / Send Your Feedback to Paessler

On the one hand, you can use this form to ask for support regarding technical issues. To make the support contact more comfortable, PRTG can automatically attach a screenshot in combination with a Support Bundle that contains several selected PRTG log files and status files. This information really helps the Paessler support team to analyze any issue you might have with PRTG. Also consider the suggested links to articles regarding the scope of your issue.

On the other hand, you can use this form to give us [feedback](#). Help improve PRTG by providing criticism, praise, bug reports, and feature requests. Any comments are welcome. Your feedback is handled directly by the Paessler support team.

PRTG securely transmits your feedback or support question including the support bundle to Paessler via the PRTG Cloud. Read more in our Knowledge Base on [how we handle your feedback](#).

- ⓘ Make sure that your PRTG core server system has access to the internet and can reach the URL <https://api.prtgcloud.com:443>

## Form Details

Ask a Question or Give Feedback

Provide the following information in this section of the contact form.

Field	Description
Your Ticket ID PAE<id>	<p>If you already have an open ticket (directly via the <a href="#">Paessler Help Desk</a>), enter the ticket ID. You can find it in your confirmation email regarding the request we received. You can provide the ID with PAE in front or only the number.</p> <p>ⓘ If you leave this field empty, you create a new ticket when you submit this form.</p>
Your Email Address	<p>Enter your email address. You can provide any of your addresses. However, by default, PRTG uses the email address of your user account to be able to associate you with your license.</p>
Scope of Your Question	<p>Select a topic regarding your issue and consider the suggested links.</p>
Emotional State	<p>If you want to, you can express your feelings about PRTG.</p>
Enter a Subject for Your Question/Feedback	<p>Provide short information with a maximum of 60 characters to indicate the topic of your issue.</p>
Enter a Detailed Description	<p>Leave any comments. They can be feedback or support questions. If you have a support question, describe your issue with as much detail as possible.</p>

## Attach a Screenshot and/or Support Bundle

To provide the most helpful information possible, you can attach a screenshot of the selected page and a support bundle with useful analytical data about your PRTG installation.

Setting	Description
Do not attach screenshot	<p>Send the ticket without a screenshot.</p> <p>ⓘ If you ask for technical help, we recommend that you attach a screenshot. This helps us a lot to analyze your issue and to provide a solution.</p>

Setting	Description
Create and attach screenshot (recommended)	<p>PRTG creates a screenshot of the selected page and sends it with your ticket. You can see a preview below the screenshot section.</p> <p><b>i</b> We recommend that you open the contact support form directly on the page where you encountered an issue. Taking screenshots is not possible on some generic error pages that are not meaningful enough for the Paessler support team.</p>

In section Support Bundle, you can choose from several packages that differ in coverage of information.

Setting	Description
Support Bundle	<p>Select the information you want to send to the Paessler support team:</p> <ul style="list-style-type: none"> <li>▪ Attach Base Pack with log files (recommended): Contains the following data about PRTG: <ul style="list-style-type: none"> <li>▫ System status</li> <li>▫ Lists of sensors in the Down status or the Unknown status</li> <li>▫ Core and probe health data</li> <li>▫ Current log entries</li> </ul> </li> <li>▪ Attach Base Pack with log files and PRTG configuration file: Contains the Base Pack and the PRTG configuration file. <ul style="list-style-type: none"> <li><b>i</b> Send this package only if the Paessler support team asks you to. User names, encrypted passwords in the <a href="#">config.dat</a> file, and passwords that your browser masks while you enter them on settings pages are removed before PRTG sends this package to the Paessler support team.</li> </ul> </li> <li>▪ Do not attach a Support Bundle: The ticket does not contain files. Choose this option only when sending feedback.</li> </ul>

Click Submit to send your request directly to the Paessler support team, or click Cancel to return to the page where you opened the contact form.

## Helpdesk

Write us in English or German and communicate via the [Helpdesk](#). The Paessler support team works closely with our development department to guarantee the fastest and most constructive assistance possible. As they need to analyze a lot of data over the course of a support case, like log files and screenshots, they use the Helpdesk as their primary support mechanism. Their office is staffed Monday to Friday from 07:00 to 22:00 (UTC+1), so you receive an answer within 24 hours on business days. Depending on the complexity of the case, they might need to ask for remote access to your system, or to schedule a remote desktop session.

## Other Resources

### Knowledge Base

Find answers to common questions in our [Knowledge Base](#).

### Supported Versions

Note that we only support PRTG versions that were released in the last 12 months. For more information on released versions, see the Paessler website: [Release notes for the "stable" release channel](#).

### License and Upgrades

If you have questions or feedback regarding your license purchase or want to upgrade your license, [contact our customer service](#)<sup>[161]</sup>.

### Network Planning

If you need help with your network setup or detailed installation planning, our partners are always happy to help. Please [contact a partner near you](#).

### Security Reports

If you are a user of PRTG or any of our other services and would like to file a security report, send an email to [security@paessler.com](mailto:security@paessler.com). Always include a detailed technical summary in your email. If you wish to send us an encrypted email, use the public key available at the [Paessler Help Desk](#).

# Part 9

# PRTG MultiBoard

## 9 PRTG MultiBoard

PRTG MultiBoard is a PRTG extension that functions as an alternative interface for PRTG. It is available on Windows, macOS, and Linux and you can use it to connect to one or several independent [PRTG core servers](#) <sup>[125]</sup> or PRTG Hosted Monitor instances to configure your setup, view monitoring results, and keep an eye on your network. It is a cross-platform application for fast access to data and monitoring management.

PRTG MultiBoard natively includes most PRTG features. For a few options, the application opens an external browser window using your default browser, for example, for system setup or probe installation.

**i** PRTG MultiBoard is mainly designed to review and manage PRTG installations that you already set up. If you have just started with monitoring, we recommend that you first run through the [smart setup](#) <sup>[41]</sup> in the [PRTG web interface](#) <sup>[152]</sup> and add your network devices there. Once finished, you can seamlessly switch to PRTG MultiBoard.

 PRTG Hosted Monitor supports connections from PRTG MultiBoard. For more information, see section [Using PRTG Hosted Monitor](#).

 Download the PRTG MultiBoard from the Paessler website: [PRTG MultiBoard](#).

### Requirements

 For more information, see the [PRTG MultiBoard and PRTG app for desktop manual \(PDF\)](#).

Category	Requirement
PRTG version	Your PRTG core server or PRTG Hosted Monitor instance must run as of PRTG 17.4.35.
PRTG license type	You must be a Paessler PRTG Enterprise Monitor user.  <b>i</b> PRTG Network Monitor users can use the general features of PRTG MultiBoard with the <a href="#">Paessler PRTG app for desktop</a> .

### General Features

General features include Multi-Edit, Desktop Alerts, and Compare Sensors.

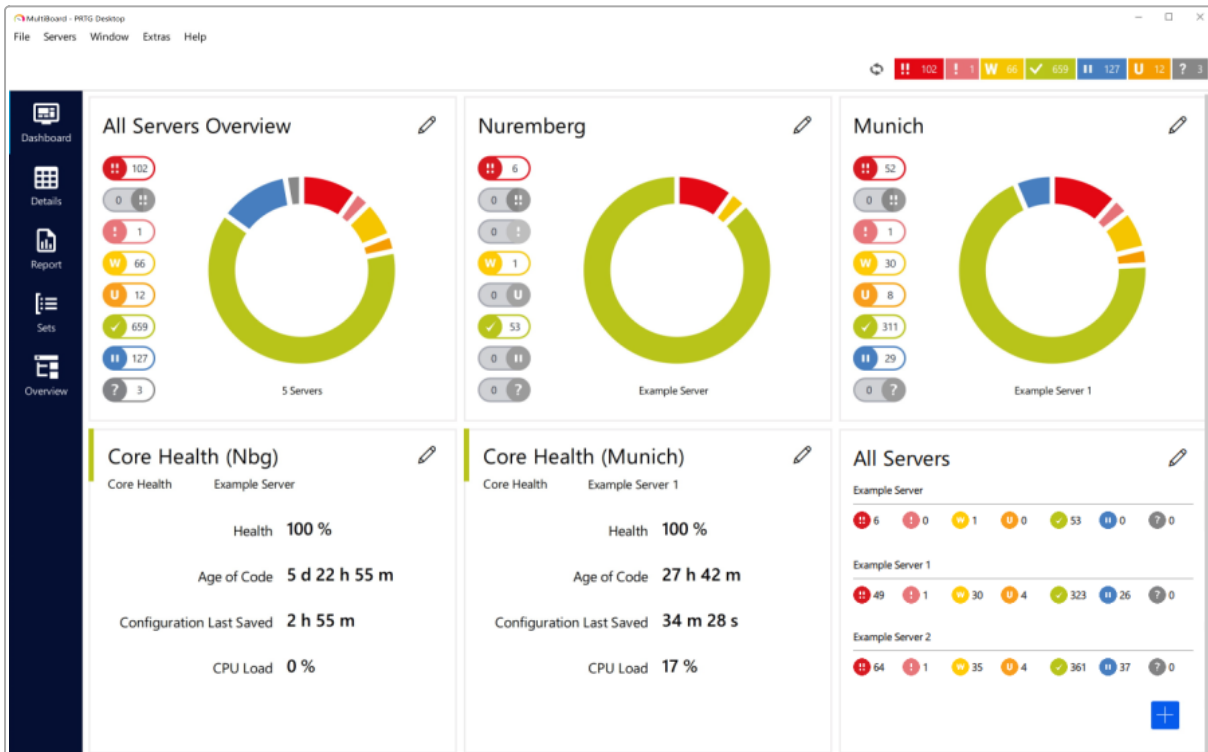

**i** These features are available for PRTG Network Monitor users.

PRTG app for desktop window

## MultiBoard Features

MultiBoard features include the MultiBoard, Probe Transfer, Configuration Viewer, and Template Transfer features.

MultiBoard window

With MultiBoard, you can connect to several independent servers to view their data and manage your monitoring centrally. Within the MultiBoard pages, you can find the following:

- **Dashboard:** Use different widget types to show overviews of your configured servers at a glance.
- **Details:** Display all sensors of all configured servers as a sensor list or in a more detailed table view.
- **Report:** Display an overview of the number of sensors on each connected server and in total, and the number of sensors that show a specific status.
- **Sets:** Group sensors into customized sensor sets across all your PRTG core servers and PRTG Hosted Monitor instances.
- **Overview:** View and edit all device tree objects in all of your PRTG core servers and PRTG Hosted Monitor instances.

## Part 10

# PRTG Apps for Mobile Network Monitoring

## 10 PRTG Apps for Mobile Network Monitoring

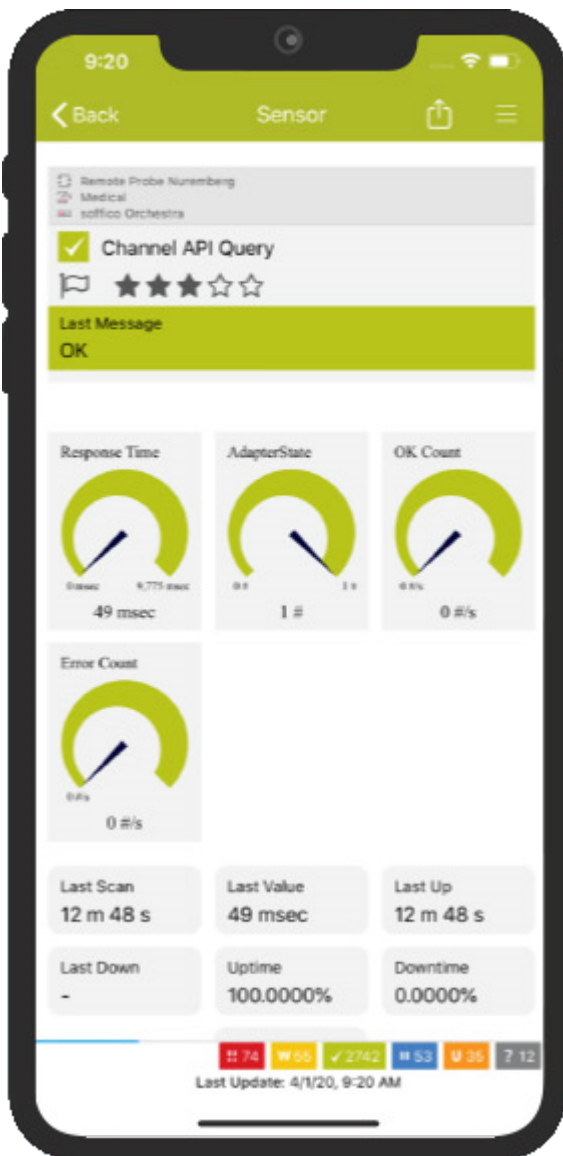

You can access your PRTG installation on your mobile devices with PRTG apps for iOS or Android. You can download and use these apps for free. [PRTG for iOS](#)<sup>2988</sup> and [PRTG for Android](#)<sup>2989</sup> let you monitor your network while on the go.

The basic requirements to use these free PRTG apps are a running PRTG core server that is accessible from the network your device is connected to (either directly or via a VPN connection) and a recent operating system version on your mobile device. For details about requirements, see below.

### PRTG for iOS

PRTG for iOS is the iOS app that you can use as of PRTG 13. You can use the newest PRTG app version on iPhone, iPad, and iPod touch as of iOS version 9. You can also use free [push notifications](#)<sup>2830</sup> with this PRTG app (required: at least PRTG for iOS 14.3.6; PRTG 15.4.20).

■ For more information and to download this PRTG app, see the Paessler website: [PRTG for iOS](#). For troubleshooting solutions, see the Knowledge Base: [I have an issue with PRTG for iOS. What can I do?](#)

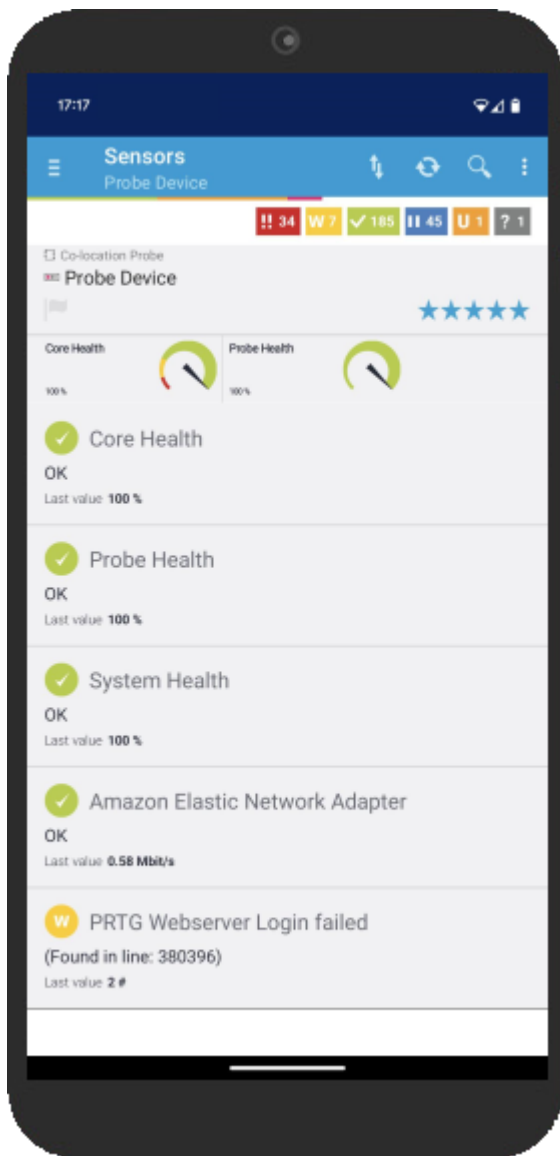

Sensor and channels on PRTG for iOS

## PRTG for Android

PRTG for Android is the Android app that you can use as of PRTG 14. Use it on your smartphone or tablet as of Android version 4.0, or on a Kindle Fire. For full functionality, we recommend that you use at least Android 4.1. You can also use free [push notifications](#) <sup>2830</sup> with the PRTG app (required: at least PRTG for Android 14.3.2; PRTG 15.4.20).

- For more information and to download this PRTG app, see the Paessler website: [PRTG for Android](#). For troubleshooting solutions, see the Knowledge Base: [I have an issue with PRTG for Android. What can I do?](#)

# Part 11

# Desktop Notifications

# 11 Desktop Notifications

While you are logged in to the PRTG web interface with Google Chrome or Mozilla Firefox, PRTG can show notifications on your desktop whenever there are new alarms in your monitoring.

PRTG shows desktop notifications (by default, in the lower-right corner of your desktop) whenever there are new alarms after a page refresh in the PRTG web interface. The notification displays the number of new alarms and the current number of each [sensor status](#)<sup>[181]</sup>.

Example of a Desktop Notification in Google Chrome

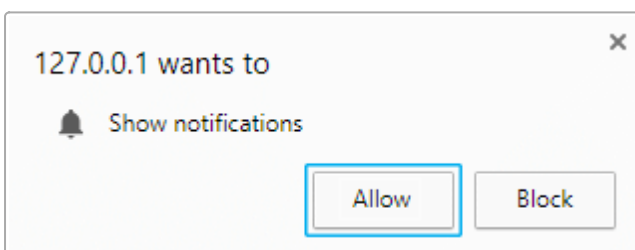

**i** Desktop notifications are not available for Internet Explorer.

## Desktop Notifications Settings

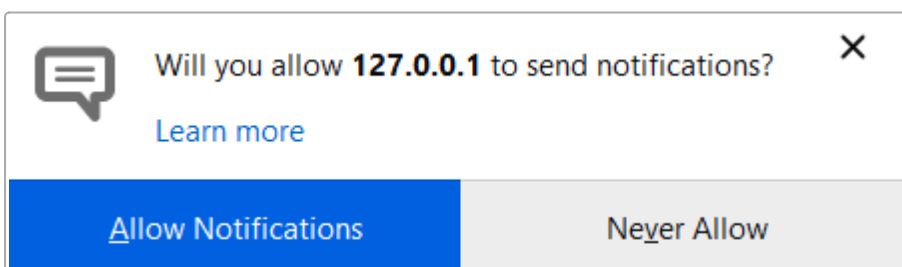

When you log in to the PRTG web interface, a message appears, asking you to allow desktop notifications. You must initially allow the notifications for each installation or profile of Firefox or Google Chrome.

**i** Desktop notifications in Google Chrome are not available for HTTP connections. See section [User Interface](#)<sup>[2856]</sup> for more information.

- In Google Chrome, click Allow to add the URL of the PRTG web interface to the allowed sites.
- In Firefox, click Allow Notifications to add the URL of the PRTG web interface to the allowed sites.

Click 'Allow' to enable Desktop Notifications in Google Chrome

Click 'Allow Notifications' to enable Desktop Notifications in Mozilla Firefox

## Disabling or Re-Enabling Desktop Notifications

To disable or re-enable desktop notifications for the PRTG web interface, edit your browser options:

- In Google Chrome: Click the View site information icon in the address bar of the browser. You can block or re-enable notifications for the PRTG web interface in section Notifications.
- In Mozilla Firefox: Click the Notification permission icon in the address bar of the browser. You can block or re-enable notifications for the PRTG web interface in section Permissions.

## Others

There are some settings that you must define in the [PRTG Administration Tool](#)<sup>[3040]</sup>. For more information, see sections:

- [PRTG Administration Tool on PRTG Core Server Systems](#)<sup>[3041]</sup>
- [PRTG Administration Tool on Remote Probe Systems](#)<sup>[3067]</sup>

# Part 12

# Sensor Technologies

## 12 Sensor Technologies

This section introduces different technologies that PRTG uses for monitoring to give you more background information.

In this section:

- [Monitoring via SNMP](#)  2997
- [Monitoring via WMI](#)  3004
- [Monitoring via SSH](#)  3007
- [Monitoring Bandwidth via Packet Sniffing](#)  3009
- [Monitoring Bandwidth via Flows](#)  3011
- [Bandwidth Monitoring Comparison](#)  3014
- [Monitoring Quality of Service](#)  3016
- [Monitoring Backups](#)  3021
- [Monitoring Virtual Environments](#)  3022
- [Monitoring Databases](#)  3028
- [Monitoring via HTTP](#)  3032

## 12.1 Monitoring via SNMP

Monitoring via the Simple Network Management Protocol (SNMP) is the most basic method of gathering bandwidth and network usage data.

### How SNMP Monitoring Works

SNMP is a set of standards for communication with devices in a Transmission Control Protocol (TCP)/IP network. SNMP monitoring is useful if you are responsible for servers and network devices such as hosts, routers, hubs, and switches. It enables you to keep an eye on network and bandwidth usage, and to monitor important metrics such as uptime and traffic levels.

You can use SNMP to monitor the bandwidth usage of routers and switches on a port-by-port basis, as well as device readings such as memory and CPU load. The target devices must support SNMP. Most devices with enabled SNMP require the same configuration (identical SNMP version and community string). To learn how to set up SNMP on a specific device, search the internet for its name and SNMP configuration.

Network Monitoring via SNMP

When you use a sensor with this technology, PRTG sends small data packets to a device, which in turn trigger reply packets. Compared to other bandwidth monitoring technologies via World Wide Name (WWN), packet sniffing, or Windows Management Instrumentation (WMI), the SNMP option creates the least CPU and network load.

### Reasons to Choose SNMP Monitoring

SNMP is the most commonly used method because it requires minimal bandwidth and CPU cycles. If your network devices support SNMP and/or if you want to monitor large networks with several hundred or thousands of sensors, we recommend that you start with SNMP.

Besides network usage monitoring, another well-known feature of SNMP is the ability to also monitor other network parameters such as CPU load, disk usage, temperature, as well as many other readings, depending on the queried device.

## SNMP Network Issues

To use SNMP for monitoring purposes, it is necessary that User Datagram Protocol (UDP) packets can be bidirectionally sent from the PRTG core server to the target device. This is usually the case in LANs and intranets. For connections across the internet, to a perimeter network (also known as DMZ, demilitarized zone, and screened subnet), or for WAN connections, some changes to the traversed firewalls might be necessary.

Keep in mind that SNMP v1 and v2c are no secure protocols, so you should not use them on the internet or with data connections that are not secure. Only SNMP v3 supports encryption.

## Understanding SNMP Sensors

To better understand and set up SNMP sensors, you might want to learn more about the principles of object identifiers (OID) and Management Information Base (MIB) files.

■ For more information, see the Knowledge Base: [How do SNMP, MIBs and OIDs work?](#)

■ For more information about all SNMP sensors, see section [Available Sensor Types](#) .

## SNMP Versions

PRTG supports three versions of the SNMP protocol: version 1, 2c, and 3.

### SNMP v1

This is the oldest and most basic version of SNMP.

- Pro: Supported by most SNMP-compatible devices.
- Con: Limited security because it only uses a simple password ([community string](#) ) and sends data in clear text (unencrypted). Because of this, you should only use it inside LANs behind firewalls, but not in WANs. SNMP v1 only supports 32-bit counters, which are not enough for high-load (gigabits/second) bandwidth monitoring.

### SNMP v2c

This version adds 64-bit counters.

- Advantage: Supports 64-bit counters to monitor bandwidth usage in networks with gigabits/second loads.
- Disadvantage: Limited security (see SNMP v1).

### SNMP v3

This version adds authentication and encryption to SNMP.

- Advantage: Offers user accounts and authentication for multiple users and optional data packet encryption to increase available security. Has all advantages of SNMP v2c.
- Disadvantage: Difficult to configure and higher overhead for the probe, which reduces the number of devices that you can monitor (see [SNMP Overload and Limitations of the SNMP System](#)  for more information).

## SNMP Traps

Various devices can send SNMP trap messages to notify you of system events.

- PRTG supports SNMP v1 and SNMP v2c traps.
- The destination for SNMP traps is the IP address of the trap receiver, which is the IP address of the probe system to which you add the [SNMP Trap Receiver](#) sensor.

## Which SNMP Version Should I Choose?

This depends on your environment. Here are some guidelines:

- If your network is publicly accessible, you might want to use SNMP v3, which has encryption and secure access. However, this also adds overhead, which results in less performance.
- If your network is isolated or well-protected behind firewalls, the lower security level of SNMP v1 or SNMP v2c might be sufficient.
- If you have a lot of devices to monitor, SNMP v2c is preferable since it has a shorter scanning interval and supports 64-bit counters.

Make sure to set the same SNMP version in the PRTG settings (for example, in the [root group settings](#) <sup>420</sup>) as in the target device. If you select an SNMP version that is not supported by the server or target device, you receive an error message. These error messages often do not explicitly say that you are using the wrong SNMP version and only provide minimum information, such as [cannot connect](#). Similar errors occur when community strings, user names, or passwords do not match.

■ For more information about basic requirements for SNMP monitoring, see the Knowledge Base: [My SNMP sensors don't work. What can I do?](#)

## SNMP Overload and Limitations of the SNMP System

SNMP v1 and v2 scale directly with the performance of the hardware and the speed of the network. In our labs, we can monitor 30,000 SNMP v1 sensors in a 60-second scanning interval with one PRTG core server (and local probe) plus two remote probes with 10,000 sensors each.

SNMP v3 has performance limitations because of the use of encryption. Furthermore, keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3.

Furthermore, the PRTG core server and probes should run on different computers. If you experience increased values in the [Interval Delay SNMP](#) or [Open Requests](#) channels of the [Probe Health](#) sensor (values above 0 % indicate that the SNMP requests cannot be performed at the desired interval), you need to distribute the load among probes. SNMP v1 and v2 do not have this limitation.

If you run into SNMP overload problems, you have the following options:

- Increase the scanning interval of the SNMP v3 sensors.
- Distribute the SNMP v3 sensors among two or more probes.
- Evenly distribute the SNMP v3 sensors on your devices (about 10 to 100 sensors per device).

- Check if your target devices answer fast enough. Performance issues might also result from slow SNMP v3 devices.
- Switch to SNMP v1 or v2 if you can go without encryption.

## What is the SNMP Community String?

The SNMP community string is similar to a user ID or password that allows access to the statistics of a device. PRTG sends the community string along with all SNMP requests. If the correct community string is provided, the device responds with the requested information. If the community string is incorrect, the device discards the request and does not respond.

- ❗ SNMP community strings are only used by devices that support SNMP v1 and SNMP v2c. SNMP v3 uses safer user name/password authentication, along with an encryption key.

By convention, most SNMP v1/v2c equipment ships with a read-only community string set to the value public. It is standard practice for network managers to change all the community strings to customized values during device setup.

## Check SNMP Capability

Make sure that each target device supports SNMP, and that SNMP is enabled. You can find out whether a device supports SNMP by either going to the vendor's website or checking that it is enabled in the configuration of the device.

- ✂ If you are uncertain whether SNMP is enabled on the target device and works, we recommend that you try [SNMP Tester](#). You can scan for uptime to perform a basic check for SNMP availability of the target device.

### Setup Checklist

1. Enable SNMP on the device.
  2. In the security settings of the device, allow SNMP access for the PRTG core server system.
  3. Allow User Datagram Protocol (UDP) packages to be sent bidirectionally from the PRTG core server to the device.
  4. SNMP requires the use of UDP ports >1023 to the PRTG client side. This is important for your firewall settings.
  5. Make sure that the firmware of the device is up to date.
  6. Select the appropriate SNMP protocol.
- ❗ It is important to know which SNMP version you need to select, because if it is not supported by the server or device you want to monitor, you receive an error message.

■ For more information, see the Knowledge Base: [My SNMP sensors don't work. What can I do?](#)

SNMP Monitoring Overview

## Vendor-specific SNMP Sensors

PRTG offers many vendor-specific SNMP sensors for some common vendors. These sensors are programmed to match the respective end devices. There are also workarounds for known vendor implementation issues, for example, if SNMP has not been fully implemented on an end device according to the RFCs. Here, our vendor-specific sensors still automatically receive the most important values.

### Supported Vendors

- APC
- Buffalo
- Cisco
- Dell
- Fujitsu
- HP

- HPE
- IBM
- Jakarta
- Juniper
- LenovoEMC
- NetApp
- Nutanix
- Poseidon
- QNAP
- Rittal
- SonicWall
- Synology

## Generic SNMP Sensors

PRTG offers several generic sensors that work with almost every device that supports SNMP, the corresponding Management Information Base (MIB) file and OIDs, and it correctly implements the respective RFCs. The standard SNMP libraries of PRTG include predefined, common values for the generic SNMP sensors. You can monitor the following parameters with the generic sensors.

## Operating System-based SNMP Sensors

PRTG also offers several operating system-based SNMP sensors that extend your SNMP monitoring. You can monitor the following parameters with these sensors.

## Custom SNMP Sensors

PRTG also offers custom SNMP sensors. The monitoring capabilities of these sensors extend the scope of the generic sensors. With custom sensors, you can show certain values that are not included in the standard libraries of PRTG. With these sensors, you can monitor most devices that support SNMP and for which PRTG does not have native sensors. Basically, you only need to find out the required OIDs for the desired device readings, for example, in the vendor's documentation for your hardware device.

- For more information, see the Knowledge Base: [How do I find out which OID I need for an SNMP Custom sensor?](#)

## 12.2 Monitoring via WMI

You can monitor Windows systems via Windows Management Instrumentation (WMI) and [Windows performance counters](#)<sup>[3004]</sup>. WMI is the Microsoft base technology for monitoring and managing Windows-based systems. PRTG uses it to access data of various Windows configuration parameters and status values. Note that sensors that use the WMI protocol generally have a high impact on system performance. In addition to strict WMI sensors, there are sensors that can use performance counters to monitor Windows systems.

To monitor via WMI and performance counters, it is usually sufficient to provide [credentials for Windows systems](#)<sup>[422]</sup> in PRTG. However, monitoring via WMI is not always trivial and can cause issues.

■ If you run into issues with WMI, see the Knowledge Base: [My WMI sensors don't work. What can I do?](#)

It is also possible to use Simple Network Management Protocol (SNMP) for Windows devices. The same information is often available using any of these protocols. Regarding performance, the preference is SNMP, then WMI or performance counters.

### How WMI Works

WMI allows access to the data of many Windows configuration parameters, as well as system status values. Access can be local or remote via a network connection. WMI is based on [COM](#) and [DCOM](#) and is integrated in Windows versions as of Windows Server 2000. PRTG officially supports WMI as of Windows 7.

ⓘ WoW64 (Windows 32-bit on Windows 64-bit) must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.

To monitor remote machines, WMI sensors need Active Directory account credentials to have access to the WMI interface. You can enter these credentials in the settings of the parent device or group, or in the [root group](#)<sup>[420]</sup>. The sensor then inherits these settings.

ⓘ Sensors using the WMI protocol generally have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#)<sup>[124]</sup>. Above this number, consider using [remote probes](#)<sup>[8198]</sup> for load balancing.

■ For more information about all WMI sensors, see section [Available Sensor Types](#)<sup>[3282]</sup>.

### Monitoring Windows Systems: Performance Counters

Besides sensors that can monitor Windows systems only via WMI, PRTG provides sensors that can use a [hybrid](#) approach. If you choose the hybrid approach, these sensors first try to query data via Windows performance counters using the [Remote Registry](#) service. These Windows sensors use WMI as a fallback if performance counters are not available or cannot be read out. When running in fallback mode, PRTG tries to connect to performance counters again after 24 hours. You can change the Preferred Data Source in the Windows Compatibility Options in the [device settings](#)<sup>[597]</sup>.

ⓘ You can identify these hybrid sensors by looking at their categories, for example, in the [Add Sensor](#)<sup>[414]</sup> dialog. Search directly for "windows" and select "Performance Counters" as Technology Used. Among them are various sensors with "Windows" in the name, as well as some Hyper-V sensors.

## Limitations of WMI on Windows Server 2008 (R1)

You should be aware that the performance of WMI-based monitoring is drastically limited when the monitoring station or the monitored client runs on Windows Server 2008 (R1). When it comes to network monitoring via WMI, Windows Server 2008 R2 is many times faster than Windows Server 2008 (R1).

- i** These are not limitations of PRTG. They arise from the WMI functionality built into the Windows operating systems mentioned.
- i** These limitations also apply to Windows Vista, which is no longer officially supported. You can still monitor machines that run Windows Vista, but the PRTG core server and probes are no longer supported on this operating system.

The results of our tests are:

- As of Windows Server 2008 R2 or Windows 7, you can run most WMI sensors if you provide optimal conditions, such as running the PRTG core server system and the target systems exclusively under Windows Server 2008 R2 and being located within the same LAN segment. Actual performance can be significantly lower depending on the network topology and the WMI health of the target systems. We have seen configurations that could not go beyond 500 sensors (and even less).
- On Windows 2008 (R1), you can run about 300 WMI sensors with a 1-minute scanning interval.
- The more Windows 2008/Windows 7 client systems you have in your network, the more the WMI monitoring performance is affected.
- System performance (CPU, memory, etc.) of virtualization does not strongly affect WMI monitoring performance.

If you want to use WMI for network monitoring of more than 20 or 30 systems, consider the following rules:

- Do not use Windows 2008 (R1) as monitoring stations for WMI-based network monitoring.
- Use at least Windows Server 2008 R2 for WMI-based network monitoring instead.
- Consider setting up remote probes for the WMI monitoring. You still get far better WMI monitoring performance with a remote probe on a virtual machine (VM) running Windows Server 2008 R2 than on any physical system running Windows 2008.
- Consider switching to SNMP-based monitoring for large networks. Using SNMP, you can monitor 10 times as many objects than with WMI on the same hardware.

## 12.3 Monitoring via SSH

Monitoring via Secure Shell (SSH) enables you to gather performance and system data from many Linux and Unix distributions, as well as from certain macOS X systems. If your system is supported, this monitoring technology works without any additional software on the target systems.

### How Monitoring via SSH Works

To monitor remote machines via SSH, PRTG needs the credentials (preferably root access) of the devices. If you use SSH sensors, you can enter the necessary credentials in the [settings](#)<sup>[201]</sup> of the parent device or group, or in the root group, in the Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems section. The sensors then inherit these settings by default.

With each scanning interval, PRTG logs in to your devices and queries data by executing specific commands.

■ For more information about all SSH sensors, see section [Available Sensor Types](#)<sup>[3232]</sup>.

■ For a list of encryption algorithms that the SSH sensors support, see the Knowledge Base: [Which encryption algorithms do PRTG SSH sensors support?](#)

### Limitations When Using SSH Monitoring

Because of the plurality of Linux/Unix derivatives, SSH sensors cannot support all distributions on the market. Also, only certain macOS systems are supported.

■ For a list of successfully tested distributions, see the Knowledge Base: [Which Linux or macOS distributions are supported by the Linux/Unix sensors \(SSH, SNMP\)?](#)

### Authentication via SSH Private Key

PRTG supports authentication via password or via private key.

When you use a private key, make sure to note the following:

- Provide the key in [OpenSSH RSA](#) format.
- The key cannot be encrypted. PRTG does not support password-protected keys.
- The key must be provided as an [RSA](#) key; you cannot use [DSA](#) keys.

When you provide an unencrypted RSA private key in OpenSSH RSA format, copy the entire key, including the

```
-----BEGIN RSA PRIVATE KEY-----
```

and

```
-----END RSA PRIVATE KEY-----
```

lines, into the designated text field in PRTG and Save your settings. Once you have pasted in and saved the private key, PRTG shows it as

```
*****
```

Make sure that a corresponding public key exists on the target device.

- For more information about how to convert and use an SSH key, see the Knowledge Base: [How can I use private keys for my SSH sensors with PRTG?](#)

## 12.4 Monitoring Bandwidth via Packet Sniffing

Packet sniffing comes into consideration if your network devices do not support the Simple Network Management Protocol (SNMP) or Flow (NetFlow, jFlow, sFlow, IPFIX) to measure bandwidth usage and if you need to differentiate the bandwidth usage by network protocol and/or IP addresses.

❶ Packet Sniffer sensors support [Toplists](#)<sup>[2707]</sup> (for example, Top Talkers or Top Connections).

### How Packet Sniffing Works

If you need to know what applications or IP addresses cause the traffic in your network, you can use a packet sniffer. A packet sniffer looks at every single data package that travels through your network for accounting purposes.

Monitoring with PRTG via Packet Sniffer Sensors

PRTG can analyze the packets that pass the network card of a PC or you can connect it to the monitoring port of a switch. To calculate bandwidth usage, PRTG inspects all network data packets either passing the PC's network card (shown on the left side in the schema above) or the data packages that a monitoring port of a switch (right side) sends with its built-in packet sniffer. Using remote probes, you can set up packet sniffers anywhere in your network.

❶ Packet Sniffer sensors use the [npcap library](#) to monitor traffic.

■ For more information, see section [Add Remote Probe](#)<sup>[3196]</sup>.

[Comparing](#)<sup>[3014]</sup> the four bandwidth monitoring technologies that PRTG provides (SNMP, Windows Management Instrumentation (WMI), flows, and packet sniffing), packet sniffing creates the most CPU and network load, so you should only use it in small to medium-sized networks, on dedicated computers for larger networks, or for individual computers.

## Reasons to Choose Packet Sniffing

It is important to understand that the packet sniffer can only access and inspect data packages that actually flow through the network interfaces of the probe system. This is fine if you only want to monitor the traffic of this machine (for example, your web server). In switched networks, only the traffic for a specific machine is sent to each machine's network card, so PRTG usually cannot discern the traffic of the other machines in the network.

If you also want to monitor the traffic of other devices in your network, you must use a switch that offers a monitoring port or port mirroring configuration (Cisco calls it Switched Port Analyzer (SPAN)). In this case, the switch sends a copy to the monitoring port of all data packages traveling through the switch. As soon as you connect one of the probe system's network cards to the switch's monitoring port, PRTG can analyze the entire traffic that passes through the switch.

An alternative is to set up the PRTG core server system as the gateway for all other computers in the network.

## Packet Sniffer Sensors

PRTG offers the following packet sniffer sensors:

- [Packet Sniffer](#)
- [Packet Sniffer \(Custom\)](#)

## Header-Based Packet Sniffing

For packet sniffing, PRTG looks at the IP addresses and ports of source and destination to assess the protocol. This is a very fast method and saves system resources.

 Sometimes, this method is not fully accurate. For example, it is not possible to identify HTTP traffic on ports other than [80](#), [8080](#), and [443](#) as HTTP. HTTP traffic on non-standard ports would not be accounted as such.

## More

### KNOWLEDGE BASE

How can I change the default groups and channels for flow and Packet Sniffer sensors?

- <https://kb.paessler.com/en/topic/60203>

## 12.5 Monitoring Bandwidth via Flows

Using Flow (NetFlow, jFlow, sFlow, IPFIX) protocols, you can monitor the bandwidth usage of all packets going through a device. In PRTG, you can view [Toplists](#) for all xFlow sensors.

xFlows are monitoring data pushed from network devices to PRTG. You can use them to monitor where and how much data is traveling to and from. This way, they determine which machine, protocol, or user is consuming bandwidth. PRTG supports the following xFlow types:

- NetFlow v5/v9 and IPFIX: Originally introduced by Cisco and supported by several vendors.
- jFlow: Traffic sampling technology introduced by Juniper networks.
- sFlow: Short for [sampled flow](#), introduced by HP. sFlow uses statistical sampling of the traffic at defined intervals to achieve scalability for high volume interfaces.

You can also use [packet sniffing](#) for bandwidth monitoring if your hardware does not support any of these xFlow versions.

### How Flow Monitoring works

You can measure bandwidth usage by IP address or by application in a network, using one of the flow protocols. They are the best choice especially for networks with high traffic (connections with hundreds of megabits or gigabits).

For flow monitoring, the router gathers bandwidth usage data (flows), aggregates it, and sends information about it to PRTG using User Datagram Protocol (UDP) packets. When you use sampling (mandatory for sFlow), only information about every n-th packet is sent to PRTG, which reduces CPU load a lot. Because the switch already performs an aggregation of traffic data beforehand, the flow of data to PRTG is much smaller than the monitored traffic. This makes flow the ideal option for high traffic networks that need to differentiate the bandwidth usage by network protocol and/or IP addresses.

### NetFlow and IPFIX Monitoring

The NetFlow (and IPFIX) protocol is mainly used by Cisco devices. Once configured, the router sends a NetFlow or IPFIX packet for each data flow to the monitoring system running on a probe. You can filter and evaluate the data in PRTG. Different NetFlow and IPFIX sensors are available: The basic sensors offer predefined channel definitions, the custom variants enable you to define your own channels.

The advantage of using NetFlow or IPFIX:

- Generates little CPU load on the router itself (according to Cisco, 10,000 active flows create about 7% additional CPU load; 45,000 active flows account for about 20% additional CPU load).
- Generates less CPU load on the PRTG core server system compared to Packet Sniffer sensors.

 You must enable NetFlow or IPFIX export on the target device. The device must send a flow data stream to the IP address of the probe system on which you set up the NetFlow or IPFIX sensor.

 You can monitor Juniper [jFlow](#) with the corresponding sensors as well. Basically they are adjusted NetFlow v5 sensors.

ⓘ NetFlow Lite monitoring is possible using the Sampling Mode of the [NetFlow v9](#) sensor or of the [NetFlow v9 \(Custom\)](#) sensor. You can turn on the sampling mode and define a suitable Sampling Rate in the sensor settings. Note that NetFlow Lite monitoring might not work in every case even with active sampling mode.

## sFlow Monitoring

sFlow works similar to NetFlow monitoring. The router sends data flow packets to the monitoring system running on a probe. The most obvious difference between the two flow protocols: With sFlow, not all of the traffic is analyzed, but only every n-th packet.

The advantage is clear: There is less data to analyze, there is less CPU load needed, and less monitoring traffic is generated. Nevertheless, you can get a good insight into your network bandwidth usage.

ⓘ PRTG supports sFlow v5.

## Set Up Flow Sensors

Find details on how to set up the different flow sensors in the following sections:

- [NetFlow v5](#)
- [NetFlow v5 \(Custom\)](#)
- [NetFlow v9](#)
- [NetFlow v9 \(Custom\)](#)
- [IPFIX](#)
- [IPFIX \(Custom\)](#)
- [sFlow](#)
- [sFlow \(Custom\)](#)
- [jFlow v5](#)
- [jFlow v5 \(Custom\)](#)

## Limitations

For example, with a dual core, 2.5 Ghz hardware system, you can process about 100,000 flows per second for one flow stream. Using sampling, the number of actual flows can be much higher. When using complex filters, the value can be much lower. For example, with a router sending about 2,000 flows/second (which corresponds to mixed traffic at gigabit/second level without sampling) you can expect to configure up to 50 flow sensors operating properly.

PRTG internally monitors its own flow processing. You can see decreased values in the Health channels of the [Core Health](#) and [Probe Health](#) sensors as soon as flow packets are not processed because of an overload (you find these sensors on the local probe device).

If you experience an overload, consider using sampling or setting up multiple probes and distributing the flow streams to them. We recommend that you do not add more than 50 flow sensors per probe.

- ① IPv6 flows are supported by NetFlow v9 sensors and IPFIX sensors, other flow sensors only support IPv4.

## 12.6 Bandwidth Monitoring Comparison

The following table shows the differences between the four bandwidth monitoring methods available in PRTG:

Category	<a href="#">WMI</a> <sup>[3004]</sup>	<a href="#">SNMP</a> <sup>[2997]</sup>	<a href="#">Packet Sniffer</a> <sup>[3009]</sup>	<a href="#">Flow (IPFIX, NetFlow, sFlow, jFlow)</a> <sup>[3011]</sup>
Setup	Medium	Low Low to high (depending on filter rules used)	Can be high (for example, the switch must be configured)	
Traffic filtering	No	No	Yes	Yes
Differentiate bandwidth usage by protocol or IP addresses	No	No	Yes	Yes
PRTG can show Toplists (Top Talkers, Top Connections, Top Protocols, custom)	No	No	Yes	Yes
Filter bandwidth usage by IP address	No	No	Yes	Yes
Filter bandwidth usage by MAC address	No	No	Yes	No
Filter bandwidth usage by physical network port	Yes	Yes	No	No
Monitor network parameters other than bandwidth usage	Yes	Yes	No	No
CPU load on the PRTG core server system	Medium	Low	Higher, depends on the amount of traffic	Higher, depends on the amount of traffic
Excess bandwidth usage of monitoring	Small	Small	None (except when monitoring switch ports are used)	Depends on the traffic

## 12.7 Monitoring Quality of Service

PRTG can monitor the Quality of Service (QoS) in a network with dedicated QoS sensors, as well as Cisco IP service level agreement (SLA) and Cisco Class Based Quality of Service (CBQoS). Slight variations in network parameters like jitter, packet loss, or packet delay variation (PDV) usually have only little effect on Transmission Control Protocol (TCP) based services (for example, HTTP and Simple Mail Transfer Protocol (SMTP)). But for User Datagram Protocol (UDP) based services like Voice over IP (VoIP) and video streaming, a steady stream of data packets is crucial. The sound quality of a VoIP call drops noticeably when UDP packets are not received in time, or if packets are lost or in the wrong order.

As a rule of thumb for good quality of service (from a VoIP perspective), it is important to have low measurements for jitter (less than 20 to 50 ms) and PDV (less than 100 ms), and preferably **zero** measurements for packet loss, duplicated packets, or packets in wrong order.

For QoS measurements, four sensors are available:

- [QoS \(Quality of Service\) One Way](#)
- [QoS \(Quality of Service\) Round Trip](#)
- [Cisco IP SLA](#)
- [SNMP Cisco CBQoS](#)

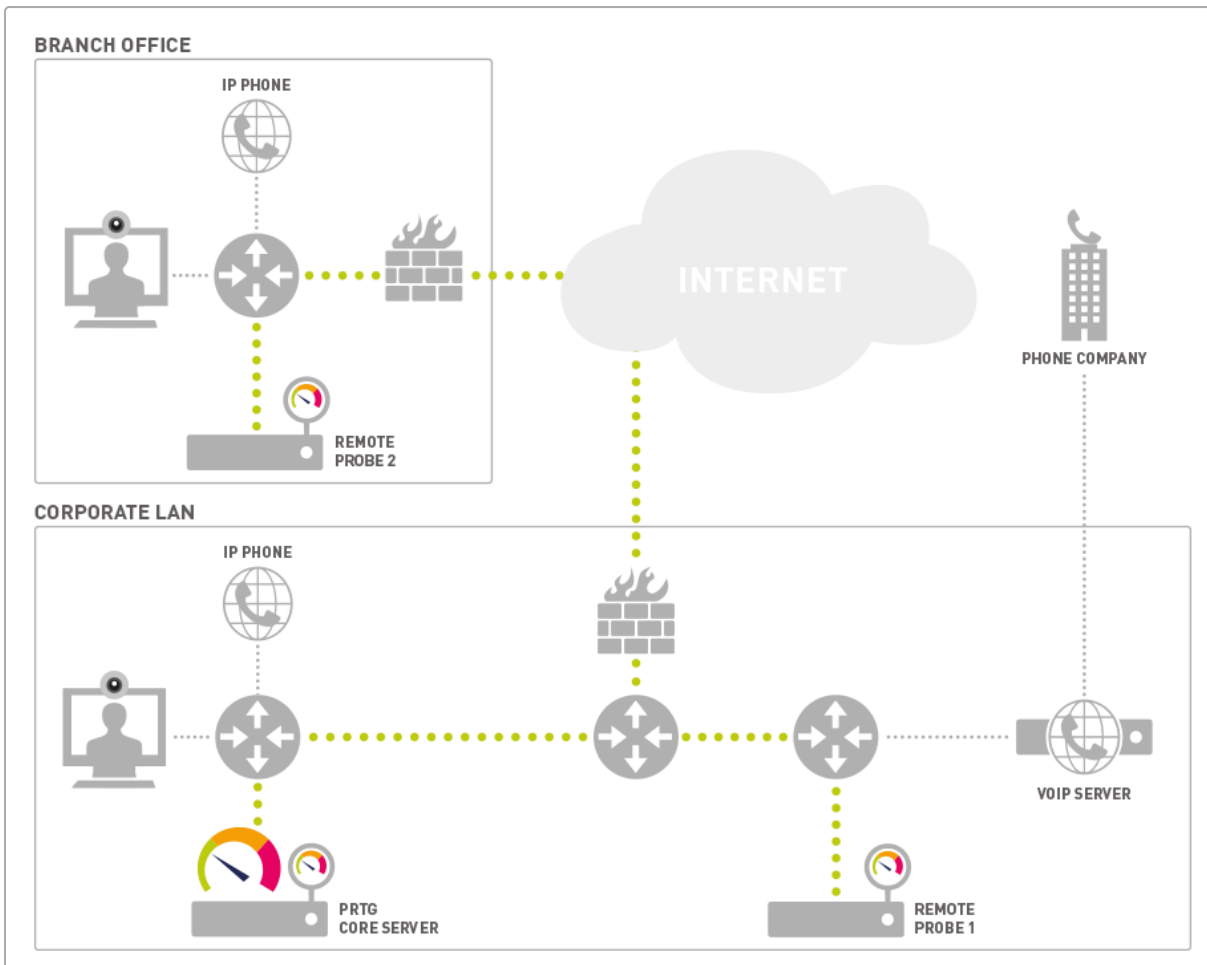

### QoS (Quality of Service) Sensors

The QoS sensors monitor the quality of a network connection by measuring the following parameters:

- Jitter in ms according to RFC 3550
- PDV in ms according to RFC 3393
- Lost packets in %
- Out-of-order packets in %
- Duplicated packets in %

The QoS sensors measure the quality of service by sending UDP packets between two probes. This means that you can test any network connection in your network by placing a [remote probe](#) on (or near) each end of the connection and measuring the connection quality between them. This way, you can find network issues that can affect VoIP sound quality or cause video streaming issues.

■ You can also use the QoS (Quality of Service) Round Trip sensor without installing a remote probe at the connection endpoint. For more information about the PRTG QoS Reflector, see the Knowledge Base: [How can I monitor QoS round trips without using remote probes?](#)

Monitoring Quality of Service with PRTG

The measurements for QoS monitoring are taken between two probes. So the first step is to place two PCs running a remote probe on (or near) both ends of the connection that you want to monitor. As an alternative, the local probe on the PRTG core server system can also be used as one end, or you can use the PRTG QoS Reflector (see the [Knowledge Base](#)) to bounce the packets when monitoring QoS roundtrips. If any firewalls, packet filters, or network address translation (NAT) systems are used, you must configure them as necessary so that the UDP packets can reach the target probe.

Create a new QoS sensor on a probe device, or, if you use the QoS (Quality of Service) Round Trip sensor, on any device. With the settings for the number and for the size of the packets, you can configure the test data stream. 1,000 packets of 172 bytes each is a good start, but if your applications use larger packets, you might want to enter other values here. Try to configure the test streams with parameters similar to that of the UDP services you are using across this connection.

- Find details about settings in the sections [QoS \(Quality of Service\) One Way](#) sensor and [QoS \(Quality of Service\) Round Trip](#) sensor.

## Cisco IP SLA Sensor

Wikipedia describes IP SLA as [a feature included in the Cisco IOS Software that can allow administrators the ability to Analyze IP Service Levels for IP applications and services. IP SLA uses active traffic-monitoring technology to monitor continuous traffic on the network. This is a reliable method in measuring over head network performance.](#) IP SLA is mostly used to monitor the sound quality of VoIP traffic.

If you have not done so already, add a device that represents the Cisco target device. Then create a new Cisco IP SLA sensor on this device.

■ Find details about settings in section [Cisco IP SLA](#) sensor.

This feature is only available in the more expensive Cisco devices. If you do not have IP SLA-capable routers and switches, you can still get similar information with QoS sensors (see [above](#)) that do not require any special hardware.

PRTG monitors the following parameters: Impairment Calculated Planning Impairment Factor (ICPIF), Mean Opinion Score (MOS), Average Jitter, Packets Lost, Packets Out of Sequence, Packets Late, Average Round Trip Time (RTT), Domain Name System (DNS) RTT, TCP RTT, Transaction RTT.

Two of these parameters are especially interesting for VoIP: MOS and ICPIF.

## SNMP Cisco CBQoS Sensor

Cisco CBQoS provides information about QoS of Cisco network devices that support the [Modular QoS Command-Line Interface \(MQC\)](#). With Class Based QoS, you can obtain monitoring data that includes summary counts and rates by traffic class before and after the enforcement of QoS policies, according to Cisco's CBQoS Management Information Base (MIB) definition.

PRTG determines CBQoS data via SNMP. The corresponding sensor is available as of PRTG 13.x.5. CBQoS is available in Cisco IOS by default as of version 12.4(4)T.

To monitor CBQoS, add a device to PRTG for the Cisco target device. Then create a new SNMP Cisco CBQoS sensor on this device.

■ See section [SNMP Cisco CBQoS](#) sensor for more details.

This sensor supports the following CBQoS classes:

- Class Map: statistical data about class maps, such as pre-policy and post-policy packets and sizes, drop packets and size, as well as no-buffer drop packets
- Match Statement: statistical data about match statement specific information, such as pre-policy packets and size
- Queueing: statistical data about queueing actions, such as current and maximum queue depth, drop packets, and drop size

You can select the desired CBQoS entries that you want to monitor while creating the sensor. The available entries are specified with their particular connections, their descriptions, and class types.

## Voice over IP

For MOS measurements, Cisco conducted a panel test where a wide range of listeners judged the quality of voice samples sent using particular codecs, on a scale of 1 (poor quality) to 5 (excellent quality). The Cisco device calculates the corresponding value for the network connection based on network parameter measurements like jitter and packet loss.

■ The Cisco IP SLA sensor reads out the MOS directly from the Cisco device. For the QoS (Quality of Service) One Way sensor and the QoS (Quality of Service) Round Trip sensor, PRTG calculates the MOS by itself. For more information, see the Knowledge Base: [How does PRTG calculate the MOS score for QoS sensors?](#)

The values and their meanings are:

MOS	Quality	Expected Quality Impairment
5	Excellent	Imperceptible
4	Good	Perceptible, but not annoying
3	Fair	Slightly annoying
2	Poor	Annoying
1	Bad	Very annoying

The second interesting parameter ICPIF is the sum of measured impairment factors minus a user-defined access Advantage Factor that is intended to represent the user's expectations, based on how the call was placed (for example, a mobile call versus a land-line call) (quoted from the Cisco website).

Upper Limit for ICPIF	VoIP Call Communication Quality
5	Very good
10	Good
20	Adequate
30	Limiting case
45	Exceptional limiting case
55	Customers likely to react strongly (complaints, change of network operator)

## 12.8 Monitoring Backups

Monitoring your backup software enables you to be sure that your recent backups succeeded. With PRTG, you can check the email notifications of various backup jobs. You only need to do two things for backup monitoring:

1. Configure your backup software to send emails to a dedicated email account.
2. Configure the [IMAP](#) sensor for backup monitoring.

PRTG analyzes the backup emails for you and sets the status of the IMAP sensor accordingly. This way you see the states of all your backup jobs.

Backup Monitoring via Email

### Setting up Backup Monitoring

## 12.9 Monitoring Virtual Environments

Monitoring your complete IT infrastructure in a comprehensive way usually means monitoring not only your physical infrastructure, but also your virtual environments. With the layer of virtualization added to the layers that represent your physical hardware, it also becomes necessary to plan beforehand how you want to logically set up your monitoring infrastructure.

### Monitoring All Layers of Your IT Infrastructure

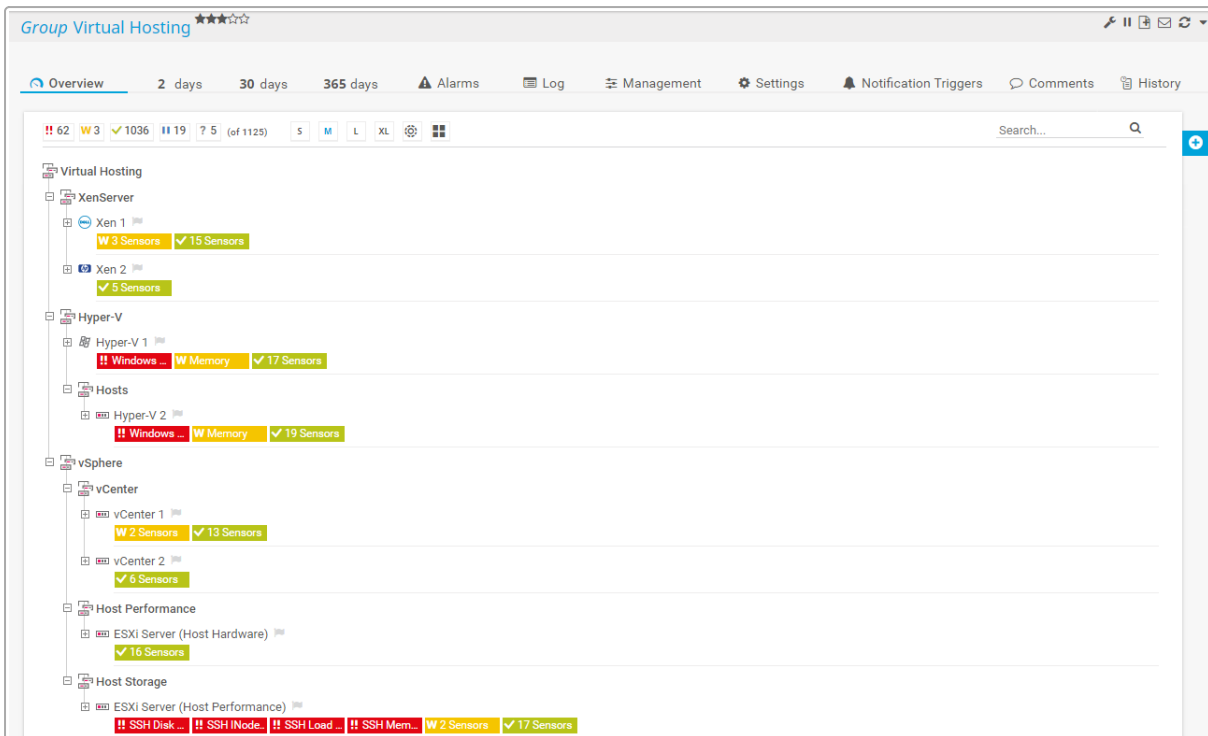

In general, you can assume that with the layer of virtualization, you need to monitor a total of four layers in your IT infrastructure.

Layer	Description
Hardware (Server Racks)	<p>Usually, you monitor most of the hardware components in your network with <a href="#">SNMP sensors</a><sup>[3263]</sup>. With <a href="#">this monitoring technology</a><sup>[2997]</sup>, you can gather monitoring data such as CPU load, memory, and disk space. You can also get information about the network traffic and bandwidth usage of your routers and switches.</p> <p>Alerts can tell you if there is an issue with a hardware component or if hardware resources are running out. In addition, you can identify potential bottlenecks that might affect your virtualized infrastructure.</p>
Host Server Hardware	<p>We recommend that you explicitly monitor the host hardware of your virtualization solution. If you have issues with your virtual machines (VM), the origin might be a host hardware failure. You should closely monitor your VM host servers to be alerted if the hardware status changes in any significant way.</p> <p>Besides the standard hardware sensors, PRTG provides specific sensors for various virtualization host servers. The following monitoring data of your host servers can prevent issues in virtualized environments:</p> <ul style="list-style-type: none"> <li>▪ VMware: current reading and health status (via Web-based Enterprise Management (WBEM)), a general status as shown in vSphere (via Simple Object Access Protocol (SOAP)), and disk space of a VMware data store (via SOAP)</li> <li>▪ Hyper-V: host health-critical values; deposited pages; network traffic; CPU usage of guests, hypervisor, and in total</li> <li>▪ Citrix XenServer: CPU, memory, and network usage; the number of running VMs on the host server; and load average</li> </ul>
Resource Usage of VMs	<p>VMs run on their particular host servers. PRTG can show you the status of single VMs and several of their performance counters. You might want to know which resources a single VM uses and needs, but we do not recommend that you monitor single VMs in every case because it has a noticeable influence on overall performance. Often, it is sufficient to only monitor VMs that are critical for your network. If a VM reaches its capacity limits, PRTG can alert you so that you can take the respective steps to solve the issue.</p>

Layer	Description
	<p>Indicators for a healthy VM that you can monitor with PRTG:</p> <ul style="list-style-type: none"> <li>▪ VMware: CPU and memory usage, disk read and write speed, read and write latency, and network usage</li> <li>▪ Hyper-V: CPU usage, disk read and write speed</li> <li>▪ Citrix XenServer: CPU usage and free memory</li> </ul>
<p>Operating Systems of VMs</p>	<p>You can monitor, for example, the Windows operating system of a single VM with the standard <a href="#">WMI sensors</a><sup>[3282]</sup>. <a href="#">With this technology</a><sup>[3004]</sup>, you can access data of various Windows parameters. Other operating systems like Linux/macOS can make data available via <a href="#">SSH</a><sup>[3007]</sup> and SNMP.</p> <p>The status of the operating systems on your VMs can indicate potential issues. You can monitor these but be careful with regard to performance considerations. This is because sensors using the WMI protocol have a high impact on system performance, so you should only monitor operating systems that are critical for your infrastructure. Furthermore, you do not need to monitor every item multiple times. For example, it might be sufficient to monitor free disk space only as a needed resource of the actual VM, not for the VM's operating system itself.</p>

## Monitoring the Virtual Infrastructure

To monitor your IT infrastructure, best practice is to first set up the monitoring of your data center's hardware layer in PRTG. This way, you can detect potential bottlenecks that might have an impact on your virtual servers. Then, you can prepare to start monitoring your virtual environment. If you use several solutions for virtual hosting, it is also a good idea to group related host servers, their VMs, and the operating systems. The screenshot below shows a possible structure of monitoring a virtual environment with PRTG.

Grouped Virtual Components

At the top level, you can see the [Virtual Hosting](#) group. This group contains several subgroups for the virtualization solutions Citrix [XenServer](#), Microsoft [Hyper-V](#), and VMware [vSphere](#). The [vSphere](#) group, for example, has three subgroups: we monitor the vCenter VMs and the vCenter Windows operating system ([vCenter](#) group), the performance of the host server ([Host Performance](#) group), and the storage system of the host ([Host Storage](#) group).

## Devices for Physical Hosts

In PRTG, set up devices that represent the physical hosts of your VMs. For example, for your VMware hosts, add devices that represent the ESXi servers. For Hyper-V, add devices that represent your Hyper-V host servers. For Citrix, add devices that represent your XenServers.

Then you can add suitable sensors to the host server devices. If you run the [auto-discovery](#)<sup>[254]</sup>, many sensors are automatically created. Several preconfigured host hardware sensors are available:

- [VMware Host Hardware \(WBEM\)](#)
- [VMware Host Hardware Status \(SOAP\)](#)
- [VMware Host Performance \(SOAP\)](#)
- [Hyper-V Host Server](#)
- [Citrix XenServer Host](#)

These sensors monitor hardware-specific counters to make sure that no hardware issues affect your actual VMs. Additional sensors can monitor the host hardware via the Simple Network Management Protocol (SNMP) (for example, traffic and custom requests), and the data storage on ESXi servers via SOAP. There are also sensors for network adapters and storage devices that are connected to a Hyper-V host server.

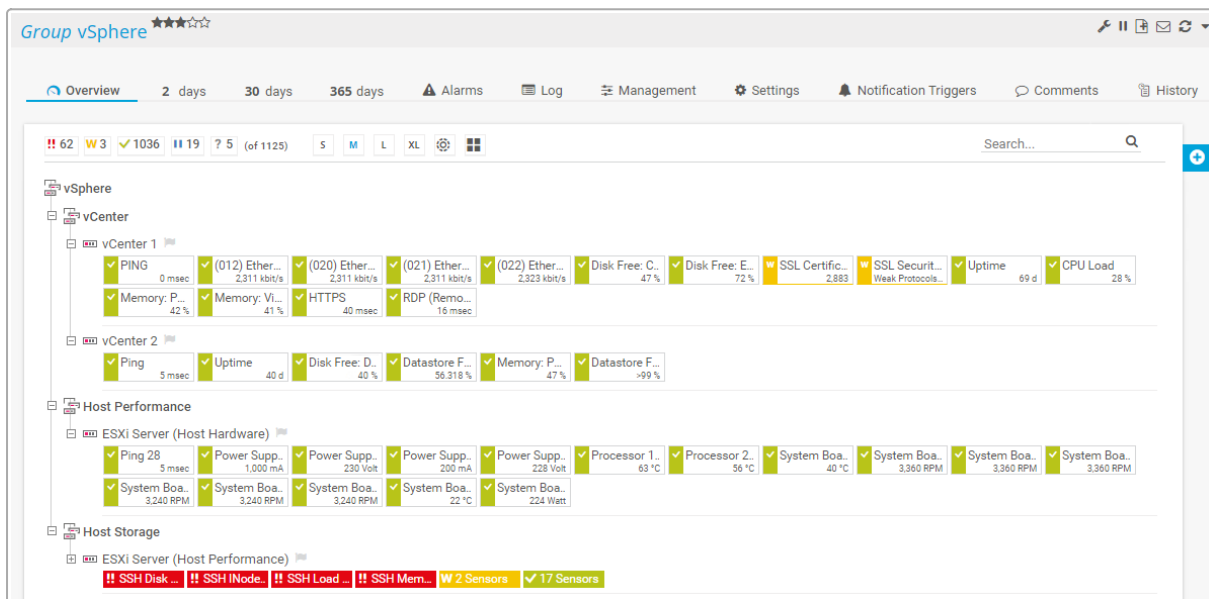

## Devices for Virtual Machines

To monitor your actual VMs, add them to your host servers in PRTG. For a better overview, you might want to add a device to PRTG that represents your host server and add sensors for your VM there. The respective sensors for VMs show you the performance of single VMs as well as their resource usage. This identifies VMs with low performance so that you can react before there is an issue with one or more of your VMs. As mentioned before, you can additionally monitor the operating systems of your VMs, if necessary. See the following sections for details about particular virtualization solutions.

### VMware Virtual Machine

The [VMware Virtual Machine \(SOAP\)](#) sensor monitors VMs on a VMware host server via SOAP. The general idea is to add a [vCenter](#) server as a device to your [vCenter](#) group and use it as a parent device to which you add the sensors for your VMs. This way, in the case of [vMotion](#), when your VMs change their host server, PRTG can follow these movements and does not lose the monitored VMs.

For this sensor, .NET 4.7.2 or later must be installed on the probe system. If you use many VMware sensors, we also recommend that you adjust the settings on your VMware host server to accept more incoming connections.

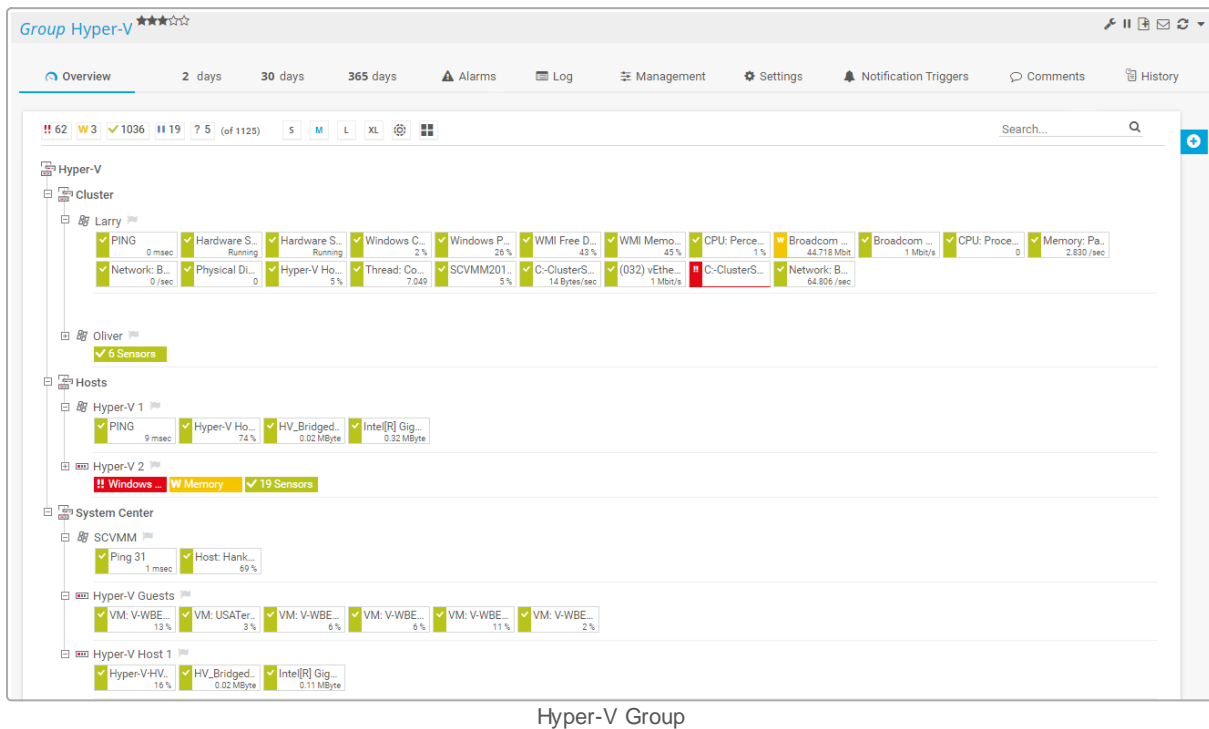

vSphere Group

This screenshot shows an example of a [vSphere](#) group. As recommended, the sensors for the VMware virtual machines are added to the [vCenter 1](#) device. There is also a dedicated [vCenter 2](#) device for the vCenter Windows operating system with common WMI sensors for CPU, memory, disk, and network usage. The ESXi host servers are organized in their own groups regarding performance and storage. In this example, PRTG monitors the hosts with the standard SNMP hardware sensors as well as with the specific VMware ESXi host sensors.

### Microsoft Hyper-V Virtual Machine

The [Hyper-V Virtual Machine](#) sensor monitors VMs via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#) [648] of the parent device. With this hybrid approach, the sensor first tries to query data via performance counters and uses WMI as a fallback if no performance counters are available. Performance counters generally need less system resources than WMI. The parent device of this sensor must be a Windows server running Hyper-V. You should also disable the User Account Control (UAC) in the Windows operating system of the VM. Otherwise, the sensor might change to the Down status with the error message [The virtual machine is not running or is powered off](#). Also, this sensor does not support [Live Migration](#).

Hyper-V Group

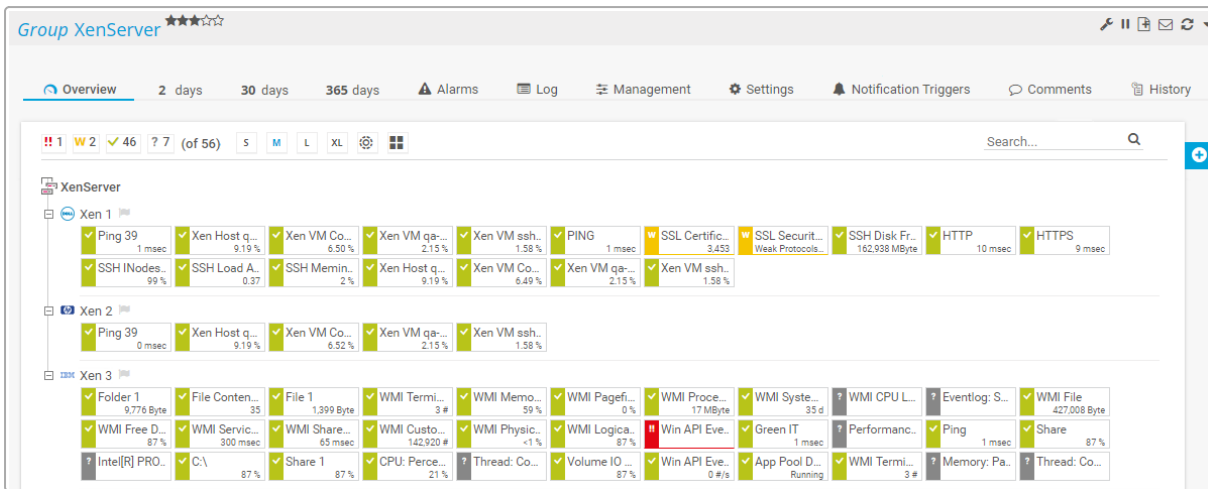

This screenshot shows an example of a [Hyper-V](#) group. There is a dedicated group for failover clusters where two cluster nodes are monitored with several SNMP and WMI sensors, as well as Hyper-V Host Server sensors and sensors for the Hyper-V virtual machines. This makes sure that Hyper-V and failover clusters work without any issues. The Hyper-V hosts are monitored the same way, organized in a dedicated group for hosts.

### Citrix XenServer Virtual Machine

The [Citrix XenServer Virtual Machine](#) sensor monitors VMs via HTTP. For this sensor, you must add a device that represents a Citrix XenServer running at least version 5.0. Another requirement is the Microsoft .NET Framework. You must install .NET 4.7.2 or later on the probe system.

In a XenServer pool, each host knows each running VM. Because of this, there is no central instance that provides all available data, so it does not matter on which host you query your VMs. All queries on any host are automatically forwarded to the pool master that manages the XenServer pool. Therefore, it is sufficient to create the desired sensors for your XenServer VMs on a device that represents one host server of your pool. The XenServer sensors find out which host is running and retrieve the respective data.

XenServer Group

This screenshot shows an example of a **XenServer** group. There are two devices for XenServer hosts, **Xen 1** and **Xen 2**, that each have a Citrix XenServer Host sensor and several Citrix XenServer Virtual Machine for the particular VMs on this host. Furthermore, the Windows operating system is represented as a dedicated **virtualcontrol** device that PRTG monitors with several WMI sensors regarding CPU, disk, memory, and network usage.

## Performance Considerations

For best performance when monitoring virtual environments, we strongly recommend that you use a computer with at least Windows Server 2016 installed on the probe system. For example, you can run up to 300 VMware sensors with a 60-second scanning interval as of Windows Server 2016, while you can only use 30 VMware sensors with the same scanning interval on Windows Server 2008 R2.

## 12.10 Monitoring Databases

Monitoring your databases lets you make sure that database queries are processed in time, and that the database itself performs within the defined parameters. Furthermore, database monitoring with PRTG can alert you via a corresponding sensor status if database queries return unexpected result values.

PRTG comes with built-in native sensors for the most common databases:

- Microsoft SQL servers
- MySQL servers
- PostgreSQL servers
- Oracle SQL servers

It is also possible to monitor many other database servers. For this case, PRTG uses the ActiveX Data Objects (ADO) interface.

There are two types of database sensors:

- [Sensors that monitor databases directly](#)<sup>[3028]</sup>: Monitor databases from the user perspective. These sensors send a request to the database server and receive corresponding values. You can optionally process data tables and show values in individual channels or monitor transactions.
- [Sensors that monitor database performance](#)<sup>[3031]</sup>: Monitor databases with a more abstract view on the servers. Usually, these sensors monitor performance counters via Windows Management Instrumentation (WMI).

### Sensors Monitoring Databases Directly

PRTG provides several sensors that can monitor the content of databases. Sensors of this type connect to the database server, execute a defined query, and show the execution time of the whole request and the query. You can use these sensors to process the data table and show requested values in individual channels.

The following sensors are available for this kind of monitoring:

- [Microsoft SQL v2](#)
- [MySQL v2](#)
- [Oracle SQL v2](#)
- [PostgreSQL](#)

For these sensors, you can define valid Structured Query Language (SQL) statements that the sensors send to the database server. Define the queries in an SQL script file and store it in the respective \Custom Sensors\sql subfolder of the [PRTG program directory](#)<sup>[3213]</sup>.

You can select this SQL script when you add the sensor. With every [scanning interval](#)<sup>[450]</sup>, the sensor executes this script with the defined query against the database and the database returns corresponding values in individual channels (see the [example](#)<sup>[3029]</sup> below for sample channel value selections). Use the [channel settings](#)<sup>[2682]</sup> to define limits for specific values.

 These sensors need .NET 4.7.2 or later installed on the probe system.

Alternatively, you can monitor almost all available database servers with the [ADO SQL v2](#) sensor via an ADO connection.

### Example: SQL Channel Value Selection

The SQL (v2) sensors determine their channel values by using column numbers, column names, row numbers, or key value pairs. This section shows which option you can choose to get the desired value from an SQL data table.

Consider the following data table that an SQL query might return from a database:

article_id	articles_av ailable	first_listing	orders
00	12	2001	4
01	345	2005	56
02	678	2008	290
03	90	2012	32

This data table has four columns with the following numbering:

- Column 0 has the name "article\_id"
- Column 1 has the name "articles\_available"
- Column 2 has the name "first\_listing"
- Column 3 has the name "orders"

The numbering of columns starts with 0, as well as the numbering for rows starts with 0. The table has four rows, each row contains the properties of one "article". The "articles" have the IDs 00, 01, 02, 03. This also illustrates the proper row numbering (0, 1, 2, 3).

With the options for channel value selection in SQL sensors, you can read out the following values:

- All values that are in row 0 (here: 00, 12, 2001, 4)
- All values that are in column 0 (here: 00, 01, 02, 03)
- All values that are in column 1 (here: 12, 345, 678, 90)

It is not possible to get values from any other cell in a data table. If you need this, you must reconstruct your data table.

The following samples show possible results for channel value selections regarding this data table:

Sample Channel Value Selection	Description
Channel Value Selection by Column Number	<p>This channel shows the value in row 0 of the column you specify. Consider you define "1" as column number. Then the channel value is "12" because it is the cell in column 1 and row 0.</p> <p>Possible return values for this option:</p> <ul style="list-style-type: none"> <li>▪ Column number "0" returns "00"</li> <li>▪ Column number "1" returns "12"</li> <li>▪ Column number "2" returns "2001"</li> <li>▪ Column number "3" returns "4"</li> </ul>
Channel Value Selection by Column Name	<p>This channel shows the value in row 0 of the column you specify. Consider you define "orders" as column name. Then the channel value is "4" because it is the cell in column "orders" and row 0.</p> <p>Possible return values for this option:</p> <ul style="list-style-type: none"> <li>▪ Column name "article_id" returns "00"</li> <li>▪ Column name "articles_available" returns "12"</li> <li>▪ Column name "first_listing" returns "2001"</li> <li>▪ Column name "orders" returns "4"</li> </ul>
Channel Value Selection by Row Number	<p>This channel shows the value in column 0 of the row you specify. Consider you define "1" as row number. Then the channel value is "01" because it is the cell in row 1 and column 0.</p> <p>Possible return values for this option:</p> <ul style="list-style-type: none"> <li>▪ Row number "0" returns "00"</li> <li>▪ Row number "1" returns "01"</li> <li>▪ Row number "2" returns "02"</li> <li>▪ Row number "3" returns "03"</li> </ul>
Channel Value Selection by Key Value Pair	<p>This channel shows the value in column 1 of the same row where the key in column 0 was found. Consider you define "02" as key. Then the channel value is "678" because it is the cell in the same row in column 1 as the key in column 0.</p> <p>Possible return values for this option:</p> <ul style="list-style-type: none"> <li>▪ Key "00" returns "12"</li> <li>▪ Key "01" returns "345"</li> <li>▪ Key "02" returns "678"</li> <li>▪ Key "03" returns "90"</li> </ul>

This sample channel value selection illustrates how to choose the correct option to get needed values from an SQL data table and shows which cells the SQL sensors can address.

#### UDF: Counting Returned Rows

If you execute a User-defined Function (UDF) on the SQL server and want to know how many rows this UDF returns, follow these steps:

- A command to execute your UDF on the SQL server might look like this, for example:

```
exec myUDF
```

- To get the information how many rows this UDF returns, extend the query in your SQL script:

```
exec myUDF;  
select @@rowcount as row_count
```

- Create a new SQL v2 sensor and select Data Processing during sensor creation.
- In the settings of your SQL sensor, select Column name under Select Channel Value by.
- Enter row\_count into the Channel #x Column Name field of the channel to show the value from this column in the channel.
- To count table rows returned by a **SELECT** statement, choose the option Count table rows in the sensor settings section Data Processing.

## Sensors Monitoring Database Performance

Performance sensors for database servers have a more abstract view on databases and observe performance externally. They do not read out any values of the database, neither do they send SQL queries to databases. This sensor is only available for Microsoft SQL.

The Microsoft SQL server sensors monitor performance via WMI. You can manually set up different performance counters for your server instances, for example, general statistics, access methods, buffer and memory manager, locks, and SQL statistics.

Microsoft SQL Server performance sensors are available for Microsoft SQL Server 2008, 2012, 2014, 2016, 2017, and 2019:

- [WMI Microsoft SQL Server 2008](#)
- [WMI Microsoft SQL Server 2012](#)
- [WMI Microsoft SQL Server 2014](#)
- [WMI Microsoft SQL Server 2016](#)
- [WMI Microsoft SQL Server 2017](#)
- [WMI Microsoft SQL Server 2019](#)

## 12.11 Monitoring via HTTP

HTTP is a standard application layer protocol and the basis for data communication on the internet. It is a request-response method for client-server architectures, where the client sends a request and the server processes and responds to the request.

Monitoring via HTTP is useful if you want to monitor websites or web servers. It enables you to keep an eye on the availability and download times of a website or the performance statistics of a web server. There are also a lot of other possible use cases for HTTP sensors. For example, you can request any application programming interface (API) that is reachable via HTTP and monitor returned values. This approach lets you include almost any type of device or application into your monitoring.

PRTG comes with sensors for HTTP monitoring:

- [AWS Alarm v2](#)
- [AWS EBS v2](#)
- [AWS EC2 v2](#)
- [AWS ELB v2](#)
- [AWS RDS v2](#)
- [Cisco Meraki License](#)
- [Cisco Meraki Network Health](#)
- [Cloud HTTP v2](#)
- [Common SaaS](#)
- [Dell EMC Unity Enclosure Health v2](#)
- [Dell EMC Unity File System v2](#)
- [Dell EMC Unity Storage Capacity v2](#)
- [Dell EMC Unity Storage LUN v2](#)
- [Dell EMC Unity Storage Pool v2](#)
- [Dell EMC Unity VMware Datastore v2](#)
- [FortiGate System Statistics](#)
- [FortiGate VPN Overview](#)
- [HPE 3PAR Common Provisioning Group](#)
- [HPE 3PAR Virtual Volume](#)
- [HTTP](#)
- [HTTP Advanced](#)
- [HTTP Apache ModStatus PerfStats](#)
- [HTTP Apache ModStatus Totals](#)
- [HTTP Content](#)
- [HTTP Data Advanced](#)
- [HTTP Full Web Page](#)

- [HTTP IoT Push Data Advanced](#)
- [HTTP Push Count](#)
- [HTTP Push Data](#)
- [HTTP Push Data Advanced](#)
- [HTTP Transaction](#)
- [HTTP v2](#)
- [HTTP XML/REST Value](#)
- [Microsoft Azure SQL Database](#)
- [Microsoft Azure Storage Account](#)
- [Microsoft Azure Subscription Cost](#)
- [Microsoft Azure Virtual Machine](#)
- [NetApp Aggregate v2](#)
- [NetApp I/O v2](#)
- [NetApp LIF v2](#)
- [NetApp LUN v2](#)
- [NetApp NIC v2](#)
- [NetApp Physical Disk v2](#)
- [NetApp SnapMirror v2](#)
- [NetApp System Health v2](#)
- [NetApp Volume v2](#)
- [Redfish Power Supply](#)
- [Redfish System Health](#)
- [Redfish Virtual Disk](#)
- [REST Custom](#)
- [REST Custom v2](#)
- [SSL Certificate](#)
- [SSL Security Check](#)
- [Veeam Backup Job Status](#)
- [Veeam Backup Job Status Advanced](#)

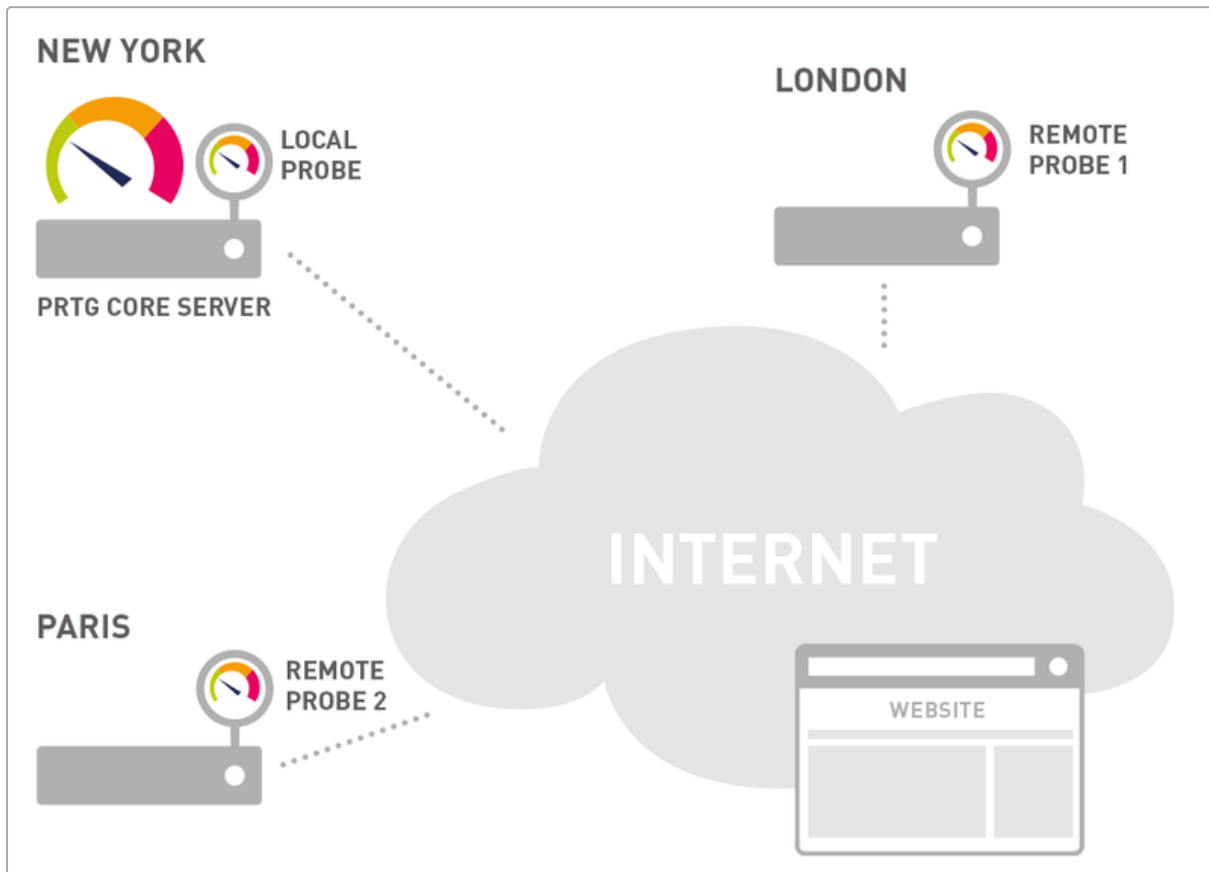

## Use Cases

- Monitor the availability and loading times of a website
- Monitor the source code and specific content of a website
- Test the login, purchasing, and shipping processes of a web shop
- Monitor performance statistics and activity of Apache web servers

## Types of HTTP Monitoring

### Availability Monitoring

This type monitors the availability of a website or a specific website element. For example, the HTTP sensor shows how long the HTML code of a website takes to load. If the sensor shows a loading time that is much longer than expected, the website might not be responding or might be unavailable.

Cloud Monitoring with HTTP Provides Better Performance Statistics

The HTTP sensor uses different HTTP requests to request the specified URL:

- GET (default): requests the website directly
- POST: sends post form data to the URL
- HEAD: requests the HTTP header only, without the actual web page body, saving bandwidth

The HTTP Advanced sensor also monitors the availability of a website, along with other parameters such as bytes received, download bandwidth (speed), and time to first byte, which shows you how fast your web server responds. This sensor lets you use a (custom) user agent when connecting to the target URL and lets you send custom HTTP headers to the target URL.

The Cloud HTTP v2 sensor monitors a web server from various locations across the globe. For example, the URL of a website to measure the loading time of a page's source code or the URL of a page asset to measure its availability and loading time. The sensor also shows the global average response time.

The Common SaaS monitors the availability of your cloud services and is an important pillar for unified monitoring.

## Content Monitoring

This type monitors internal values of a web server based application or changes to specific content on a website. The HTTP Full Web Page sensor measures the time it takes to download a web page including all embedded page elements, for example Flash content or images.

 This monitoring option can create a lot of bandwidth traffic, depending on the page size and the scanning interval.

Additionally, the HTTP Content sensor monitors a numeric value returned by an HTTP request. It can also optionally trigger a 'change' notification to notify you of changes to the content.

## Example: Content Monitoring

 For example, consider a URL <http://www.example.com/status.html> that returns a PHP script with the current system status in a simple HTML page.

```
<html>
  <body>
    Description: Script gives back current status of disk free (%) and CPU usage (%).
    [85.5][12.0]
  </body>
</html>
```

You would configure the HTTP Content sensor using

- the script URL from above,
- value type Float,
- and number of channels 2.

The sensor calls the URL with every scanning interval and only regards the two values in brackets [ ], handling each of them in one channel. The additional description text and HTML tags are not necessary. In this example, they are added in case a human calls the URL.

 If you define the number of channels as 1, the sensor only reads the first value. The second value is ignored. Using 3 as number of channels results in a sensor error message.

To be notified when the website content changes, you first need to configure a Trigger 'change' notification in the sensor's settings and then the notification itself.

 For more information, see section [Notification Triggers Settings](#)  <sup>2702</sup>.

## Performance Monitoring

The HTTP Transaction sensor checks if a web shop is working as expected: with a series of requests, for example, you can simulate the login, purchasing, and shipping processes. Only if all actions can be completed successfully in a row, the check returns an "OK" message. If anything goes wrong, you are immediately alerted and can react instantly to avoid loss of earnings for your company because the web shop is unavailable or very slow.

### Apache Web Server Monitoring

The HTTP Apache ModStatus PerfStats and HTTP Apache ModStatus Totals sensors monitor performance statistics and the activity of an Apache web server using mod\_status over HTTP. Among other HTTP sensors, these sensors let you enter credentials for web pages that need authentication and let you choose the necessary authentication method.

### Security Monitoring

PRTG also provides the option to monitor the security of your website by checking the status of Secure Sockets Layer (SSL) certificates and the security of a connection:

- [SSL Certificate](#) sensor: monitors the certificate of an SSL/TLS-secured connection. For example, it displays whether a certificate has been revoked, or is trusted as root authority, or is self-signed.
- [SSL Security Check](#) sensor: monitors the SSL connectivity to the port of a device. It tries to connect to the specified TCP/IP port number of a device with different SSL/TLS versions and shows if a specific protocol is supported.

### Push Monitoring

PRTG provides the option to monitor passively received data. For this purpose, you can set up a device in a way that it automatically sends the data to PRTG. Specific sensors can receive this data and alert you based on your individual settings. For example, all Linux/Unix and most network devices support remote devices generating data, which has to be configured on each device, and sending the messages to a probe system. Usually, only the destination IP and port are required.

■ For more information, see the Paessler website: [How to use push monitoring via HTTP](#).

### Other Data

You can also monitor other types of data from your website, for example the number of website visitors via the HTTP XML/REST Value sensor. The sensor lets you monitor values within the returned Extensible Markup Language (XML) code, provided your web analytics tool has an XML export option. The HTTP Data Advanced sensor accesses a web server and retrieves XML or JavaScript Object Notation (JSON) encoded data.

The REST Custom sensor queries a Representational State Transfer (REST) application programming interface (API) endpoint and maps the JSON or XML result to sensor values. The mapping rule has to be available as a REST configuration file in JSON template (\*.template) format according to the PRTG API definition.

■ For more information about the return value format, see section [Custom Sensors](#) .

## HTTP Status Codes

The HTTP sensors show their status depending on the HTTP status codes that they receive. By default, the sensor states are the following:

HTTP Status Code	HTTP Sensor Status
2xx Success	Up
3xx Redirection	Warning, Down for too many redirects)
4xx Client Error	Down
5xx Server Error	Down

**i** You need to configure your HTTP sensors manually only if you want to change these default reactions. In this case, you can change the sensor status based on limits and/or keyword checks.

## Other HTTP Sensor Settings

- **Server Name Indication:** You can configure SNI, which has to be a fully qualified domain name (FQDN) and must match the configuration of the target server. For more information, see the Knowledge Base: [My HTTP sensors fail to monitor websites which use SNI. What can I do?](#)
- **HTTP Version:** You can choose the HTTP version that the sensor uses when connecting to the target URL.
- **Authentication Method:** You can define if the configured URL needs authentication, enter credentials, and choose an authentication method.
- **Custom User Agent:** You can enter a string to be used as user agent when connecting to the target URL.
- **Custom HTTP Headers:** You can send custom HTTP headers to the target URL.

## HTTP Sensor Troubleshooting

For troubleshooting and other tips for monitoring with HTTP sensors, see [More](#) below.

# Part 13

# PRTG Administration Tool

## 13 PRTG Administration Tool

The PRTG Administration Tool is part of every PRTG installation. You can use it to edit the administrative settings of local probe and remote probe installations.

You can start the PRTG Administration Tool from the Windows Start menu on the PRTG core server system or on the remote probe system. If you start the PRTG Administration Tool on the PRTG core server system, you can change settings that affect the entire installation and the local probe. If you run the PRTG Administration Tool on a remote probe system, you can only change settings that are related to the remote probe.

Any settings that you change require a restart of the affected PRTG core server service and PRTG probe service to apply any changes to the configuration.

- ① You can also change many administrative settings via the [Setup](#) <sup>[2799]</sup> in the PRTG web interface. For probes, administrative settings are also available on the Settings [tab](#) <sup>[521]</sup> in the PRTG web interface.
- ① You can review the history of all changes to the settings of the PRTG Administration Tool in the \Logs\serveradmin subfolder of the [PRTG program directory](#) <sup>[3213]</sup>. The name of the corresponding log file is ServerAdmin.log.

In this section:

- [PRTG Administration Tool on PRTG Core Server Systems](#) <sup>[3041]</sup>
- [PRTG Administration Tool on Remote Probe Systems](#) <sup>[3067]</sup>

## 13.1 PRTG Administration Tool on PRTG Core Server Systems

With the PRTG Administration Tool, you can define various system settings regarding the PRTG core server installation, restart services, and view log information. You can also change many of these settings via the [system administration](#) [2855] in the PRTG web interface.

In this section:

- [Start the PRTG Administration Tool](#) [3041]
- [PRTG Web Server](#) [3041]
- [PRTG Core Server](#) [3046]
- [Cluster](#) [3047]
- [Administrator](#) [3054]
- [Probe Settings for Core Connection](#) [3055]
- [Probe Settings for Monitoring](#) [3058]
- [Service Start/Stop](#) [3059]
- [Logs and Info](#) [3062]
- [Send Logs to Paessler](#) [3063]
- [Activate Changed Settings](#) [3065]

 This section describes the settings that are available in the PRTG Administration Tool when you open it on the PRTG core server system. This means that you can edit settings for the PRTG core server or PRTG web server and the local probe.

 Settings that you define are only valid for the PRTG core server system on which you start the PRTG Administration Tool. Make sure that you log in to the system that you want to make changes to and open the PRTG Administration Tool there.

 This feature is not available in PRTG Hosted Monitor.

### Start the PRTG Administration Tool

- From the Windows Start menu, select the PRTG Network Monitor folder and click PRTG Administration Tool to open the application.
- Confirm the question of the Windows [User Account Control](#) with Yes to allow the PRTG Administration Tool to start.

### PRTG Web Server

Edit IP addresses, ports, access methods, and language for the PRTG web interface.

 You can also change these settings under Setup | System Administration | User Interface in the PRTG web interface. For more information, see section [User Interface](#) [2860].

Setting	Description
TCP Port for PRTG Web Server	Specify how the PRTG web server accepts incoming web page requests:

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Secure HTTPS server (default port 443, recommended, mandatory for internet access): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured HTTPS connection on port 443.               <ul style="list-style-type: none"> <li>❗ This setting is required if you want to access the PRTG web interface via the internet.</li> <li>❗ Although the connection is secure, you see an SSL certificate warning in your browser when you log in to the PRTG web interface because the default certificate is unknown to your browser. For more information, see the Knowledge Base: <a href="#">Why does my browser show an SSL certificate warning when I open the PRTG web interface?</a>. You can install a different SSL certificate for PRTG. For more information, see section <a href="#">How to use your own SSL certificate with the PRTG web server</a>.</li> <li>❗ If port 80 is available, PRTG reserves it as well. If port 80 is not available, PRTG tries port 8080 as fallback. If this port is also not available, PRTG searches from port 8081 upwards for a free port. PRTG sends a <a href="#">ticket</a><sup>[213]</sup> that shows you the currently used port number and switches back to port 80 as soon as it is available again. When users try to connect on port 80 via HTTP, they are redirected to port 443 via HTTPS. You can change this behavior via a registry setting. If port 443 is not available, PRTG tries port 8443 as fallback. If this port is also not available, PRTG searches from port 8444 upwards for a free port. PRTG sends a ticket that shows you the currently used port number and switches back to port 443 as soon as it is available again.</li> </ul> </li> <li>▪ Unsecure HTTP server (default port 80): Use the PRTG web server without SSL/TLS on port 80.               <ul style="list-style-type: none"> <li>❗ This setting is not recommended for WAN connections.</li> <li>❗ If you use the PRTG web server via the internet without connection security, attackers could potentially spy on credentials that you enter in PRTG. We strongly recommend that you use this option only in a LAN.</li> </ul> </li> <li>▪ Custom configuration: Specify a custom port for the PRTG web server and the security of the connection. This option is intended for systems that already have a web server on the standard port.               <ul style="list-style-type: none"> <li>❗ If PRTG always uses a fallback port after a server restart, check for other programs that use the same port as PRTG. For example, the Microsoft Microsoft Internet Information Services (IIS) web server also uses port 80 (port 443 for secure connections) by default and blocks it. We recommend that you disable such programs and services on startup.</li> </ul> </li> </ul>
<p>Custom configuration: <a href="#">Connection security</a></p>	<p><a href="#">This setting is only visible if you select Custom configuration above.</a></p> <p>Specify if you want to use connection security:</p>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Use HTTPS (secured with SSL/TLS): Use an SSL/TLS secured HTTPS connection on the port that you define as PRTG Web Server Port.               <ul style="list-style-type: none"> <li>❗ Although the connection is secure, you see an SSL certificate warning in your browser when you log in to the PRTG web interface, because the default certificate is unknown to your browser. You can install a different SSL certificate for PRTG later. For more information, see the Paessler website: <a href="#">How to use your own SSL certificate with the PRTG web server.</a></li> </ul> </li> <li>▪ Do not use connection security: Use the PRTG web server without SSL/TLS on the port that you define as PRTG Web Server Port.               <ul style="list-style-type: none"> <li>❗ We recommend that you do not use this setting for WAN connections.</li> <li>❗ If you use the PRTG web server without connection security on the internet, attackers could potentially spy on credentials that you enter in PRTG. We strongly recommend that you use this setting in a LAN only.</li> </ul> </li> </ul>
<p>Custom configuration: <a href="#">Web server port</a></p>	<p><a href="#">This setting is only visible if you select Custom configuration above.</a></p> <p>Enter the TCP port number (between 1 and 65535) that you want the PRTG web server to run on.</p> <p>Enter the TCP port number (between 1 and 65535) that you want the PRTG web server to run on. Enter an integer.</p> <ul style="list-style-type: none"> <li>❗ If you use a secure connection and port 80 is free, PRTG also reserves it. When users try to connect on port 80 via HTTP, they are redirected to the custom port via HTTPS. You can change this behavior via a registry setting.</li> <li>❗ If the port that you define for secure connections is not available, PRTG tries port 8443 as fallback. If this port is also not available, PRTG searches from port 8444 upwards for a free port. PRTG sends a <a href="#">ticket</a><sup>[213]</sup> that shows you the currently used port and switches back to the original port as soon as it is available again.</li> </ul>
<p>IP Address for PRTG Web Server</p>	<p>The PRTG web server provides access via the PRTG web interface and the <a href="#">PRTG app for desktop</a><sup>[2984]</sup>. Once you specify an IP address, you use it to log in to the PRTG web interface in your browser. Specify on which IP address the PRTG web server runs:</p>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Localhost, 127.0.0.1 (PRTG is not accessible from other computers): Use <a href="#">127.0.0.1</a> only. The PRTG web interface and the PRTG app for desktop are only accessible from the PRTG core server system. <ul style="list-style-type: none"> <li>❗ Either the selected port or at least one port in the range from <a href="#">8080</a> to <a href="#">8089</a> must be available on <a href="#">127.0.0.1</a>.</li> <li>❗ If you run PRTG on localhost, do not use the DNS name <a href="#">http://localhost</a> to log in to the PRTG web server. This might considerably slow down the PRTG web interface. Use your local IP address or <a href="#">http://127.0.0.1</a> instead.</li> </ul> </li> <li>▪ All IP addresses available on this computer (recommended): Use all IP addresses that are available on the PRTG core server system and enable access to the PRTG web server for all of these IP addresses. <ul style="list-style-type: none"> <li>❗ The selected Transmission Control Protocol (TCP) port for the PRTG web server must be available on all selected IP addresses.</li> </ul> </li> <li>▪ Specify IP addresses: Select specific IP addresses on which the PRTG web server runs. The list is specific to your setup. Enable check boxes in front of every IP address that you want the PRTG web server to be available at. You can also select all IP addresses by clicking the Select all IP addresses button or deselect all addresses by clicking the Deselect all IP addresses button. <ul style="list-style-type: none"> <li>❗ Either the selected port or at least one port in the range from <a href="#">8080</a> to <a href="#">8089</a> must be available on the specified IP address.</li> <li>❗ Regardless of the setting that you select, one port in the range from <a href="#">8080</a> to <a href="#">8180</a> must be available on the specified IP address so that PRTG can create reports. The report engine tries to connect to the PRTG core server on one of these ports.</li> <li>❗ If PRTG does not find a network card on startup, it switches this setting to Localhost, 127.0.0.1 (PRTG is not accessible from other computers). This setting remains even if a network card is available later on. If you disable or remove the network card on the PRTG core server system, check this setting.</li> </ul> </li> </ul>
<p>Select System Language</p>	<p>Select the language. The default language is English.</p> <p>❗ This setting defines the language of the PRTG web interface and the <a href="#">PRTG Administration Tool</a><sup>[3046]</sup>.</p> <p>List of available languages:</p> <ul style="list-style-type: none"> <li>▪ Deutsch (German)</li> <li>▪ English</li> <li>▪ Español (Spanish)</li> <li>▪ Français (French)</li> <li>▪ Nederlands (Dutch)</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Português (Portuguese)</li> <li>▪ Русский (Russian)</li> <li>▪ 日本語 (Japanese)</li> <li>▪ 简体中文 (Simplified Chinese)</li> </ul>

## PRTG Core Server

Define settings for the PRTG core server.

The screenshot shows the 'PRTG Network Monitor - PRTG Administration Tool' window. The 'PRTG Core Server' tab is selected. The interface includes a header with the Paessler logo and 'PRTG Network Monitor'. Below the header are four tabs: 'Probe Settings for Core Connection', 'Probe Settings for Monitoring', 'Service Start/Stop', and 'Logs and Info'. Under 'Probe Settings for Core Connection', there are sub-tabs for 'PRTG Web Server', 'PRTG Core Server', 'Cluster', and 'Administrator'. The 'PRTG Core Server' sub-tab is active, showing the 'Probe Connection Management' section with three radio button options: 'Accept connections from the local probe only (default, does not allow remote probes)', 'Accept connections from remote probes on all IP addresses' (which is selected), and 'Accept connections from remote probes on selected IP addresses only:'. Below these options is a list of IP addresses with checkboxes: '192.0.2.0' (unchecked) and '127.0.0.1' (checked). The 'Local Storage of Data Files and Monitoring Database' section contains a 'Folder:' label, a text box with the path 'C:\ProgramData\Paessler\PRTG Network Monitor\' and a browse button (...), and a 'Revert to default folder' button. A note below reads: 'Note: Please copy your data files to the desired location BEFORE you change the path here.' At the bottom right, there are 'Save & Close' and 'Cancel' buttons.

PRTG Core Server Tab

Setting	Description
Probe Connection Management	<p>Define how PRTG handles incoming connections from probes:</p> <ul style="list-style-type: none"> <li>▪ Accept connections from the local probe only (default, does not allow remote probes): Only accept connections from the local probe. If you select this option, you cannot use <a href="#">remote probes</a>.</li> <li>▪ Accept connections from remote probes on all IP addresses: Accept incoming connections from remote probes, no matter on which IP address of the PRTG core server they come in.</li> <li>▪ Accept connections from remote probes on selected IP addresses only: Accept incoming connections from remote probes on the selected IP address(es) of the PRTG core server. In the list, select the IP addresses by enabling a check box in front of the desired IP addresses.</li> </ul> <p> You can also change this setting under Setup   System Administration   <a href="#">Core &amp; Probes</a> in the PRTG web interface.</p>
Local Storage of Data Files and Monitoring Database	<p>Select the directory where PRTG stores configuration and monitoring data. Click  to choose a different folder on the system.</p> <p> Before you change the path, make sure you stop both the PRTG core server service and the PRTG probe service and copy all data to the new location.</p> <p> The directory name must include only ANSI characters. PRTG does not support data paths with non-ANSI characters.</p> <p>Click Revert to default folder to reset this setting to the default.</p>

## Cluster

On the Cluster tab, you can change how the PRTG core server behaves in a cluster. Before you change settings here, see section [Failover Cluster Configuration](#).

Cluster Tab

Setting	Description
Cluster Settings	<p>Depending on the cluster settings, different options are available.</p> <ul style="list-style-type: none"> <li>Cluster Mode: Shows the cluster mode of the PRTG core server. Possible values are Standalone (no cluster mode), Cluster Mode: Master Node, or Cluster Mode: Failover Node.</li> </ul> <p><b>i</b> This setting is for your information only. You cannot change it.</p> <ul style="list-style-type: none"> <li>Cluster Port: This setting is only visible if PRTG runs in cluster mode.</li> <li>Cluster Access Key: This setting is only visible if PRTG runs in cluster mode.</li> <li>Cluster NodeID: This setting is only visible if PRTG runs in cluster mode.</li> </ul>

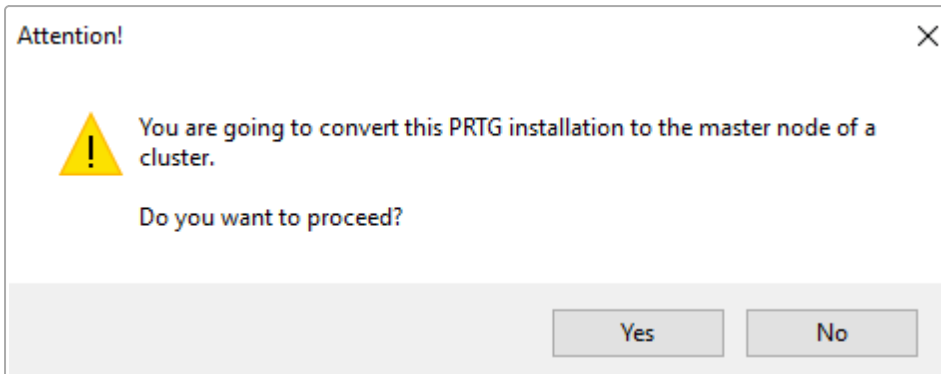

Setting	Description
	<p> This setting is for your information only. You cannot change it.</p>
Cluster Mode Actions	<p>Depending on the cluster settings, you see different active buttons.</p> <ul style="list-style-type: none"> <li>▪ Create a Cluster</li> <li>▪ Join a Cluster</li> <li>▪ Change Cluster Settings</li> <li>▪ Revert to Standalone</li> </ul> <p> For details, see section <a href="#">Cluster Mode Actions</a> <small>3049</small> below.</p>
Master Heartbeat	<p>This section is only visible if PRTG runs in cluster mode. The current master node can execute an external executable file on a regular basis. We call this a <b>heartbeat</b>.</p> <p>You can use this, for example, to report the IP address of the current master node to a dynamic Domain Name System (DNS) provider, so that a DNS name is always redirected to the current master node in case the primary master node fails and a failover node (with a different IP address) becomes the current master node.</p> <ul style="list-style-type: none"> <li>▪ No heartbeat: Do not execute a file on a regular basis.</li> <li>▪ Run an external executable file every 5 minutes: Click  to browse for the file that you want to execute. This can be, for example, a command-line tool or a batch file. PRTG executes it on the current master node only, in a fixed interval of five minutes. You cannot change the interval.</li> </ul> <p> Make sure that the selected file is available under the same (local) path on all failover nodes. In case one of your failover nodes becomes the current master node, PRTG can only execute the heartbeat reliably if the executable file exists on all of your failover nodes.</p>

### Cluster Mode Actions

Follow these instructions to create or to join a cluster, to change a cluster's settings, or to revert a cluster node to standalone mode:

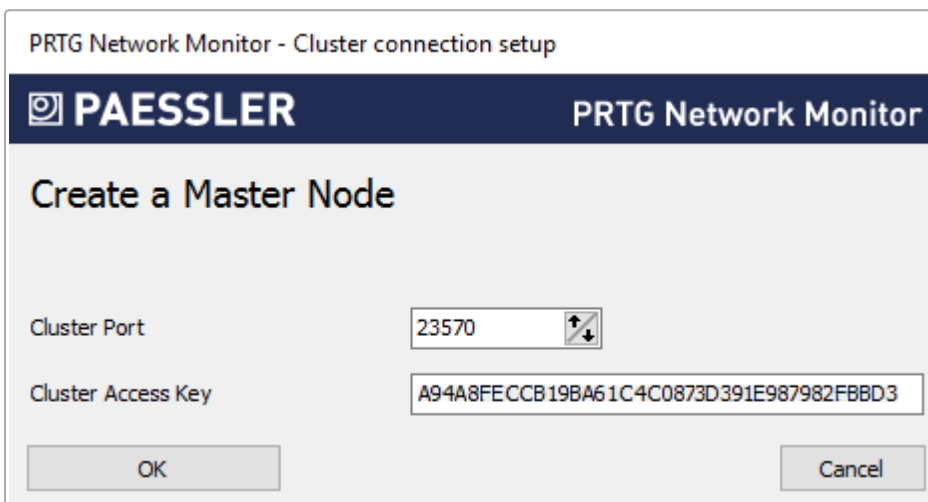

#### Create a Cluster

- Click Create a Cluster to create a cluster. The current PRTG core server is then the **master node** of the cluster.
- Click Yes to convert this installation to a master node.

Converting an Installation to a Master Node

- A dialog box appears.

Creating a Master Node

- Enter a Cluster Port. This is the port on which PRTG sends the internal communication between the cluster nodes. Make sure that connections between the cluster nodes are possible on the port that you select.
- Enter or paste a Cluster Access Key. This is a unique access key. All cluster nodes must use the same cluster access key to join the cluster. Connection attempts with a different access key are not possible.

**i** We recommend that you use the default value.

- Save the Cluster Access Key so that you have it at hand when you configure the failover nodes.

- After confirming your settings, you are asked to restart Windows services. Click OK to restart the Windows services so that your changes take effect.

Restart Services to Apply Changes

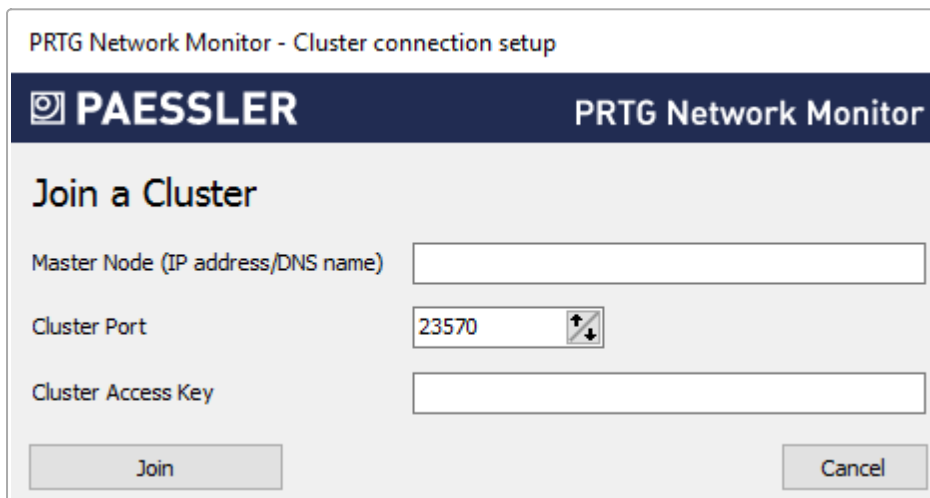

### Join a Cluster

- Click Join a Cluster to add this installation to a cluster that already has a [master node](#). The current PRTG core server is then a [failover node](#).
- This button is also available if the PRTG core server is in Cluster Mode: Master Node. This option then changes the master node to a failover node.
- Click Yes to convert this installation into a failover node.

Converting an Installation to a Failover Node

- A dialog box appears.

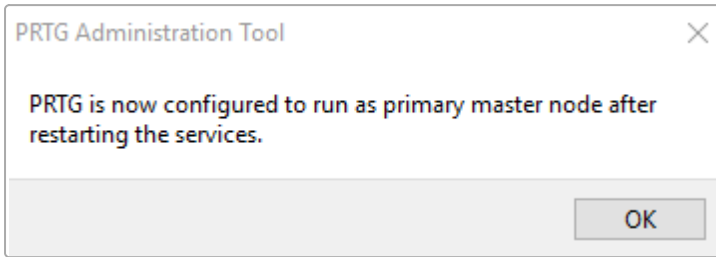

Cluster Connection Setup

- Enter a Master Node (IP address/DNS name) for the cluster. It must be reachable from the machine that runs the failover node.
- Enter the other settings as defined in the settings of the [master node](#). Make sure that you use the same settings on all cluster nodes.
- Enter a Cluster Port. This is the port on which PRTG sends the internal communication between the cluster nodes. Make sure that connections between the cluster nodes are possible on the port that you select.
- Enter or paste a Cluster Access Key. This is a unique access key. All cluster nodes must use the same cluster access key to join the cluster. Connection attempts with a different access key are not possible.

**i** We recommend that you use the default value.

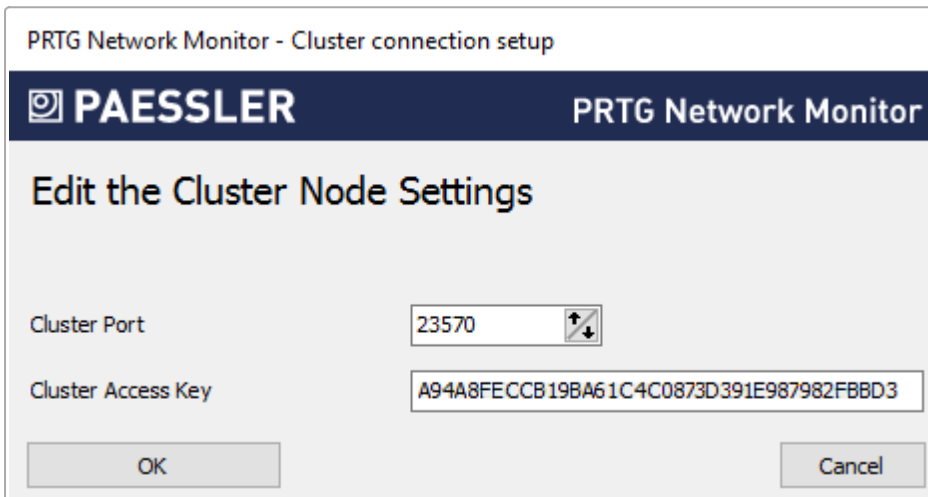

- After confirming your settings, you are asked to restart Windows services. Click OK to restart the Windows services so that your changes take effect.

Restart Services to Apply Changes

### Change Cluster Settings

- If you run PRTG in cluster mode, you can change the settings. Click Change Cluster Settings to do so.
- A dialog box appears.

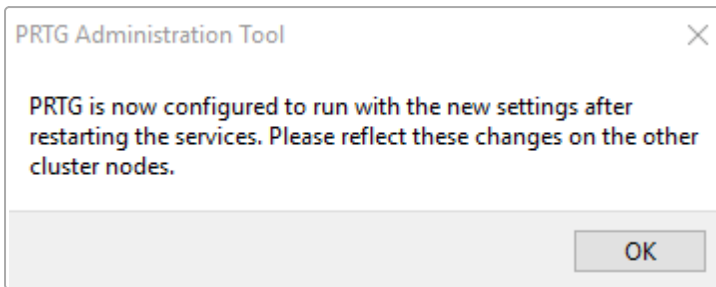

Edit Cluster Node Settings

- Enter a Cluster Port. This is the port on which PRTG sends the internal communication between the cluster nodes. Make sure that connections between the cluster nodes are possible on the port that you select.
- Enter or paste a Cluster Access Key. This is a unique access key. All cluster nodes must use the same cluster access key to join the cluster. Connection attempts with a different access key are not possible.

**i** We recommend that you use the default value.

- Make sure that you use the same settings on all cluster nodes.
- After confirming your settings, you are asked to restart Windows services. Click OK to restart the Windows services so that your changes take effect.

Restart Services to Apply Changes

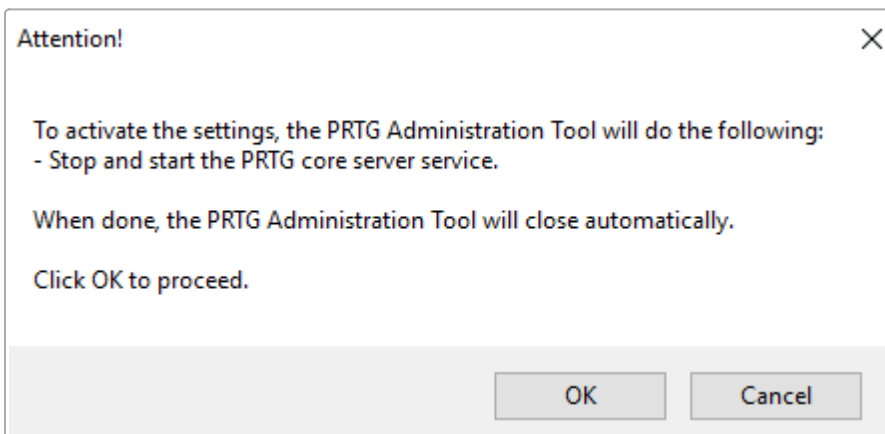

#### Revert to Standalone

- Click Revert to Standalone to revert this cluster node to a standalone installation.
- A dialog box appears.

Revert Cluster to Standalone Installation

- Click Yes to convert this cluster node to a standalone installation.
- A dialog box appears where PRTG asks you to agree to restart the PRTG core server service. Click OK to proceed.

Restart Services

- ① When you revert a cluster node to Standalone mode, the cluster probe remains in the device tree to keep your device and sensor setup. If you want to completely remove the cluster probe from the device tree, you need to delete it manually.

## Administrator

On the Administrator tab, you can change settings for the [PRTG System Administrator](#) user.

- ① You can also change the password for the [PRTG System Administrator](#) user account under Setup | Account Settings | [My Account](#) in the PRTG web interface.

The screenshot shows the 'Administrator' tab in the PRTG Administration Tool. The main heading is 'Login Credentials for the PRTG System Administrator User Account'. There are three input fields: 'Email Address' with the value 'johnqpublic@example.com', 'Login Name' with the value 'prtgadmin', and 'Password' with a masked value '\*\*\*\*\*'. A 'Generate new password' button is located to the right of the password field. At the bottom right, there are 'Save & Close' and 'Cancel' buttons.

Administrator Tab

Setting	Description
Email Address	Enter a valid email address for the <a href="#">PRTG System Administrator</a> user account. By default, PRTG sends notifications and important messages

Setting	Description
	to this address.
Login Name	Enter a login name for the <a href="#">PRTG System Administrator</a> user account. You use it when you log in to the PRTG web interface or the PRTG app for desktop.   The default login name is <a href="#">prtgadmin</a> .
Password	Click Generate new password and confirm to generate a new password for the <a href="#">PRTG System Administrator</a> user account. Click Save & Close to set the new password. You use it when you log in to the PRTG web interface or the PRTG app for desktop.   The default password is <a href="#">prtgadmin</a> .

## Probe Settings for Core Connection

Define general settings regarding the local probe and connections.

Probe Settings for Core Connection Tab

Probe Settings

Setting	Description
Probe Name	Enter a meaningful name to identify the local probe. By default, PRTG shows this name in the <a href="#">device tree</a> <sup>[164]</sup> , as well as in <a href="#">alarms</a> <sup>[202]</sup> , <a href="#">logs</a> <sup>[210]</sup> , <a href="#">notifications</a> <sup>[2735]</sup> , <a href="#">reports</a> <sup>[2754]</sup> , <a href="#">maps</a> <sup>[2776]</sup> , <a href="#">libraries</a> <sup>[2738]</sup> , and <a href="#">tickets</a> <sup>[213]</sup> . Enter a string.  ⓘ If the name contains angle brackets (<>), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a>
Reconnect Time	Define the time that PRTG waits for the local probe to reconnect to the PRTG core server if the connection fails. Enter an integer.

### Connection to PRTG Core Server

These settings affect the way that the local probe connects to the PRTG core server.

Setting	Description
Server (IPv4 Address or DNS Name)	The local probe connects to the PRTG core server via <a href="#">127.0.0.1</a> . You cannot change this.
GID	<p>The <a href="#">probe GID</a> is a unique identifier for the local probe. You cannot change the GID on the PRTG core server system.</p> <ul style="list-style-type: none"> <li>ⓘ Edit GID and Generate new GID are only available on the remote probe system. For more information, see section <a href="#">PRTG Administration Tool on Remote Probe Systems</a><sup>[3067]</sup>.</li> <li>ⓘ You can deny GIDs under Setup   System Administration   <a href="#">Core &amp; Probes</a><sup>[2890]</sup> in the PRTG web interface.</li> </ul>
Access Key	<p>Access Key is only available on the remote probe system.</p> <ul style="list-style-type: none"> <li>ⓘ For more information, see section <a href="#">PRTG Administration Tool on Remote Probe Systems</a><sup>[3067]</sup>.</li> </ul>
Confirm Access Key	<p>Confirm Access Key is only available on the remote probe system.</p> <ul style="list-style-type: none"> <li>ⓘ For more information, see section <a href="#">PRTG Administration Tool on Remote Probe Systems</a><sup>[3067]</sup>.</li> </ul>

### Path for the PRTG Data Directory on the Probe System

Setting	Description
Path	This setting is not available on the PRTG core server system. Please use Local Storage of Data Files and Monitoring Database on the <a href="#">PRTG Core Server</a> <sup>[3046]</sup> tab instead.

## Probe Settings for Monitoring

PRTG Network Monitor - PRTG Administration Tool

**PAESSLER** PRTG Network Monitor

PRTG Web Server PRTG Core Server Cluster Administrator

Probe Settings for Core Connection **Probe Settings for Monitoring** Service Start/Stop Logs and Info

**IPv4: Outgoing IP Address for Monitoring Requests**

IPv4 Address	Adapter Name	Adapter Type
<input checked="" type="radio"/> auto		
<input type="radio"/> 192.0.2.1	Ethernet0	Ethernet

**IPv6: Outgoing IP Address for Monitoring Requests**

IPv6 Address	Adapter Name	Adapter Type
<input checked="" type="radio"/> auto		
<input type="radio"/> 2001:db8::1234:5678	Ethernet0	Ethernet

Save & Close Cancel

Probe Settings for Monitoring Tab

Define the IP address to use for outgoing monitoring requests.

- If more than one IP is available on the system, you can specify the IP address that PRTG uses for the outgoing monitoring requests of certain sensors.
  - This setting is for sensors that use the following connection types: HTTP, Domain Name System (DNS), File Transfer Protocol (FTP), Internet Message Access Protocol (IMAP), Post Office Protocol version 3 (POP3), port, remote desktop, Simple Mail Transfer Protocol (SMTP), and Simple Network Management Protocol (SNMP).
  - The setting is valid for all monitoring requests that this probe sends.
  - This setting is useful for devices that expect a certain IP address when they are queried.
  - The default setting is auto. PRTG automatically selects an IP address.
- i** This feature does not support all sensors for technical reasons.
- i** If you change this setting, some sensors might stop working. For example, sensors might show the Down status if the selected IP address is blocked on the way to or directly on the target device.

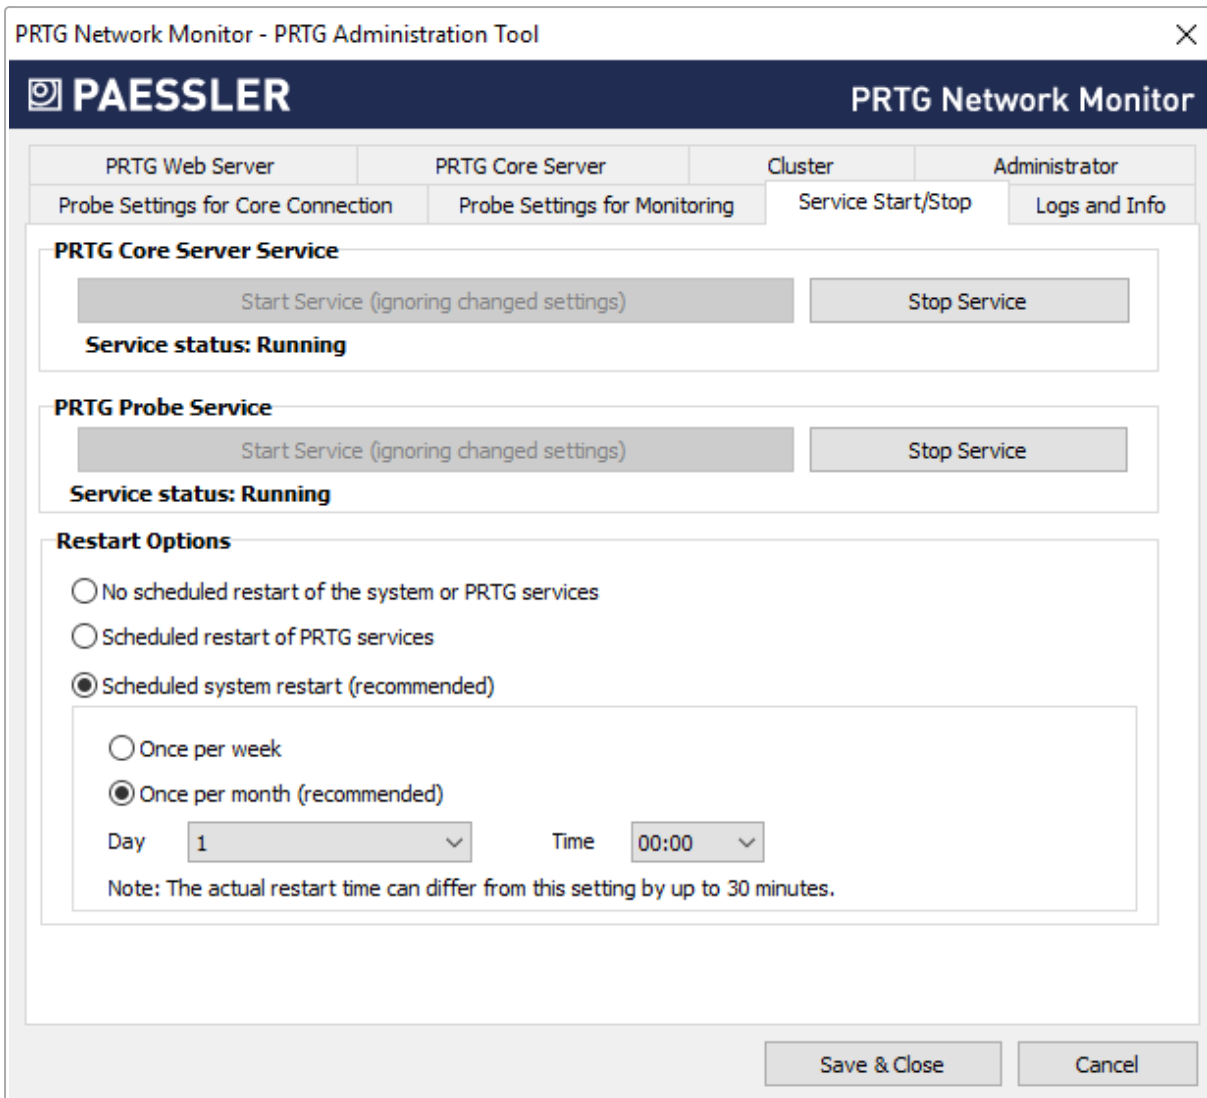

Setting	Description
IPv4: Outgoing IP for Monitoring Requests	Define the IP address for outgoing requests that use the IPv4 protocol. The list shows all available IP addresses on the system. Choose a specific IP address or select auto.
IPv6: Outgoing IP for Monitoring Requests	Define the IP address for outgoing requests that use the IPv6 protocol. The list shows all available IP addresses on the system. Choose a specific IP address or select auto.  ■ For more information, see section <a href="#">IPv6 Support</a> <sup>[150]</sup> .

## Service Start/Stop

You can manually start and stop the PRTG core server service and PRTG probe service. Click the respective buttons to start or stop the respective service. Both actions usually take from a few seconds up to several minutes. You can also restart the PRTG core server service and PRTG probe service under Setup | System Administration | [Administrative Tools](#)<sup>[2919]</sup> in the PRTG web interface.

**i** We recommend that you schedule automatic system restarts.

Service Start/Stop Tab

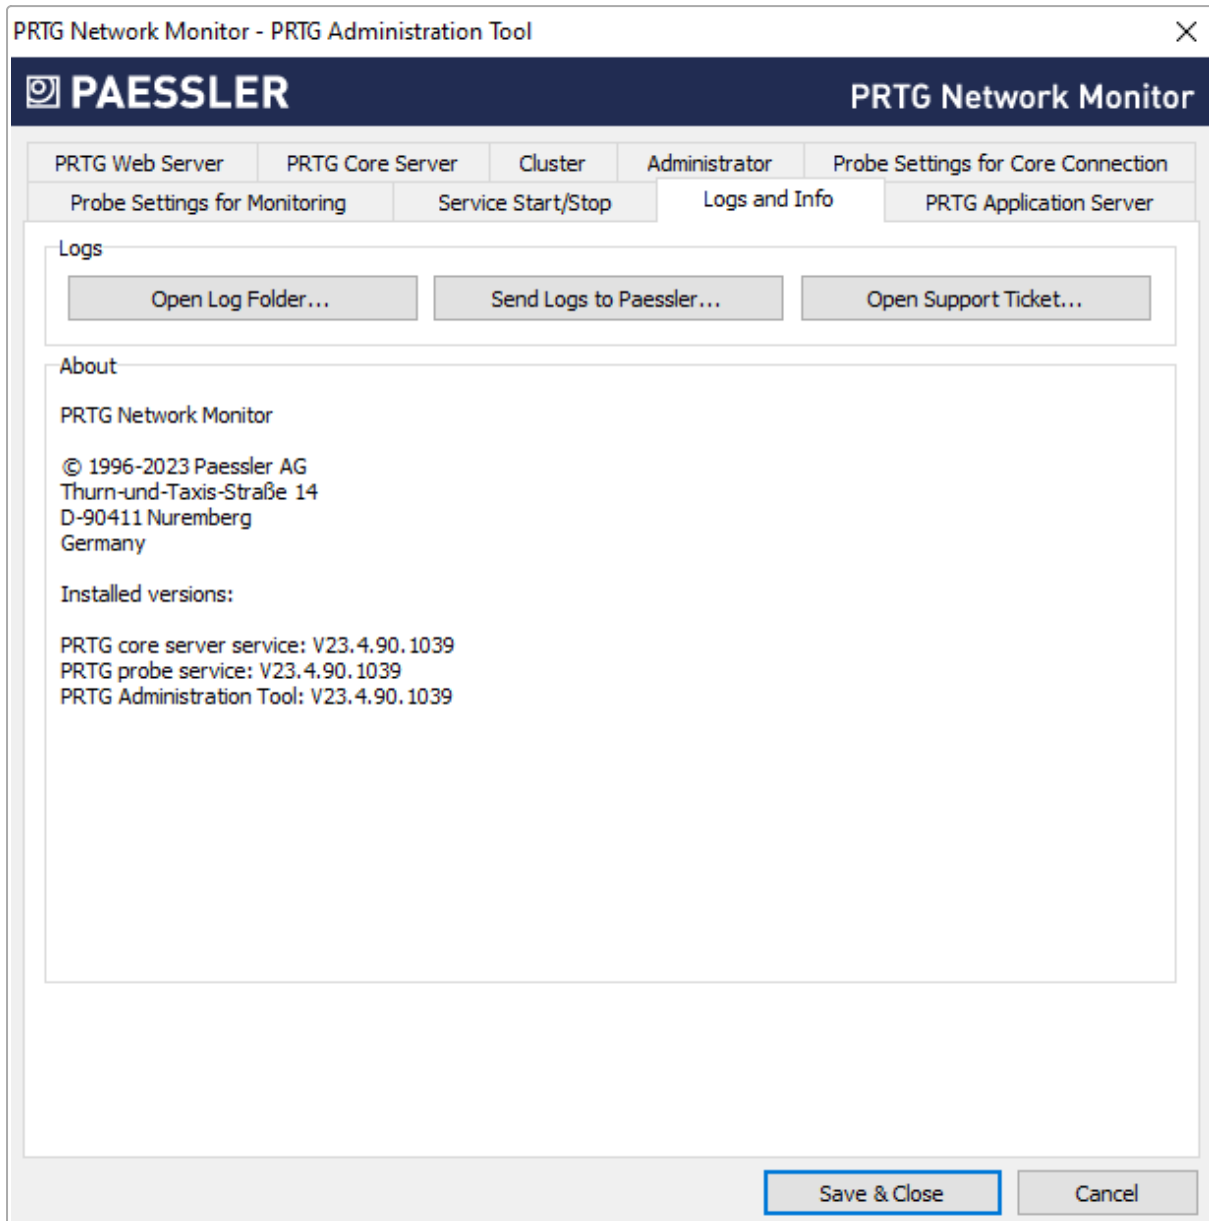

### Restart Options

Setting	Description
Restart Options	<p>Define if you want to schedule an automatic restart:</p> <ul style="list-style-type: none"> <li>▪ <b>No scheduled restart of the system or PRTG services:</b> Do not automatically perform a scheduled restart of services. We recommend that you manually restart the PRTG core server system every few weeks. You can also restart the PRTG core server service and PRTG probe service under <a href="#">Administrative Tools</a> (2918) in the PRTG web interface.</li> <li>▪ <b>Scheduled restart of PRTG services:</b> Restart the PRTG core server service on the PRTG core server system. If you select this option, the PRTG probe service restarts as well. Define a schedule under Restart Schedule.</li> </ul>

Setting	Description
	<p>☁ This setting is not available on the hosted probe of a PRTG Hosted Monitor instance.</p> <ul style="list-style-type: none"> <li>▪ Scheduled system restart (recommended): Define a schedule under Restart Schedule. We recommend that you restart every PRTG core server system once a month for best performance.</li> </ul>
Restart Schedule	<p><b>This setting is only visible if you select</b> Scheduled restart of PRTG services <b>or</b> Scheduled system restart (recommended) <a href="#">above</a>.</p> <p>Choose how often you want to restart the PRTG core server service, PRTG probe service, or the PRTG core server system:</p> <ul style="list-style-type: none"> <li>▪ Once per week: Select a day and a time below.</li> <li>▪ Once per month (recommended): Select a day of the month and a time below.</li> </ul>
Day	<p><b>This setting is only visible if you select</b> Scheduled restart of PRTG services <b>or</b> Scheduled system restart (recommended) <a href="#">above</a>.</p> <p>Select a day of the week (<a href="#">Monday</a> to <a href="#">Sunday</a>) or month (<a href="#">1st</a> to <a href="#">30th</a> or <a href="#">Last</a>). If you select Last, PRTG restarts the PRTG core server system on the last day of the month, regardless of how many days the month has.</p> <p><b>i</b> If you select a date that does not exist in every month (for example, the 30th day in February), PRTG automatically restarts the PRTG core server system on the last day of this month.</p>
Time	<p><b>This setting is only visible if you select</b> Scheduled restart of PRTG services <b>or</b> Scheduled system restart (recommended) <a href="#">above</a>.</p> <p>Select the time of the day when PRTG restarts the PRTG core server system.</p> <p><b>i</b> You get a Windows warning message 10 minutes before the restart to inform you about the restart if you are logged in to PRTG. The actual restart time can differ by up to 30 minutes from the time you enter here.</p>

**i** You can also define a restart schedule on the Settings [tab](#)<sup>523</sup> of a remote probe in the PRTG web interface.

## Logs and Info

Logs and Info Tab

## Logs

Button	Description
Open Log Folder	Open the <a href="#">PRTG data directory</a> <sup>[3214]</sup> to access all logs that PRTG creates.
Send Logs to Paessler	Open an assistant to send logs to the Paessler support team. See <a href="#">Send Logs to Paessler</a> <sup>[3063]</sup> for details.

Button	Description
	<ul style="list-style-type: none"> <li>ⓘ This feature is only available with the <a href="#">commercial edition</a> of PRTG.</li> <li>ⓘ You can also send logs with the support bundle via <a href="#">Contact Support</a> in the PRTG web interface.</li> </ul>
Open Support Ticket	<p>Open the Help Desk portal on the Paessler website in a browser window.</p> <ul style="list-style-type: none"> <li>ⓘ If you need help, we recommend that you use the Contact Support option in the PRTG web interface instead.</li> </ul>

### About

The About section shows information about the version of installed PRTG programs and copyright information.

### Send Logs to Paessler

- ⓘ You can also send logs with the support bundle via Contact Support in the PRTG web interface.

Send Logs to Paessler

**PAESSLER**
PRTG Network Monitor

### Send Logs to Paessler

Name

Email

Ticket#

Please supply your ticket number (PAEXXXX) if you already have an open support ticket.

Configuration  Include configuration file (contains passwords)

Note: All passwords used in PRTG are encrypted in the configuration file, but SNMP community names and hostnames might be written in plain text.

If you click the "Send" button, this program will upload the relevant log files and, if selected, the configuration file of your PRTG installation to the Paessler FTP server and support ticket system.

Please ensure that outgoing FTP and HTTP connections are enabled on this machine.

Note: Support communication can only be provided in English or German!

Send Logs to Paessler

If you open a support ticket, the Paessler support team might ask you to send logs for further analysis.

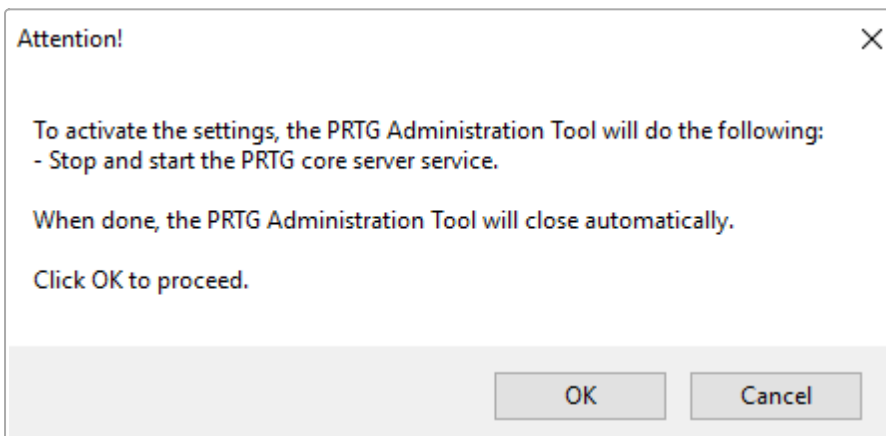

Field	Description
Name	Enter your name.
Email	Enter a valid email address. You can provide any email address but we recommend that you use the email address of your user account, which PRTG enters by default.
Ticket #	This field is optional. If you have already opened a ticket with the Paessler support team, provide the ticket number you received. Your files are then automatically associated with your ticket.

Field	Description
	Enter the ticket number starting with <b>PAE</b> followed by four or more digits, for example, <b>PAE12345</b> . If you do not have a ticket number, leave this field empty.
Configuration	<p>Define if you want to include the configuration file. PRTG removes all passwords from the configuration file before sending it to the Paessler support team.</p> <p><b>i</b> If a configuration file is too large, some 32-bit systems might not be able to send the file with hidden passwords. In these cases, PRTG confirms that you still want to send the configuration file to the Paessler support team. The passwords are still encrypted.</p>

Click Send to start the data upload. PRTG then automatically collects, compresses, and sends your logs to our FTP over SSL (FTPS) server. Make sure that FTPS and HTTP connections are allowed on the remote probe system.

### Activate Changed Settings

After you change settings, click Save & Close. A new dialog box appears where PRTG asks you to agree to restart the PRTG core server service. Click OK to proceed.

Restart Services

## 13.2 PRTG Administration Tool on Remote Probe Systems

If you start the PRTG Administration Tool on a remote probe system, you can define various probe-related settings, restart services, and view log information. You can also change many of these settings via the [system administration](#)<sup>[2853]</sup> and the [probe settings](#)<sup>[521]</sup> in the PRTG web interface.

**i** The PRTG Administration Tool is only available on Windows systems and does not affect multi-platform probes. For more information on how to configure and restart multi-platform probes, see the [Multi-Platform Probe for PRTG](#) manual.

In this section:

- [Start the PRTG Administration Tool](#)<sup>[3067]</sup>
- [Probe Settings for Core Connection](#)<sup>[3067]</sup>
- [Probe Settings for Monitoring](#)<sup>[3071]</sup>
- [Service Start/Stop](#)<sup>[3072]</sup>
- [Scheduled Restart Settings](#)<sup>[3073]</sup>
- [Logs and Info](#)<sup>[3075]</sup>
- [Send Logs to Paessler](#)<sup>[3076]</sup>
- [Activate Changed Settings](#)<sup>[3078]</sup>

**i** This section describes the available settings in the PRTG Administration Tool when you open it on a remote probe system. This is not the complete set of available settings. If you need access to all settings regarding the entire PRTG installation, open the PRTG Administration Tool on the PRTG core server system.

**i** Settings you make here are only valid for the remote probe system on which you open the PRTG Administration Tool. Make sure that you log in to the system that you want to make changes to and open the PRTG Administration Tool there.

### Start the PRTG Administration Tool

- From the Windows Start menu, select the PRTG Network Monitor folder and click PRTG Administration Tool to open the application.
- Confirm the question of the Windows [User Account Control](#) with Yes to allow the PRTG Administration Tool to start.

### Probe Settings for Core Connection

Define general settings regarding the remote probe and connections.

Probe Settings for Core Connection Tab

Probe Settings

Setting	Description
Probe Name	<p>Enter a name to identify the remote probe. PRTG shows this name, for example, in the device tree, and in all alarms by default. Enter a string.</p> <p><b>i</b> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>

Setting	Description
Reconnect Time	Define the time that PRTG waits for the remote probe to reconnect to the PRTG core server if the connection fails. Enter an integer.

#### Connection to PRTG Core Server

These settings affect the way the remote probe connects to the PRTG core server.

Setting	Description
Server (IPv4 Address or DNS Name)	Enter the IP address or Domain Name System (DNS) name of the PRTG core server.
GID	<p>The <b>probe GID</b> (global ID (GID)) is a unique identifier for the remote probe. We recommend that you do not change it.</p> <p><b>Exceptions:</b> If you substitute a remote probe from a different computer, you must copy the GID from the old probe to the new probe. To do so, click Edit GID and confirm the warning with Yes. You can then change the GID. PRTG checks if the GID is valid. You can also generate a new GID if necessary. To do so, click Generate new GID and confirm the warning with Yes.</p> <p><b>i</b> You can deny GIDs under Setup   System Administration   <a href="#">Core &amp; Probes</a><sup>[2890]</sup> in the PRTG web interface. If you remove a remote probe from the device tree or if you <a href="#">deny a remote probe after installation</a><sup>[106]</sup>, PRTG automatically enters its GID in the Deny GIDs list.</p>
Access Key	<p>The probe access key must match one of the access keys in the PRTG core server installation. If it does not match, the remote probe is not able to connect to the PRTG core server.</p> <p><b>■</b> For more information, see section <a href="#">Core &amp; Probes</a><sup>[2890]</sup>.</p> <p><b>i</b> Also check the allowed and denied IP addresses in the <a href="#">Core &amp; Probes</a><sup>[2890]</sup> settings to make sure that the PRTG core server accepts the IP address of the remote probe.</p>
Confirm Access Key	If you enter an access key for a remote probe, enter it in this field again to confirm it.

#### Path for the PRTG Data Directory on the Probe System

Setting	Description
Path	<p>Select the directory where PRTG stores configuration and monitoring data. Click  to choose a different folder on the system.</p> <p> Before you change the path, make sure you stop both the PRTG core server service and the PRTG probe service and copy all data to the new location.</p> <p> The directory name must include only ANSI characters. PRTG does not support data paths with non-ANSI characters.</p>

Language for the PRTG Administration Tool for Remote Probes

Setting	Description
[your language]	<p>Choose the language for the PRTG Administration Tool on the remote probe. The default is English.</p> <p>List of available languages:</p> <ul style="list-style-type: none"> <li>▪ Deutsch (German)</li> <li>▪ English</li> <li>▪ Español (Spanish)</li> <li>▪ Français (French)</li> <li>▪ Nederlands (Dutch)</li> <li>▪ Português (Portuguese)</li> <li>▪ Русский (Russian)</li> <li>▪ 日本語 (Japanese)</li> <li>▪ 简体中文 (Simplified Chinese)</li> </ul>

## Probe Settings for Monitoring

**IPv4: Outgoing IP for Monitoring Requests**

IPv4 Address	Adapter Name	Adapter Type

<input type="radio"/> 2001:db8::7777:8888	inhttpsinterface	Tunnel

Buttons: Save & Close, Cancel

Probe Settings for Monitoring Tab

Define the IP address to use for outgoing monitoring requests.

- If more than one IP is available on the system, you can specify the IP address that PRTG uses for the outgoing monitoring requests of certain sensors.
- This setting is for sensors that use the following connection types: HTTP, Domain Name System (DNS), File Transfer Protocol (FTP), Internet Message Access Protocol (IMAP), Post Office Protocol version 3 (POP3), port, remote desktop, Simple Mail Transfer Protocol (SMTP), and Simple Network Management Protocol (SNMP).
- The setting is valid for all monitoring requests that this probe sends.
- This setting is useful for devices that expect a certain IP address when they are queried.
- The default setting is auto. PRTG automatically selects an IP address.

**i** This feature does not support all sensors for technical reasons.

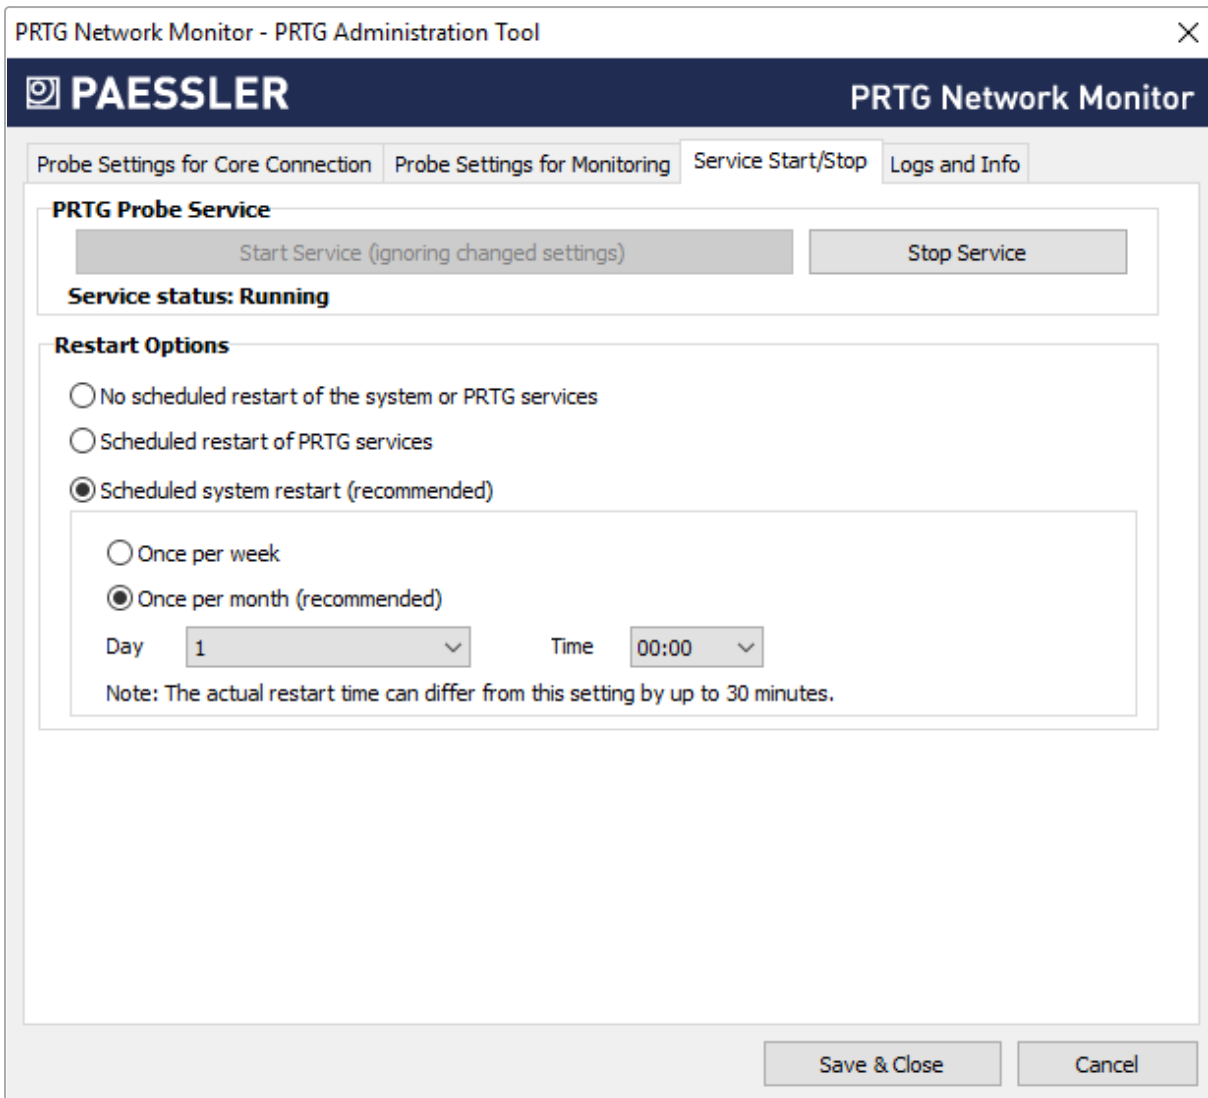

**i** If you change this setting, some sensors might stop working. For example, sensors might show the Down status if the selected IP address is blocked on the way to or directly on the target device.

Setting	Description
IPv4: Outgoing IP for Monitoring Requests	Define the IP address for outgoing requests that use the IPv4 protocol. The list shows all available IP addresses on the system. Choose a specific IP address or select auto.
IPv6: Outgoing IP for Monitoring Requests	Define the IP address for outgoing requests that use the IPv6 protocol. The list shows all available IP addresses on the system. Choose a specific IP address or select auto.  ■ For more information, see section <a href="#">IPv6 Support</a> <sup>[150]</sup> .

## Service Start/Stop

You can manually start and stop the PRTG probe service. Click Start Service to start the service or Stop Service to stop it. Both actions usually take from a few seconds up to several minutes. You can also restart the PRTG probe service under Setup | System Administration | [Administrative Tools](#)<sup>[2919]</sup> in the PRTG web interface.

**i** We recommend that you schedule automatic service restarts.

Service Start/Stop Tab

## Scheduled Restart Settings

☁ This setting is not available on the hosted probe of a PRTG Hosted Monitor instance.

Setting	Description
Restart Options	<p>Define if you want to schedule an automatic restart:</p> <ul style="list-style-type: none"> <li>No scheduled system or service restart: Do not automatically perform a scheduled restart of services. We recommend that you manually restart the PRTG core server system every few weeks. You can initiate a restart of the PRTG probe service in the <a href="#">Administrative Tools</a> [2918] in the PRTG web interface.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Scheduled restart of PRTG services: Restart the PRTG probe service on the probe system. If you select this option on the local probe, the PRTG core server service restarts as well. Define a schedule under Restart Schedule.</li> <li>▪ Scheduled system restart (recommended): Define a schedule under Restart Schedule. We recommend that you restart probe systems once a month for best performance.</li> </ul>
Restart Schedule	<p><b>This setting is only visible if you select</b> Scheduled restart of PRTG services <b>or</b> Scheduled system restart (recommended) <b>above</b>.</p> <p>Choose how often you want to restart the PRTG probe service or the probe system:</p> <ul style="list-style-type: none"> <li>▪ Once per week: Select a day and a time below.</li> <li>▪ Once per month (recommended): Select a day of the month and a time below.</li> </ul>
Day	<p><b>This setting is only visible if you select</b> Scheduled restart of PRTG services <b>or</b> Scheduled system restart (recommended) <b>above</b>.</p> <p>Select a day of the week (<b>Monday</b> to <b>Sunday</b>) or month (<b>1st</b> to <b>30th</b> or <b>Last</b>). If you select Last, PRTG restarts the PRTG core server system on the last day of the month, regardless of how many days the month has.</p> <p><b>i</b> If you select a date that does not exist in every month (for example, the 30th day of February), PRTG automatically initiates the restart on the last day of this month.</p>
Time	<p><b>This setting is only visible if you select</b> Scheduled restart of PRTG services <b>or</b> Scheduled system restart (recommended) <b>above</b>.</p> <p>Select the time of day when PRTG performs the restart.</p> <p><b>i</b> You get a Windows warning message 10 minutes before the restart to inform you about the restart if you are logged in to PRTG. The actual restart time can differ by up to 30 minutes from the time you enter here.</p>

**i** You can also define a restart schedule on the Settings [tab](#) of a remote probe in the PRTG web interface.

### Send Logs to Paessler

Name

Email

Ticket#

Please supply your ticket number (PAEXXXX) if you already have an open support ticket.

If you click the "Send" button, this program will upload the relevant logfiles to Paessler's FTP server and support ticket system.

Please ensure that outgoing FTP and HTTP connections are enabled on this machine.

Note: Support communication can only be provided in English or German!

Send Logs to Paessler

If you open a support ticket, the Paessler support team might ask you to send logs for further analysis.

Field	Description
Name	Enter your name.
Email	Enter a valid email address. You can provide any email address but we recommend that you use the email address of your user account, which PRTG enters by default.
Ticket #	This field is optional. If you have already opened a ticket with the Paessler support team, provide the ticket number you received. Your files are then automatically associated with your ticket.

Field	Description
	Enter the ticket number starting with <b>PAE</b> followed by four or more digits, for example, <b>PAE12345</b> . If you do not have a ticket number, leave this field empty.

Click Send to start the data upload. PRTG then automatically collects, compresses, and sends your logs to our FTP over SSL (FTPS) server. Make sure that FTPS and HTTP connections are allowed on the remote probe system.

### Activate Changed Settings

After you change settings, click Save & Close. A new window opens where PRTG asks you to agree to restart the PRTG probe service. Click OK to proceed.

Restart Services

## Advanced Topics

# 14 Advanced Topics

In this section, we cover more advanced topics. If you already have some experience with PRTG, you might want to learn more about the following topics.

In this section:

- [Active Directory Integration](#) 
- [Application Programming Interface \(API\) Definition](#) 
  - [HTTP API](#) 
  - [Live Data](#) 
  - [Live Graphs](#) 
  - [Historic Data](#) 
  - [Object Manipulation](#) 
  - [Custom Sensors](#) 
  - [Custom Notifications](#) 
  - [Mini Probe API](#) 
- [Filter Rules for Flow, IPFIX, and Packet Sniffer Sensors](#) 
- [Channel Definitions for Flow, IPFIX, and Packet Sniffer Sensors](#) 
- [Define IP Address Ranges](#) 
- [Define Lookups](#) 
- [Regular Expressions](#) 
- [Calculating Percentiles](#) 
- [Add Remote Probe](#) 
  - [Remote Probes and Multiple Probes](#) 
  - [Classic Remote Probe Setup via Device Tools](#) 
- [Failover Cluster Configuration](#) 
- [Data Storage](#) 

## 14.1 Active Directory Integration

You can add PRTG user groups to PRTG, or you can add user groups from an Active Directory (AD). When you integrate the AD into PRTG, you map a user group from the AD to a user group in PRTG. All members of the AD group can then log in to PRTG with their AD domain credentials.

 You cannot add single AD users to PRTG. You can only allow access for entire AD groups. PRTG automatically creates a user account for each AD user that successfully logs in to PRTG.

 This feature is not available in PRTG Hosted Monitor.

### Step 1: Prepare the AD

- In the AD, make sure that the users that you want to give access to PRTG are members of the same user group in the AD.
- You can also organize users into different user groups, for example, one user group whose members have administrative rights in PRTG, and one user group whose members only have read access in PRTG.

### Step 2: Prepare the PRTG Core Server

- Make sure that the PRTG core server system is a member of the domain that you want to integrate it into. To check this setting, open the Windows Control Panel and click the Change settings link under System, section Computer name, domain, and workgroup settings.

### Step 3: Add AD Domain and Credentials (optional) to System Settings

- In the [PRTG web interface](#) <sup>124</sup>, select Setup | System Administration | Core & Probes from the main menu.
- In section Active Directory Integration, enter the name of the local AD domain in the Domain Name field.
  -  You can only integrate one AD domain into PRTG.
- The following process is optional. PRTG uses the same Windows user account from which a user runs the PRTG core server service. By default, this is the [local system](#) Windows user account. If this user does not have sufficient rights to query a list of all user groups from the AD, provide the credentials of a user account that has full AD access by using the Use explicit credentials option as Access Type.
  -  If you cannot save changes to the Core & Probes settings because you get an [Error \(Bad Request\)](#) with the message [Active Directory Domain not accessible](#), select Use explicit credentials as Access Type and provide the correct credentials for your AD domain.
- Save your settings.

### Step 4: Add a New User Group

- Go to the User Groups [tab](#) <sup>2912</sup>.
- Hover over  and click Add User Group to add a new user group.
- Enter a User Group Name to identify the group and select Use Active Directory integration under Active Directory or Single Sign-On Integration.

- From the Active Directory Group dropdown list, select the group in the AD whose members have access to PRTG. If you have a very large AD with more than 1,000 entries, you see an input field instead of a dropdown list. In this case, you can only enter the name of the user group in the AD. PRTG automatically adds the domain name prefix.
- For User Type, define the [access rights](#)<sup>[145]</sup> that a user from the selected AD group has when they log in to PRTG for the first time. You can choose between Read/write user and Read-only user. Read-only access is useful to only show data to a large group of users.
- Click Create.

All users in this newly created AD group can now log in to PRTG with their AD domain credentials. Their user accounts have the [group access rights](#)<sup>[145]</sup> of the user group that you just created.

## Notes and Restrictions

- AD users can [log in](#)<sup>[153]</sup> to the PRTG web interface with their Windows user name and password. Do not enter any domain information in the Login Name field. When an AD user logs in, PRTG automatically creates a corresponding local account on the PRTG core server. PRTG synchronizes credentials every hour.
- Do not change the Login Name in PRTG for AD users unless the name changes in the AD. If you change the Login Name in PRTG, it has no effect on the name in the AD.
- AD queries are in read-only mode and are compatible with Read-only Domain Controllers (RODC).
- For performance reasons, PRTG caches all requests to AD servers for one hour. If a password changes, if you add a new user group in the AD, or if you change the group membership of an AD user, you must either wait one hour or manually clear the cache by selecting Setup | System Administration | Administrative Tools from the main menu and clicking Go! in the Clear Caches section.
- By default, no access rights for monitoring objects, libraries, maps, or reports are set for the new user group in PRTG. This is why, initially, users in this user group do not see monitoring objects, libraries, maps, or reports. This does not apply if the new user group has administrative rights. Edit the monitoring [object's settings](#)<sup>[201]</sup> and the settings of libraries, maps, and reports, and set access rights for the newly created user group in the respective Access Rights section.
  - ⓘ We recommend that you set these access rights in the [root group settings](#)<sup>[453]</sup> and use the [inheritance of settings](#)<sup>[136]</sup>.
- PRTG only supports **explicit** user group rights. If the AD uses groups that are members of other user groups, PRTG does **not** regard the inherited implicit rights of the parent group and therefore refuses the login for members of these user groups.
- PRTG ignores AD information about organization units (OU). PRTG cannot read these values. However, if you use the AD in an [auto-discovery group](#)<sup>[262]</sup>, you can restrict the auto-discovery to machines that are part of an OU.
- You can integrate only one AD domain into PRTG.
- PRTG does not support trusted domains or AD subdomains.
- If you have a very large AD with more than 1,000 entries, you see an input field instead of a dropdown list. In this case, you can only enter the name of the user group in the AD. PRTG automatically adds the domain name prefix.
- A local user account for an AD user is only created if this AD user has successfully logged in to PRTG. If you want to send [email notifications](#)<sup>[2815]</sup> to an AD group in PRTG using the option Send to User Group in the notification settings, a member of this AD group has to log in to PRTG at least once to receive email notifications. To avoid this, enter the email address of the AD group in the Send to Email Address field in the notification settings and select None for the Send to User Group option.

- If you want to delete an AD group from PRTG because of some changes to the AD, for example, you must delete all users that are in this user group first. This is because AD users always have this user group set as their primary group, and user accounts must have a primary group.
- If you change the group membership of an AD user, this change is only reflected in the respective user groups in PRTG if this AD user has logged in to PRTG again.
- If you delete an AD user from all user groups in the AD that are related to PRTG access, this user cannot log in to PRTG anymore. However, you still see the user in the user account list in PRTG.

## 14.2 Application Programming Interface (API) Definition

The PRTG API enables you to access monitoring data and manipulate objects using HTTP requests, run your own written sensors and notifications, and implement mini probes.

In this section:

- [HTTP API](#)<sup>[3085]</sup>
- [Live Data](#)<sup>[3088]</sup>
  - [Single Object Property](#)<sup>[3089]</sup>
  - [Single Object Status](#)<sup>[3092]</sup>
  - [Multiple Object Property or Status](#)<sup>[3099]</sup>
  - [System Information](#)<sup>[3120]</sup>
- [Live Graphs](#)<sup>[3124]</sup>
- [Historic Data](#)<sup>[3127]</sup>
- [Object Manipulation](#)<sup>[3130]</sup>
- [Custom Sensors](#)<sup>[3137]</sup>
- [Custom Notifications](#)<sup>[3151]</sup>
- [Mini Probe API](#)<sup>[3153]</sup>

### More

#### KNOWLEDGE BASE

- <https://kb.paessler.com/en/topic/63737>

Where can I find PRTG mini probes which are ready to use?

- <https://kb.paessler.com/en/topic/61215>

## 14.2.1 HTTP API

All calls to the PRTG API are performed by HTTP GET requests. The URLs consist of a path to the API function and some parameters.

- If you are accessing the PRTG API inside your secure LAN, you can use HTTP. In environments that are not secure (for example, when accessing your PRTG core server via the internet), you should use HTTPS requests to make sure that your parameters and passwords are encrypted. This way, all communication between the PRTG core server and your client is Secure Sockets Layer (SSL) encrypted.
- For every API call, the default limit of items is **500**. If you want to receive more items per call, add a `count=xxx` parameter with enough room for all sensors.
- You must include authentication with API key or user name and `passhash` (or user name and password) in each request.  
■ See section [Authentication](#) for more information.
- All data in the GET parameters must be **UTF-8**-encoded and **URL** encoded.

### Output Formats

Most data that you can request from the PRTG API is available in data tables in the Extensible Markup Language (XML), the JavaScript Object Notation (JSON) format, and the comma-separated values (CSV) format (using the XML format is recommended). Here are some sample calls with different output formats.

 **Examples**

**XML**

```
https://yourserver/api/table.xml?content=sensors&columns=sensor
```

**JSON**

```
https://yourserver/api/table.json?content=sensors&columns=sensor
```

**CSV**

```
https://yourserver/api/table.xml?content=sensors&columns=sensor&output=csvtable
```

The example URLs consist of the following elements.

Element	Description
yourserver	The name of your PRTG server.
/api/table.xml or /api/table.json	Addresses an API function. Here, the function renders a table in the XML format or in the JSON format.
content=sensors	Parameter for additional control. In this case, it includes all sensors in the table.

Element	Description
columns=sensor	Parameter for additional control. In this case, only the names of all sensors are shown in the table.
output=csvtable (optional)	Renders a table in the CSV format.

## Authentication

All requests to the PRTG API are stateless, which means that there is no multi-step login process of any kind. You must include the authentication with an API key or with a user name and a passhash (or a user name and a password) in each request by using the apitoken parameter or the user name and passhash (or user name and password) parameters:

apitoken parameter

- apitoken=myapitoken

**i** You can add, edit, and delete your API keys in the account settings on the [API Keys](#)  tab.

user name and passhash (or user name and password) parameters

- username=myuser&passhash=hash (or password=mypassword)

**i** You can request the passhash for an account with the following API call:

<https://yourserver/api/getpasshash.htm?username=myuser&password=mypassword>

**i** Make sure that the user name and password are URL-encoded.

### Examples

```
https://yourserver/api/table.xml?content=sensors&columns=sensor&apitoken=myapitoken
```

or:

```
https://yourserver/api/table.xml?content=sensors&columns=sensor&username=myuser&password=mypassword
```

or:

```
https://yourserver/api/table.xml?content=sensors&columns=sensor&username=myuser&passhash=hash
```

## Versioning

Most XML replies from the PRTG API contain a `<version>` field that contains the [program version](#) and [buildnumber](#) of the server's PRTG installation. Your client must look at this version number and compare it to the version number that was used to develop the client. Do not accept version numbers older (smaller) than this one. You should display a warning to the user (or stop processing) if the version number differs by **0.1** or more (for example, version **18.1** vs. **18.2**, or version **17.x** vs. **18.x**). PRTG API conventions or parameters might have changed between versions.

**i** Newer versions of the same major version of PRTG reply to API calls just like previous versions did.

## Error Handling

Depending on whether an API call was successfully processed or not, the PRTG core server replies with the following HTTP status codes:

HTTP Status Code	Meaning	Comments
200	OK	The API call was successfully completed , the XML response contains the result data.
302	Found	The API call was successfully completed and a new object was created (the redirection URL contains the new object ID).
400	Bad Request	The API call could not be successfully completed. The XML response contains the error message.
401	Unauthorized	The user name/password credentials cannot be accepted.

For 400 error codes, the error .xml document includes the error message as follows:

```
<?xml version="1.0" encoding="UTF-8" ?>
<prtg>
  <version>23.4.90.1235+</version>
  <error>Sorry, there is no object with the specified id.</error>
</prtg>
```

## More

### ■ KNOWLEDGE BASE

How can I use the PRTG Application Programming Interface (API)?

- <https://kb.paessler.com/en/topic/593>

## 14.2.2 Live Data

You can access live data and live status data of objects using the PRTG API.

In this section:

- [Single Object Property](#) [3089]
- [Single Object Status](#) [3092]
- [Multiple Object Property or Status](#) [3099]
- [System Information](#) [3120]

### Getting PRTG System Status

You can also get the PRTG system status such as the number of alarms or messages using the following API calls.

 **Examples**

Live system status in the Extensible Markup Language (XML) format:

```
/api/getstatus.xml?id=0
```

Live system status in the JavaScript Object Notation (JSON) format:

```
/api/getstatus.htm?id=0
```

All sensors in use in the JSON format:

```
/api/sensortypesinuse.json
```

Number of all sensor states:

```
/api/gettreenodestats.xml
```

### Getting PRTG Health Status

You can also get the overall PRTG system health status such as probe connection status and if login is possible using the following API calls:

 **Examples**

Live overall system status of PRTG in the JSON format:

```
/api/healthstatus.json
```

Live overall system status of PRTG Hosted Monitor in the JSON format:

```
/api/healthstatus.json&mode=hosted
```

## Getting PRTG Health Data

You can also get the PRTG health data such as system CPU used (%), system memory used (%), disk space used (%), disk space used (GB), health (%), total number of probes, disconnected probes, total sensors, and sensor in the Unknown status using the following API calls:

### Example

Live health data of PRTG in the JSON format using `maxage`:

```
/api/health.json&maxage=age
```

**i** `maxage` is the age in seconds for data to be considered "old". For example, if data is older than 4 minutes and `maxage=120`, the data will be refreshed and then sent to the client.

Live health data of PRTG in the JSON format using `refreshnow`:

```
/api/health.json&refreshnow=1/anything_else
```

**i** If `refreshnow=1`, the data will be refreshed before the API call is returned. Also, if `refreshnow=1` is present in the API call, `maxage` will not be considered.

## More

### KNOWLEDGE BASE

How can I use the PRTG Application Programming Interface (API)?

- <https://kb.paessler.com/en/topic/593>

### 14.2.2.1 Single Object Property

You can access live data and live status data of single objects using the PRTG API.

**i** Authentication with API key or user name and `passhash`<sup>[2803]</sup> (or user name and password) must always be included in each PRTG API request. See section [HTTP API](#)<sup>[8086]</sup> for more information.

In this section:

- [Property/Setting of an Object](#)<sup>[3089]</sup>
- [Supported Object Types](#)<sup>[3090]</sup>
- [Available Channel Parameters](#)<sup>[3091]</sup>
- [Property of a Channel](#)<sup>[3091]</sup>

### Property/Setting of an Object

You can get the properties or settings of an object (name, hostname, url) using the following API calls.

**i** Because properties might contain HTML content, we recommend that you include `&show=nohtmlencode` in all `getobjectproperty` API calls.

 Examples

Get an object property/setting:

```
/api/getobjectproperty.htm?id=objectid&name=propertyname&show=nohtmlencode
```

 For **propertyname**, look at the name of the INPUT fields while editing an object. You can discern the **propertyname** parameter by opening the Settings tab of an object and looking at the HTML source of the INPUT fields. For example, the INPUT field for the tags of an object has the name **tags\_**. Leave away the underscore **\_** and use **tags** as a value for the **propertyname** parameter.

Get a list of all tags for object ID 1003

```
/api/getobjectproperty.htm?id=1003&name=tags&show=nohtmlencode
```

The Extensible Markup Language (XML) result looks like this:

```
<?xml version="1.0" encoding="UTF-8" ?>
<prtg>
  <version>23.4.90.1235+</version>
  <result>probehealthsensor</result>
</prtg>
```

## Supported Object Types

[getobjectproperty.htm](#) supports the following object types:

- probe
- group
- device
- sensor
- channel
- library
- map
- notification
- report
- schedule
- user account

[getobjectproperty.htm](#) does not support the object types **ticket** and **user group**.

## Available Channel Parameters

Name of Input Field	Setting Name (as displayed in the PRTG web interface)
name	Name
limitmode	Limit disabled or enabled (0 or 1)
limitmaxerror	Upper Error Limit
limitmaxwarning	Upper Warning Limit
limitminwarning	Lower Warning Limit
limitminerror	Lower Error Limit
limiterroormsg	Error Limit Message
limitwarningmsg	Warning Limit Message

## Property of a Channel

With this API call, you can get a sensor's [channels settings](#)<sup>2681</sup>, for example channel limits. In general, this works like getting properties of any other object. To get channel properties via the PRTG API, you need to provide

- the ID of a sensor (parameter `id`),
- a `subtype` (`channel` for channels), and
- a `subid` (ID of the channel that you want to edit)

**i** Because properties might contain HTML content, we recommend that you include `&show=nohtmlencode` in all `getobjectproperty` API calls.

### Examples

#### Get a channel limit

```
/api/getobjectproperty.htm?  
id=sensorid&subtype=channel&subid=channelid&name=limitname&show=nohtmlencode
```

For example, the following API call gets the upper warning limit of a channel with the ID `0` of a sensor with the ID `1003`

```
/api/getobjectproperty.htm?  
id=1003&subtype=channel&subid=0&name=limitmaxwarning&show=nohtmlencode
```

The XML result looks like this:

```
<?xml version="1.0" encoding="UTF-8" ?>
<prtg>
  <version>23.4.90.1235+</version>
  <result>25</result>
</prtg>
```

## More

### ■ KNOWLEDGE BASE

How can I use the PRTG Application Programming Interface (API)?

- <https://kb.paessler.com/en/topic/593>

### 14.2.2.2 Single Object Status

You can access live data and live status data of single objects using the PRTG API.

- ❗ Authentication with API key or user name and [passhash](#) (or user name and password) must always be included in each PRTG API request. See section [HTTP API](#) for more information.

In this section:

- [Status of an Object](#)
- [Supported Object Types](#)
- [Supported getobjectstatus Output Columns \("Name=" Parameter\)](#)
- [Sensor Details](#)
- [Ticket Status and Message](#)

## Status of an Object

You can get the status information (lastvalue, downtime) of an object using the following API calls:

### 🗨 Examples

Get object status:

```
/api/getobjectstatus.htm?id=objectid&name=columnname
```

The Extensible Markup Language (XML) result looks like this:

```
<?xml version="1.0" encoding="UTF-8" ?>
<prtg>
  <<version>23.4.90.1235</version>
  <result>True</result>
</prtg>
```

**i** In some cases, the result can contain HTML formatting elements.

## Supported Object Types

[getobjectstatus.htm](#) supports the following object types:

- probe
- group
- device
- sensor

## Supported getobjectstatus Output Columns ("Name=" Parameter)

With [getobjectstatus.htm](#), you can use the following column names for the `name` parameter.

**i** Only one column name is allowed in the API call.

**i** If you want to use combinations of column names or more than one object in a single API call, use a [table](#) API call instead. For more information, see section [Multiple Object Property or Status](#) <sup>3093</sup>.

Column Name	What It Displays	Can Be Used for
objid	ID of the object	probes, groups, devices, sensors
type	Object type or sensor type	probes, groups, devices, sensors
name	Name of the object	probes, groups, devices, sensors
tags	List of all tags. This includes tags from the object itself plus tags that are inherited from parent objects.	probes, groups, devices, sensors
active	True/false depending on whether an object is set to paused by a user	probes, groups, devices, sensors
downtime	Cumulated downtime of the sensor (displayed as percentage of uptime+downtime)	sensors

Column Name	What It Displays	Can Be Used for
downtime	Cumulated downtime of the sensor (in minutes/hours)	sensors
downtimesince	Elapsed time since the last Up status of the sensor	sensors
uptime	Cumulated uptime of the sensor (displayed as percentage of uptime+downtime)	sensors
uptime	Cumulated uptime of the sensor (in minutes/hours)	sensors
uptimesince	Elapsed time since the last Down status of a sensor	sensors
knowntime	Sum of cumulated uptime and downtime of the sensor   The output contains HTML.	sensors
cumsince	Time stamp when accumulation of uptimes/downtimes began	sensors
sensor	Name of the sensor	sensors
interval	Effective interval setting for the sensor	sensors
lastcheck	Time stamp of the last sensor result   The output contains HTML.	sensors
lastup	Time stamp of the most recent Up status of the sensor   The output contains HTML.	sensors
lastdown	Time stamp of the most recent Down status of the sensor   The output contains HTML.	sensors
device	For sensors: ID of the associated device	devices, sensors

Column Name	What It Displays	Can Be Used for
	For devices: name of the associated device	
group	For sensors: ID of the associated group For devices: name of the associated group	groups, devices, sensors
probe	Name of the associated probe	probes, groups, devices, sensors
grpdev	Name of the associated device and associated group, separated by slash	sensors
notifiesx	Returns a string containing the number of each trigger type defined for this object. If trigger inheritance is active, it displays <a href="#">Inherited</a> .	probes, groups, devices, sensors
intervalx	Either <a href="#">Inherited</a> or the current interval setting of the object	probes, groups, devices, sensors
dependency	Name of an associated dependency or <a href="#">Parent</a>   The output contains HTML.	probes, groups, devices, sensors
probegroupdevice	Partial object hierarchy with names of associated device, group, and probe separated by angle brackets (>).   The output contains HTML.   <a href="#">probegroupdevice</a> is not available in the CSV format.   For the complete object hierarchy, use probe, group, device instead.	probes, groups, devices, sensors
status	Integer of the status of the object (0=None, 1=Unknown, 2=Scanning, 3=Up, 4=Warning, 5=Down, 6=No Probe, 7=Paused by User, 8=Paused by Dependency, 9=Paused by Schedule, 10=Unusual, 11=Not Licensed, 12=Paused Until, 13=Down Acknowledged, 14=Down Partial)	probes, groups, devices, sensors

Column Name	What It Displays	Can Be Used for
message	Detailed message of the object ⓘ The output contains HTML.	probes, groups, devices, sensors
priority	Priority setting of the object ⓘ The output contains HTML.	probes, groups, devices, sensors
lastvalue	Last sensor result value	sensors
upsens	Number of sensors in the Up status ⓘ PRTG only counts the sensor itself or sensors below the object in the hierarchy. ⓘ If the count is <1 PRTG returns "".	probes, groups, devices, sensors
downsens	Number of sensors in the Down status ⓘ PRTG only counts the sensor itself or sensors below the object in the hierarchy. ⓘ If the count is <1 PRTG returns "".	probes, groups, devices, sensors
downacksens	Number of sensors in the Down (Acknowledged) status ⓘ PRTG only counts the sensor itself or sensors below the object in the hierarchy. ⓘ If the count is <1 PRTG returns "".	probes, groups, devices, sensors
partialdownsens	Number of sensors in the Down (Partial) status ⓘ PRTG only counts the sensor itself or sensors below the object in the hierarchy. ⓘ If the count is <1 PRTG returns "".	probes, groups, devices, sensors
warnsens	Number of sensors in the Warning status	probes, groups, devices, sensors

Column Name	What It Displays	Can Be Used for
	<p>ⓘ PRTG only counts the sensor itself or sensors below the object in the hierarchy.</p> <p>ⓘ If the count is &lt;1 PRTG returns "".</p>	
pausedsens	<p>Number of sensors in the Paused status</p> <p>ⓘ PRTG only counts the sensor itself or sensors below the object in the hierarchy.</p> <p>ⓘ If the count is &lt;1 PRTG returns "".</p>	probes, groups, devices, sensors
unusualsens	<p>Number of sensors in the Unusual status</p> <p>ⓘ PRTG only counts the sensor itself or sensors below the object in the hierarchy.</p> <p>ⓘ If the count is &lt;1 PRTG returns "".</p>	probes, groups, devices, sensors
undefinedsens	<p>Number of sensors in an undefined status, like None, Unknown, No Probe</p> <p>ⓘ PRTG only counts the sensor itself or sensors below the object in the hierarchy.</p> <p>ⓘ If the count is &lt;1 PRTG returns "".</p>	probes, groups, devices, sensors
totalsens	<p>Number of all sensors</p> <p>ⓘ PRTG only counts the sensor itself or sensors below the object in the hierarchy.</p> <p>ⓘ If the count is &lt;1 PRTG returns "".</p>	probes, groups, devices, sensors
favorite	<p>An exclamation mark (!) if the object is marked as favorite</p> <p>ⓘ The output contains HTML.</p>	groups, devices, sensors
schedule	<p>Name of the associated schedule</p>	probes, groups, devices, sensors

Column Name	What It Displays	Can Be Used for
minigraph	Numeric data for the minigraphs. Numbers are 5-minute averages for the last 24 hours (must be scaled to the maximum of the series). There are two datasets: " " separates measured value series and error series.   The output contains HTML.	sensors
comments	Object comments	probes, groups, devices, sensors
host	Hostname or IP address	devices
condition	For probes: If the probe is connected or disconnected (0=Disconnected, 1=Unauthorized, 2=Connected, 3=Banned, 4=Init)  For groups: The auto-discovery status	probes, groups
basetype	Object type (string)	probes, groups, devices, sensors
baselink	URL of the object	probes, groups, devices, sensors
icon	URL of the device icon	devices
parentid	ID of the parent object	probes, groups, devices, sensors
location	Location property (used in Geo Maps)   The output contains HTML.	devices
groupnum devicenum	Number of groups or devices in the probe or group	probes, groups

## Sensor Details

You can get details about a sensor (sensortype, interval, uptime) using the following API calls:

-  You need the sensor ID to get details about a sensor. You can find the ID on the sensor's Overview tab or by hovering over a sensor in the device tree, for example. For more information about the Overview tab, see the Knowledge Base: [What options do I have to review my monitoring data in detail?](#)

 Examples

Get details about a sensor in the XML format:

```
/api/getsensordetails.xml?id=sensorid
```

Get details about a sensor in the JavaScript Object Notation (JSON) format:

```
/api/getsensordetails.json?id=sensorid
```

## Ticket Status and Message

The following API calls return status and message of a ticket.

 Examples

The status of a ticket:

```
/api/getticketstatus.htm?id=ticketid
```

The subject and assignee of a ticket:

```
/api/getticketmessage.htm?id=ticketid
```

## More

### KNOWLEDGE BASE

How can I use the PRTG Application Programming Interface (API)?

- <https://kb.paessler.com/en/topic/593>

What options do I have to review my monitoring data in detail?

- <https://kb.paessler.com/en/topic/90007>

### 14.2.2.3 Multiple Object Property or Status

You can access live data and live status data of multiple objects using the PRTG API.

 Authentication with API key or user name and [passhash](#)<sup>[2803]</sup> (or user name and password) must always be included in each PRTG API request. See section [HTTP API](#)<sup>[8086]</sup> for more information.

In this section:

- [Property or Status of Multiple Objects](#)<sup>[3100]</sup>
- [Table Query Builder](#)<sup>[3100]</sup>
- [Output Data Format](#)<sup>[3100]</sup>
- [RAW Date/Time Format](#)<sup>[3101]</sup>
- [Common Data Table Parameters](#)<sup>[3101]</sup>
- [Filtering by Object ID](#)<sup>[3102]</sup>

- [Sorting and Advanced Filtering](#) <sup>[3103]</sup>
- [Supported Output Columns \("columns=" Parameter\)](#) <sup>[3111]</sup>

## Property or Status of Multiple Objects

Most data that you can request from the PRTG API is available in data tables in the Extensible Markup Language (XML) format, the JavaScript Object Notation (JSON) format, and the comma-separated values (CSV) format (using the XML format is recommended). The API function [/api/table.xml](#) is used to access data in tables. Here are some sample calls (URLs are shown without authentication parameters to enhance readability).

- i** The example URLs only show the XML URLs. Use the API function [/api/table.csv](#) or the `output=constable` parameter to select the CSV format, or [/api/table.json](#) to return the JSON format.

**Examples**

A hierarchical list of all groups, devices, and sensors with their status information:

```
/api/table.xml?content=sensortree
```

**i** `sensortree` does not support JSON output.

All sensors (with status information):

```
/api/table.xml?
content=sensors&columns=objid,group,device,sensor,status,message,lastvalue,priority
,favorite
```

All recent log entries:

```
/api/table.xml?
content=messages&columns=objid,datetime,parent,type,name,status,message
```

You have the easiest start if you use the [table query builder](#) <sup>[3100]</sup> or click , which most data tables have in the PRTG web interface. Navigate to the information that you want to use, click , and you are taken to a URL that renders the content of the table in XML format. You can now use the URL as it is or change various parameters to suit your needs.

- For more information on possible raw message status values returned by table-based API calls, see the Knowledge Base: [Is there a list of log status values for the PRTG API?](#)

## Table Query Builder

You can use the query builder tool to experiment with the PRTG API and to fine-tune your queries. You can find it in the PRTG web interface under Setup | PRTG API, section Live Data.

## Output Data Format

XML data from the PRTG API contains the fields that you requested in the `columns` parameter. In most cases, numeric values are included twice: One field contains the value in human-readable format and an additional `_RAW` field contains the value as a number, which is better suited for further processing and calculations.

**Example**

```
<status>Up</status>
<status_RAW>3</status_RAW>
<lastvalue>98 %</lastvalue>
<lastvalue_RAW>97.7583</lastvalue_RAW>
<message>Created.<br/>18.3.43.1360</message>
<message_RAW>Created. 18.3.43.1360</message_RAW>
```

- The **status** field shows the value Up (the according RAW value is 3).
- The **lastvalue** field shows the value 98% (the according RAW value is 97.7583).
- The **message** field shows the text Created.<br/>18.3.43.1360 (the according RAW value is Created. 18.3.43.1360).

**i** Strings returned from **\_RAW** columns are surrounded by double quotation marks (") in JSON output.

### RAW Date/Time Format

For columns with date/time value, the RAW value is defined as follows: The integral part of a value is the number of days that have passed since Dec 30th, 1899. The fractional part of a value is a fraction of a 24-hour day that has elapsed. To find the fractional number of days between two dates, subtract the two values. Similarly, to increment a date and time value by a certain fractional number of days, add the fractional number to the date and time value.

Here are some examples of date/time RAW values and their corresponding dates and times:

RAW Date/Time Value	Description
0	12/30/1899 00h00m (12:00 midnight)
2.75	1/1/1900 18h00m (6:00 pm)
35065	1/1/1996 00h00m (12:00 midnight)

### Common Data Table Parameters

The following parameters are common to all data table API calls:

Parameter	Description	Possible Values
content	Select the objects that you want to have in your table.	sensortree (JSON output not supported)

Parameter	Description	Possible Values
		devices sensors tickets ticketdata messages values channels reports storedreports toplists sysinfo (only JSON output supported)
columns	Comma-separated list of columns per record	see <a href="#">Supported Output Columns ("columns=" Parameter)</a>
output	Control the output format	xml: default format (recommended) xmltable: an HTML table in the XML format csvtable: CSV format html: HTML table json: JSON format jsontable: a table in the JSON format
count	Maximum number of items (The default count is 500)	1-50000
start	Start with this entry number (can be used with "count" to request the data page by page)	any

### Filtering by Object ID

Add an ID parameter (for example, `id=1`) to the API URL to select a subset of items for the data table, for example, to reduce the amount of data transferred for each data table API call. The data table only contains information for this object ID and its child objects.

**i** Some table types require an ID. If you omit the ID parameter or if it has the value zero (0), all available objects are used.

Table Type (content=)	ID Required or Optional	Description	Object Types Allowed for the ID
sensortree	optional	You only get a part of the tree (the object with the specified ID and all child objects below it).   JSON output is not supported.	Probe Group
sensors devices	optional	You only get the object with the specified ID and all child objects below it.	Probe Group Device
tickets messages	optional	You only get tickets or log file entries that are related to the object with the specified ID or any child objects below it.	Any object
values channels	required	You get the data values (or channels) of the sensor with the specified ID.	Sensor
reports	not used	This data table always includes all reports.	n/a
storedreports	required	You get a list of stored .pdf files of the report selected by the ID.	Report
ticketdata	required	You get the history of the ticket selected by the ID.	Ticket
sysinfo	required	You get system information of the object with the specified ID.	Device

## Sorting and Advanced Filtering

There are various options to further filter and to sort the data for each data table API call:

Parameter	Description	Possible Values
filter_drel	<p>Only include records younger than this setting</p> <p><b>i</b> For <a href="#">content=messages</a> and <a href="#">content=tickets</a> only.</p>	<p>today</p> <p>yesterday</p> <p>7days</p> <p>30days</p> <p>12months</p> <p>6months</p>
filter_status	<p>Only include sensors with a specific status. Using multiple filter_status fields performs a logical OR.</p> <p><b>i</b> For <a href="#">content=sensors</a> and <a href="#">content=devices</a> only.</p>	<p>Unknown=1</p> <p>Collecting=2</p> <p>Up=3</p> <p>Warning=4</p> <p>Down=5</p> <p>NoProbe=6</p> <p>Paused by User=7</p>

Parameter	Description	Possible Values
		Paused by Dependency = 8 Paused by Schedule = 9 Unusual = 10 Paused by License = 11 Paused Until = 12 Down Acknowledged = 13 Down Partial = 14
filter_tags	Only include sensors with a specific tag. Using multiple filter_tag fields performs a logical OR. ⓘ For <a href="#">content=sensors</a> only.	@tag(tagname)

Parameter	Description	Possible Values
filter_xyz	<p>Filter the data. (Samples: filter_type=ping, filter_favorite=1). Using multiple filter_xyz fields performs a logical AND.</p> <p>Filtering using columns is only possible for tree objects. You cannot use columns to filter objects like messages or tickets, for example. For <a href="#">content=tickets</a>, you can use the special filter terms filter_status, filter_user, and filter_type (this corresponds to column tickettype).</p> <p>Like for messages, you can also use filter_drel, filter_dstart, and filter_dend.</p> <p> Multiple filters are not available for tickets.</p>	filter_xyz where xyz is any column name used in the columns parameter

Parameter	Description	Possible Values
		Numerical values not equal to/above/below: use filter _xy z= @n eq(value), filter _xy z= @above(value), filter _xy z= @below(value)

Parameter	Description	Possible Values
		<p>Partial match substrings: use filter _xy z= @sub(s ubstring 1,substring2)</p> <p>Exact match substrings: use filter _xy z= @xt(s ubstring) or filter _xy z= @nt(xt(s ubstring))</p>

Parameter	Description	Possible Values
		<p> @txt and @nxt require that you enter the entire substring to filter properly. The filters are case sensitive. Use @nxt if you want to define a substring to exclude from the results.</p>

Parameter	Description	Possible Values
sortby	Sort the data. If this parameter is omitted, the table is sorted based on the first column. Add a leading "-" to reverse sort order. (Samples: sortby=name, sortby=lastvalue, sortby=-lastvalue, sortby=uptime)	Any column name used in the columns parameter.   Log tables with content=messages are always sorted by descending date.

 Examples

Here are some samples for filtered API calls:

All sensors that are not in the Up [status](#)<sup>1811</sup> (with their status and downtime information):

```
/api/table.xml?
content=sensors&columns=objid,downtimesince,device,sensor,lastvalue,status,message,
priority
&filter_status=5&filter_status=4&filter_status=10&filter_status=13&filter_status=14
&sortby=priority
```

**Fastest Ping sensors:**

```
/api/table.xml?
content=sensors&columns=objid,sensor,lastvalue,status,message&sortby=lastvalue
&filter_type=ping
```

**Log entries of the last 7 days for object id 2003:**

```
/api/table.xml?content=messages&id=2003&start=0&filter_drel=7days&columns=
objid,datetime,type,name,status,message
```

**Supported Output Columns ("columns=" Parameter)**

You can use the following column names for the `columns` parameter (separated by comma, for example, `columns=objid,name,type`).

Column Name	What It Displays	Can Be Used for
objid	ID of the object	all object tables
type	Object type (group, device, report, etc.), or the sensor type (ping, http, etc.), or event type for tickets (relevant for ToDo tickets)	all object tables
name	Name of the object or channel.  For log messages/tickets: the name of the related object.  For stored reports: the name of the report file.	all object tables  channels  messages  storedreports  toplists  tickets
tags	List of all tags (for tickets: tags for the related object). This includes tags from the object itself plus tags that are inherited from parent objects.	all object tables (except for user)

Column Name	What It Displays	Can Be Used for
active	True/false depending on whether an object is set to paused by a user (for tickets: related object). For notifications that are paused by schedule, it also displays the end of the schedule.	all object tables
downtime	Cumulated downtime of the sensor (displayed as percentage of uptime+downtime)	sensors
downtimetype	Cumulated downtime of the sensor (in minutes/hours)	sensors
downtimesince	Elapsed time since last Up status of the sensor	sensors
uptime	Cumulated uptime of the sensor (displayed as percentage of uptime+downtime)	sensors
uptimetype	Cumulated uptime of the sensor (in minutes/hours)	sensors
uptimesince	Elapsed time since the last Down status of the sensor	sensors
knowntime	Sum of cumulated uptime and downtime of the sensor	sensors
cumsince	Time stamp when accumulation of uptimes/downtimes began	sensors
sensor	Name of the sensor	sensors toplists
interval	Effective interval setting for the sensor	sensors
lastcheck	Time stamp of the last sensor result	sensors
lastup	Time stamp of the most recent Up status of the sensor	sensors

Column Name	What It Displays	Can Be Used for
lastdown	Time stamp of the most recent Down status of the sensor	sensors
device	Name of the associated device	sensors devices
group	Name of the associated group	sensors devices groups
probe	Name of the associated probe	sensors devices groups probes
grpdev	Name of the associated device and the associated group separated by a forward slash (/)	sensors devices
notifiesx	Number of each trigger type defined for the object	probes groups devices sensors
intervalx	Either <a href="#">Inherited</a> or the current interval setting of the object	probes groups devices sensors
accessrights	Access rights of the current user for the sensor tree object	all objects (except for user), for example: probes groups devices sensors
dependency	Name of an associated dependency or <a href="#">Parent</a>	probes

Column Name	What It Displays	Can Be Used for
		groups devices sensors
probegroupdevice	<p>Partial object hierarchy with names of associated device, group, and probe separated by a forward slash (/).</p> <ul style="list-style-type: none"> <li><b>i</b> The output contains HTML.</li> <li><b>i</b> <code>probegroupdevice</code> is not available in the CSV format.</li> <li><b>i</b> For the complete object hierarchy, use <code>probe</code>, <code>group</code>, <code>device</code> instead.</li> </ul>	sensor device group probe
status	<p>For sensor tree objects: status of the object (0=None, 1=Unknown, 2=Scanning, 3=Up, 4=Warning, 5=Down, 6=No Probe, 7=Paused by User, 8=Paused by Dependency, 9=Paused by Schedule, 10=Unusual, 11=Not Licensed, 12=Paused Until, 13=Down Acknowledged, 14=Down Partial)</p> <p>For messages: category of the log message</p> <p>For tickets: status of ticket (open, resolved, closed)</p>	sensors devices groups probes messages tickets
message	Detailed message of the sensor tree object (for example, last error of the sensor) or the history entry, log entry, ticket subject	sensors devices groups probes messages tickets ticketdata history

Column Name	What It Displays	Can Be Used for
priority	Priority setting of the sensor tree object or the priority of the log entry/ticket	sensors devices groups probes messages tickets (not supported: schedule, notification, user)
lastvalue	Last sensor result value or channel values  When used with channels, you must use <code>lastvalue_</code> to automatically display volumes and speed.	sensors channels
upsens	Number of sensors in the Up status   PRTG only counts the sensor itself or sensors below the object in the hierarchy.	all sensors devices groups probes
downsens	Number of sensors in the Down status   PRTG only counts the sensor itself or sensors below the object in the hierarchy.	all sensors devices groups probes
downacksens	Number of sensors in the Down (Acknowledged) status   PRTG only counts the sensor itself or sensors below the object in the hierarchy.	all sensors devices groups probes
partialdownsens	Number of sensors in the Down (Partial) status   PRTG only counts the sensor itself or sensors below the object in the hierarchy.	all sensors devices groups probes

Column Name	What It Displays	Can Be Used for
warnsens	<p>Number of sensors in the Warning status</p> <p><b>i</b> PRTG only counts the sensor itself or sensors below the object in the hierarchy.</p>	<p>all sensors</p> <p>devices</p> <p>groups</p> <p>probes</p>
pausedsens	<p>Number of sensors in the Paused status. This includes all Paused states ('paused by user', 'paused by dependency', 'paused by schedule', etc.).</p>	<p>all sensors</p> <p>devices</p> <p>groups</p> <p>probes</p>
unusualsens	<p>Number of sensors in the Unusual status</p> <p><b>i</b> PRTG only counts the sensor itself or sensors below the object in the hierarchy.</p>	<p>all sensors</p> <p>devices</p> <p>groups</p> <p>probes</p>
undefinedsens	<p>Number of sensors in an undefined status, like None, Unknown, No Probe</p> <p><b>i</b> PRTG only counts the sensor itself or sensors below the object in the hierarchy.</p>	<p>all sensors</p> <p>devices</p> <p>groups</p> <p>probes</p>
totalsens	<p>Number of all sensors</p> <p><b>i</b> PRTG only counts the sensor itself or sensors below the object in the hierarchy.</p>	<p>all sensors</p> <p>devices</p> <p>groups</p> <p>probes</p>
size	<p>Performance impact of the sensor (1=Very Low, 2=Low, 3=Medium, 4=High, 5=Very High)</p>	<p>sensors</p>
value	<p>The channel value or the Toplist value</p>	<p>values</p> <p>topdata</p>

Column Name	What It Displays	Can Be Used for
	Should only be used as <code>value_</code> , because then it is expanded for all visible channels/toplist columns	
coverage	Sensor coverage of the time span in a value table.	values
favorite	An exclamation mark (!) if the sensor tree object is marked as favorite	sensors devices groups probes
user	User responsible for a history entry or the user (or user group) a ticket is assigned to.	history tickets ticketdata
parent	Name of the parent object of the associated object of a log message	messages
datetime	Time stamp or time span of the object (for tickets: last modification)	messages tickets ticketdata values history storedreports topidx
dateonly	Like <code>datetime</code> but only the date part	messages tickets history values
timeonly	Like <code>datetime</code> but only the time part	messages tickets history

Column Name	What It Displays	Can Be Used for
		values
schedule	For sensor tree objects: Name of the associated schedule  For reports: Report generation schedule	probes groups devices sensors reports
period	Period of the report (day, week, etc.)	reports
email	Email address of the report	reports
template	Template used by the report	reports
lastrun	Time stamp of the last generation of a report	reports
nextrun	Time stamp of the next generation of a report	reports
size	Size of a stored report	size of a stored report
minigraph	Numeric data for the minigraphs. Numbers are 5-minute averages for the last 24 hours (must be scaled to the maximum of the series). There are two datasets: " " separates measured value series and error series.	sensors
deviceicon	Device icon	devices
comments	Object comments  For tickets: related object	all objects
host	Hostname or IP address	devices
devices	For probes: probe status (0=Disconnected, 1=Unauthorized, 2=Connected, 3=Banned, 4=Init)	probes groups

Column Name	What It Displays	Can Be Used for
	For groups: auto-discovery status	
basetype	Object type (string)	all tree objects
baselink	URL of the object	all tree objects
icon	URL of the device icon	devices
parentid	ID of the parent object or ID of a ticket	all tree objects tickets
location	Location property (used in Geo Maps)	devices
fold	Subobjects are folded up (true) or down (false)  For tickets: user (or user group) to which a ticket is assigned read it since last change	probes groups tickets
groupnum devicenum	Number of groups or devices in the probe or group	probes groups
tickettype	Type of ticket: user, notification, todo	tickets
modifiedby	User who edited the ticket most recently	tickets ticketdata
actions	Types of all ticket edits	ticketdata
content	Text of the ticket that was added with the last edit	ticketdata
channel	Number of channels with an ID greater than or equal to 0	sensors
_key, _value	Key value pair from the system table	sysinfo (category: system)

Column Name	What It Displays	Can Be Used for
_displayname, _class, _caption	Display name, class, and caption from the system table	sysinfo (category: hardware)
_user, _domain	User and domain pair from the system table	sysinfo (category: loggedonusers)
_displayname, _creationdate, _processid	Display name, creation date, and process id from the system table	sysinfo (category: processes)
_displayname, _state, _startmode	Display name, state, and start mode from the system table	sysinfo (category: services)
_displayname, _version	Display name and version pair from the system table	sysinfo (category: software)

## More

### ■ KNOWLEDGE BASE

Is there a list of log status values for the PRTG API?

- <https://kb.paessler.com/en/topic/76501>

How can I use the PRTG Application Programming Interface (API)?

- <https://kb.paessler.com/en/topic/593>

### 14.2.2.4 System Information

You can access live data and live status data for system information using the PRTG API.

- ❗ Authentication with API key or user name and [passhash](#)<sup>[2803]</sup> (or user name and password) must always be included in each PRTG API request. See section [HTTP API](#)<sup>[8086]</sup> for more information.

To retrieve system information using API calls, we recommend that you use the following order:

1. Refresh the system information so that it is up to date, if necessary.  
For details, see [Scan Now](#)<sup>[3121]</sup>.
2. Retrieve generic system information to make sure that the last scan (step 1) was successful and that there are no errors.  
For details, see [Generic Data](#)<sup>[3121]</sup>.
3. Retrieve system information in the form of data tables.  
For details, see [Data Tables](#)<sup>[3122]</sup>.

- ❗ System information API calls only support the JavaScript Object Notation (JSON) output.

## Scan Now

The following API calls to retrieve new information for a [system information](#) <sup>[205]</sup> category. To refresh system information via the API, you need to provide

- the ID of a device (parameter `id`), and
- a `kind` ([system information category](#) <sup>[3127]</sup>).

**i** We recommend that you only refresh system information if absolutely necessary because the refresh triggers a rescan of all system information tables.

**Examples**

Refresh process information

```
/api/sysinfochecknow.json?id=deviceid&kind=processes
```

Refresh hardware information

```
/api/sysinfochecknow.json?id=deviceid&kind=hardware
```

**i** `sysinfochecknow` only supports JSON output.

## Supported Output Columns ("kind=" Parameter)

Column Name	Category (as displayed in the PRTG web interface)
system	System
hardware	Hardware
processes	Processes
services	Services
software	Software
loggedonusers	Users

## Generic Data

The following API calls retrieve generic data about the system information category since the last scan, for example time stamps and if the last scan was successful. To retrieve this information via the PRTG API, you need to provide

- the ID of a device (parameter `id`), and
- a `kind` (system information category).

 Examples

**Users**

```
/api/sysinfo.json?id=deviceid&kind=loggedonusers
```

**Services**

```
/api/sysinfo.json?id=deviceid&kind=services
```

 **sysinfo** only supports JSON output.

## Data Tables

The following API calls retrieve all information from a system information category table. To retrieve this information via the PRTG API, you need to provide

- the content type (always **sysinfo**),
- the category (as displayed in the PRTG web interface),
- columns (see [Supported Output Columns \("columns=" Parameter\)](#)<sup>B122</sup>), and
- the ID of a device (parameter id).

 Examples

**System**

```
/api/table.json?
id=deviceid&content=sysinfo&category=system&usecaption=true&headers=key,value&columns=_key,_value
```

**Software**

```
/api/table.json?
id=deviceid&content=sysinfo&category=software&usecaption=true&headers=key,value&columns=_displayname,_version
```

 Data tables for system information only support JSON output.

## Supported Output Columns ("columns=" Parameter)

You can use the following sysinfo-specific column names for the **columns** parameter (separated by comma, for example, **columns=\_key,\_value**).

- For a list of all supported column names, see section [Multiple Object Property or Status](#)<sup>B111</sup>.

Column Name	Description	Can Be Used for
_key, _value	Key value pair from the system table	sysinfo (category: system)
_displayname, _class, _caption	Display name, class, and caption from the system table	sysinfo (category: hardware)
_user, _domain	User and domain pair from the system table	sysinfo (category: loggedonusers)
_displayname, _creationdate, _processid	Display name, creation date, and process id from the system table	sysinfo (category: processes)
_displayname, _state, _startmode	Display name, state, and start mode from the system table	sysinfo (category: services)
_displayname, _version	Display name and version pair from the system table	sysinfo (category: software)

### ■ KNOWLEDGE BASE

How can I use the PRTG Application Programming Interface (API)?

- <https://kb.paessler.com/en/topic/593>

### 14.2.3 Live Graphs

You can use live sensor graphs from PRTG in other web pages using the PRTG API. PRTG renders graphs as .png or .svg files. You can include them in other web pages.

**i** Authentication with API key or user name and [passhash](#) (or user name and password) must always be included in each PRTG API request. See section [HTTP API](#) for more information.

**Examples**

Live graph as a .png file:

```
/chart.png?type=graph&width=300&height=160&graphid=2&id=0
```

Live graph as an .svg file:

```
/chart.svg?type=graph&width=300&height=160&graphid=2&id=0
```

**i** To switch between PNG and SVG images, change the file extension of `/chart` to `.png` or `.svg`.

**i** The URL does not start with `/api`. When placing these URLs on web pages, keep in mind that the URLs contain the account user name and password/passhash. This can imply security issues. We recommend that you set up a dedicated [read-only](#) user account in PRTG that is member of a dedicated user group, for example, that only has read access to the root group and all underlying entries or, even better, only for the object IDs that are used for graph URLs.

#### Parameters for Live Graph URLs (chart.png or chart.svg)

Parameter	Description
type	Must be <a href="#">graph</a>
graphid	Select time span of the graph: <ul style="list-style-type: none"> <li>▪ 0=live</li> <li>▪ 1=last 48 hours</li> <li>▪ 2=30 days</li> <li>▪ 3=365 days</li> </ul>
width	Width of the image in pixels
height	Height of the image in pixels
id	The object ID of the desired graph object. This is usually the ID of a sensor.
clgid	The NodeID of the cluster node of the desired graph object

Parameter	Description
	<p><b>i</b> Use the format <code>clgid=%7BXXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX%7D</code>. You can also use <code>clgid=%7B00000000-0000-0000-0000-000000000000%7D</code> to return a graph that has data from all cluster nodes.</p>
graphstyling	<p>Allow control of some graph styles:</p> <ul style="list-style-type: none"> <li>▪ Display legend: <code>graphstyling=showLegend%3D%271%27</code></li> <li>▪ Hide legend: <code>graphstyling=showLegend%3D%270%27</code></li> <li>▪ Control font size: <code>graphstyling=baseFontSize%3D%27XX%27</code> (XX is the font size)</li> <li>▪ Control legend and font size at the same time: <code>graphstyling=showLegend%3D%271%27+baseFontSize%3D%275%27</code></li> </ul>
bgcolor	<p>Background color of the PNG image, for example, #ffff. This affects the area that surrounds the graph.</p> <p><b>i</b> The value must be URL encoded, for example, %23ffff.</p>
plotcolor	<p>Color of the graph's plot area, for example, #ffff. This affects the whole area within the graph box.</p> <p><b>i</b> The value must be URL encoded, for example, %23ffff.</p>
plotcolor1	<p>Alternating color of the graph's plot area, for example, #ffff. This affects the tiles within the graph box alternating with <code>plotcolor2</code>. The result is a striped graph box.</p> <p><b>i</b> The value must be URL encoded, for example, %23ffff.</p> <p><b>i</b> This parameter is overwritten when using the parameter <code>plotcolor</code>.</p>
plotcolor2	<p>Alternating color of the graph's plot area, for example, #ffff. This affects the tiles within the graph box alternating with <code>plotcolor1</code>. The result is a striped graph box.</p> <p><b>i</b> The value must be URL encoded, for example, %23ffff.</p> <p><b>i</b> This parameter is overwritten when using the parameter <code>plotcolor</code>.</p>
gridcolor	<p>Color of grid lines in the graph's plot area, for example, #ffff. This affects the horizontal and vertical lines within the graph box.</p> <p><b>i</b> The value must be URL encoded, for example, %23ffff.</p>

Parameter	Description
hide	Do not show defined channels in the graph. Use the ID of a channel to hide it. For example, use <code>hide=-4</code> to not show the Downtime channel in the graph. To hide more than one channel, use commas to separate the IDs.

## Retrieving Chart Legends (JSON)

You can show the legend of a sensor graph (channel IDs, colors, units, channel names) in the JavaScript Object Notation (JSON) format.

 Example

Chart legend in the JSON format:

```
/api/chartlegend.json?id=sensorid
```

## More

### KNOWLEDGE BASE

How can I use the PRTG Application Programming Interface (API)?

- <https://kb.paessler.com/en/topic/593>

## 14.2.4 Historic Data

You can download the historic monitoring data for one sensor in the Extensible Markup Language (XML) format or the comma-separated values (CSV) format using the following API calls. You can either request the results of each single monitoring request (called raw data) or you can let PRTG calculate averages of the data (for example, hourly or daily averages).

To avoid potential server overload, the number of requestable values per API call is limited by means of automatic averaging as follows:

Minimum Level of Detail (Average Interval)	Maximum Timeframe per API Call
Raw data (all single monitoring requests)	For up to 40 days per API request
60 minutes/1 hour averages	40 to 500 days per API request ⓘ If you try to use a larger time span than 500 days, PRTG automatically reduces it to 365 days.

ⓘ API calls for historic data are limited to 5 requests per minute.

### API Calls for Historic Data

ⓘ Authentication with API key or user name and [passhash](#) (or user name and password) must always be included in each PRTG API request. See section [HTTP API](#) for more information.

The API calls for historic data tables look like this:

**Examples**

**XML:**

```
/api/historicdata.xml?id=objectid&avg=0&sdate=2023-01-20-00-00-00&edate=2023-01-21-00-00-00
```

**CSV:**

```
/api/historicdata.csv?id=objectid&avg=0&sdate=2023-01-20-00-00-00&edate=2023-01-21-00-00-00
```

**JavaScript Object Notation (JSON):**

```
/api/historicdata.json?id=objectid&avg=0&sdate=2023-01-20-00-00-00&edate=2023-01-21-00-00-00&usecaption=1
```

ⓘ You must supply the object ID of a sensor as well as a start date/time [sdate](#) and end date/time [edate](#).

**i** If you use the JSON call, additionally provide the parameter `usecaption=1` to get more information than just the raw data table.

## API Call for Historic Graphs

Historic graphs are also available (in the PNG format):

**Example**

**PNG:**

```
/chart.png?id=objectid&avg=15&sdate=2023-01-20-00-00-00&edate=2023-01-21-00-00-00&width=850&height=270&graphstyling=baseFontSize='12'%20showLegend='1'&graphid=-1
```

## Common Parameters for Historic Data API Calls

You can use the following parameters for the graphs and the data tables:

Parameter	Description	Possible Values
id	ID of the specific sensor	integer
sdate	Start of the time span (date and time)	yyyy-mm-dd-hh-mm-ss
edate	End of the time span (date and time)	yyyy-mm-dd-hh-mm-ss
avg	Average interval in seconds; use 0 to download raw data (= results of all single monitoring requests)	integer
width/height	Width and height of the graph in pixels	integer
graphstyling	baseFontSize='x' sets the size of the font showLegend='x' enables (1) or disables (0) the graph legend	baseFontSize='x'%20showLegend='x'

## Historic Data Query Builder

You can also use the [historic data reports](#) <sup>185</sup> to manually generate and analyze historic sensor data via the PRTG web interface.

## More

**KNOWLEDGE BASE**

How can I export historic data from the PRTG API?

- <https://kb.paessler.com/en/topic/76768>

How can I export raw sensor data automatically from PRTG?

- <https://kb.paessler.com/en/topic/343>

## 14.2.5 Object Manipulation

You can use the following functions to manipulate objects (URLs are shown without user name or passhash to enhance readability).

In this section:

- [Changing Object Settings](#) <sup>[3130]</sup>
- [Supported Object Types for rename.htm](#) <sup>[3131]</sup>
- [Switch Inheritance Off/On](#) <sup>[3131]</sup>
- [Changing Properties of Channels](#) <sup>[3131]</sup>
- [Pausing/Resuming](#) <sup>[3132]</sup>
- [Supported Object Types for pause.htm](#) <sup>[3132]</sup>
- [Error Handling](#) <sup>[3133]</sup>
- [Rescanning, Triggering Auto-Discovery](#) <sup>[3133]</sup>
- [Reordering Objects in the Sensor Tree](#) <sup>[3133]</sup>
- [Report-related](#) <sup>[3133]</sup>
- [Notification-related](#) <sup>[3134]</sup>
- [Adding/Deleting Objects](#) <sup>[3134]</sup>
- [Supported Object Types for duplicateobject.htm](#) <sup>[3134]</sup>
- [Duplicating Sensors and Changing Clone Settings](#) <sup>[3135]</sup>
- [Setting Geo Location](#) <sup>[3136]</sup>

### Changing Object Settings

**i** Authentication with API key or user name and [passhash](#) <sup>[2803]</sup> (or user name and password) must always be included in each PRTG API request. See section [HTTP API](#) <sup>[3086]</sup> for more information.

#### Examples

Rename an object:

```
/api/rename.htm?id=objectid&value=newname
```

Set priority of an object (valid values for x are 1 to 5):

```
/api/setpriority.htm?id=objectid&prio=x
```

Change properties of objects:

```
/api/setobjectproperty.htm?id=id_of_object&name=property_name&value=new_value
```

**i** This function can change most string and number properties of objects (names, numeric values, object identifiers (OID), etc.). Use it with caution. You can discern the [property\\_name](#) parameter by opening the Settings page of an object and looking at the HTML source of the INPUT fields. For example, the INPUT field for the tags of an object has the name `tags_`. Leave away the underscore `_` and use `tags` as a value for the [property\\_name](#) parameter.

## Supported Object Types for rename.htm

[rename.htm](#) supports the following object types:

- group
- device
- sensor
- map
- report
- library
- notification template
- schedule
- user
- user group

[rename.htm](#) does not support other object types.

## Switch Inheritance Off/On

This API call sets the [inherit](#) setting of objects (location, credentials, compatibility options, proxy settings, scanning interval, access rights, channel unit). In general, this works like changing properties for any other object.

### Example

Replace the parameter [inheritType](#) with the name of the inheritance type:

```
/api/setobjectproperty.htm?id=id_of_object&name=inheritType_&value=0_or_1
```

 This internal name must be followed by an underscore (`_`), in contrast to changing properties above. Use the value `0` for switching off inheritance, and `1` for switching on inheritance. For example, the inheritance type for the scanning interval setting has the name `intervalgroup_`. Thus, this specific part in the URL is `&name=intervalgroup_&value=0` (switches off inheritance for scanning interval).

 This call does not work with the Schedules, Dependencies, and Maintenance Window settings.

## Changing Properties of Channels

With this API call, you can change a sensor's [channel settings](#)<sup>2681</sup>. In general, this works like changing properties of any other object. To set channel properties via the PRTG API, you need to provide

- the ID of a sensor (parameter `id`),
- a `subtype` (channel for channels), and
- a `subid` (ID of the channel that you want to edit).

**Example: Enabling and Setting Limits for Channels**

Set limits for channels:

```
/api/setobjectproperty.htm?
id=sensorid&subtype=channel&subid=0&name=limitmaxerror&value=limitvalue
```

**i** You must set the limits for a channel before you can enable limits.

Enable limits for channels:

```
/api/setobjectproperty.htm?
id=sensorid&subtype=channel&subid=0&name=limitmode&value=1
```

For example, the following API call sets the upper error limit of a channel with the ID 0 of a sensor with the ID 2970 to the value 25.

```
/api/setobjectproperty.htm?
id=2970&subtype=channel&subid=0&name=limitmaxerror&value=25
```

**i** For Toplists, you can use the subtype **toplist** to change the properties. When using this subtype, **subid** is the ID of a Toplist.

■ For a list of available channel parameters, see section [Single Object Property](#)<sup>3091</sup>.

## Pausing/Resuming

**Examples**

Pause a sensor or object indefinitely:

```
/api/pause.htm?id=objectid&pausemsg=yourmessage&action=0
```

Pause a sensor or object for x minutes:

```
/api/pauseobjectfor.htm?id=objectid&pausemsg=yourmessage&duration=x
```

**i** The pause message is optional. You can leave out the parameter **&pausemsg=yourmessage** if you do not want to display a message.

Simulate an error for a sensor:

```
/api/simulate.htm?id=objectid&action=1
```

**i** **simulate.htm** only works for sensors in the Up, Warning, Unusual, or Unknown [status](#)<sup>181</sup>.

Resume monitoring of a sensor or object:

```
/api/pause.htm?id=objectid&action=1
```

## Supported Object Types for pause.htm

**pause.htm** supports the following object types:

- probe
- group

- device
- sensor
- notification
- user account

[pause.htm](#) does not support other object types.

## Error Handling (Acknowledge Alarm)

### Example

Acknowledge the Down status:

```
/api/acknowledgealarm.htm?id=objectId&ackmsg=yourmessage
```

## Rescanning, Triggering Auto-Discovery

### Examples

Scan a sensor now:

```
/api/scannow.htm?id=objectId
```

Run an auto-discovery for a group or device:

```
/api/discovernow.htm?id=objectId&template=filename
```

**i** Providing a [device template](#) 27251 for auto-discovery is optional. You can leave out the parameter `&template=filename` to run the auto-discovery with the options defined in the object's settings. If you use a template, provide the whole file name including file extension surrounded by double quotation marks (") and encode whitespaces, if necessary. Example: `&template="Linux%20SNMP.odt"`

**i** [discovernow.htm](#) overrides the Auto-Discovery setting of the target group or device. If it is set to No auto-discovery, it automatically changes to Standard auto-discovery (default).

## Reordering Objects in the Sensor Tree

### Example

Move an object in the sensor tree (x can be [up](#), [down](#), [top](#), [bottom](#)):

```
/api/setposition.htm?id=objectId&newpos=x
```

## Report-related

### Example

Add a group, device, or sensor to a report:

```
/api/reportaddsensor.htm?id=reportid&addid=objectid
```

## Notification-related

 Example

Trigger a notification immediately for testing purposes:

```
/api/notificationtest.htm?id=objectid
```

```
/api/notificationtest.json?id=objectid
```

 **objectid** is the ID of the notification template.

## Adding/Deleting Objects

Adding and deleting objects in your configuration is the most complex and potentially most critical process when using the PRTG API. Keep in mind that adding or deleting objects is much better guided in the normal PRTG web interface with more warnings and alerts.

 We recommend that you use the PRTG web interface for adding and deleting objects, if possible.

### Deleting Objects

 API calls to the delete function immediately delete the referenced object including all subobjects, if there are any. For example, deleting a group deletes all its devices and sensors. There is no way to undo a deletion, so use this function with care.

 Example

Delete an object:

```
/api/deleteobject.htm?id=objectid&approve=1
```

### Adding Objects

Adding completely new objects from scratch is not supported via the PRTG API because of the complexity of object creation and its parameters. To add new objects to PRTG, create a "master" object that is cloned into new objects.

## Supported Object Types for `duplicateobject.htm`

`duplicateobject.htm` supports the following object types:

- group
- device
- sensor

- report
- library
- map
- notification template

[duplicateobject.htm](#) does not support other object types.

 Examples

Duplicate a group:

```
/api/duplicateobject.htm?
id=id_of_group_to_clone&name=new_name&targetid=id_of_target_group
```

Duplicate a device:

```
/api/duplicateobject.htm?
id=id_of_device_to_clone&name=new_name&host=new_hostname_or_ip&targetid=id_of_target_group
```

Duplicate a sensor:

```
/api/duplicateobject.htm?
id=id_of_sensor_to_clone&name=new_name&targetid=id_of_target_device
```

Duplicate a library:

```
/api/duplicateobject.htm?id=id_of_library_to_clone&name=new_name
```

Duplicate a notification template:

```
/api/duplicateobject.htm?id=id_of_notification_template_to_clone&name=new_name
```

-  If [duplicateobject](#) succeeds, the PRTG core server replies with a redirect to the URL of the new object (for example, [/sensor.htm?id=1234](#)), so your application should parse the new object ID from this URL.
-  When a group, device, or sensor is cloned, it is initially set to Paused so you have the chance to edit parameters as desired. You must resume it with an API call afterward.
-  The API calls for duplicating reports, maps, libraries, and notification templates do not require a [targetid](#).

## Duplicating Sensors and Changing Clone Settings

The following process duplicates a sensor, changes some settings, and then starts monitoring:

 Example

Duplicate the sensor (the server replies with a redirect to the new object's web page, for example [/sensor.htm?id=10214](#), parse id [10214](#) from the URL):

```
/api/duplicateobject.htm?id=2002&name=mynewsensor&targetid=2001
```

Rename the new sensor:

```
/api/setobjectproperty.htm?id=10214&name=name&value=newname
```

Change the OID (in this example for an [SNMP Custom](#) sensor):

```
/api/setobjectproperty.htm?id=10214&name=oid&value=1.2.3.4.5.6.7
```

Resume monitoring for the new sensor:

```
/api/pause.htm?id=10214&action=1
```

## Setting Geo Location

You can set the location of any object via an API call. Provide the object ID together with parameters for location and/or longitude and latitude.

If only the location parameter is specified, the PRTG core server executes the geo location lookup (this can take up to three minutes). Provide the name of the location, for example, [New York](#). It is shown in the Location settings, no matter the longitude or latitude.

If the longitude and latitude parameter is specified, the marker in the map is set to this position, no matter of the location parameter. Provide longitude and latitude separated by a comma, for example - [73.998672,40.714728](#).

### Example

Set the geo location of an object:

```
/api/setlonlat.htm?  
id=objectid&location=name_of_object_location&lonlat=longitude,latitude
```

### KNOWLEDGE BASE

How can I use the PRTG Application Programming Interface (API)?

- <https://kb.paessler.com/en/topic/593>

## 14.2.6 Custom Sensors

Custom sensors can perform a number of monitoring tasks that extend the standard sensor set. Apart from parameterized versions of Simple Network Management Protocol (SNMP), Packet Sniffer, and NetFlow sensors, you can create your own sensors using Windows Management Instrumentation Query Language (WQL) or Python, by compiling an .exe file, using any Windows software development tool, and you can request any Representational State Transfer (REST) application programming interface (API) that returns JavaScript Object Notation (JSON) or Extensible Markup Language (XML) and map the results to channels.

**i** The multi-platform probe currently does not support all custom sensor types. For more information, see the Knowledge Base: [What is the multi-platform probe and how can I use it?](#)

The following documentation describes the custom [EXE/Script](#)<sup>[3137]</sup>, [Python Script](#), and [SSH Script](#) sensors. The defined XML and JSON formats for the advanced sensors are also used for advanced HTTP data sensors and the [REST Custom](#) sensor.

**■** For more information about custom sensors based on SNMP, Windows Management Instrumentation (WMI), Packet Sniffing, and Flow (NetFlow, jFlow, sFlow, IPFIX), see the respective [custom sensors](#)<sup>[2676]</sup>.

**i** For each sensor interval, PRTG can run an external process. The process can be a Windows .exe file, or a .bat, .cmd, .vbs, or PowerShell file, as well as a Python or Secure Shell (SSH) script.

In this section:

- [Standard and Advanced EXE/Script Sensor](#)<sup>[3137]</sup>
- [Standard and Advanced SSH Script Sensor](#)<sup>[3138]</sup>
- [Interface Definition for EXE/BAT/CMD/VBS/PowerShell/SSH Sensors](#)<sup>[3138]</sup>
- [Return Values for EXE/BAT/CMD/VBS/PowerShell/SSH Sensors](#)<sup>[3139]</sup>
- [Standard EXE/Script Sensor](#)<sup>[3139]</sup>
- [SSH Script Sensor](#)<sup>[3140]</sup>
- [Advanced Script, HTTP Data, and REST Custom Sensors](#)<sup>[3140]</sup>
- [Advanced Script, HTTP Data, and REST Custom Sensors: Elements](#)<sup>[3142]</sup>
- [Command-line Parameters](#)<sup>[3148]</sup>
- [Environment Values](#)<sup>[3150]</sup>

### Standard and Advanced EXE/Script Sensor

**i** You must create the sensor as a file and store it in a specific subfolder on the probe system. In a cluster, you must store it on each cluster node.

Place executables (.exe), batch files (.cmd, .bat), VBS scripts (.vbs), or PowerShell scripts (.ps1) into a subfolder of the [PRTG program directory](#)<sup>[3213]</sup>. For the standard [EXE/Script](#) sensor, this is the following subfolder of the PRTG program directory:

```
Custom Sensors\EXE
```

If your executable or script returns XML or JSON, you use it with the [EXE/Script Advanced](#) sensor. In this case, store your file in the following subfolder of the PRTG program directory:

```
Custom Sensors\EXEXML
```

You find a sample set of demo sensors in these subfolders, too. As soon as a file is placed into the subfolders mentioned above, you can create your own custom EXE sensor and select the new file from the list of files.

The probe then executes the file on the probe system using the account configured for the PRTG probe service (the default is [system](#)). The local probe runs the file on the local PRTG core server system. For remote probes, the file actually runs on the remote probe system.

**i** If you use a PowerShell script (.ps1) and if the PowerShell Security Enhancement [experimental feature](#)<sup>[2876]</sup> is enabled, scripts that use the [write-host](#) cmdlet to provide their output to PRTG do not work. Use the [write-output](#) cmdlet instead.

**i** We recommend that you not edit the demo files. Create your own new files and make sure to give them unique names that do not start with [Demo](#), for example.

**i** If your custom sensor code relies on other files (for example, .NET framework, Windows PowerShell) you must manually copy or install these files on the probe system.

**i** EXE sensors fail if they attempt to open any graphical user interface windows using the Win32 APIs. This is not allowed for processes that are started by a system service.

## Standard and Advanced SSH Script Sensor

**i** You must create the sensor as an SSH script and place it in a specific directory on the target system running your Linux/Unix installation where the script is executed.

Place your SSH script files for the standard [SSH Script](#) sensor in the following directory of the target system:

```
/var/prtg/scripts
```

If your SSH script returns XML or JSON, you use it with the [SSH Script Advanced](#) sensor. In this case, store your file in the following directory of the target system:

```
/var/prtg/scriptsxml
```

As soon as a file is placed into the respective directory, you can create your own SSH script sensor and select the new script file from the list of scripts.

**i** With each scanning interval, PRTG executes the script on the target system and receives the result as a sensor result.

## Interface Definition for EXE/BAT/CMD/VBS/PowerShell/SSH Sensors

Every time the sensor is run, the selected file is executed. The string entered in the Parameters field of the sensor's settings is used as command line (you can use placeholders, see [Command-line Parameters](#)<sup>[3148]</sup>). The executable file must send the results to the Standard OUT. For the format of returned data, see below.

**i** If the executable file does not return control to the PRTG process, it is killed as soon as the timeout value set for this sensor is reached.

You can test the .exe file that you want to use for the sensor via the command line (cmd.exe). To do so, start the .exe file and pipe the results into a file.

**Example**

```
sensorexex parameter > result.txt
```

The results are written into the file [result.txt](#) and you can check the results with notepad or any other text editor.

#### Remarks

- For PowerShell scripts, make sure that they are executed by either signing the files or changing the security policy for Powershell.exe accordingly.
- In SSH scripts, you can use alphanumeric characters and the special characters ".", "\_", "-", "=", and "/" outside of quoted strings in the Parameters field of the sensor's settings.
- The API interface for custom EXE sensors is compatible with the custom EXE sensors provided by PRTG.

#### Return Values for EXE/BAT/CMD/VBS/PowerShell/SSH Sensors

The expected return values are different, depending on the type of EXE/Script sensor used. The standard sensor needs a simple [value:message](#) pair. The EXE/Script Advanced sensor processes an XML or JSON return value. When using the standard SSH Script sensor, it expects [returncode:value:message](#) as result. See details below.

#### Standard EXE/Script Sensor

The returned data for standard EXE/Script sensors must be in the following format:

```
value:message
```

**i** Value has to be a 64-bit integer or float. It is used as the resulting value for this sensor (for example, bytes, milliseconds) and stored in the database. The message can be any string (maximum length: [2000](#) characters).

The exit code of the executable file has to be one of the following values:

Value	Description
0	OK
1	WARNING

Value	Description
2	System Error (for example, a network/socket error)
3	Protocol Error (for example, web server returns a 404)
4	Content Error (for example, a web page does not contain a required word)

## SSH Script Sensor

The returned data for standard SSH Script sensors must be in the following format:

```
returncode:value:message
```

**i** Value has to be a 64-bit integer or float. It is used as the resulting value for this sensor (for example, bytes, milliseconds) and stored in the database. The message can be any string (maximum length: 2000 characters).

The SSH script `returncode` has to be one of the following values:

Value	Description
0	OK
1	WARNING
2	System Error (for example, a network/socket error)
3	Protocol Error (for example, web server returns a 404)
4	Content Error (for example, a web page does not contain a required word)

## Advanced Script, HTTP Data, and REST Custom Sensors

The returned data for the [EXE/Script Advanced](#), [Python Script Advanced](#), [SSH Script Advanced](#), [HTTP Push Data Advanced](#), [HTTP Data Advanced](#), and [HTTP IoT Push Data Advanced](#) sensors must be in XML or JSON format, the REST configuration file for the [REST Custom](#) sensor must be available as JSON template.

Most parameters have a default value and are not required. The following minimum examples leave most parameters to their default values and return two static channel values.

 Examples

**XML Return Format: Minimum Example:**

```
<prtg>
  <result>
    <channel>First channel</channel>
    <value>10</value>
  </result>
  <result>
    <channel>Second channel</channel>
    <value>20</value>
  </result>
</prtg>
```

**To return an error, the XML format is:**

```
<prtg>
  <error>1</error>
  <text>Your error message</text>
</prtg>
```

**JSON Return Format: Minimum Example**

```
{
  "prtg": {
    "result": [
      {
        "channel": "First channel",
        "value": 10
      },
      {
        "channel": "Second channel",
        "value": 20
      }
    ]
  }
}
```

**To return an error, the JSON format is:**

```
{
  "prtg": {
    "error": 1,
    "text": "Your error message"
  }
}
```

**i** You can find a more detailed demo script for the EXE/Script Advanced sensor in the \Custom Sensors\EXEXML subfolder of the [PRTG program directory](#) [3213]. You find demo files for other sensors in the \Custom Sensors folder as well.

## Advanced Script, HTTP Data, and REST Custom Sensors: Elements

You can optionally define the encoding of your .xml file at the beginning of the document. For example, to define UTF-8, you would use:

```
<?xml version="1.0" encoding="UTF-8" ?>
```

You can use the following elements in the section between `<result>` and `</result>`. In each section, you can return one channel. You can define a maximum of 50 channels.

**i** If you exceed this limit, PRTG tries to display all channels. However, be aware that this is an unsupported procedure and you experience limited usability and performance.

**i** For XML output, the tag names are not case-sensitive. For example, you can use both "VALUE" and "value". For JSON output, the tag names are case-sensitive but you can also use lowercase. For example, you can use both "CustomUnit" and "customunit".

Tag	Mandatory	Description	Possible Content
<code>&lt;Channel&gt;</code>	Yes	Name of the channel as displayed in user interfaces. <b>i</b> This parameter is required and must be unique for the sensor.	Any string
<code>&lt;Value&gt;</code>	Yes	The value as integer or float. <b>i</b> Make sure the <code>&lt;Float&gt;</code> setting matches the kind of value provided. Otherwise PRTG shows 0 values.	Integer or float value
<code>&lt;Unit&gt;</code>	No	The unit of the value. The default is <a href="#">Custom</a> . This is useful for PRTG to convert volumes and times.	BytesBandwidth BytesDisk Temperature Percent TimeResponse TimeSeconds Custom Count

Tag	Mandatory	Description	Possible Content
			<p>CPU: This is a % unit that is accounted to the CPU load in index graphs.</p> <p>BytesFile</p> <p>SpeedDisk</p> <p>SpeedNet</p> <p>TimeHours</p>
<CustomUnit>	No	If Custom is used as unit, this is the text displayed behind the value.	Any string (keep it short)
<SpeedSize> <VolumeSize>	No	<p>Size used for the display value. For example, if you have a value of 50000 and use Kilo as size, the display is 50 kilo #.</p> <p>The default is <b>One</b> (value used as returned). For the Bytes and Speed units, this is overridden by the setting in the user interface.</p>	<p>One</p> <p>Kilo</p> <p>Mega</p> <p>Giga</p> <p>Tera</p> <p>Byte</p> <p>KiloByte</p> <p>MegaByte</p> <p>GigaByte</p> <p>TeraByte</p> <p>Bit</p> <p>KiloBit</p> <p>MegaBit</p> <p>GigaBit</p> <p>TeraBit</p>
<SpeedTime>	No	See above, used when displaying the speed. The default is <b>Second</b> .	<p>Second</p> <p>Minute</p> <p>Hour</p> <p>Day</p>
<Mode>	No	Select if the value is an absolute value or counter. The default is <b>Absolute</b> .	Absolute

Tag	Mandatory	Description	Possible Content
			Difference
<Float>	No	<p>Define if the value is a float. The default is 0 (no). If set to 1 (yes), use a dot as decimal separator in values.</p> <p><b>i</b> Define decimal places with the &lt;DecimalMode&gt; element.</p>	<p>0 (= no, integer)</p> <p>1 (= yes, float)</p>
<DecimalMode>	No	<p>Init value for the Decimal Places option. If 0 is used in the &lt;Float&gt; element (use integer), the default is <b>Auto</b>. Otherwise (for float) the default is <b>All</b>.</p> <p><b>i</b> You can change this initial setting later in the sensor's <a href="#">channel settings</a> <sup>[268]</sup>.</p>	<p>Auto</p> <p>All</p>
<Warning>	No	<p>If enabled for at least one channel, the entire sensor is set to the Warning status. The default is 0 (no).</p>	<p>0 (= no)</p> <p>1 (= yes)</p>
<ShowChart>	No	<p>Init value for the Show in graphs option. The default is 1 (yes).</p> <p><b>i</b> The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and can be omitted). You can change this initial setting later in the sensor's channel settings.</p>	<p>0 (= no)</p> <p>1 (= yes)</p>
<ShowTable>	No	<p>Init value for the Show in tables option. The default is 1 (yes).</p> <p><b>i</b> The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and can be omitted). You can change this initial setting later in the sensor's channel settings.</p>	<p>0 (= no)</p> <p>1 (= yes)</p>

Tag	Mandatory	Description	Possible Content
<LimitMaxError>	No	<p>Define an upper error limit for the channel. If enabled, the sensor is set to the Down status if this value is exceeded and the LimitMode is activated.</p> <p><b>i</b> Provide the value for the limit in the unit of the base data type as it is used in the &lt;Value&gt; element of this section. When a sensor shows the Down status triggered by a limit, it still receives data in its channels.</p> <p><b>i</b> The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and can be omitted). You can change this initial setting later in the sensor's channel settings.</p>	String with numbers
<LimitMaxWarning>	No	<p>Define an upper warning limit for the channel. If enabled, the sensor is set to the Warning status if this value is exceeded and the LimitMode is activated.</p> <p><b>i</b> Provide the value for the limit in the unit of the base data type as it is used in the &lt;Value&gt; element of this section. When a sensor shows the Down status triggered by a limit, it still receives data in its channels.</p> <p><b>i</b> The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and can be omitted). You can change this initial setting later in the sensor's channel settings.</p>	String with numbers
<LimitMinWarning>	No	<p>Define a lower warning limit for the channel. If enabled, the sensor is set to the Warning status if this value falls below the defined limit and the LimitMode is activated.</p>	String with numbers

Tag	Mandatory	Description	Possible Content
		<p><b>i</b> Provide the value for the limit in the unit of the base data type as it is used in the &lt;Value&gt; element of this section. When a sensor shows the Down status triggered by a limit, it still receives data in its channels.</p> <p><b>i</b> The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and can be omitted). You can change this initial setting later in the sensor's channel settings.</p>	
<LimitMinError>	No	<p>Define a lower error limit for the channel. If enabled, the sensor is set to the Down status if this value falls below the defined limit and the LimitMode is activated.</p> <p><b>i</b> Provide the value for the limit in the unit of the base data type as it is used in the &lt;Value&gt; element of this section. When a sensor shows the Down status triggered by a limit, it still receives data in its channels.</p> <p><b>i</b> The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and can be omitted). You can change this initial setting later in the sensor's channel settings.</p>	String with numbers
<LimitErrorMsg>	No	<p>Define an additional message. It is added to the sensor's message when entering the Down status that is triggered by a limit.</p> <p><b>i</b> The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and can be omitted). You can change this initial setting later in the sensor's channel settings.</p>	Any string

Tag	Mandatory	Description	Possible Content
<LimitWarningMessage>	No	<p>Define an additional message. It is added to the sensor's message when entering the Warning status that is triggered by a limit.</p> <p><b>i</b> The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and can be omitted). You can change this initial setting later in the sensor's channel settings.</p>	Any string
<LimitMode>	No	<p>Define if the limit settings defined above are active. The default is 0 (no; limits inactive). If 0 is used, the limits are written to the channel settings as predefined values, but limits are disabled.</p> <p><b>i</b> The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and can be omitted). You can change this initial setting later in the sensor's channel settings.</p>	0 (= no) 1 (= yes)
<ValueLookup>	No	<p>Define if you want to use a lookup file (for example, to view integers as status texts). Enter the ID of the lookup file that you want to use, or omit this element to not use lookups.</p> <p><b>i</b> The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and can be omitted). You can change this initial setting later in the sensor's channel settings.</p>	Any string
<NotifyChanged>	No	<p>If a returned channel contains this tag, it triggers a change notification that you can use with the <a href="#">change trigger</a> to send a notification.</p>	No content required

You can use the following elements in the section between `<prtg>` and `</prtg>`, outside the `<result>` section.

**i** For XML output, the tag names are not case-sensitive. For example, you can use both "TEXT" and "text". For JSON output, the tag names are case-sensitive but you can also use lowercase. For example, you can use both "Text" and "text".

Tag	Mandatory	Description	Possible Content
<code>&lt;Text&gt;</code>	No	Text the sensor returns in the Message field with every scanning interval. There can be one message per sensor, regardless of the number of channels. The default message is <b>OK</b> .  <b>i</b> This element has to be provided outside of the <code>&lt;result&gt;</code> element.	Any string  Maximum length: 2000 characters  <b>i</b> PRTG does not support the number sign (#) in sensor messages. If a message contains a number sign, PRTG clips the message at this point.
<code>&lt;Error&gt;</code>	No	If enabled, the sensor returns the Down status. This element can be combined with the <code>&lt;Text&gt;</code> element to show an error message. The default is <b>0</b> .  <b>i</b> This element has to be provided outside of the <code>&lt;result&gt;</code> element. A sensor in this error status cannot return any data in its channels. If used, all channel values in the <code>&lt;result&gt;</code> section are ignored.	0 (= no)  1 (= yes, set sensor to error; ignore <code>&lt;result&gt;</code> section)

**i** Each run (sensor scan) might return either any number of channels (`<result>...</result>`) or one error response. It is not possible to mix result and error entries.

**i** You can either write the XML output to standard OUT line by line, or give back the entire expression in one line without breaks.

## Command-line Parameters

In the `parameter` field, you can use the following placeholders:

Placeholder	Description
%sensorid	The ID of the EXE/Script sensor.
%deviceid	The ID of the device the sensor is created on.
%groupid	The ID of the group the sensor is created in.
%probeid	The ID of the probe the sensor is created on.
%host	The IP address/DNS name of the device the sensor is created on.
%device	The name of the device the sensor is created on.
%group	The name of the group the sensor is created in.
%probe	The name of the probe the sensor is created on.
%name	The name of the EXE/Script sensor.
%windowsdomain	The domain for Windows access (can be inherited from parent).
%windowsuser	The user name for Windows access (can be inherited from parent).
%windowspassword	The password for Windows access (can be inherited from parent).
%linuxuser	The user name for Linux access (can be inherited from parent).
%linuxpassword	The password for Linux access (can be inherited from parent).
%snmpcommunity	The community string for SNMP v1 or v2 (can be inherited from parent).

**i** You need to escape placeholders that you use in the [parameter](#) field with quotation marks so that they can be correctly resolved from the command line.

**i** You need to escape special characters and whitespaces in your parameters and surround them with double quotation marks ("). See section [Escape Special Characters and Whitespaces in Parameters](#)<sup>[3312]</sup> for details.

**■** See section [Inheritance of Settings](#)<sup>[136]</sup> for more information on inherited settings.

## Environment Values

If the Set placeholders as environment values option is enabled in the sensor's settings, the values of all placeholders available for [command-line parameters](#) <sup>3148</sup> are additionally provided as "Environment Variables" during run time, so you can use them in your executable or script file. The variables' names are the same as for placeholders mentioned above, with the prefix `prtg_` and without the `%` character. For example, refer to the sensor's own name by using the variable `prtg_name`.

Additionally, the following variables are available:

Variable	Description
<code>prtg_version</code>	The version number of your PRTG installation.
<code>prtg_url</code>	The IP address/DNS name of your PRTG installation.
<code>prtg_primarychannel</code>	The ID of the sensor's primary channel (1 if not set).

## More

You can find sample projects for these custom sensors and more information about custom scripts here:

## 14.2.7 Custom Notifications

In addition to the various standard methods for notifications, you can define your own notifications that can trigger desired actions. The following documentation describes these custom notifications. You can also combine different notification methods in one notification.

■ For more general information about notifications based on email, messaging, and others, see section [Notifications](#) <sup>[2735]</sup>.

### Execute HTTP Action

This notification method executes a GET request or sends any POST, PUT, or PATCH data to a custom URL. You can execute specific actions on a web server or control any web service that accepts commands via one-time HTTP requests. Whenever a notification of this kind is triggered, the HTTP action is sent.

With this method, you can also call any application programming interface (API) function of the PRTG web interface. For example, you can automatically pause a sensor or acknowledge an alarm.

ⓘ Authentication with API key or user name and [passhash](#) <sup>[2803]</sup> (or user name and password) must always be included in each PRTG API request. See section [HTTP API](#) <sup>[8086]</sup> for more information.

#### Examples

To automatically pause the sensor that triggers the notification, enter the following HTTP action:

```
http://yourserver/api/pause.htm?id=%  
sensorid&action=0&username=myuser&password=mypassword
```

To use the notification to automatically acknowledge the alarm that triggered it, enter this HTTP action:

```
http://yourserver/api/acknowledgealarm.htm?id=%sensorid&ackmsg=Auto-  
Acknowledged&username=myuser&password=mypassword
```

■ For more information about authentication within the URL and for other possible actions you can configure, see sections [HTTP API](#) <sup>[3083]</sup> and [Object Manipulation](#) <sup>[3130]</sup>.

### Execute Program

With this notification method, you can execute a script or a program as an external process. It can be a Windows executable file or a .bat, .cmd, or PowerShell file. You can use .exe, .com, .bat, .cmd, .vbs, or .ps1 files.

ⓘ You must create the notification as a file and place it in a specific subfolder on the PRTG core server system (in a cluster, copy the files to every cluster node).

Place executables (.exe, .com), batch files (.cmd, .bat), VBS scripts (.vbs), or PowerShell scripts (.ps1) into the folder:

```
\Notifications\EXE
```

As soon as a file is placed into the subfolder, you can create or edit your own custom execute program notification and select the new file from the list of files. You can also enter start parameters and use PRTG placeholders for this.

#### Notes

- PRTG executes the file on the local PRTG core server system using the account configured for the PRTG core server service (the default is [system](#)).
- If your custom notification's code relies on other files (for example, .dll, .NET framework, or Windows PowerShell), you must copy/install these files on the PRTG core server system manually.
- Make sure the return code of the executable is 0 (zero). Otherwise PRTG assumes something went wrong with the notification and tries to send it up to 3 times.
- If you run PRTG in a cluster, copy the respective files to every cluster node to make sure the notification also works when the primary master node is not reachable.
- EXE notifications fail if they attempt to open any graphical user interface windows using the Win32 APIs (this is not allowed for processes that are started by a system service).
- To remotely run PowerShell scripts, make sure that you set the according Execution Policy. For more information, see the Knowledge Base: [PowerShell 32 bit and 64 bit and Execution Policy](#).

#### Placeholders

- For more information about the placeholders you can use, see section [Placeholders for Notifications](#) 3325.

#### PRTG Sensor Hub

You can find scripts for custom sensors that were written by dedicated PRTG customers in the [PRTG Sensor Hub](#).

## 14.2.8 Mini Probe API

### Important Notice

We do not further develop the Mini Probe API because we plan major changes to the underlying PRTG Application Programming Interface (PRTG API). You can still use the Mini Probe API "as is" but note that it may be deprecated at any time.

 Knowledge Base: [Where can I find PRTG mini probes which are ready to use?](#)

Mini probes allow users to create small probes on any device to meet specific needs. In general, probes are the part of PRTG that run monitoring processes and deliver monitoring results back to the PRTG core server. Mini probes gather monitoring data from platforms where it is not possible or is inapplicable to use the common local and remote probes of PRTG. Mini probes have a less complex implementation than standard probes so that you can create them on any platform. The only requirement is HTTPS connectivity to send monitoring data to your PRTG core server.

 With the current version of PRTG, you can use the mini probe interface with your custom code to implement solutions to special scenarios that you might have in your network. Note that there are major changes planned to the underlying PRTG API. Therefore, any code you write now likely needs to be changed later, so it can be used for future versions of PRTG. For example, if the available HTTP Push sensors are not sufficient for your needs, you can still use the Mini Probe API.

 Because the mini probe requires a Secure Sockets Layer (SSL) secured connection to the PRTG core server, it is not possible by default to connect if SSL is deactivated for PRTG. This is necessary because probably unencrypted passwords are transferred between the probe and the PRTG core server. So it is important to encrypt the connection even on internal routes. If your network setup ensures security in a different way (for example, a VPN), you can use a registry key option for disabling SSL to get a connection to your mini probe.

 For more information, see the Knowledge Base: [How can I disable SSL for Mini Probes?](#)

 The Mini Probe API is not available in PRTG Hosted Monitor

In this section:

  - [Tasks Definition](#)  <sup>3162</sup>
  - [Data Definition](#)  <sup>3164</sup>

## Differences Between Probe Types

The following table shows technical specifications of the two probe types in PRTG.

Functionality	Local and Remote Probes	Mini Probe
Connection Protocol from Probe to PRTG Core Server	Protocol from PRTG	HTTPS
Security	Data is secured with SSL and an access key. New probe connections must be approved by an administrator. IP address and globally unique identifier (GUID) filtering is possible.	The same security level as for local and remote probes.
Estimated Limit for Sensors per Probe	Several thousand sensors	Fewer than 100 sensors
Estimated Limit for Probes per Installation	Hundreds of probes	Fewer than 100 probes
Estimated Minimum Scanning Interval	Some seconds	At least 60 seconds
Estimated Number of Sensors	More than 200	A few
Updates to New PRTG Versions by the PRTG Core Server	Yes	No
Complexity	High	Very low
Documented API	No	Yes
Supported Platforms	At least Windows (32-bit/64-bit)	Any platform
Scheduling of Sensor Requests Performed by	Probe	Probe
Code Managed by	Paessler GmbH	Writer of the probe
Probe Scans for Available Measurements Beforehand	Yes	No
Sensors Support <a href="#">Inheritance of Settings</a> <small>[136]</small>	Yes	No

Functionality	Local and Remote Probes	Mini Probe
Limitations by Administrator for Allowed Sensors that a User Can Create	Yes	No

## The PRTG Mobile Probe Protocol

The PRTG Mini Probe Protocol (PMPP) is a simple, lightweight protocol that extends PRTG with custom remote probes. It can be implemented in a variety of programming languages and runs on any kind of platform. These include, for example, Linux, Android, macOS, and iOS.

**i** Mini probes are not intended for high performance monitoring and support only the sensors that you implement.

## Communication and Security

The PMPP uses GET and POST requests via HTTPS to communicate with the PRTG core server. All requests are sent to the defined Transmission Control Protocol (TCP) port for the common PRTG web server (the default port is 443 for SSL), or you specify an extra port explicitly for mini probe connections in the [Core & Probes](#) settings. Mini probes use the GET method to receive tasks, and the POST method to send information about the probe and the monitoring results to the PRTG core server.

**i** The data format of some HTTP fields has to be JavaScript Object Notation (JSON) encoded. See [JSON Definition](#) for data definitions that require JSON. All exchanged data is secured with SSL.

## Authentication

The PMPP uses the same authentication methods as the common remote probes in PRTG. The authentication includes the following steps:

- Allow and deny IP addresses filter
- Deny global ID (GID) filter
- Access key
- Unique GID that must be approved in the PRTG web interface
- In addition, mini probes must be allowed to connect in the probe connection settings in PRTG. Additionally, you must provide the mini probe's IP address in the Allow IP Addresses field (or enter any).

There are no sessions on the server: Every request must contain the required authentication information.

**■** For more details, see section [Core & Probes](#).

## HTTP Requests

The PMPP includes three different HTTP requests that are sent to the PRTG web server:

- announce: An announce request is sent once when the probe starts. Afterward, the task and data commands are run in a scheduled manner.
- tasks: With a tasks request, the probe requests a list of tasks to perform.
- data: The data request sends the monitoring results to the core.

All requests of the mini probe to the PRTG core server must contain the following HTTP fields:

- gid: The unique GUID of the probe. We recommend a GUID that is generated by the operating system. This identifier must stay the same for as long as the probe installation exists. You can use any string. If you clone a probe, you must update this field to a new value.
- key: An access key as defined in the probe settings of the PRTG core server. The key has to be encoded in SHA1 hash (for example, `key=a94a8fe5ccb19ba61c4c0873d391e987982fbbd3`).
- protocol: The version of the protocol you use. Currently, this value is "1"

All requests return common HTTP response codes.

■ For more information, see section [HTTP API](#)<sup>[3085]</sup>.

### Announce Request

The announce request uses the POST method and provides all required information about the capabilities of the mini probe for the PRTG core server. The target URL is <https://<yourPRTGserver>/probe/announce>.

**i** This HTTP request must be sent at least once to be able to add sensors. We recommend you send this request every time the probe starts. You should NOT send it with every scanning interval.

The announce request must contain the following HTTP fields:

- name: The name of the mini probe. PRTG uses this name to create a corresponding node in the device tree.
- version: The version number of the mini probe you have implemented. This is a single integer, for example, 1.
- baseinterval: The number of seconds between two calls of the task/data requests. We recommend 60 or 300 seconds. Depending on the usage, higher or lower values are possible.
- sensors: The definition of supported sensors in JSON format.  
■ See [Sensor Definition](#)<sup>[3157]</sup> for more information.
- icon (optional): You can optionally send the file name of a device icon to show it for the mini probe device in the PRTG web interface.

**i** If you change the definition of a sensor that has already been announced, these changes are only active after the next start of PRTG. A definition never changes while PRTG is running. However, there is one exception: Setting the "deprecated" flag works without any restart. Because of this, you can replace a sensor with a new one that uses a different definition.

### Tasks Request

The tasks request uses the GET method and is sent from your mini probe in the defined scheduler interval to the PRTG core server (for example, every 5 minutes). The target URL is

```
https://<PRTGserver>/probe/tasks
```

This HTTP request returns a list of tasks in JSON format that need to be run by the mini probe.

■ See [Tasks Definition](#) <sup>3162</sup> for more information.

### Data Request

The data request uses the POST method and contains the HTTP field data. This HTTP field contains any number of sensor results in JSON format. The target URL is

```
https://<PRTGserver>/probe/data
```

You can split the results of one tasks list into several result requests (for example, if some sensors are faster than others). The mini probe should combine as many results as possible into one request but keep the time between measurement and reporting of the value at a low level.

■ See [Data Definition](#) <sup>3164</sup> for more information.

### JSON Definition

All data definitions of sensors, tasks, and result data of mini probes are JSON encoded. JSON is a language-independent data format that is used to transmit data objects consisting of attribute-value pairs between a server and an application. Refer to the JSON documentation for a general overview of this data format.

### Sensor Definition

This section shows how you can define the available sensors for your mini probe. Sensor definitions are specified in the HTTP field "sensors" of the announce request. The sensor types definition is a JSON array where each sensor type is defined in one array element as a JSON object. A JSON object denoting a sensor definition consists of the following JSON name/value pairs:

Name	Mandatory	Description	Possible Value
kind	X	Unique identifier for the sensor type in the mini probe. Used in the tasks definition to identify the sensor type.  ⓘ Underscore "_" is not allowed here.	Any string
name	X	The display name of the sensor.	Any string
deprecated	—	You can flag the sensor to status deprecated. A flagged sensor can still run but this kind of sensor is not shown when you add new sensors to the probe.	1 (= deprecated) 0 (= not deprecated)

Name	Mandatory	Description	Possible Value
description	—	A short description of the sensor that is shown in the <a href="#">Add Sensor</a> <sup>[414]</sup> dialog in the PRTG web interface.	Any string
help	—	A help text that is shown in a popup in the Add Sensor dialog in the PRTG web interface.	Any string
tag	—	A default tag for the sensor that is automatically added to the sensor.	Any string
default	—	A sensor of this type is automatically created with the probe if set to "default".	(= set to default) 0 (= not default)
groups	—	In the "groups" array, available settings for this sensor type are defined.	An array of grouped settings JSON objects.  ⓘ See <a href="#">Definition of Setting Groups Objects</a> <sup>[3158]</sup> for more information.

### Definition of Setting Groups Objects

One settings group definition (one element of the "groups" array) consists of three elements:

Name	Mandatory	Description	Possible Value
name	X	The internal name of the settings group.	Any unique string
caption	X	The label of the settings group as shown in the PRTG web interface.	Any string
fields	X	The available settings of the settings group.	An array of field definition objects.  ⓘ See <a href="#">Parameters for Setting Fields</a> <sup>[3158]</sup> for more information.

### Parameters for Setting Fields

The following table shows available JSON name/value pairs for setting fields:

Name	Mandatory	Description	Available in Type	Possible Value
type	X	Type of the field. This defines the possible content.	All	Edit Password Integer Radio  See <a href="#">Definition of Setting Fields: Field Types</a> <sup>[3160]</sup> for more information.
name	X	The internal name of the field. The name has to be unique per sensor. It is sent with the settings of the probe in the task request.	All	Any unique string
caption	X	The label of the field. It is displayed left of the field.	All	Any string
required	—	If a field is defined as required, this field has to be set when adding or editing the sensor settings. The default is not required.	All	0 (= not required) 1 (= required)
default	—	The default value of the field.	All	Any string or integer (depending on the field type)
help	—	A help text that is displayed right of the field.  You can use limited BBCode: "[b]" and "[/b]" for bold, "[i]" and "[/i]" for italics, and "[br]" for line break.	All	Any string

Name	Mandatory	Description	Available in Type	Possible Value
maximum	—	The maximum value that is allowed for this field.	Integer	Integer
minimum	—	The minimum value that is allowed for this field.	Integer	Integer
options	—	A JSON array that provides several radio buttons to choose a desired option.	Radio	"name": "value" pairs. See <a href="#">Example</a> <sup>[3160]</sup> below.

 Example

"name": "value" pairs that define radio button options:

```

{
    "1": "This is option 1",
    "2": "This is option 2",
    "XYZ": "Another option"
}

```

### Definition of Setting Fields: Field Types

A sensor type can have any number of setting fields that are organized in groups of settings. One field is one element in the "fields" array of a settings group. Currently, mini probes support four different field types for settings:

- edit: One line edit field.
- password: An edit field with masked characters.
- integer: A number field with optional minimum/maximum selection.
- radio: A selection of multiple options with radio buttons.

 Example

The following is a detailed example that shows the JSON object definition of a sensor type that is used in the HTTP field sensors of the announce request.

This sensor type is called [Sample Sensor](#) and is from the type [Sample](#). It has a description, a help text, and a default tag. There are two setting groups, [Group](#) and [group2](#), with several setting fields (six in the first group, one in the second group). The example also shows how you can use the available JSON name/value pairs in the [fields](#) array object.

```
[
  {
    "kind": "Sample",
    "name": "Sample Sensor",
    "description": "This is a sample demo sensor",
    "help": "This is the help text of the demo sensors",
    "tag": "demosensor",
    "groups": [
      {
        "name": "Group",
        "caption": "Group",
        "fields": [
          {
            "type": "edit",
            "name": "simpleedit",
            "caption": "Edit Field",
          },
          {
            "type": "edit",
            "name": "extendededit",
            "caption": "Edit Field 2",
            "required": "yes",
            "default": "Default Value",
            "help": "Help text displayed to the right of the field"
          },
          {
            "type": "integer",
            "name": "simplenumber",
            "caption": "Number",
          },
          {
            "type": "integer",
            "name": "number2",
            "caption": "Number 2",
            "required": "1",
            "minimum": 23,
            "maximum": 99,
            "help": "Number field with limit 23-99"
          },
          {
            "type": "password",
            "name": "password",
          }
        ]
      }
    ]
  }
]
```

```

        "caption": "Password",
        "help": "This is a password field"
    },
    {
        "type": "radio",
        "name": "radiotest",
        "caption": "Radio test",
        "help": "This is a radio selection field",
        "options": {
            "1": "This is option 1",
            "2": "This is option 2",
            "3": "This is option 3"
        },
        "default": "2"
    },
    ]
},
{
    "name": "group2",
    "caption": "Group 2",
    "fields": [
        {
            "name": "testfield2",
            "caption": "Test2",
            "type": "edit"
        }
    ]
}
]
}
]

```

### Tasks Definition

A tasks definition is a JSON array where each task is one object. Tasks contain all name/value pairs as defined in the sensor settings definition, which are filled with the values you have provided. Additionally, the following information is included:

Name	Mandatory	Description	Possible Value
kind	X	The type of the sensor.	String

Name	Mandatory	Description	Possible Value
sensorid	X	The ID of the sensor.	Integer
host	X	The IP address/DNS name of the parent device as specified for this device. For the probe device, the default is <a href="#">127.0.0.1</a> .	IP address/DNS name
all defined fields	X	All fields that are defined in the sensor setting group objects are included in the tasks definition as name/value pairs.	name/value pairs

**i** This data comes from PRTG, so the mandatory JSON objects are included automatically.

**Example**

Definition of two tasks, the first one is the simplest possible one without any values, and the second one uses the sensor settings objects as defined above:

```
[
  {
    "sensorid": "2009",
    "kind": "ping",
    "host": "www.google.com"
  },
  {
    "sensorid": "2010",
    "kind": "sample",
    "host": "www.paessler.com",
    "simpleedit": "Test2",
    "extendededit": "Extended Test",
    "simplenumber": "3",
    "number2": "42",
    "password": "masked text",
    "radiotest": "1",
    "testfield2": "This is test 3"
  }
]
```

## Data Definition

A data definition is a JSON array where each result of a task is one object. Every array element contains the following name/value pairs:

Name	Mandatory	Description	Possible Value
sensorid	X	The ID of a specific sensor.	Integer
time	—	<p>The time of measurement in Coordinated Universal Time (UTC)/GMT time zone as a JSON number in the Unix time format (in milliseconds since Unix epoch, which is 00:00:00 UTC on January 1, 1970). Time values must be strictly chronological, so the Unix time of each measurement must be greater than the one before. The time values should be close to the current time (which is now) to prevent sensors in the Unknown <a href="#">status</a><sup>[181]</sup>.</p> <p><b>i</b> If no time value is provided, the current time (now) is used.</p>	JSON number defining Unix time
message	—	An optional text message.	Any string
channel	X	The channel result values.	<p>An array of name/value pairs.</p> <p><b>i</b> See <a href="#">Parameters for Data Definitions: Channel Result Values</a><sup>[3165]</sup> for more information.</p>

### Examples

Data definition object with sensor status **OK**:

```
[
  {
    "sensorid":"2003",
    "message":"Optional Message",
    "channel":[
      {
        "name":"Time",
        "mode":"integer",
        "unit":"TimeResponse",
        "value":6
        "showchart":1
        "showtable":1
      }
      {
        "name":"Pages",
        "mode":"counter",
        "unit":"Custom",
        "customunit":"Pages",
        "value":99
      }
    ]
  }
]
```

Data definition object with sensor status error:

```
[
  {
    "sensorid":"2003",
    "error":"Response",
    "code":10,
    "message":"Error Message"
  }
]
```

#### Parameters for Data Definitions: Channel Result Values

The following table shows name/value pairs that can be used in the "channel" array objects of data definition objects:

Name	Mandatory	Description	Possible Value
Name	X	The name of the channel as displayed in user interfaces.	Any string
Value	X	Any number without quotation marks.	An integer, float, or counter value
Mode	—	The type of the value. <b>i</b> Make sure that it matches the provided value, otherwise PRTG shows 0 values.	Integer, float, or counter
Unit	—	The unit of the value. <b>i</b> If you set the correct unit type instead of using custom units, PRTG can display received values better.	BytesBandwidth BytesMemory BytesDisk BytesFile TimeResponse TimeSeconds TimeHours Temperature Percent Count CPU: This is a % unit that is accounted to the CPU load in index graphs. Custom (define the name of the unit using the additional field customunit)
ShowChart	—	Init value for the Show in graphs option. <b>i</b> The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.	0 (= do not show graph) 1 (= show graph)

Name	Mandatory	Description	Possible Value
ShowTable	—	<p>Init value for the Show in graphs option.</p> <p><b>i</b> The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	<p>0 (= do not show table)</p> <p>1 (= show table)</p>
SpeedSize VolumeSize	—	<p>Size used for the display value. For example, if you have a value of 50000 and use Kilo as size, the display is 50 kilo #. The default is <b>One</b> (value used as returned).</p> <p><b>i</b> For the Bytes and Speed units, this is overridden by the setting in the user interface.</p>	<p>One</p> <p>Kilo</p> <p>Mega</p> <p>Giga</p> <p>Tera</p> <p>Byte</p> <p>KiloByte</p> <p>MegaByte</p> <p>GigaByte</p> <p>TeraByte</p> <p>Bit</p> <p>KiloBit</p> <p>MegaBit</p> <p>GigaBit</p> <p>TeraBit</p>
SpeedTime	—	<p>See above, used when displaying the speed. The default is <b>Second</b>.</p>	<p>Second</p> <p>Minute</p> <p>Hour</p> <p>Day</p>

Name	Mandatory	Description	Possible Value
decimalMode	—	<p>Init value for the Decimal Places option. If 0 is used in the float mode (use integer), the default is <a href="#">Automatic</a>. Otherwise (for float), the default is <a href="#">All</a>.</p> <p><b>i</b> You can change this initial setting later in the sensor's <a href="#">channel settings</a> <sup>[268]</sup>.</p>	<p>Automatic</p> <p>All</p> <p>Custom</p>
decimalDigits	—	<p>If you define Custom as decimalMode, specify the number of digits after the delimiter.</p>	Integer
ValueLookup	—	<p>Define if you want to use a lookup file (for example, to view integers as status texts). Enter the ID of the lookup file that you want to use, or omit this element to not use lookups.</p> <p><b>■</b> See section <a href="#">Define Lookups</a> <sup>[318]</sup> for more information.</p> <p><b>i</b> This setting is only considered on the first sensor scan, when the channel is newly created. It is ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	Any string
LimitMaxError	—	<p>Define an upper error limit for the channel. If enabled, the sensor is set to the Down status if this value is exceeded and the LimitMode is activated.</p> <p><b>i</b> Provide the value for the limit in the unit of the base data type as it is used in the &lt;Value&gt; element of this section. When a sensor shows the Down status triggered by a limit, it still receives data in its channels.</p>	Integer

Name	Mandatory	Description	Possible Value
		<p><b>i</b> The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	
LimitMaxWarning	—	<p>Define an upper warning limit for the channel. If enabled, the sensor is set to the Warning status if this value is exceeded and the LimitMode is activated.</p> <p><b>i</b> Provide the value for the limit in the unit of the base data type as it is used in the &lt;Value&gt; element of this section.</p> <p><b>i</b> The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	Integer
LimitMinWarning	—	<p>Define a lower warning limit for the channel. If enabled, the sensor is set to the Warning status if this value falls below the defined limit and the LimitMode is activated.</p> <p><b>i</b> Provide the value for the limit in the unit of the base data type as it is used in the &lt;Value&gt; element of this section.</p>	Integer

Name	Mandatory	Description	Possible Value
		<p><b>i</b> The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	
LimitMinError	—	<p>Define a lower error limit for the channel. If enabled, the sensor is set to the Down status if this value falls below the defined limit and the LimitMode is activated.</p> <p><b>i</b> Provide the value for the limit in the unit of the base data type as it is used in the &lt;Value&gt; element of this section.</p> <p><b>i</b> The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	Integer
LimitErrorMsg	—	<p>Define an additional message. It is added to the sensor's message when entering the Down status that is triggered by a limit.</p> <p><b>i</b> The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	Any string

Name	Mandatory	Description	Possible Value
LimitWarningMessage	—	<p>Define an additional message. It is added to the sensor's message when entering the Warning status that is triggered by a limit.</p> <p><b>i</b> The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	Any string
LimitMode	—	<p>Define if the limit settings defined above are active. The default is 0 (no; limits inactive). If 0 is used, the limits are written to the channel settings as predefined values, but limits are disabled.</p> <p><b>i</b> The values defined with this element are only considered during the first sensor scan when the channel is newly created. They are ignored on all further sensor scans (and may be omitted). You can change this initial setting later in the sensor's channel settings.</p>	0 (= no) 1 (= yes)
Warning	—	<p>If enabled for at least one channel, the entire sensor is set to the Warning status. The default is 0 (no).</p>	0 (= no) 1 (= yes)
Message	—	<p>Text the sensor returns in the Message field with every scanning interval. There can be one message per sensor, regardless of the number of channels. The default message is <b>OK</b>.</p>	Any string

Name	Mandatory	Description	Possible Value
Error	—	<p>The type of error.</p> <p><b>i</b> The type is not necessarily shown in PRTG.</p>	<p>Data: The monitored device returned a value but the sensor could not process it.</p> <p>Response: The monitored device reported an error. This includes timeouts, HTTP response codes, etc.</p> <p>Exception: Error in sensor handling.</p> <p>Socket: Socket error.</p>
Code	—	The error code that is stored in the database.	Integer

## 14.3 Filter Rules for Flow, IPFIX, and Packet Sniffer Sensors

You can use filter rules for the Include Filter, Exclude Filter, and Channel Definition fields of [packet sniffer](#)<sup>[3009]</sup>, [flow, and IPFIX](#)<sup>[3011]</sup> sensors. The filter rules are based on the following format:

```
field[filter]
```

In this section:

- [Valid Fields for All Sensors](#)<sup>[3173]</sup>
- [Additional Fields for Packet Sniffer Sensors Only](#)<sup>[3174]</sup>
- [Additional Fields for NetFlow v5 and jFlow v5 Sensors Only](#)<sup>[3174]</sup>
- [Additional Fields for NetFlow v9 and IPFIX Sensors Only](#)<sup>[3175]</sup>
- [Additional Fields for sFlow Sensors Only](#)<sup>[3176]</sup>
- [Valid Data Formats](#)<sup>[3176]</sup>
- [Examples](#)<sup>[3176]</sup>

### Valid Fields for All Sensors

Field	Possible Filter Values
IP	IP address or Domain Name System (DNS) name  For more information, see section <a href="#">Valid Data Formats</a> <sup>[3176]</sup> .
Port	Any number
SourceIP	IP address or DNS name
SourcePort	Any number
DestinationIP	IP address or DNS name
DestinationPort	Any number
Protocol	<a href="#">Transmission Control Protocol (TCP)</a> , <a href="#">User Datagram Protocol (UDP)</a> , <a href="#">Internet Control Message Protocol (ICMP)</a> , <a href="#">Open Shortest Path First (OSPF)</a> , any number
ToS	<a href="#">Type of Service (ToS)</a> : any number
DSCP	<a href="#">Differentiated Services Code Point (DSCP)</a> : any number

### Additional Fields for Packet Sniffer Sensors Only

Field	Possible Filter Values
MAC	Physical address  For more information, see section <a href="#">Examples</a> <sup>3176</sup> .
SourceMAC	Physical address
DestinationMAC	Physical address
EtherType	<a href="#">IPV4</a> , <a href="#">ARP</a> , <a href="#">RARP</a> , <a href="#">APPLE</a> , <a href="#">AARP</a> , <a href="#">IPV6</a> , <a href="#">IPXold</a> , <a href="#">IPX</a> , any number
VlanPCP	IEEE 802.1Q VLAN Priority Code Point
VlanID	IEEE 802.1Q VLAN Identifier
TrafficClass	IPv6 Traffic Class: corresponds to <a href="#">TOS</a> used with <a href="#">IPv4</a>
FlowLabel	IPv6 Flow Label

### Additional Fields for NetFlow v5 and jFlow v5 Sensors Only

Field	Possible Filter Values
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP address of the sending device. Use this if you have several devices that send flow data on the same port, and you want to divide the traffic of each device into a different channel.  Possible values: IP address or DNS name  For more information, see section <a href="#">Valid Data Formats</a> <sup>3176</sup> .
SourceASI	Any number

Field	Possible Filter Values
DestinationASI	Any number

### Additional Fields for NetFlow v9 and IPFIX Sensors Only

Field	Possible Filter Values
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	<p>IP address of the sending device. Use this if you have several devices that send flow data on the same port, and you want to divide the traffic of each device into a different channel.</p> <p>Possible values: IP address or DNS name</p> <p> For more information, see section <a href="#">Valid Data Formats</a> <sup>3176</sup>.</p>
SourceASI	Any number
DestinationASI	Any number
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address
Mask	Mask values represent subnet masks in the form of a single number (number of contiguous bits).
DestinationMask	Mask values represent subnet masks in the form of a single number (number of contiguous bits).
NextHop	IP address or DNS name
VLAN	VLAN values represent a VLAN identifier (any number).

Field	Possible Filter Values
SourceVLAN	VLAN values represent a VLAN identifier (any number).
DestinationVLAN	VLAN values represent a VLAN identifier (any number).

### Additional Fields for sFlow Sensors Only

Field	Possible Filter Values
Interface	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	<p>IP address of the sending device. Use this if you have several devices that send flow data on the same port, and you want to divide the traffic of each device into a different channel.</p> <p>Possible values: IP address or DNS name</p> <p> For more information, see section <a href="#">Valid Data Formats</a> <sup>B176</sup>.</p>
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address

### Valid Data Formats

- IP fields support wildcards (\*), range (10-20) and hostmask ( /10, /255.255.0.0) syntax, as well as DNS names.
  -  IP fields do not support IPv6 wildcards, IPv6 ranges, and IPv6 hostmasks.
- Number fields support range (80-88) syntax.
- Protocol and EtherType fields support numbers and a list of predefined constants.

 For more information on IP address ranges, see section [Define IP Address Ranges](#) <sup>B180</sup>.

### Examples

All of the following filter rules are valid examples:

```
SourceIP[10.0.0.1]
SourceIP[10.*.*.*]
SourceIP[10.0.0.0/10]
DestinationIP[10.0.0.120-130]
DestinationPort[80-88]
Protocol[UDP]
MAC[00-60-50-X0-00-01]
DSCP[46]
```

You can create more complex expressions by using parentheses ( ) and the words **and**, **or**, or **and not**. For example, these are valid filter rules:

```
Protocol[TCP] and DestinationIP[10.0.0.1]
```

This rule filters for all TCP traffic with the destination IP address 10.0.0.1.

```
Protocol[TCP] or DestinationIP[10.0.0.1]
```

This rule filters for all TCP traffic and all traffic with the destination IP address 10.0.0.1.

```
Protocol[TCP] and (DestinationIP[10.0.0.1] or SourceIP[10.0.0.120-130])
```

This rule filters for all TCP traffic with either the destination IP address 10.0.0.1 or the source IP address range 10.0.0.120-130.

```
Protocol[TCP] and not (DestinationIP[10.0.0.1] or SourceIP[10.0.0.120-130])
```

This rule filters for all TCP traffic that does not have the destination IP address 10.0.0.1 and the source IP address range 10.0.0.120-130.

How can I change the default groups and channels for flow and Packet Sniffer sensors?

- <https://kb.paessler.com/en/topic/60203>

## 14.4 Channel Definitions for Flow, IPFIX, and Packet Sniffer Sensors

With [custom Flow sensors](#), [custom IPFIX](#)<sup>[3011]</sup>, or [custom Packet Sniffer sensors](#)<sup>[3009]</sup>, you have the option to provide a Channel Definition with the following syntax, one entry per channel:

```
#<id> : <Name>
<Rule>
```

### Syntax

- The `<id>` must be 1 or a higher number, and it must be unique for the sensor. This means that each channel definition must have a unique ID.
  - ❗ The maximum channel ID that you can use is **2147483648** ( $2^{31}$ ). PRTG does not support higher IDs. We recommend that you use channel IDs like 1, 2, or 3.
- The `<id>` is linked to the historic data.
  - ❗ As soon as you change the ID, you lose the history for the channel that the ID was linked to.
- One rule can span multiple lines.
- The next rule starts with a `#` as the first character in a line.
- The `<name>` is the display name of the channel.
- PRTG processes the rules from top to bottom (the number does not matter) and accounts the data to the first match.
- PRTG automatically adds one channel named Other. This channel counts all traffic for which you do not define a specific channel.
- After the name, you can use an optional `[<unit>]` to override the automatic unit, which is based on the source sensor.

The `<Rule>` syntax is identical to the one described in section [Filter Rules for Flow, IPFIX, and Packet Sniffer Sensors](#)<sup>[3173]</sup>. Because PRTG accounts data to the first match, make sure that you start with the most specific rule at the top and get less specific towards the bottom.

❗ We recommend that you write the rules list in an external editor first and then paste it into the Channel Definition field of the sensor. If the rules contain an error, PRTG removes the entries after you add them.

❗ You cannot delete channels even if you remove a channel from the channel definition. You also cannot change the display name of channels using the channel definition of custom flow sensors. You can only rename channels in the [channel settings](#)<sup>[2681]</sup>.

### Example

General example:

```
#5:HTTP
Protocol[TCP] and
(SourcePort[80] or DestinationPort[80] or SourcePort[8080] or
DestinationPort[8080])
```

Channel definition example for differentiating by protocol:

```
#1:TCP
Protocol[TCP]

#2:UDP
Protocol[UDP]

#3:ICMP
Protocol[ICMP]
```

## 14.5 Define IP Address Ranges

In some setting fields, you can either enter a host name or a single IP address, or you can define IP address ranges. These are available, for example, for [Flow and Packet Sniffer sensors](#)<sup>[2832]</sup> and for [probe connection settings](#)<sup>[2890]</sup>. PRTG follows a common syntax for IP address ranges.

■ For the supported syntax of the automatic network discovery feature in PRTG, see section [Add an Auto-Discovery Group](#)<sup>[267]</sup>.

### Available Options

Option	Description	Syntax	Examples
Simple	Enter a fixed IP address.	a.b.c.d	10.0.10.9
Hostname	Enter a hostname. PRTG resolves it to an IP address in your network.	hostname	device-xyz
Hostmask	Enter a hostmask. A hostmask defines the relevant bits of the IP address.   Valid hostmasks are /0 - /32 for IPv4 and /0 - /128 for IPv6.	a.b.c.d/h or a.b.c.d/e.f.g.h	10.0.0.0/24
Range	Enter an IP address range. Replace each letter of a, b, c, d with either <ul style="list-style-type: none"> <li>▪ * (asterisk) for any value; corresponds to 0-255 or</li> <li>▪ x-y for any range between 0 and 255.</li> </ul>	a.b.c.d	10.0.0.1-20 or 10.*.0.* or 10.0.0-50.*

## 14.6 Define Lookups

PRTG uses lookups for some sensors and for other sensors that have custom channels. In general, lookups map status values as returned by a device (usually integers) to more informative expressions in words. Additionally, lookups can define a [sensor status](#)<sup>[181]</sup> based on the status value returned by a device, just like [channel limits](#)<sup>[2682]</sup> can define a sensor status. For a printer that returns the status value 1, for example, PRTG can show a sensor in the Warning status with the text message **Toner Low** instead of only displaying the status value 1.

You can customize lookups by defining your own text messages that a channel shows and by mapping them to a certain sensor status. See section [Customizing Lookups](#)<sup>[3187]</sup>.

If a channel uses lookups, you can individually define how to control the status of the sensor, either by using the lookup definition or by using limits for numeric values returned by the device. For more information, see section [Channel Settings](#)<sup>[2682]</sup>. It is not possible to use both definitions at the same time.

- i Lookups do not change data in the PRTG database, they merely change the way a sensor shows a channel. Any change to lookup definition files applies to historic data as well as to live data.
- i Some exceptions apply to the [SNMP Custom String Lookup](#) sensor that basically does an inverse lookup. It does not map an integer to a text message but only looks for matching strings in the lookup definition and shows a status based on this text value.

 To upload customized lookups to PRTG Hosted Monitor, see section [Manage a PRTG Hosted Monitor Subscription](#).

In this section:

- [Requirement: Channel Unit "Custom"](#)<sup>[3181]</sup>
- [Visualization of Lookup Channels](#)<sup>[3182]</sup>
- [Lookups Directory and Format](#)<sup>[3184]</sup>
- [The XML Schema](#)<sup>[3185]</sup>
- [Customizing Lookups](#)<sup>[3187]</sup>
- [desiredValue Attribute](#)<sup>[3189]</sup>
- [Lookup Types: SingleInt, Boolean, BitField, Range](#)<sup>[3189]</sup>
- [Define Lookup Files in Channel Settings](#)<sup>[3190]</sup>
- [Loading Lookups](#)<sup>[3190]</sup>
- [Debugging](#)<sup>[3191]</sup>

### Requirement: Channel Unit "Custom"

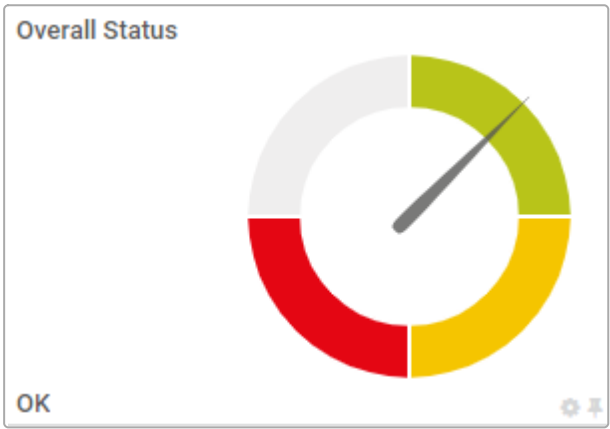

All channels with an enabled Lookup need to use the Channel Unit **"Custom"**. For more information, see section [Channel Settings](#)<sup>[2682]</sup>.

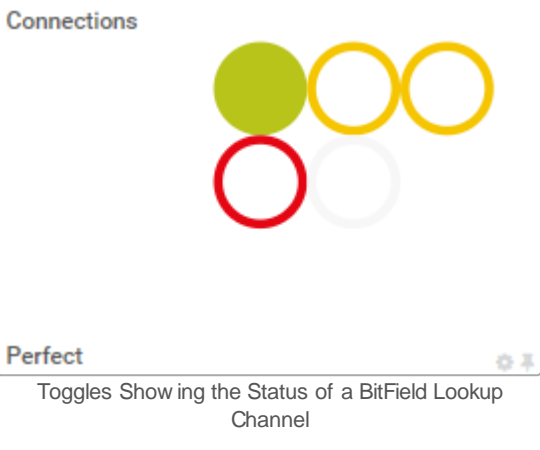

- i There are sensors that provide the Channel Unit **"Lookup"** in their settings. Do **not** use the Channel Unit **"Custom"** for channels of these sensors if you want to use lookups. This results in malfunctioning lookup definitions. For the following sensors, select the Channel Unit **"Lookup"** in the settings and select the lookup file directly under Channel Lookup during sensor creation:

- [Microsoft SQL v2](#)
- [MySQL v2](#)
- [Oracle SQL v2](#)
- [PostgreSQL](#)
- [SNMP Custom Advanced](#)
- [SNMP Custom Table](#)

### Visualization of Lookup Channels

PRTG can display channels that use lookups as follows.

Lookup Type	Visualization	Example
SingleInt, Range	Gauge	 <p>A Gauge Showing the Status of a Lookup Channel</p>
Boolean	Switch	 <p>A Switch Showing the Status of a Boolean Lookup Channel</p>

Lookup Type	Visualization	Example
BitField	Toggles	

You can view the text messages for the different lookup values by hovering over the respective section.

Gauge Showing the Respective Lookup Message when Hovering over a Color Section

To see which lookup value in which channel shows the Warning or Down status, check the sensor message on a sensor's Overview tab:

Sensor Message on the Overview Tab

**i** We recommend that you stay below 120 lookup values to display visually informative gauges for primary channels. Non-primary channels have an upper limit of around 40 lookup values for gauges.

Gauge Showing 120 Lookup Values

- i** The various sensor states that are displayed in gauges always follow the clockwise order Up < Warning < Down < Unknown. This order stays the same, no matter which numeric value you map to which sensor status in the lookup definition. See the following example:

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="example.lookups" desiredValue="1" undefinedState="olsWarning"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="PaeValueLookup.xsd">
<Lookups>
  <SingleInt state="OK" value="1">
    Works
  </SingleInt>
  <SingleInt state="OK" value="2">
    Works a bit
  </SingleInt>
  <SingleInt state="Warning" value="4">
    Is slow
  </SingleInt>
  <SingleInt state="Error" value="8">
    Does not work
  </SingleInt>
  <SingleInt state="OK" value="16">
    Works sometimes
  </SingleInt>
</Lookups>
</ValueLookup>
```

Even though the value 8 comes before the value 16, PRTG displays the state **OK** (shown as the Up status) before the state **Error** (shown as the Down status).

- See [Lookups Directory and Format](#)<sup>[3184]</sup> and [The XML Schema](#)<sup>[3185]</sup> for more information about the lookup code and format.

## Lookups Directory and Format

Lookups are defined in Extensible Markup Language (XML) format in files that end with **.ov**. PRTG standard lookup files are located in the `\lookups` subfolder of the [PRTG program directory](#)<sup>[3213]</sup>. PRTG maintains these files. In each of the files, lookups for one or more sensors are defined. Furthermore, the `\lookups` subfolder contains the `\custom` subfolder to store your customized lookups.

- For a list of all standard lookup files, see section [Standard Lookup Files](#)<sup>[3335]</sup>.

The files follow a basic principle. For each numeric value, you can define the following:

- A message that the sensor looks up and shows instead of the numeric value.
- The status that the sensor shows.

❗ Use the [SNMP Custom String Lookup](#) sensor to map a string to a corresponding status. For this purpose, use the [lookup type](#)<sup>3189</sup> SingleInt.

☁ You cannot access this directory on PRTG Hosted Monitor instances.

## The XML Schema

An exemplary schema of the .xml files that contain the lookup definitions can look like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="..." desiredValue="..." undefinedState="..." xmlns="..." xsi="...">
  <Lookups>
    <SingleInt state="..." value="...">status text</SingleInt>
    <SingleInt state="..." value="...">status text</SingleInt>
    <SingleInt state="..." value="...">status text</SingleInt>
  </Lookups>
</ValueLookup>
```

Element	Description	Attributes, Value Assignment, and Content
<?xml> <a href="#">content</a>	This is the XML declaration that every .xml file begins with.	<ul style="list-style-type: none"> <li>version and encoding are <a href="#">1.0</a> and <a href="#">UTF-8</a> respectively</li> <li>content: &lt;ValueLookup&gt;<a href="#">contentValueLookup</a>&lt;/ValueLookup&gt;</li> </ul>
<ValueLookup> <a href="#">contentValueLookup</a> </ValueLookup>	Defines the ID of the channel, which <a href="#">desiredValue</a> is used, the status for undefined values ( <a href="#">undefinedState</a> ), and links to the predefined schema definitions in PRTG that allow you to edit lookup files with supported editors.	<ul style="list-style-type: none"> <li>id: Specifies how the name of the lookup file is shown in the <a href="#">channel settings</a><sup>2681</sup>. ❗ PRTG parses the <a href="#">id</a> as a lowercase string.</li> <li><a href="#">desiredValue</a><sup>3189</sup>: Contains the value that PRTG uses for the calculation of the <a href="#">Coverage</a>.</li> <li>undefinedState: Optionally define a status for values that are not defined in the lookup file. If the target device returns a value that is not included in the lookup definition, the sensor shows this status (<a href="#">OK</a>, <a href="#">Warning</a>, <a href="#">Error</a>, or <a href="#">None</a>) with an according message. Without a definition of <a href="#">undefinedState</a>, the sensor only shows the returned value.</li> </ul>

Element	Description	Attributes, Value Assignment, and Content
		<ul style="list-style-type: none"> <li>▪ xmlns:xsi/xsi: Refers to predefined XML schema definitions in PRTG that allow you to edit lookup files with supported editors.</li> <li>▪ <code>contentValueLookup</code>: Lookup definitions  <code>&lt;Lookups&gt;contentLookups&lt;/Lookups&gt;</code></li> </ul>
<code>&lt;Lookups&gt; contentLookups &lt;/Lookups&gt;</code>	Defines the particular lookups for the sensor data.	<ul style="list-style-type: none"> <li>• <code>contentLookups</code>: One or more lookup entries, see below.</li> </ul>
<code>&lt;SingleInt&gt; status text &lt;/SingleInt&gt;</code>  <code>&lt;Boolean&gt; status text &lt;/Boolean&gt;</code>  <code>&lt;BitField&gt; status text &lt;/BitField&gt;</code>  <code>&lt;Range&gt; status text &lt;/Range&gt;</code>	<p>Each element defines one lookup entry. There can be one or more lookup entries from the same <a href="#">lookup type</a> <sup>B189</sup>.</p> <p><b>i</b> You can use only <b>one</b> kind of lookup type in <b>one</b> lookup file. This means only <b>SingleInt</b>, only <b>Boolean</b>, only <b>BitField</b>, or only <b>Range</b>. Different lookup types in one file are not allowed.</p> <p>The notation for the different lookup types can vary:</p> <ul style="list-style-type: none"> <li>▪ <code>&lt;SingleInt state="..." value="..."&gt;status text&lt;/SingleInt&gt;</code></li> <li>▪ <code>&lt;Boolean state="..." value="..."&gt;status text&lt;/Boolean&gt;</code></li> <li>▪ <code>&lt;BitField state="..." value="..."&gt;status text&lt;/BitField&gt;</code></li> <li>▪ <code>&lt;Range state="..." from="..." to="..."&gt;status text&lt;/Range&gt;</code></li> </ul>	<ul style="list-style-type: none"> <li>▪ <code>state</code>: Defines the status that the sensor shows. Allowed values are <b>OK</b>, <b>Warning</b>, <b>Error</b>, and <b>None</b>. <b>None</b> does not trigger a status change.</li> <li>▪ <b>i</b> <code>State</code> values must be capitalized for the sensor to work properly.</li> <li>▪ <code>value</code>: Defines the value that triggers the lookup. Enter an integer.</li> <li>▪ <b>i</b> Range always needs both values "from" and "to".</li> <li>▪ <code>status text</code>: Defines a <code>status text</code> that PRTG uses as substitution text and shows instead of the integer, for example, a status message.</li> <li>▪ <b>i</b> The SNMP Custom String Lookup sensor maps the status text to one of the specified states. For this sensor, use <b>SingleInt</b>.</li> </ul>

Because all .xml files that contain lookup definitions are delivered in a previously specified schema as indicated above, you can [customize lookups](#) <sup>B187</sup> accordingly.

## Example

The following code illustrates the lookup definition for the toner status of the [SNMP HP LaserJet Hardware](#) sensor:

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="oid.paessler.hplaserjet.tonerstatus" desiredValue="1"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="PaeValueLookup.xsd">
  <Lookups>
    <SingleInt state="OK" value="0">Toner Okay</SingleInt>
    <SingleInt state="Warning" value="1">Toner Low</SingleInt>
    <SingleInt state="Error" value="2">No Toner Cartridge Loaded</SingleInt>
  </Lookups>
</ValueLookup>
```

In our example, the lookup file has the following effect:

Value as Reported from HP Printer	Text Shown in PRTG (Channel)	Sensor Status Shown in PRTG	
0	Toner Okay		Up
1	Toner Low		Warning
2	No Toner Cartridge Loaded		Down

## Customizing Lookups

 To upload customized lookups to PRTG Hosted Monitor, see section [Manage a PRTG Hosted Monitor Subscription](#).

If you want to change the status definitions of a channel, follow these steps:

1. Find out the (file) name of the default lookup file in the settings of the channel that you want to change the status definitions for.
  2. From the \lookups subfolder of the [PRTG program directory](#) , copy this file into the \lookups\custom subfolder. Make sure that you do not change the file name.  
OR  
create a new .xml file there.
-  If you use the same ID in the [ValueLookup](#) tag, the files in the \lookups\custom subfolder have a higher priority than the original files in the \lookups folder. This way, PRTG prefers your customizations to the original lookup settings. If you want to use custom lookup definitions [in addition](#) to the standard lookups, define a new ID in the lookup file that is not used by any other lookup file. PRTG identifies lookup definitions via this ID, it does [not](#) use the file name.

3. Open the file with an XML or text editor and customize the lookups as you like. You can define your own text messages or customize sensor states for specific return values. For example, if you do not want a sensor to show the Down status for the return value 2 but only the Warning status, replace the state **Error** with **Warning**.

**i** All possible states are specified in the LookupState.xsd file in the custom directory. Follow the schema of the .xml files that are delivered with PRTG to make sure that you safely edit lookups.

**i** If you [import an .oidlib file](#) that contains lookups (you can see this in section [Lookup in MIB Importer](#)), you can define your own sensor states for the returned values. If you add an [SNMP Library](#) sensor and use this .oidlib file, PRTG creates a lookup definition file that uses the [lookupname](#) of the chosen library as **id** parameter. Override this lookup definition with your own custom lookup as described in this section. This is important because lookups that you add via an .oidlib file do not contain any status definitions and result in the Warning status of the sensor by default because of the entry `undefinedState="Warning"`.

**i** If you use an SNMP Custom String Lookup sensor, you can create a new custom lookup definition in the \lookups\custom subfolder with the expected return values. In this case, use the [lookupname](#) of the chosen library as **id** parameter to override the lookups from the .oidlib file.

**i** When you save an edited lookup, make sure that you save it as an .ov file. Otherwise, the lookup might accidentally be saved as a .txt file and might not be loaded.

#### Example for Lookups Customization

For example (for illustration purposes only), imagine you want

- the sensor to show the Warning status for all undefined values that the target device might return,
- to change the shown status for the return value 2 from the Down to the Warning status, and
- to add the state **None** (shown as the Unknown status) to the [example<sup>B1871</sup>](#) above.

Then take the following steps:

1. Copy the file `oid.paessler.hplaserjet.tonerstatus` to the \lookups\custom subfolder of the PRTG program directory.
2. Open this file with a text editor.
3. Leave the **id** value unchanged to prioritize the customized lookup file.
4. Insert the status definition for undefined values into the [ValueLookup](#) element:  
`undefinedState="Warning"`
5. Replace the state **Error** with **Warning** for value 2.
6. Add a [SingleInt](#) element with the state **None** for the (hypothetical) return value 3.
7. Save the file and [reload<sup>B1901</sup>](#) the custom lookup folder in PRTG.

The customized lookup file looks like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="oid.paessler.hp.laserjet.tonerstatus" desiredValue="1"
undefinedState="Warning" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="PaeValueLookup.xsd">
  <Lookups>
    <SingleInt state="OK" value="0">Toner Okay</SingleInt>
    <SingleInt state="Warning" value="1">Toner Low</SingleInt>
    <SingleInt state="Warning" value="2">No Toner Cartridge
Loaded</SingleInt>
    <SingleInt state="None" value="3">Unknown Status of Toner</SingleInt>
  </Lookups>
</ValueLookup>
```

■ See also the [SNMP Custom String Lookup](#) sensor for a lookup definition that maps a string value to a sensor status.

### desiredValue Attribute

It is necessary to define a [desiredValue](#) in the lookup files. The desiredValue corresponds to a [status value](#) that triggers a lookup. PRTG calculates the percentage of time this specific status was monitored. PRTG displays the result for all data tables and graphs that show averaged values.

Considering the example above where the desiredValue is **1**, PRTG calculates the percentage of time that the toner status showed the Warning status. If, during a time span of five minutes, four of five sensor scans returned [Warning](#), PRTG shows an average of 80% for this time span because 80% of the time, the sensor showed the Warning status.

**i** The desiredValue attribute always has to be an [integer](#). For the lookup type [Range](#), use an integer that you defined for one of your "from" or "to" parameters in the lookup file.

■ For more information, see the Knowledge Base: [Can I graph text values?](#)

### Lookup Types: SingleInt, Boolean, BitField, Range

Besides the lookup type [SingleInt](#) as seen above, there are three other lookup types: [Boolean](#), [BitField](#), and [Range](#). Using these types, you can define lookup values beyond simple integers.

Lookup Type	Description	Syntax
SingleInt	Use an <a href="#">integer</a> to define a lookup for one status value.	value="int" <b>i</b> PRTG supports the full 32-bit integer range.
Boolean	Use <b>0</b> or <b>1</b> to define a lookup for two different status values.	value="0" value="1"

Lookup Type	Description	Syntax
BitField	Use a <a href="#">bitfield</a> for multiple status values.	<p>Only use this lookup type if you have some basic knowledge of bitmasks. See section <a href="#">More</a><sup>[19]</sup> for a general introduction.</p> <ul style="list-style-type: none"> <li><span style="color: red;">❗</span> Every value has to be zero (0) or has to equal a power of two (for example, 1, 2, 4, 8, 16, 32, 64, etc.).</li> <li><span style="color: red;">❗</span> The SNMP Custom String Lookup sensor does not support BitFields.</li> </ul>
Range	Use an inter range <a href="#">from-to</a> to define a lookup for several status values.	<p>from="int" to="int"</p> <ul style="list-style-type: none"> <li><span style="color: red;">❗</span> Using ranges, the parameters "from" and "to" must always be defined. If you want to query only one single value in a range file, this value must be set as a parameter for "from" <b>and</b> "to" (for example, from="2" to="2").</li> <li><span style="color: red;">❗</span> The SNMP Custom String Lookup sensor does not support ranges.</li> <li><span style="color: red;">❗</span> The full 32-bit integer range is supported.</li> </ul> <p><span style="color: blue;">■</span> For more information, see the Knowledge Base: <a href="#">Custom lookup range</a>.</p>

❗ You can use only **one** kind of lookup type in **one** lookup file. This means, only [SingleInt](#), only [Boolean](#), only [BitField](#), or only [Range](#). Different lookup types in one file are not allowed.

## Define Lookup Files in Channel Settings

For each sensor with a custom channel, you can define a lookup file to use with the option Lookup in the channel settings. This option is visible for many SNMP sensors, some application sensors, and always for the following sensors:

- [EXE/Script](#)
- [EXE/Script Advanced](#) (if you define a Custom unit)
- [SNMP Custom](#)

■ For more information, see section [Channel Settings](#)<sup>[268]</sup>.

## Loading Lookups

You can (re)load the lookups in the custom folder by going to Setup | System Administration | [Administrative Tools](#)<sup>[291]</sup> in the PRTG web interface and clicking Go! under Load Lookups and File Lists.

 A sensor whose lookup file you have modified and reloaded does not re-evaluate this lookup before the next sensor scan. For sensors with long scanning intervals, use the Scan Now option from the [context menu](#)<sup>[229]</sup> to immediately apply the new lookup definition and to avoid an incorrect sensor status.

## Debugging

What happens if...

- a return value is defined in the lookups that is never returned by a device because the value is not assigned? The value is never triggered, so PRTG ignores this entry.
- PRTG receives a return value that is not defined for lookups? No substitution message can be found. PRTG only shows the return value. You can optionally define a status for unknown values with a definition of [undefinedState](#) in the [ValueLookup](#) element (see section [The XML Schema](#)<sup>[185]</sup>).
- different lookup types are in one lookup file? This is not allowed and PRTG discards this lookup definition. If you use miscellaneous lookup types in one file, for example, ranges and SingleInts together, PRTG creates a ticket when loading lookups or restarting the PRTG core server with the following error message: [Lookup file "\[...\]" could not be loaded \(" " is not a valid integer\)](#).
- XML code is incorrect? PRTG creates a new ticket when it loads lookups or restarts the PRTG core server with a corresponding error message and discards this lookup definition.
- a lookup file has a file extension other than [.ovm](#)? The file is not loaded.
- alerting is disabled or based on limits? [Error](#) and [Warning](#) states that are defined in the lookup do not apply. Make sure that you select the option Enable alerting based on lookups in the channel settings if you want to use lookup definitions to control the sensor status.
- you define a scaling factor in channel settings? This does not modify the values that are defined by lookups. Any applied lookup always uses the raw value as retrieved from the target device. If you use a scaling factor for such a channel, you notice the scaling in data graphs but the channel value appears unmodified in data tables.

MIB Importer

- <https://www.paessler.com/tools/mibimporter>

## 14.7 Regular Expressions

For some sensors, you can use regular expressions (regex) to match a search pattern. PRTG supports Perl Compatible Regular Expression (PCRE).

The following sensors support regex:

- [DHCP](#)
- [File Content](#)
- [HTTP Advanced](#)
- [IMAP](#)
- [Port](#)
- [SNMP Custom String](#)
- [WMI Custom String](#)

**i** You can only use regex for the respective sensors if you explicitly enable regex in the sensors' settings.

**i** PRTG supports regex options in the form [\(?ismxUJ\)](#) and their negations, for example, [\(?-i\)](#). PRTG does not support regex flags like [/g](#) (global), [/s](#) (single line), or [/gs](#), and does not correctly search for the target string if you try to set flags.

### Common Search Patterns

Find matches that contain the word [error](#) or [alarm](#):

```
\b(error|alarm)\b
```

Find matches that contain the word [ERROR](#), not [error](#), using case sensitivity:

```
(?-i)\bERROR\b
```

Find matches that contain the words [error](#) and [alarm](#), in any order:

```
(?=.*\berror\b)(?=.*\balarm\b).*
```

Find matches that contain all of the words [tree](#), [flower](#), [leaf](#), and [bug](#), in any order:

```
(?=.*\btree\b)(?=.*\bflower\b)(?=.*\bleaf\b)(?=.*\bbug\b).*
```

**i** It is not possible to match an empty string with the regex search with sensors.

### Example

The search pattern

```
(?i)(?=.*\berror\b)(?=.*\balarm\b).*
```

matches the following expressions:

- Alarm error
- Error alarm

- I am an error and I trigger an alarm.
- I am an alarm and I indicate an error.
- An alarm combined with an error indeed!
- An error combined with an alarm, too!

## 14.8 Calculating Percentiles

PRTG not only monitors your network and informs you in the case of issues that are worth a closer look, it also stores a lot of historic data that it gathers from your sensors. This means that you have a base for the statistical analysis and evaluation of what is and was happening in your network. When you create a [report](#)<sup>[2754]</sup> or a [historic data report](#)<sup>[188]</sup>, you get raw data, sums, averages, and percentages of your monitoring data.

Additionally, PRTG also offers percentile calculation. This statistical method arranges your data, for example, from the lowest value to the highest value, and calculates the percentile that you want, optimally informing you about the distribution of your network-relevant data.

**i** For example, if you request the 95th percentile, you know that 95 percent of the measured data is below a certain value and PRTG can tell you what this certain value is.

If applied to bandwidth, for example, you know which values you have when talking about the 5 percent of unusually high bandwidth consumption, and which value your users do not exceed 95 percent of the time. Service providers often use percentiles to offer billing that excludes infrequent usage peaks.

**■** If you want to know more about the formula that PRTG uses for percentile calculation, see the Knowledge Base: [What are percentiles and what differences do they make in PRTG reports?](#)

What are percentiles and what differences do they make in PRTG reports?

- <https://kb.paessler.com/en/topic/9563>

## 14.9 Add Remote Probe

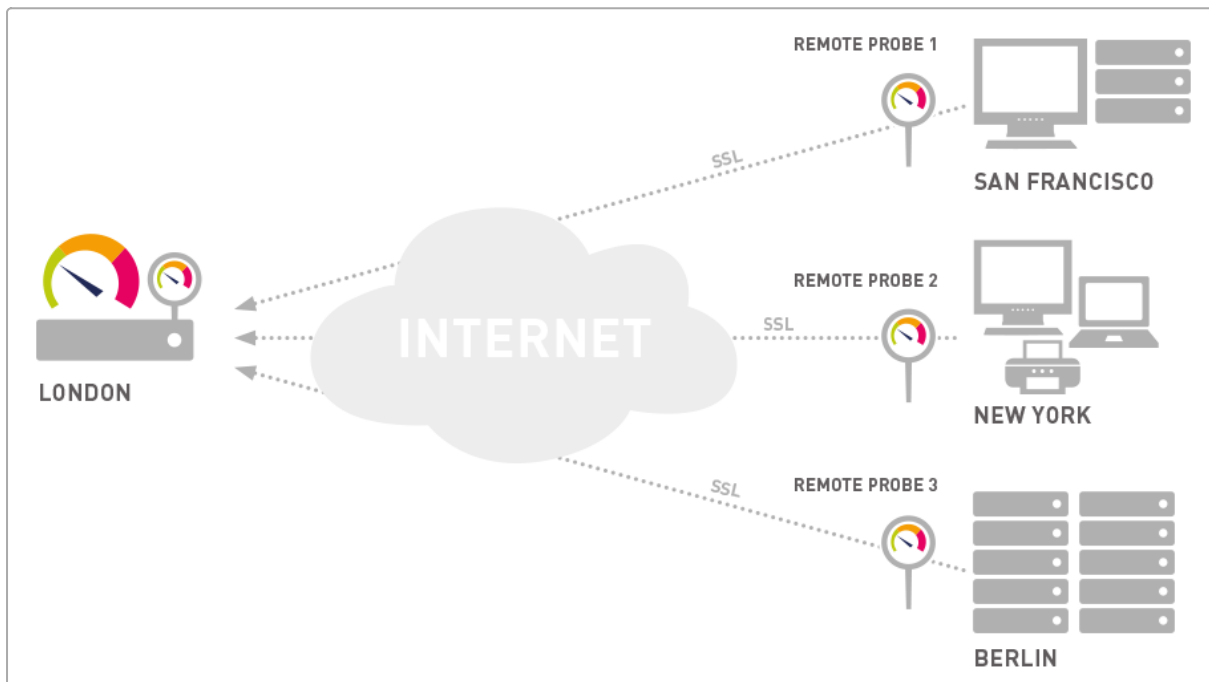

Remote probes can extend your monitoring with PRTG:

- Monitor different subnetworks that are separated from your PRTG core server by a firewall, and keep an eye on remote locations. You can install [one or more remote probes](#)<sup>[3198]</sup>.
- Distribute monitoring load by taking it from the PRTG core server system and putting it on one or more remote probe systems.

☁ You need a classic remote probe if you want to monitor your local network with a PRTG Hosted Monitor instance.

There are three types of remote probes:

1. [Classic remote probe](#)<sup>[3313]</sup>
2. [Multi-platform probe](#)<sup>[3316]</sup>
3. [Mini probe](#)<sup>[3316]</sup>

Monitoring Remote Locations via Remote Probes

### Classic Remote Probe

For more information on how to add a classic remote probe, see the following sections:

- Background information: [Remote Probes and Multiple Probes](#)<sup>[3198]</sup>
- Step-by-step installation: [Install a Remote Probe](#)<sup>[106]</sup>
- Partially automatic installation: [Classic Remote Probe Setup via Device Tools](#)<sup>[3202]</sup>
- Quick installation guide on the Paessler website: [How to install a PRTG remote probe in 4 steps](#)

## Multi-Platform Probe

For more information on how to add a multi-platform probe, see the [Multi-Platform Probe for PRTG](#) manual.

Distributed monitoring with PRTG

- [https://www.paessler.com/support/videos-and-webinars/videos/distributed\\_monitoring](https://www.paessler.com/support/videos-and-webinars/videos/distributed_monitoring)

## 14.9.1 Remote Probes and Multiple Probes

Upon installation, PRTG automatically creates the first probe, namely the local probe in PRTG Network Monitor, and the hosted probe in PRTG Hosted Monitor. They run on the PRTG core server system and monitor all reachable devices, servers, and services from the system, using the sensors you configure.

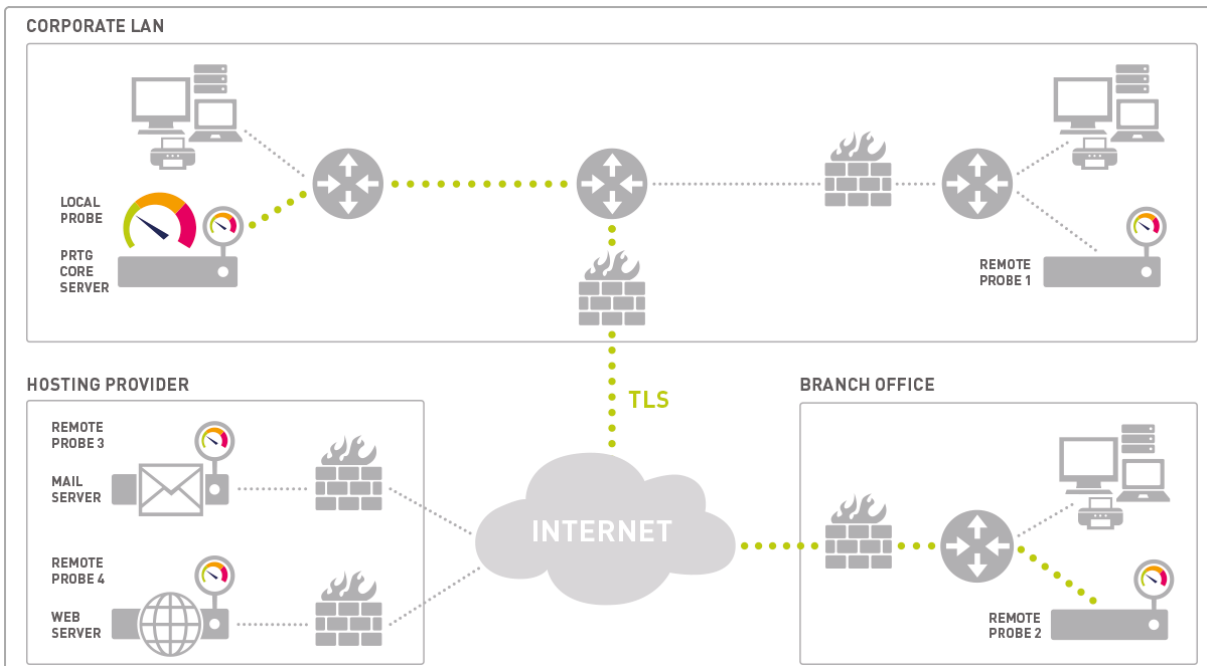

Working only with a local probe should suffice for LAN monitoring with PRTG Network Monitor and if you want to monitor one location only. For LAN monitoring with PRTG Hosted Monitor, at least one classic remote probe is required because the hosted probe can only reach targets that are publicly available via the internet.

### Scenarios That Require Remote Probes

There are several situations that make it necessary to work with remote probes in the same LAN or in remote locations:

- You use PRTG Hosted Monitor and want to monitor your local network.
- You have more than one location and you need to make sure that services are available from all locations.
- Your network is divided into several LANs that are separated by firewalls, and the local probe cannot monitor specific services across these firewalls.
- You want to monitor systems in a secure network and you need a secure connection between the PRTG core server and that network.
- You want to sniff packets on a different computer.
- You want to monitor NetFlow data on a different computer.
- You experience performance issues with CPU-intensive sensors like Packet Sniffer or NetFlow sensors and need to distribute the load among more than one computer.
- You want to monitor a non-Windows system. This is only possible with a [multi-platform probe](#)<sup>B316</sup>.

The following chart shows an example for a remote probe scenario.

Monitoring a Distributed Network with PRTG

The PRTG core server inside the [corporate LAN](#) (top left) can monitor:

- Services that are inside the [corporate LAN](#) using the [local probe](#).
- Services that are behind a firewall in the [corporate LAN](#) using [remote probe 1](#).
- Secured services that are inside the [branch office](#) (bottom right) using [remote probe 2](#).
- Secured services on [mail server](#) and [web server](#) using [remote probe 3](#) and [remote probe 4](#) installed directly on these servers.
- Public services on the internet using any of the probes.

## How Probes Work

As soon as a probe starts, it automatically connects to the [PRTG core server](#)<sup>[125]</sup>, downloads the sensor configuration, and begins its monitoring tasks. The PRTG core server sends new configuration data to a probe as soon as the user changes the monitoring configuration. Probes monitor autonomously and send the monitoring results back to the PRTG core server for each check that they perform.

If the connections between the PRTG core server and a probe fail for any reason (for example, restarting the PRTG core server system), the probe continues to monitor and stores the results. During a connection loss, a buffer stores a maximum of **500,000** sensor results in the RAM of the remote probe system (up to 50 - 200 MB). This means that for 100 sensors with a 1-minute scanning interval, the probe can buffer the monitoring results of up to 3 days (or 52 minutes for 10,000 sensors with a 1-minute scanning interval). The probe automatically reconnects to the PRTG core server as soon as it is available again and transmits all monitoring results that it gathered during the connection loss.

The connection between a probe and the PRTG core server is initiated by the probe and is secured with Secure Sockets Layer (SSL)/Transport Layer Security (TLS). This means that the data that is sent back and forth between the PRTG core server and the probe is not visible to someone that is capturing data packets. The PRTG core server provides an open TCP/IP port and waits for connection attempts from probes. If a new probe connects for the first time, you receive a ToDo [ticket](#)<sup>[213]</sup> and then you see the new probe in the device tree.

As a security precaution, you must manually approve the probe in the device tree before you can create any sensors. You can also deny a probe. PRTG then disconnects it. PRTG accepts no further connection attempts and it adds the probe IP address to the Deny IP Addresses list in the probe's [system settings](#)<sup>[2887]</sup>. This makes sure that unauthorized probes cannot connect to a PRTG core server.

Because the remote probe initiates the connection, you must make sure that a connection to your PRTG core server from the outside can be established. The process is the same as if you wanted to allow access to the PRTG web server provided by the PRTG core server via port 80 or 443. In most cases, this means that you will require an [allow](#) or [allow-nat](#) network address translation (NAT) rule that enables a remote probe to reach the PRTG core server via the Transmission Control Protocol (TCP) port [23560](#). Then, the remote probe uses a dynamic port from the high port range ([49152 - 65535](#)) for outgoing connections.

☁ For remote probe connections to PRTG Hosted Monitor instances, the above also applies with the main difference that you only have to configure the remote probe side so that the outgoing connection to your PRTG Hosted Monitor (DNS name or underlying IP address) is possible and is reachable under this specific port.

If you run PRTG in a cluster, remote probes also connect to all cluster nodes and send monitoring data. This works as described above for a single PRTG core server. If the master node fails, you can still see monitoring data on the failover nodes. You can define the Cluster Connectivity of each probe in the probe's [settings](#)<sup>[521]</sup>, section Administrative Probe Settings.

## Automatic Probe Update

Whenever you install a new version of PRTG on the PRTG core server, all classic remote probes automatically download and install the updated version as soon as they reconnect to the updated PRTG core server.

❗ PRTG does not automatically update multi-platform probes. If you installed a multi-platform probe via the Paessler Linux package repository, your package manager notifies you when there is an update. Otherwise, manually update your multi-platform probes with the updated package. For more information, see the [Multi-Platform Probe for PRTG](#) manual.

PRTG updates the local probe when you update the PRTG core server. All classic remote probes automatically download the new binaries via the SSL/TLS-secured probe connection or PRTG core server connection. Downloading the 4 MB file takes anywhere from a few seconds (in LANs) up to a few minutes (via internet connections), depending on the available bandwidth. As soon as the update is downloaded, the remote probe disconnects, installs the update, and reconnects to the PRTG core server. This takes between 20 and 100 seconds. Note that during the update phase, monitoring by the local probe can be affected because of the bandwidth that is required for the downloads.

❗ If a classic remote probe keeps disconnecting after an update, check if the server with the remote probe has two network connections with different IP addresses. Make sure that these addresses are in the list of allowed IP addresses in the [Core & Probes](#)<sup>[2890]</sup> settings.

## Delete Remote Probe

If you delete a connected remote probe via the device tree, it stops the [PRTG probe service](#) on the remote probe system and sets the startup type to manual. We recommend that you additionally uninstall the remote probe on the remote probe system.

If you delete a disconnected remote probe, it does not stop the [PRTG probe service](#) on the remote probe system and does not affect the startup type. The remote probe will continue to try to reconnect to the PRTG core server until you manually stop the PRTG probe service or uninstall the remote probe on the remote probe system.

## 14.9.2 Classic Remote Probe Setup via Device Tools

You can directly install a classic remote probe via the [context menu](#)<sup>[229]</sup> of a device in the device tree. This partially automatic installation mechanism is an alternative to the [Classic Remote Probe Installer](#)<sup>[106]</sup>. For a quick installation guide, see the Paessler website: [How to install a PRTG remote probe in 4 steps](#).

**i** This is an experimental feature. It might not work in all situations. In this case, see section [Debugging](#)<sup>[3206]</sup>.

**☁** This feature is not available in PRTG Hosted Monitor.

**i** You cannot install a remote probe on the local probe device or hosted probe device. The Classic Remote Probe Setup via Device Tools is also not available for devices on remote probes. In this case, use the Classic Remote Probe Installer.

**i** If you run PRTG in a cluster, see [Cluster and Remote Probes Outside the LAN](#)<sup>[8204]</sup>.

### Steps to Take

To install a remote probe directly from the device tree in the PRTG web interface, follow these steps:

- [Step 1: Meet the Requirements](#)<sup>[3202]</sup>
- [Step 2: Prepare the PRTG Core Server](#)<sup>[3203]</sup>
- [Step 3: Configure the Failover Node](#)<sup>[3204]</sup>
- [Step 4: Confirm the Failover Node](#)<sup>[3205]</sup>
- [Step 5: Approve the New Remote Probe](#)<sup>[3206]</sup>

### Step 1: Meet the Requirements

To install a classic remote probe on a target system, make sure that you meet the following requirements:

- The target system runs on at least Windows 7.
- The target system is accessible via remote procedure call (RPC). This is usually the case when your PRTG core server and the target system are located in the same LAN segment. Otherwise, open Windows [services.msc](#) on the target system and start the RPC service.
- Programs are allowed to communicate through your Windows Firewall. Open the settings of your firewall and select Allow an app through firewall. Mark the check box for Remote Service Management, and the check box Public in the corresponding line.
- Because the remote probe initiates the connection, you must make sure that a connection to your PRTG core server from the outside can be established. The process is the same as if you wanted to allow access to the PRTG web server provided by the PRTG core server via port 80 or 443. In most cases, this means that you will require an [allow](#) or [allow-nat](#) network address translation (NAT) rule that enables a remote probe to reach the PRTG core server via the Transmission Control Protocol (TCP) port [23560](#). Then, the remote probe uses a dynamic port from the high port range ([49152 - 65535](#)) for outgoing connections.

**■** If you need to set a different port, which we do not recommend, see the Knowledge Base: [How can I customize ports for core-probe connections used by PRTG?](#)

**i** You cannot install a remote probe on a system that already has a probe installed.

**■** For more information on the requirements for remote probes, see section [System Requirements](#) <sup>23</sup>.

## Step 2: Prepare the PRTG Core Server

**i** Because remote probes need to connect to your PRTG core server, PRTG needs to accept incoming remote probe connections. So, with PRTG Network Monitor, first prepare your PRTG core server before you install a remote probe.

Edit the relevant settings in section [Core & Probes](#) <sup>2887</sup>. From the main menu in the [PRTG web interface](#) <sup>1241</sup>, select Setup | System Administration | Core & Probes to access the probe settings and go to the Probe Connection Settings.

### Probe Connection Settings

**Probe Connection IP Addresses** <sup>1</sup>

Local probe only, 127.0.0.1

All IP addresses available on this computer

Specify IP addresses

**Access Keys** <sup>1</sup>

**Allow IP Addresses** <sup>1</sup>

**Deny IP Addresses** <sup>1</sup>

**Deny GIDs** <sup>1</sup>

**Connection Security** <sup>1</sup>

High security (TLS 1.3, TLS 1.2)

Default security (TLS 1.3, TLS 1.2) (recommended)

Weakened security (TLS 1.3, TLS 1.2, TLS 1.1, TLS 1.0)

**Mini Probes** <sup>1</sup>

Do not allow mini probes (default)

Allow mini probes to connect to the PRTG web server

Allow mini probes to connect to an extra port

**PRTG MultiBoard File Transfer** <sup>1</sup>

Disable (default)

Enable

Probe Connection Settings in System Administration

### Step 2.1: Probe Connection IP Addresses

By default, a PRTG core server accepts connections from the local probe only (IP address [127.0.0.1](#)). This setting is the most secure setting, but it does not allow any remote probes to connect to your PRTG core server.

To accept remote probes, select one of the following settings:

- All IP addresses available on this computer: Any IP address on your PRTG core server system accepts incoming probe connections.
- Specify IP addresses: Specify IP addresses that accept incoming connections.

### Step 2.2: Allow IP Addresses

In the Allow IP Addresses field, you can enter the IP address of the target system on which you want to install a remote probe. You can also enter the word [any](#). This sets the PRTG core server to accept remote probe connections from any IP address.

 If you use [any](#), make sure that you only write the word in lower case. Other variations are not valid.

Other settings are not required. For more information about the fields for Access Keys, Deny IP Addresses, and Deny GIDs, see section [Core & Probes](#)<sup>[2890]</sup>.

When you are done, click Save to save your settings.

 If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After you click Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, the [PRTG app for desktop](#)<sup>[2984]</sup>, or the [PRTG Apps for Mobile Network Monitoring](#)<sup>[2988]</sup> are disconnected and reconnected.

 To edit the core-probe connection settings, you can also use the [PRTG Administration Tool](#)<sup>[3041]</sup> on your PRTG core server.

### Cluster and Remote Probes Outside the LAN

 If you run PRTG as a cluster and you want to run remote probes outside your local network, you must make sure that your cluster nodes and the addresses that they use are reachable from the outside. Check your cluster node settings under [Cluster](#)<sup>[2923]</sup> before you install a remote probe outside your local network. Enter valid Domain Name System (DNS) names or IP addresses for both cluster nodes to reach each other and for remote probes to individually reach all cluster nodes. Remote probes outside your LAN cannot connect to your cluster nodes if they use local addresses.

If you already have a remote probe installed outside your LAN and the remote probe is disconnected because of this, follow these steps:

1. Uninstall the remote probe.
2. Update the [cluster node settings](#)<sup>[2923]</sup> with addresses that are reachable from outside your LAN.
3. Restart the PRTG core servers.
4. Install the remote probe again. It then obtains the IP address or DNS name entries that it can reach.

 See also section [Failover Cluster Configuration](#)<sup>[3210]</sup>, section Remote Probes in a Cluster.

### Step 3: Configure the Failover Node

If you have not yet done so, [add a device](#)<sup>[364]</sup> that represents the target system on which you want to install the remote probe. Set the correct Windows credentials for this device.

1. Open the [device settings](#) .
2. In the Credentials for Windows Systems section, provide Domain or Computer Name, User Name, and Password for the target system. You can also [inherit](#)  the credentials from the settings of a parent object in the device tree.

 Make sure that this user account has administration rights on the target system.

## Step 4: Confirm the Failover Node

1. In the device tree, open the [context menu](#) .
2. Select Device Tools | Install Remote Probe to open the install dialog in a new window.
  -  This option is only available for devices on the local probe of PRTG Network Monitor.

**Install Remote Probe on Device Workstation**

Please note: This is an experimental feature, it might not work in all situations. Please send your feedback to [support@paessler.com](mailto:support@paessler.com).

You are about to install a remote probe on the computer "Workstation". This will allow PRTG to monitor this computer locally instead of using remote monitoring features. This can sometimes be a good workaround for performance or authentication problems (for example, for WMI sensors). Additionally, this will allow you to use some probe-only sensors like Packet Sniffer, NetFlow, and others.

---

**Details**

Device Name	 Workstation
Status	OK
Priority	★★★★☆
Parent Probe	 Probe (Local Probe) 
Parent Group	 Servers
Sensors by State	 2 (Total: 2)

---

**Prerequisites**

Please make sure you fulfill the following conditions.

- The target device must be a computer with a supported Windows version.
- The target computer must be accessible through RPC (this is usually the case when your PRTG server and the target computer are located in the same LAN segment).
- Open or forward port 23560 in your firewall to allow connections between the probe and your PRTG core server.
- Windows credentials must be set in the [device settings](#) or its parents' settings (current user name: paesslergmbh\Testadmin) and the user account must have administration rights on the target machine.
- You have to allow remote probe connections to your PRTG core server. Open the **Core & Probes** tab in the System Administration of your PRTG web interface. In section **Probe Connection Settings**, select the option **All IPs available on this computer** or specify IPs for the setting **Probe Connection IPs**. Do not use the "Local Probe only" (127.0.0.1) setting! (Current setting: 10.0.0.1)

---

**Start Probe Installation**

The installation will take between 10 and 100 seconds.

[Install Remote Probe on "Workstation"](#)

Remote Probe Installation Dialog

The install dialog includes four sections:

- Experimental feature notice and short introduction
- Details: Overview of the device like Device Name, Status, Priority, Parent Probe, Parent Group, and Sensors by Status.
- Prerequisites: Make sure that you meet the requirements listed here. If not, PRTG cannot start the installation process. Open requirements are highlighted in red.

#### Prerequisites

Please make sure you fulfill the following conditions.

- The target device must be a computer with a supported Windows version.
- The target computer must be accessible through RPC (this is usually the case when your PRTG server and the target computer are located in the same LAN segment).
- Open or forward port 23560 in your firewall to allow connections between the probe and your PRTG core server.
- You cannot install a remote probe on a probe device.
- Windows credentials must be set in the device settings or its parents' settings (current user name: test\test) and the user account must have administration rights on the target machine.
- **Please correct before proceeding:** You have to allow remote probe connections to your PRTG core server. Open the Core & Probes tab in the System Administration of your PRTG web interface. In section Probe Connection Settings, select the option All IPs available on this computer or specify IPs for the setting Probe Connection IPs. Do not use the "Local Probe only" (127.0.0.1) setting! (Current setting: 127.0.0.1)

Installation Unable to Start Because Prerequisites Are Not Met

- Start Probe Installation: Time estimation for the installation and installation start button

If all prerequisites are met, you can install the remote probe on the target system by clicking Install Remote Probe on "[device name]". Wait until the process has ended. If the installation is successful, the following message appears in the Start Probe Installation section: **Done. Result is: OK.**

- ① Every time you start an installation, PRTG automatically adds a new key to the field Access Keys in the [Core & Probes](#) settings, no matter if the installation is successful or not.

## Step 5: Approve the New Remote Probe

If the installation is successful, you receive further instructions after the result message. You also receive a new [ToDo ticket](#).

Click Approve and auto-discover to acknowledge the new remote probe and to instantly start an [auto-discovery](#) in this network. Click Approve new probe to acknowledge the new remote probe without running an auto-discovery. You can also discard the remote probe by clicking Deny.

- ① When you deny or remove a remote probe, this device's global ID (GID) is listed in the Deny GIDs field in the [Core & Probes](#) settings. Future probe connections from this device are automatically denied.

- ① When you deny the remote probe in the device tree, this does **not** uninstall the remote probe but only denies access to the PRTG core server. The remote probe continues to run on the target system until you uninstall it manually.

Wait while the remote probe connects. Once the remote probe has connected, you can create groups, devices, and sensors to customize your monitoring via the new remote probe.

## Debugging

- Note that installing a remote probe directly from the device tree in the PRTG web interface is an experimental feature. This approach might not be possible in all situations.
- Make sure you meet all the requirements as described in [step 1](#) such as the Windows Firewall settings.
- If the quick installation procedure as described in this section does not work with your setup, manually install the remote probe via the Classic Remote Probe Installer as described in section [Install a Remote Probe](#).

## 14.10 Failover Cluster Configuration

A failover cluster consists of two or more PRTG core servers that work together to form a high availability monitoring system. PRTG offers the single failover cluster (one master node and one failover node) in all licenses, including the freeware edition.

☁ This feature is not available in PRTG Hosted Monitor.

Illustration of a Single Failover Cluster

■ For more information about clusters in general, see section [Failover Cluster](#)<sup>[128]</sup>.

### Before You Start

Consider the following notes about clusters:

- You need two target systems that run any Windows version (as of Windows 7). The target systems can be physical machines or virtual machines (VM). For more information, see section [System Requirements](#)<sup>[22]</sup>.
- The machines must be up and running.
- The machines must be similar in regard to the system performance and speed (like CPU, RAM, etc.).
- In a cluster, each of the cluster nodes individually monitors the devices that you add to the cluster probe. This means that the monitoring load increases with every cluster node. Make sure that your devices and your network can handle these additional requests. Often, a longer scanning interval for your entire monitoring setup is a good idea. For example, set a scanning interval of five minutes in the root group's [settings](#)<sup>[420]</sup>.
- We recommend that you install PRTG on dedicated, physical machines for best performance.
- Keep in mind that a machine that runs a cluster node might automatically restart without prior notice, for example, because of special software updates.
- Both machines must be visible for each other through the network.
- Communication between the two machines must be possible in **both directions**. Make sure that no software or hardware firewall blocks communication. All communication between cluster nodes is directed through one specific Transmission Control Protocol (TCP) port. You define the port during the cluster setup. By default, it is TCP port [23570](#).

- In a cluster, a Domain Name System (DNS) name that you enter under Setup | System Administration | User Interface in the PRTG web interface is only used in links that point to the master node. You cannot enter a DNS name for a failover node. This means that any HTTP or HTTPS links that point to a failover node (for example, in notifications or in maps) always point to the failover node's IP address in your local network and might therefore not be reachable from external networks or from the internet, particularly if you use network address translation (NAT) rules.
- Email notifications for failover: The failover master node sends notifications if the primary master node is not connected to the cluster. To make sure that PRTG can deliver emails in this case, configure the [notification delivery](#) settings so that PRTG can use them to deliver emails from your failover node as well. For example, use the option to set up a secondary Simple Mail Transfer Protocol (SMTP) email server. This fallback server must be available for the failover master node so that it can send emails over it independently from the first email server.
- Make your machines secure. Every cluster node has full access to all stored credentials, other configuration data, and the monitoring results of the cluster. Also, PRTG software updates can be deployed from every cluster node. So, make sure you take security precautions to avoid security attacks like hackers and Trojans. Secure every cluster node as carefully as the master node.
- Run cluster nodes either on 32-bit or 64-bit Windows versions only. Avoid using both 32-bit and 64-bit versions in the same cluster. This configuration is not supported and might result in an unstable system. Also, ZIP compression for the cluster communication is disabled and you might encounter higher network traffic between your cluster nodes.
- If you run cluster nodes on Windows systems with different time zone settings and you use [schedules](#) to pause monitoring of sensors, the schedules apply **at the local time of each cluster node**. Because of this, the overall status of a particular sensor is shown as Paused every time the schedule matches a cluster node's local system time. Use the same time zone setting on each Windows system with a cluster node to avoid this behavior.
- The password for the **PRTG System Administrator** user account is not automatically synchronized on cluster nodes. The default credentials (**prtgadmin**) for the **PRTG System Administrator** user account do not work on the failover node. For more information, see the Knowledge Base: [I cannot log in to my failover node anymore. What can I do?](#)
- Stay below 2,500 sensors per cluster for best performance in a single failover. Clusters with more than 5,000 sensors are not officially supported. For each additional failover node, divide the number of sensors by two.

In cluster mode, you cannot use sensors that wait for data to be received. Because of this, you can use the following sensors only on a [local probe or remote probe](#):

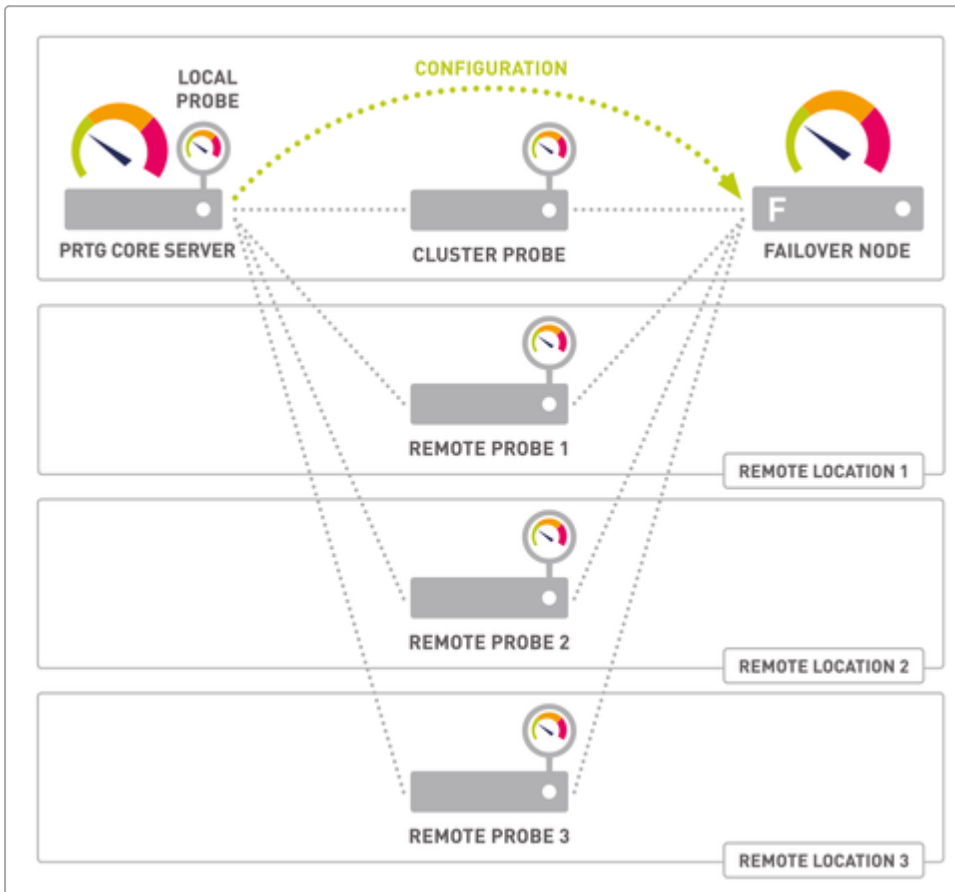

- [DHCP](#)
- [HTTP Push Count](#)
- [HTTP Push Data](#)
- [HTTP Push Data Advanced](#)
- [IPFIX](#) and [IPFIX \(Custom\)](#)
- [jFlow v5](#) and [jFlow v5 \(Custom\)](#)
- [NetFlow v5](#) and [NetFlow v5 \(Custom\)](#)
- [NetFlow v9](#) and [NetFlow v9 \(Custom\)](#)
- [Packet Sniffer](#) and [Packet Sniffer \(Custom\)](#)
- [sFlow](#) and [sFlow \(Custom\)](#)
- [SNMP Trap Receiver](#)

- [Syslog Receiver](#)

## Remote Probes in a Cluster

PRTG provides cluster support for classic remote probes. This means that all of your classic remote probes can connect to all of your cluster nodes. Because of this, you can still see the monitoring data of classic remote probes and sensor warnings and errors even when your master node fails.

- ❗ You cannot add multi-platform probes to a cluster. For more information about the multi-platform probe, see the [Multi-Platform Probe for PRTG](#) manual.

Remote Probes with Cluster Connectivity

Consider the following notes about clusters with classic remote probes:

- You must allow remote probe connections to your failover nodes. To do so, log in to each system in your cluster and open the [PRTG Administration Tool](#)<sup>[3046]</sup>. On the PRTG Core Server tab, accept connections from remote probes on each cluster node.
- If you use remote probes [outside your local network](#): You must use IP addresses or Domain Name System (DNS) names for your cluster nodes that are valid for both the cluster nodes to reach each other and for remote probes to reach all cluster nodes individually. Open the [Cluster](#)<sup>[2923]</sup> settings and adjust the entries for cluster nodes accordingly so that these addresses are reachable from the outside. New remote probes try to connect to these addresses but cannot reach cluster nodes that use private addresses.

- If you use network address translation (NAT) with remote probes [outside the NAT](#): You must use IP addresses or DNS names for your cluster nodes that are reachable from the outside. If your cluster nodes are inside the NAT and the cluster configuration only contains internal addresses, your remote probes from outside the NAT are not able to connect. The PRTG core server must be reachable under the same address for both other cluster nodes and remote probes.
  - A remote probe only connects to the PRTG core server with the defined IP address when it starts.
    - ❗ This PRTG core server must be the primary master node.
  - Initially, remote probes are not visible on failover nodes. You need to set their Cluster Connectivity first in the [Administrative Probe Settings](#)<sup>[521]</sup> for them to be visible and to work with all cluster nodes. Select Remote probe sends data to all cluster nodes for each remote probe that you want to connect to all cluster nodes.
  - Newly connected remote probes are visible and work with all cluster nodes immediately after you acknowledge the probe connection. The connectivity setting Remote probe sends data to all cluster nodes is default for new remote probes.
  - As soon as you activate a remote probe for all cluster nodes, it automatically connects to the correct IP addresses and ports of all cluster nodes.
  - Once a remote probe has connection data from the primary master node, it can connect to all other cluster nodes also when the primary master node fails.
  - Changes that you make in the connection settings of cluster nodes are automatically sent to the remote probes.
  - If a PRTG core server (cluster node) in your cluster is not running, the remote probes [deliver monitoring data](#)<sup>[519]</sup> after the PRTG core server restarts. This happens individually for each PRTG core server in your cluster.
  - If you enable cluster connectivity for a remote probe, it does not deliver monitoring data from the past when cluster connectivity was disabled. For sensors that use difference values, the difference between the current value and the last value is shown with the first new measurement (if the respective sensor previously sent values to the PRTG core server).
  - Except for this special case, all PRTG core servers show the same values for sensors on devices that you add to the cluster probe.
  - The PRTG core server that is responsible for the configuration and management of a remote probe is always the current master node. This means that only the current master node performs all tasks of the PRTG core server. If you use a split cluster with several master nodes, only the master node that appears first in the cluster configuration is responsible.
- ❗ You can use remote probes in a cluster as described above, which is showing monitoring data of all remote probes on all cluster nodes. However, you cannot cluster a remote probe itself. To ensure gapless monitoring for a specific remote probe, install a second remote probe on a machine in your network next to the remote probe. Then create all devices and sensors of the original remote probe on the second remote probe by [cloning](#)<sup>[2714]</sup> the devices from the original remote probe, for example. The second remote probe is then a copy of the first remote probe and you can still monitor the desired devices if the original remote probe fails.
- ❗ Remote probes that send data to all cluster nodes result in increased bandwidth usage. Select Remote probe sends data only to primary master node in the [probe settings](#)<sup>[521]</sup> for one or more remote probes to lower bandwidth usage if necessary.
- ❗ Explicitly check on each cluster node if a remote probe is connected. PRTG does not notify you if a remote probe is disconnected from a cluster node. For example, log in to the PRTG web interface on a cluster node and check in the device tree if your remote probes are connected.

How to set up a failover cluster in PRTG in 6 steps

- <https://www.paessler.com/support/how-to/failover-cluster>

## 14.11 Data Storage

PRTG stores the monitoring configuration, monitoring data, logs, tickets, and reports, as well as support and debug data into different subfolders in the PRTG data directory on the PRTG core server system. Additionally, there is data in the PRTG program directory (for example, scripts for your [custom sensors](#)<sup>[3213]</sup>) and in the Windows registry.

☁ You cannot access these directories in PRTG Hosted Monitor.

In this section:

- [PRTG Program Directory](#)<sup>[3213]</sup>
- [Subfolders in the PRTG Program Directory](#)<sup>[3213]</sup>
- [PRTG Data Directory](#)<sup>[3214]</sup>
- [Files and Subfolders in the PRTG Data Directory](#)<sup>[3214]</sup>
- [Structure of the Logs Folder](#)<sup>[3216]</sup>
- [Windows Registry](#)<sup>[3217]</sup>
- [HTTP Full Web Page Sensor: Cached Files](#)<sup>[3217]</sup>
- [Auto-Update Files](#)<sup>[3217]</sup>

### PRTG Program Directory

32-bit systems:

```
%programfiles%\PRTG Network Monitor
```

64-bit systems:

```
%programfiles(x86)%\PRTG Network Monitor
```

ⓘ These are the default paths. If you specified a different installation directory, you can find your data there.

### Subfolders in the PRTG Program Directory

You can find the following folders in the PRTG program directory:

Folder	Description
\cert	Certificates used by PRTG
\Custom Sensors	Custom sensor templates, custom scripts, and example scripts
\devicetemplates	Default and custom device templates
\download	Downloads from PRTG

Folder	Description
\lookups	Standard lookup files maintained by PRTG ⓘ The \lookups subfolder contains the \custom subfolder to store your customized lookups.
\MIB	Management Information Base (MIB) files referenced by sensors
\notifications	Custom notifications and notification sounds
\PRTG Installer Archive	PRTG Network Monitor installers for the currently installed version and the previously installed version
\python	Python environment files
\Sensor System	Sensor configuration files
\snmplibs	SNMP library files and converted .oidlib files
\webroot	PRTG web interface data

## PRTG Data Directory

On supported Windows versions:

```
%programdata%\Paessler\PRTG Network Monitor
```

ⓘ These are the default paths, depending on your Windows version. If you specified a custom path for data storage, you need to look it up in the [PRTG Administration Tool](#)<sup>[3046]</sup> on the PRTG Core Server tab. You can find the path there.

ⓘ The Windows ProgramData folder is hidden by default. To display it, you need to enable hidden items in the View options of your Windows system.

ⓘ You can find the supported Windows versions in section [System Requirements](#)<sup>[26]</sup>.

## Files and Subfolders in the PRTG Data Directory

You can find the following files in the PRTG data directory:

File	Description
PRTG Configuration.dat	Monitoring configuration (for example probes, groups, devices, sensors, users, maps, reports, and more)

File	Description
	<p><b>i</b> This configuration file is the central storage for all your credentials, such as passwords and secrets used by PRTG for authentication. Handle all configuration files as sensitive, even if there are already security measures in place in your system.</p> <p><b>■</b> For recommendations on how to handle your configuration files in a secure manner, see <a href="#">Handling Configuration Files</a> <sup>[3216]</sup> below.</p>
PRTG Configuration.old	Backup of previous version of monitoring configuration
PRTG Graph Data Cache.dat	Precalculated data for the graphs throughout the PRTG web interface (if missing, this file is automatically recalculated from the files in the monitoring database)

You can find the following folders in the PRTG data directory:

Folder	Description
\Configuration Auto-Backups	Backup versions of the PRTG Configuration.dat file
\Log Database	Database with the recent event history for the whole system: menu option Logs in the PRTG web interface
\Logs	Text file based logs <b>■</b> For more information, see section <a href="#">Structure of the Logs Folder</a> <sup>[3216]</sup>
\Monitoring Database	Results of all monitoring requests for all sensors (required for historic reports)
\Report PDFs	Older PDF <a href="#">reports</a> <sup>[2754]</sup> stored in the file system
\System Information Database	Retrieved <a href="#">system information</a> <sup>[205]</sup> for the categories hardware, users (loggedonusers), processes, services, software, system (in according subfolders)
\Ticket Database	Database with all <a href="#">tickets</a> <sup>[213]</sup> (ticketdata.dat)
\ToDo Database	Database with all ToDo entries <b>i</b> The ToDo feature is deprecated as of <a href="#">PRTG 14.1.8</a>

## Handling Configuration Files

Configuration files are the central storage for all your credentials, such as passwords and secrets used by PRTG for authentication. When you create a support bundle within PRTG that contains the configuration file, all secrets are removed or masked before the file is included in the support bundle.

Administrators should not depend solely on PRTG and their operating system (OS) to secure the configuration files, but rather ensure that the security and access control for these files are maintained during transit, deployment, and storage (e.g. backups). Handle all configuration files as sensitive, even if there are already security measures in place in your system.

Scenario	Example	Recommendations
In transit	<ul style="list-style-type: none"> <li>Sharing files to customer support</li> <li>Migration to a new server</li> </ul>	<ul style="list-style-type: none"> <li>Always use an encrypted or an offline channel to share the configuration files.</li> <li>Do not share the configuration files with untrustworthy third parties.</li> <li>Use the support bundle feature and share the raw configuration file only when specifically requested by support.</li> </ul>
In deployment	<ul style="list-style-type: none"> <li>Storing data in non-default paths</li> </ul>	<ul style="list-style-type: none"> <li>Ensure that any custom data path restrict access to those files to only users with high privileges (e.g. administrators).</li> <li>Use the default path whenever possible.</li> </ul>
In storage	<ul style="list-style-type: none"> <li>Backups (which includes the configuration files) in the same or alternative location</li> </ul>	<ul style="list-style-type: none"> <li>Any backup containing files with sensitive information, like the configuration file, should be protected in the same manner as the live system.</li> <li>Storing backups may erase or change the current access rights and result in more users being able to access the stored data. Always maintain the same level of access control on the paths where configurations files are stored as used in deployment.</li> </ul>

## Structure of the Logs Folder

Folder	Description
\appserver	Currently not in use

Folder	Description
\core	Text file based logs of the PRTG core server system and the cluster system
\debug	Text file based debug logs of the PRTG core server system and probe system, and PRTG core server cache recalculation
\desktopclient	Currently not in use
\enterpriseconsole	Text file based logs of the deprecated Enterprise Console
\probe	Text file based logs of the probe system
\probeadapter	Text file based logs of the probe adapter  The probe adapter supports multi-platform probe connections.
\sensordeprecation	Text file based log of deprecated sensors
\sensors	Text file based logs of sensors
\serveradmin	Text file based logs of the administration system
\webserver	HTTP server log files of the PRTG web server

## Windows Registry

System settings on 32-bit systems:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Paessler\PRTG Network Monitor
```

System settings on 64-bit systems:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Paessler\PRTG Network Monitor
```

## HTTP Full Web Page Sensor: Cached Files

If you use the HTTP Full Web Page, files might be cached in this directory:

```
C:\Windows\System32\config\systemprofile\AppData\Local\Microsoft\Windows\Temporary Internet Files\Content.IE5
```

## Auto-Update Files

PRTG automatically saves downloaded software versions in the \download subfolder of the PRTG program directory. The compressed prtg.zip file that contains all necessary files is also cached there.

## 15.1 Abbreviations

See below for a list of abbreviations used in this documentation.

### A

ACL	access control list
AD	Active Directory
ADO	ActiveX Data Objects
ADSL	asymmetric digital subscriber line
AES	Advanced Encryption Standard
AET	Application Entity Title
AIM	AOL Instant Messenger
AJAX	Asynchronous JavaScript and XML
API	application programming interface
ARP	Address Resolution Protocol
ASN.1	Abstract Syntax Notation One
AWS	Amazon Web Services

### B

BA	basic authentication
BMC	Baseboard Management Controller

### C

CA	certificate authority
----	-----------------------

CBQoS	Class Based Quality of Service
CGI	Common Gateway Interface
CIFS	Common Internet File System
CLI	command-line interface
CLR	common language runtime
COM	component object model
CPG	Common Provisioning Group
CRC	cyclic redundancy check
CSP	cloud solution provider
CSV	comma-separated values

## D

DAE	disk-array enclosure
DAG	Database Availability Group
DBMS	database management system
DC	domain controller
DCS	domain components
DES	Data Encryption Standard
DHCP	Dynamic Host Configuration Protocol
DICOM	Digital Imaging and Communications in Medicine
DN	distinguished name
DNS	Domain Name System
DoS	denial of service

DPE	disk processor enclosure
DSCP	Differentiated Services Code Point
DTU	Database Transaction Unit

## E

EBS	Elastic Block Store
EC2	Elastic Compute Cloud
ECC	Elliptic Curve Cryptography
eDTU	elastic Database Transaction Unit
ELB	Elastic Load Balancing
EVA	Enterprise Virtual Array

## F

FAT	file allocation table
FCP	Fibre Channel Protocol
FIPS	Federal Information Processing Standards
Flow	Flow (NetFlow, jFlow, sFlow, IPFIX)
FQDN	fully qualified domain name
FTP	File Transfer Protocol
FTPS	FTP over SSL

## G

GID	global ID
GUID	globally unique identifier

H

HL7	Health Level 7
HTTP	Hypertext Transfer Protocol

I

I/O	input/output
IAM	Identity and Access Management
ICMP	Internet Control Message Protocol
ICPIF	Impairment Calculated Planning Impairment Factor
IDE	integrated development environment
iDRAC	Integrated Dell Remote Access Controller
IIS	Microsoft Internet Information Services
IKE	Internet Key Exchange
iLO	HPE Integrated Lights Out
IMAP	Internet Message Access Protocol
IMM	Integrated Management Module
IOPS	input/output operations per second
IoT	Internet of Things
IPC	Industrial PC
IPFIX	Internet Protocol Flow Information Export
IPMI	Intelligent Platform Management Interface
IPsec	Internet Protocol Security
IRC	Internet Relay Chat

iRMC	integrated Remote Management Controller
iSCSI	Internet Small Computer System Interface

## J

JSON	JavaScript Object Notation
JWKS	JSON Web Key Set

## L

L2L	LAN-to-LAN
LCU	load balancer capacity units
LDAP	Lightweight Directory Access Protocol
LIF	logical interface
LUN	logical unit number

## M

MD5	message-digest algorithm 5
MIB	Management Information Base
MOID	managed object identifier
MOS	mean opinion score
MQTT	Message Queue Telemetry Transport
ms	milliseconds
msec	milliseconds
MSH	message header
MSMQ	Microsoft Message Queuing

MSP	managed service provider
mutex	mutual exclusion
MWL	Modality Worklist

## N

NAS	network-attached storage
NAT	network address translation
NFS	network file system
NIC	network interface card
Nmap	Network Mapper
NSA	Network Security Appliance
NTFS	New Technology File System
NTLM	NT LAN Manager

## O

OAuth2	Open Authorization 2
ODBC	Open Database Connectivity
OID	object identifier
OLE DB	Object Linking and Embedding, Database
OMSA	OpenManage Server Administrator
ONTAPI	DATA ONTAP API
OPC UA	OPC Unified Architecture
OSPF	Open Shortest Path First

OU	organizational unit
----	---------------------

**P**

P2P	Peer-to-Peer
PACS	picture archiving and communication system
PAP	Password Authentication Protocol
PCRE	Perl Compatible Regular Expression
PDV	packet delay variation
PEM	Privacy-Enhanced Mail
PMPP	PRTG Mini Probe Protocol
POP3	Post Office Protocol version 3

**Q**

QNAP	Quality Network Appliance Provider
QoS	Quality of Service

**R**

RADIUS	Remote Authentication Dial-In User Service
RAID	redundant array of independent disks
RDP	Remote Desktop Protocol
RDS	Relational Database Service
Redfish	Redfish Scalable Platforms Management API
regex	regular expression
REST	Representational State Transfer

RMON	Remote Monitoring
RODC	Read-only Domain Controllers
RPC	remote procedure call
RPM	revolutions per minute
RST	number of reset
RTT	round-trip time
RTU	Remote Terminal Unit

## S

S.M.A.R.T.	Self-Monitoring, Analysis and Reporting Technology
SaaS	software as a service
SAN	storage area network
SASL	Simple Authentication and Security Layer
SCSI	Small Computer System Interface
SHA	Secure Hash Algorithm
SID	Oracle System ID
SIP	Session Initiation Protocol
SMB	server message block
SMTP	Simple Mail Transfer Protocol
SNI	Server Name Indication
SNMP	Simple Network Management Protocol
SNR	signal-to-noise ratio
SNS	Simple Notification Service

Sntp	Simple Network Time Protocol
SOAP	Simple Object Access Protocol
SPA	Single Page Application
SPAN	Switched Port Analyzer
SPN	Service Principal Name
SQL	Structured Query Language
SRP	Secure Remote Password
SSD	solid-state drive
SSH	Secure Shell
SSL	Secure Sockets Layer
SSO	single sign-on
SVC	switched virtual circuit

## T

TCP	Transmission Control Protocol
TFTP	Trivial File Transfer Protocol
TLS	Transport Layer Security
ToS	Type of Service
TOTP	Time-based One-time Password algorithm

## U

UAC	User Account Control
UCS	Unified Computing System

UDF	User-defined Function
UDP	User Datagram Protocol
UID	Unique Identifier
UNC	Universal Naming Convention
UPS	uninterruptible power supplies
URI	uniform resource identifier
UTC	Coordinated Universal Time
UUID	universally unique identifier

## V

vCore	virtual core
VM	virtual machine
VoIP	Voice over IP
VPN	virtual private network

## W

WBEM	Web-based Enterprise Management
WMI	Windows Management Instrumentation
WQL	Windows Management Instrumentation Query Language
WSAPI	Web Services API
WSUS	Windows Server Update Services
WWN	World Wide Name

X

XML	Extensible Markup Language
-----	----------------------------

## 15.2 Available Sensor Types

Here you can find a list of all available sensors, including their category, the version they were introduced in, their performance impact, IP version, meta-scan capability, device template capability, notification triggers, and what they monitor.

**i** In the [Add a Sensor](#) assistant, you have various options to filter for suitable sensors. You can also filter for device template capability, IP version, and meta-scan functionality, among others, via /sensorlist.htm, for example <https://yourserver/sensorlist.htm>.

In this section:

<ul style="list-style-type: none"> <li><a href="#">General</a></li> <li><a href="#">Backup and replication monitoring</a></li> <li><a href="#">Bandwidth monitoring</a></li> <li><a href="#">Beta sensors</a></li> <li><a href="#">Cloud service</a></li> <li><a href="#">Custom</a></li> <li><a href="#">Database server</a></li> <li><a href="#">eHealth</a></li> </ul>	<ul style="list-style-type: none"> <li><a href="#">EXE</a></li> <li><a href="#">Hardware parameter</a></li> <li><a href="#">IoT and IIoT</a></li> <li><a href="#">Linux/Unix/macOS</a></li> <li><a href="#">Mail server</a></li> <li><a href="#">New sensors</a></li> <li><a href="#">PRTG internal</a></li> <li><a href="#">PRTG Sensor Hub</a></li> </ul>	<ul style="list-style-type: none"> <li><a href="#">SNMP</a></li> <li><a href="#">Storage and file server</a></li> <li><a href="#">Various server</a></li> <li><a href="#">Virtual server</a></li> <li><a href="#">VoIP and QoS</a></li> <li><a href="#">Web server (HTTP)</a></li> <li><a href="#">Windows WMI/performance counter</a></li> </ul>
---	---	---

### General

General sensors let you monitor the basic parameters of your network.

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">Beckhoff IPC System Health</a>	21.3.71		No	No	Yes	State Threshold
<a href="#">Cloud HTTP v2</a>	20.3.62		No	No	No	State Threshold
<a href="#">Cloud Ping v2</a>	20.3.62		Yes	No	No	State Threshold
<a href="#">HTTP</a>	7		No	No	Yes	State Threshold

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">Ping</a>	7		No	No	Yes	State Threshold
<a href="#">Port</a>	7		No	No	Yes	State Threshold
<a href="#">Port Range</a>	12.x.4		No	No	Yes	State Threshold Change
<a href="#">SNMP Traffic</a>	7		No	Yes	Yes	State Speed Volume
<a href="#">SSL Certificate</a>	15.x.19		No	No	Yes	State Threshold
<a href="#">SSL Security Check</a>	14.x.12		No	No	Yes	State Threshold
<a href="#">Windows Network Card</a>	7		No	Yes	Yes	State Speed Volume

## Backup and replication monitoring

Backup and replication monitoring sensors let you monitor backup and replication jobs.

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">Active Directory Replication Errors</a>	8.3.0		No	Yes	Yes	State Threshold

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
						Change
<a href="#">File</a>	7		No	No	Yes	State Threshold Change
<a href="#">Folder</a>	7		No	No	Yes	State Threshold Change
<a href="#">IMAP</a>	7		Yes	No	Yes	State Threshold
<a href="#">Veeam Backup Job Status</a>	20.4.64		No	No	Yes	State Threshold
<a href="#">Veeam Backup Job Status Advanced</a>	21.x.69		No	Yes	Yes	State Threshold

## Bandwidth monitoring

Bandwidth monitoring sensors let you analyze your network bandwidth.

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">IPFIX</a>	13.x.7		Yes	No	No	State Speed Volume
<a href="#">IPFIX (Custom)</a>	13.x.7		Yes	No	No	State Speed Volume

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">jFlow v5</a>	8.2.0		Yes	No	No	State Speed Volume
<a href="#">jFlow v5 (Custom)</a>	8.2.0		Yes	No	No	State Speed Volume
<a href="#">NetFlow v5</a>	7		No	No	No	State Speed Volume
<a href="#">NetFlow v5 (Custom)</a>	7		No	No	No	State Speed Volume
<a href="#">NetFlow v9</a>	7		No	No	No	State Speed Volume
<a href="#">NetFlow v9 (Custom)</a>	7		No	No	No	State Speed Volume
<a href="#">Packet Sniffer</a>	7		No	No	No	State Speed Volume
<a href="#">Packet Sniffer (Custom)</a>	7		No	No	No	State Speed Volume
<a href="#">sFlow</a>	7		Yes	No	No	State Speed

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
						Volume
<a href="#">sFlow (Custom)</a>	7		Yes	No	No	State Speed Volume
<a href="#">SNMP Cisco ADSL</a>	12.x.1		No	Yes	Yes	State Threshold
<a href="#">SNMP Cisco ASA VPN Traffic</a>	12.x.1		No	Yes	Yes	State Speed Volume
<a href="#">SNMP HPE ProLiant Network Interface</a>	12.x.4		No	Yes	Yes	State Speed Volume
<a href="#">SNMP Library</a>	7		No	Yes	Yes	State Threshold Change
<a href="#">SNMP NetApp Network Interface</a>	12.x.3		No	Yes	Yes	State Speed Volume
<a href="#">SNMP RMON</a>	12.x.1		No	Yes	Yes	State Speed Volume
<a href="#">SNMP SonicWall VPN Traffic</a>	13.x.6		No	Yes	Yes	State Speed Volume
<a href="#">SNMP Traffic</a>	7		No	Yes	Yes	State

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
						Speed Volume
<a href="#">Windows Network Card</a>	7		No	Yes	Yes	State Speed Volume

### Beta sensors

Here you can find a list of sensors that are currently in the beta status.

**i** To use beta sensors, enable the Beta Sensors experimental feature of PRTG. For more information, see the Knowledge Base: [What are beta sensors and how can I use them?](#)

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">Cisco WLC Access Point Overview</a>	N/A		No	Yes	No	State Threshold
<a href="#">Port v2</a>	N/A		No	No	Yes	State Threshold
<a href="#">REST Custom v2</a>	N/A		No	Yes	No	State Threshold
<a href="#">SNMP Custom v2</a>	N/A		No	No	No	State Threshold
<a href="#">SNMP Disk Free v2</a>	N/A		No	Yes	No	State Threshold
<a href="#">SNMP Traffic v2</a>	N/A		No	Yes	No	State Speed

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
						Volume

## Cloud service

Cloud service sensors let you get a quick overview of all cloud services.

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">AWS Alarm v2</a>	22.x.76		No	Yes	Yes	State Threshold
<a href="#">AWS Cost</a>	20.1.56		No	No	Yes	State Threshold
<a href="#">AWS EBS v2</a>	22.x.76		No	Yes	Yes	State Threshold
<a href="#">AWS EC2 v2</a>	22.x.76		No	Yes	Yes	State Threshold
<a href="#">AWS ELB v2</a>	22.x.76		No	Yes	Yes	State Threshold
<a href="#">AWS RDS v2</a>	22.x.77		No	No	Yes	State Threshold
<a href="#">Common SaaS</a>	15.x.19		No	No	Yes	State Threshold
<a href="#">Microsoft 365 Mailbox</a>	22.x.79		No	Yes	No	State Threshold
<a href="#">Microsoft 365 Service Status</a>	20.3.61		No	No	Yes	State

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
						Threshold
<a href="#">Microsoft 365 Service Status Advanced</a>	20.3.61		No	Yes	Yes	State Threshold
<a href="#">Microsoft Azure SQL Database</a>	21.x.70		No	Yes	Yes	State Threshold
<a href="#">Microsoft Azure Storage Account</a>	21.x.70		No	Yes	Yes	State Threshold
<a href="#">Microsoft Azure Subscription Cost</a>	20.4.64		No	No	Yes	State Threshold
<a href="#">Zoom Service Status</a>	20.3.61		No	No	Yes	State Threshold

## Custom

Custom sensors let you enhance the monitoring task far beyond the standard sensor set.

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">Business Process</a>	15.x.20		No	No	No	State Threshold
<a href="#">EXE/Script</a>	7		No	Yes	Yes	State Threshold Change
<a href="#">EXE/Script Advanced</a>	7		No	Yes	Yes	State Threshold Change

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">IPFIX (Custom)</a>	13.x.7		Yes	No	No	State Speed Volume
<a href="#">jFlow v5 (Custom)</a>	8.2.0		Yes	No	No	State Speed Volume
<a href="#">NetFlow v5 (Custom)</a>	7		No	No	No	State Speed Volume
<a href="#">NetFlow v9 (Custom)</a>	7		No	No	No	State Speed Volume
<a href="#">Packet Sniffer (Custom)</a>	7		No	No	No	State Speed Volume
<a href="#">Python Script Advanced</a>	15.x.19		No	Yes	Yes	State Threshold
<a href="#">REST Custom</a>	17.3.33		No	Yes	No	State Threshold
<a href="#">Sensor Factory</a>	7		No	No	No	State Threshold
<a href="#">sFlow (Custom)</a>	7		Yes	No	No	State Speed Volume
<a href="#">SNMP Custom</a>	7		No	No	Yes	State

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
						Threshold Change
<a href="#">SNMP Custom Advanced</a>	15.x.18		No	No	Yes	State Threshold
<a href="#">SNMP Custom String</a>	9.1.0		No	No	Yes	State Threshold Change
<a href="#">SNMP Custom String Lookup</a>	14.x.14		No	Yes	Yes	State Threshold
<a href="#">SNMP Custom Table</a>	15.x.18		No	Yes	Yes	State Threshold
<a href="#">SSH Script</a>	12.x.1		Yes	Yes	Yes	State Threshold Change
<a href="#">SSH Script Advanced</a>	12.x.6		Yes	Yes	Yes	State Threshold Change

## Database server

Database server sensors let you monitor the most common databases.

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">ADO SQL v2</a>	16.x.24		No	Yes	Yes	State Threshold

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
						Change
<a href="#">Microsoft SQL v2</a>	14.x.12		No	Yes	Yes	State Threshold Change
<a href="#">MySQL v2</a>	14.x.12		No	Yes	Yes	State Threshold Change
<a href="#">Oracle SQL v2</a>	14.x.13		No	Yes	Yes	State Threshold Change
<a href="#">Oracle Tablespace</a>	15.x.18		No	Yes	Yes	State Threshold Change
<a href="#">PostgreSQL</a>	14.x.12		No	Yes	Yes	State Threshold Change
<a href="#">WMI Microsoft SQL Server 2005</a>	8.1.0		No	No	Yes	State Threshold
<a href="#">WMI Microsoft SQL Server 2008</a>	8.1.0		No	Yes	Yes	State Threshold
<a href="#">WMI Microsoft SQL Server 2012</a>	12.x.6		No	Yes	Yes	State Threshold
<a href="#">WMI Microsoft SQL Server 2014</a>	14.x.13		No	Yes	Yes	State Threshold

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">WMI Microsoft SQL Server 2016</a>	16.x.26		No	Yes	Yes	State Threshold
<a href="#">WMI Microsoft SQL Server 2017</a>	18.x.42		No	Yes	Yes	State Threshold
<a href="#">WMI Microsoft SQL Server 2019</a>	20.3.62		No	Yes	Yes	State Threshold

## eHealth

eHealth sensors let you monitor medical equipment.

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">DICOM Bandwidth</a>	18.1.38		No	No	No	State Threshold Change
<a href="#">DICOM C-ECHO</a>	18.1.38		No	No	No	State Threshold Change
<a href="#">DICOM Query/Retrieve</a>	18.1.38		No	No	No	State Threshold Change
<a href="#">HL7</a>	18.1.38		No	Yes	No	State Threshold Change
<a href="#">Soffico Orchestra Channel Health</a>	20.4.63		No	Yes	No	State

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
						Threshold

## EXE

EXE sensors let you carry out a wide range of different operations.

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">Active Directory Replication Errors</a>	8.3.0		No	Yes	Yes	State Threshold Change
<a href="#">ADO SQL v2</a>	16.x.24		No	Yes	Yes	State Threshold Change
<a href="#">Citrix XenServer Host</a>	12.x.1		Yes	Yes	Yes	State Threshold Change

<a href="#">OPC UA Certificate</a>	21.1.66		No	No	Yes	State Threshold
<a href="#">OPC UA Custom</a>	21.1.66		No	No	Yes	State Threshold
<a href="#">OPC UA Server Status</a>	20.4.63		No	No	Yes	State Threshold
<a href="#">SNMP Rittal CMC III Hardware Status</a>	22.x.76		No	No	Yes	State

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
						Threshold

## Linux/Unix/macOS

Linux/Unix/macOS sensors let you monitor Linux-based networks.

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">Python Script Advanced</a>	15.x.19		No	Yes	Yes	State Threshold
<a href="#">SFTP Secure File Transfer Protocol</a>	12.x.6		Yes	No	Yes	State Threshold
<a href="#">SNMP Linux Disk Free</a>	8.1.0		No	No	Yes	State Threshold
<a href="#">SNMP Linux Load Average</a>	8.1.0		No	No	Yes	State Threshold
<a href="#">SNMP Linux Meminfo</a>	8.1.0		No	No	Yes	State Threshold
<a href="#">SNMP Linux Physical Disk</a>	13.x.5		No	Yes	Yes	State Speed Volume Threshold
<a href="#">SSH Disk Free</a>	8.1.0		Yes	Yes	Yes	State Threshold
<a href="#">SSH INodes Free</a>	8.1.1		Yes	No	Yes	State Threshold

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">SSH Load Average</a>	8.1.0		Yes	No	Yes	State Threshold
<a href="#">SSH Meminfo</a>	8.1.0		Yes	No	Yes	State Threshold
<a href="#">SSH Remote Ping</a>	12.x.1		Yes	No	Yes	State Threshold
<a href="#">SSH SAN Enclosure</a>	14.x.12		Yes	Yes	Yes	State Threshold
<a href="#">SSH SAN Logical Disk</a>	14.1.9		Yes	Yes	Yes	State Threshold
<a href="#">SSH SAN Physical Disk</a>	14.1.9		Yes	Yes	Yes	State Threshold
<a href="#">SSH SAN System Health</a>	14.1.9		Yes	Yes	Yes	State Threshold
<a href="#">SSH Script</a>	12.x.1		Yes	Yes	Yes	State Threshold Change
<a href="#">SSH Script Advanced</a>	12.x.6		Yes	Yes	Yes	State Threshold Change

## Mail server

Mail server sensors let you monitor different parameters of mail servers.

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">Exchange Backup (PowerShell)</a>	13.x.5		Yes	Yes	No	State Threshold Change
<a href="#">Exchange Database (PowerShell)</a>	13.x.5		Yes	Yes	No	State Threshold Change
<a href="#">Exchange Database DAG (PowerShell)</a>	15.x.18		Yes	Yes	No	State Threshold Change
<a href="#">Exchange Mail Queue (PowerShell)</a>	13.x.5		Yes	Yes	No	State Threshold Change
<a href="#">Exchange Mailbox (PowerShell)</a>	13.x.5		Yes	Yes	No	State Threshold Change
<a href="#">Exchange Public Folder (PowerShell)</a>	13.x.5		Yes	Yes	No	State Threshold Change
<a href="#">IMAP</a>	7		Yes	No	Yes	State Threshold
<a href="#">IP on DNS Blacklist</a>	8.3.0		No	No	Yes	State Threshold Change
<a href="#">POP3</a>	7		Yes	No	Yes	State Threshold

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">SMTP</a>	7		Yes	Yes	Yes	State Threshold
<a href="#">SMTP&amp;IMAP Round Trip</a>	7		Yes	Yes	Yes	State Threshold
<a href="#">SMTP&amp;POP3 Round Trip</a>	7		Yes	Yes	Yes	State Threshold
<a href="#">SSL Security Check</a>	14.x.12		No	No	Yes	State Threshold
<a href="#">Windows SMTP Service Received</a>	8.1.0		No	No	Yes	State Speed Volume
<a href="#">Windows SMTP Service Sent</a>	8.1.0		No	No	Yes	State Speed Volume
<a href="#">WMI Exchange Server</a>	9		No	Yes	Yes	State Threshold
<a href="#">WMI Exchange Transport Queue</a>	12.x.1		No	Yes	Yes	State Threshold

## New sensors

Here you can find a list of sensors that are new. Sensors are **new** for a few versions after the Stable release.

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">AWS Alarm v2</a>	22.2.76		No	Yes	Yes	State Threshold
<a href="#">AWS EBS v2</a>	22.2.76		No	Yes	Yes	State Threshold
<a href="#">AWS EC2 v2</a>	22.2.76		No	Yes	Yes	State Threshold
<a href="#">AWS ELB v2</a>	22.2.76		No	Yes	Yes	State Threshold
<a href="#">AWS RDS v2</a>	22.2.76		No	Yes	Yes	State Threshold
<a href="#">Cisco Meraki License</a>	22.1.75		No	Yes	Yes	State Threshold
<a href="#">Cisco Meraki Network Health</a>	22.1.75		No	Yes	Yes	State Threshold
<a href="#">FortiGate VPN Overview</a>	22.1.74		No	No	Yes	State Threshold
<a href="#">HPE 3PAR Drive Enclosure</a>	22.2.76		No	Yes	Yes	State Threshold
<a href="#">HTTP v2</a>	22.4.81		No	No	Yes	State Threshold
<a href="#">Local Folder</a>	21.3.70		No	No	Yes	State Threshold
<a href="#">Microsoft 365 Mailbox</a>	22.3.79		No	Yes	No	State Threshold

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">Modbus RTU Custom</a>	21.3.71		No	No	Yes	State Speed Volume
<a href="#">Multi-Platform Probe Health</a>	24.1.92		No	No	No	State Threshold
<a href="#">NetApp Aggregate v2</a>	23.2.84		No	Yes	Yes	State Threshold
<a href="#">NetApp I/O v2</a>	23.2.84		No	Yes	Yes	State Threshold
<a href="#">NetApp LIF v2</a>	23.2.84		No	Yes	Yes	State Threshold
<a href="#">NetApp LUN v2</a>	23.2.84		No	Yes	Yes	State Threshold
<a href="#">NetApp NIC v2</a>	23.2.84		No	Yes	Yes	State Threshold
<a href="#">NetApp Physical Disk v2</a>	23.2.84		No	Yes	Yes	State Threshold
<a href="#">NetApp SnapMirror v2</a>	23.2.84		No	Yes	Yes	State Threshold
<a href="#">NetApp System Health v2</a>	23.2.84		No	Yes	Yes	State Threshold
<a href="#">NetApp Volume v2</a>	23.2.84		No	Yes	Yes	State Threshold
<a href="#">Network Share</a>	21.4.73		No	No	Yes	State

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
						Threshold
<a href="#">Ping v2</a>	22.4.81		No	No	Yes	State Threshold
<a href="#">Redfish Virtual Disk</a>	21.3.71		No	Yes	Yes	State Threshold
<a href="#">Script v2</a>	24.2.97		No	Yes	Yes	State Threshold
<a href="#">SNMP Rittal CMC III Hardware Status</a>	22.2.76		No	No	Yes	State Threshold
<a href="#">SNMP Uptime v2</a>	23.2.84		No	No	No	State Threshold
<a href="#">Soffico Orchestra Scenario</a>	23.3.88		No	Yes	Yes	State Threshold
<a href="#">System Health v2</a>	24.1.92		No	No	No	State Threshold

## PRTG internal

PRTG internal sensors let you monitor internal parameters of PRTG.

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">Application Server Health (Autonomous)</a>	21.x.73		No	No	No	State Threshold
<a href="#">Cluster Health</a>	9.1.0		No	No	No	State

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
						Threshold
<a href="#">Core Health</a>	9.1.0		No	No	No	State Threshold
<a href="#">Core Health (Autonomous)</a>	21.2.67		No	No	No	State Threshold
<a href="#">Probe Health</a>	9.1.0		No	No	No	State Threshold
<a href="#">System Health</a>	9.1.0		No	No	No	State Threshold

## PRTG Sensor Hub

In addition to the built-in sensors, you can create your own. You can write a script or a program and use it with a [custom sensor](#)<sup>[3150]</sup>. There are already many free, useful scripts, plugins, and add-ons for PRTG in the [PRTG Sensor Hub](#). You can also directly open the PRTG Sensor Hub from the [Add Sensor](#)<sup>[414]</sup> dialog in the PRTG web interface.

- To use the sensors in the PRTG Sensor Hub, go to <https://www.paessler.com/sensor-hub> and follow the instructions there.

## SNMP

SNMP sensors let you monitor a wide range of devices via SNMP.

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">Cisco IP SLA</a>	7		Yes	Yes	Yes	State Threshold
<a href="#">SNMP APC Hardware</a>	9.1.0		No	Yes	Yes	State Threshold

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
						Change
<a href="#">SNMP Buffalo TS System Health</a>	17.1.29		No	No	Yes	State Threshold

## Storage and file server

Storage and file server sensors let you monitor different parameters of storage and file servers.

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">Dell EMC Unity Enclosure Health v2</a>	20.4.64		No	Yes	Yes	State Threshold
<a href="#">Dell EMC Unity File System v2</a>	20.3.62		No	Yes	Yes	State Threshold
<a href="#">Dell EMC Unity Storage Capacity v2</a>	20.3.62		No	No	Yes	State Threshold
<a href="#">Dell EMC Unity Storage LUN v2</a>	20.3.61		No	Yes	Yes	State Threshold
<a href="#">Dell EMC Unity Storage Pool v2</a>	20.3.62		No	Yes	Yes	State Threshold
<a href="#">Dell EMC Unity VMware Datastore v2</a>	20.4.63		No	Yes	Yes	State Threshold
<a href="#">Dell PowerVault MDi Logical Disk</a>	12.x.1		Yes	Yes	Yes	State Threshold
<a href="#">Dell PowerVault MDi Physical Disk</a>	14.x.13		No	Yes	Yes	State Threshold
<a href="#">Enterprise Virtual Array</a>	13.x.6		No	Yes	No	State Threshold
<a href="#">File</a>	7		No	No	Yes	State Threshold Change
<a href="#">File Content</a>	7		No	No	Yes	State Threshold Change

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">Folder</a>	7		No	No	Yes	State Threshold Change
<a href="#">FTP</a>	7		Yes	No	Yes	State Threshold
<a href="#">FTP Server File Count</a>	8.3.0		No	No	Yes	State Threshold Change
<a href="#">HPE 3PAR Common Provisioning Group</a>	21.x.70		No	Yes	Yes	State Threshold

<a href="#">SNMP NetApp Network Interface</a>	12.x.3		No	Yes	Yes	State Speed Volume
<a href="#">SNMP NetApp System Health</a>	12.x.3		No	No	Yes	State Threshold
<a href="#">IFTP</a>	8.1.0		Yes	No	Yes	State Threshold

## Various server

Various server sensors let you monitor a wide range of server parameters.

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">DHCP</a>	8.2.0		Yes	Yes	No	State Threshold Change
<a href="#">DNS v2</a>	20.2.59		No	No	Yes	State Threshold
<a href="#">IPMI System Health</a>	14.x.11		No	Yes	No	State Threshold Change
<a href="#">LDAP</a>	8.1.0		Yes	No	Yes	State Threshold
<a href="#">OPC UA Certificate</a>	21.1.66		No	No	Yes	State Threshold

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">OPC UA Custom</a>	21.1.66		No	No	Yes	State Threshold
<a href="#">OPC UA Server Status</a>	20.4.63		No	No	Yes	State Threshold
<a href="#">Ping</a>	7		No	No	Yes	State Threshold
<a href="#">Ping Jitter</a>	8.3.0		No	No	Yes	State Threshold Change
<a href="#">Port</a>	7		No	No	Yes	State Threshold
<a href="#">Port Range</a>	12.x.4		No	No	Yes	State Threshold Change
<a href="#">RADIUS v2</a>	14.x.13		Yes	No	Yes	State Threshold Change
<a href="#">RDP (Remote Desktop)</a>	7		No	No	Yes	State Threshold
<a href="#">SNMP Trap Receiver</a>	7		No	No	No	State Speed Volume
<a href="#">SNTP</a>	8.1.0		No	No	Yes	State Threshold

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">SSL Security Check</a>	14.x.12		No	No	Yes	State Threshold
<a href="#">Syslog Receiver</a>	7		No	No	No	State Speed Volume
<a href="#">Traceroute Hop Count</a>	8.3.0		No	No	Yes	State Threshold Change

## Virtual server

Virtual server sensors let you monitor your virtualized IT infrastructure.

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">Citrix XenServer Host</a>	12.x.1		Yes	Yes	Yes	State Threshold Change
<a href="#">Citrix XenServer Virtual Machine</a>	8.1.0		Yes	Yes	Yes	State Threshold Change
<a href="#">Dell EMC Unity VMware Datastore v2</a>	20.4.63		No	Yes	Yes	State Threshold
<a href="#">Docker Container Status</a>	16.x.22		Yes	Yes	No	State Threshold

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">Hyper-V Cluster Shared Volume Disk Free</a>	12.3.4		No	Yes	Yes	State Threshold Change
<a href="#">Hyper-V Host Server</a>	7		No	No	Yes	State Threshold
<a href="#">Hyper-V Virtual Machine</a>	7		No	Yes	Yes	State Threshold
<a href="#">Hyper-V Virtual Network Adapter</a>	9.1.0		No	Yes	Yes	State Threshold
<a href="#">Hyper-V Virtual Storage Device</a>	12.4.4		No	Yes	Yes	State Threshold
<a href="#">Microsoft Azure Virtual Machine</a>	20.4.63		No	Yes	Yes	State Threshold
<a href="#">SNMP Nutanix Cluster Health</a>	20.1.55		No	Yes	Yes	State Threshold
<a href="#">SNMP Nutanix Hypervisor</a>	20.1.55		No	Yes	Yes	State Threshold
<a href="#">VMware Datastore (SOAP)</a>	15.x.19		No	Yes	Yes	State Threshold Change
<a href="#">VMware Host Hardware (WBEM)</a>	8.1.0		Yes	Yes	Yes	State Threshold
<a href="#">VMware Host Hardware Status (SOAP)</a>	12.x.1		No	Yes	Yes	State Threshold Change

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">VMware Host Performance (SOAP)</a>	12.x.1		No	Yes	Yes	State Threshold Change
<a href="#">VMware Virtual Machine (SOAP)</a>	7		No	Yes	Yes	State Threshold Change

## VoIP and QoS

VoIP and QoS sensors let you monitor the QoS in a network and all VoIP-relevant network parameters.

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">Cisco IP SLA</a>	7		Yes	Yes	Yes	State Threshold
<a href="#">QoS (Quality of Service) One Way</a>	7		Yes	No	No	State Threshold
<a href="#">QoS (Quality of Service) Round Trip</a>	9.1.0		Yes	No	No	State Threshold
<a href="#">SIP Options Ping</a>	12.x.1		No	Yes	Yes	State Threshold Change
<a href="#">SNMP Cisco CBQoS</a>	13.x.5		Yes	Yes	Yes	State Speed Volume

## Web server (HTTP)

Web server (HTTP) sensors let you monitor server parameters with HTTP.

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">Cloud HTTP v2</a>	20.3.62		No	No	No	State Threshold
<a href="#">Common SaaS</a>	15.x.19		No	No	Yes	State Threshold
<a href="#">HTTP</a>	7		No	No	Yes	State Threshold
<a href="#">HTTP Advanced</a>	7		No	No	Yes	State Threshold Change
<a href="#">HTTP Apache ModStatus PerfStats</a>	12.x.3		No	No	Yes	State Threshold
<a href="#">HTTP Apache ModStatus Totals</a>	12.x.3		No	No	Yes	State Speed Volume
<a href="#">HTTP Content</a>	7		No	No	Yes	State Threshold Change
<a href="#">HTTP Data Advanced</a>	15.x.16		No	No	Yes	State Change
<a href="#">HTTP Full Web Page</a>	7		No	No	Yes	State Threshold
<a href="#">HTTP IoT Push Data Advanced</a>	18.3.43		No	No	Yes	State

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">HTTP Push Count</a>	13.4.8		No	No	Yes	State Speed Threshold
<a href="#">HTTP Push Data</a>	14.1.9		No	No	Yes	State Threshold
<a href="#">HTTP Push Data Advanced</a>	14.1.10		No	No	Yes	State
<a href="#">HTTP Transaction</a>	7		No	No	Yes	State Threshold
<a href="#">HTTP XML/REST Value</a>	8.3.0		No	No	Yes	State Threshold Change
<a href="#">REST Custom</a>	17.3.33		No	Yes	No	State Threshold
<a href="#">SSL Certificate</a>	15.x.19		No	No	Yes	State Threshold
<a href="#">SSL Security Check</a>	14.x.12		No	No	Yes	State Threshold
<a href="#">Windows IIS Application</a>	12.x.1		No	Yes	Yes	State Speed Volume Threshold

### Windows WMI/performance counter

Windows WMI/performance counter sensors let you monitor Windows systems via WMI and Windows performance counters.

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">Active Directory Replication Errors</a>	8.3.0		No	Yes	Yes	State Threshold Change
<a href="#">Event Log (Windows API)</a>	7		No	No	Yes	State Speed Volume Change
<a href="#">PerfCounter Custom</a>	12.x.3		No	No	Yes	State Threshold
<a href="#">PerfCounter IIS Application Pool</a>	12.x.6		No	Yes	Yes	State Threshold
<a href="#">Windows CPU Load</a>	7		No	No	Yes	State Threshold
<a href="#">Windows IIS Application</a>	12.x.1		No	Yes	Yes	State Speed Volume Threshold
<a href="#">Windows MSMQ Queue Length</a>	8.3.0		No	Yes	Yes	State Threshold Change
<a href="#">Windows Network Card</a>	7		No	Yes	Yes	State Speed Volume
<a href="#">Windows Pagefile</a>	12.x.4		No	No	Yes	State Threshold

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
<a href="#">Windows Physical Disk I/O</a>	16.x.24		No	Yes	Yes	State Threshold
<a href="#">Windows Print Queue</a>	8.3.0		No	Yes	Yes	State Threshold Change
<a href="#">Windows Process</a>	7		No	No	Yes	State Threshold
<a href="#">Windows SMTP Service Received</a>	8.1.0		No	No	Yes	State Speed Volume
<a href="#">Windows SMTP Service Sent</a>	8.1.0		No	No	Yes	State Speed Volume
<a href="#">Windows System Uptime</a>	8.1.0		No	No	Yes	State Threshold
<a href="#">Windows Updates Status (PowerShell)</a>	13.x.6		No	Yes	Yes	State Threshold Change
<a href="#">WMI Battery</a>	19.x.52		No	Yes	Yes	State Threshold
<a href="#">WMI Custom</a>	7		No	Yes	Yes	State Threshold Change
<a href="#">WMI Custom String</a>	12.x.4		No	Yes	Yes	State Threshold

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
						Change
<a href="#">WMI Disk Health</a>	19.4.54		No	Yes	Yes	State Threshold
<a href="#">WMI Event Log</a>	7		No	Yes	Yes	State Speed Volume Change
<a href="#">WMI Exchange Server</a>	9		No	Yes	Yes	State Threshold
<a href="#">WMI Exchange Transport Queue</a>	12.x.1		No	Yes	Yes	State Threshold
<a href="#">WMI File</a>	7		No	No	Yes	State Threshold Change
<a href="#">WMI Free Disk Space (Multi Disk)</a>	7		No	No	Yes	State Threshold
<a href="#">WMI HDD Health</a>	12.x.1		Yes	Yes	Yes	State
<a href="#">WMI Logical Disk I/O</a>	16.x.24		No	Yes	Yes	State Threshold
<a href="#">WMI Memory</a>	7		No	No	Yes	State Threshold
<a href="#">WMI Microsoft SQL Server 2005</a>	8.1.0		No	No	Yes	State Threshold
<a href="#">WMI Microsoft SQL Server 2008</a>	8.1.0		No	Yes	Yes	State

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
						Threshold
<a href="#">WMI Microsoft SQL Server 2012</a>	12.x.6		No	Yes	Yes	State Threshold
<a href="#">WMI Microsoft SQL Server 2014</a>	14.x.13		No	Yes	Yes	State Threshold
<a href="#">WMI Microsoft SQL Server 2016</a>	16.x.26		No	Yes	Yes	State Threshold
<a href="#">WMI Microsoft SQL Server 2017</a>	18.x.42		No	Yes	Yes	State Threshold
<a href="#">WMI Microsoft SQL Server 2019</a>	20.3.62		No	Yes	Yes	State Threshold
<a href="#">WMI Remote Ping</a>	12.x.1		No	No	Yes	State Threshold
<a href="#">WMI Security Center</a>	9		No	Yes	Yes	State Threshold Change
<a href="#">WMI Service</a>	7		No	Yes	Yes	State Threshold Change
<a href="#">WMI Share</a>	8.1.0		No	Yes	Yes	State Threshold
<a href="#">WMI SharePoint Process</a>	12.x.1		No	Yes	Yes	State Threshold
<a href="#">WMI Storage Pool</a>	19.4.54		No	Yes	Yes	State

Sensor	As of PRTG	Perf. Impact	IPv4 Only	Meta-Scan	Device Template	Notification Trigger
						Threshold
<a href="#">WMI Terminal Services (Windows 2008+)</a>	8.1.0		No	No	Yes	State Threshold
<a href="#">WMI Terminal Services (Windows XP/Vista/2003)</a>	8.1.0		No	No	Yes	State Threshold
<a href="#">WMI UTC Time</a>	9.2.0		Yes	No	Yes	State Threshold
<a href="#">WMI Vital System Data v2</a>	7		No	Yes	Yes	State Threshold
<a href="#">WMI Volume</a>	7		No	Yes	Yes	State Threshold
<a href="#">WSUS Statistics</a>	9.1.0		No	No	Yes	State Change

## More

### ■ KNOWLEDGE BASE

What are beta sensors and how can I use them?

- <https://kb.paessler.com/en/topic/88697>

## 15.3 Default Ports

Here you can find lists for all default ports used in PRTG:

- [Ports Used by Sensors](#) <sup>3288</sup>
- [Ports Used in Other Contexts](#) <sup>3291</sup>

### Ports Used by Sensors

Sensors	Default Port Numbers	Description
Cloud HTTP v2 and Cloud Ping v2	443	Port for the communication via the PRTG Cloud
Cloud Ping v2	80	Port for the TCP ping
Dell EMC	443	Port for the connection to the Dell EMC system
DICOM	104	Port for the connection to the DICOM interface
<a href="#">DNS v2</a>	53	Port for the connection to the device that runs the DNS service
<a href="#">Docker Container Status</a>	2376 (Docker over TLS)	Port for the connection to the Docker container
FortiGate	443	Port for the connection to the FortiGate system
<a href="#">FTP</a>	21	Port for the connection to the file server
<a href="#">HL7</a>	104	Port for the connection to the HL7 interface
HPE 3PAR	WSAPI port: <ul style="list-style-type: none"> <li>▪ 8080 (secure)</li> <li>▪ 8008 (unsecure)</li> </ul> SSH port: <ul style="list-style-type: none"> <li>▪ 22 (secure)</li> </ul>	WSAPI and SSH port for the connections to the HPE 3PAR system
HTTP	8080	Port of the proxy

Sensors	Default Port Numbers	Description
<a href="#">HTTP IoT Push Data Advanced</a>	5051	Port on which the sensor listens for incoming HTTPS requests  <b>i</b> This port is fixed. You cannot change it.
HTTP Push	<ul style="list-style-type: none"> <li>▪ 5051 (secure)</li> <li>▪ 5050 (unsecure)</li> </ul>	Port on which the sensor listens for incoming HTTP or HTTPS requests
<a href="#">IMAP</a>	<ul style="list-style-type: none"> <li>▪ 993 (secure)</li> <li>▪ 143 (unsecure)</li> </ul>	Port for the IMAP connection
<a href="#">LDAP</a>	<ul style="list-style-type: none"> <li>▪ 636 (secure)</li> <li>▪ 389 (unsecure)</li> </ul>	Port for the connection to the LDAP server
NetApp	443	Port for the NetApp API access
<a href="#">Microsoft SQL v2</a>	1433	Port for the connection to the Microsoft SQL database
<a href="#">MySQL v2</a>	3306	Port for the connection to the MySQL database
<a href="#">Modbus TCP Custom</a>	502	Port for the connection to the Modbus TCP server
MQTT	<ul style="list-style-type: none"> <li>▪ 8883 (secure)</li> <li>▪ 1883 (unsecure)</li> </ul>	Port for the MQTT connection
OPC UA	4840	Port for the connection to the OPC UA server
Oracle	1521	Port for the connection to the Oracle SQL database
<a href="#">POP3</a>	<ul style="list-style-type: none"> <li>▪ 995 (secure)</li> <li>▪ 110 (unsecure)</li> </ul>	Port for the POP3 connection
<a href="#">Port v2</a>	443	Port for the TCP connection
<a href="#">PostgreSQL</a>	5432	Port for the connection to the PostgreSQL database

Sensors	Default Port Numbers	Description
QoS	50000	Port on which the sensor listens for the UDP packets
<a href="#">RADIUS v2</a>	1812	Port for the connection to the RADIUS server
<a href="#">RDP (Remote Desktop)</a>	3389	Port for the RDP connection
Redfish	443	Port for the Redfish connection
REST	8080	Port for the proxy
<a href="#">SIP Options Ping</a>	5060	Port for the UDP connection
SMTP	<ul style="list-style-type: none"> <li>▪ 465 or 587 (secure)</li> <li>▪ 25 (unsecure)</li> </ul>	Port used to send an email via SMTP
<a href="#">SMTP&amp;IMAP Round Trip</a>	<ul style="list-style-type: none"> <li>▪ 993 (secure)</li> <li>▪ 143 (unsecure)</li> </ul>	Port for the IMAP connection
<a href="#">SMTP&amp;POP3 Round Trip</a>	<ul style="list-style-type: none"> <li>▪ 995 (secure)</li> <li>▪ 110 (unsecure)</li> </ul>	Port for the POP3 connection
SNMP	161	Port for the SNMP connection
<a href="#">SNMP Trap Receiver</a>	162	Port on which the sensor listens for SNMP traps and on which trap messages are sent
<a href="#">Soffico Orchestra Channel Health</a>	<ul style="list-style-type: none"> <li>• 8443 (secure)</li> <li>• 8019 (unsecure)</li> </ul>	Port for the connection to the Orchestra platform
SSH	22	Port for the connection via SSH
SSL	443	Port for the Secure Sockets Layer (SSL)/Transport Layer Security (TLS) connection
<a href="#">Syslog Receiver</a>	514	Port on which the sensor listens for Syslog messages and on which Syslog messages are sent

Sensors	Default Port Numbers	Description
<a href="#">TFTP</a>	69	Port of the device on which the TFTP service runs
Veeam Backup Job Status	9398	Port for the connection to the Veeam Backup Enterprise Manager
VMware (SOAP)	443	Port for the VMware (SOAP) connection
WBEM	<ul style="list-style-type: none"> <li>▪ 5988 (unsecure)</li> <li>▪ 5989 (secure)</li> </ul>	Port for the communication via WBEM
<a href="#">Windows Updates Status (PowerShell)</a>	5985	Port for the connection to Microsoft or to the local WSUS server
WMI	135	Port for the RPC server connection via WMI
<a href="#">WSUS Statistics</a>	8530	Port for the connection to the device on which the WSUS server service runs

### Ports Used in Other Contexts

Context	Default Port Numbers	Description
Active Directory integration	<ul style="list-style-type: none"> <li>▪ 389 (unsecure)</li> <li>▪ 636 (secure)</li> </ul>	The LDAP port for Active Directory integration
Auto-update and activation	443	Port for auto-update and activation  For more information, see the Knowledge Base: <a href="#">Which servers does PRTG connect to for software auto-update, activation, etc.?</a>
Cluster communication	23570	Port for the communication between cluster nodes
Incoming probe connections	23560	Port on which PRTG listens for incoming remote probe connections
Multi-platform probe and PRTG core server	23562	Port for the connections between multi-platform probes and the PRTG core server

Context	Default Port Numbers	Description
Notifications	<ul style="list-style-type: none"> <li>▪ 443 (push)</li> <li>▪ 25 (SMTP)</li> <li>▪ 162 (SNMP trap)</li> <li>▪ 514 (Syslog)</li> </ul>	<p>Port for the notifications</p> <p><b>i</b> The target URL for push is <a href="https://api.prtgcloud.com:443">https://api.prtgcloud.com:443</a>.</p>
PRTG application server and PRTG core server	23580	Port for the connections between the PRTG application server and the PRTG core server
PRTG Cloud	443	Port used by the PRTG Cloud for support tickets, for example
PRTG MultiBoard File Transfer	44387	Port used to transfer files between PRTG core servers
PRTG web server	<ul style="list-style-type: none"> <li>▪ 443 (secure)</li> <li>▪ 80 (unsecure)</li> </ul> <p>Fallbacks:</p> <ul style="list-style-type: none"> <li>▪ 8443 and 8443+ (secure)</li> <li>▪ 8080+ (unsecure)</li> </ul>	<p>Port used by the PRTG web server</p> <p><b>i</b> PRTG app for desktop, PRTG MultiBoard, and the PRTG mobile apps also use this port to connect to the PRTG web server.</p>
Remote probes and PRTG core server	23560	<p>Port for the connections between remote probes and the PRTG core server</p> <p><b>■</b> It is sufficient to open or forward this TCP port only on the PRTG core server. If you need to change it, see the Knowledge Base: <a href="#">How can I customize ports for core-probe connections used by PRTG?</a></p>
Report generation	8085 (PDF)	Port for the report generation
Update check and download	80	<p>Port for the update check and download</p> <p><b>■</b> For more information, see the Knowledge Base: <a href="#">Which servers does PRTG connect to for software auto-update, activation, etc.?</a></p>

## 15.4 Differences between PRTG Network Monitor and PRTG Hosted Monitor

See below for the differences between the settings and features that PRTG Network Monitor and PRTG Hosted Monitor have to offer.

### Licensing, Payment, Infrastructure

Topic	PRTG Network Monitor	PRTG Hosted Monitor
Trial period	30 days	10 days
Freeware edition	Freeware (100 sensors) available	No freeware available, smallest edition is Hosted 500
Payment	Annual subscription	Monthly or annual subscription
Change of subscription or license size	Up only	Up and down, anytime
Maximum installation size	Max. 10,000 sensors recommended	10,000 sensors
PRTG update management	Done by user	Done by Paessler

### Features

Feature	PRTG Network Monitor	PRTG Hosted Monitor
Local probe	Yes	No
Hosted probe	No	Yes
Multi-platform probe	Yes	Yes
Cluster	Yes	No
Freeware edition (100 sensors)	Yes	No

Feature	PRTG Network Monitor	PRTG Hosted Monitor
Remote Desktop Protocol (RDP) access to PRTG core server	Yes	No
Historic data purging (manually defined)	Yes	No
Active Directory integration	Yes	No
License/subscription settings via PRTG web interface	Yes	No
Recommended sensors on local probe/hosted probe	Yes	No
Auto-discovery for groups on local probe/hosted probe	Yes	No
Mini probes	Yes	No
Device tools on local probe/hosted probe	Yes	No
Proxy server settings	Yes	No
System information on local probe/hosted probe	Yes	No
PRTG Administration Tool on PRTG core server	Yes	No
Notification methods:		
▪ Send Email	Yes	Yes
▪ Send SMS/Pager Message	Yes	Yes
▪ Execute HTTP Action	Yes	Yes
▪ Send Amazon Simple Notification Service Message	Yes	Yes
▪ Assign Ticket	Yes	Yes

Feature	PRTG Network Monitor	PRTG Hosted Monitor
▪ Send Push Notification	Yes	Yes
▪ Send Microsoft Teams Message	Yes	Yes
▪ Send Slack Message	Yes	Yes
▪ Send MQTT Publish Notification	Yes	Yes
▪ Send OPC UA Notification	Yes	Yes
▪ Add Entry to Event Log	Yes	No
▪ Send Syslog Message	Yes	No
▪ Send SNMP Trap	Yes	No
▪ Execute Program	Yes	No
Re-login request on setup pages after 15 minutes	Yes	No
IPv6 on local probe/hosted probe	Yes	No
Multi-factor authentication	No*	Yes

\* PRTG Network Monitor supports multi-factor authentication with Microsoft Entra ID and Okta.

- For more information, see the Knowledge Base: [How can I enable Microsoft Entra ID multifactor authentication?](#)
- For more information, see the Knowledge Base: [How can I enable Okta multi-factor authentication?](#)

### Sensors on the Hosted Probe of PRTG Hosted Monitor

You can use the following sensors on the hosted probe of PRTG Hosted Monitor:

Supported Sensors
AWS Alarm v2 sensor
AWS Cost sensor

Supported Sensors
AWS EBS v2 sensor
AWS EC2 v2 sensor
AWS ELB v2 sensor
AWS RDS v2 sensor
Beckhoff IPC System Health sensor
Business Process sensor
Cisco IP SLA sensor
Citrix XenServer Host sensor
Citrix XenServer Virtual Machine sensor
Cloud HTTP v2 sensor
Cloud Ping v2 sensor
Cluster Health sensor
Common SaaS sensor
Core Health sensor
Dell EMC Unity Enclosure Health v2 sensor
Dell EMC Unity File System v2 sensor
Dell EMC Unity Storage Capacity v2 sensor
Dell EMC Unity Storage LUN v2 sensor
Dell EMC Unity Storage Pool v2 sensor
Dell EMC Unity VMware Datastore v2 sensor
DICOM Bandwidth sensor

Supported Sensors
DICOM C-ECHO sensor
DICOM Query/Retrieve sensor
DNS v2 sensor
Docker Container Status sensor
FortiGate System Statistics sensor
FTP sensor
FTP Server File Count sensor
HL7 sensor
HPE 3PAR Common Provisioning Group sensor
HPE 3PAR Drive Enclosure sensor
HPE 3PAR Virtual Volume sensor
HTTP sensor
HTTP Advanced sensor
HTTP Apache ModStatus PerfStats sensor
HTTP Apache ModStatus Totals sensor
HTTP Content sensor
HTTP Data Advanced sensor
HTTP IoT Push Data Advanced sensor
HTTP Transaction sensor
HTTP XML/REST Value sensor
IMAP sensor

Supported Sensors
IP on DNS Blacklist sensor
LDAP sensor
Microsoft 365 Mailbox sensor
Microsoft 365 Service Status sensor
Microsoft 365 Service Status Advanced sensor
Microsoft Azure SQL Database sensor
Microsoft Azure Storage Account sensor
Microsoft Azure Subscription Cost sensor
Microsoft Azure Virtual Machine sensor
Modbus TCP Custom sensor
MQTT Round Trip sensor
MQTT Statistics sensor
MQTT Subscribe Custom sensor
NetApp Aggregate sensor
NetApp I/O sensor
NetApp LIF sensor
NetApp LUN sensor
NetApp NIC sensor
NetApp Physical Disk sensor
NetApp SnapMirror sensor
NetApp System Health sensor

Supported Sensors
NetApp Volume sensor
NetApp Volume v2
OPC UA Certificate sensor
OPC UA Custom sensor
OPC UA Server Status sensor
Ping sensor
Ping Jitter sensor
POP3 sensor
Probe Health sensor
RADIUS v2 sensor
RDP (Remote Desktop) sensor
Redfish Power Supply sensor
Redfish System Health sensor
REST Custom sensor
Sensor Factory sensor
SFTP Secure File Transfer Protocol sensor
SIP Options Ping sensor
SMTP&IMAP Round Trip sensor
SMTP&POP3 Round Trip sensor
SNMP APC Hardware sensor
SNMP Buffalo TS System Health sensor

Supported Sensors
SNMP Cisco ADSL sensor
SNMP Cisco ASA VPN Connections sensor
SNMP Cisco ASA VPN Traffic sensor
SNMP Cisco ASA VPN Users sensor
SNMP Cisco CBQoS sensor
SNMP Cisco System Health sensor
SNMP Cisco UCS Blade sensor
SNMP Cisco UCS Chassis sensor
SNMP Cisco UCS Physical Disk sensor
SNMP Cisco UCS System Health sensor
SNMP CPU Load sensor
SNMP Custom sensor
SNMP Custom Advanced sensor
SNMP Custom String sensor
SNMP Custom String Lookup sensor
SNMP Custom Table sensor
SNMP Dell EqualLogic Logical Disk sensor
SNMP Dell EqualLogic Member Health sensor
SNMP Dell EqualLogic Physical Disk sensor
SNMP Dell Hardware sensor
SNMP Dell PowerEdge Physical Disk sensor

Supported Sensors
SNMP Dell PowerEdge System Health sensor
SNMP Disk Free sensor
SNMP Fujitsu System Health v2 sensor
SNMP Hardware Status sensor
SNMP HP LaserJet Hardware sensor
SNMP HPE BladeSystem Blade sensor
SNMP HPE BladeSystem Enclosure Health sensor
SNMP HPE ProLiant Logical Disk sensor
SNMP HPE ProLiant Memory Controller sensor
SNMP HPE ProLiant Network Interface sensor
SNMP HPE ProLiant Physical Disk sensor
SNMP HPE ProLiant System Health sensor
SNMP IBM System X Logical Disk sensor
SNMP IBM System X Physical Disk sensor
SNMP IBM System X Physical Memory sensor
SNMP IBM System X System Health sensor
SNMP interSeptor Pro Environment sensor
SNMP Juniper NS System Health sensor
SNMP LenovoEMC Physical Disk sensor
SNMP LenovoEMC System Health sensor
SNMP Library sensor

Supported Sensors
SNMP Linux Disk Free sensor
SNMP Linux Load Average sensor
SNMP Linux Meminfo sensor
SNMP Linux Physical Disk sensor
SNMP Memory sensor
SNMP NetApp Disk Free sensor
SNMP NetApp Enclosure sensor
SNMP NetApp I/O sensor
SNMP NetApp License sensor
SNMP NetApp Logical Unit sensor
SNMP NetApp Network Interface sensor
SNMP NetApp System Health sensor
SNMP Nutanix Cluster Health sensor
SNMP Nutanix Hypervisor sensor
SNMP Poseidon Environment sensor
SNMP Printer sensor
SNMP QNAP Logical Disk sensor
SNMP QNAP Physical Disk sensor
SNMP QNAP System Health sensor
SNMP Rittal CMC III Hardware Status sensor
SNMP RMON sensor

Supported Sensors
SNMP SonicWall System Health sensor
SNMP SonicWall VPN Traffic sensor
SNMP Synology Logical Disk sensor
SNMP Synology Physical Disk sensor
SNMP Synology System Health sensor
SNMP System Uptime sensor
SNMP Traffic sensor
SNMP Windows Service sensor
SNTP sensor
Soffico Orchestra Channel Health sensor
SSH Disk Free sensor
SSH INodes Free sensor
SSH Load Average sensor
SSH Meminfo sensor
SSH Remote Ping sensor
SSH SAN Enclosure sensor
SSH SAN Logical Disk sensor
SSH SAN Physical Disk sensor
SSH SAN System Health sensor
SSH Script sensor
SSH Script Advanced sensor

Supported Sensors
SSL Certificate sensor
SSL Security Check sensor
System Health sensor
TFTP sensor
Traceroute Hop Count sensor
Veeam Backup Job Status sensor
Veeam Backup Job Status Advanced sensor
VMware Datastore (SOAP) sensor
VMware Host Hardware (WBEM) sensor
VMware Host Hardware Status (SOAP) sensor
VMware Host Performance (SOAP) sensor
VMware Virtual Machine (SOAP) sensor
Zoom Service Status sensor

## Sensors on a Classic Remote Probe Device

You can use the following sensors only on a [classic remote probe](#) [3198] device.

 For performance reasons, you cannot add these sensors to the hosted probe of PRTG Hosted Monitor.

Supported Sensors
Active Directory Replication Errors sensor
ADO SQL v2 sensor
Dell PowerVault MDi Logical Disk sensor

Supported Sensors
Dell PowerVault MDi Physical Disk sensor
DHCP sensor
Enterprise Virtual Array sensor
Event Log (Windows API) sensor
Exchange Backup (PowerShell) sensor
Exchange Database DAG (PowerShell) sensor
Exchange Database (PowerShell) sensor
Exchange Mailbox (PowerShell) sensor
Exchange Mail Queue (PowerShell) sensor
Exchange Public Folder (PowerShell) sensor
EXE/Script sensor
EXE/Script Advanced sensor
File sensor
File Content sensor
Folder sensor
HTTP Full Web Page sensor
HTTP Push Count sensor
HTTP Push Data sensor
HTTP Push Data Advanced sensor
Hyper-V Cluster Shared Volume Disk Free sensor
Hyper-V Host Server sensor

Supported Sensors
Hyper-V Virtual Machine sensor
Hyper-V Virtual Network Adapter sensor
Hyper-V Virtual Storage Device sensor
IPFIX sensor
IPFIX (Custom) sensor
IPMI System Health sensor
jFlow v5 sensor
jFlow v5 (Custom) sensor
Microsoft SQL v2 sensor
MySQL v2 sensor
NetFlow v5 sensor
NetFlow v5 (Custom) sensor
NetFlow v9 sensor
NetFlow v9 (Custom) sensor
Oracle SQL v2 sensor
Oracle Tablespace sensor
Packet Sniffer sensor
Packet Sniffer (Custom) sensor
PerfCounter Custom sensor
PerfCounter IIS Application Pool sensor
Port sensor

Supported Sensors
Port Range sensor
PostgreSQL sensor
Python Script Advanced sensor
QoS (Quality of Service) One Way sensor
QoS (Quality of Service) Round Trip sensor
sFlow sensor
sFlow (Custom) sensor
Share Disk Free sensor
SMTP sensor
SNMP Trap Receiver sensor
Syslog Receiver sensor
Windows CPU Load sensor
Windows IIS Application sensor
Windows MSMQ Queue Length sensor
Windows Network Card sensor
Windows Pagefile sensor
Windows Physical Disk I/O sensor
Windows Print Queue sensor
Windows Process sensor
Windows SMTP Service Received sensor
Windows SMTP Service Sent sensor

Supported Sensors
Windows System Uptime sensor
Windows Updates Status (PowerShell) sensor
WMI Battery sensor
WMI Custom sensor
WMI Custom String sensor
WMI Disk Health sensor
WMI Event Log sensor
WMI Exchange Server sensor
WMI Exchange Transport Queue sensor
WMI File sensor
WMI Free Disk Space (Multi Disk) sensor
WMI HDD Health sensor
WMI Logical Disk I/O sensor
WMI Memory sensor
WMI Microsoft SQL Server 2005 sensor (Deprecated)
WMI Microsoft SQL Server 2008 sensor
WMI Microsoft SQL Server 2012 sensor
WMI Microsoft SQL Server 2014 sensor
WMI Microsoft SQL Server 2016 sensor
WMI Microsoft SQL Server 2017 sensor
WMI Microsoft SQL Server 2019 sensor

Supported Sensors
WMI Remote Ping sensor
WMI Security Center sensor
WMI Service sensor
WMI Share sensor
WMI SharePoint Process sensor
WMI Storage Pool sensor
WMI Terminal Services (Windows 2008+) sensor
WMI Terminal Services (Windows XP/Vista/2003) sensor
WMI UTC Time sensor
WMI Vital System Data v2 sensor
WMI Volume sensor
WSUS Statistics sensor

## Settings

 These settings are only available in PRTG Network Monitor.

Setting Title	Setting Name
Auto-Update	When a New Version is Available
	Installation Time
	Release Channel
Notification Templates	Add Entry to Event Log
	Send Syslog Message

Setting Title	Setting Name
	Send SNMP Trap
	Execute Program
Core & Probes	Proxy Configuration
	Probe Connection IP Addresses
	Mini Probes
	Mini Probe Port
Administrative Tools For Probes	Restart Probe (local probe)
Scanning Intervals	Available Intervals (definition of individual intervals)
Notification Delivery	SMTP Delivery (everything but sender email address and name)
Recommended Sensors Detection	Detection Handling
User Interface (PRTG Web Interface)	DNS Name
	Google Analytics Tracking ID
User Interface (PRTG Web Server)	IP Address for PRTG Web Server
	TCP Port for PRTG Web Server
	PRTG Web Server Port
	PRTG Web Server Security
	Connection Security
	Active IP Address/Port Combinations
User Accounts	Login Name
	Password

Setting Title	Setting Name
	Passhash
Administrative Tools For The PRTG Core Server	Create Configuration Snapshot
	Write Core Status File
	Clear Caches
	Load Lookups and File Lists
	Recalculate PRTG Graph Data Cache
	Restart PRTG Core Server Service
	Reload Logging Configuration
Advanced Network Analysis	System Information
Scheduled Restart Settings (Local Probe)	Restart Options
	Restart Schedule
	Specify Day
	Specify Hour

## 15.5 Escape Special Characters and Whitespaces in Parameters

You must escape special characters in parameters that you pass to an executable or script and surround them with quotation marks to make sure that the characters are correctly interpreted. PowerShell scripts in particular require adequate escaping so that the parameters are passed in a valid PowerShell syntax. PRTG automatically does most of the escaping for you.

Follow these rules to escape special characters and whitespaces in the parameters fields:

- Use double (") or single (') quotation marks for parameters that contain whitespaces.

```
-name "Mr John Q Public"
-name 'Mr John Q Public'
```

- Use double quotation marks (") for parameters that already contain single quotation marks (').

```
-name "Mr 'John Q' Public"
```

- Use single quotation marks (') for parameters that already contain double quotation marks (").

```
-name 'Mr "John Q" Public'
```

- Use a backslash (\) to escape and pass a literal double quotation mark.

```
-name pub\"lic
```

- Use double quotation marks (") for parameters that contain double (") and single (') quotation marks and escape double quotation marks (").

```
-name "pu'b\"lic"
```

**i** In SSH scripts, you can use alphanumeric characters and the special characters ".", "\_", "-", "=", and "/" outside of quoted strings.

**i** We recommend that you do not pass passwords in parameters. Use placeholders instead. For more information, see section [Custom Sensors](#) <sup>3148</sup>.

## 15.6 Glossary

This section explains PRTG-specific terminology.

### A

Alarms	The <a href="#">alarms</a> list shows all <a href="#">sensors</a> that are in the Down, Down (Partial), Down (Acknowledged), Warning, or Unusual <a href="#">status</a> . The alarms list shows you all irregularities in your network.
Auto-discovery	The <a href="#">auto-discovery</a> process uses ping to scan your network for <a href="#">devices</a> (for <a href="#">groups</a> only). It assesses the device type for all discovered devices, and it creates <a href="#">sensor</a> sets that match the discovered device types based on built-in templates or your custom <a href="#">device templates</a> .

### C

Channel	The monitoring data of a <a href="#">sensor</a> is shown in <a href="#">channels</a> . For example, sensors that measure network traffic have one channel each for traffic <a href="#">in</a> , traffic <a href="#">out</a> , and traffic <a href="#">total</a> . You can set various <a href="#">triggers</a> for each channel to define <a href="#">sensor status</a> changes or <a href="#">notifications</a> based on the monitoring data received.
Classic remote probe	A <a href="#">classic remote probe</a> is a small piece of software that is installed on a Windows system in the local or remote network. It is one of three types of <a href="#">remote probes</a> . It scans the network and sends monitoring results to the <a href="#">PRTG core server</a> . Once the connection has been established, the classic remote probe is shown in the <a href="#">device tree</a> . You can add <a href="#">groups</a> and <a href="#">devices</a> to the classic remote probe.
Cluster	A <a href="#">cluster</a> consists of two or more <a href="#">PRTG core servers</a> that work together to form a high availability monitoring system. A cluster consists of a <a href="#">master node</a> and one or more <a href="#">failover nodes</a> . Every <a href="#">cluster node</a> can monitor every <a href="#">device</a> in a network for fail-safe monitoring.
Cluster node	<a href="#">Cluster nodes</a> make up a cluster. Cluster nodes can be <a href="#">master nodes</a> or <a href="#">failover nodes</a> .
Cluster probe	When you create or join a <a href="#">cluster</a> , PRTG automatically creates a <a href="#">cluster probe</a> . All <a href="#">objects</a> that you create on the cluster probe (or below in the <a href="#">device tree</a> ) are monitored by all <a href="#">cluster nodes</a> . Create or move <a href="#">objects</a> there for fail-safe monitoring. If one cluster node fails, the other cluster nodes continue to monitor all objects. You can add <a href="#">groups</a> and <a href="#">devices</a> to the cluster probe. The cluster probe runs as part of the <a href="#">local probe</a> .

Cluster probe device	The <a href="#">cluster probe device</a> is an internal system device that PRTG automatically adds to the <a href="#">cluster probe</a> <sup>[3313]</sup> . It has access to the <a href="#">cluster node</a> <sup>[3313]</sup> system and monitors its health parameters using several <a href="#">sensors</a> <sup>[3320]</sup> .
----------------------	---

## D

Dashboard	A preconfigured sample <a href="#">dashboard</a> is available in the Home menu of the PRTG web interface. Dashboards provide an overview of the overall status of your monitoring configuration. You can create custom dashboards using the <a href="#">Maps</a> <sup>[3316]</sup> feature.
Device	A <a href="#">device</a> represents a physical or virtual component in your network that is reachable via an IP address. For a clear <a href="#">device tree</a> <sup>[3314]</sup> structure, you usually create one device for each physical or virtual component that you want to monitor. You can add one or more <a href="#">sensors</a> <sup>[3320]</sup> to a device.
Device template	If you want to add a specific <a href="#">device</a> <sup>[3314]</sup> several times, you can create a <a href="#">device template</a> from a device in the <a href="#">device tree</a> <sup>[3314]</sup> . When you create a device template, PRTG saves information for nearly all <a href="#">sensors</a> <sup>[3320]</sup> on the device to a template file. You can later use the template file in combination with the <a href="#">auto-discovery</a> <sup>[3313]</sup> (restrictions apply for a few sensor types).
Device tree	The configuration of PRTG is represented in a hierarchical tree structure called the <a href="#">device tree</a> , which contains all monitoring <a href="#">objects</a> <sup>[3317]</sup> . While building the device tree, you can relate to your network's topology to make your monitoring setup more understandable.

## F

Failover master node	If the <a href="#">primary master node</a> <sup>[3317]</sup> of a <a href="#">cluster</a> <sup>[3313]</sup> fails, a <a href="#">failover node</a> <sup>[3314]</sup> becomes a <a href="#">failover master node</a> . The failover master node takes over the role of the primary master node until it reconnects to the cluster.
Failover node	In a <a href="#">cluster</a> <sup>[3313]</sup> , a <a href="#">failover node</a> monitors all <a href="#">sensors</a> <sup>[3320]</sup> on the <a href="#">cluster probe</a> <sup>[3313]</sup> and it provides monitoring data for the <a href="#">PRTG core server</a> <sup>[3318]</sup> . Additionally, it serves as a backup in case the <a href="#">master node</a> <sup>[3316]</sup> fails.
Flows	PRTG supports NetFlow v5, NetFlow v9, IPFIX, sFlow v5, and jFlow v5.

G

Gauge	A <a href="#">gauge</a> is a type of visual representation of the values of a <a href="#">channel</a> <sup>[3313]</sup> . The gauge needle points to the current value of the channel. Other types of visual representations are <a href="#">toggles</a> <sup>[3320]</sup> and <a href="#">switches</a> <sup>[3320]</sup> .
Geo Maps	The <a href="#">Geo Maps</a> feature shows the different locations of your <a href="#">devices</a> <sup>[3314]</sup> on a geographical map using the location data that you provide in the settings of <a href="#">probes</a> <sup>[3317]</sup> , <a href="#">groups</a> <sup>[3315]</sup> , or devices. The status icons on the geographical maps that represent your devices also show the overall status of a location. This is useful for monitoring distributed networks.
Group	A <a href="#">group</a> is an organizational unit in the <a href="#">device tree</a> <sup>[3314]</sup> . You can add <a href="#">devices</a> <sup>[3314]</sup> or subgroups to groups. This way, you can model your physical network's topology within the PRTG configuration. You can use groups to arrange similar objects so that they inherit the same settings.

H

Hosted probe	The <a href="#">hosted probe</a> in PRTG Hosted Monitor is like the <a href="#">local probe</a> <sup>[3316]</sup> in PRTG Network Monitor. When you create a PRTG Hosted Monitor instance, the system automatically adds the hosted probe. The hosted probe runs on the <a href="#">PRTG core server system</a> <sup>[3318]</sup> that we host for you and it shows the monitoring values of your PRTG Hosted Monitor instance. You can use the hosted probe to monitor <a href="#">devices</a> <sup>[3314]</sup> , servers, and services that are publicly available on the internet like, for example, websites. To monitor your LAN, you need at least one <a href="#">remote probe</a> <sup>[3319]</sup> installation in your network. The local probe and the multi-platform probe are not available in PRTG Hosted Monitor.
--------------	---

L

Library	A <a href="#">library</a> enables you to create additional views of your <a href="#">device tree</a> <sup>[3314]</sup> . These views are updated in the same scanning interval as your device tree and show the same monitoring data, but arranged the way you want. This is useful if you want to display data in different ways, like depending on target groups or a specific use case.
Library node	<a href="#">Libraries</a> <sup>[3315]</sup> use <a href="#">library nodes</a> to reference <a href="#">objects</a> <sup>[3317]</sup> in your monitoring setup. Library nodes can show a subtree of the <a href="#">device tree</a> <sup>[3314]</sup> or they can show a collection of filtered <a href="#">sensors</a> <sup>[3320]</sup> .
Limit	<a href="#">Limits</a> let you define thresholds for <a href="#">channel</a> <sup>[3313]</sup> values. When the value of a channel is above or below the defined limit, the sensor can show the Warning or Down status.

Local probe	When installing PRTG Network Monitor, the <a href="#">local probe</a> is installed together with the <a href="#">PRTG core server</a> . All <a href="#">objects</a> created on the local probe, or underneath it in the <a href="#">device tree</a> , are monitored by the local PRTG core server system. You can add <a href="#">groups</a> and <a href="#">devices</a> to the local probe. If you use PRTG Hosted Monitor, the <a href="#">hosted probe</a> replaces the local probe.
Local probe device	The <a href="#">local probe device</a> is an internal system device that PRTG automatically adds to the <a href="#">local probe</a> . It has access to the <a href="#">local probe system</a> and monitors its health parameters using several <a href="#">sensors</a> .
Lookup	PRTG uses <a href="#">lookups</a> for some <a href="#">sensor</a> types and for some sensors with custom <a href="#">channels</a> . In general, lookups map status values as returned by a <a href="#">device</a> (usually integers) to more informative expressions in words.

**M**

Maps	The <a href="#">Maps</a> feature lets you present monitoring data the way you want it. An editor is available that lets you create maps (sometimes referred to as <a href="#">dashboards</a> ) directly in your browser. Using maps, you can also make overviews of live data publicly available.
Master node	In a <a href="#">cluster</a> , the <a href="#">master node</a> controls the settings and cluster management. It also takes over notifications. All changes to the monitoring configuration are made on the master node, which distributes the changes among all other cluster nodes in real time. There are two types of master nodes: <a href="#">primary master node</a> and <a href="#">failover master node</a> .
Meta-scan	Sensors that use the <a href="#">meta-scan</a> feature, for example SNMP sensors, first look at the according <a href="#">device</a> to find what they can monitor. This can be tables, object identifiers (OID), or disks, for example. When the meta-scan is finished, the second step of the <a href="#">Add Sensor</a> dialog shows you the parameters that you can monitor. Some sensors require basic information before they can perform a meta-scan. Provide the requested information, such as credentials, in the appearing dialog box. PRTG then scans and recognizes all parameters that are available for monitoring based on your input.
Mini probe	With a <a href="#">mini probe</a> , you can create small <a href="#">probes</a> on any <a href="#">device</a> (not only on Windows systems). It is one of three types of <a href="#">remote probes</a> .
Multi-platform probe	A <a href="#">multi-platform probe</a> is a small piece of software that is installed on a Linux system in a remote network. It is one of three types of <a href="#">remote probes</a> . It scans the network and sends monitoring results to the <a href="#">PRTG core server</a> via a NATS server. Once the connection has been established, the multi-platform probe is shown in the <a href="#">device tree</a> . You can add <a href="#">groups</a> and <a href="#">devices</a> to the multi-platform probe.

N

Notification	PRTG uses <a href="#">notifications</a> to send you alerts whenever it discovers a defined status, such as slow <a href="#">sensors</a> <sup>[3320]</sup> , or when <a href="#">channels</a> <sup>[3313]</sup> breach threshold values. You can define an unlimited number of notifications. You can use one or more of several notification methods like email, text messaging, push notifications to Android and iOS devices, and more.
Notification trigger	PRTG sends a <a href="#">notification</a> <sup>[3317]</sup> when a defined event triggers it. These events are known as <a href="#">notification triggers</a> . The following events can trigger notifications: <a href="#">sensor status</a> <sup>[3320]</sup> changes, <a href="#">sensor</a> <sup>[3320]</sup> value threshold breaches, speed threshold breaches, volume threshold breaches, and sensor value changes.

O

Object	All types of items in the <a href="#">device tree</a> <sup>[3314]</sup> are generally referred to as <a href="#">objects</a> , or <a href="#">monitoring objects</a> . An object can be a <a href="#">probe</a> <sup>[3317]</sup> , a <a href="#">group</a> <sup>[3315]</sup> , a <a href="#">device</a> <sup>[3314]</sup> , or a <a href="#">sensor</a> <sup>[3320]</sup> .
Object hierarchy	All <a href="#">objects</a> <sup>[3317]</sup> are arranged in a hierarchical order called the <a href="#">object hierarchy</a> . The object hierarchy is used to define common settings for groups of objects.
Object selector	The <a href="#">object selector</a> lets you browse all <a href="#">objects</a> <sup>[3317]</sup> in your configuration and lets you select an object. The left-hand side shows the <a href="#">device tree</a> <sup>[3314]</sup> . If you have selected a <a href="#">device</a> <sup>[3314]</sup> , the right-hand side shows the <a href="#">sensors</a> <sup>[3320]</sup> on the device.

P

Primary group	Every user has to be a member of a <a href="#">primary group</a> to make sure there is no user without group membership. Membership in other user groups is optional.
Primary master node	In a <a href="#">cluster</a> <sup>[3313]</sup> , the <a href="#">primary master node</a> is the <a href="#">cluster node</a> <sup>[3313]</sup> that is the <a href="#">master node</a> <sup>[3316]</sup> by configuration.
Probe	A <a href="#">probe</a> is where the actual monitoring takes place. There are <a href="#">local probes</a> <sup>[3316]</sup> , <a href="#">cluster probes</a> <sup>[3313]</sup> , <a href="#">remote probes</a> <sup>[3319]</sup> , <a href="#">hosted probes</a> <sup>[3315]</sup> , and <a href="#">multi-platform probes</a> <sup>[3316]</sup> .
Probe device	The <a href="#">probe device</a> is an internal system device that PRTG automatically adds to the <a href="#">probe</a> <sup>[458]</sup> . It has access to the <a href="#">probe system</a> <sup>[3318]</sup> and monitors its health parameters using several <a href="#">sensors</a> <sup>[3320]</sup> .

<p>Probe system</p>	<p>A <a href="#">probe system</a> is the system, or Windows computer, that runs a <a href="#">probe</a>. A <a href="#">remote probe</a>, a <a href="#">cluster probe</a>, and the <a href="#">local probe</a> run on a probe system.</p>
<p>PRTG Administration Tool</p>	<p>The <a href="#">PRTG Administration Tool</a> is part of your PRTG installation. You can use it to edit the administrative settings of the <a href="#">local probe</a> and <a href="#">remote probe</a> installations. You can start the PRTG Administration Tool from the Windows Start menu on the <a href="#">PRTG core server system</a> or on the <a href="#">remote probe system</a>.</p>
<p>PRTG app for desktop</p>	<p>The <a href="#">PRTG app for desktop</a> is an alternative interface that you can use to connect to the <a href="#">PRTG core server</a> or a PRTG Hosted Monitor instance to configure your setup, view monitoring results, and keep an eye on your network. It is a cross-platform application for fast access to data and monitoring management.</p>
<p>PRTG Application Programming Interface (PRTG API)</p>	<p>The <a href="#">PRTG API</a> enables you to access monitoring data and to manipulate <a href="#">objects</a> using HTTP requests, to run your own written <a href="#">sensors</a> and <a href="#">notifications</a>, and to implement <a href="#">mini probes</a>.</p>
<p>PRTG Cloud</p>	<p><a href="#">PRTG Cloud</a> is used by the <a href="#">Cloud HTTP v2</a> sensor and the <a href="#">Cloud Ping v2</a> sensor to monitor the loading times of a web server via HTTP or the Transmission Control Protocol (TCP) ping times to a parent device from different locations worldwide. PRTG also sends push notifications and securely transmits support bundles to Paessler via PRTG Cloud.</p>
<p>PRTG core server</p>	<p>The <a href="#">PRTG core server</a> is the central unit of PRTG. It receives monitoring data from the <a href="#">probe</a> and handles reporting and notifications, provides the web server for the user interfaces, and much more. In a <a href="#">cluster</a>, one PRTG core server is installed on every <a href="#">cluster node</a>. The PRTG core server is configured as a Windows service that is permanently run by the Windows system without requiring a user that is logged in.</p>
<p>PRTG core server service</p>	<p>The <a href="#">PRTG core server service</a> is responsible for running the <a href="#">PRTG core server</a>. It is a Windows service that permanently runs on the <a href="#">PRTG core server system</a>.</p>
<p>PRTG core server system</p>	<p>The <a href="#">PRTG core server system</a> is the system, or Windows computer, that runs the <a href="#">PRTG core server</a>.</p>
<p>PRTG data directory</p>	<p>The <a href="#">PRTG data directory</a> is the directory on the <a href="#">PRTG core server system</a> or <a href="#">remote probe system</a> where PRTG stores monitoring data, configuration data, and logs.</p>
<p>PRTG Hosted Monitor</p>	<p><a href="#">PRTG Hosted Monitor</a> is the PRTG cloud solution where we at Paessler run the <a href="#">PRTG core server</a> and <a href="#">hosted probe</a> for you. PRTG Hosted Monitor does not require a PRTG core server installation inside your network.</p>

PRTG Network Monitor	<a href="#">PRTG Network Monitor</a> is a network monitoring application for Windows-based systems with which you can monitor your entire network. PRTG Network Monitor requires a <a href="#">PRTG core server</a> installation inside your network.
PRTG probe service	The <a href="#">PRTG probe service</a> is responsible for running a <a href="#">probe</a> . It is a Windows service that permanently runs on the <a href="#">probe system</a> .
PRTG program directory	The <a href="#">PRTG program directory</a> is the directory on the <a href="#">PRTG core server system</a> where PRTG stores all files that are required for it to run.
PRTG web interface	The <a href="#">PRTG web interface</a> is the Asynchronous JavaScript and XML (AJAX) based web interface of PRTG. It is the default interface for setting up your monitoring.

**R**

Recommended Sensors Detection	The <a href="#">Recommended Sensors Detection</a> feature enables PRTG to analyze <a href="#">devices</a> in your network and to suggest sensors that are still missing for a comprehensive monitoring setup. If enabled, the analysis runs in the background with low priority if you add a new device, if the last analysis was executed more than 30 days ago, or if you manually start it.
Release channel	PRTG updates are delivered in different <a href="#">release channels</a> . With PRTG Network Monitor, you can choose between maximum stability ( <a href="#">Stable</a> ), or most early access to new features ( <a href="#">Canary</a> or <a href="#">Preview</a> ). PRTG Hosted Monitor does not have release channels. Instead, we roll out the latest stable version to PRTG Hosted Monitor instances in stages, so your instance automatically updates to the latest stable version.
Remote probe	A <a href="#">remote probe</a> is a small piece of software that is installed on a computer, or <a href="#">remote probe system</a> , in the local or remote network. It scans the network and sends monitoring results to the <a href="#">PRTG core server</a> . Once the connection has been established, the remote probe is shown in the <a href="#">device tree</a> . All <a href="#">objects</a> that you create on the remote probe, or below it in the device tree, are monitored by the remote probe system. You can add <a href="#">groups</a> and <a href="#">devices</a> to the remote probe. In a <a href="#">cluster</a> , remote probes can connect to all cluster nodes so you can view monitoring data of a remote probe on all <a href="#">cluster nodes</a> .
Remote probe device	The <a href="#">remote probe device</a> is an internal system device that PRTG automatically adds to the <a href="#">remote probe</a> . It has access to the <a href="#">remote probe system</a> and monitors its health parameters using several <a href="#">sensors</a> .
Remote probe system	The <a href="#">remote probe system</a> is the system, such as a Windows or Linux computer, that runs a <a href="#">remote probe</a> .

Root group	The <a href="#">root group</a> is the topmost instance in the <a href="#">object hierarchy</a> [3317] in the device tree. It contains all <a href="#">objects</a> [3317] in your monitoring setup. All objects inherit the settings of the root group by default.
------------	---

## S

Schedule	You can use <a href="#">schedules</a> to pause monitoring or notifications for certain periods of time or at certain times. You can also use schedules to define the periods of time that are covered when creating reports.
Sensor	A <a href="#">sensor</a> monitors one aspect of a <a href="#">device</a> [3314]. For example, one sensor monitors if a device responds to a ping request. A different sensor monitors the traffic of one Ethernet port of a router, and so on. The data of sensors is shown in their respective <a href="#">channels</a> [3313]. Each sensor has at least one channel.
Sensor status	The color of a <a href="#">sensor</a> [3320] represents the <a href="#">sensor status</a> . There are 8 different sensor states: Down, Down (Partial), Down (Acknowledged), Warning, Unusual, Up, Paused, and Unknown.
Similar Sensors Detection	The <a href="#">Similar Sensors Detection</a> feature enables PRTG to analyze <a href="#">sensor</a> [3320] data for similarities. If enabled, the detection runs in the background with low priority. The recommended setting for the analysis depth is to let PRTG automatically decide how many <a href="#">channels</a> [3313] it analyzes.
Switch	A <a href="#">switch</a> is a type of visual representation of the values of a <a href="#">channel</a> [3313]. Switches represent boolean values when using <a href="#">lookups</a> [3316].

## T

Tickets	<a href="#">Tickets</a> are created by the system or by a user and contain important messages or action steps for the administrator or other users to take. You should view every <a href="#">ticket</a> [213] to take appropriate action. You can access the list of tickets from the main menu.
Toggle	A <a href="#">toggle</a> is a type of visual representation of the values of a <a href="#">channel</a> [3313]. Toggles represent bitfields when using <a href="#">lookups</a> [3316].
Toplist	Packet Sniffer and Flow (NetFlow, jFlow, sFlow, IPFIX) <a href="#">sensor</a> [3320] types can break down traffic by IP address, port, protocol, and other parameters. The results are shown in graphs that are called <a href="#">Toplists</a> .

## U

Unusual Detection	The <b>Unusual Detection</b> feature can set <a href="#">sensors</a> to the Unusual <a href="#">status</a> when it detects values that are not typical for the time span in which they are measured. If the detection is enabled, PRTG compares the current average values to the historic monitoring results for this purpose. If the current values show a big difference to the values that are normally retrieved by a sensor, this sensor indicates this with the Unusual status.
-------------------	--

## 15.7 Icons

See below for a list of icons used in this documentation.

	Notes that contain additional information.
	Notes that contain critical information on the functioning of PRTG. Pay close attention to this information to avoid serious consequences for PRTG.
	There is more information on this topic in a different section of the PRTG Manual or in the Knowledge Base.
	This feature is in beta status and might not function properly in all situations.
	There is a video on this topic.
	Examples on how to use a feature.
	This information is relevant for PRTG Hosted Monitor.
	This information is relevant for PRTG Network Monitor.
	There is a Paessler tool that you can use.
	There is more information on this topic in the PRTG Manual, the Knowledge Base, the Paessler Blog, on the Paessler website, or on other websites. This icon is only used in More sections.

## 15.8 Legal Notices

See below for an excerpt of the libraries and licenses that PRTG uses:

- Build using Indy Internet Direct (<https://www.indyproject.org/>).  
This product includes cryptographic software written by Eric Young ([eay@cryptsoft.com](mailto:eay@cryptsoft.com))
- Uses the net-SNMP library, see [netsnmp-license.txt](#)

## 15.9 Placeholders for Notifications

Here you can find a list of all placeholders for notifications. You can use placeholders in different settings fields of a notification when editing [notification templates](#).

In this section:

- [Notification Settings Fields](#)
- [Placeholders in Summarized Notifications](#)
- [Available Placeholders](#)

### Notification Settings Fields

Notification	Settings field
Send Email	<ul style="list-style-type: none"> <li>▪ Subject</li> <li>▪ Custom Text if you select the option Custom text</li> </ul>
Add Entry to Event Log	Message
Send SMS/Pager Message	Message
Execute HTTP Action	Payload if you select the options POST, PUT, or PATCH
Execute Program	Parameters
Send Syslog Message	Message
Send SNMP Trap	Message
Send Amazon Simple Notification Service Message	Message
Assign Ticket	<ul style="list-style-type: none"> <li>▪ Subject</li> <li>▪ Content</li> </ul>
Send Push Notification	Message
Send Microsoft Teams Message	<ul style="list-style-type: none"> <li>▪ Title</li> <li>▪ Subtitle</li> </ul>

Notification	Settings field
Send Slack Message	<ul style="list-style-type: none"> <li>▪ Sender Name</li> <li>▪ Title</li> <li>▪ Subtitle</li> </ul>
Send MQTT Publish Notification	Message

❗ Placeholders are **not** case-sensitive.

❗ Depending on **where** you use a placeholder in a notification, PRTG might resolve the placeholder differently. A resolved placeholder in the **body** of a notification, for example, can contain more information compared to when PRTG resolves the same placeholder in the **subject** of a notification. The reason for this is to save space in the subject line.

## Placeholders in Summarized Notifications

Placeholders in summarized notifications have limited functionality:

- PRTG does **not** resolve placeholders in the subject field of summarized notifications if more than one trigger was evoked during the summarized time span. An exception are the placeholders %sitename and %summarycount. These are **always resolved** in summarized notifications.
- If only one event is triggered during the time span you defined, PRTG does not send a summarized notification, it only sends a common notification. A summarized notification requires at least two triggered events.

## Available Placeholders

Placeholder	Resolved Content	Synonym	Comment
%colorofstate	Color of the current object status (hex code)		Might not work in older versions.
%company	Copyright string of Paessler GmbH		
%comments	Comments entered for the sensor	%commentssensor	As of PRTG 15.4.21, resolved placeholders contain the heading <b>Sensor Comments</b> .

Placeholder	Resolved Content	Synonym	Comment
%commentssensor	Comments entered for the sensor	%comments	As of PRTG 15.4.21, resolved placeholders contain the heading <a href="#">Sensor Comments</a> .
%commentsdevice	Comments entered for the parent device		As of PRTG 15.4.21, resolved placeholders contain the heading <a href="#">Device Comments</a> .
%commentsgroup	Comments entered for the parent group		As of PRTG 15.4.21, resolved placeholders contain the heading <a href="#">Group Comments</a> .
%commentsprobe	Comments entered for the parent probe		Available as of PRTG 12.4. As of PRTG 15.4.21, resolved placeholders contain the heading <a href="#">Probe Comments</a> .
%coverage	Covered time span		Might not work in older versions.
%cumsince	Since when data has been accumulated		
%date	An event's date in the time zone of the PRTG core server system		
%datetime	An event's date and time in the time zone of the PRTG core server system		
%device	Name of the device in which the event was triggered	%server	
%deviceid	ID number of the device in which the event was triggered		

Placeholder	Resolved Content	Synonym	Comment
%down	Time the item was down		
%downtime	Accumulated downtime		
%elapsed_lastcheck	Elapsed time since the sensor's last scan		Available as of PRTG 20.1.57.
%elapsed_lastdown	Elapsed time since the sensor last showed a Down status		Available as of PRTG 20.1.57.
%elapsed_lastup	Elapsed time since the sensor last showed an Up status		Available as of PRTG 20.1.57.
%group	Group in which the event was triggered		
%groupid	ID number of the group in which the event was triggered		
%history	History of sensor events		
%home	URL of the PRTG web server		
%host	IP or DNS name of the device that triggered the event		As of PRTG 13.x.7, the placeholder can be used as Agent IP in SNMP trap notifications sent by PRTG.
%iconofstate	File name including the extension of the icon for the current object status		Might not work in older versions.

Placeholder	Resolved Content	Synonym	Comment
%lastcheck	Point in time of the sensor's last scan including time stamp		
%lastdown	Point in time when the sensor last showed a Down status, including the time stamp		
%lastmessage	Message that the sensor sent the last time	%message	
%laststatus	Current sensor status		Available as of PRTG 20.1.57.
%lastup	Point in time when the sensor last showed an Up status, including the time stamp		
%lastvalue	Value that the sensor sent the last time		
%linkprobe	URL of the probe that triggered the event		Might not work in older versions.
%linkgroup	URL of the group that triggered the event		Might not work in older versions.
%linkdevice	URL of the device that triggered the event		Might not work in older versions.
%linksensor	URL of the sensor that triggered the event		Might not work in older versions.

Placeholder	Resolved Content	Synonym	Comment
%location	Location of the device or server for which the event was triggered		
%message	Message that the sensor sent the last time	%lastmessage	
%name	Name of the sensor that triggered the event, including the sensor type	%sensor	
%nodename	Name of the node if PRTG runs in a cluster		Might not work in older versions.
%objecttags	All tags of a sensor		Available as of PRTG 20.1.56.
%parenttags	All tags of a sensor's parent objects		Available as of PRTG 20.1.56.
%prio	A sensor's priority setting	%priority	
%priority	A sensor's priority setting	%prio	
%probe	Probe under which the event was triggered		
%probeid	ID number of the probe under which the event was triggered		
%programname	Official name of PRTG		
%programversion	Program version of PRTG		

Placeholder	Resolved Content	Synonym	Comment
%sensor	Name of the sensor that triggered the event, including the sensor type	%name	
%sensorid	ID number of the sensor that triggered the event		
%server	Name of the device under which the event was triggered	%device	
%serviceurl	Service URL configured for the device under which the event was triggered		Available as of PRTG 9.1.
%settings	Miscellaneous sensor settings, such as the user name for Windows, HTTP, POP3 credentials, and so on		
%shortname	Name of the sensor that triggered the event		
%since	Point in time since the current object status has been active	%statesince	
%sitename	Name of the PRTG web server		
%statesince	Point in time since the current object status has been active	%since	

Placeholder	Resolved Content	Synonym	Comment
%status	Old sensor status and current sensor status		
%summarycount	Number of events triggered during the defined time span		<p> For summarized notifications only.</p>
%syslogerrors	Max. last 20 syslog entries before the notification trigger		<p>Available as of PRTG 14.x.10.</p> <p> Works only with <a href="#">Syslog Receiver</a>.</p> <p> Can only be used in the Custom Content field of Send Email notifications.</p>
%syslogmessages	Max. last 20 syslog entries before the notification trigger		<p>Available as of PRTG 14.x.10.</p> <p> Works only with <a href="#">Syslog Receiver</a>.</p> <p> Can only be used in the Custom Content field of Send Email notifications.</p>
%syslogwarnings	Max. last 20 syslog entries before the notification trigger		<p>Available as of PRTG 14.x.10.</p> <p> Works only with <a href="#">Syslog Receiver</a>.</p> <p> Can only be used in the Custom Content field of Send Email notifications.</p>
%systemdatetime	Date and time when the notification was sent in the time zone of the PRTG core server system		
%tags	All tags of a sensor and its parent objects		Available as of PRTG 20.1.56.

Placeholder	Resolved Content	Synonym	Comment
%time	An event's time in the time zone of the PRTG core server system		
%timezone	Time zone name of the PRTG core server system		
%toaddress	Address to which the notification was sent		
%traperrors	Max. last 20 SNMP trap entries before the notification trigger		<p>Available as of PRTG 14.x.10.</p> <p> Works only with <a href="#">SNMP Trap Receiver</a>.</p> <p> Can only be used in the Custom Content field of Send Email notifications.</p>
%trapmessages	Max. last 20 SNMP trap entries before the notification trigger		<p>Available as of PRTG 14.x.10.</p> <p> Works only with <a href="#">SNMP Trap Receiver</a>.</p> <p> Can only be used in the Custom Content field of Send Email notifications.</p>
%trapwarnings	Max. last 20 SNMP trap entries before the notification trigger		<p>Available as of PRTG 14.x.10.</p> <p> Works only with <a href="#">SNMP Trap Receiver</a>.</p> <p> Can only be used in the Custom Content field of Send Email notifications.</p>
%uptime	Accumulated uptime		

- ① As of PRTG 15.4.21, PRTG uses default content in HTML email notifications. You can still change the content of emails in plain text in the Send Email notification settings and also use placeholders there.
- ① As of PRTG 16.x.24, the placeholder `%state` has been deprecated. You can use the placeholder `%status` with the same functionality instead.
- For a list of placeholders that are available for EXE/Script and other custom sensors, as well as for command-line parameters, see section [Custom Sensors](#)<sup>B137</sup>.

## 15.10 Standard Lookup Files

Here you can find a list of all PRTG standard lookup files that are located in the \lookups subfolder of the [PRTG program directory](#) <sup>[3213]</sup>.

**i** The actual number of standard lookup files in the \lookups subfolder of your PRTG installation depends on your system configuration and might differ from this list.

**■** For more information, see section [Define Lookups](#) <sup>[3187]</sup>.

Standard Lookup	Used by

## 15.11 Supported AWS Regions and Their Codes

Here you can find a list of all supported Amazon Web Services (AWS) regions and their codes. The following sensors support these AWS regions:

- [AWS Alarm v2 sensor](#)
- [AWS EBS v2 sensor](#)
- [AWS EC2 v2 sensor](#)
- [AWS ELB v2 sensor](#)
- [AWS RDS v2 sensor](#)

Region	Code
Africa (Cape Town)	af-south-1
Asia Pacific (Hong Kong)	ap-east-1
Asia Pacific (Mumbai)	ap-south-1
Asia Pacific (Osaka)	ap-northeast-3
Asia Pacific (Seoul)	ap-northeast-2
Asia Pacific (Singapore)	ap-southeast-1
Asia Pacific (Sydney)	ap-southeast-2
Asia Pacific (Tokyo)	ap-northeast-1
Canada (Central)	ca-central-1
Europe (Frankfurt)	eu-central-1
Europe (Ireland)	eu-west-1
Europe (London)	eu-west-2
Europe (Milan)	eu-south-1
Europe (Paris)	eu-west-3
Europe (Stockholm)	eu-north-1

Region	Code
Middle East (Bahrain)	me-south-1
South America (São Paulo)	sa-east-1
US East (Northern Virginia)	us-east-1
US East (Ohio)	us-east-2
US West (Northern California)	us-west-1
US West (Oregon)	us-west-2
