# Contents

<b>Part 1 Welcome to PRTG</b>	<b>13</b>
1.1 About this Document	15
1.2 Key Features	16
1.3 New in this Version	19
1.4 Available Licenses	20
1.5 System Requirements	22
1.6 Introduction: Monitoring with PRTG	33
<b>Part 2 Quick Start Guide</b>	<b>37</b>
2.1 Step 1: Download, Installation, and First Login	39
2.2 Step 2: Smart Setup	41
<b>Part 3 Using PRTG Hosted Monitor</b>	<b>48</b>
3.1 Create a PRTG Hosted Monitor Instance	50
3.2 Manage a PRTG Hosted Monitor Subscription	61
3.3 Use Multi-Factor Authentication with PRTG Hosted Monitor	79
<b>Part 4 Installing the Software</b>	<b>89</b>
4.1 Download PRTG	91
4.2 Update From Previous Versions	92
4.3 Install a PRTG Core Server	94
4.4 Install a Cluster	101
4.5 Enter a License Key	102
4.6 Activate the Product	104
4.7 Install a Remote Probe	106
4.8 Uninstall PRTG Products	119
<b>Part 5 Understanding Basic Concepts</b>	<b>122</b>
5.1 Architecture and User Interfaces	124
5.2 Failover Cluster	128
5.3 Object Hierarchy	132
5.4 Inheritance of Settings	136
5.5 Tags	138
5.6 Dependencies	140
5.7 Scheduling	141
5.8 Notifying	142
5.9 Access Rights Management	145
5.10 Data Reporting	149
5.11 IPv6 Support	150
<b>Part 6 Basic Procedures</b>	<b>151</b>
6.1 Login	153
6.2 Welcome Page	157
6.2.1 Customer Service	161

6.3	General Layout .....	164
6.4	Sensor States .....	181
6.5	Historic Data Reports .....	185
6.6	Similar Sensors .....	192
6.7	Recommended Sensors .....	197
6.8	Object Settings .....	201
6.9	Alarms .....	202
6.10	System Information .....	205
6.11	Logs .....	210
6.12	Tickets .....	213

6.18	Hover Popup .....	235
6.19	Main Menu Structure .....	237
<b>Part 7 Device and Sensor Setup .....</b>		<b>252</b>
7.1	Auto-Discovery .....	254
7.2	Create Objects Manually .....	257
7.2.1	Add an Auto-Discovery Group .....	258
7.2.2	Add a Group .....	313
7.2.3	Add a Device .....	363
7.2.4	Add a Sensor .....	414
7.3	Manage Device Tree .....	418
7.4	Root Group Settings .....	420
7.5	Probe Settings .....	458
7.6	Group Settings .....	526
7.7	Device Settings .....	597
7.8	Sensor Settings .....	667
7.8.1	Active Directory Replication Errors Sensor .....	669
7.8.2	ADO SQL v2 Sensor .....	675
7.8.3	Application Server Health (Autonomous) Sensor .....	688
7.8.4	AWS Alarm v2 Sensor .....	693
7.8.5	AWS Cost Sensor .....	699
7.8.6	AWS EBS v2 Sensor .....	707
7.8.7	AWS EC2 v2 Sensor .....	714
7.8.8	AWS ELB v2 Sensor .....	721
7.8.9	AWS RDS v2 Sensor .....	728
7.8.10	Beckhoff IPC System Health Sensor .....	735
7.8.11	Business Process Sensor .....	740
7.8.12	Cisco IP SLA Sensor .....	748
7.8.13	Cisco Meraki License Sensor .....	754
7.8.14	Cisco Meraki Network Health Sensor .....	759
7.8.15	Cisco WLC Access Point Overview Sensor (BETA) .....	765
7.8.16	Citrix XenServer Host Sensor .....	771
7.8.17	Citrix XenServer Virtual Machine Sensor .....	777
7.8.18	Cloud HTTP v2 Sensor .....	783
7.8.19	Cloud Ping v2 Sensor .....	792
7.8.20	Cluster Health Sensor .....	800
7.8.21	Common SaaS Sensor .....	804

7.8.22	Core Health Sensor .....	809
7.8.23	Core Health (Autonomous) Sensor .....	814
7.8.24	Dell EMC Unity Enclosure Health v2 Sensor .....	820
7.8.25	Dell EMC Unity File System v2 Sensor .....	826
7.8.26	Dell EMC Unity Storage Capacity v2 Sensor .....	831
7.8.27	Dell EMC Unity Storage LUN v2 Sensor .....	836
7.8.28	Dell EMC Unity Storage Pool v2 Sensor .....	841
7.8.29	Dell EMC Unity VMware Datastore v2 Sensor .....	847
7.8.30	Dell PowerVault MDi Logical Disk Sensor .....	852
7.8.31	Dell PowerVault MDi Physical Disk Sensor .....	857
7.8.32	DHCP Sensor .....	862
7.8.33	DICOM Bandwidth Sensor .....	869
7.8.34	DICOM C-ECHO Sensor .....	875
7.8.35	DICOM Query/Retrieve Sensor .....	881
7.8.36	DNS v2 Sensor .....	888
7.8.37	Docker Container Status Sensor .....	894
7.8.38	Enterprise Virtual Array Sensor .....	900
7.8.39	Event Log (Windows API) Sensor .....	905
7.8.40	Exchange Backup (PowerShell) Sensor .....	914
7.8.41	Exchange Database (PowerShell) Sensor .....	920
7.8.42	Exchange Database DAG (PowerShell) Sensor .....	926
7.8.43	Exchange Mail Queue (PowerShell) Sensor .....	933
7.8.44	Exchange Mailbox (PowerShell) Sensor .....	939
7.8.45	Exchange Public Folder (PowerShell) Sensor .....	945
7.8.46	EXE/Script Sensor .....	951
7.8.47	EXE/Script Advanced Sensor .....	961
7.8.48	File Sensor .....	970
7.8.49	File Content Sensor .....	976
7.8.50	Folder Sensor .....	983
7.8.51	FortiGate System Statistics Sensor .....	990
7.8.52	FortiGate VPN Overview Sensor .....	995
7.8.53	FTP Sensor .....	1000
7.8.54	FTP Server File Count Sensor .....	1006

7.8.66	HTTP Full Web Page Sensor .....	1093
7.8.67	HTTP IoT Push Data Advanced Sensor .....	1101
7.8.68	HTTP Push Count Sensor .....	1108
7.8.69	HTTP Push Data Sensor .....	1114
7.8.70	HTTP Push Data Advanced Sensor .....	1122
7.8.71	HTTP Transaction Sensor .....	1130
7.8.72	HTTP XML/REST Value Sensor .....	1141
7.8.73	Hyper-V Cluster Shared Volume Disk Free Sensor .....	1152
7.8.74	Hyper-V Host Server Sensor .....	1158
7.8.75	Hyper-V Virtual Machine Sensor .....	1163
7.8.76	Hyper-V Virtual Network Adapter Sensor .....	1169

7.8.77	Hyper-V Virtual Storage Device Sensor .....	1175
7.8.78	IMAP Sensor .....	1181
7.8.79	IP on DNS Blacklist Sensor .....	1194
7.8.80	IPFIX Sensor .....	1199
7.8.81	IPFIX (Custom) Sensor .....	1208
7.8.82	IPMI System Health Sensor .....	1216
7.8.83	jFlow v5 Sensor .....	1221
7.8.84	jFlow v5 (Custom) Sensor .....	1231
7.8.85	LDAP Sensor .....	1240
7.8.86	Local Folder Sensor .....	1245
7.8.87	Microsoft 365 Mailbox Sensor .....	1252
7.8.88	Microsoft 365 Service Status Sensor .....	1262
7.8.89	Microsoft 365 Service Status Advanced Sensor .....	1267
7.8.90	Microsoft Azure SQL Database Sensor .....	1272
7.8.91	Microsoft Azure Storage Account Sensor .....	1279
7.8.92	Microsoft Azure Subscription Cost Sensor .....	1284
7.8.93	Microsoft Azure Virtual Machine Sensor .....	1290
7.8.94	Microsoft SQL v2 Sensor .....	1296
7.8.95	Modbus RTU Custom Sensor .....	1309
7.8.96	Modbus TCP Custom Sensor .....	1318
7.8.97	MQTT Round Trip Sensor .....	1326
7.8.98	MQTT Statistics Sensor .....	1331
7.8.99	MQTT Subscribe Custom Sensor .....	1336
7.8.100	Multi-Platform Probe Connection Health (Autonomous) Sensor .....	1343
7.8.101	Multi-Platform Probe Health Sensor .....	1347
7.8.102	MySQL v2 Sensor .....	1352
7.8.103	NetApp Aggregate Sensor .....	1365
7.8.104	NetApp Aggregate v2 Sensor .....	1372
7.8.105	NetApp I/O Sensor .....	1378
7.8.106	NetApp I/O v2 Sensor .....	1386
7.8.107	NetApp LIF Sensor .....	1392
7.8.108	NetApp LIF v2 Sensor .....	1399
7.8.109	NetApp LUN Sensor .....	1405
7.8.110	NetApp LUN v2 Sensor .....	1412
7.8.111	NetApp NIC Sensor .....	1418
7.8.112	NetApp NIC v2 Sensor .....	1425
7.8.113	NetApp Physical Disk Sensor .....	1431
7.8.114	NetApp Physical Disk v2 Sensor .....	1438
7.8.115	NetApp SnapMirror Sensor .....	1444
7.8.116	NetApp SnapMirror v2 Sensor .....	1451
7.8.117	NetApp System Health Sensor .....	1457
7.8.118	NetApp System Health v2 Sensor .....	1465
7.8.119	NetApp Volume Sensor .....	1472
7.8.120	NetApp Volume v2 Sensor .....	1479
7.8.121	NetFlow v5 Sensor .....	1486
7.8.122	NetFlow v5 (Custom) Sensor .....	1496
7.8.123	NetFlow v9 Sensor .....	1505
7.8.124	NetFlow v9 (Custom) Sensor .....	1515
7.8.125	Network Share Sensor .....	1524
7.8.126	OPC UA Certificate Sensor .....	1531
7.8.127	OPC UA Custom Sensor .....	1536
7.8.128	OPC UA Server Status Sensor .....	1542
7.8.129	Oracle SQL v2 Sensor .....	1547
7.8.130	Oracle Tablespace Sensor .....	1560
7.8.131	Packet Sniffer Sensor .....	1567

7.8.132	Packet Sniffer (Custom) Sensor .....	1575
7.8.133	PerfCounter Custom Sensor .....	1583
7.8.134	PerfCounter IIS Application Pool Sensor .....	1589
7.8.135	Ping Sensor .....	1594
7.8.136	Ping v2 Sensor .....	1600
7.8.137	Ping Jitter Sensor .....	1606
7.8.138	POP3 Sensor .....	1611
7.8.139	Port Sensor .....	1618
7.8.140	Port v2 Sensor (BETA) .....	1626
7.8.141	Port Range Sensor .....	1632
7.8.142	PostgreSQL Sensor .....	1637
7.8.143	Probe Health Sensor .....	1649
7.8.144	Python Script Advanced Sensor .....	1655
7.8.145	QoS (Quality of Service) One Way Sensor .....	1664
7.8.146	QoS (Quality of Service) Round Trip Sensor .....	1671
7.8.147	RADIUS v2 Sensor .....	1679
7.8.148	RDP (Remote Desktop) Sensor .....	1685
7.8.149	Redfish Power Supply Sensor .....	1689
7.8.150	Redfish System Health Sensor .....	1695
7.8.151	Redfish Virtual Disk Sensor .....	1702
7.8.152	REST Custom Sensor .....	1708
7.8.153	REST Custom v2 Sensor (BETA) .....	1728
7.8.154	Script v2 Sensor .....	1750
7.8.155	Sensor Factory Sensor .....	1757
7.8.156	sFlow Sensor .....	1770
7.8.157	sFlow (Custom) Sensor .....	1780
7.8.158	SFTP Secure File Transfer Protocol Sensor .....	1788
7.8.159	Share Disk Free Sensor .....	1794
7.8.160	SIP Options Ping Sensor .....	1798
7.8.161	SMTP Sensor .....	1803
7.8.162	SMTP&IMAP Round Trip Sensor .....	1810
7.8.163	SMTP&POP3 Round Trip Sensor .....	1820
7.8.164	SNMP APC Hardware Sensor .....	1829
7.8.165	SNMP Buffalo TS System Health Sensor .....	1834

# Part 1

# Welcome to PRTG

# 1 Welcome to PRTG

Welcome to PRTG. You have chosen a software product that comes with a comprehensive set of features to monitor your entire network.

A Standard Installation of PRTG

## Monitoring Networks with PRTG

PRTG is a comprehensive network monitoring application for Windows-based systems. It is suitable for networks of all sizes and capable of LAN, WAN, WLAN, and VPN monitoring. You can also monitor physical or virtual web, mail, and file servers, Linux systems, Windows clients, routers, and much more.

PRTG monitors network availability and bandwidth usage, as well as various other network parameters such as quality of service, memory load, and CPU usage, even on remote machines. PRTG provides system administrators with live readings and periodical usage trends to optimize the efficiency, layout, and setup of leased lines, routers, firewalls, servers, and other network components.

The software monitors a network that uses Simple Network Management Protocol (SNMP), Windows Management Instrumentation (WMI), packet sniffer, Cisco NetFlow, IPFIX, sFlow, jFlow, and many other industry standard protocols. It runs on a Windows-based machine in your network for 24 hours a day. PRTG constantly records the network usage parameters and the availability of network systems. The recorded data is stored in an internal database for later analysis.

## 1.1 About this Document

This document introduces you to PRTG Network Monitor and Paessler PRTG Enterprise Monitor, both from now on referred to as **PRTG**. Everything you need to know to use PRTG or PRTG Hosted Monitor is in this document:

- Plan monitoring results
- Achieve the best monitoring results
- Use a cluster for fail-safe monitoring
- Set up devices, sensors, dependencies, and much more

This document is also a reference for all settings in PRTG. While there is short contextual help in the PRTG web interface, this document provides more comprehensive information about available options. Whenever possible, links to more detailed resources are provided, such as articles in our [Knowledge Base](#).

This document does not give an in-depth explanation of monitoring protocols and file formats. It also only briefly addresses the use of the application programming interface (API) built into PRTG.

- To use PRTG right away, see section [Quick Start Guide](#) <sup>38</sup>.
  - To learn more about monitoring with PRTG, see section [Introduction: Monitoring with PRTG](#) <sup>33</sup>.
  - For more information, browse the manual content or use the manual search with keywords and choose the section that you want to read.
- For an overview of the icons and abbreviations that are used in this document, see section [Appendix](#) <sup>3220</sup>.

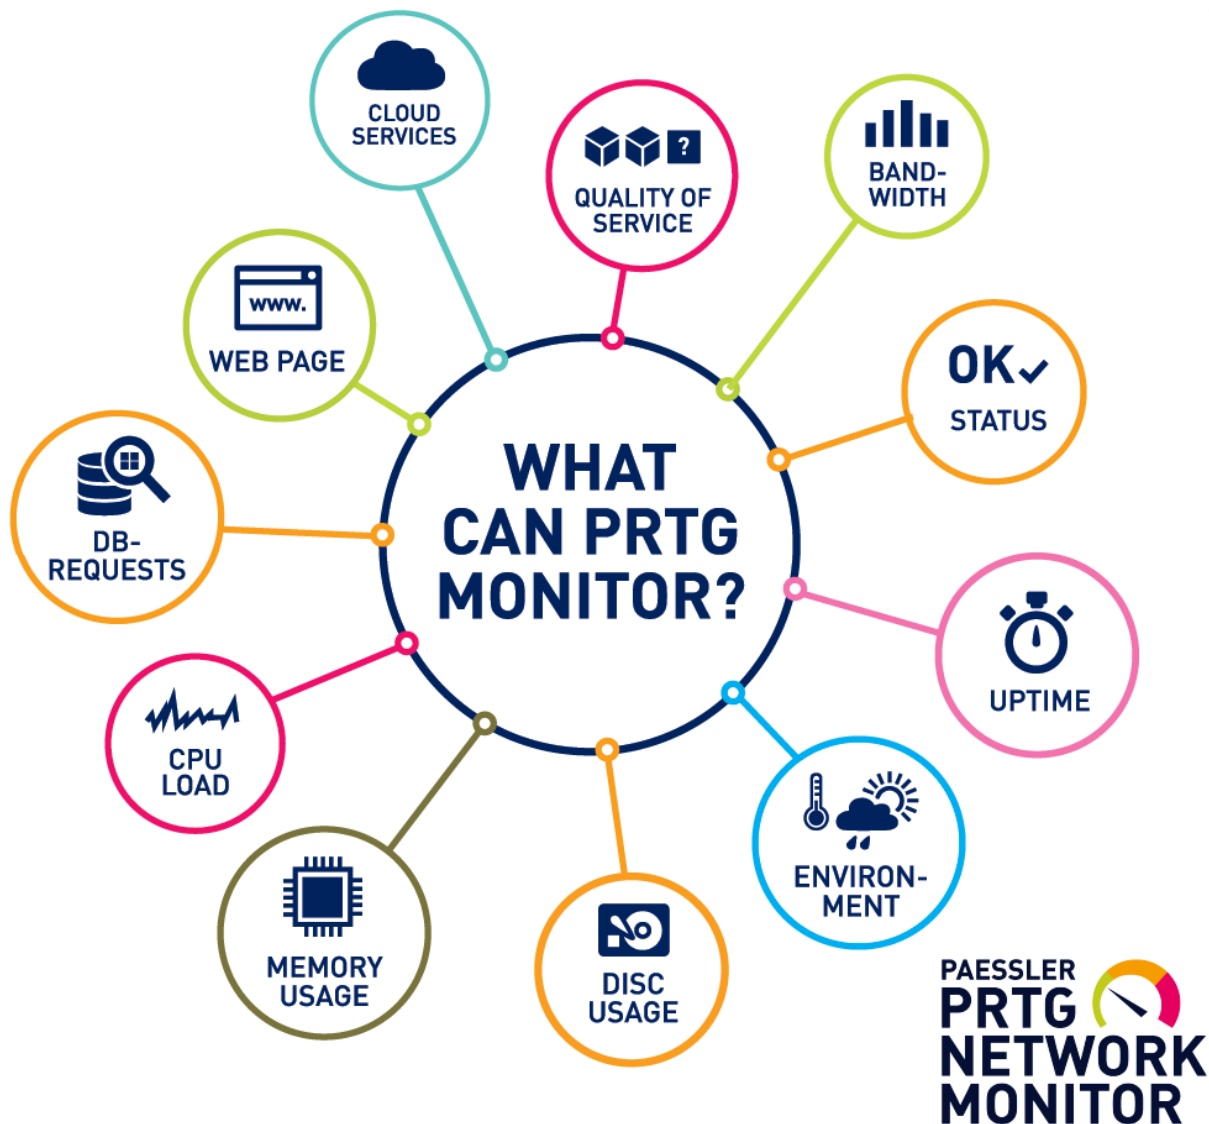

## 1.2 Key Features

PRTG offers two options to monitor your network: PRTG Network Monitor and PRTG Hosted Monitor.

- PRTG Network Monitor: The PRTG core server and local probe run in your network.
- PRTG Hosted Monitor: Paessler runs the PRTG core server and hosted probe for you in the cloud.

**i** The PRTG web interface is the same for both PRTG Hosted Monitor and PRTG Network Monitor.

### Areas of Application

PRTG can monitor:

- Uptimes, downtimes, and slow servers
- System health of hardware devices
- Network devices and bandwidth

- Applications
- Virtual servers
- Service level agreements (SLA)
- System usage (for example CPU load, free memory, and free disk space)
- Database performance and table values
- Email servers
- Physical network environments
- Cloud services

It can also:

- Classify network traffic and content by source or destination
- Measure Quality of Service (QoS) and Voice over IP (VoIP) parameters
- Collect system information for hardware
- Detect unusual activity between network components and warns about potential security issues
- Detect unusual behavior by devices or users
- Assess the real usage of network and hardware
- Fail-safe monitor a cluster

## Key Features

- High performance: The database system stores raw monitoring results as well as logs, Toplists, and tickets. This outperforms Structured Query Language (SQL) servers for monitoring data. You can distribute high loads among several probes and also access the database through the PRTG API.
- Low [system requirements](#)<sup>[22]</sup>: To run PRTG Network Monitor, an average PC that is not older than 2 years is enough. Even a netbook can monitor more than a thousand sensors.

 PRTG Hosted Monitor requires no hardware for the PRTG core server.

- High security standards: Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connections and web servers, secure ciphers, personalized user rights management, and much more.  For more information, see the Knowledge Base: [What security features does PRTG include?](#)
- SSL/TLS-secured web server with HTTP and HTTPS support for the PRTG web interface. This acts as a Single Page Application (SPA) to avoid time-intensive page reloading.
- Email relay server for automatic email delivery.
- Customizable alerts for specific needs:
  - Various notification methods: email, push, SMS text messages, Syslog messages and Simple Network Management Protocol (SNMP) traps, HTTP requests, event logs, Amazon Simple Notification Service (SNS), executing scripts.
  - Multiple ways to trigger notifications: status alerts, limit alerts, threshold alerts, multiple condition alerts, escalation alerts.
  - Gradual dependencies to avoid alarm floods, acknowledging certain alarms to avoid further notifications, and alert scheduling.

- In-depth report generator to create reports on demand or scheduled reports in HTML, as .pdf, .csv, or .xml. Several report templates are available by default.
- Graphics engine for user-friendly live graphs and historic data graphs.
- Network analysis modules to automatically find network devices and sensors.
- Distributed monitoring to monitor several networks in different locations.
- Special features for managed service providers (MSP) to monitor customer networks and increase the quality of service.
- Data publishing with real-time [dashboards](#), including live performance and status information. Design these dashboards with many different objects and integrate external objects as well.
- Multiple languages: English, German, Spanish, French, Portuguese, Dutch, Japanese, Russian, and Simplified Chinese.
- Customization: The PRTG API lets you develop your own features. Additionally, you can create custom sensors, notifications, and device templates according to your specific needs.

PRTG supports monitoring for up to several thousand sensors per installation, depending on various parameters. It can also work with remote probes to distribute high monitoring loads, to monitor multiple sites or network segments from one central core installation, and to monitor non-Windows systems. It is also possible to configure fail-safe monitoring with a cluster to perform automatic failovers.

## More

### KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

## 1.3 New in this Version

The continuous development and rollout of PRTG constantly expands its functionalities. Instead of delivering only a few versions with massive changes in every update each year, PRTG is automatically and consistently improved with new features and fixes.

PRTG Network Monitor has three release channels:

- **Stable:** Best tested version for live systems. It is updated about once every 8 weeks. Use it on live systems.
- **Preview:** Offers the latest features and fixes and is updated twice between stable releases. Consider this version a "beta", so do not use this version on live systems that you depend on.
- **Canary:** Provides nightly builds and is updated very often. It is not extensively tested. Never use it on live systems that you depend on.

With the release channels, you can choose from maximum stability, early access to new features, or a mix of both.

 PRTG Hosted Monitor does not have release channels. Instead, we roll out the latest Stable version to PRTG Hosted Monitor instances in stages.

 For an overview of all changes in the different versions, see the Paessler website: [Release notes for the "stable" release channel](#)

## 1.4 Available Licenses

PRTG licenses count by [sensors](#)<sup>[134]</sup>. Three different license editions are available.

Edition	Description
Trial edition	<p>The trial edition is intended for evaluation purposes:</p> <ul style="list-style-type: none"> <li>▪ Allows you to use an unlimited number of sensors.</li> <li>▪ Supports all available sensors.</li> <li>▪ For PRTG Network Monitor, you must request a trial license key. Click the Free Trial button on the <a href="#">Paessler website</a> to see the license details and the key.</li> <li>▪ The trial edition of PRTG Network Monitor is limited to 30 days and automatically turns into a freeware edition afterward.</li> </ul> <p>☁ PRTG Hosted Monitor provides a 10-day trial. Afterward, your instance is deleted. Upgrade to a commercial edition to keep your instance.</p> <p>ⓘ Each PRTG Network Monitor license includes one single failover <a href="#">cluster</a><sup>[128]</sup> that consists of two cluster nodes. A cluster with two or three failover nodes requires an additional license key. A cluster with four failover nodes requires two additional license keys.</p> <p>ⓘ After the trial period, the PRTG Network Monitor trial edition automatically turns into a freeware edition that lets you use up to 100 sensors for free.</p>
Freeware edition	<p>The freeware edition is a good solution for starters or for private use:</p> <ul style="list-style-type: none"> <li>▪ Free for personal and commercial use.</li> <li>▪ Allows you to use up to 100 sensors.</li> <li>▪ Supports all available sensors.</li> </ul> <p>ⓘ If you want to use the freeware edition, install the trial edition first and get a trial license key. After the trial period, the trial edition automatically turns into a freeware edition that lets you use up to 100 sensors for free.</p> <p>☁ The freeware edition is not available in PRTG Hosted Monitor.</p>
Commercial edition	<p>There are several types of commercial edition available that suit the demands of smaller as well as larger customers and organizations:</p> <ul style="list-style-type: none"> <li>▪ Allows you to use a maximum number of sensors (consider our <a href="#">recommendations</a><sup>[27]</sup>).</li> <li>▪ Supports all available sensors.</li> </ul>

Edition	Description
	<p> Each PRTG Network Monitor license includes one single failover <a href="#">cluster</a><sup>128</sup> that consists of two cluster nodes. A cluster with two or three failover nodes requires an additional license key. A cluster with four failover nodes requires two additional license keys.</p> <p> For more information about available commercial edition subscription licenses, see the Paessler Portal: <a href="#">PRTG Network Monitor licenses &amp; pricing</a>.</p>

## 1.5 System Requirements

There are different aspects that you need to consider regarding the system requirements for PRTG. Meet these requirements to avoid issues while you monitor your network.

In this section:

- [Basic System Requirements](#) 
  - [Requirements for the PRTG Core Server](#) 
  - [Requirements for Remote Probes](#) 
  - [General Performance Impact Considerations](#) 
  - [Running PRTG in Virtual Environments](#) 
  - [Running PRTG in a Cluster](#) 
  - [Large PRTG Installations](#) 
- [Detailed System Requirements](#) 
  - [Supported Operating Systems for the PRTG Core Server and Remote Probes](#) 
  - [Hardware and Network Size Requirements for the PRTG Core Server](#) 
  - [Hardware and Network Size Requirements for Classic Remote Probes](#) 
  - [Hardware and Network Size Requirements for Multi-Platform Probes](#) 
  - [Performance Impact Considerations Based on Sensor Types](#) 
  - [Supported Web Browsers](#) 
- [Further System Requirements](#) 
  - [Screen Resolution](#) 
  - [Requirements for Monitored Devices](#) 
  - [Requirements for Smartphones and Tablets](#) 

### Basic System Requirements

PRTG consists of two main [system parts](#) : PRTG core server and probes.

- If you want to use PRTG Network Monitor, you need to install PRTG on a system that meets the [basic system requirements for the PRTG core server](#) .

 If you want to use PRTG Hosted Monitor, you need to install at least one remote probe on a system that meets the [basic system requirements for remote probes](#) .

### Requirements for the PRTG Core Server

 For more information, see the [hardware and network size requirements](#)  for the PRTG core server.

For installations of the [PRTG core server](#) , you need to meet the following requirements.

Category	Requirements
Hardware	We recommend that you use x64 server hardware or a properly configured <a href="#">virtual environment</a> <sup>[25]</sup> .
Operating system	We recommend that you use Microsoft Windows Server 2022, Microsoft Windows Server 2019, Microsoft Windows Server 2016, Microsoft Windows 11, or Microsoft Windows 10.
Microsoft .NET Framework	It is required that <a href="#">.NET 4.7.2 or later</a> of the Microsoft .NET Framework is installed on the PRTG core server system or the remote probe system. For new installations of the PRTG core server or classic remote probes, we recommend .NET Framework <a href="#">4.8</a> .  ■ For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a>
Web browser	The following browsers are officially supported by the PRTG web interface: <ul style="list-style-type: none"> <li>▪ Google Chrome 75</li> <li>▪ Mozilla Firefox 67</li> <li>▪ Microsoft Edge 79</li> <li>▪ Safari 11 or iOS (Safari) 11</li> </ul> <p>ⓘ For security and performance reasons, we strongly recommend that you always use the latest version of Google Chrome to access the PRTG web interface.</p>

☁ PRTG Hosted Monitor does not require any hardware for the PRTG core server, but it needs at least one remote probe installation to monitor your local network.

## Requirements for Remote Probes

■ For more information, see the [hardware and network size requirements](#)<sup>[28]</sup> for remote probes.

For installations of [classic remote probes](#)<sup>[3198]</sup>, you need to meet the following requirements:

Category	Requirement
Hardware	We recommend that you use compatible x86 hardware or a properly configured <a href="#">virtual environment</a> <sup>[25]</sup> .
Operating system	We recommend that you use Microsoft Windows Server 2022, Microsoft Windows Server 2019, Microsoft Windows Server 2016, Microsoft Windows 11, or Microsoft Windows 10.

Category	Requirement
Microsoft .NET Framework	<p>It is required that <a href="#">.NET 4.7.2 or later</a> of the Microsoft .NET Framework is installed on the PRTG core server system or the remote probe system. For new installations of the PRTG core server or classic remote probes, we recommend .NET Framework <a href="#">4.8</a>.</p> <p> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
Stable network connection	<p>Remote probes require a stable network connection between the PRTG core server and the remote probe.</p> <p> Remote probes that connect to a PRTG Hosted Monitor instance need a reliable internet connection. Unstable connections, for example via 3G, might work but you might lose monitoring data if the connection is unreliable.</p>

 For more information on system requirements for the multi-platform probe, see the see the [Multi-Platform Probe for PRTG](#) manual.

### General Performance Impact Considerations

Category	Performance Impact Considerations
Hardware resources	<p>For a PRTG core server to work properly, it is crucial to have a certain amount of hardware resources available. If the server runs out of resources, PRTG sends warning and emergency messages to the primary email address of the <a href="#">PRTG System Administrator</a> user.</p> <p> You receive warning messages if the available disk space falls below <a href="#">1 GB</a> or if the available memory falls below <a href="#">500 MB</a>, and emergency messages if the available disk space or memory fall below <a href="#">50 MB</a>. In this case, react immediately and free up system resources.</p>
Sensors	<p>Ping and SNMP sensors create much less load than complex sensors like flow sensors, VMware sensors, Sensor Factory sensors, WMI sensors. or Syslog Receiver or SNMP Trap Receiver sensors, for example.</p> <p> There are also limitations for some sensors that do not depend on hardware resources, for example, WMI and SNMP v3 sensors. You can overcome these limitations if you distribute the sensors between remote probes.</p> <p> For clusters, we recommend that you stay below 2,500 sensors per cluster.</p>

Category	Performance Impact Considerations
Channels	We recommend that you use sensors with less than <b>50</b> channels. Note that sensors with more than 50 channels are not officially supported. PRTG will try to display all channels but it will limit usability and have a high impact on system performance.
Scanning interval	For a single PRTG core server setup without a cluster, we recommend that you mainly use 1-minute scanning intervals for up to 2,000 sensors and 5-minute intervals if you have more sensors.  <b>i</b> To give you an impression: To monitor 5,000 sensors with a 1-minute scanning interval, PRTG takes 7.2 million measurements and evaluates, notifies, and stores them. This adds 700 MB of additional data to the database every single day.
CPU-intensive features	Try to limit the use of the following features: <ul style="list-style-type: none"> <li>▪ Many quickly refreshed <a href="#">maps</a> <sup>[2776]</sup></li> <li>▪ Frequent generation of huge <a href="#">reports</a> <sup>[2754]</sup></li> <li>▪ Heavy usage of <a href="#">packet sniffing</a> <sup>[3009]</sup>, Sensor Factory sensors, and <a href="#">Toplists</a> <sup>[2707]</sup></li> <li>▪ Frequent automatically scheduled <a href="#">auto-discoveries</a> <sup>[254]</sup> for large network segments</li> <li>▪ Constant queries of monitoring data via the <a href="#">PRTG API</a> <sup>[3084]</sup></li> </ul>
Network connection quality	The quality of your network also plays an important role. When you monitor via User Datagram Protocol (UDP), for example, a high packet loss rate can lead to frequent timeouts. Remote probes that connect via unstable (WAN) connections can lead to delays as well.

## Running PRTG in Virtual Environments

You can run the PRTG core server and remote probes on virtualized platforms. However, PRTG consists of a lot of different components that all rely on the performance and the stability of the probe system where virtual environments add even more layers of complexity. This needs to be considered when you want to set up your PRTG installation in a way that you can achieve the same level of performance as on a physical server.

Most PRTG installations from 500 to 5,000 sensors do not need any specific optimization regarding your virtual infrastructure.

If you run larger installations of PRTG with more than 5,000 sensors, we strongly recommend that you follow the instructions in our [Best Practice Guide: Running large installations of PRTG in a virtual environment](#).

**i** Particularly for virtual systems, make sure that you have a unique Windows security identifier [per system](#).

## Running PRTG in a Cluster

We recommend a single [failover cluster](#)<sup>128</sup> for fail-safe monitoring. This consists of two PRTG core servers that each work as a cluster node.

In a cluster, the monitoring load doubles with each cluster node, so the performance of each additional cluster node is halved. Therefore, in a single failover cluster, divide our recommended numbers from earlier in the section in half.

☁ This feature is not available in PRTG Hosted Monitor.

## Large PRTG Installations

The maximum number of sensors you can monitor with one PRTG Network Monitor installation mainly depends on the monitoring technology and the scanning intervals you use. In general, we recommend that you use a dedicated physical machine to run both the PRTG core server and remote probes. [Running large installations of PRTG in a virtual environment](#) is possible if you follow some specific rules and guidelines to achieve the required level of performance.

■ For more information, see section [Detailed System Requirements](#)<sup>26</sup>.

■ For more information, see the Knowledge Base: [How can I speed up PRTG—especially for large installations?](#)

☁ PRTG Hosted Monitor is restricted to a maximum of 10,000 sensors. More sensors are not possible.

## Detailed System Requirements

### Supported Operating Systems for the PRTG Core Server and Remote Probes

Category	Requirements
Supported operating systems	<p>The 32-bit and 64-bit versions of the following operating systems are officially supported for the PRTG core server service and PRTG probe service:</p> <ul style="list-style-type: none"> <li>▪ Microsoft Windows Server 2022*</li> <li>▪ Microsoft Windows Server 2019*</li> <li>▪ Microsoft Windows Server 2016*</li> <li>▪ Microsoft Windows 11</li> <li>▪ Microsoft Windows 10</li> </ul> <p>* Windows servers in <a href="#">Core</a> mode or <a href="#">Minimal Server Interface</a> are not officially supported.</p>

Category	Requirements
Operating system version	The version (32-bit or 64-bit) of the PRTG core server depends on the version of your operating system.
Microsoft .NET Framework	<p>It is required that <a href="#">.NET 4.7.2 or later</a> of the Microsoft .NET Framework is installed on the PRTG core server system or the remote probe system. For new installations of the PRTG core server or classic remote probes, we recommend .NET Framework <a href="#">4.8</a>.</p> <ul style="list-style-type: none"> <li><span style="color: #0070C0;">■</span> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></li> <li><span style="color: #0070C0;">ⓘ</span> The .NET framework is imperative if you want to monitor VMware and XenServer virtual environments. Many other sensors also need an installed Microsoft .NET Framework.</li> </ul>
Disabled FIPS mode	<p>Make sure that the Federal Information Processing Standards (FIPS) mode (Windows security option "System Cryptography: Use FIPS-compliant algorithms for encryption, hashing, and signing.") is disabled on Windows systems that run the PRTG core server service or PRTG probe service. FIPS-compliant encryption can cause issues with sensors that use the .NET framework.</p> <ul style="list-style-type: none"> <li><span style="color: #0070C0;">■</span> For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></li> </ul>

☁ PRTG Hosted Monitor is restricted to a maximum of 10,000 sensors. More sensors are not possible.

## Hardware and Network Size Requirements for the PRTG Core Server

Hardware requirements for the PRTG core server service mainly depend on the sensors and scanning intervals that you use. Your network size can also influence the performance of your monitoring.

Sensors per PRTG core server	CPU cores	RAM	Disk space	Concurrently active administrator sessions	Number of remote probes
Up to 500	4	4 GB	100 GB	< 30	< 30
Up to 1,000	6	6 GB	500 GB	< 30	< 30
Up to 2,500	8	8 GB	750 GB	< 20	< 60
Up to 5,000	8	12 GB	1,000 GB	< 20	< 60

Sensors per PRTG core server	CPU cores	RAM	Disk space	Concurrently active administrator sessions	Number of remote probes
Up to 10,000	10 - 12	16 GB	1,500 GB	< 15	< 80
> 10,000	We recommend that you set up additional PRTG core servers. For more information on scaling, you can also contact the <a href="#">Paessler Presales team</a> .				

### Hardware and Network Size Requirements for Classic Remote Probes

Hardware requirements for the PRTG probe service mainly depend on the sensors and scanning intervals that you use. Your network size can also influence performance of your monitoring.

Sensors per classic remote probe	CPU cores	RAM	Disk space
Up to 200	2	2 GB	40 GB
200 - 2,000	4	4 GB	40 GB
2,000 - 5,000	6	6 GB	40 GB
> 5,000	We recommend that you set up additional remote probes. For more information on scaling, you can also contact the <a href="#">Paessler Presales team</a> .		

**i** A remote probe system does not have any special disk requirements (< 1 GB). In general, we recommend at least 40 GB.

### Hardware and Network Size Requirements for Multi-Platform Probes

Hardware requirements for the multi-platform probe mainly depend on the operating system, sensors, and scanning intervals that you use. Your network size can also influence performance of your monitoring.

**i** Multi-platform probes currently support the following non-Windows systems: Ubuntu Linux, Debian Linux, RHEL/CentOS, and Raspberry PI OS.

Sensors per multi-platform probe	CPU cores	RAM	Disk space
Up to 200	2	1 GB	8 GB
200 - 2,000	4	2 GB	8 GB
2,000 - 5,000	6	2 GB	8 GB
> 5,000	We recommend that you set up additional multi-platform probes. For more information on scaling, you can also contact the <a href="#">Paessler Presales team</a> .		

**i** For more information about concrete hardware examples you can use with the multi-platform probe, see the [Multi-Platform Probe for PRTG](#) manual.

### Performance Impact Considerations Based on Sensor Types

You can find the [performance impact](#)<sup>[2952]</sup> of a specific sensor on the Overview tab of the sensor or in the [Add Sensor](#)<sup>[414]</sup> dialog.

**■** For an overview list of all sensors, including their performance impact, see section [Available Sensor Types](#)<sup>[3232]</sup>.

In general, consider the following rules for the different sensor types:

Sensor Type	Performance Impact Considerations
SNMP v1 and v2, Ping, Port, and HTTP	We recommend that you use these sensor types for scenarios with thousands of sensors.
SNMP v3	SNMP v3 has performance limitations because of the use of encryption. Furthermore, keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3.
WMI	Try to keep the number of WMI sensors per probe below 120 sensors (with a 60-second scanning interval), or below 600 sensors (with a 300-second scanning interval).
Flow	The maximum number of flow sensors depends on the traffic pattern, the number of flow packets per second that the probe receives, as well as the performance of the probe system.

Sensor Type	Performance Impact Considerations
Packet Sniffer	This sensor type creates the highest CPU load on the probe system. We only recommend this technology for monitoring low traffic connections (< 50 Mbit/s steady stream). If the traffic often exceeds 10 Mbit/s, use a dedicated remote probe.
VMware monitoring	Monitoring VMware is limited to about 30 sensors at a 60-second scanning interval, or 100 sensors at a 5-minute scanning interval. On probes that run on at least Windows Server 2016, you can use more VMware sensors. These limitations come from the VMware platform.  ■ For more information, see the Knowledge Base: <a href="#">How can I increase the connection limit on VMware systems? PE121</a>

❗ You can overcome these limitations if you distribute the sensors between remote probes.

### Supported Web Browsers

❗ Microsoft Internet Explorer 11, older versions of Microsoft Edge 79, as well as other browsers that are not officially supported, have issues with some functionalities of the PRTG web interface. However, you can access the PRTG web interface with any browser.

❗ Deprecated Internet Explorer versions as well as some mobile browsers might not be able to display all features of the PRTG web interface.

Category	Requirements
Mozilla Firefox	❗ Mozilla Firefox is potentially vulnerable to cross-site scripting (XSS) attacks. These XSS exploits are possible if you click, for example, phishing links in emails that contain malicious code, and you are logged in to PRTG with Mozilla Firefox.  ■ For more information, see the Knowledge Base: <a href="#">How secure is it to access the PRTG web interface with Firefox?</a>
Plugins	Plugins can also have an effect when you view the PRTG web interface. Make sure that you add exceptions for PRTG in the plugins' settings, particularly if you use ad blockers.  ■ For more information, see the Knowledge Base: <a href="#">The logs page in the PRTG web interface does not load. What can I do?</a>

### Further System Requirements

#### Screen Resolution

A screen resolution of at least 1024x768 pixels is sufficient for most functions of PRTG. However, we recommend a screen resolution of 1200x800 pixels or higher.

## Requirements for Monitored Devices

Category	Requirement
SNMP monitoring	<p>The target devices must support SNMP v1, v2c, or v3. An SNMP-compatible software must be installed on the device. You must enable SNMP on the device and you must grant the PRTG core server system access to the SNMP interface.</p> <p>■ For more information, see section <a href="#">Monitoring via SNMP</a><sup>[2997]</sup>.</p>
Windows/WMI monitoring	<p>To monitor via WMI, you need a Windows network. Use only the officially <a href="#">supported operating systems</a><sup>[26]</sup> when you monitor via WMI.</p> <p>■ For more information, see section <a href="#">Monitoring via WMI</a><sup>[3004]</sup>.</p>
Flow monitoring	<p>The target devices must be able to send NetFlow (NetFlow v5, NetFlow v9, or IPFIX) data packets or sFlow v5 packets to the probe system.</p> <p>■ For more information, see section <a href="#">Monitoring Bandwidth via Flows</a><sup>[3011]</sup>.</p>
Packet sniffer monitoring	<p>PRTG can only analyze data packets that pass the network card of the local machine. Switches with monitoring ports are necessary for network-wide monitoring in switched networks.</p> <p>■ For more information, see section <a href="#">Monitoring Bandwidth via Packet Sniffing</a><sup>[3009]</sup>.</p>
Other sensor types	<p>You can find specific sensor and device requirements (for example, modules, components, device configurations) in the corresponding sensor section and in the Add Sensor dialog.</p>

## Requirements for Smartphones and Tablets

You can optionally use the PRTG apps for iOS and Android.

- For more information and system requirements, see section [PRTG Apps for Mobile Network Monitoring](#)<sup>[2988]</sup>.

## 1.6 Introduction: Monitoring with PRTG

This section shows you how to prepare your IT infrastructure so that you can monitor it with PRTG.

In this section:

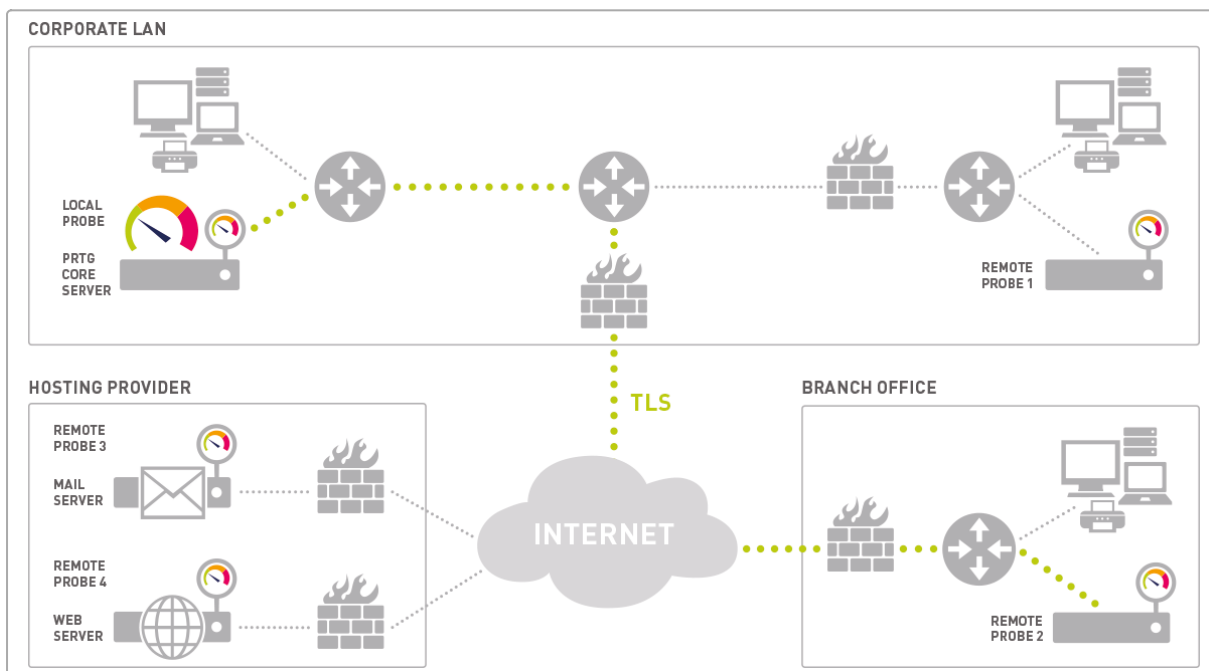

- [What PRTG Does](#)<sup>[33]</sup>
- [How to Monitor with PRTG](#)<sup>[34]</sup>
- [What PRTG Monitors](#)<sup>[34]</sup>
- [How to Prepare Monitoring](#)<sup>[35]</sup>
- [Which Hardware Do I Want to Monitor](#)<sup>[35]</sup>

■ To immediately start monitoring with PRTG, go to section [Quick Start Guide](#)<sup>[38]</sup>.

### What PRTG Does

PRTG is a unified monitoring tool that can monitor almost any object that has an IP address. It consists of the [PRTG core server](#)<sup>[125]</sup> and one or more [probes](#)<sup>[125]</sup>:

- The PRTG core server is responsible for configuration, data management, PRTG web server, and more.
- Probes collect data and monitor processes on [devices](#)<sup>[134]</sup> via [sensors](#)<sup>[134]</sup>.

Sensors are the building blocks of PRTG. A sensor can tell you about one or more aspects of a device:

- Uptime
- Load
- Interface throughput

- Bandwidth usage
- Loading times
- Speed
- Hardware status
- Temperature
- Quality
- Resource consumption
- User counts
- Record counts
- Log events
- Database requests

## How to Monitor with PRTG

PRTG obtains monitoring data from target devices in the following ways:

- Polls or queries sensor data: PRTG actively gathers data from a device in regular intervals. This includes, for example, device status, resource usage, and performance metrics. Most sensors use this method. PRTG can also consume and collect sensor data based on interfaces with, for example, HTTP or HTTPS requests, port checks, email checks, File Transfer Protocol (FTP) downloads, and database requests.
- Listens for or receives sensor data: PRTG passively receives data from a device or application. This includes, for example, unexpected events, Syslogs and Simple Network Management Protocol (SNMP) traps, [detailed data flow](#)<sup>[3014]</sup>, and event log messages.

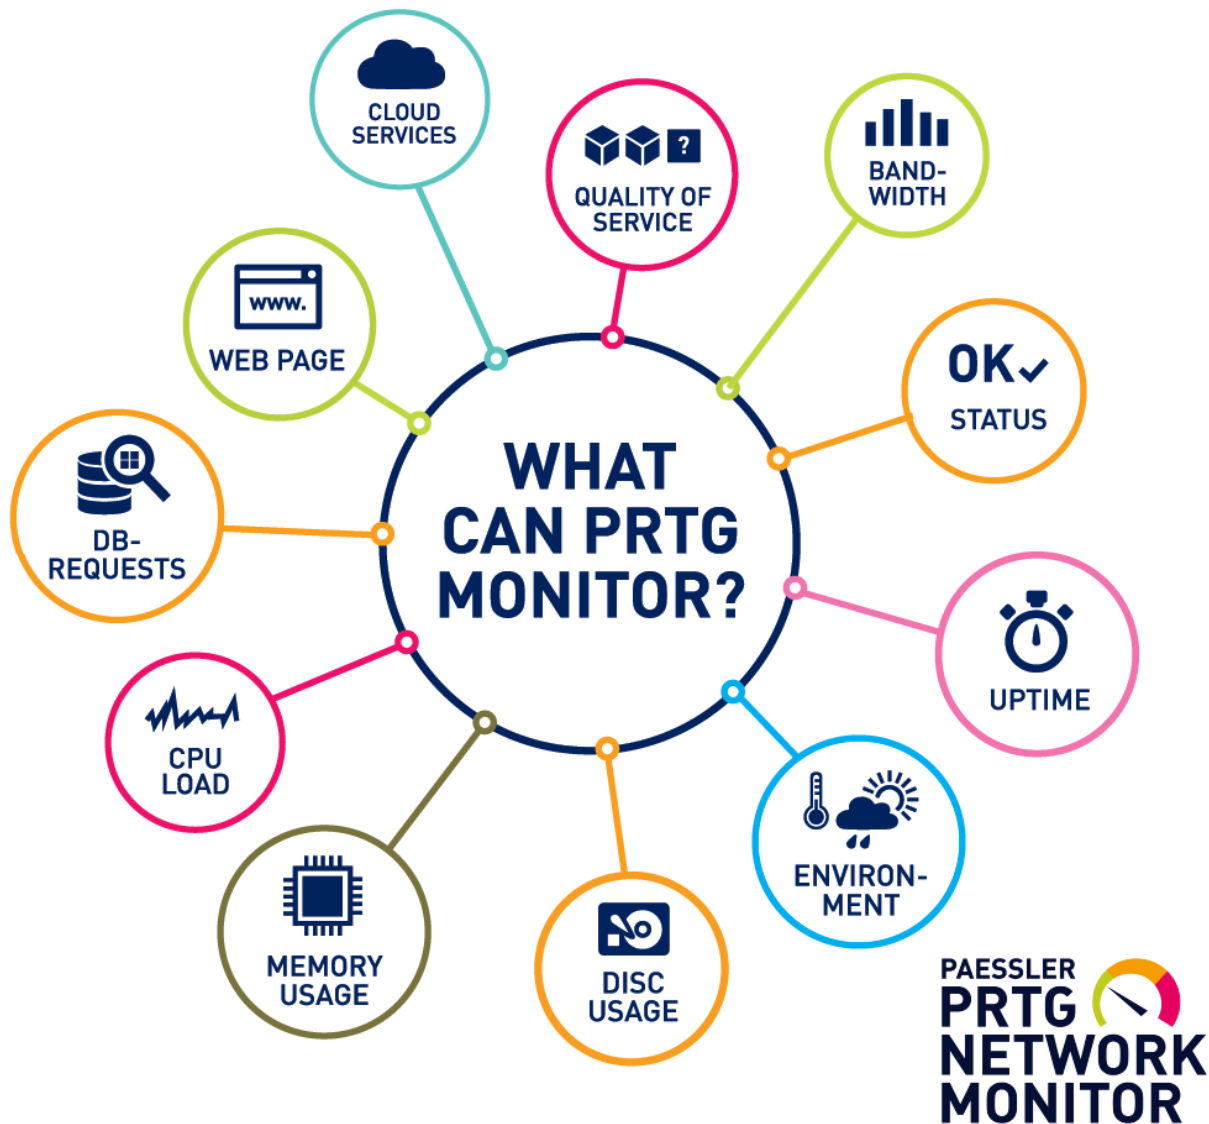

Most of the monitoring data that PRTG collects is actively queried. It is the basis for statistical sampling to see how a device or application performs over time.

■ For more information, see section [Sensor Technologies](#)<sup>[2996]</sup>.

## What PRTG Monitors

PRTG comes with [hundreds of sensors](#)<sup>[3232]</sup>. They range from platform-specific sensors to generic hardware and bandwidth sensors. Some of them are preconfigured to immediately gather monitoring data from their target devices. You can also create custom sensors or write custom scripts that return data from applications. Visit the [PRTG Sensor Hub](#)<sup>[3263]</sup> to learn more about ready-to-use custom sensors.

■ For more information, see section [Available Sensor Types](#) <sup>3232</sup>.

## How to Prepare Monitoring

The first step in comprehensive monitoring is to make a plan. Think about the following questions:

- What do I need to monitor in my IT infrastructure?
- How can I retrieve the needed information? Which technologies and credentials are required?
- Which notification methods do I want to use to receive alerts if something is wrong?

## Which Hardware Do I Want to Monitor?

We recommend that you start with your [Business Critical Tier-1](#). This usually includes the core network and other infrastructure that all network devices depend upon:

- Key infrastructure, such as core routers, switches, VPN and firewalls

- Basic network services, such as Dynamic Host Configuration Protocol (DHCP) and Domain Name System (DNS)
- Authentication, like Lightweight Directory Access Protocol (LDAP)

Use the following list to help you plan the monitoring of your IT infrastructure with PRTG:

1. Core infrastructure
  - a. Routers, switches, firewalls
  - b. Core network services: DNS, Active Directory (AD), LDAP servers
2. For your hardware devices, you need statistics on availability, usage, and performance.
3. PRTG retrieves data via standard protocols:
  - a. Ping, SNMP; web queries via HTTP and HTTPS; email via Post Office Protocol version 3 (POP3), Internet Message Access Protocol (IMAP), Simple Mail Transfer Protocol (SMTP)
  - b. Hardware parameters via SNMP, Secure Shell (SSH), Simple Object Access Protocol (SOAP)
  - c. Bandwidth usage via Flow (NetFlow, jFlow, sFlow, IPFIX), packet sniffing, SNMP
  - d. Windows systems via Windows Management Instrumentation (WMI)
  - e. Other interfaces via SSH and scripts (for example, PowerShell and Python)

# Part 2

# Quick Start Guide

## 2 Quick Start Guide

Welcome to PRTG. This section gives you a quick start into monitoring with PRTG.

Welcome Page

To set up your network monitoring, download the PRTG installer from the [Paessler website](#) and follow the steps in the installation wizard, or set up a PRTG Hosted Monitor instance on <https://www.paessler.com/prtg/prtg-hosted-monitor> and install a remote probe in your LAN. Provide some information about your network in the [smart setup](#)<sup>39</sup> and PRTG immediately starts to monitor your network. You can adjust the setup to your needs later on.

In this section:

- [Step 1: Download, Installation, and First Login](#)<sup>39</sup>
- [Step 2: Smart Setup](#)<sup>41</sup>

## 2.1 Step 1: Download, Installation, and First Login

To use PRTG Network Monitor, download it from the [Paessler website](#) and install it on a Windows system.

☁ For information on how to set up a PRTG Hosted Monitor instance, see section [Create a PRTG Hosted Monitor Instance](#).

### Download PRTG

Download the latest stable version of PRTG from the [Paessler website](#) as a [trial version](#)<sup>[20]</sup>. Buy and manage your license at the [Paessler Portal](#).

### Install PRTG

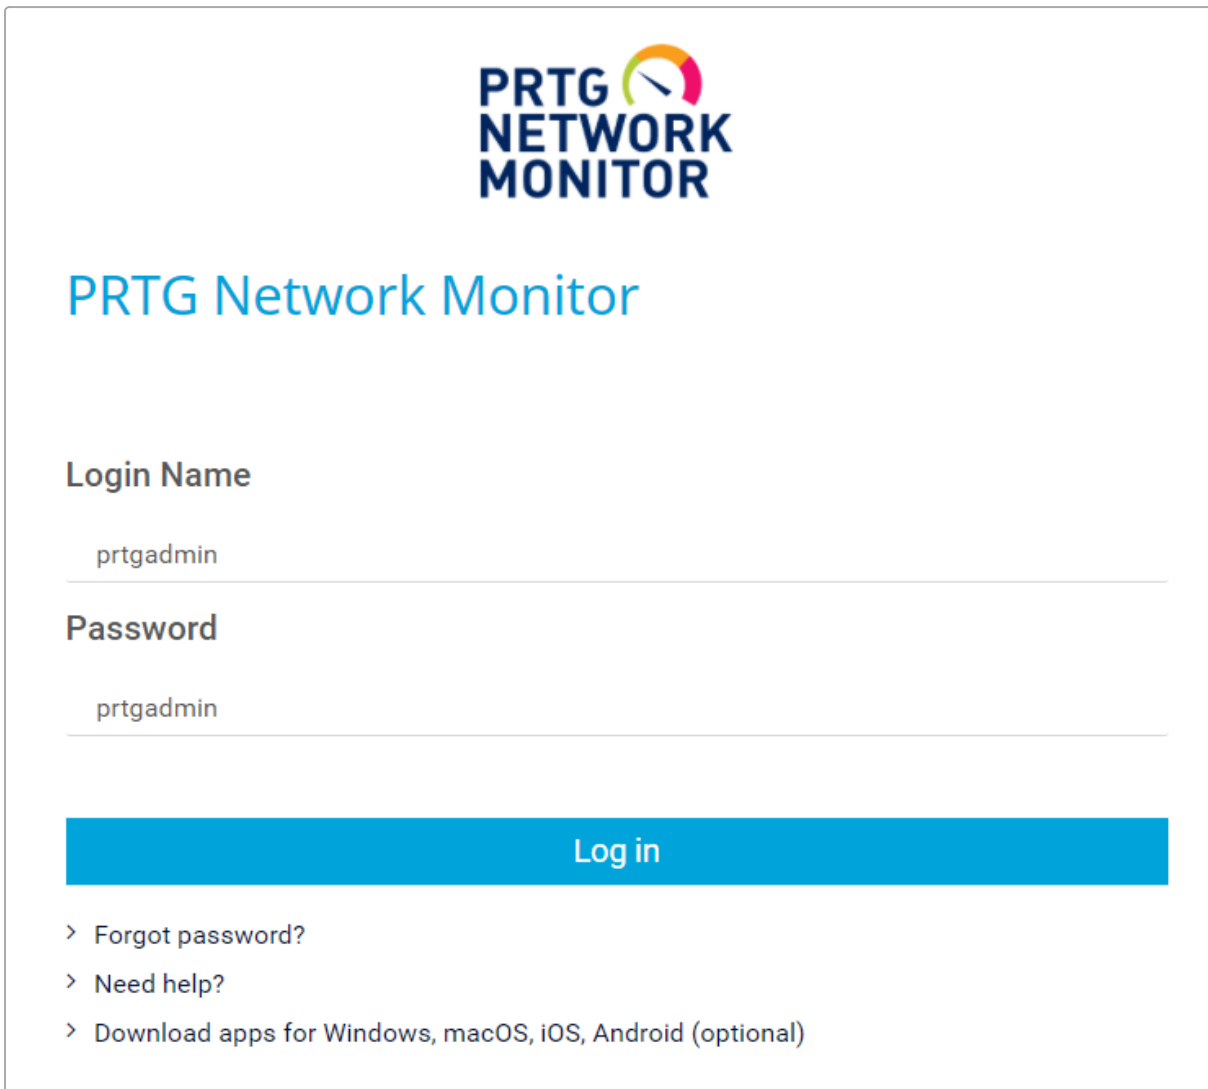

Double-click the setup file on the system that you want to use as the PRTG core server. Follow the [installation wizard](#)<sup>[94]</sup> and install the software.

At the end of the installation, open the PRTG web interface with one of the officially [supported browsers](#)<sup>[22]</sup>.

ⓘ Because of scripting incompatibilities, you might not be able to use all functionalities of the PRTG web interface with Internet Explorer 10 or earlier and other older browsers. If you cannot access the PRTG web interface, open the URL of PRTG in a different supported browser.

### Login

After you installed PRTG Network Monitor, open the PRTG web interface with a supported browser. You see the login screen.

**PRTG NETWORK MONITOR**

## PRTG Network Monitor

**Login Name**

prtgadmin

**Password**

prtgadmin

**Log in**

- > [Forgot password?](#)
- > [Need help?](#)
- > [Download apps for Windows, macOS, iOS, Android \(optional\)](#)

Login Screen

PRTG automatically fills in the credentials of the predefined [PRTG System Administrator](#) user. The login name and the initial password is [prtgadmin](#). Click Log in to proceed.

■ See the [next step](#) <sup>41</sup> for more information about the initial configuration of PRTG. <sup>41</sup>

### More

 VIDEO TUTORIAL

All video tutorials

- <https://www.paessler.com/support/videos-and-webinars/videos>

## 2.2 Step 2: Smart Setup

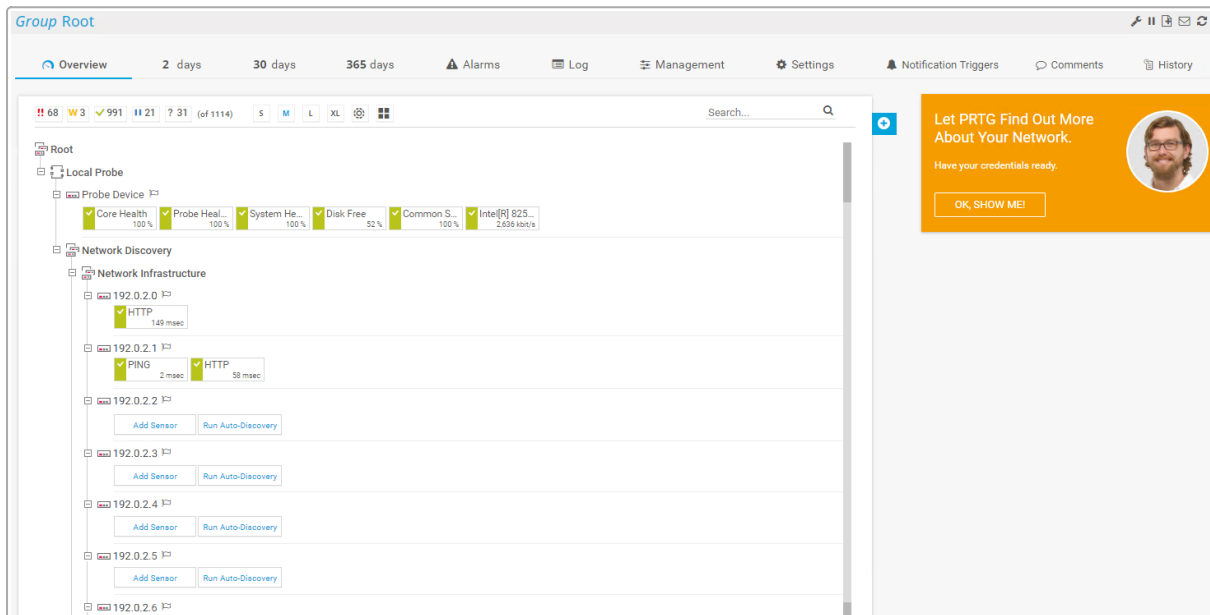

PRTG automatically starts the smart setup on a new PRTG installation. This setup assistant guides you through the initial setup of your network monitoring system. The smart setup reappears until you have completed all steps. You can skip the introduction altogether right at the beginning.

### First Start

When you log in for the first time, you see the [device tree](#)<sup>164</sup>. PRTG Network Monitor already includes several [devices](#)<sup>134</sup> with [sensors](#)<sup>134</sup> that monitor your network, sorted into different [groups](#)<sup>133</sup>. PRTG automatically creates the device tree during the installation process via the [auto-discovery](#)<sup>254</sup> feature.

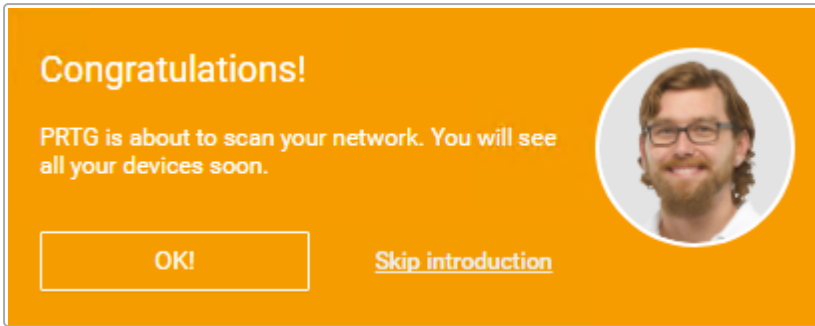

PRTG scans your network by pinging IP addresses in the subnet of your PRTG core server and adds all reachable devices to your specific network monitoring structure.

- ❶ The smart setup scans only for devices with IP addresses in private network ranges. You can manually start an auto-discovery for other subnets later.

Device Tree after Initial Auto-Discovery

In the upper-right corner of the PRTG web interface, you can see the smart setup assistant. They guide you through 5 setup steps during which you can enter more information about your network. PRTG runs another auto-discovery with this information to add additional devices and sensors to your monitoring. You can still edit the settings that you provided during the smart setup later on to adjust the monitoring to your needs.

Start Your Introduction to PRTG

Click OK! to start a guided tour.

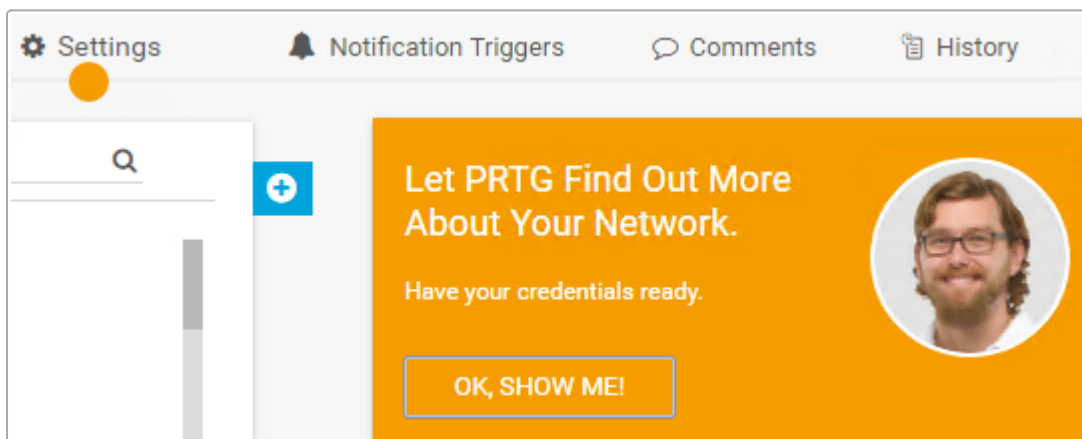

**i** If you click Skip introduction, the smart setup assistant never appears again. We strongly recommend that you take the guided tour if you are new to PRTG.

The steps to take are:

- [Step 1: Provide Credentials](#)<sup>42</sup>
- [Step 2: Enter Location Information](#)<sup>44</sup>
- [Step 3: Change Your PRTG Login Password](#)<sup>44</sup>
- [Step 4: Confirm Your Email Address](#)<sup>45</sup>
- [Step 5: Switch to SSL/TLS](#)<sup>46</sup> (if you access PRTG from a different system)

## Step 1: Provide Credentials

Your smart setup assistant asks you to provide credentials for devices in your network. Click OK, Show Me!, follow the animated mouse pointer, and open the Settings tab of the root group.

Have Your Credentials Ready

On the Settings tab, enter various administrator credentials for your network environment. With these credentials, PRTG can automatically add a large number of additional devices and sensors to your device tree. This way, you do not need to manually add every single device.

### Credentials for Windows Systems

Domain or Computer Name <sup>?</sup>

User Name <sup>?</sup>

Password <sup>?</sup>

---

### Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems

User Name <sup>?</sup>

Authentication Method <sup>?</sup>  Password (default)  
 Private key

Password <sup>?</sup>

WBEM Protocol <sup>?</sup>  HTTP  
 HTTPS (default)

WBEM Port <sup>?</sup>  Default  
 Custom

SSH Port <sup>?</sup>

SSH Rights Elevation <sup>?</sup>  Run the command as the connecting user (default)  
 Run the command as a different user using 'sudo' (with password)  
 Run the command as a different user using 'sudo' (without password)  
 Run the command as a different user using 'su'

SSH Connection Mode <sup>?</sup>  Default  
 Compatibility mode (deprecated)

**How Can PRTG Access Your Systems?**

Please enter administrator credentials so PRTG can discover more sensors for your devices.

Provide Your Credentials

- To monitor your Windows clients and servers via Windows Management Instrumentation (WMI), enter Windows administrator credentials for your network. We recommend that you use domain administrator credentials if you use an Active Directory. For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#)<sup>[3004]</sup>.
- If you have systems that run on Linux, Solaris, or macOS, enter root access credentials for these systems. For a general introduction to Secure Shell (SSH) monitoring, see section [Monitoring via SSH](#)<sup>[3007]</sup>.
- If you use the virtual environments VMware or Citrix XenServer, enter root access credentials for these systems. For a general introduction to the monitoring of virtual environments, see section [Monitoring Virtual Environments](#)<sup>[3022]</sup>.
- To monitor hardware like routers or switches, the Simple Network Management Protocol (SNMP) is the most commonly used protocol. Usually, all SNMP-enabled devices use the same settings by default: SNMP  $v2c$ , the community string `public`, and SNMP port `161`. For a general introduction to the technology behind SNMP, see section [Monitoring via SNMP](#)<sup>[2997]</sup>.
- You can also enter credentials for database management systems or credentials for Amazon Web Services (AWS) monitoring.

PRTG stores these credentials in the root group of your device tree. All dependent devices automatically inherit these credentials and use them for monitoring. You can disable the [inheritance of settings](#)<sup>[136]</sup> at any level if you want to enter other credentials instead.

■ For more information about the available options, see section [Root Group Settings](#)<sup>[422]</sup>.

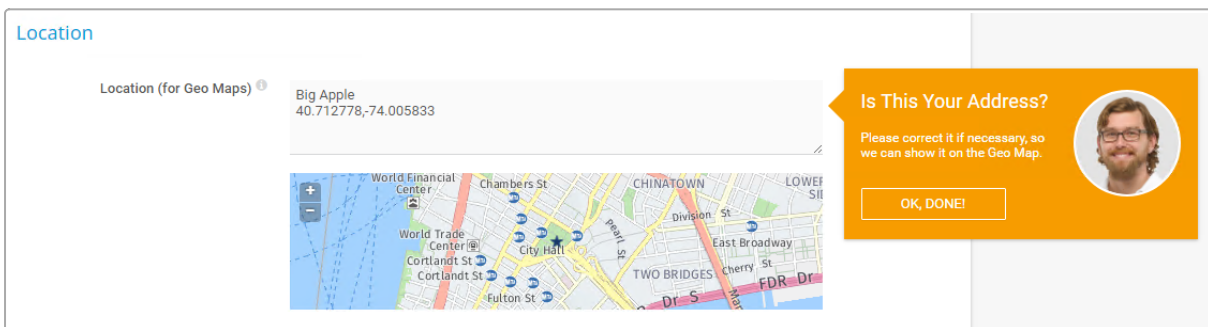

Click OK, Done! to finish this setup step. Click OK, Do It! to start a detailed auto-discovery.

Start a Detailed Auto-Discovery

### Step 2: Enter Location Information

While PRTG runs a new auto-discovery in your network with the provided credentials, the setup assistant asks you to provide the location of your PRTG core server. This information is displayed in [geographical maps](#)<sup>[2731]</sup>. Enter your location and confirm with OK, Done!. Click OK, Show Me! to get back to the device tree.

Enter Your Location

■ For more information about the available options, see section [Root Group Settings](#)<sup>[422]</sup>.

### Step 3: Change Your PRTG Login Password

Back in the device tree, the setup assistant in PRTG Network Monitor asks you to change your password. Click OK, Show Me! and follow the assistant to your account settings. By default, PRTG uses the **PRTG System Administrator** user account with the login name **prtgadmin** and the password **prtgadmin**. So we strongly recommend that you change the password to protect PRTG from unauthorized access.

Start the Password Change

Enter your New Password and confirm it under Confirm Password. The password must meet the following requirements:

- At least eight characters long
- At least one numeral
- At least one capitalized letter

Click OK, Done! to save your new password.

Change the Default Password

■ For more information about the available options, see section [My Account](#) <sup>2802</sup>.

### Step 4: Confirm Your Email Address

To complete the smart setup, check whether the email address that you entered during the installation is correct.

**i** A correct email address is mandatory for PRTG to reach you via email notifications when there are alarms and for other important messages.

Click OK, Done! and follow the assistant back to the device tree.

Verify Your Email Address

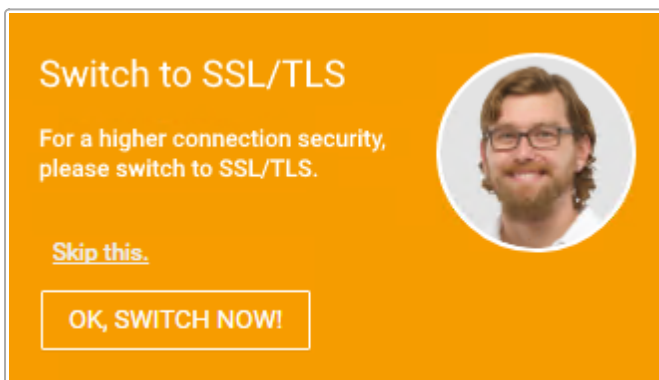

■ For more information about the available options, see section [My Account](#)<sup>2801</sup>.

## Step 5: Switch to SSL/TLS

For PRTG Network Monitor, if you access the PRTG web interface from a system other than the system where you installed PRTG, the setup assistant asks you to switch to a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection. We strongly recommend that you run the PRTG web interface secured with SSL/TLS, especially if you make your PRTG web interface available from the internet. Otherwise, your passwords are sent over your network without encryption.

- Click OK, Switch Now! to get more information about using SSL/TLS for the PRTG web server.
- In the new window, click Yes, switch to SSL/TLS to switch to an SSL/TLS-secured connection.
- PRTG must restart its services to apply the changes. The PRTG web interface is reachable under an HTTPS URL afterward.
- When the PRTG web interface reloads, it most likely shows a certificate warning. Confirm the certificate warning to proceed to the login screen.

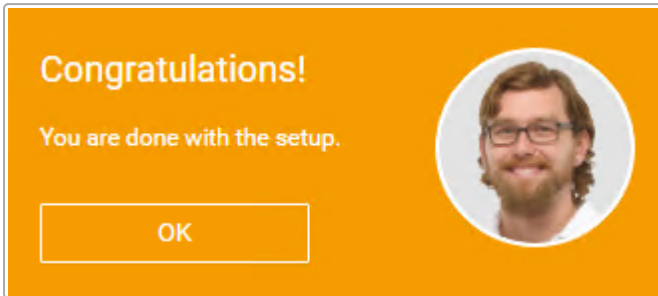

■ For more information, see the Knowledge Base: [Why does my browser show an SSL certificate warning when I open the PRTG web interface?](#)

Switch to a Secure Connection

■ For more information, see section [User Interface](#)<sup>2855</sup>.

## You Are Done

Finish the Smart Setup

While you went through the smart setup, PRTG created additional devices and sensors for you. The first monitoring values are also available.

- To become familiar with the PRTG web interface, we recommend that you read on in section [General Layout](#)<sup>[164]</sup>.

## More

### 3.1 Create a PRTG Hosted Monitor Instance

To create a PRTG Hosted Monitor instance, open a web browser and go to the [PRTG Hosted Monitor Customer Portal](#).

 We recommend that you use Google Chrome 75.

The banner features the Paessler PRTG Hosted Monitor logo in the top left corner. The main text reads "Hosted monitoring software for cloud and hybrid IT infrastructures". Below this, there are three bullet points: "✓ Monitor your systems, devices, applications, traffic & more", "✓ Suited for small to large environments", and "✓ Start monitoring with our cloud-based monitoring solution". At the bottom left, there is a prominent orange button labeled "FREE TRIAL".

Free Trial

In this section:

- [Create a PRTG Hosted Monitor Instance](#)  51
- [Smart Setup for PRTG Hosted Monitor](#)  60

## Create a PRTG Hosted Monitor Instance

1. On the [PRTG Hosted Monitor Customer Portal](#), click Free Trial to create your PRTG Hosted Monitor instance. PRTG Hosted Monitor automatically assigns a domain name to your instance. You can change the domain name at any time.

Subscription Progress

14. The Subscription Overview page opens and shows the progress of the PRTG Hosted Monitor installation.

PRTG Hosted Monitor Instance Ready

15. Your PRTG Hosted Monitor instance is now ready. Click Open PRTG to open your PRTG Hosted Monitor instance in the PRTG web interface.

16. Enter your credentials on the [login screen](#) <sup>53</sup>.

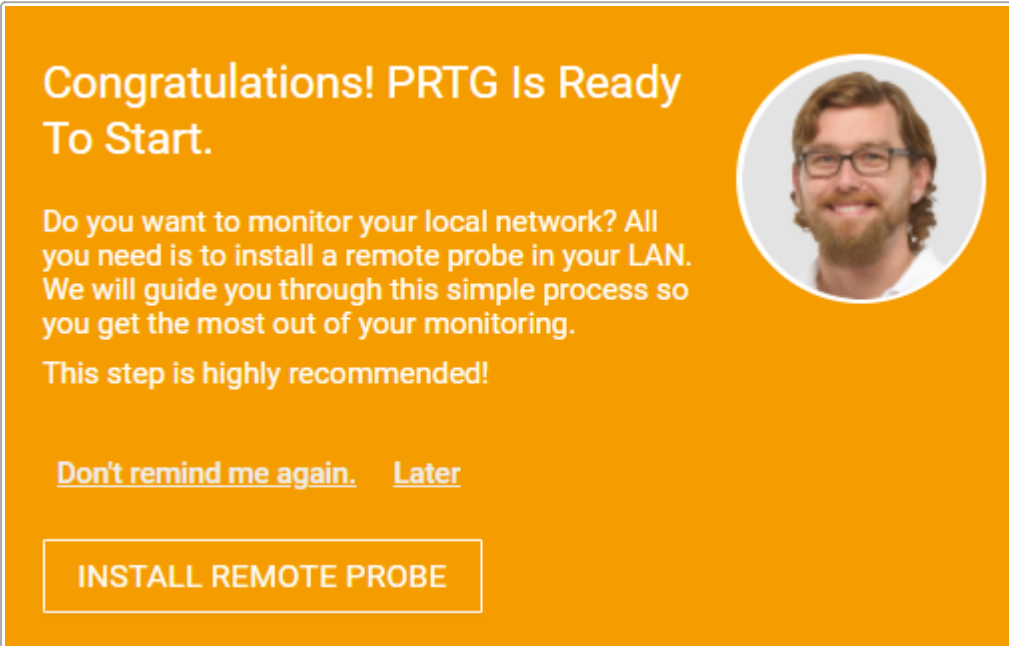

Welcome

Your PRTG Hosted Monitor instance is now up and running. To open the [device tree](#), click View Results, or click Devices in the [main menu bar](#).

PRTG Hosted Monitor automatically creates a [hosted probe](#) that runs on the hosted instance. It shows several health values of the instance and you can instantly monitor all servers, services, and devices that are publicly available via the internet with the hosted probe.

## Smart Setup for PRTG Hosted Monitor

A Paessler employee guides you through the smart setup. In particular, you must install a [remote probe](#), which is required for monitoring your LAN. We strongly recommend that you do so.

The image shows a notification box with an orange background. On the left, the text reads: "Congratulations! PRTG Is Ready To Start." followed by "Do you want to monitor your local network? All you need is to install a remote probe in your LAN. We will guide you through this simple process so you get the most out of your monitoring." and "This step is highly recommended!". At the bottom left are two links: "Don't remind me again." and "Later". At the bottom center is a button labeled "INSTALL REMOTE PROBE". On the right side of the notification is a circular profile picture of a man with glasses and a beard.

Smart Setup: Install a Remote Probe

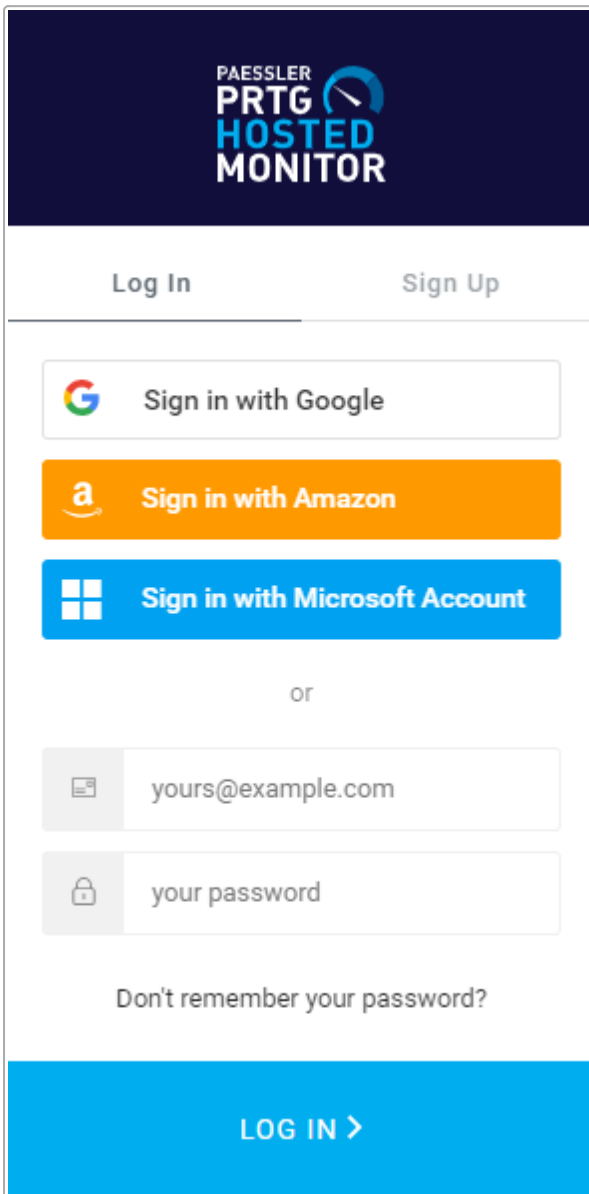

Click Install Remote Probe to start the installation.

-  The multi-platform probe is currently not compatible with PRTG Hosted Monitor.
-  For more information, see section [Install a Remote Probe](#).
-  For more information about other steps of the smart setup, see section [Step 2: Smart Setup](#) for PRTG Network Monitor.

### 3.2 Manage a PRTG Hosted Monitor Subscription

PRTG Hosted Monitor offers subscription plans that you can tailor to your needs and that you can manage via the PRTG Hosted Monitor Customer Portal. To manage your subscription, open a web browser, go to the [PRTG Hosted Monitor Customer Portal](#), and log in.

**i** We recommend that you use Google Chrome 75.

Login Screen

Provide the credentials that you entered when you signed up, the code that is shown, and click Log In, or use single sign-on (SSO) and continue with your Google, Amazon, or Microsoft account via the respective button.

### ■ KNOWLEDGE BASE

Can I enable multi-factor authentication for my PRTG Hosted Monitor instance?

- <https://kb.paessler.com/en/topic/88234>

How to integrate Microsoft Entra ID into PRTG Hosted Monitor?

- <https://kb.paessler.com/en/topic/91634>

### 3.3 Use Multi-Factor Authentication with PRTG Hosted Monitor

You can use multi-factor authentication with PRTG Hosted Monitor. In combination with an authenticator app that supports the Time-based One-time Password algorithm (TOTP), such as Google Authenticator, you can make your PRTG Hosted Monitor instance even more secure.

☁ Multi-factor authentication is only available in PRTG Hosted Monitor. For more information, see the Knowledge Base: [Can I enable multi-factor authentication for my PRTG Hosted Monitor instance?](#)

In this section:

- [Initial Setup](#) <sup>79</sup>
- [Manually Enter the QR Code](#) <sup>84</sup>
- [Log In With Multi-Factor Authentication](#) <sup>84</sup>
- [Disable Multi-Factor Authentication](#) <sup>85</sup>
- [Use The Recovery Code](#) <sup>86</sup>

#### Initial Setup

To set up multi-factor authentication for your PRTG Hosted Monitor instance, open a web browser, go to the [PRTG Hosted Monitor Customer Portal](#), and log in. Then click your account in the upper-right corner.

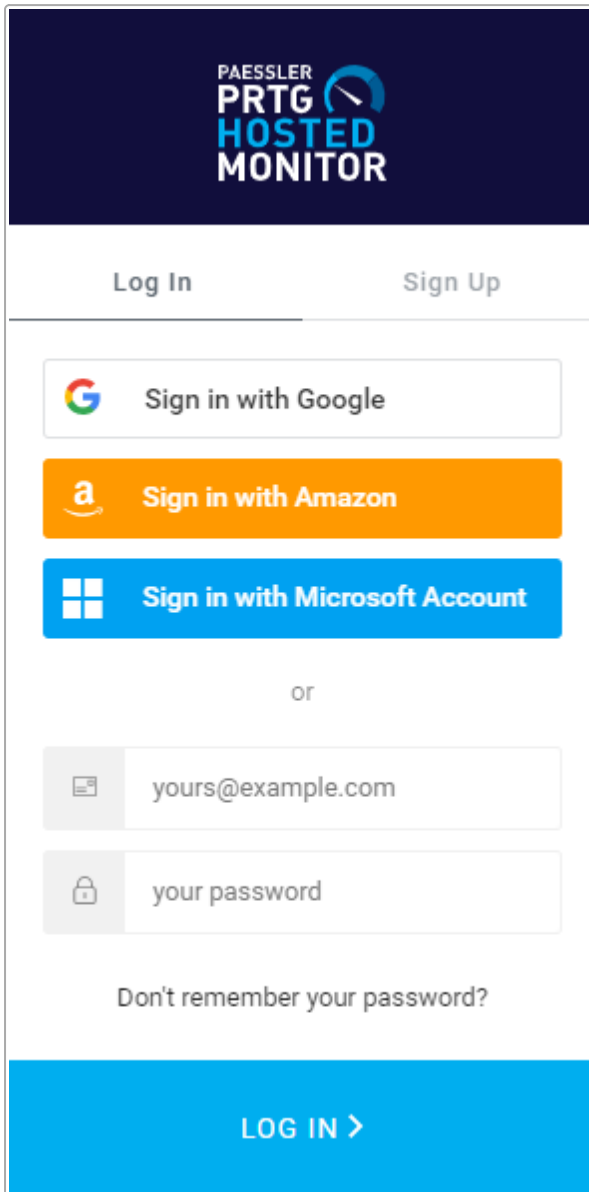

ⓘ We recommend that you use Google Chrome 75.

ⓘ You can only enable multi-factor authentication for your own user account here. To enable or disable multi-factor authentication for all users of your PRTG Hosted Monitor instance, go to [Manage Subscription](#). For more information, see section [Manage a PRTG Hosted Monitor Subscription](#) <sup>67</sup>.

The screenshot shows the 'Account Overview' page for a user with the email 'johnqpublic@example.com'. The page is titled 'Account' and features a navigation sidebar on the left with icons for home, settings, and user profile. The main content area is divided into two sections. The first section, titled 'Auth0', states that the account is managed and secured by the third-party service Auth0. It displays the user's email, provider (auth0), and user ID (123456789abcde1234567890). A toggle switch for 'Multi-factor authentication' is currently off, with a note that enabling it requires a login. A 'RESET PASSWORD' button is located below this section. The second section, titled 'Chargebee', states that all billing and payment details are managed and secured by the third-party service Chargebee. It includes 'EDIT BILLING DETAILS' and 'EDIT PAYMENT DETAILS' buttons. At the bottom, there is a privacy notice: 'I accept the transfer of my data for the purpose of invoicing to Stripe Inc. and Chargebee Inc. If you want to delete your whole account or just your credit card or billing details, please contact our Support.'

Account Overview

1. To enable multi-factor authentication, click .  
 If you enable multi-factor authentication for the first time, you must log in again.

Login Screen

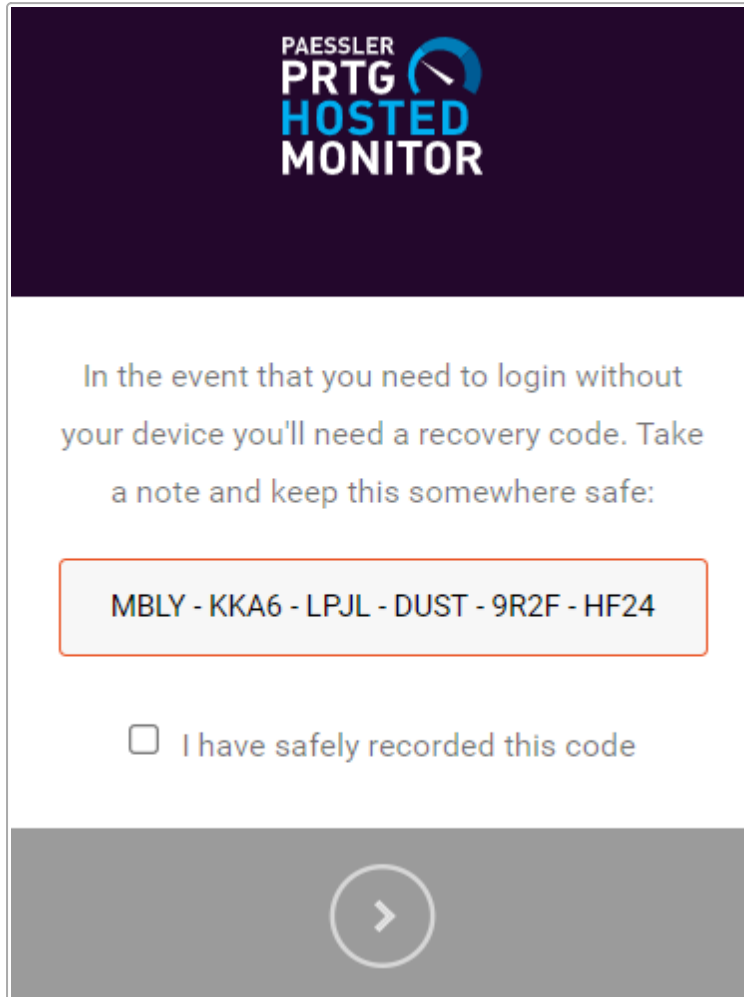

2. Provide the credentials you entered when you signed up and click Log In, or use single sign-on (SSO) and continue with your Google, Amazon, or Windows account via the respective button. For more information on this, see the Knowledge Base: [How to integrate Microsoft Entra ID into PRTG Hosted Monitor?](#)

Scan QR Code

3. Scan the QR code with your authenticator app and enter the passcode from the authenticator app in the field below the QR code.  
■ If your authenticator app is unable to scan the code, see [Manually Enter the QR Code](#)  for more information.

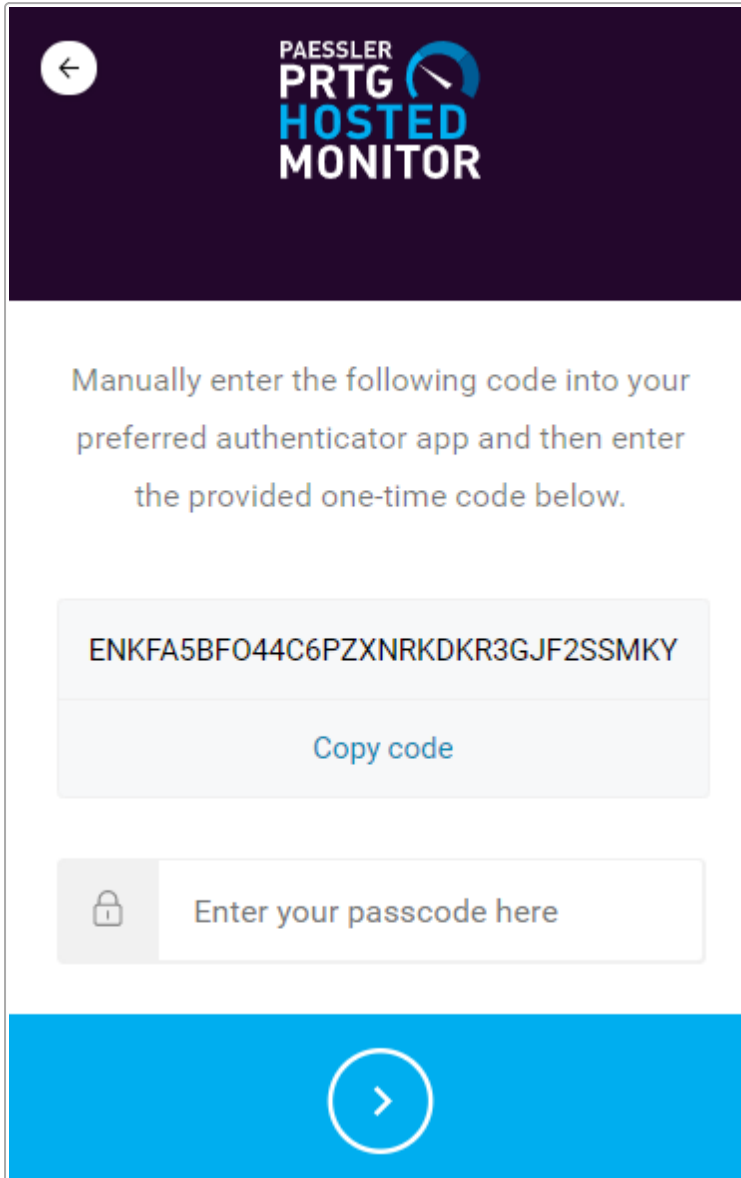

Recovery Code

4. You receive a recovery code. Make sure to save it somewhere safe. Click the check box to confirm that you have safely recorded the code.
5. Click  to log in to the [PRTG Hosted Monitor Customer Portal](#).
-  If you lose your recovery code, [contact the Paessler support team](#).

## Manually Enter the QR Code

1. If your authenticator app is unable to scan the QR code, click [Trouble scanning?](#)

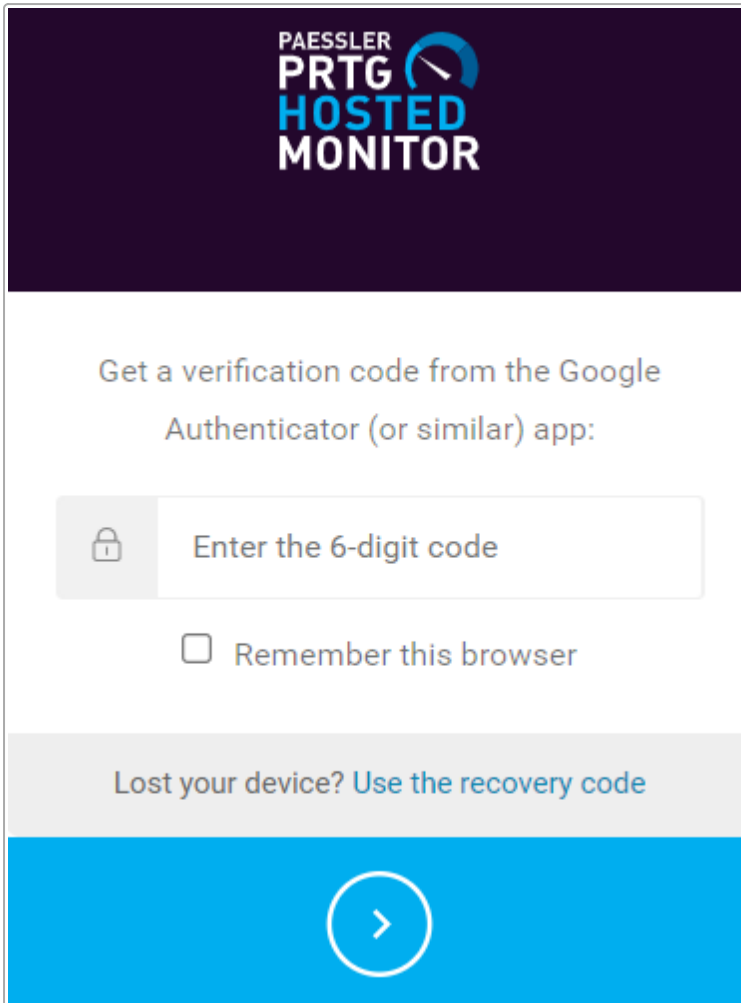

Manually Enter the QR Code

2. Follow the instructions in your authenticator app to manually enter the code.
3. Enter the one-time passcode that your authenticator app generates in the [Enter your passcode here](#) field.
4. Click  to continue.

## Log In With Multi-Factor Authentication

After you set up multi-factor authentication, the next time you log in to the [PRTG Hosted Monitor Customer Portal](#), you see an additional login screen.

Log In With Multi-Factor Authentication

1. Enter the 6-digit code from your authenticator app.
  2. Select the check box next to Remember this browser if you do not want to enter the code in this browser every time you log in.
    - ⓘ This applies for 30 days. If you clear your browsing data such as cookies during this time, it no longer applies.
  3. Click  to continue.
- ⓘ If you lose your device, see [Use The Recovery Code](#)  for more information.

## Disable Multi-Factor Authentication

To disable multi-factor authentication, follow these steps:

1. Log in to the [PRTG Hosted Monitor Customer Portal](#).
2. Click your account in the upper-right corner.
3. Click  under Multi-Factor Authentication.

You see the following message.

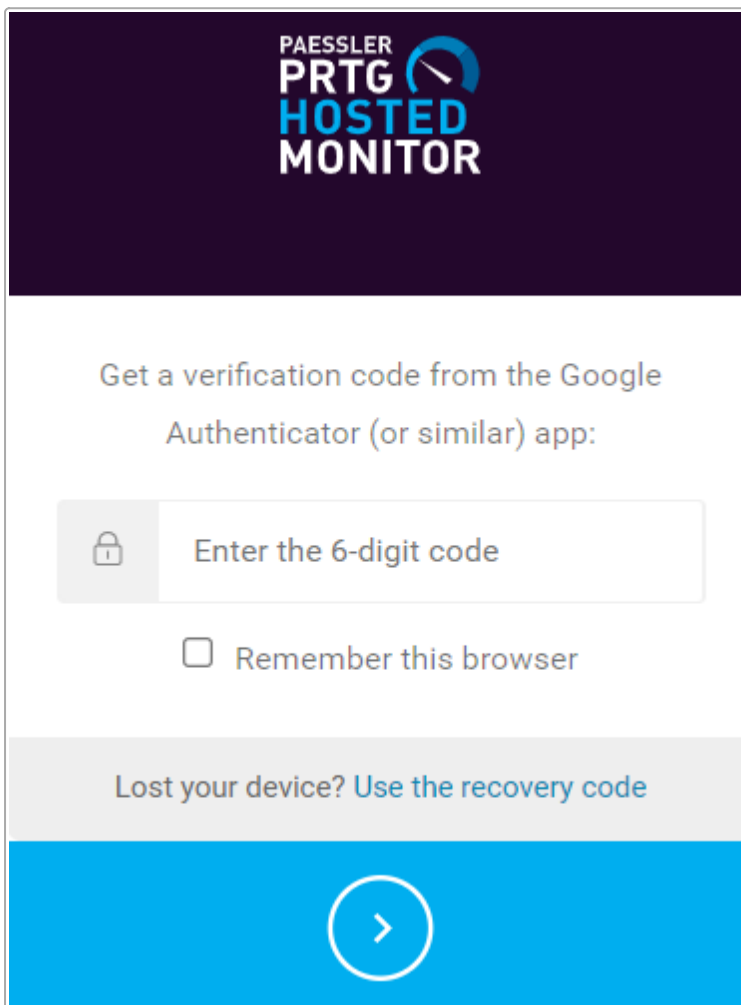

Multi-factor authentication is now disabled. **CLOSE**

Multi-Factor Authentication Now Disabled

The next time you log in to the PRTG Hosted Monitor Customer Portal, multi-factor authentication is no longer enabled.

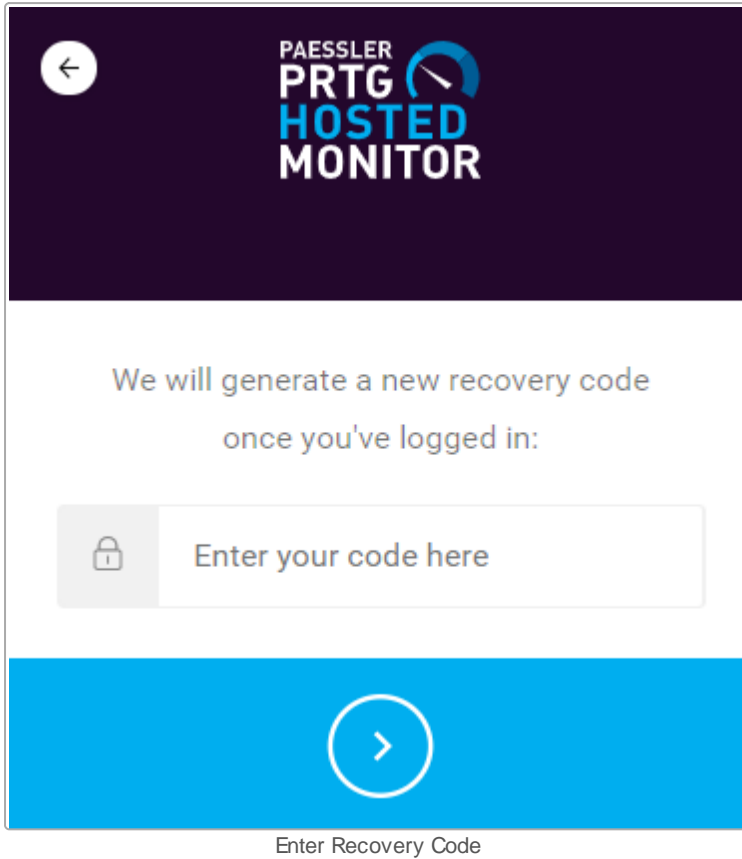

### Use The Recovery Code

1. If you lose your device, click Use the recovery code on the login screen.

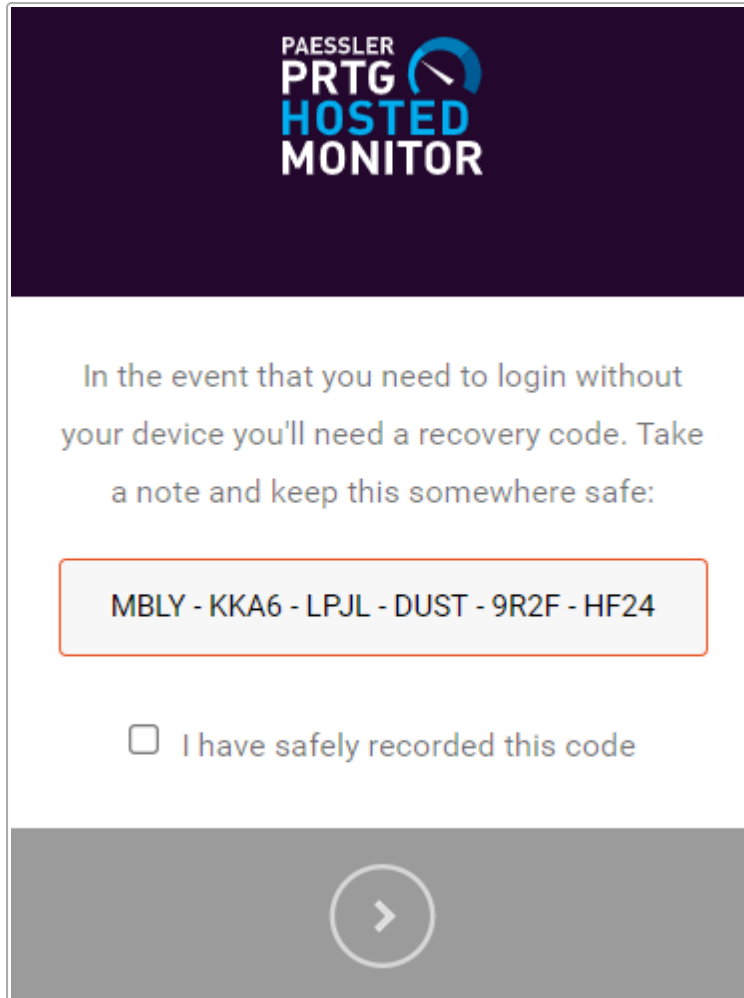

Log In With Multi-Factor Authentication

You see the following screen.

2. Enter your recovery code and click  to continue.  
 The recovery code must contain 24 alphanumeric characters.

3. You receive a new recovery code.

Recovery Code

4. Make sure to save the recovery code somewhere safe. Click the check box to confirm that you have safely recorded the code.
5. Click  to log in to the [PRTG Hosted Monitor Customer Portal](#).
- ① If you lose your recovery code, [contact the Paessler support team](#).

- <https://kb.paessler.com/en/topic/91634>

# Part 4

## Installing the Software

## 4 Installing the Software

The following sections show you how to download and install PRTG Network Monitor.

☁ If you want to use PRTG Hosted Monitor, go straight to section [Create a PRTG Hosted Monitor Instance](#) to get started.

In this section:

- [Download PRTG](#)  <sup>91</sup>
- [Update from Previous Versions](#)  <sup>92</sup>
- [Install a PRTG Core Server](#)  <sup>94</sup>
- [Install a Cluster](#)  <sup>101</sup>
- [Enter a License Key](#)  <sup>102</sup>
- [Activate the Product](#)  <sup>104</sup>
- [Install a Remote Probe](#)  <sup>106</sup>
- [Uninstall PRTG Products](#)  <sup>119</sup>

## 4.1 Download PRTG

Download the latest stable version of PRTG from the [Paessler website](#) as a [trial version](#)<sup>[20]</sup>. Buy and manage your license at the [Paessler Portal](#).

The banner features the Paessler PRTG Network Monitor logo at the top left. The main text reads 'PRTG Download' in a large, white, sans-serif font, followed by 'One solution to monitor everything' in a slightly smaller font. Below this, it states 'Unlimited use of PRTG for 30 days free of charge.' A prominent orange button with the text 'FREE DOWNLOAD' is centered. At the bottom, it clarifies: 'Unlimited use of PRTG for 30 days. After 30 days PRTG reverts to the freeware edition. You can upgrade to a paid license at any time.'

Download PRTG

 Once you have installed PRTG, the [auto-update](#)<sup>[20]</sup> automatically downloads and installs new software versions.

## 4.2 Update From Previous Versions

If you have a previous PRTG version installed, there are several things you need to consider before you update to the newest PRTG version. See also the [system requirements](#)<sup>[22]</sup> for all requirements.

**i** While in most cases, your monitoring data and configuration are maintained when you update PRTG, we still recommend that you have a backup of both. For more information, see the Knowledge Base: [How do I back up all data and configuration of my PRTG installation?](#)

**i** In certain cases, antivirus software like Windows Defender interferes with the PRTG installer. This might cause high CPU load on the PRTG core server, which might prevent an update. Temporarily disable Windows Defender and other antivirus software if you have issues when you install PRTG updates.

**☁** On PRTG Hosted Monitor instances, updates are managed automatically, so you do not need to do them manually.

In this section:

- [Update to PRTG 22.2.77](#)<sup>[92]</sup>
- [Update from PRTG 16.1.22 or later](#)<sup>[92]</sup>
- [Update from Older PRTG Products](#)<sup>[93]</sup>

### Update to PRTG 22.2.77

As of PRTG 22.2.77, PRTG is signed with renewed certificates. To seamlessly update to any version as of PRTG 22.2.77, an [intermediate update](#) is required for the PRTG core server and all probes if you run a version previous to PRTG 22.1.75. If you auto-update from previous versions which are lower than PRTG 22.1.75, PRTG automatically installs an intermediate version first. The intermediate version you receive via auto-update or from the Paessler support team is PRTG 22.1.75.1594. You must perform an additional auto-update to install the newest version. PRTG notifies you with a [ticket](#)<sup>[213]</sup> about this. Your configuration is kept.

**i** We recommend that you use the auto-update to install the newest PRTG version.

### Update from PRTG 16.1.22 or later

If you run any version as of PRTG 16.1.22 or later, [install](#)<sup>[94]</sup> the newest version on top of the previous version. Your configuration is kept. PRTG automatically updates [classic remote probes](#)<sup>[3198]</sup> as well. If you have configured PRTG as a [failover cluster](#)<sup>[128]</sup>, you only need to install an update on any cluster node (master node or failover node). PRTG automatically deploys the new version to the cluster.

We recommend that you use the [auto-update](#)<sup>[2969]</sup> to install the newest version. Always make sure that you have a proper backup of your monitoring data.

**i** Important notes:

- PRTG 19.3.52: PRTG does not run on Windows XP anymore. Make sure that you install PRTG on an [officially supported operating system](#)<sup>[26]</sup>.
- PRTG 19.1.48: Sensors that require the .NET framework need .NET 4.7.2 or later. For more information, see the Knowledge Base: [Which .NET version does PRTG require?](#)

- PRTG 18.3.43: PRTG does not run on Windows Server 2003 R2 anymore. Make sure that you install PRTG on an officially supported operating system.
- PRTG 17.3.34: This version comes with a completely rewritten PRTG web interface. If you have customized the PRTG web interface with one of the dedicated files in a previous version, all your customizations are lost as soon as you install PRTG 17.3.34. You must redo your changes to keep the customizations.
- PRTG 16.3.26: The Mobile Web GUI was removed from PRTG.
- PRTG 16.2.25: Several sensors were removed from PRTG.

## Update from Older PRTG Products

For more information on updating from older PRTG versions, see the Knowledge Base: [How do I update from older versions?](#)

## More

### KNOWLEDGE BASE

## 4.3 Install a PRTG Core Server

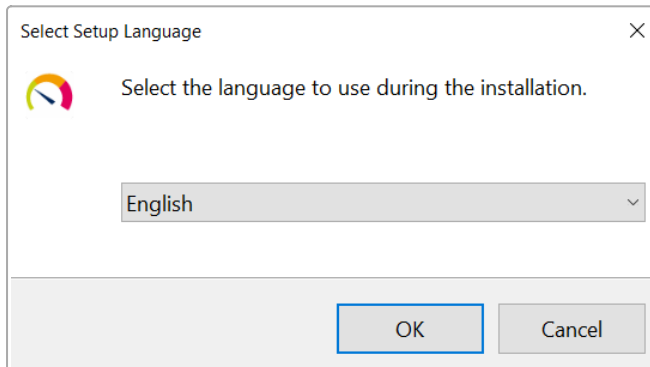

Installing PRTG Network Monitor works like other Windows-based applications. To install PRTG, run the installation setup program from the .zip file that you downloaded.

1. Confirm the question of the [Windows User Account Control](#) with Yes to allow PRTG to install. The installation dialog guides you through the installation process.

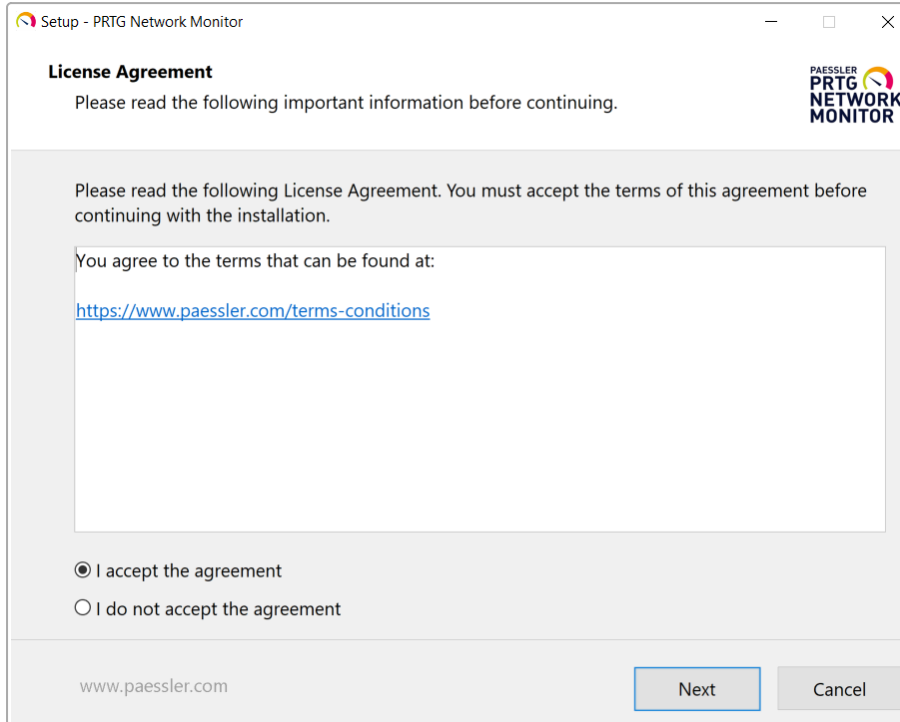

Windows User Account Control Confirmation Request

2. Select a language for the installation and click OK. The available language options depend on both your Windows version and the setup file.

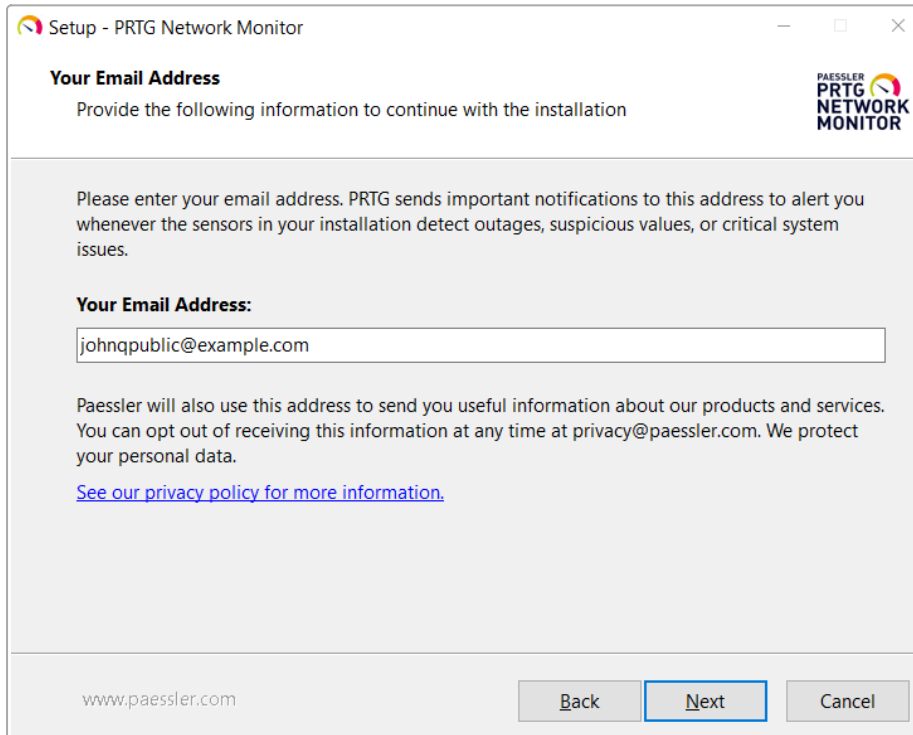

Setup Language Selection

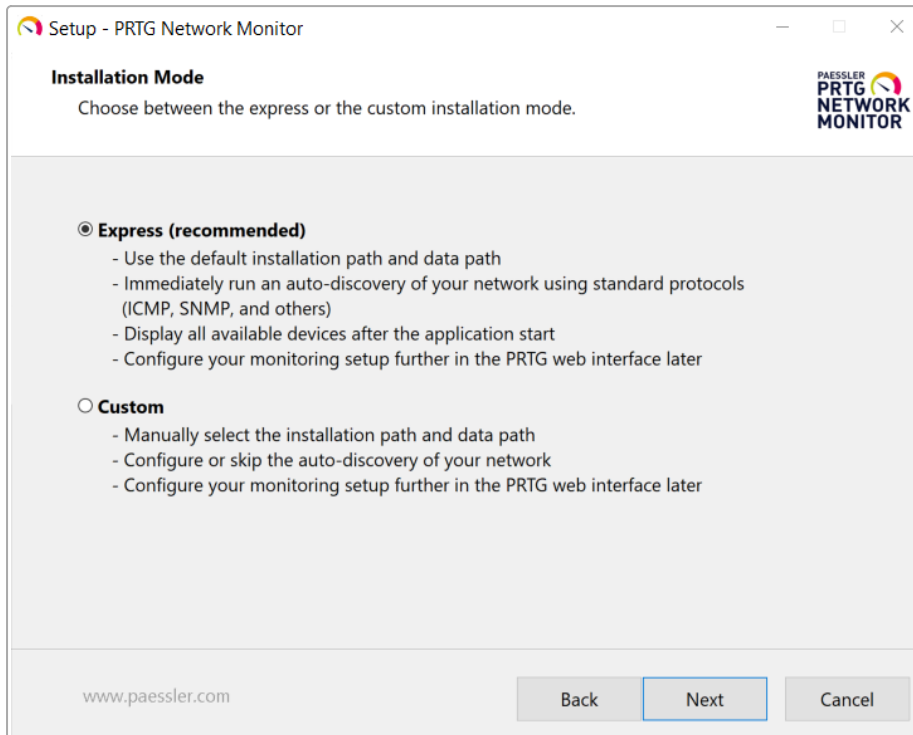

3. Accept the [license agreement](#) and click Next.

4. Enter your email address to make sure you receive important system alerts and click Next.

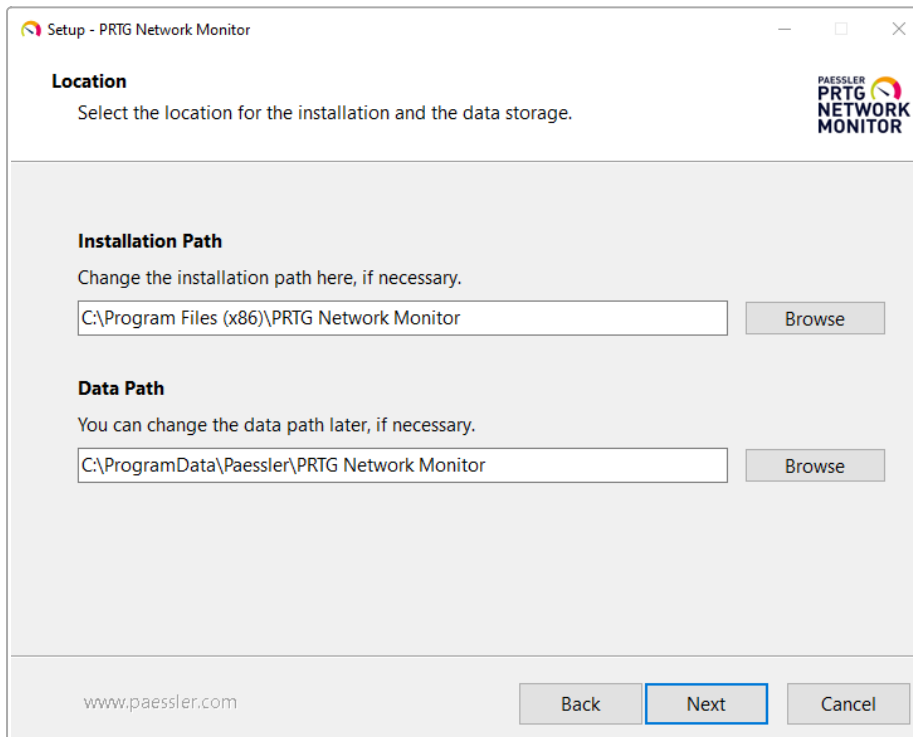

5. Select if you want to use the Express or the Custom installation mode and click Next. If you select the Express installation mode, you can directly proceed with step 9.

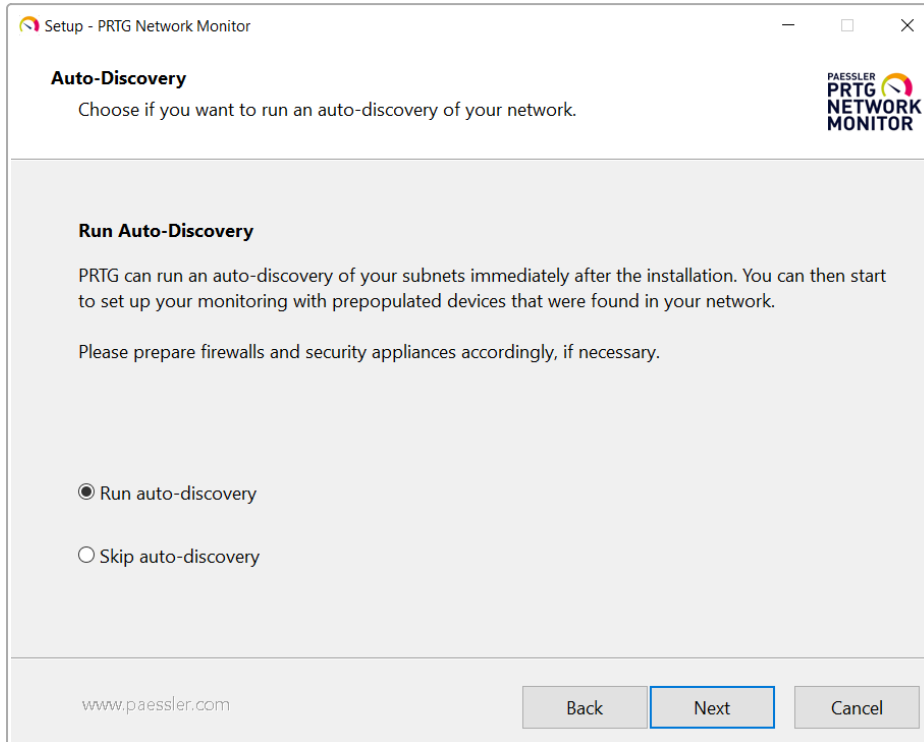

Setup Dialog: Installation Mode

6. This page is only visible if you use the Custom installation mode. You can change the paths to the [PRTG program directory and PRTG data directory](#), if necessary. Click Next.

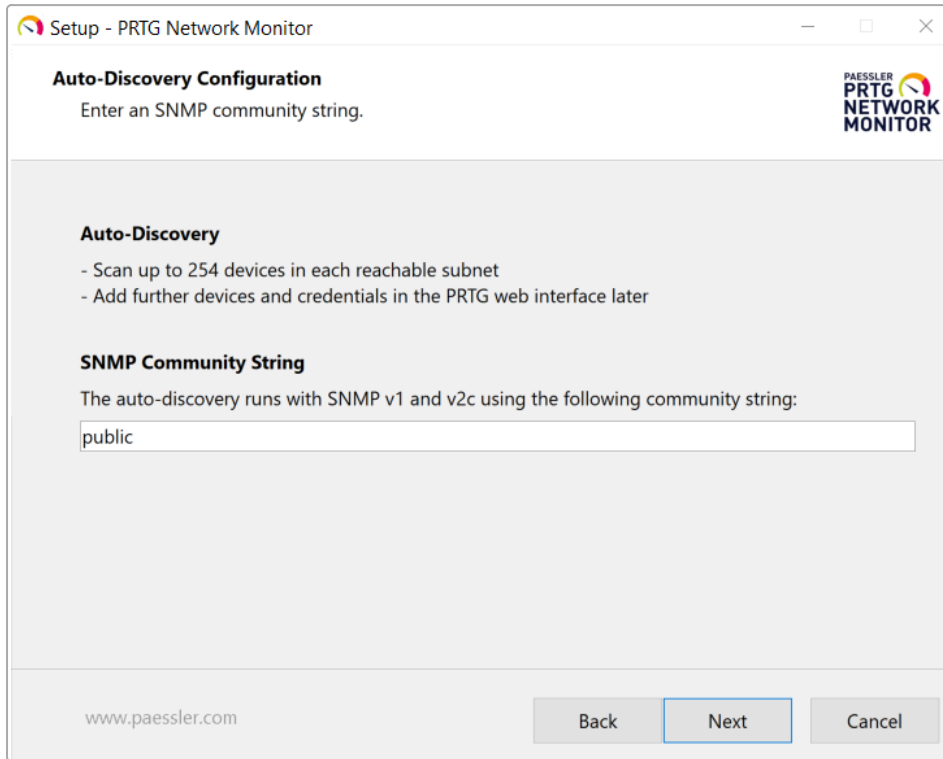

Setup Dialog: Location for Installation and Data Storage

7. This page is only visible if you use the Custom installation mode. Select if you want to run an [auto-discovery](#) of your network or if you want to skip the auto-discovery. Click Next.

Setup Dialog: Run or Skip Auto-Discovery

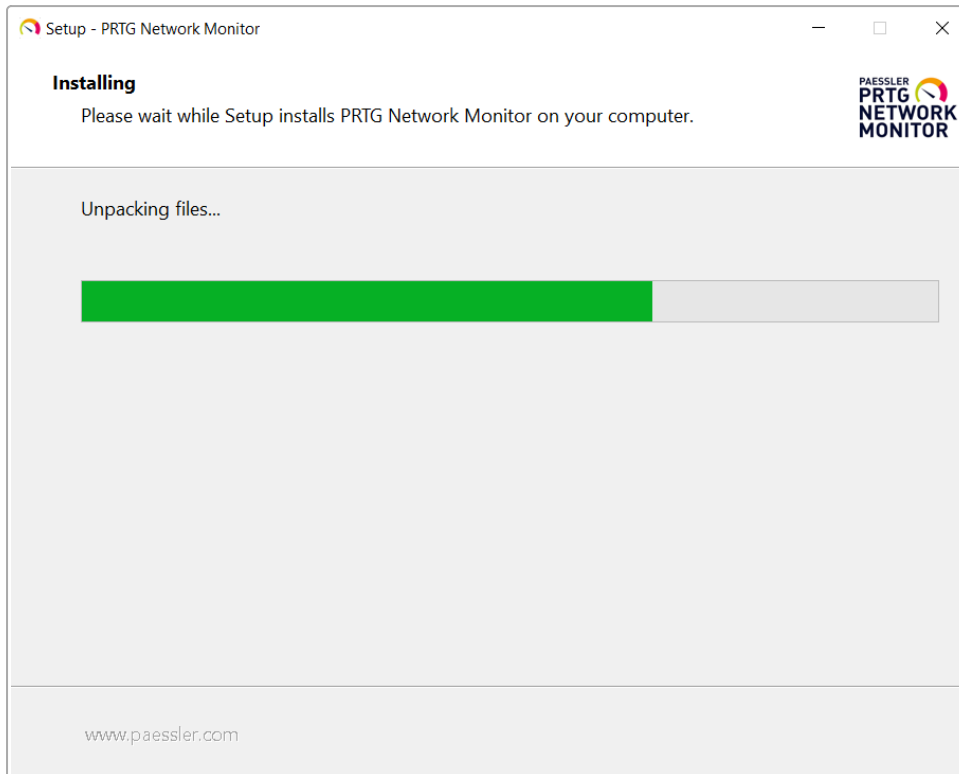

- This page is only visible if you select Run auto-discovery. You can enter a Simple Network Management Protocol (SNMP) community string. The default SNMP community string is **public**. Click Next.

Setup Dialog: Auto-Discovery Configuration

9. PRTG is installed on your system.

Setup: Installing PRTG

10. Click Finish to complete the setup of PRTG.

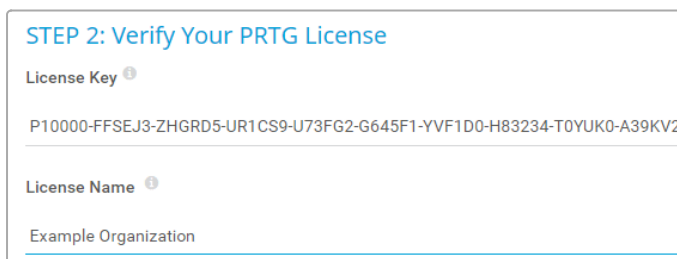

After installation, you can open the [PRTG web interface](#)<sup>[152]</sup> in your system's default browser. Make sure that a [supported browser](#)<sup>[22]</sup> is available on the system.

**i** In some cases, antivirus software like Windows Defender interferes with the PRTG installer. This might cause high CPU load on the PRTG core server, which might prevent a successful installation. Temporarily disable Windows Defender and other antivirus software in these cases.

## Enter License Information

PRTG validates your license information during the installation process by connecting to the activation server. If there are issues with the license information, PRTG asks you to verify your License Key and License Name on the first login.

Enter the License Key and, if prompted, the License Name exactly as received from Paessler.

Setup Dialog: Enter License Information

■ For more information, see section [Enter a License Key](#)<sup>[102]</sup>.

If you think that you have correctly entered your license information but get a [License Invalid](#) message, contact [sales@paessler.com](mailto:sales@paessler.com).

❶ You can find the label License Owner in some documents from the Paessler Portal. License Owner is the same as License Name. PRTG might ask you for this information during installation or when you [change your license key](#)<sup>[102]</sup>.

❶ When you update a commercial version with a new trial installer, PRTG ignores the new trial license key.

- <https://www.paessler.com/privacy-policy>

## 4.4 Install a Cluster

PRTG offers one single failover cluster in all licenses, including the freeware edition. A single failover cluster consists of two machines, **master node** and **failover node**. Each machine runs one installation of PRTG. They are connected to each other and exchange configuration and monitoring data. You can run a cluster with up to five cluster nodes.

☁ This feature is not available in PRTG Hosted Monitor.

■ For more information, see section [Failover Cluster Configuration](#) 3208.

### More

#### ■ KNOWLEDGE BASE

What is the clustering feature in PRTG?

- <https://kb.paessler.com/en/topic/6403>

## 4.5 Enter a License Key

The license information consists of a License Key and the License Name. The License Key is a string that consists of 10 blocks with six characters each.

License Information	Example
License Key	P10000-FFSEJ3-ZHGRD5-UR1CS9-U73FG2-G645F1-YVF1D0-H83234-T0YUK0-A39KV2
License Name	Example Organization

### Your License Information

For the trial edition and freeware edition, you receive the required license information on the Paessler web page when you download the trial edition of PRTG. When you install the trial edition, you usually do not need to manually enter your license key, as the installation setup program extracts all the necessary information from the file name. If the installer cannot extract the information from the file name or if other issues occur, you might need to enter your license information manually.

For the commercial edition, you receive your license information from Paessler via email or in a license document in the [Paessler Portal](#). When you install the commercial edition, PRTG asks you to enter your license information during the setup process. We recommend that you copy and paste the information.

**i** If there are issues with the license information, PRTG asks you to verify your license information on the first login.

**i** You can find the label License Owner in some documents from the Paessler Portal. License Owner is the same as License Name. PRTG might ask you for this information during installation or when you [change your license key](#)<sup>[102]</sup>.

**■** For more information about the different licenses, see section [Available Licenses](#)<sup>[20]</sup>.

### Change License Key

Because PRTG already asks for a license key during installation, you usually do not need to manually enter one afterward. However, there are still scenarios where you need to change your license key and activate the respective license. For example, you must provide the subscription license key of your commercial edition if you upgrade from a freeware edition or trial edition, or if you want to upgrade your subscription license to one with a higher sensor count.

To enter a new license key, follow these steps:

1. Log in to the [PRTG web interface](#)<sup>[124]</sup>.
2. Select Setup | License Information from the [main menu bar](#)<sup>[250]</sup>.
3. Click Change License Key. The Update Your License page appears where you can activate your new license.

4. Select the activation type Automatic (online activation with optional HTTP proxy) if your PRTG core server can connect to the internet.

**i** Without internet access, you must select Manual (offline activation). The activation process works a bit differently in this case and requires manual interaction. See section [License Information](#) for more information.

5. Enter your license information and click Update License.

6. PRTG connects to the Paessler activation server on port 443 and validates your license.

If everything works fine, you see the message Activation was successful as License Status at the top of the page.

**i** The PRTG core server needs an internet connection on port 443 to activate. If a proxy connection is needed, see [step 3](#) on the Update Your License page. If the activation fails, you can also try an offline activation.

For more information, see section [License Information](#).

### License Information

License Status	Activation was successful
License Name	Example Organization
License Key	P10000-FFSEJ3-ZHGRD5-UR1CS9-U73FG2-G645F1-YVF1D0-H83234
System ID	SYSTEMID-AAAA1111-BBBB2222-3333CCCC-4444DDDD-5555EEEE
Customer ID	012345678
Licensed Edition	PRTG Network Monitor (next validation on 15/3/2024 at the latest)
Last Update	02/02/2024 13:21:54
Subscription until	07/05/2027 (1059 days left)
Number of Sensors	Unlimited

Manage License
Change License Key
Refresh Information
Deactivate this License

Update Your License: Click Change License Key

### KNOWLEDGE BASE

How do I upgrade to a later edition of PRTG?

- <https://kb.paessler.com/en/topic/4193>

The automatic license activation of my PRTG Enterprise Monitor license does not work. What can I do?

- <https://kb.paessler.com/en/topic/89281>

## 4.6 Activate the Product

PRTG Network Monitor automatically activates your license via the internet during the installation process. If PRTG cannot access the activation server, you must manually activate your license.

 You must complete the product activation process once to use PRTG, otherwise it does not run. Do not forget to activate your subscription license when you want to upgrade your installation from a trial edition or freeware edition.

### Online Activation

Because PRTG already asks for a license key during installation, you usually do not need to manually enter one afterward. However, there are still scenarios where you need to change your license key and activate the respective license. For example, you must provide the subscription license key of your commercial edition if you upgrade from a freeware edition or trial edition, or if you want to upgrade your subscription license to one with a higher sensor count.

To enter a new license key, follow these steps:

1. Log in to the [PRTG web interface](#)<sup>[124]</sup>.
2. Select Setup | License Information from the [main menu bar](#)<sup>[250]</sup>.
3. Click Change License Key. The Update Your License page appears where you can activate your new license.
4. Select the activation type Automatic (online activation with optional HTTP proxy) if your PRTG core server can connect to the internet.

 Without internet access, you must select Manual (offline activation). The activation process works a bit differently in this case and requires manual interaction. See section [License Information](#)<sup>[296]</sup> for more information.

5. Enter your license information and click Update License.
6. PRTG connects to the Paessler activation server on port 443 and validates your license.

If everything works fine, you see the message Activation was successful as License Status at the top of the page.

 The PRTG core server needs an internet connection on port 443 to activate. If a proxy connection is needed, see [step 3](#)<sup>[296]</sup> on the Update Your License page. If the activation fails, you can also try an offline activation.

 For more information, see section [License Information](#)<sup>[296]</sup>.

### Offline Activation

 The following process only applies to PRTG Network Monitor. If you use PRTG Enterprise Monitor, see the Paessler website: [How to use PRTG Enterprise Monitor in an offline environment in 5 steps](#).

If no internet connection is available, you must activate PRTG manually:

1. In the PRTG web interface, select Setup | License Information from the main menu bar.

2. Click Change License Key. The Update Your License page appears where you can activate your license.
3. Select the activation type Manual (offline activation).
4. Enter your license information and follow the instructions of [step 3b](#)<sup>[2967]</sup> and [step 4](#)<sup>[2967]</sup> on the Update Your License page.
5. Click Update License.

If the activation was successful, you see the message Activation was successful as License Status at the top of the page.

 For more information, see section [License Information](#)<sup>[2965]</sup>.

 If your PRTG core server is offline, you must manually activate your license each time. This makes sure that you can install updates, for example.

## 4.7 Install a Remote Probe

Remote probes can extend your monitoring with PRTG:

- Monitor different subnetworks that are separated from your PRTG core server by a firewall, and keep an eye on remote locations. You can install [one or more remote probes](#)<sup>[319]</sup>.
- Distribute monitoring load by taking it from the PRTG core server system and putting it on one or more remote probe systems.

☁ You need a classic remote probe if you want to monitor your local network with a PRTG Hosted Monitor instance.

There are three types of remote probes:

1. [Classic remote probe](#)<sup>[3313]</sup>
2. [Multi-platform probe](#)<sup>[3316]</sup>
3. [Mini probe](#)<sup>[3316]</sup>

ⓘ You can use multi-platform probes to extend your monitoring to non-Windows systems. For more information about multi-platform probes, see the [Multi-Platform Probe for PRTG](#) manual.

ⓘ If you run PRTG in a cluster, see [Cluster and Remote Probes Outside the LAN](#)<sup>[109]</sup> in this section.

■ If you have issues after the installation, see section [Debugging Classic Remote Probe Connection Issues](#)<sup>[115]</sup>.

■ For a partially automatic installation of a classic remote probe directly from the device tree in the PRTG web interface, see section [Classic Remote Probe Setup via Device Tools](#)<sup>[3202]</sup>. For a quick installation guide, see the Paessler website: [How to install a PRTG remote probe in 4 steps](#).

### Steps to Take

To install a classic remote probe with the Classic Remote Probe Installer, follow these steps:

- [Step 1: Meet the Requirements](#)<sup>[106]</sup>
- [Step 2: Prepare the PRTG Core Server](#)<sup>[107]</sup>
- [Step 3: Download the Classic Remote Probe Installer from the PRTG Web Interface](#)<sup>[109]</sup>
- [Step 4: Install a New Classic Remote Probe](#)<sup>[110]</sup>
- [Step 5: Approve the New Remote Probe](#)<sup>[113]</sup>

### Step 1: Meet the Requirements

To install a classic remote probe on a target system, make sure that you meet the following requirements:

- The target system runs on at least Windows 7.
- The target system is accessible via remote procedure call (RPC). This is usually the case when your PRTG core server and the target system are located in the same LAN segment. Otherwise, open Windows [services.msc](#) on the target system and start the RPC service.

- Programs are allowed to communicate through your Windows Firewall. Open the settings of your firewall and select Allow an app through firewall. Mark the check box for Remote Service Management, and the check box Public in the corresponding line.
- Because the remote probe initiates the connection, you must make sure that a connection to your PRTG core server from the outside can be established. The process is the same as if you wanted to allow access to the PRTG web server provided by the PRTG core server via port 80 or 443. In most cases, this means that you will require an [allow](#) or [allow-nat](#) network address translation (NAT) rule that enables a remote probe to reach the PRTG core server via the Transmission Control Protocol (TCP) port [23560](#). Then, the remote probe uses a dynamic port from the high port range ([49152 - 65535](#)) for outgoing connections.

 If you need to set a different port, which we do not recommend, see the Knowledge Base: [How can I customize ports for core-probe connections used by PRTG?](#)

 You cannot install a remote probe on a system that already has a probe installed.

 For more information on the requirements for remote probes, see section [System Requirements](#)<sup>[23]</sup>.

 If you are using PRTG Hosted Monitor, start from [Step 3: Download the Classic Remote Probe Installer from the PRTG Web Interface](#)<sup>[109]</sup>.

## Step 2: Prepare the PRTG Core Server.

 Because remote probes need to connect to your PRTG core server, PRTG needs to accept incoming remote probe connections. So, with PRTG Network Monitor, first prepare your PRTG core server before you install a remote probe.

Edit the relevant settings in section [Core & Probes](#)<sup>[2887]</sup>. From the main menu in the [PRTG web interface](#)<sup>[124]</sup>, select Setup | System Administration | Core & Probes to access the probe settings and go to the Probe Connection Settings.

### Probe Connection Settings

**Probe Connection IP Addresses** ⓘ

Local probe only, 127.0.0.1

All IP addresses available on this computer

Specify IP addresses

**Access Keys** ⓘ

**Allow IP Addresses** ⓘ

**Deny IP Addresses** ⓘ

**Deny GIDs** ⓘ

**Connection Security** ⓘ

High security (TLS 1.3, TLS 1.2)

Default security (TLS 1.3, TLS 1.2) (recommended)

Weakened security (TLS 1.3, TLS 1.2, TLS 1.1, TLS 1.0)

**Mini Probes** ⓘ

Do not allow mini probes (default)

Allow mini probes to connect to the PRTG web server

Allow mini probes to connect to an extra port

**PRTG MultiBoard File Transfer** ⓘ

Disable (default)

Enable

Probe Connection Settings in System Administration

#### Step 2.1: Probe Connection IP Addresses

By default, a PRTG core server accepts connections from the local probe only (IP address [127.0.0.1](#)). This setting is the most secure setting, but it does not allow any remote probes to connect to your PRTG core server.

To accept remote probes, select one of the following settings:

- All IP addresses available on this computer: Any IP address on your PRTG core server system accepts incoming probe connections.
- Specify IP addresses: Specify IP addresses that accept incoming connections.

#### Step 2.2: Allow IP Addresses

In the Allow IP Addresses field, you can enter the IP address of the target system on which you want to install a remote probe. You can also enter the word [any](#). This sets the PRTG core server to accept remote probe connections from any IP address.

ⓘ If you use [any](#), make sure that you only write the word in lower case. Other variations are not valid.

Other settings are not required. For more information about the fields for Access Keys, Deny IP Addresses, and Deny GIDs, see section [Core & Probes](#)<sup>[2890]</sup>.

When you are done, click Save to save your settings.

**i** If you change this setting, PRTG needs to restart the PRTG core server to apply your changes. After you click Save, a dialog box appears that asks you to confirm the restart. Click OK to trigger the restart. During the restart, all users of the PRTG web interface, the [PRTG app for desktop](#)<sup>[2984]</sup>, or the [PRTG Apps for Mobile Network Monitoring](#)<sup>[2988]</sup> are disconnected and reconnected.

**i** To edit the core-probe connection settings, you can also use the [PRTG Administration Tool](#)<sup>[3041]</sup> on your PRTG core server.

### Cluster and Remote Probes Outside the LAN

**i** If you run PRTG as a cluster and you want to run remote probes outside your local network, you must make sure that your cluster nodes and the addresses that they use are reachable from the outside. Check your cluster node settings under [Cluster](#)<sup>[2923]</sup> before you install a remote probe outside your local network. Enter valid Domain Name System (DNS) names or IP addresses for both cluster nodes to reach each other and for remote probes to individually reach all cluster nodes. Remote probes outside your LAN cannot connect to your cluster nodes if they use local addresses.

If you already have a remote probe installed outside your LAN and the remote probe is disconnected because of this, follow these steps:

1. Uninstall the remote probe.
2. Update the [cluster node settings](#)<sup>[2923]</sup> with addresses that are reachable from outside your LAN.
3. Restart the PRTG core servers.
4. Install the remote probe again. It then obtains the IP address or DNS name entries that it can reach.

 See also section [Failover Cluster Configuration](#)<sup>[3210]</sup>, section Remote Probes in a Cluster.

### Step 3: Download the Classic Remote Probe Installer from the PRTG Web Interface

1. On the Windows system on which you want to install a classic remote probe, log in to the PRTG web interface.
2. From the main menu bar, select Setup | Optional Downloads | Classic Remote Probe Installer.
3. Click Add Remote Probe to start the installation assistant.  
**i** The Add Remote Probe button is also available in the device tree.
4. Wait until the installation is completed. The classic remote probe then automatically connects to your PRTG core server.
5. In the appearing dialog window, click Prepare and Download to start the download.
6. Save the setup program to your local disk.

In the installation approach with the assistant, PRTG guides you through the installation process. If you Download the Classic Remote Probe Installer directly, you must install the classic remote probe without the assistant.

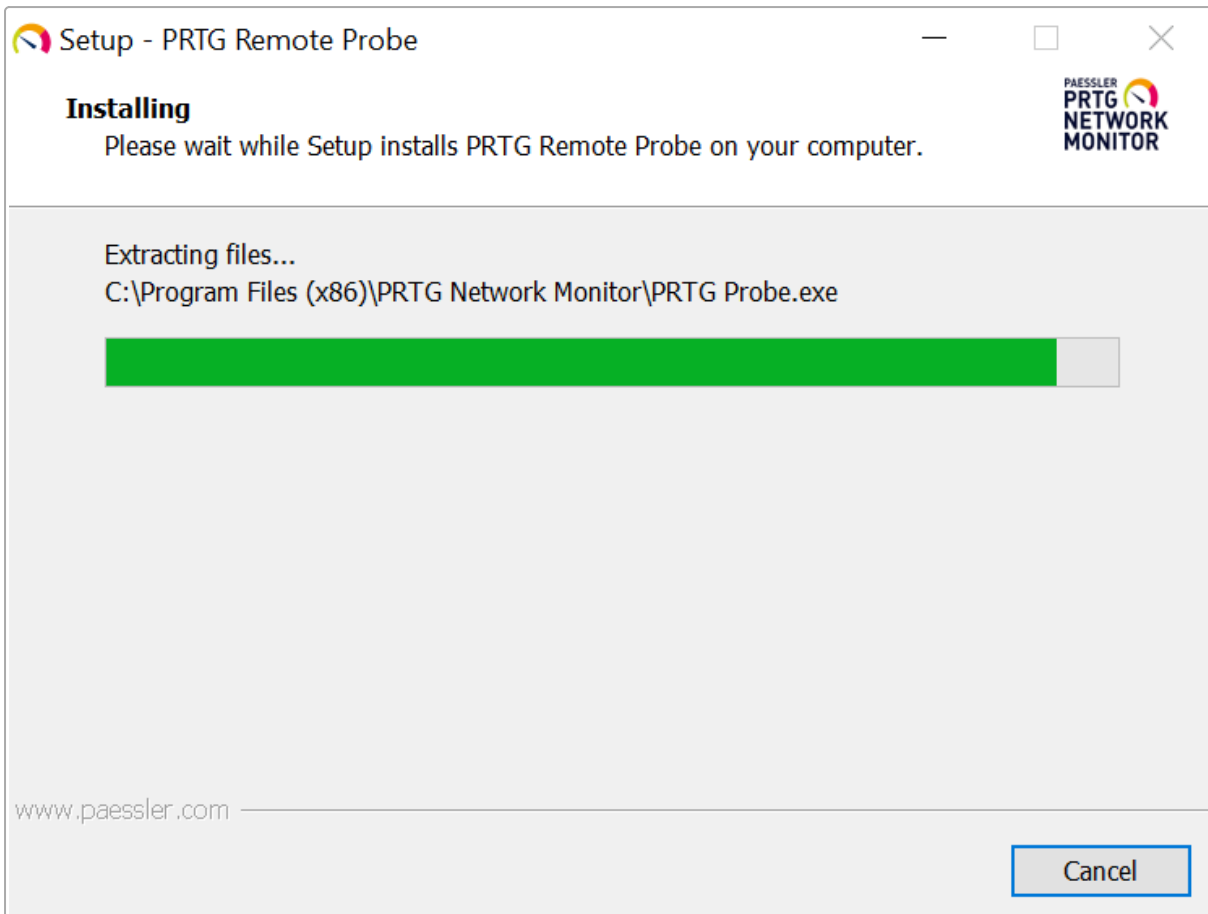

- ☰ If you connect remote probes to PRTG Network Monitor, [prepare](#)<sup>107</sup> your Probe Connection Settings first.

- ❗ The PRTG version numbers of the PRTG core server service and PRTG probe service must match. PRTG automatically updates classic remote probes when you install a new version on the PRTG core server. If PRTG advises you to manually update your classic remote probe, open a web browser on the remote system and download the classic remote probe installer as described in this section.

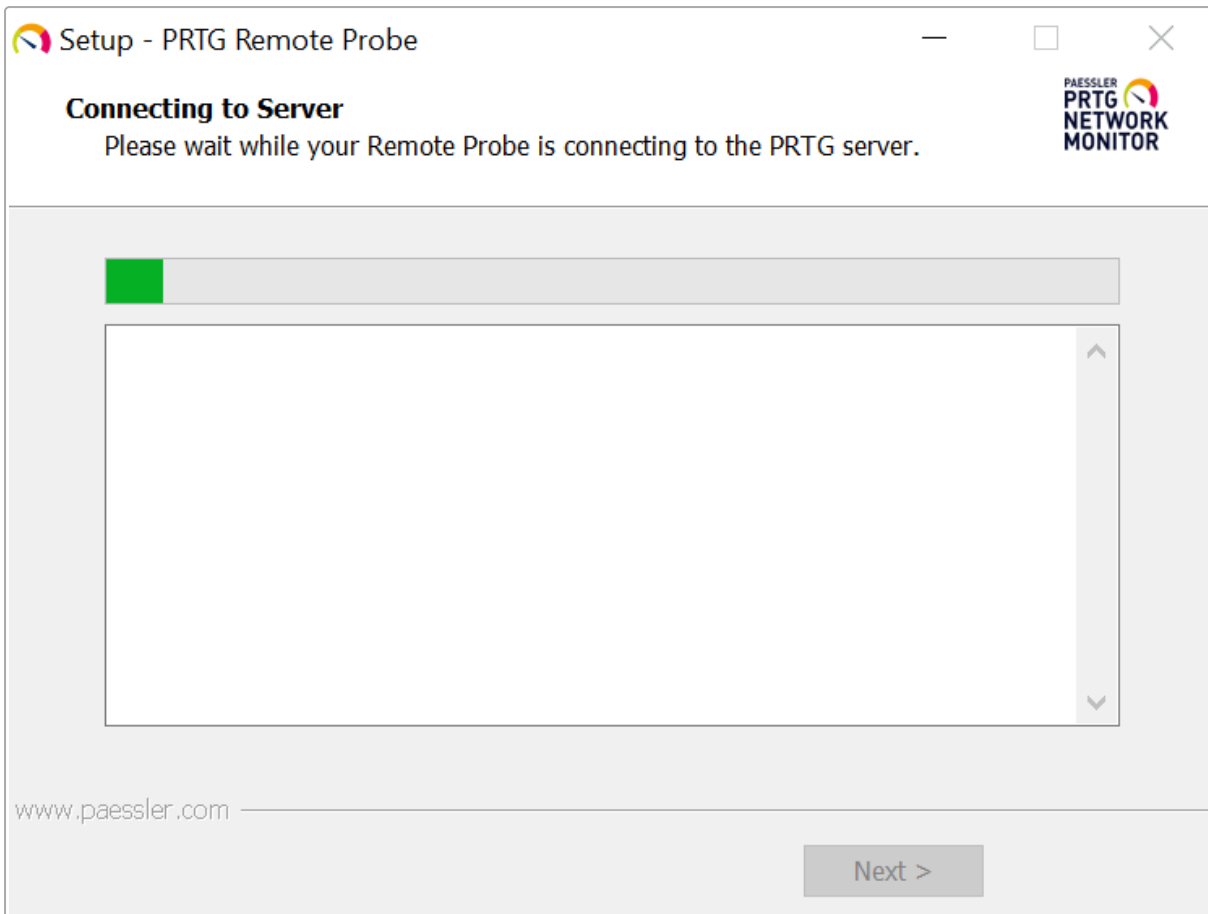

#### Step 4: Install a New Classic Remote Probe

1. Execute the setup program that you downloaded.
2. Confirm the [Windows User Account Control](#) dialog with Yes to allow the installation. The usual software installation wizard guides you through the installation process.
3. Click Install to start the installation process.

Remote Probe Setup Installing

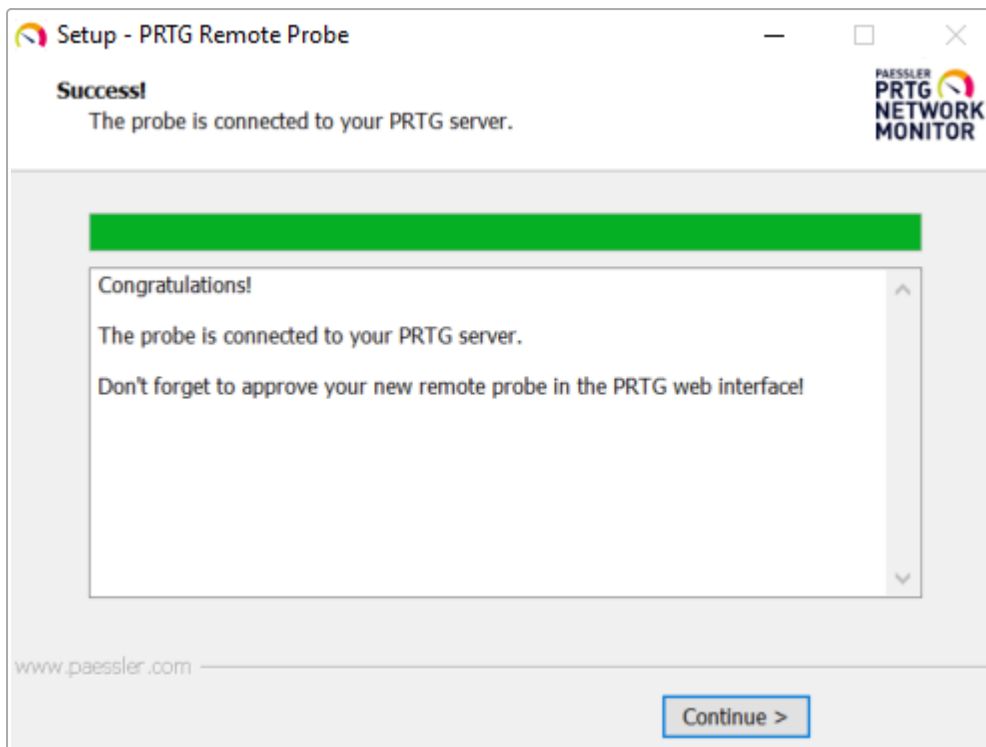

Wait until the installation is complete. The remote probe then automatically connects to your PRTG core server.

Remote Probe Setup Connecting to the PRTG Core Server

If the remote probe successfully connects to your PRTG core server, you can complete the setup of your new remote probe.

**i** To allow your new remote probe to connect to a PRTG Hosted Monitor instance, PRTG automatically sets the Allow IP Addresses field in [Core & Probes](#) to [any](#). You can also use [any](#) for PRTG Network Monitor, but we recommend that you use this setting in intranets only. If [any](#) is not an option for you, cancel it in the Allow IP Addresses field and enter the IP address of your remote probe instead.

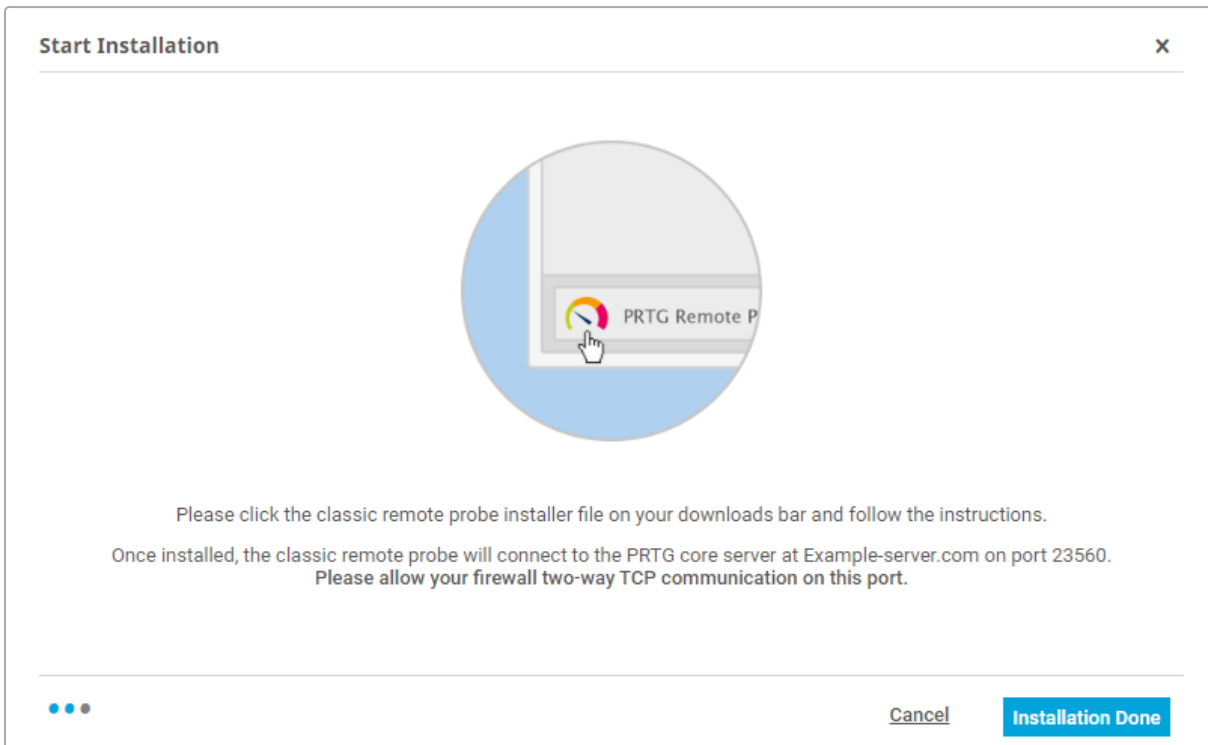

Remote Probe Setup Successful

4. Click Continue to finish the remote probe installation.
5. Click Finish to exit the installation wizard.

The remote probe is now installed on your computer as a Windows service.

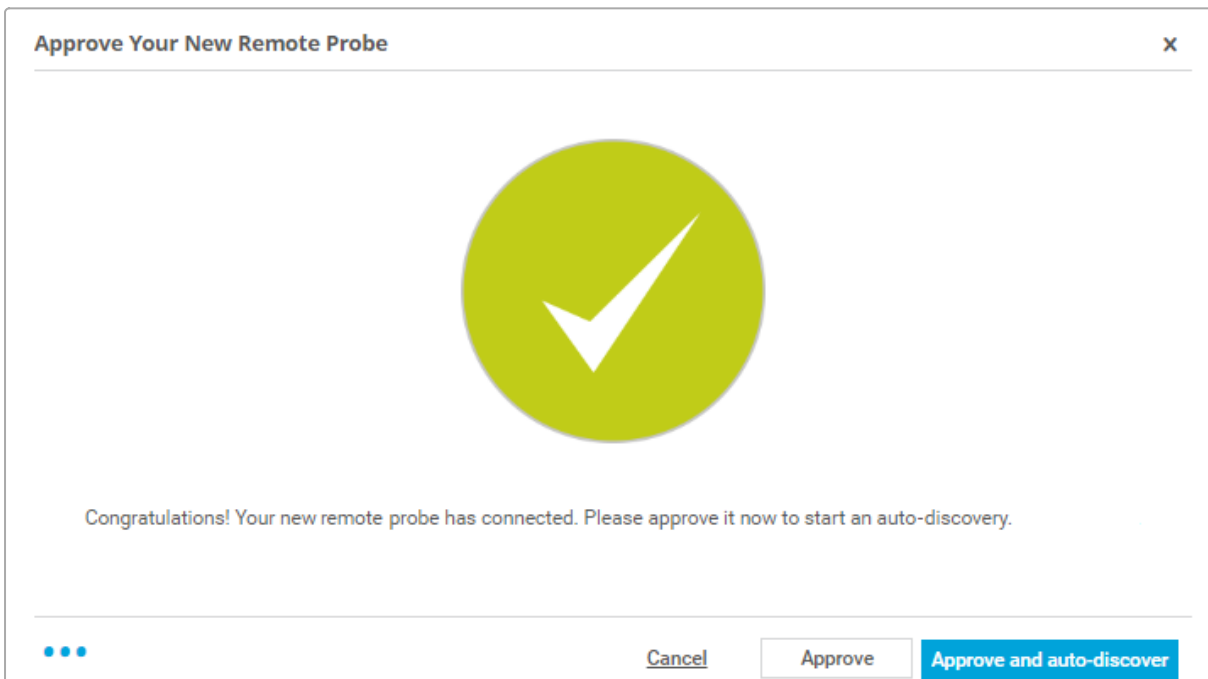

### Step 5: Approve the New Remote Probe

In the installation assistant, click Installation Done.

Confirm that Installation is Done

☁ If you successfully installed the remote probe from a PRTG Hosted Monitor installation, you see the following dialog box.

Approve Remote Probe for PRTG Hosted Monitor

Click **Approve and auto-discover** to include the new remote probe and network in your device tree and to start the [auto-discovery](#)<sup>[254]</sup>. It discovers devices and automatically creates suitable sensors. Optionally, click **Approve** to only approve the remote probe without the auto-discovery. The remote probe appears in your device tree.

For unwanted remote probe connections, click Cancel. A new window appears in the lower-right corner.

Click **Deny** to deny the new remote probe.

**i** If you deny or remove a remote probe, PRTG automatically adds the global ID (GID) of this device to the Deny GIDs list in [Core & Probes](#)<sup>[2888]</sup>. PRTG automatically denies future remote probe connections from this device.

**i** If you deny the remote probe in the device tree, it does **not** uninstall the remote probe, but only denies access to the PRTG core server. The remote probe continues to run on the target system until you uninstall it manually.

Once approved, PRTG automatically opens the new remote probe in the device tree and creates a set of sensors for the remote probe to make sure you can immediately detect bottlenecks on the remote probe system. We recommend that you keep these sensors. You can now create groups, devices, and sensors for monitoring via the new remote probe.

**i** You do not need to approve classic remote probes after updates.

When a new remote probe connects to the PRTG core server for the first time, you receive a new ToDo ticket.

**i** PRTG automatically updates classic remote probes but, in rare cases, you must manually update classic remote probes. You receive a [ToDo ticket](#)<sup>[213]</sup> in this case. Follow the steps [above](#)<sup>[109]</sup> to manually update classic remote probes.

## Debugging Classic Remote Probe Connection Issues

If you have issues with the connection between the PRTG core server and classic remote probe, make sure that you meet the following requirements:

- Recheck if you fulfilled all the requirements as described in [step 1](#)<sup>[106]</sup> of this section like the Windows Firewall settings.
- The IP address of the computer on which you want to install a remote probe is not listed in the Deny IP Addresses field in [Core & Probes](#)<sup>[2888]</sup>.
- You can also take a look at the log files of the classic remote probe. The probe process writes log files with a file name in the format PRTG Probe Log (x).log. Open the one with the most recent date.

For a correct connection, the log should look similar to this:

```

11/6/2023 1:21:58 PM PRTG Probe V23.4.90.1235
11/6/2023 1:21:58 PM System time zone: (UTC+01:00) Amsterdam, Berlin, Bern, Rome,
Stockholm, Vienna
11/6/2023 1:21:58 PM libeay32.dll=1.0.2.11

11/6/2023 1:21:58 PM (14608):Initializing WMIConnectionPool
11/6/2023 1:21:58 PM (14608):WMIConnectionPool maximum number of concurrent
establishings is set to: 20
11/6/2023 1:22:03 PM Connect from to example-DNS.exempldomain.com:23560
11/6/2023 1:22:03 PM TCP connected from 10.49.12.51:55199 to example-
DNS.exempldomain.com:23560
11/6/2023 1:22:03 PM State changed to connected (example-DNS.exempldomain.com:23560)
11/6/2023 1:22:03 PM Reconnect
11/6/2023 1:22:04 PM Connected
11/6/2023 1:22:10 PM Send Login
11/6/2023 1:22:10 PM Local: 11/6/2023 1:22:10 PM UTC: 11/6/2023 12:22:10 PM
11/6/2023 1:22:10 PM MarkUnused
11/6/2023 1:22:10 PM Login OK: Welcome to PRTG

```

If the connection fails, for example because of an incorrect Access Key, or because of incorrect IP address settings (see [step 2](#)<sup>[107]</sup>), you see:

```

11/6/2023 1:42:02 PM Try to connect...
11/6/2023 1:42:02 PM Connected to 10.0.2.167:23560
11/6/2023 1:42:07 PM Login NOT OK: Access key not correct!

```

If you need to adjust any settings for the connection to the PRTG core server, use the [PRTG Administration Tool](#)<sup>[3067]</sup> on the remote probe system.

Remote Probe Settings in PRTG Administration Tool

Under Connection to PRTG Core Server, you can then edit the following settings:

- **Server (IPv4 Address or DNS Name):** Enter the IP address or Domain Name System (DNS) name of the PRTG core server that the remote probe is to connect to. If you use network address translation (NAT) rules, you must enter the IP address that is externally visible, because the remote probe connects from outside your network.
- **Access Key and Confirm Access Key:** Enter the access key that the remote probe is to send to the PRTG core server. You must define this access key on the PRTG core server in [Core & Probes](#)<sup>[2888]</sup>. Make sure that the access keys match.

Click Save & Close to confirm your settings and to (re)start the PRTG probe service.

For more information about these settings, see section [PRTG Administration Tool](#)<sup>[3067]</sup>.

- <https://www.paessler.com/support/how-to/firewall>

How to install a PRTG remote probe in 4 steps

- <https://www.paessler.com/support/how-to/remote-probe-installation>

## 4.8 Uninstall PRTG Products

Whether you uninstall an entire PRTG installation or a remote probe installation, take the following steps. Use the Windows uninstall routines to remove the software from your system.

■ For more information on how to uninstall a multi-platform probe, see the [Multi-Platform Probe for PRTG](#) manual.

### Step 1

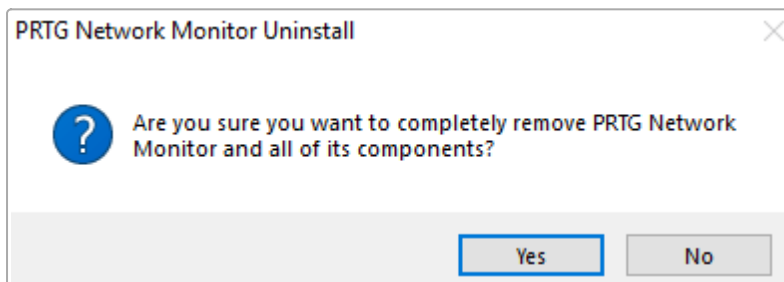

From the Windows Start menu, run Uninstall PRTG Network Monitor or open your Windows Control Panel and select the desired entry in the Programs and Features section. To uninstall a remote probe, only the second option applies. Depending on the installed products, not all uninstall programs are available.

### Step 2

If asked, confirm the question of the Windows User Account Control with Yes to allow the program to uninstall. The software uninstall dialog guides you through the uninstall process.

### Step 3

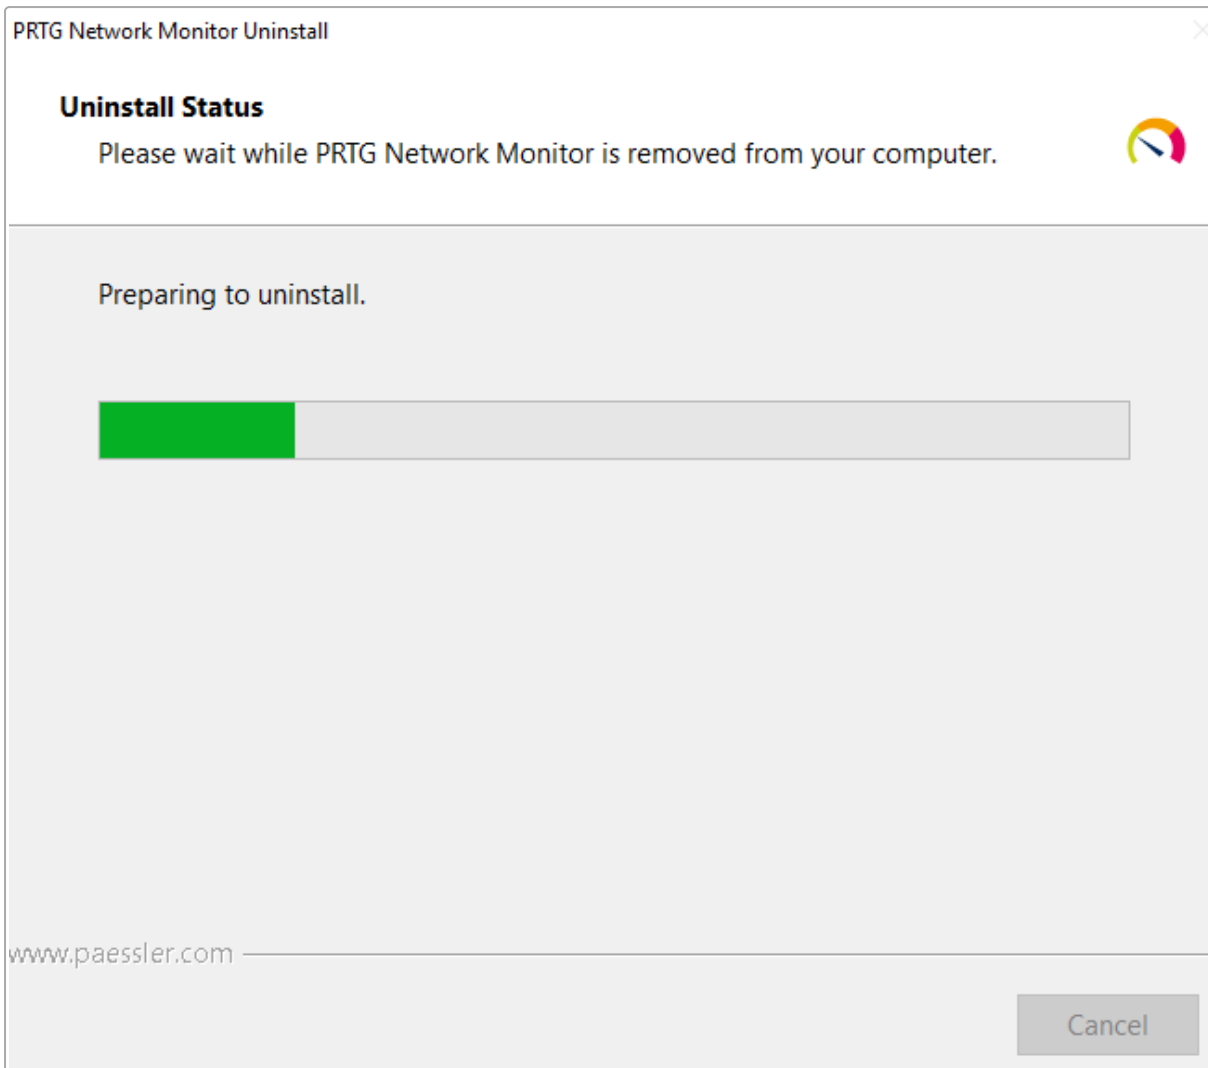

Confirm the removal of the software with Yes.

Uninstall PRTG Network Monitor Step 1

### Step 4

Wait while the software is removed.

Uninstall PRTG Network Monitor Step 2

## Step 5

Confirm a system restart with Yes.

Uninstall PRTG Network Monitor Step 3

## Step 6

After the system restart, the software is removed, but there is still some custom data in the PRTG program directory. If you have uninstalled an entire PRTG installation or a remote probe installation, your monitoring data is still stored on the system. To completely remove all PRTG data, delete the PRTG Network Monitor folder as well as the Paessler\PRTG Network Monitor folder in the PRTG data directory.

■ For more information, see section [Data Storage](#) .

## Step 7

During the installation of PRTG, a component called Npcap is also installed on your system. After you uninstall PRTG, you need to manually uninstall this feature. To do so, open your Windows Control Panel and select Npcap 0.9983 in the Programs and Features section. Click Uninstall to remove this feature from your Windows system.

 If you updated to PRTG 19.2.50, you also need to manually uninstall the Npcap loopback adapter. For more information, see the Knowledge Base: [I have issues with additional services after updating to PRTG 19.2.50. What can I do?](#)

# Part 5

# Understanding Basic Concepts

## 5 Understanding Basic Concepts

There are a number of basic concepts that are essential for understanding the functionality of PRTG. This includes, for example, the underlying architecture of the monitoring system, the hierarchy of objects, the inheritance of settings, the access rights management, and notifications.

In this section:

- [Architecture and User Interfaces](#)  124
- [Failover Cluster](#)  128
- [Object Hierarchy](#)  132
- [Inheritance of Settings](#)  136
- [Tags](#)  138
- [Dependencies](#)  140
- [Scheduling](#)  141
- [Notifying](#)  142
- [Access Rights Management](#)  145
- [Data Reporting](#)  149
- [IPv6 Support](#)  150

## 5.1 Architecture and User Interfaces

In this section, you can find an overview of the components of PRTG and how it works.

### Overview

You can classify the components of PRTG into three main categories: system parts, user interfaces, and basic system administration tools.

Category	Components
System Parts	<p><a href="#">PRTG core server</a><sup>[125]</sup> This is the central part of a PRTG installation. The PRTG core server includes the data storage, the web server, the report engine, the notification system, and more. The PRTG core server is configured as a Windows service that permanently runs.</p> <p><a href="#">Probes</a><sup>[125]</sup> This is the part of PRTG that performs the actual monitoring. There are local probes, remote probes, and cluster probes in PRTG Network Monitor, and there are hosted probes and remote probes in PRTG Hosted Monitor. Probes forward all monitoring data to the central PRTG core server. Probes are configured as services that permanently run.</p> <p> We assume that all systems on which the PRTG core server with the local probe or any remote probes run are secure. It is every system administrator's responsibility to make sure that only authorized persons can access these systems. For this reason, we highly recommend that you use dedicated machines for your PRTG system parts.</p>
User Interfaces	<p><a href="#">PRTG web interface</a> With the Asynchronous JavaScript and XML (AJAX) based PRTG web interface, you can configure devices and sensors, review monitoring results, and configure the system administration and user management.</p> <p><a href="#">PRTG app for desktop</a><sup>[2984]</sup> The PRTG app for desktop is a cross-platform application that you can use as an alternative interface for fast access to data and monitoring management. With the PRTG app for desktop, you can connect to several independent PRTG core servers or PRTG Hosted Monitor instances to display their data and centrally manage your monitoring.</p> <p><a href="#">PRTG apps for mobile network monitoring</a><sup>[2988]</sup> With the PRTG apps for iOS and Android, you can monitor your network on the go and receive push notifications in case of alerts.</p>
System Administration Tools	<p><a href="#">PRTG Administration Tool on PRTG Core Server Systems</a><sup>[3041]</sup>  With the PRTG Administration Tool on the PRTG core server system, you can configure basic PRTG core server settings in PRTG Network Monitor such as the <a href="#">PRTG System Administrator</a> user login, web server IP addresses and the web server port, probe connection settings, the cluster mode, the system language, and more.</p>

Category	Components
	<p><a href="#">PRTG Administration Tool on Remote Probe Systems</a><sup>130671</sup></p> <p>With the PRTG Administration Tool on the remote probe system, you can configure basic remote probe settings such as the name of the remote probe, IP address and server connection settings, and more.</p>

## PRTG Core Server

The PRTG core server is the heart of PRTG. It performs the following tasks:

- Configuration management for target devices (for example, servers, workstations, printers, switches, routers, or virtual machines (VM))
- Management and configuration of connected probes
- Cluster management
- Database for monitoring results
- Notification management including a mail server for email delivery
- Report generation and scheduling
- User account management
- Data purging (for example, deleting data that is older than 365 days)
- Web server and application programming interface (API) server

**i** In a [cluster](#)<sup>128</sup>, the master node is responsible for all of these tasks.

The built-in and secure web server, for which you require no additional Microsoft Internet Information Services (IIS) or Apache, supports HTTP as well as HTTPS (secured with Secure Sockets Layer (SSL)/Transport Layer Security (TLS)). It serves the PRTG web interface when you access it via a browser and also answers PRTG API calls.

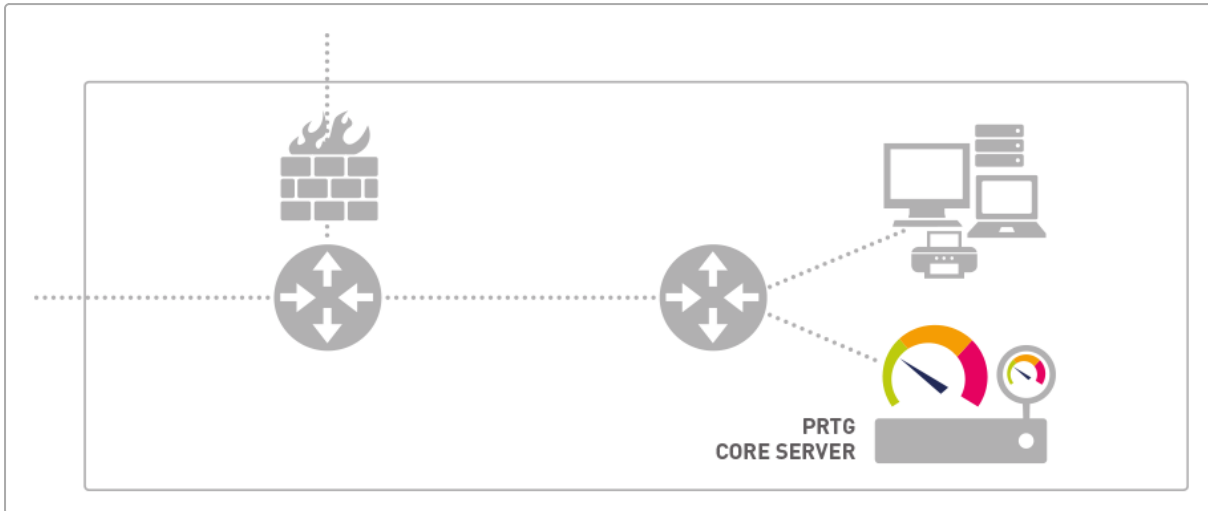

**i** The PRTG core server is configured as a Windows service that permanently runs. A logged-in user is not required.

## Probes

On the probe, PRTG performs the actual monitoring via the sensors that you created on a device (for example, a computer, a router, a server, a firewall, and more). The probe receives its configuration from the PRTG core server, runs the monitoring processes, and delivers monitoring results back to the PRTG core server.

**☰** For PRTG Network Monitor, there is always a local probe that runs on the PRTG core server system.

**☁** For PRTG Hosted Monitor instances, there is always a hosted probe that runs on the PRTG core server system that Paessler hosts for you.

PRTG Core Server and Local Probe That Monitors a LAN

The actual monitoring is performed by probe processes that run on one or more systems.

- ❶ The probes are configured as a Windows service that permanently runs. A logged-in user is not required.

Probe Type	Description
Local probe	<p>During the installation, PRTG automatically creates the <a href="#">local probe</a>. In a single-probe installation, which is the default setup, the local probe performs all monitoring.</p> <p>For PRTG Network Monitor, the PRTG core server with the local probe inside the corporate LAN can monitor services and servers in the entire LAN.</p>
Hosted probe	<p>When you create a PRTG Hosted Monitor instance, the system automatically creates the <a href="#">hosted probe</a>. The hosted probe shows monitoring values of the hosted instance and can monitor devices, servers, and services that are publicly available in the internet like websites.</p>
Cluster probes	<p>In a cluster, a <a href="#">cluster probe</a> runs on all cluster nodes. All devices that you create on the cluster probe are monitored by all cluster nodes, so data from different perspectives is available and monitoring continues even if one of the cluster nodes fails.</p>
Remote probes	<p>You can create additional <a href="#">remote probes</a> to monitor multiple locations, to monitor a LAN with PRTG Hosted Monitor, or for several other scenarios. Remote probes use SSL/TLS-secured connections to the PRTG core server. With remote probes, you can securely monitor services and systems inside remote networks that are not publicly available or that are secured by firewalls.</p>

Probe Type	Description
	<p>There are three types of remote probes: classic remote probes, multi-platform probes, and mini probes.</p> <ul style="list-style-type: none"> <li>■ For more information, see section <a href="#">Add Remote Probe</a><sup>[3196]</sup>.</li> <li>▶ For more information, see the video tutorial: <a href="#">Distributed monitoring with PRTG</a>.</li> </ul>
Classic remote probes	<p>Classic remote probes extend your monitoring to other Windows systems in your local or remote network.</p> <ul style="list-style-type: none"> <li>■ For more information, see section <a href="#">Install a Remote Probe</a><sup>[106]</sup>.</li> </ul>
Multi-platform probes 	<p>You can install <a href="#">multi-platform probes</a> on Linux systems in your local or remote network. The multi-platform probe scans the network and sends monitoring results to the <a href="#">PRTG core server</a><sup>[125]</sup> via a NATS server.</p> <ul style="list-style-type: none"> <li>■ For more information, see the <a href="#">Multi-Platform Probe for PRTG</a> manual.</li> </ul>
Mini probes 	<p>Mini probes let you create small probes on any device, not only on Windows systems.</p> <ul style="list-style-type: none"> <li>■ For more information, see section <a href="#">Mini Probe API</a><sup>[3153]</sup>.</li> </ul>

## 5.2 Failover Cluster

A [cluster](#) consists of two or more PRTG core servers that work together to form a high-availability monitoring system.

 This feature is not available in PRTG Hosted Monitor.

### Cluster Concept

A cluster consists of at least two cluster nodes: one [master node](#) and one or more [failover nodes](#), where up to four failover nodes are possible. Each cluster node is a full PRTG core server installation that can perform all of the monitoring and alerting on its own.

Cluster with Two Cluster Nodes

See the following table for more information on how a cluster works:

Feature	Description
Connection and communication	Cluster nodes are connected to each other with two TCP/IP connections. They communicate in both directions and a single cluster node only needs to connect to one other cluster node to integrate itself into the cluster.

Feature	Description
Object configuration	During normal operation, you configure devices, sensors, and all other monitoring objects on the master node. The master node automatically distributes the configuration among all other cluster nodes in real time.
Fail-safe monitoring	<p>All devices that you create on the cluster probe are monitored by all cluster nodes, so data from different perspectives is available and monitoring continues even if one of the cluster nodes fails.</p> <p>If the master node fails, one of the failover nodes takes over and controls the cluster until the master node is back. This ensures continuous data collection.</p>
Active-active mode	A cluster works in <a href="#">active-active</a> mode. This means that all cluster nodes permanently monitor the network according to the common configuration that they receive from the master node. Each cluster node stores the results in its own database. PRTG also distributes the storage of monitoring results among the cluster.
PRTG updates	You only need to install PRTG updates on one cluster node. This cluster node automatically deploys the new version to all other cluster nodes.
Notification handling	If one or more cluster nodes discover downtime or threshold breaches, only one installation, either the primary master node or the failover master node, sends out notifications, for example, via email, SMS text message, or push message. Because of this, there is no notification flood from all cluster nodes in case of failures.
Data gaps	<p>During the outage of a cluster node, it cannot collect monitoring data. The data of this single cluster node shows gaps. However, monitoring data for the time of the outage is still available on the other cluster nodes.</p> <p> There is no functionality to fill these gaps with the data of other cluster nodes.</p>
Monitoring results review	Because the monitoring configuration is centrally managed, you can only change it on the primary master node. However, you can review the monitoring results of any of the failover nodes in read-only mode if you log in to the PRTG web interface.
Remote probes	<p>If you use <a href="#">classic remote probes in a cluster</a><sup>[5210]</sup>, each remote probe connects to each cluster node and sends the data to all cluster nodes. You can define the Cluster Connectivity of each remote probe in its <a href="#">settings</a><sup>[521]</sup>.</p> <p> You cannot add multi-platform probes to a cluster. For more information about the multi-platform probe, see the <a href="#">Multi-Platform Probe for PRTG</a> manual.</p>

## Performance Considerations for Clusters

Monitoring traffic and load on the network is multiplied by the number of used cluster nodes. Furthermore, the devices on the cluster probe are monitored by all cluster nodes, so the monitoring load increases on these devices as well.

For most usage scenarios, this does not pose a problem, but always keep in mind the [system requirements](#). As a rule of thumb, each additional cluster node means that you need to divide the number of sensors that you can use by two.

 PRTG does not officially support more than 5,000 sensors per cluster. Contact the [Paessler Presales team](#) if you exceed this limit. For possible alternatives to a cluster, see the Knowledge Base: [Are there alternatives to the cluster when running a large installation?](#)

## Cluster Setup

 For more information, see section [Failover Cluster Configuration](#).

## 5.3 Object Hierarchy

PRTG arranges all objects in the monitoring configuration in a tree-like hierarchy. You can arrange the objects in groups that monitor similar devices, services, or particular locations. You can also use this hierarchical order to define common settings for larger groups of objects. The settings of the root group, for example, apply to all other objects underneath in the object hierarchy by default.

For more information, see section [Inheritance of Settings](#)<sup>[136]</sup>.

Object Hierarchy in PRTG

### Root Group

The [root group](#) is the topmost instance in PRTG. It contains all other objects in your setup. We recommend that you [adjust all default settings for the root group](#)<sup>[420]</sup>. This is because all other objects in the device tree [inherit](#)<sup>[136]</sup> these standard settings by default so that you do not need to set up the same configuration for each object anew.

## Probe

Each group is part of a **probe** (this excludes root group). This is where the actual monitoring takes place. All objects that you add to a probe are monitored via that probe. In PRTG Network Monitor, every PRTG core server installation automatically installs the **local probe**.

☁ In PRTG Hosted Monitor, every instance has the **hosted probe**.

In a **failover cluster**<sup>[128]</sup>, there is an additional **cluster probe** that runs on all cluster nodes. All devices that you create on the cluster probe are monitored by all cluster nodes, so data from different perspectives is available and monitoring continues even if one of the cluster nodes fails.

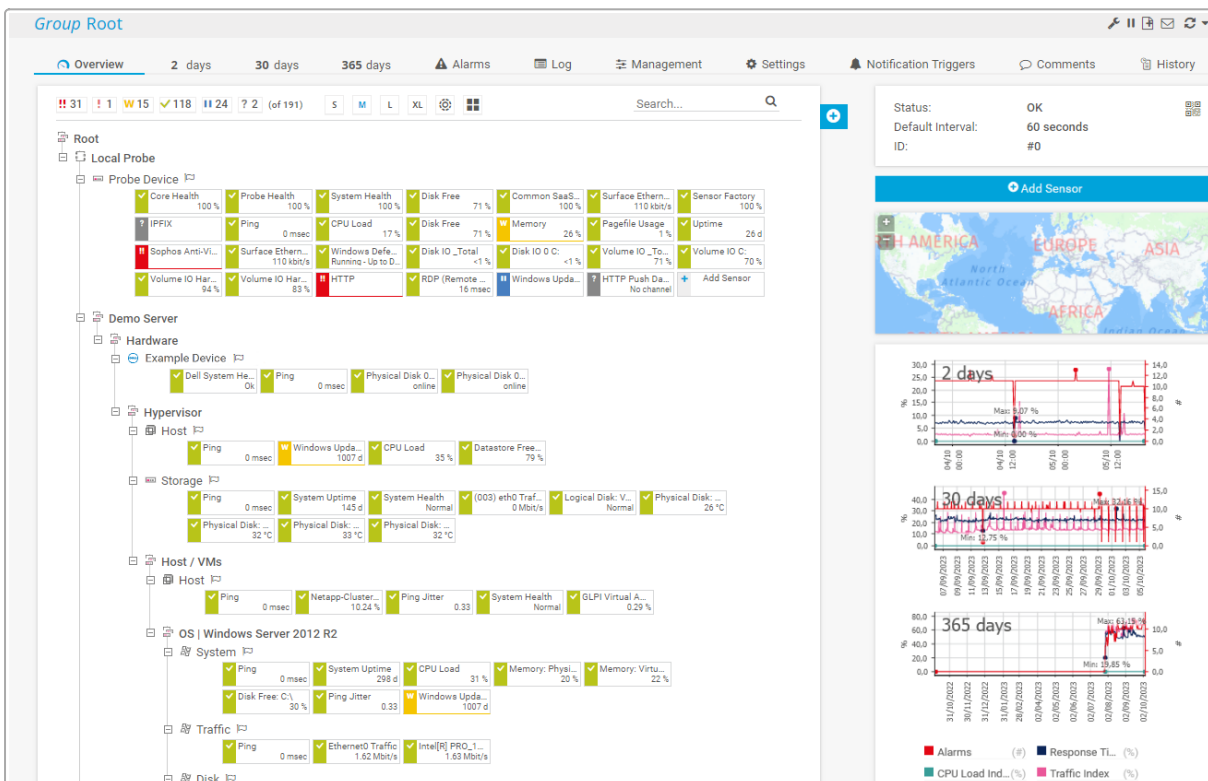

You can add additional probes and remote probes to your configuration to also monitor remote devices from outside your network.

■ For more information, see section **Add Remote Probe**<sup>[3196]</sup>.

## Group

On each probe, there are one or more **groups** that have structural purposes. Use groups to arrange similar objects so that they inherit the same settings. To a group, you add devices. You can arrange your devices in different nested groups to reflect the structure of your network.

Here you can see a sample configuration of a device tree with the local probe, several groups, devices, and their sensors:

Object Hierarchy in the Device Tree

## Device

You can add [devices](#) that you want to monitor to each probe or group. Each device in your configuration represents real hardware or a virtual device in your network, for example:

- Web or file servers
- Client computers (Windows, Linux, or macOS)
- Routers or network switches
- Almost every device in your network that has its own IP address

 You can add devices with the same IP address or Domain Name System (DNS) name multiple times. This way, you can get a more detailed overview when you use a large number of sensors or you can use different device settings for different groups of sensors. The sensors on all of these devices then query the same real hardware device in your network.

PRTG additionally adds the [probe device](#) to the local probe. This is an internal system device with several sensors. It has access to the probe system and monitors the system's health parameters.

PRTG automatically analyzes the devices that you add and recommends appropriate sensors on the Overview tab of the device. To create recommended sensors, click Add These Sensors in the Recommended Sensors table.

 For more information about the Overview tab, see the Knowledge Base: [What options do I have to review my monitoring data in detail?](#)

 You can turn off the sensor recommendation in the system administration settings under [Monitoring](#)<sup>2874</sup>.

## Sensor

On each device, you can create a number of [sensors](#). Every sensor monitors one single aspect of a device, for example:

- A network service like Simple Mail Transfer Protocol (SMTP), File Transfer Protocol (FTP), or HTTP
- The traffic on a network switch
- The CPU load of a device
- The memory usage of a device
- The traffic on one network card
- A NetFlow device
- The system health of a device
- And much more

 For more information, see the video tutorial: [What is a sensor?](#)

## Channel

Every sensor has a number of [channels](#) through which it receives the different data streams. The available channels depend on the type of sensor. One channel can contain, for example:

- Downtime and uptime of a device
- Traffic in, Traffic out, or Traffic sum of a bandwidth device (for example, a router)
- Mail traffic of a NetFlow device
- CPU load of a device
- Loading time, Download bandwidth, or Time to first byte of a web page
- Response time of a ping request to a device
- And much more

## More

 VIDEO TUTORIAL

What is a sensor?

- <https://www.paessler.com/support/videos-and-webinars/videos/what-is-a-sensor>

## 5.4 Inheritance of Settings

The [hierarchically structured](#)<sup>[132]</sup> device tree organizes the devices in your network. This object hierarchy is the basis for the [inheritance of settings](#). Objects in the device tree can inherit their settings from a higher level. For example, you can change the scanning interval of all sensors by editing the interval setting of the root group (if you define no other setting underneath in the object hierarchy).

### Inheritance to Child Objects

You can override the inheritance of settings to child objects at any level of the object hierarchy if you set a different value for a specific probe, group, device, or sensor. All objects underneath inherit these new settings. Object settings from higher levels do not inherit the new settings.

Settings that are inherited to all objects include:

- Scanning intervals
  - [Notification triggers](#)<sup>[2693]</sup>
  - Credentials for different systems
  - Compatibility settings for specific sensor types
  - Channel and unit configurations
  - [Access rights](#)<sup>[145]</sup>
  - [Tags](#)<sup>[138]</sup>
  - Paused [status](#)<sup>[181]</sup>: If an object is paused by the user or by a schedule, PRTG sets all sensors on this object to the Paused status as well
- i** There is one exception for devices and sensors. Sensors [always](#) inherit the IP Address/DNS Name of a device and the compatibility settings. You cannot change these settings at sensor level.

Here you can see the Credentials for Windows Systems setting that the object inherits from the parent:

Inherited Credentials for Windows Systems

Click  next to inherit from [\[parent object\]](#) to override the parent object's settings and enter new settings for this object and all objects underneath in the object hierarchy.

Credentials for Windows Systems

**i** Click Save for your settings to take effect. If you click  after you enter your settings, the object inherits the parent object's settings again and your object-specific settings do not take effect.

## Default Settings in Root Group

For all settings except passwords, PRTG already includes a set of default values. The following settings, for example, are inherited by all sensors from the root group:

- A default scanning interval of one minute
- SNMP v1 with the community string set to public (this is the default setting for most devices)
- The dependency type Use parent (default)
- And more

Before you set up your monitoring, we recommend that you review the root group settings and set the default values to suit your setup. This includes the credentials for the different systems in your network that you want to monitor (Windows, Linux, virtual servers, different vendors, and more).

■ For more information, see section [Root Group Settings](#) <sup>420</sup>.

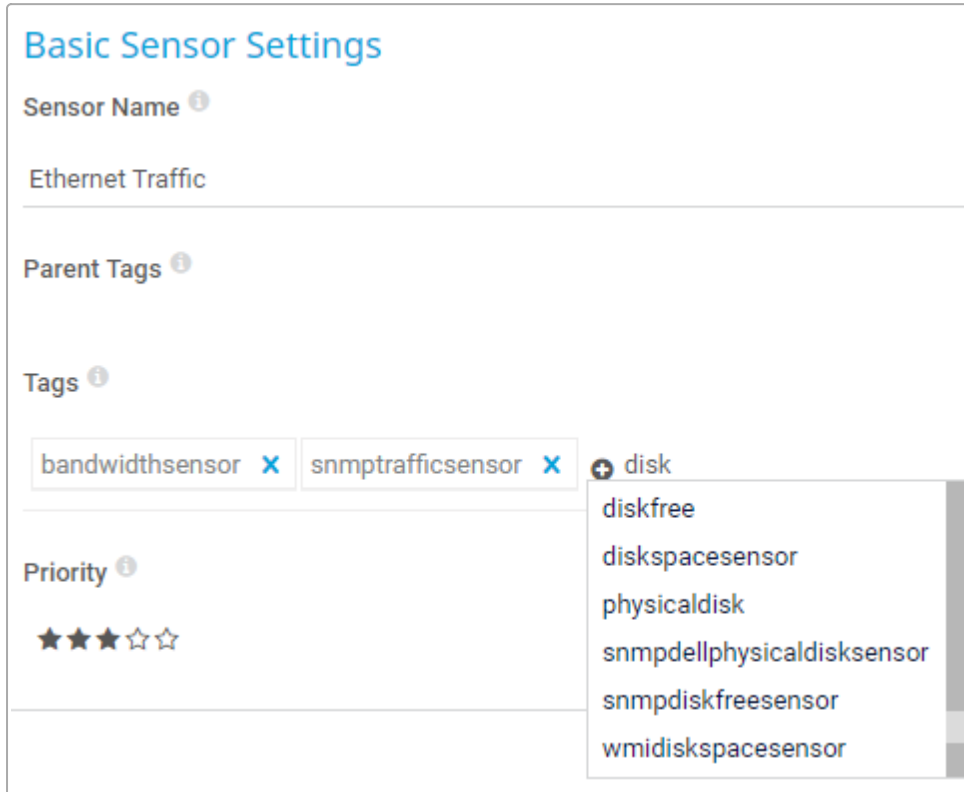

## Inheritance of Notification Triggers

If you add notification triggers at probe, group, or device level, these are also inherited to all sensors underneath in the object hierarchy unless you manually disable the inheritance.

■ For more information, see section [Notification Triggers Settings](#) <sup>2693</sup>.

## 5.5 Tags

For every object in your setup, you can define tags in the [object settings](#)<sup>[201]</sup> to additionally categorize these objects. Although some tags are predefined when you [add objects](#)<sup>[257]</sup>, you can add further tags. For example, you can mark all bandwidth sensors that are especially important for you with the tag [bandwidthimportant](#).

View and Edit Tags in Basic Sensor Settings

To confirm a tag, use the Enter key, the Spacebar key, or a comma.

- ❶ If you multi-edit tags, PRTG overwrites existing tags.
- ❷ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (<>).
- ❸ For performance reasons, it can take some minutes until you can filter for new tags that you added.

### Inheritance of Tags

Tags in object settings are automatically [inherited](#)<sup>[136]</sup> by all other objects underneath in the [object hierarchy](#)<sup>[132]</sup>. You can view inherited tags in section Parent Tags in the settings of a sensor, device, or group.

For example, a device with the tag [netflow](#) automatically passes on this tag to all sensors that you add to the device. This is useful, for example, if you include sensors by tag in [reports settings](#)<sup>[276]</sup>. PRTG adds all sensors with the tag [netflow](#) to the report so that you do not need to manually tag every single sensor.

 You cannot disable the inheritance of tags.

## Filter by Tags

You can use one or more tags to filter [table lists](#)<sup>[218]</sup> for specific objects, or to add sensors to [libraries](#)<sup>[2738]</sup> and [reports](#)<sup>[2754]</sup>.

When you filter by tags, you can also use the plus sign (+) or the minus sign (-) to categorize tags as [must have](#) or [must not have](#).

- Use a tag with a leading + to specify that objects with this tag must be included.
- Use a tag with a leading – to specify that objects with this tag must not be included.
- Use tags without a leading plus or minus sign to specify that objects need to have at least one of these tags to be included.

The filter only shows an object if all three conditions are met. The order of the tags in a tag field does not matter.

### Examples

Here are some examples that show how to filter by tags:

- If you enter [-netflow](#), the table list, library, or report includes all objects that do not have this tag. With the tags [+netflow](#) or [netflow](#), you filter for objects that have this tag.
- If you enter [+netflow -bandwidthimportant](#), the table list, library, or report includes all objects that have the tag 'netflow', but excludes all objects that have the tag 'bandwidthimportant'.
- If you enter [netflow bandwidthimportant](#), the table list, library, or report includes all objects that have either the tag 'netflow' or the tag 'bandwidthimportant' or both tags.

## Tag Display Limits

For performance reasons, PRTG has a display limit of 1,000 tags when you select Sensors | By Tag in the [main menu bar](#)<sup>[241]</sup>. If you have more than 1,000 tags, PRTG shows no tags here. You can, however, still use tags for filters and searches, for example.

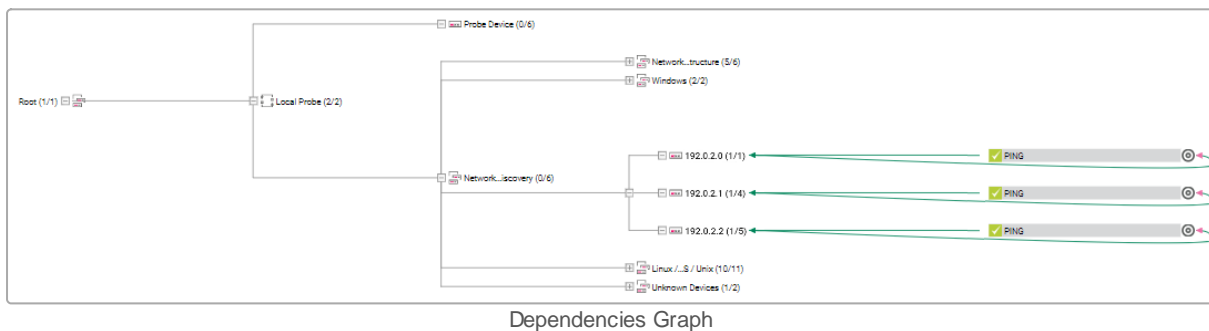

## 5.6 Dependencies

You can use dependencies to pause sensors based on the [status](#) of a different (master) sensor to avoid false alarms and incorrect downtime recording. A dependency stops the monitoring of one sensor or a set of sensors as soon as the parent sensor shows the Down status or if the parent sensor shows the Paused status because of another dependency. This means, for example, that you can stop monitoring remote network services when the corresponding firewall is down because of connection problems.

When you use the [auto-discovery](#) feature, PRTG sets the [Ping](#) sensor of a device as the [master](#) object for the device by default. This means that monitoring for the entire device is paused if the Ping sensor shows the Down status or if it shows the Paused status because of a dependency. Usually, it makes little sense to monitor any other parameters while the Ping sensor indicates that the device is unavailable.

- i** You do not trigger a status change by [dependency](#) if you manually pause a master object or if you pause it by [schedule](#). For more information, see the Knowledge Base: [Why will dependent objects not automatically pause when I pause the master object?](#)
- i** If a sensor shows the Paused status because of a dependency, the objects that use the sensor as parent also show the Paused status.

To view the list of dependencies, select Devices | Dependencies and the corresponding dependencies path from the [main menu bar](#). From there you can also access the [dependencies graph](#) that visualizes all dependencies in your network.

- For more information about the dependency settings, see the [settings of the object](#) for which you want to set a dependency, section Schedules, Dependencies, and Maintenance Window.

### More

#### ■ KNOWLEDGE BASE

Why will dependent objects not automatically pause when I pause the master object?

- <https://kb.paessler.com/en/topic/76351>

## 5.7 Scheduling

With schedules, you can specify active and inactive time spans for monitoring. For example, you can choose to monitor only on Sundays between 16:00 and 20:00. If you use scheduling, PRTG automatically [pauses](#)<sup>[227]</sup> specific objects outside of the scheduled active times. A sensor in the Paused [status](#)<sup>[181]</sup> does not collect monitoring data, does not change its status, and does not trigger any [notifications](#)<sup>[142]</sup>. You can also pause monitoring for planned system maintenance windows to avoid false alarms. You can apply different schedules to every object. PRTG also uses schedules for reports and notifications.

**i** You do not trigger a status change by [dependency](#)<sup>[140]</sup> if you manually pause a master object or if you pause it by [schedule](#)<sup>[141]</sup>. For more information, see the Knowledge Base: [Why will dependent objects not automatically pause when I pause the master object?](#)

### Schedules, Dependencies, and Maintenance Window

 inherit from  Internet

*Schedules, dependencies, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all child objects and the inheritance cannot be disabled. Below you can set additional schedules, dependencies, or maintenance windows that will be used in parallel to any inherited setting.*

**Schedule** **i** None ▼

- <https://kb.paessler.com/en/topic/76351>

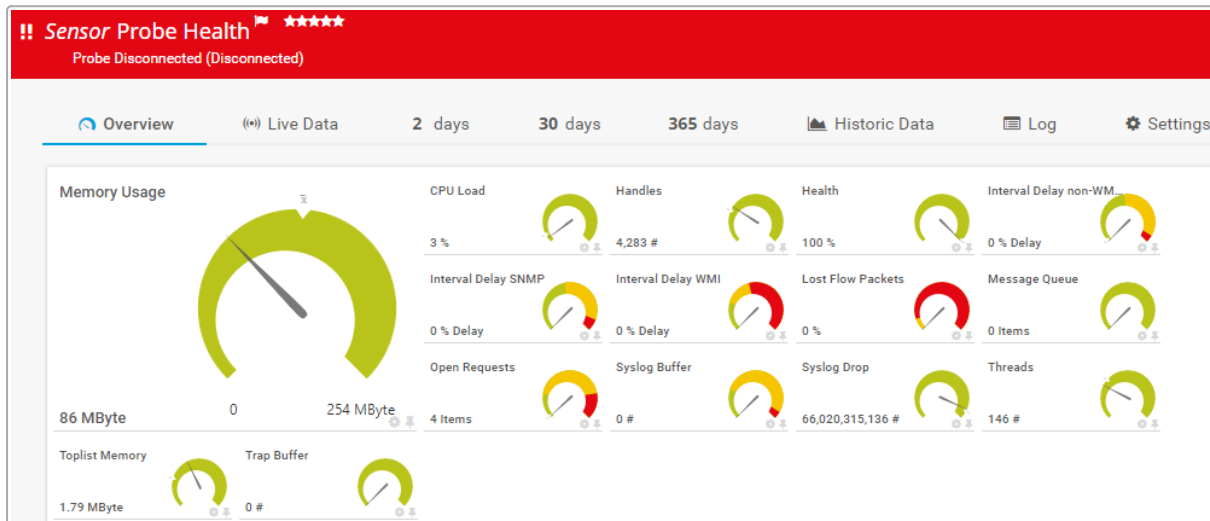

## 5.8 Notifying

PRTG keeps you or other responsible people informed about the status of the network. There are several methods that you can use to stay up to date.

### Internal Sensor Alerts

Alerts are an important part of monitoring that informs you when there are issues, when values exceed limits, or when a sensor status changes, for example. Some sensors display internal alerts in case of errors, for example, disconnected probes or socket and timeout errors. There are also sensors whose internal sensor alerts you can modify. To see if you can modify an alert, check the sensor's settings for customizable options.

Here is an example of a sensor that is in the Down [status](#)<sup>[181]</sup> because of an internal sensor alert.

Probe Health Sensor with Disconnected Probe Alert

HTTP sensors, for example, show preconfigured internal alerts based on specific HTTP status codes.

For more information, see the Knowledge Base: [Which HTTP status code leads to which HTTP sensor status?](#)

### Channel Limits

There are also alerts that are triggered by limits that you can set in the [channel settings](#)<sup>[2681]</sup> of a sensor. PRTG triggers a [sensor status](#)<sup>[181]</sup> change when a sensor measures values that exceed or fall below a defined limit. For example, you can set an [SNMP CPU Load](#) sensor to the Down status when it measures values that you consider critical. This sensor then appears in the [alarms](#)<sup>[202]</sup> list as well.

**i** This type of alert only applies when a value breaches the configured limits. If the value is normal again in the next sensor scan, the sensor shows the Up status again.

**i** The value type that you need to configure for limits depends on the type of data that the channel returns. You can set [absolute values or delta values](#)<sup>[2690]</sup>.

**▶** For more information, see the video tutorial: [How to set channel limits.](#)

## Lookups for Channels

PRTG also uses lookups for some sensors. In general, lookups make data more human friendly because they map status values that a device returns, usually integers, to more informative expressions in words that show you the status of a target device in plain text.

SNMP HP LaserJet Hardware Gauge

Additionally, lookups can define the sensor status in combination with specific status codes. For example, a sensor can show the Unknown status if a channel value, provided by lookups, indicates that the device is **inactive**, instead of displaying a numeric value like **-1**.

You can also modify preconfigured lookups or create your own custom lookups.

■ For more information, see section [Define Lookups](#) <sup>[3181]</sup>.

## Notifications

PRTG can send a [notification](#) <sup>[2735]</sup> when it discovers, for example, downtime, an overloaded system, threshold breaches, or similar situations. Notifications use various [methods](#) <sup>[2815]</sup> to notify you of issues. After you create [notification templates](#) <sup>[2808]</sup> in the system settings, you can select the templates on the Notification Triggers tab of probes, groups, devices, and sensors, as well as the root group.

The status or the data of a sensor can also trigger notifications. With this mechanism, you can configure custom external alerts. Which [notification triggers](#) <sup>[2693]</sup> are available depends on the kind of object you edit. You can define notification triggers that are activated by an 'on change' event. Some sensors offer the option to trigger a notification whenever sensor values change.

■ For more information, see section [Notifications](#) <sup>[2735]</sup>.

## Alarms

The alarms list shows all sensors that are in the Down, Down (Partial), Down (Acknowledged), Warning, or Unusual status. Sensors in the Up, Paused, or Unknown states do not appear here.

■ For more information, see section [Alarms](#) <sup>[202]</sup>.

## Logs

The logs list shows the log file that includes all monitoring events. PRTG documents the activity of every single object, so you can use this data to check if your setup works as expected.

■ For more information, see section [Logs](#) .

## Tickets

The tickets list shows tickets with important system information or actions that you need to take. We recommend that you view every ticket and take appropriate action. By default, PRTG sends an email to the [PRTG System Administrator](#) user for every new ticket that the system or a user creates. If a ticket is assigned to a specific user, this user also receives an email by default.

■ For more information, see section [Tickets](#) .

## 5.9 Access Rights Management

With the access rights management, you can define which user in which user group can access which objects in your PRTG installation, and you can manage all user access rights and group access rights.

You can create a nearly unlimited number of other users, which you can organize in a nearly unlimited number of user groups. Each user group can have separate [access rights](#)<sup>[145]</sup> for each object in the device tree except channels, as well as for libraries, maps, and reports. Objects can also [inherit](#)<sup>[136]</sup> access rights according to the [object hierarchy](#)<sup>[132]</sup>.

### User Access Rights Overview

Each user also has specific access rights. There are [administrators](#) who are user group members with administrative rights, [read/write users](#), and [read-only users](#). You can define the user type in the user account settings (read-only user or read/write user).

■ For more information, see section [User Accounts](#)<sup>[2901]</sup>.

**Account Settings**

<b>User Type</b> ⓘ	<input type="radio"/> Read/write user <input checked="" type="radio"/> Read-only user
<b>Acknowledge Alarms</b> ⓘ	<input type="radio"/> Allow user to acknowledge alarms <input checked="" type="radio"/> Do not allow user to acknowledge alarms (default)
<b>Password Change</b> ⓘ	<input type="radio"/> Allow user to change the account password <input checked="" type="radio"/> Do not allow user to change the account password (default)
<b>Primary Group</b> ⓘ	PRTG Users Group
<b>Status</b> ⓘ	<input checked="" type="radio"/> Active <input type="radio"/> Paused
<b>Last Login</b> ⓘ	(has not logged in yet)

User Access Rights in User Accounts Settings

Individual user access rights, combined with the access rights of the groups that the user is a member of, determine the access rights for device tree objects, libraries, maps, and reports. In general, group access rights override user access rights unless a user is a read-only user. Read-only users always have only read access.

You can define the group access rights for each object in the device tree via the corresponding [context menus](#)<sup>[229]</sup> or in the [object settings](#)<sup>[201]</sup>.

### Group Access Rights Overview

The following classes of group access rights are available, in hierarchical order (from the lowest group access right to the highest group access right).

ⓘ The access rights apply to device tree objects and to libraries, maps, and reports.

Group Access Rights	Description
No access	The members of the user group <b>cannot</b> see or access the object. They also cannot see or access logs, tickets, or alarms for the object.
Read access	The members of the user group can <b>only</b> view the object and its settings. <b>i</b> <b>Read-only users</b> who have been explicitly allowed to acknowledge alarms and <b>read/write users</b> in a user group that has <b>read access</b> can still acknowledge alarms. For more information, see section <a href="#">User Accounts</a> [2906].
Write access	The members of the user group can view the object and edit its settings. They can also add and delete objects, acknowledge alarms, edit notification templates, notification contacts, and schedules.
Full access	The members of the user group can view the object and edit its settings. They can also add and delete objects, acknowledge alarms, edit notification templates, notification contacts, and schedules. In addition, they can edit group access rights for objects.

If a user group has **administrative rights**, all user group members always have **full access** to every object in the device tree, library, map, and report, and all other functionalities and features of PRTG.

**i** Group access rights that you define directly on an object, for example a device, override inherited rights. If you do not define group access rights directly on an object, PRTG checks the next object that is higher up in the object hierarchy for group access rights until there is no higher-level object available.

Access Rights		
Object ▼	Access ↕	Comments ↕
PRTG Administrators	Full access	Administrator
PRTG Users Group	Write access	Defined in current object
UserGroup Admin	Full access	Administrator
UserGroup No Ticket	Read access	Defined in current object

Different Access Rights Depending on User Groups

**i** Users are either members of **PRTG user groups** or of **Active Directory groups**. They cannot be members of both types of user group. We recommend that you use only one type of user group to minimize administration.

## Group Access Rights in Combination with User Access Rights

The following table shows the correlation between group access rights and user access rights. The table applies to both PRTG user groups and Active Directory groups, as well as to both PRTG users and Active Directory users. The column headings show the group access rights to an object. The row headings show the type of user.

Group Access Rights and User Access Rights Combined				
	User group has read access to an object	User group has write access to an object	User group has full access to an object	Administrator group
Read-only user	Read access	Read access	Read access	n/a
Read/write user	Read access	Write access	Full access	Full access
Administrator	Full access	Full access	Full access	Full access

The following rules apply:

- Read-only users
  - always have only read access, no matter what access rights you define for the user groups they are members of.
  - can never see or use the ticket system.
  - can acknowledge alarms and change their own password in their user account settings, if an administrator allows them to.
  - can never be members of user groups with administrative rights.
- Read/write users
  - can use the ticket system if the user group they are members of has access to the ticket system.
  - can acknowledge alarms.
  - can change their own password.
  - can have full access to device tree objects, libraries, maps, and reports, if the user group they are members of has full access to the respective object.
  - always have administrative rights if they are members of a group with administrative rights.
- Administrators
  - are members of groups with administrative rights.
  - have no access restrictions at all.

- can also manage user accounts, user groups, and cluster setups.
  - can change the monitoring configuration of PRTG.
- ⓘ If a user is a member of more than one user group, the group access rights of the user group with the highest access rights apply.

## 5.10 Data Reporting

With PRTG, you can view, analyze, and review monitoring data for specific time spans. There are several ways to create customized data reporting.

### View Historic Sensor Data

To get an overview of a single sensor's historic data, you can generate historic data reports via the sensor's Historic Data tab.

■ For more information, see section [Historic Data Reports](#) <sup>[185]</sup>.

### Generate Reports

In addition to reports about a single sensor's historic data, you can also create comprehensive and detailed reports for all monitoring data.

■ For more information, see section [Reports](#) <sup>[2754]</sup>.

### Export Data with the PRTG API

You can also export all raw monitoring data to .xml or .csv files and generate your own reports with any third-party software.

■ For more information, see section [Application Programming Interface \(API\) Definition](#) <sup>[3084]</sup>.

### Make Data Available

You can make monitoring data available to others via a specific read-only user, or you can create public HTML pages to display your monitoring data via the [Maps](#) feature.

■ For more information, see section [Access Rights Management](#) <sup>[145]</sup> and section [Maps](#) <sup>[2776]</sup>.

## 5.11 IPv6 Support

PRTG supports the IPv6 protocol for most sensors. You can choose whether you want to query data from your network devices via an IPv4 or IPv6 connection. Specify your preference in the [device settings](#)<sup>[597]</sup>. The sensors you add to the device use the protocol that you select.

In the IPv6: Outgoing IP for Monitoring Requests setting of the [PRTG Administration Tool](#)<sup>[8058]</sup>, you can additionally select the IPv6 address that PRTG uses for outgoing monitoring requests. The same option is also available for IPv4.

 Not all sensors are IPv6 compatible. Incompatible sensors are not selectable on IPv6 devices. For an overview list of all sensors, including the IP version that they support, see section [Available Sensor Types](#)<sup>[3232]</sup>.

 The hosted probe of a PRTG Hosted Monitor instance does not support the IPv6 protocol. If you want to use sensors that support IPv6, add them to a remote probe device.

# Part 6

## Basic Procedures

## 6 Basic Procedures

The following sections introduce the basic features and concepts of PRTG:

- [Login](#)  153
- [Welcome Page](#)  157
  - [Customer Service](#)  161
- [General Layout](#)  164
- [Sensor States](#)  181
- [Historic Data Reports](#)  185
- [Similar Sensors](#)  192
- [Recommended Sensors](#)  197
- [Object Settings](#)  201
- [Alarms](#)  202
- [System Information](#)  205
- [Logs](#)  210
- [Tickets](#)  213
- [Working with Table Lists](#)  218
- [Object Selector](#)  222
- [Priority and Favorites](#)  224
- [Pause](#)  227
- [Context Menus](#)  229
- [Hover Popup](#)  235
- [Main Menu Structure](#)  237

## 6.1 Login

For PRTG Network Monitor, you can log in to the PRTG web interface once the PRTG core server is installed. In your browser, open the IP address or Domain Name System (DNS) name of the PRTG core server system and click Log in.

You can look up and change the web server settings of PRTG Network Monitor at any time in the [PRTG Administration Tool](#)<sup>[3041]</sup> on the PRTG core server system. In particular, when you access PRTG from the internet, you should use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection. To secure your connection, click Switch to SSL/TLS under Enable SSL/TLS for the PRTG web interface on the welcome screen.

### Load the PRTG Web Interface

In a web browser, enter the IP address or URL of the PRTG core server system. If you use a cluster, connect to the master node. You can also double-click the PRTG Network Monitor desktop icon on the PRTG core server system.

 If you run PRTG on localhost, do not use the DNS name <http://localhost> to log in to the PRTG web server, as this might considerably slow down the PRTG web interface. Use your local IP address or <http://127.0.0.1> instead.

If you see an SSL certificate warning in your browser, you can usually confirm it.

 For more information, see the Knowledge Base: [Why does my browser show an SSL certificate warning when I open the PRTG web interface?](#)

### Login Screen

After loading the PRTG web interface, the login screen is visible. You can either log in as the predefined [PRTG System Administrator](#) user or as any other user. As an administrator, you can use all functionalities of the PRTG web interface. Administrators can [create additional users](#)<sup>[2901]</sup> with administrative rights or users with more restricted user access rights (for example, read-only users).

**PRTG NETWORK MONITOR**

## PRTG Network Monitor

**Login Name**

prtgadmin

**Password**

prtgadmin

**Log in**

- > [Forgot password?](#)
- > [Need help?](#)
- > [Download apps for Windows, macOS, iOS, Android \(optional\)](#)

Login Screen

### Log In as Predefined Administrator (First Time Login)

 This option is not available in PRTG Hosted Monitor.

When you log in for the first time, the login name and password for the predefined [PRTG System Administrator](#) user account are both `prtgadmin`. PRTG automatically fills in the default credentials and shows the password in plain text.

-  After login, you should change the default password. To do so, go to [Setup | Account Settings | My Account](#) and specify a new password in section [User Account Settings](#).
-  If you are not logged in to the PRTG web interface, you can change the credentials for the predefined user account at any time in the [PRTG Administration Tool](#).
-  If you enter a different login name or change your password, the password is no longer shown in plain text.

## Log In as User

If you received user credentials from your system administrator, enter them in the login screen to log in to the PRTG web interface. This also applies if you use other administrator credentials.

## Login Options

- Log in: Log in to the fully featured PRTG web interface. We recommend that you use this option for PRTG whenever possible. It offers the full functionality of PRTG. Use Google Chrome 75 or Mozilla Firefox 67 for best performance.
  - ❗ Make sure that a [supported browser](#)<sup>[22]</sup> is available on the system.
    - Download apps for Windows, macOS, iOS, Android (optional): Opens Setup | Optional Downloads in the PRTG web interface. You can optionally [download](#)<sup>[2974]</sup> the [PRTG apps](#)<sup>[2988]</sup> for iOS or Android or the [PRTG app for desktop](#)<sup>[2984]</sup>.
  - ❗ If you use this download option, you require your login name and password for the login (or the default credentials).
- ❗ Only Google Chrome 75 and Mozilla Firefox 67 are fully compatible with the PRTG web interface.

Enter specific credentials or use the default credentials that PRTG fills in automatically. Click Log in to proceed to the PRTG web interface.

## Recover Password

If you cannot remember your PRTG Network Monitor password, click the Forgot password? link. The Password Recovery page opens. Enter your Login Name, click Request a New Password, and PRTG sends an email to the primary email address of your user account. Click the link in the email to set a new password. The link is valid for 60 minutes. Enter a New Password, then enter it again under Confirm Password. Click Set New Password to change your password.

- ❗ The password must be at least 8 characters long and must contain a capital letter and a number.
- ❗ When the password is successfully reset, all active user sessions of this user account are logged out. Log in again with the new password.

## Login Screen with Single Sign-On (SSO)

After you [configure SSO](#)<sup>[2925]</sup>, you see a new button on the login screen of the PRTG web interface.

## PRTG Network Monitor

Password

prtgadmin

Log in

> [Forgot password?](#)

Log in with single sign-on

> [Need help?](#)

> [Download apps for Windows, macOS, iOS, Android \(optional\)](#)

Log in with SSO

Click Log in with single sign-on to continue with the login procedure of the single sign-on provider. After finishing the login procedure, you will be transferred back to PRTG.

### More

#### KNOWLEDGE BASE

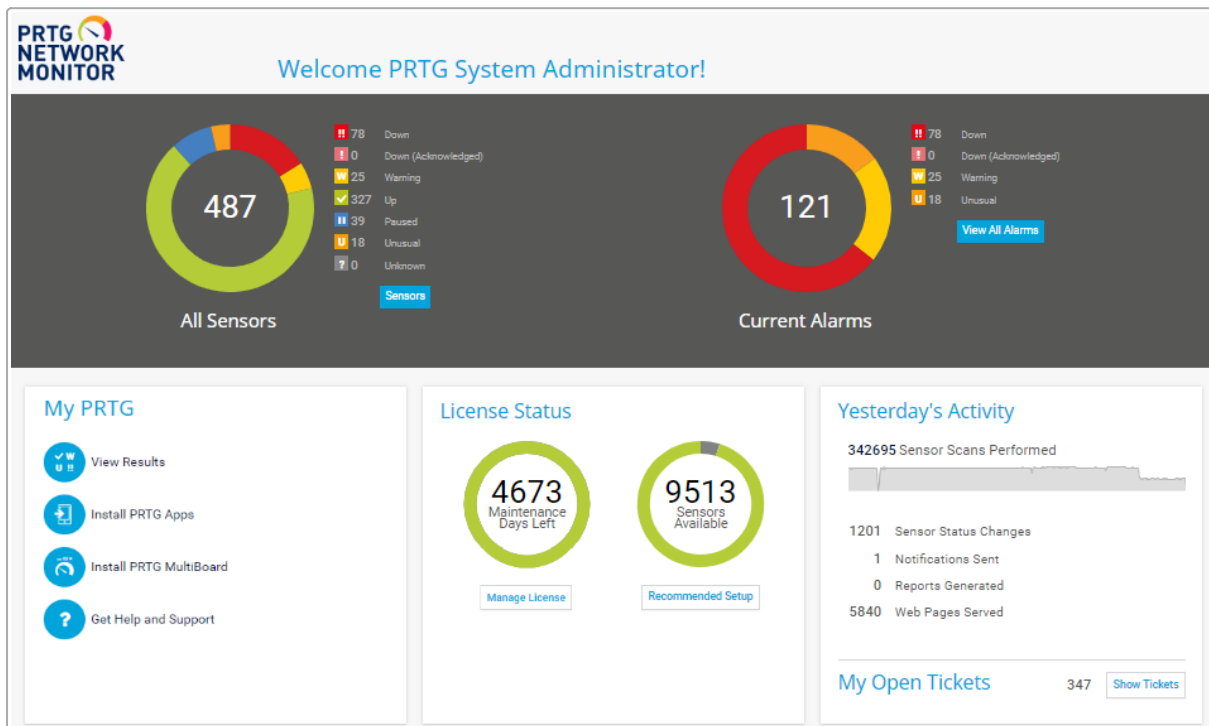

Why does my browser show an SSL certificate warning when I open the PRTG web interface?

- <https://kb.paessler.com/en/topic/89984>

## 6.2 Welcome Page

After you completed the [smart setup](#) [41], you see the Welcome page by default when you log in to the PRTG web interface. The collected information about your PRTG installation makes the page a good starting point for your daily monitoring activities. You can set a different home page in your [account settings](#) [200]. Of course, you can also use the [Maps](#) [277] feature to create customized dashboards that you can use as your home page.

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

Welcome to PRTG

### Sensor Overview

The Welcome page displays various information about your PRTG installation and is similar to a dashboard. It keeps you informed about all sensors and alarms:

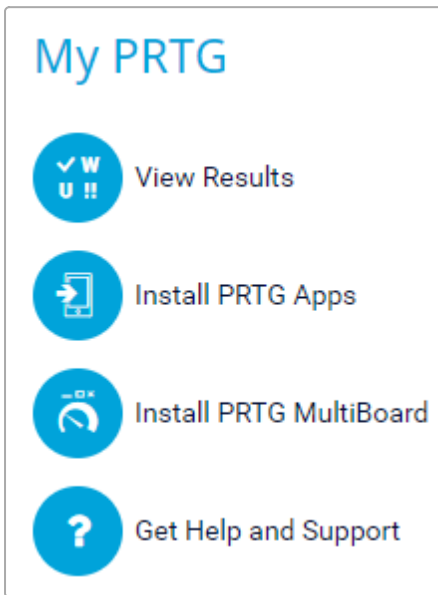

Sensor Overview on the Welcome Page

- Click Sensors to open the [top 10 lists](#) for sensors.
- Click View All Alarms to open a [list of alarms](#) in your installation.
- Click a sensor [status](#) to open a list of all sensors with the corresponding status.

## My PRTG Section

In the My PRTG section, you can directly access different pages in the PRTG web interface.

My PRTG Section on the Welcome Page

Option	Description
View Results	Open the <a href="#">device tree</a> that shows your monitoring results.
Install PRTG Apps	Open the download page for the <a href="#">PRTG apps for iOS or Android</a> .
Install PRTG MultiBoard	Open the download page for <a href="#">PRTG MultiBoard</a> .
Get Help and Support	Open the <a href="#">Help and Support Center</a> from where you can access the PRTG Manual, the Knowledge Base, and video tutorials. You can also open <a href="#">support tickets</a> and contact <a href="#">our customer service</a> from this page.
Manage Subscription	<p> This option is only visible if you use PRTG Hosted Monitor.</p> <p>Open your PRTG Hosted Monitor dashboard and manage your subscriptions.</p>

## Other Sections

Other sections are, for example, the License Status section, the Yesterday's Activity section, the Paessler Blog section, and the Update Available section.

The screenshot displays two main sections on the Welcome Page. The 'License Status' section features two circular progress indicators: one for 'Maintenance Days Left' at 4697 and another for 'Sensors Available' at 9550. Below these are buttons for 'Manage License' and 'Recommended Setup'. The 'Yesterday's Activity' section shows a total of 173326 sensor scans performed, accompanied by a mini bar chart. Below the chart, it lists: 350 Sensor Status Changes, 3 Notifications Sent, 0 Reports Generated, and 11788 Web Pages Served. At the bottom of this section, it says 'My Open Tickets' with a count of 12 and a 'Show Tickets' button.

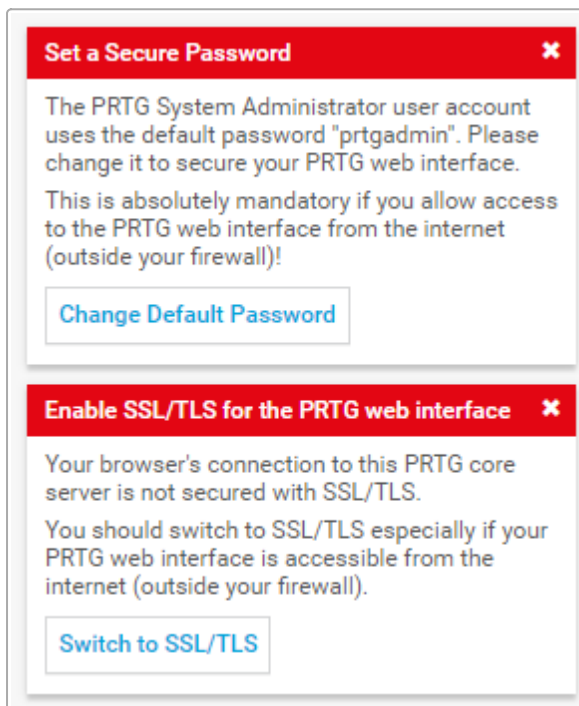

License Status Section and Yesterday's Activity Section on the Welcome Page

Section	Description
License Status	<p>Shows the remaining number of days your PRTG Network Monitor the maintenance or subscription is active and the number of sensors that you can still add with your license. Click <a href="#">Manage License</a> to open the Paessler Portal and manage your license. Click <a href="#">Get More Sensors</a> to open the Paessler Portal and upgrade your license. See also section <a href="#">License Information</a><sup>[2962]</sup>.</p> <p><b>i</b> For technical reasons, the number of available sensors that is displayed here includes sensors in the Paused status although they do not count towards the maximum number of sensors that your license allows. Add the number of <a href="#">indefinitely paused</a><sup>[227]</sup> sensors to the displayed number to know exactly how many sensors are still available on your installation.</p> <p><b>i</b> If your license has an unlimited number of sensors, PRTG takes 10,000 sensors as the starting point to calculate the number of available sensors that is displayed here. Consider the <a href="#">system requirements</a><sup>[22]</sup> for a recommended PRTG core server setup and click <a href="#">Recommended Setup</a> for more information.</p>
Yesterday's Activity	<p>Shows what your PRTG core server or PRTG Hosted Monitor instance did for you on the day before. Hover over the mini graph to show the number of sensor scans on a specific day. See also the Activity History in section <a href="#">System Status</a><sup>[2948]</sup>. Click <a href="#">Show Tickets</a> under My Open Tickets to display all open tickets that are assigned to you.</p>

Section	Description
Paessler Blog	Shows recent information about PRTG and Paessler. Click the heading of an article to open it on the Paessler website.
Update Available	This section is only visible if an update is available. It shows the version number of your PRTG Network Monitor installation and the version number of the latest available PRTG version. You see the label <b>NEW</b> if a newer version is available. Click Install Update to open the <a href="#">Auto-Update</a> page.

## Further options

There are some further options on the Welcome page, for example, you can set a secure password or enable SSL/TLS for the PRTG web interface.

Further Options on the Welcome Page

- If your PRTG Network Monitor installation is not Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured, PRTG asks you to enable SSL/TLS for the PRTG web interface. Click [Switch to SSL/TLS](#) and in the Do you want to switch to SSL/TLS? dialog, click Yes, switch to SSL/TLS to enable SSL/TLS. See also section [User Interface](#). Click to remove this note.
- If you still use the default password of the [PRTG System Administrator](#) user ([prtgadmin](#)) for PRTG Network Monitor, PRTG asks you to set a secure password if your PRTG web interface is publicly available. Click [Change Default Password](#) to define a new password. See also section [User Accounts](#). Click to remove this note.
- In the video section, you find informative videos about monitoring with PRTG. Click a video to open it and play it on the Paessler website.

## 6.2.1 Customer Service

If you have any questions about license purchases or upgrades, you can directly contact the Paessler Customer Service from the [Help and Support Center](#)<sup>[2976]</sup> in the PRTG web interface. We readily assist you with quotes or information about licenses, and guide you through the purchasing process. Our Customer Service team is also happy to send you the contact information of a knowledgeable PRTG partner in your region or research any technical specifications you might need beforehand.

① PRTG securely transmits your feedback or questions to Paessler via the PRTG Cloud. Make sure that your PRTG core server has access to the internet and can reach the URL <https://api.prtgcloud.com:443> for successful transmission.

## Ask a Question or Give Us Your Feedback

Provide the following information in this section of the Contact Paessler Customer Service form.

Field	Description
Your Name	Enter your full name for contact information.
Your Email Address	Enter an email address with which we can reach you.
Your Country	Select the country in which you run PRTG so that we can provide you with contact information for a partner nearby.
Your Phone Number	Enter a phone number with which we can reach you.
How Can We Help?	Select the scope of your question.
Emotional State	If you want to, you can indicate your feelings about PRTG and your purchase process.
Describe Your Question in One Sentence	Provide a short description that indicates the topic of your request.
Do You Have Any Further Comments?	Enter your comments here. This can be feedback or any questions for our customer service.

Click OK to send your question or feedback to our customer service. Click Cancel to close the customer service contact form without sending it.

 If you have technical questions about your setup, [contact the Paessler support team](#) .

## 6.3 General Layout

This section provides a general overview of the structure of the PRTG web interface. The central focus is the Devices view, which you can select via the [main menu bar](#)<sup>[238]</sup>. The Devices view presents the device tree and your monitoring results.

In this section:

- [Welcome Page](#)<sup>[164]</sup>
- [Device Tree View Layout](#)<sup>[164]</sup>
- [Navigation](#)<sup>[167]</sup>
- [Global Header Area](#)<sup>[168]</sup>
- [Page Header Bar](#)<sup>[170]</sup>
- [Page Content](#)<sup>[171]</sup>
- [Switch Device Tree View](#)<sup>[174]</sup>
- [Classic Device Tree View](#)<sup>[174]</sup>
- [Extended Device Tree Views](#)<sup>[175]</sup>
- [Add Button](#)<sup>[178]</sup>
- [Default Objects in the Device Tree](#)<sup>[178]</sup>
- [Priority and Favorites](#)<sup>[179]</sup>

### Welcome Page

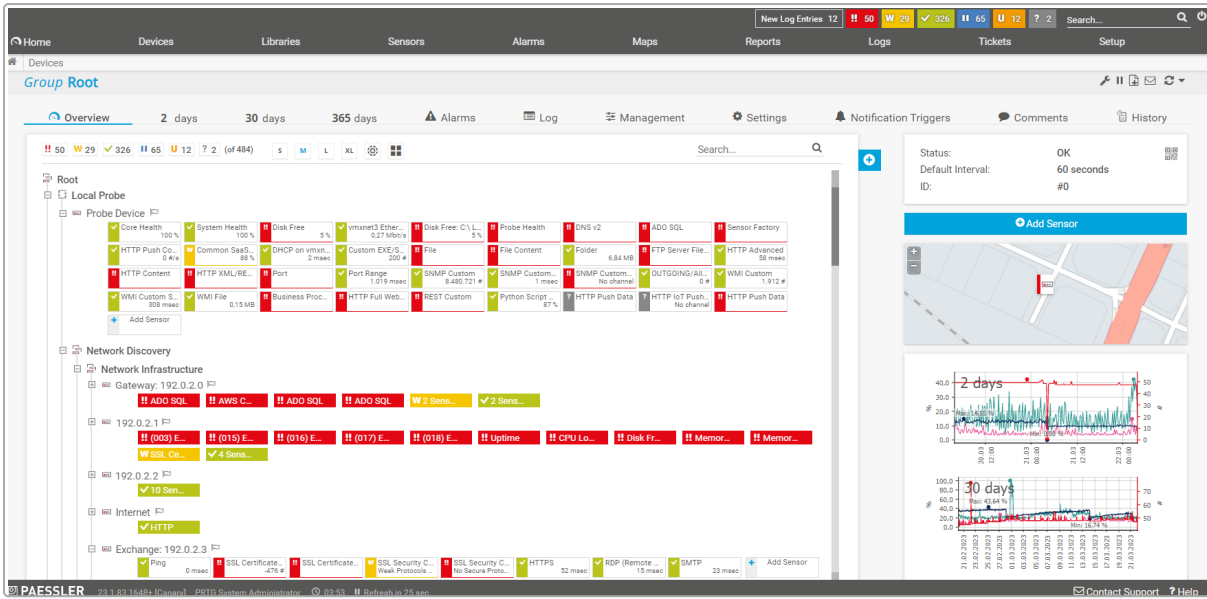

When you log in to the PRTG web interface, you see the Welcome [page](#)<sup>[157]</sup> by default. You can set a different home page in your [account settings](#)<sup>[280]</sup>.

Click View Results to open the device tree.

### Device Tree View Layout

Click View Results on the Welcome page or select Devices from the main menu bar to display the device tree.

### Device Tree

Device Tree

From top to bottom, the device tree page has several areas that are covered in further detail in this section. For a general overview of the device tree page, see the table below.

### Global Header Area

Global Header Area

Item	Description
<a href="#">Global header area</a> <sup>[168]</sup>	This area contains the main menu bar at the very top, the global status bar, breadcrumbs that show the path to the selected object, a quick search box, and the logout button.

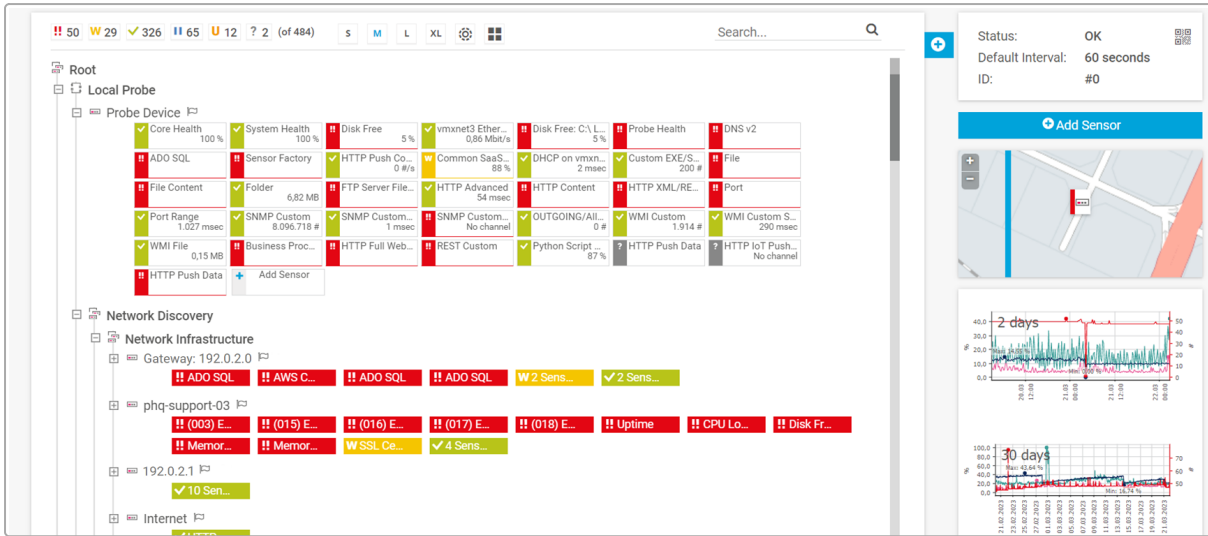

### Page Header Bar

Page Header Bar

Item	Description
<a href="#">Page header bar</a> <sup>[170]</sup>	This area contains the page heading with the name of the selected object, several tabs with settings, and quick action buttons.

### Page Content

Page Content

Item	Description
<a href="#">Page content</a> <sup>171</sup>	This area contains information about the selected object and all other objects underneath in the device tree hierarchy, the object's status bar, a quick search box, the QR code that links to the URL of the selected page, and graphs for different time spans.

View Options

View Options

Item	Description
<a href="#">Viewing options</a> <sup>174</sup>	These are part of the page content. Here you can adjust how your device tree is displayed.

Footer Section

Footer Section

Item	Description
Page footer	This area shows information about the version of PRTG, the logged in user account, and the time (depending on the <a href="#">time zone settings</a> for the logged in user).
Pause (⏸) Resume (▶) Auto-Update (🔄) Contact support (✉) Help (?)	<p>A timer counts down how much time remains until the next automatic page refresh. Click Pause to pause the refresh timer and click Resume to resume. If you open a different page while the refresh timer is paused, the timer resumes automatically and starts with the defined Refresh Interval (Sec.) that you can configure in your account settings.</p> <p><b>i</b> Long <a href="#">table lists</a> that are set to display 1000 items at a time are excluded from the automatic refresh to ensure system performance.</p> <p>Click Auto-Update for quick access to the <a href="#">auto-update</a> settings if a new version is available. To open the <a href="#">Contact Support form</a>, click Contact support. For context-sensitive help, click Help.</p> <p>If you run PRTG in a cluster, you also see a cluster-related element. It shows the name of the cluster node that you are logged in to and displays whether this is a master node or a failover node. Click the bar to show the <a href="#">cluster status</a>. On a failover node, you can review all data, but PRTG does not save changes in the settings. To change the settings, log in to the master node.</p>

## Navigation

To navigate the PRTG web interface, the following options are available:

- The main menu bar provides access to all important aspects of the software.
- The quick search is often the fastest way to find a specific object (for example, a sensor or a device).
- The clickable breadcrumbs show the path to a selected object in the object hierarchy.
- Click an object to see its details. In the page heading of the page header bar, you always see the name of the object that you have selected.
- Use the page tabs to switch between various subpages.
- Right-click objects to open their [context menu](#).
- Hover over objects to display tool tips. Hover longer to open a quick-access window ([hover popup](#)).
- Drill down into the object hierarchy of probes, groups, devices, and sensors in the device tree. To do so, click a subobject of the displayed object (for example, click a sensor on the Overview tab of a device).

These navigation options offer complete access to the functionality of PRTG.

In the following sections, we describe the different areas of the PRTG web interface.

## Global Header Area

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

## Global Header Area

Global Header Area

The global header area of the PRTG web interface provides important, very condensed information about your installation and offers access to all content and settings. The following table lists the elements that make up the global header area.

## Main Menu Bar

Main Menu Bar

Item	Description
Main menu bar	To navigate the PRTG web interface, the main menu bar is the best starting point. We recommend that you take a few minutes to familiarize yourself with the main menu bar and its submenus.  ■ For more information, see section <a href="#">Main Menu Structure</a> <sup>[237]</sup> .

## New Alarms

Item	Description
New alarms, New log entries, Updated tickets	The information boxes show how many new alarms, new log entries, and updated tickets have occurred. Click the respective box to view the lists of <a href="#">alarms</a> <sup>[202]</sup> , <a href="#">logs</a> <sup>[210]</sup> , or <a href="#">tickets</a> <sup>[213]</sup> .

## Global Sensor Status Symbols

Global Sensor Status Symbols

Item	Description
Global sensor status symbols	<p>This area shows the accumulated states of all configured sensors, grouped into the different sensor states. You see boxes with numbers that show the amount of sensors that are in the respective status. For example, you can see how many sensors are in the Up, Down, or Warning status. Click a box to view a list of all sensors that are in the respective status.</p> <p> For more information, see section <a href="#">Sensor States</a> <sup>181</sup>.</p>

### Search Box

Search Box

Item	Description
<p>Search ()</p> <p>Log out ()</p>	<p>You can start a Search or Log out in the top-right corner.</p> <p>To search for an object, enter a name, parts of a name, an IP address, a Domain Name System (DNS) name, or a tag in the search box and confirm with the Enter key. PRTG performs a string search in your entire monitoring setup, including groups, devices, sensors, libraries, maps, reports, tickets, and object comments.</p> <p>A page with items and online help articles that are related to the search term opens.</p>

### Breadcrumbs

3 breadcrumbs

Item	Description
Breadcrumbs	<p>Below the main menu bar, PRTG shows a path that retraces the steps back to the Welcome page (or your defined starting page). Use these breadcrumbs to navigate back to where you came from.</p> <p>If you click  on a breadcrumb item, a dropdown list opens that shows all objects on the same level. You can either search for an object or select one directly. For example, you can directly access all other sensors on a device, other devices within a group, and other groups on the same probe. Other probes in your root group are also available.</p>

## Page Header Bar

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

Page Header Bar

The page header bar below the global header area consists of the following elements.

### Page Heading

Item	Description
Page heading Priority star ( ★★☆☆☆ )	The page heading displays the selected object's type and name. In the screenshot, this is the group that is called <b>Root</b> . Here you can define the object's priority as well. To do so, click one of the five stars on Priority star next to the object's name (this setting is not available for the root group).  ■ For more information, see section <a href="#">Priority and Favorites</a> <sup>224</sup> .

### Quick Action Buttons

Quick Action Buttons

Item	Description
<p>Quick action buttons</p> <p>Pause (  )</p> <p>Resume (▶)</p> <p>Settings of the object (🔧)</p> <p>Add a ticket (🎫)</p> <p>Send a link to the selected page per email (✉)</p> <p>Perform an immediate scan (🔄)</p> <p>Context menu (▼)</p>	<p>On the right-hand side, there is a row of icons for several actions. Depending on the selected page, you can Pause and Resume the object. You can also open the Settings of the object, Add a ticket, Send a link to the selected page per email, or Perform an immediate scan.</p> <p>Click on Context menu to open the context menu of the selected object for further options.</p> <p>■ For more information, see section <a href="#">Context Menus</a> <sup>229</sup>.</p>

### Tabs General Layout

Tabs General Layout

Item	Description
<p>Tabs</p>	<p>Via tabs, you can navigate to the various subpages of an object, for example, to its monitoring data or settings.</p> <p>■ For more information, see section <a href="#">Object Settings</a> <sup>201</sup> and the Knowledge Base: <a href="#">What options do I have to review my monitoring data in detail?</a></p>

### Page Content

The page content of the general layout varies depending on the selected object. It shows information about the object and all other objects underneath in the object hierarchy. The deeper down in the hierarchy you can find a selected object, the more detailed is the displayed information.

Page Content

### Sensor Status Bar

Sensor Status Bar

Item	Description
Sensor status bar	<p>This element is visible when you view a probe, a group (including the root group), or a device. It is not available on the Overview tab of a sensor. The sensor status bar shows the accumulated states of all sensors for the selected object, grouped into different sensor states. They show the number of sensors that are in the respective status.</p> <p>For example, you can see how many sensors are in the Up, Down, or Warning status. You can hide sensors that are in a certain status by clicking the respective status icon. To show the sensors again, click the status icon again.</p> <p>For more information on sensor states, see section <a href="#">Sensor States</a> <sup>181</sup></p>

### View Options

View Options

Item	Description
Viewing options	This element is only visible when you view a probe or a group. It is not available when you view device or sensor details. For a detailed description, see <a href="#">Switch Device Tree View</a> <sup>[174]</sup> below.

Device Tree Search

Device Tree Search

Item	Description
Device tree search	In the search box to the right of the viewing options, enter a keyword to search the device tree for matching items. The device tree highlights matching devices and sensors by graying out all others. This gives you a quick overview of sensors that monitor a specific part of your network. For example, you can enter the keyword <b>firewall</b> to highlight devices and sensors that match this string.

Add Button

Item	Description
Add (+)	Click Add to add new objects to your monitoring setup. For a detailed description, see <a href="#">Add Button</a> <sup>[178]</sup> below.

Object Status

Status:	OK	
Default Interval:	60 seconds	
ID:	#0	

Object Status

Item	Description
Object status, Scanning interval, Object ID, QR code	<p>This element displays the status of the selected object, the interval in which PRTG scans the object, the ID of the object, and the QR code for the selected page. If you use a <a href="#">PRTG app for iOS or Android</a>, you can scan the code to directly view the object on your mobile device. Click the QR code to enlarge it for scanning.</p> <p>Depending on the object type, this element shows additional information:</p> <ul style="list-style-type: none"> <li>▪ All objects underneath the root group show their <a href="#">dependency</a>.</li> <li>▪ Groups and devices display the time that has elapsed since the last execution of the <a href="#">auto-discovery</a> on the selected object.</li> <li>▪ Devices show their DNS name or IP address as defined in the <a href="#">device settings</a> and the time that has elapsed since the last execution of the <a href="#">sensor recommendation</a> on this device.</li> <li>▪ Sensors show additional monitoring statistics as well as their <a href="#">performance impact</a>.</li> </ul>

## Switch Device Tree View

Wherever a probe or group is displayed, you can choose between a number of viewing options.

### Device Tree Viewing Options

## Classic Device Tree View

Via the Switch Device Tree View in the page header bar, you can adjust how much information is included next to each object. Use it to switch from a very condensed view ( **S** ) to a very spacious view ( **L** ). Use **XL** to switch the device tree to a list view.

In the classic device tree view, you can collapse devices, groups, and probes. Click  left of the object name to summarize the sensors according to their respective status. By default, sensors in the Down, Down (Partial), or Down (Acknowledged) status are summarized if there are more than ten sensors with the same status, otherwise they are displayed individually.

## Extended Device Tree Views

There are two additional options to the classic device tree view with which you can display the status of all sensors of your entire installation in a single overview. Click  to change to the sunburst view. To change to the tree map view, click .

### Sunburst View

The sunburst view displays your entire installation as a circle diagram. The groups are represented as inner circles, and all devices that belong to a group are shown as 'cake slices' that are attached to the outside of a circle element.

The sunburst is interactive:

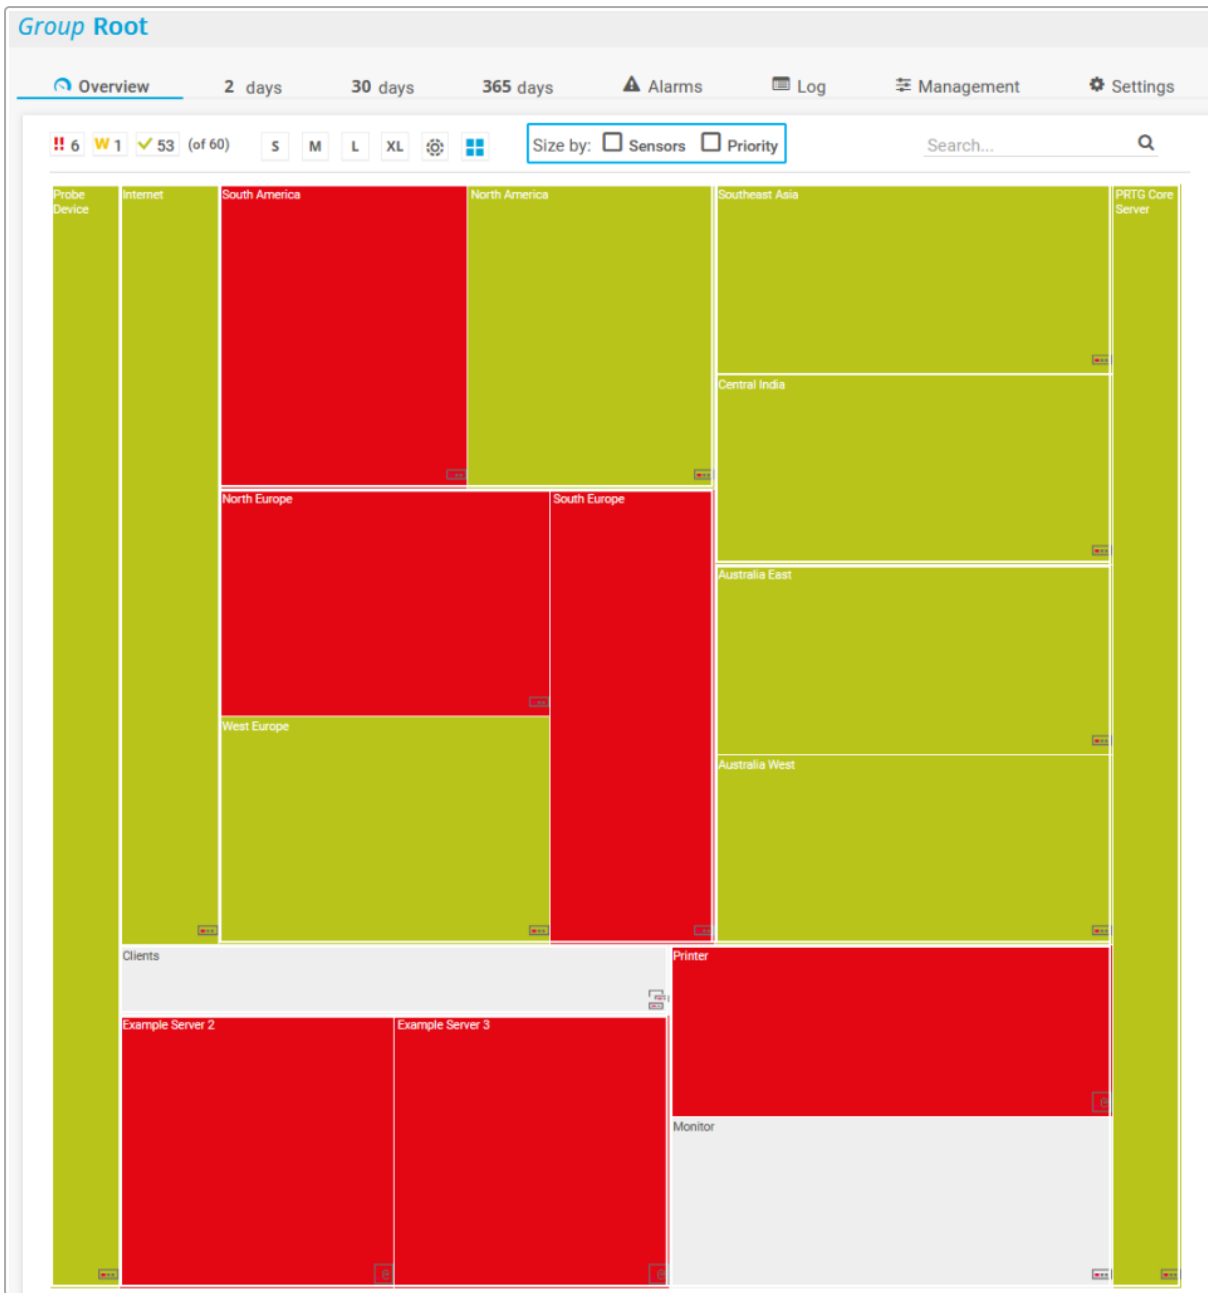

- You can click elements to open the Overview tab of your monitoring objects.
- You can zoom in and out with your mouse wheel while pressing the Ctrl key.

Sunburst View

### Tree Map View

The tree map view displays all devices of your entire installation as tiles that are sorted into a square and that are arranged according to the groups they belong to. Each device dynamically changes color to reflect the overall status of the sensors on the device.

Tree Map View

The following aspects apply to both the sunburst view and the tree map view:

### Colors

A device or group can have different colors, depending on the states of the sensors that are on the device or in the group. The sensor states are ranked according to their priority, for example, the Down status has a higher priority than the Warning status, which has a higher priority than the Up status.

■ For an overview of the colors and their states, see section [Sensor States](#)<sup>181</sup>.

Size by: Sensors / Size by: Priority

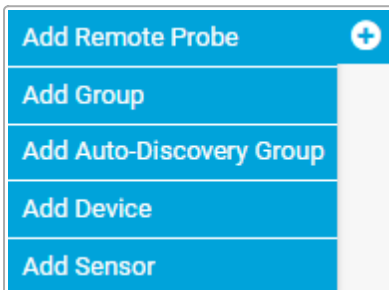

You can adjust the size of the different squares according to the number of sensors that run on a device or in a group, or the sensors' [priority](#)<sup>[224]</sup>, or both. Select the check boxes in the page header bar to change the square size.

## Add Button

Hover over  to add new objects to your monitoring setup. An assistant appears and guides you through the necessary steps.

 The content of the menu varies depending on the selected object.

Add Button Menu

See the following sections for more information:

- [Add Remote Probe](#)<sup>[3196]</sup>
- [Add an Auto-Discovery Group](#)<sup>[258]</sup>
- [Add a Group](#)<sup>[313]</sup>
- [Add a Device](#)<sup>[363]</sup>
- [Add a Sensor](#)<sup>[414]</sup>

## Default Objects in the Device Tree

By default, PRTG Network Monitor creates a [probe device](#) on the local probe or on the hosted probe (PRTG Hosted Monitor). The probe device represents the probe system. PRTG automatically monitors the system health of the PRTG core server and each probe to discover overload that might distort monitoring results. To monitor the status of the probe system, PRTG automatically creates the following sensors:

- [Core Health](#)
- [Core Health \(Autonomous\)](#)
- [Probe Health](#)
- [System Health](#)
- Some device-specific sensors for disk usage and bandwidth.

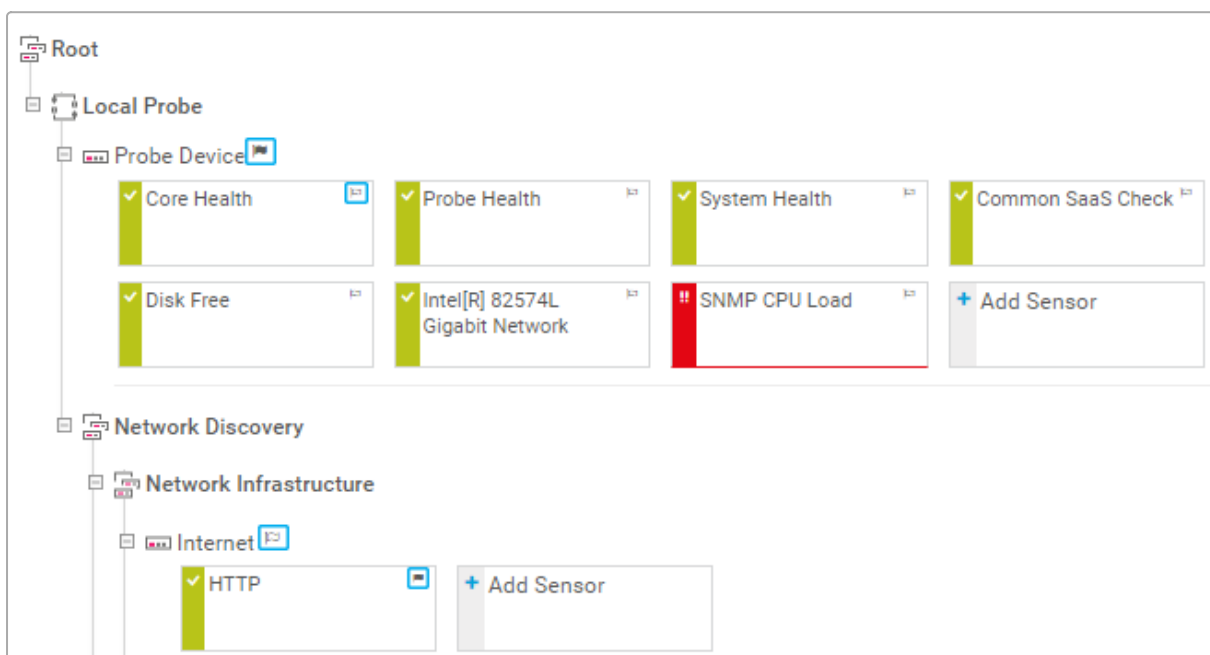

In a cluster, PRTG also creates a [cluster probe device](#) with a [Cluster Health](#) sensor that monitors the system health of the cluster.

With multi-platform probes, PRTG also creates a [Multi-Platform Probe Health](#) sensor and a [Multi-Platform Probe Connection Health \(Autonomous\)](#) sensor that monitor the health of the multi-platform probes.

## Priority and Favorites

You can mark a device or sensor as a favorite. To do so, click  to the right of the respective object in the device tree. The flag turns dark gray. To remove an object from your favorites, click . The flag turns transparent again.

One-Click Favorites in the Device Tree

 The favorite flag for sensors is available for the [L](#) or [XL](#) viewing options.

A quick way to set the priority of an object is via the five stars in the [page header bar](#)<sup>170</sup> next to the object name. Click the stars to adjust the priority. ★★★★★ means top priority, ★☆☆☆☆ means lowest priority.

One-Click Favorite and Priority in the Page Header Bar

You can also add any device or sensor to your favorites in the page header bar of the respective object. To do so, click  for a device or  for a sensor. Click  for a device or  for a sensor to remove the respective object from your favorites.

 For more information, see section [Priority and Favorites](#)<sup>224</sup>.

## More

### ■ KNOWLEDGE BASE

- <https://kb.paessler.com/en/topic/90007>

## 6.4 Sensor States

The color of a sensor or object indicates its status. In the table below, you find a list of states that a sensor or object can show. This list also reflects the priority of the sensor states whenever PRTG shows summarized sensor states, for example, in the [device tree](#)<sup>[164]</sup> or in [geographical maps](#)<sup>[2731]</sup>. For example, if all sensors on a device show the Up status and one of the sensors changes to the Down status, the device shows the Down status as well because this status has a higher priority. The device is then displayed accordingly in the [extended device tree views](#)<sup>[175]</sup>.

- ❗ The Down and Down (Partial) states are considered to be equal regarding status priority.
- ❗ In the device tree, hover over an object's name to view the total number of alarms for the object. In geographical maps, hover over the location marker to view the total number of alarms at this location.

Status Icon	Status Name	Meaning
	Down	<p>At least one sensor on this object (or at this location) shows the Down status.</p> <ul style="list-style-type: none"> <li>▪ PRTG is unable to reach the device or the sensor has detected an error. For more information, see section <a href="#">Sensor Behavior for the Warning and Down States</a><sup>[183]</sup>. <ul style="list-style-type: none"> <li>❗ In this case, the sensor does not record any data in its channels while it shows the Down status.</li> </ul> </li> <li>▪ There is an error limit in the <a href="#">channel settings</a><sup>[2681]</sup> or the sensor shows the Down status because of a <a href="#">lookup</a><sup>[3181]</sup>. <ul style="list-style-type: none"> <li>❗ In this case, the sensor continues to record data in all channels although it shows the Down status.</li> </ul> </li> </ul>
	Down (Partial)	<p>In a cluster, at least one cluster node reports that this sensor shows the Down status, while at least one other cluster node reports that the same sensor shows the Up status.</p> <ul style="list-style-type: none"> <li>❗ This status is not available for sensors on remote probes in a <a href="#">failover cluster</a><sup>[128]</sup>.</li> </ul>
	Down (Acknowledged)	<p>At least one sensor on this object (or at this location) showed the Down status and a user acknowledged this status via Acknowledge Alarm in the <a href="#">context menu</a><sup>[229]</sup>.</p> <ul style="list-style-type: none"> <li>▪ There is no sensor in the Down status.</li> <li>❗ For acknowledged alarms, PRTG does not send further <a href="#">notifications</a><sup>[2735]</sup>.</li> </ul>

Status Icon	Status Name	Meaning
		<p> If you pause and resume a sensor in the Down (Acknowledged) status, it shows the Down status again.</p>
	Warning	<p>At least one sensor on this object (or at this location) shows the Warning status.</p> <ul style="list-style-type: none"> <li>▪ The sensor detected an error and shows the Warning status but the sensor is trying to reach the target device again. The sensor might soon change to the Down status. For more information, see <a href="#">Sensor Behavior for the Warning and Down States</a><sup>[183]</sup>.</li> <li>▪ There is a warning limit in the channel settings or the sensor shows the Warning status because of a lookup.</li> <li>▪ There is no sensor in the Down or Down (Acknowledged) status.</li> </ul>
	Unusual	<p>At least one sensor on this object (or at this location) shows the Unusual status.</p> <ul style="list-style-type: none"> <li>▪ The sensor reports unusual values for this weekday and this time of the day. The unusual detection is based on the sensor's historic average data. You can configure or disable the unusual detection in the system administration settings under <a href="#">Monitoring</a><sup>[2871]</sup>.</li> <li>▪ You can also disable the unusual detection for specific groups. <ul style="list-style-type: none"> <li>■ For more information, see section <a href="#">Group Settings</a><sup>[593]</sup>.</li> </ul> </li> <li>▪ There is no sensor in the Down, Down (Acknowledged), or Warning status.</li> </ul>
	Up	<p>All sensors on this object (or at this location) show the Up status.</p> <ul style="list-style-type: none"> <li>▪ The last scan was okay and the sensors receive data.</li> <li>▪ There is no sensor in the Down, Down (Acknowledged), Warning, Paused, or Unusual status.</li> </ul>
	Paused	<p>All sensors on this object (or at this location) show the Paused status.</p>

Status Icon	Status Name	Meaning
		<ul style="list-style-type: none"> <li>The sensor is paused for a specific time span, indefinitely, or because of a <a href="#">dependency</a><sup>[140]</sup>.</li> <li>There is no sensor in the Down, Down (Acknowledged), Warning, Unusual, or Up status.</li> </ul> <p><b>i</b> A sensor in the Paused status does not count towards the maximum number of sensors that your license allows.</p>
	Unknown	<p>All sensors on this object (or at this location) show the Unknown status.</p> <ul style="list-style-type: none"> <li>The sensor has not received any data yet or there is an error in (network) communication, likely on the probe system. If sensors continuously show this status, you might need to restart PRTG. <ul style="list-style-type: none"> <li>For more information about extended troubleshooting, see the Knowledge Base: <a href="#">What to check if sensors are gray?</a> and <a href="#">My sensors show the Unknown status after a PRTG core server restart. What can I do?</a></li> </ul> </li> <li>There is no sensor in the Down, Down (Acknowledged), Warning, Unusual, Paused, or Up status.</li> </ul>

## Sensor Behavior for the Warning and Down States

The Down status indicates that there is an issue with an object, for example, a device. There are various reasons for the Down status, for example, an interruption in the physical connection to the device or an internet connection outage.

After a failed request, PRTG tries to contact the device again before it sets a sensor to the Down status (this is true for almost all sensors):

- If a request to a device fails for the first time, the sensor changes to the Warning status. PRTG repeats the request and immediately attempts to rescan the device.
- If the second request also fails, the sensor changes to the Down status by default until the device is reachable again. You can change this behavior in the [scanning interval](#)<sup>[450]</sup> settings of any object in the device tree. PRTG tries to reach the device with every scanning interval.

This procedure gives devices and services the chance to recover from a momentary overload and prevents false alarms. Still, you are immediately informed about any network issues.

- i** This behavior does not apply to the Warning or Down states that result from warning limits or error limits in the channel settings. This behavior also does not apply to channels that use lookups.

## 6.5 Historic Data Reports

For quick reviews of a sensor's monitoring data, use historic data reports as an alternative to the comprehensive [reports](#) feature. You can run and view a historic data report for each sensor on demand. Additionally, you can export a sensor's historic data as an .xml file or a .csv file to your computer to further process the data with third-party applications.

There are two ways to open historic data reports: Either click the Historic Data tab of a sensor or select Sensors | View Historic Data from the [main menu bar](#).

Historic Data Tab of a Ping Sensor

### Historic Data (Sensor Tab)

Probe, group, device, and sensor pages have tabs that you can use to navigate between different options. For example, you can view your network's status, view monitoring results, or change settings.

Tabs Bar for Sensors

The Historic Data tab is only available for sensors, not for probes, groups, or devices. When you open the Historic Data tab of a sensor, no sensor selection is available. If you want to select a different sensor for the report, select Sensors | View Historic Data from the main menu bar.

## Historic Monitoring Data (Sensors Main Menu)

When you open historic data reports via Sensors | View Historic Data from the main menu bar, PRTG asks you to select the sensor for which you want to create a report with the [object selector](#)<sup>[222]</sup>.

Historic Data Report Settings

Setting	Description
Sensor	<p>This setting is only visible if you open View Historic Data from the main menu bar.</p> <p>To select the sensor for which you want to create the report, click  to open the object selector.</p> <p> For more information, see section <a href="#">Object Selector</a><sup>[222]</sup>.</p>
Start	<p>Specify the start date and time for the data that you want to review. Use the date time picker to enter the date and time.</p> <p> You cannot generate the historic data report if monitoring data was <a href="#">deleted</a><sup>[289]</sup> after the specified start date. Set the start of the report to a date for which data is available.</p>

Setting	Description
End	Specify the end date and time for the data that you want to review. Use the date time picker to enter the date and time.
Quick Range	<p>You can use several buttons to select start and end dates more quickly. Click any of these buttons to change the Start and End values:</p> <ul style="list-style-type: none"> <li>▪ 1 Day, 2 Days, 7 Days, or 14 Days: Set the <a href="#">date range</a><sup>[220]</sup> to the respective day or days. The current time of the current day is the end date.</li> <li>▪ Today, Yesterday, Last Week (Mo-Su), Last Week (Su-Sa), Last Month, 2 Months, 6 Months, 12 Months: Set the date range to the last matching period. It starts at 00:00 and ends at 00:00 of the following day.</li> </ul>
Averaging Interval	<p>With this option, you can activate and configure averaging. Select an interval for which PRTG calculates the average value:</p> <ul style="list-style-type: none"> <li>▪ No interval (display raw data): PRTG performs no averaging and displays only raw data. <ul style="list-style-type: none"> <li>ⓘ PRTG stores raw data for up to 40 days. After this time, PRTG calculates averages again.</li> </ul> </li> <li>▪ 15 seconds, 30 seconds, or 60 seconds/1 minute</li> <li>▪ 2 minutes, 5 minutes, 10 minutes, 15 minutes, 20 minutes, or 60 minutes/1 hour</li> <li>▪ 2 hours, 4 hours, 6 hours, 12 hours, or 24 hours/1 day</li> </ul> <p>ⓘ A shorter interval results in a more detailed historic data report for the sensor.</p> <p>The best settings for you depend on the scanning interval of the sensor, the selected time period, and the intended use for the historic data report. Try different settings and compare the results. See also <a href="#">Automatic Averaging</a><sup>[190]</sup> in this section.</p>
Channels in Graph	<p><a href="#">This setting is only visible if you view historic data via the Historic Data tab of a sensor.</a></p> <p>Select the channels that you want to include in the graph of the historic data report. You can select individual channels via the respective check boxes, and show or hide all channels via the Show all or Hide all buttons. In the graph, PRTG then only shows the data of selected channels.</p> <p>ⓘ The historic data report table always shows the data of all channels.</p>
Cluster Node	<p><a href="#">This setting is only visible if the sensor runs on a cluster probe.</a></p>

Setting	Description
	<p>Select the cluster node's data that PRTG includes in the historic data report:</p> <ul style="list-style-type: none"> <li>▪ All nodes: Include the data of all cluster nodes in the report.</li> <li>▪ [Several specific nodes]: Use a specific cluster node's data for the report. The cluster nodes you see are specific to your setup.</li> </ul>
File Format	<p>Select the output format for the report:</p> <ul style="list-style-type: none"> <li>▪ HTML web page: Display the result directly as an HTML web page. This is also a good option if you want to check the results before you export them to a different file format.</li> <li>▪ .xml file: Export the data as an .xml file. Your browser usually shows a download dialog when you use this option.</li> <li>▪ .csv file: Export the data as a .csv file, for example, to import it into Microsoft Excel. Your browser usually shows a download dialog when you use this option.</li> </ul>

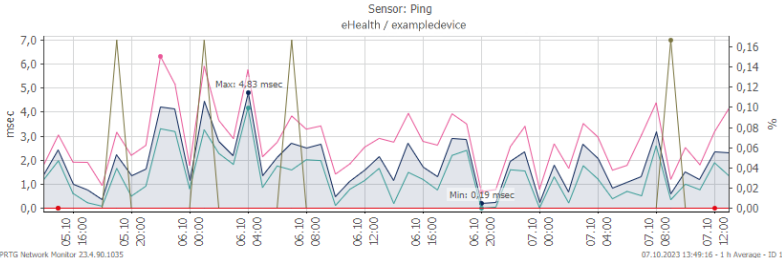

## Percentile Handling

### Percentile Handling

Percentile Results ⓘ  Do not show percentiles  
 Show percentiles

Percentile Handling

Setting	Description
Percentile Results	<p>Define if you want to include an additional <a href="#">percentile calculation</a> ⓘ of your data in the historic report:</p> <ul style="list-style-type: none"> <li>▪ Do not show percentiles: PRTG does not use a percentile formula to calculate your monitoring results. It only shows the standard values.</li> </ul>

Setting	Description																																								
	<ul style="list-style-type: none"> <li>Show percentiles: PRTG displays an additional percentile calculation for the <b>primary</b> channel in the value table for each scanning interval.</li> </ul> <div data-bbox="512 472 1342 1232" style="border: 1px solid #ccc; padding: 10px;"> <p><b>Report for Ping</b></p> <p>Report Time Span: 05.10.2023 13:47:00 - 07.10.2023 13:47:00</p> <p>Sensor Type: Ping (30 s interval)</p> <p>Probe, Group, Device: Local Probe &gt; eHealth &gt; exampledevice</p> <p>Uptime Stats: Up: 100 % [01d 23h 59m 30s] Down: 0 % [00s]</p> <p>Request Stats: Good: 100 % [5761] Failed: 0 % [0]</p> <p>Average (Ping Time): 2 msec</p> <p>Percentile: 11 msec</p>  <p>Legend: Downtime (%), Ping Time (msec), Minimum (msec), Maximum (msec), Packet Loss (%)</p> <table border="1" data-bbox="526 1064 1340 1232"> <thead> <tr> <th>Date Time</th> <th>Ping Time (msec)</th> <th>Minimum (msec)</th> <th>Maximum (msec)</th> <th>Packet Loss (%)</th> <th>Downtime (%)</th> <th>Percentile (Ping Time)</th> <th>Coverage (%)</th> </tr> </thead> <tbody> <tr> <td>Averages (of 48 values)</td> <td>2 msec</td> <td>1 msec</td> <td>3 msec</td> <td>&lt;1 %</td> <td>0 %</td> <td></td> <td>99 %</td> </tr> <tr> <td>05.10.2023 13:00:00 - 14:00:00</td> <td>1 msec</td> <td>1 msec</td> <td>2 msec</td> <td>0 %</td> <td>0 %</td> <td>1 msec</td> <td>43 %</td> </tr> <tr> <td>05.10.2023 14:00:00 - 15:00:00</td> <td>2 msec</td> <td>2 msec</td> <td>3 msec</td> <td>0 %</td> <td>0 %</td> <td>11 msec</td> <td>100 %</td> </tr> <tr> <td>05.10.2023 15:00:00 - 16:00:00</td> <td>1 msec</td> <td>1 msec</td> <td>2 msec</td> <td>0 %</td> <td>0 %</td> <td>1 msec</td> <td>100 %</td> </tr> </tbody> </table> <p>Example of a Historic Data Report with Percentile Calculation for the Primary Channel</p> </div>	Date Time	Ping Time (msec)	Minimum (msec)	Maximum (msec)	Packet Loss (%)	Downtime (%)	Percentile (Ping Time)	Coverage (%)	Averages (of 48 values)	2 msec	1 msec	3 msec	<1 %	0 %		99 %	05.10.2023 13:00:00 - 14:00:00	1 msec	1 msec	2 msec	0 %	0 %	1 msec	43 %	05.10.2023 14:00:00 - 15:00:00	2 msec	2 msec	3 msec	0 %	0 %	11 msec	100 %	05.10.2023 15:00:00 - 16:00:00	1 msec	1 msec	2 msec	0 %	0 %	1 msec	100 %
Date Time	Ping Time (msec)	Minimum (msec)	Maximum (msec)	Packet Loss (%)	Downtime (%)	Percentile (Ping Time)	Coverage (%)																																		
Averages (of 48 values)	2 msec	1 msec	3 msec	<1 %	0 %		99 %																																		
05.10.2023 13:00:00 - 14:00:00	1 msec	1 msec	2 msec	0 %	0 %	1 msec	43 %

05.10.2023 15:00:00 - 16:00:00	1 msec	1 msec	2 msec	0 %	0 %	1 msec	100 %																																		
<p>Percentile Type</p>	<p>This setting is only visible if you select Show percentiles above.</p> <p>Enter the percentile type that you want PRTG to use for the calculation. If you choose, for example, to calculate the 95th percentile, enter <b>95</b> here and 5% of peak values are discarded. Enter an integer.</p>																																								
<p>Percentile Averaging Interval</p>	<p>This setting is only visible if you select Show percentiles above.</p> <p>Enter a value to define the averaging interval on which PRTG bases the percentile calculation. The default value is <b>300</b> seconds (5 minutes). This means that PRTG takes 5-minute averages as basic values for the percentile calculation. Enter an integer.</p>																																								
<p>Percentile Mode</p>	<p>This setting is only visible if you select Show percentiles above.</p> <p>Select the mode for percentile calculation:</p> <ul style="list-style-type: none"> <li>Discrete: PRTG takes discrete values to calculate percentile results.</li> <li>Continuous: PRTG interpolates between discrete values and bases the calculation on interpolated values.</li> </ul>																																								

Click Start to generate a historic data report.

**i** You cannot generate the historic data report if monitoring data was [deleted](#) after the specified start date. Set the start of the report to a date for which data is available.

## Remarks for Reports

- Any sensor graph in your report only shows channels that you select via the Show in graphs option in the [channel settings](#).
- Reports show statistics for the uptime (the Up and Down [states](#) in percent) and for requests ([Good](#) and [Failed](#) in percent). PRTG rounds values between 5% and 95%, as well as 100% and 0%, to whole numbers without decimal places. Other values are shown with 3 decimal places.
- Because PRTG rounds values, the statistics in the report section Sensor Status History can differ from the values in the report section Uptime Stats by a few seconds.
- PRTG limits data reporting to 5 requests per minute.
- Reports cannot show uptime or downtime data for the [Sensor Factory](#) sensor.
- Create reports that include an appropriate amount of data. Reports might not work as expected if PRTG has to process too many sensors with short scanning intervals. Adjust your report size and the time span that the report covers, if necessary.

## Automatic Averaging

For performance reasons, PRTG automatically averages monitoring data when it calculates data for large periods of time.

Period of Time in Report	Minimum Level of Detail (Averaging Interval)
Up to 40 days	Any
40 to 500 days	60 minutes/1 hour or longer

**i** Reports for periods that are longer than 500 days are not possible. If you enter a longer period, PRTG automatically shortens it to 365 days.

**i** In some cases, the generated report might contain a period of time that differs from the defined start and end date for the report because of internal averaging processes. When averaging intervals are longer than 1 hour and do not equal 24 hours, and when they are combined with specific periods of time, the resulting data points might be asynchronous to the periods of time. Consider this behavior particularly if you use [application programming interface \(API\) calls](#) to generate reports.

How does PRTG compute CPU Index, Traffic Index and Response Time Index?

- <https://kb.paessler.com/en/topic/313>

## 6.6 Similar Sensors

With PRTG, you can detect relationships between different components in your network. For example, you can detect extraordinarily high CPU load that correlates with extraordinarily high traffic at a specific time of a day or week. This can give you a hint to further investigate that part of your network.

### What Is Similarity?

The similarity calculation is based on the values that are saved in the sensor history. If measured values change in the same way, the [Similar Sensors Detection](#) feature detects it and shows you the sensors for which it found similar data relations. PRTG shows all sensors that reach 85% to 100% similarity.

The analysis of similar sensors is a heuristic calculation that shows interconnections and correlations in your network. The analysis is completely automated. It is based on mathematics and fuzzy logic and optimizes your sensor usage by tracking redundant monitoring of some aspects of your system.

### Similar Sensors Detection

You can adjust the depth of the similar sensors detection or turn it off under Setup | System Administration | Monitoring.

### Similar Sensors Detection

**Analysis Depth** ⓘ

- Manage automatically based on sensor count (default)
- Analyze only primary channels
- Analyze all channels (higher CPU load)
- Disable detection of similar sensors

Similar Sensors Detection Settings

You can also enable or disable the similar sensors detection for specific probes, groups, and devices, and specify [inheritance](#)<sup>[136]</sup> in the [object's settings](#)<sup>[201]</sup>, section Advanced Network Analysis.

### Advanced Network Analysis

	<b>Unusual Detection</b> ⓘ	<input checked="" type="radio"/> Enable (default) <input type="radio"/> Disable
	<b>Similar Sensors Detection</b> ⓘ	<input checked="" type="radio"/> Enable (default) <input type="radio"/> Disable
	<b>System Information</b> ⓘ	<input checked="" type="radio"/> Enable (default) <input type="radio"/> Disable

Activation of the Similar Sensors Detection

There are two options to view similar sensors:

- Via the Overview tab of sensors that includes a [Similar Sensors section](#)<sup>193</sup> where PRTG lists channels that show similarities to channels of the selected sensor.
- Via Sensors | Simulate Error Status in the main menu bar where you get an [overview](#)<sup>195</sup> of all similar sensors.

To edit the list of similar sensors results, use the [available filters](#)<sup>196</sup>.

## Similar Sensors (Sensor Overview Tab)

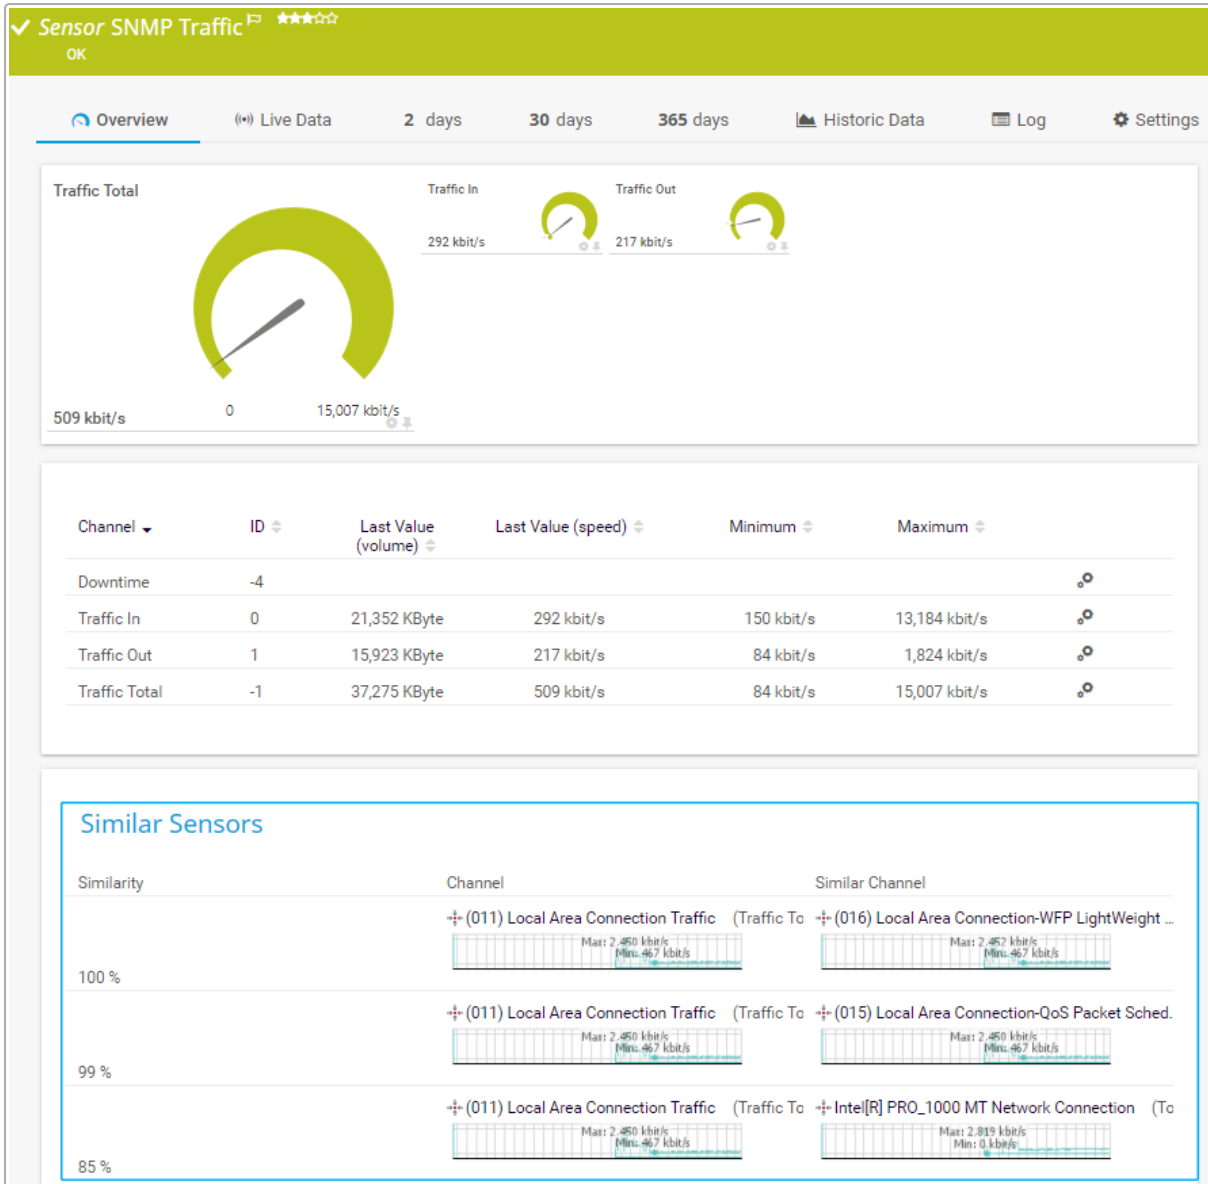

Probe, group, device, and sensor pages have tabs that you can use to navigate between different options. For example, you can view your network's status, view monitoring results, or change settings.

Tabs Bar for Sensors

On the Overview tab of a sensor, PRTG lists channels that show similarities to channels of the selected sensor. The table is empty if PRTG detects no similarities to the selected sensor.

- ⓘ PRTG shows similar sensors here when channels have 85% similarity or more. The similar sensors detection saves up to 15 entries per sensor.

Similar Sensors Section on a Sensor's Overview Tab

The Similar Sensors section provides the following information.

Column Header	Description
Similarity	Shows the similarity between two channels in percent.
Channel	Shows a channel of the selected sensor.
Similar Channel	Shows a channel of a sensor that is similar to the channel of the selected sensor that you can see in the Channel column in the same row.

**i** PRTG does not show the Similar Sensors section when the analysis is disabled or when you exceed 1,000 sensors and select the Manage automatically based on sensor count (default) option as Analysis Depth in the [Monitoring](#) settings. In this case, you see the following notice:

The similar sensors detection is a heuristic calculation that analyzes similar values in the sensor data of your entire PRTG installation. This way, PRTG can detect unexpected correlations between different components in your network and help optimize your sensor usage.

Why can't I see any sensor similarities here?

- The Similar Sensors Detection feature is currently turned off. To enable the detection and analysis of similar sensors, open **Setup | System Administration | Monitoring** and set your preferred analysis depth in the **Similar Sensors Detection** section.
- For more information about the similar sensors detection in PRTG, see the [PRTG Manual: Similar Sensors](#).

Similar Sensors Detection Notice

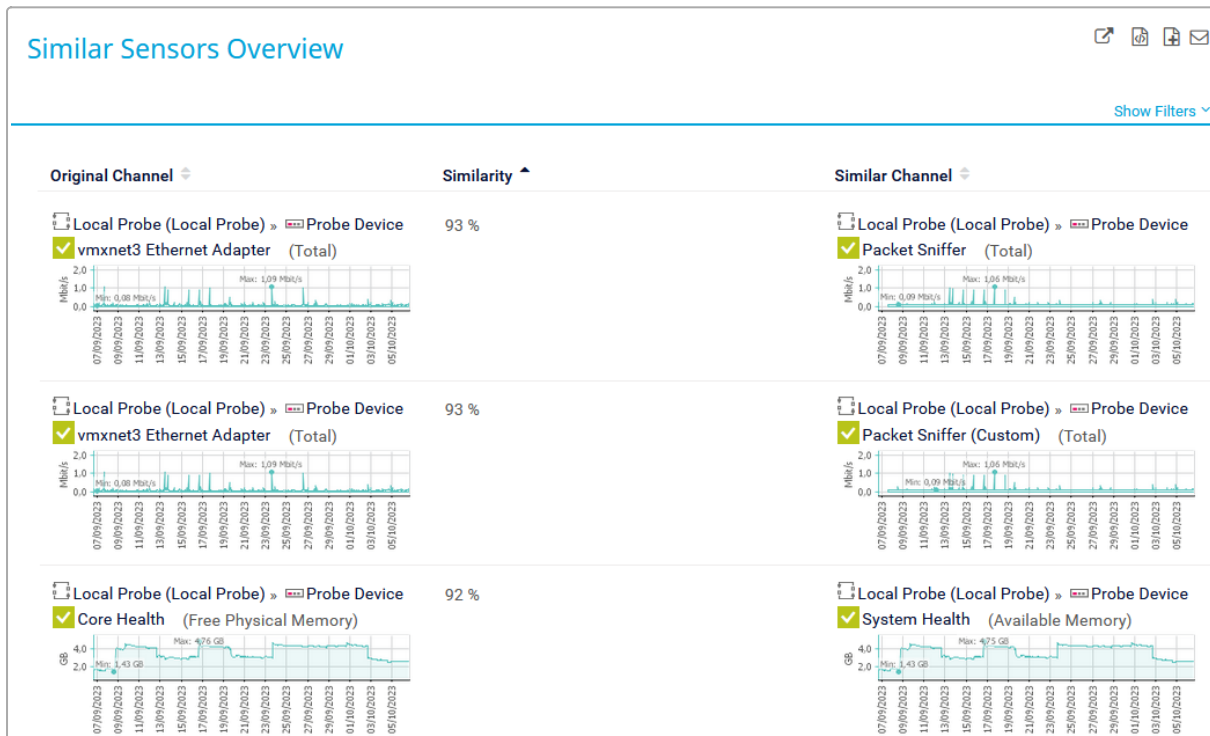

## Similar Sensors Overview (Sensors Menu)

This page shows the results of the similar sensors detection from the entire monitoring database. PRTG lists all channels with similarities here. Above the table, there are several filter options to display similar sensors as required. Select the object of interest, the degree of similarity, and display back references.

For more information, see section [Working with Table Lists](#).

**i** The analysis of similar sensors requires sensor data from at least seven days to have enough data for comparison. If not enough data is available, no data is shown on the Similar Sensors Overview or in the Similar Sensors section on a sensor's Overview tab.

**i** PRTG shows similar sensors here when channels have at least 85% similarity. Furthermore, the analysis saves up to 15 entries per sensor.

Similar Sensors Overview

You can click the column headers to sort the list. The Similar Sensors Overview provides the following information.

Column Header	Description
Original Channel	Shows channels that other channels are compared to. Click the column header to sort the list according to the order in the device tree in ascending or descending order.
Similarity	Shows the similarity between two channels in percent. Click the column header to sort the list according to the similarities in ascending or descending order.
Similar Channel	Shows a channel that is similar compared to the original channel. Click the column header to sort the list according to the order in the device tree in ascending or descending order.

**i** PRTG does not show the Similar Sensors Overview item in the main menu bar if you disable the analysis or if you exceed 1,000 sensors and select the Manage automatically based on sensor count (default) option as Analysis Depth in the [Monitoring](#) settings.

### Adjust the Similar Sensors Overview to Your Needs

You can use various filters to adjust the results in the Similar Sensors Overview. Click Show Filters and edit the filters that appear.

Filters for the Similar Sensors Analysis

Filter	Description
Filter By Object	Select the device, probe, or group that you want the Similar Sensors Detection to cover. This way, you can apply the analysis to the parts of your network that you are interested in.
Filter By Maximum Similarity	Select a degree of similarity from 85% to 100%.
Inverted Relationships	If you select Show, PRTG shows all similarity relationships, that is, <b>A matches B</b> and <b>B matches A</b> .  If you select Hide, PRTG only shows <b>A matches B</b> relationships. This reduces the number of displayed similar sensors.

## 6.7 Recommended Sensors

With the [Recommended Sensors Detection](#) feature, PRTG can explore any device and check which sensors you have already created. If it finds useful sensors that you have not created yet, you see a list of recommended sensors for your device.

☁ You cannot use this feature on the hosted probe of a PRTG Hosted Monitor instance. You can use this feature on remote probes.

ⓘ The recommended sensors detection does not apply to the [user group setting](#) <sup>[2914]</sup> Allowed Sensors. Therefore, read/write users can also add all recommended sensors.

The screenshot shows the 'Device Internet' overview page. At the top, there are navigation tabs for 'Overview', '2 days', '30 days', '365 days', 'Alarms', 'System Information', 'Log', and 'Settings'. A message box states: 'To see sensor gauges here, please change the priority of one or more sensors to ★★★★★ / ★★★★★.' Below this is a table of existing sensors:

Pos	Sensor	Status	Message	Graph	Priority	
1.	HTTP	Up	OK	Loading time 110 μsec	★★★★☆	<input type="checkbox"/>

Below the table is a 'Recommended Sensors' section with the following data:

Priority	Sensors	Total Sensors	Links
★★★★★	1xPing	1	<a href="#">Add These Sensors</a>
★★★★☆	1xSSL Security Check (Port 4...)	2	<a href="#">Add These Sensors</a>

At the bottom left of the recommended sensors section is a 'Recommend Now' button.

Recommended Sensors on Device Overview Tab

### Get Sensor Recommendations

By default, PRTG recommends sensors for any device that you add and shows the suggested sensors for the device on its Overview tab, as long as your installation includes less than 5,000 sensors in total. To add the recommended sensors, click [Add These Sensors](#).

You can see the time that has passed since the last sensor recommendation in the [page header bar](#) <sup>[170]</sup> on the Overview tab of a device.

If you want to manually start the recommended sensors detection on any device, follow the steps below.

## Step 1: Select the Device

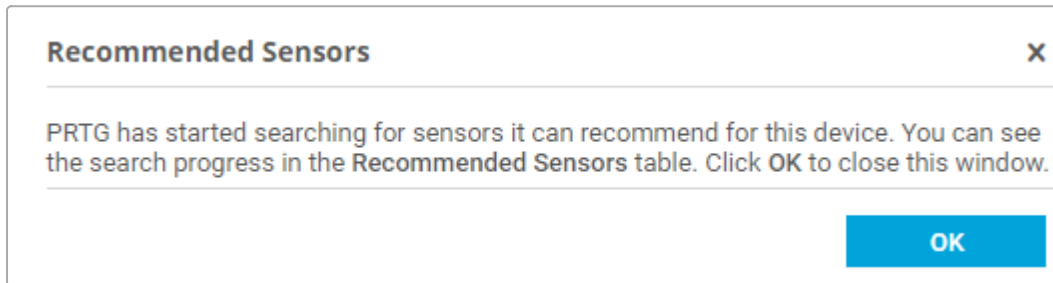

Open the Overview tab of the device that you want to analyze.

## Step 2: Recommend Now

To start the analysis of your device, click Recommend Now or right-click the device and select Recommend Now from the [context menu](#)<sup>[229]</sup>.

- ⓘ If you do not see the Recommend Now option, make sure that the Recommended Sensors Detection in the [Monitoring](#)<sup>[2874]</sup> settings. Probe devices do not support this option.

Depending on the complexity of your device, it can take some time until you see the results of the analysis.

Recommended Sensors Investigation

PRTG runs the recommended sensors detection with low priority in the background to prevent potential performance issues. Because of this, the recommended sensors detection can take more time than expected if PRTG needs resources to ensure the gapless monitoring of your network. By default, the recommended sensors detection starts automatically when you add a new device, when you do not have more than 5,000 sensors, or when the last analysis was executed more than 30 days ago. You can change these settings under Setup | System Administration | Monitoring, section Recommended Sensors Detection.

- ⓘ To recommend [Simple Network Management Protocol \(SNMP\) sensors](#)<sup>[3232]</sup> for a device, the detection engine uses the SNMP version that you defined in the Credentials for SNMP Devices section of the [device settings](#)<sup>[615]</sup>.

## Step 3: Get the Results

After PRTG analyzed your device, it suggests a list of sensors that are useful for a more comprehensive monitoring.

### Recommended Sensors

Priority	Sensors	Total Sensors	Links
★★★★★	1xPING	1	<a href="#">Add These Sensors</a>
★★★★☆	1xSSL Security Check (Port 443), 1xSSL Certificate Sensor (Port ...	2	<a href="#">Add These Sensors</a>

[Recommend Now](#)

**What is this?**  
PRTG can inspect your devices to recommend useful sensors.

List of Recommended Sensors

The list of recommended sensors provides the following information.

Column Header	Description
Priority	Shows which <a href="#">priority</a> <sup>[224]</sup> the suggested sensors have when you add them. The recommended sensors table is sorted by priority, beginning with the top priority (★★★★★) in the first row.  ⓘ You can manually change the priority of a sensor after you add it.
Sensors	Shows the suggested sensors and the number of sensors of one type that PRTG recommends for this device. For example, you might want to add an <a href="#">SNMP Traffic</a> sensor multiple times for several network interfaces.
Total Sensors	Shows the total number of suggested sensors per table row. These sensors have the same priority.
Links	Displays an Add These Sensors button for every table row. Click to automatically add the sensors in this table row to the device.

ⓘ The recommended sensors detection checks if a certain sensor exists on your device and recommends that you add this sensor if it does not exist. If this sensor existed previously on the device, but you deleted it, PRTG suggests this sensor again. In this case, ignore the recommendation of this sensor or follow [step 4](#)<sup>[199]</sup>.

## Step 4: Add Recommended Sensors

Click Add These Sensors in a table row to add all sensors in this row to the analyzed device.

ⓘ If you want to add **all** suggested sensors regardless of their priority, click every Add These Sensors button in the Recommended Sensors table. If you want to add only **some** of the sensors of a certain priority, click Add These Sensors, then [delete](#)<sup>[229]</sup> or [pause](#)<sup>[227]</sup> the sensors you do not need afterward.

## Settings for the Recommended Sensors Detection

You can also adjust the settings for the recommended sensors detection or disable it under Setup | System Administration | Monitoring.

**Recommended Sensors Detection**

Detection Handling ⓘ  Manage automatically based on sensor count (default)  
 Always show recommended sensors  
 Disable sensor recommendation

Recommended Sensors Detection Settings

If you use the Manage automatically based on sensor count (default) setting, PRTG uses an intelligent assistant to count the number of sensors you have and decides whether to start the detection of recommended sensors or not. The detection does not start if your PRTG installation includes 5,000 sensors or more to prevent performance issues. We recommend that you use this option so that you do not miss any important monitoring data about your network and so that you do not risk performance issues.

- ⓘ Disable the recommended sensors detection if you encounter performance issues or if you do not want to display this information on device Overview tabs.

## Auto-discovery

You can also use the auto-discovery to find suitable sensors. You can start the auto-discovery when you [add a new device](#)<sup>[369]</sup>, you can [manually start](#)<sup>[255]</sup> it at any time, or you can choose if you want PRTG to [analyze a whole section](#)<sup>[602]</sup> of your network, for example, devices that are covered by a certain IP address range.

- ⓘ The auto-discovery has a higher priority than the detection of recommended sensors. If both are active, PRTG queues the sensor recommendation and executes the auto-discovery first.

## 6.8 Object Settings

Probe, group, device, and sensor pages have tabs that you can use to navigate between different options. For example, you can view your network's status, view monitoring results, or change settings.

Tabs Bar for Sensors

### General Settings

On the Settings tab, you can define all settings for the selected object. The available options vary depending on the kind of object that you select. See the following sections for information about the object types:

- [Root Group Settings](#) 
- [Probe Settings](#) 
- [Group Settings](#) 
- [Device Settings](#) 
- [Sensor Settings](#)

 You cannot open [channel settings](#)  via tabs. Go to a sensor's Overview tab to edit the channel settings.

### Notification Triggers Settings

On the Notification Triggers tab, you can set notification triggers for every object. If you use these settings for a probe, group, or device, they are inherited to all sensors on these objects. The available notification trigger options are the same for all objects.

 For more information, see section [Notification Triggers Settings](#) .

### Comments

On the Comments tab, you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

### History

On the History tab, all changes in the settings of an object are logged with a time stamp, the name of the user who made the change, and a message. The history log retains the last 100 entries.

 On some pages, you can click  in the [page header bar](#)  to access the history of subordinate objects. This includes [system administration](#)  settings and [account settings](#) , [reports](#) , [libraries](#) , and [maps](#) . For more information, see section [Logs](#) .

## 6.9 Alarms

You can see all sensors that are in the Down, Down (Partial), Down (Acknowledged), Warning, or the Unusual [status](#). Sensors in other states, for example, Up, Paused, or Unknown, do not appear here. This is useful for keeping track of all irregularities in your network.

**i** By default, [table lists](#)<sup>[218]</sup> that show alarms are sorted by [priority](#)<sup>[224]</sup>. Click a column header to sort the list items by a different category.

Sensor	Probe Group Device	Status	Down for	Last Value	Message	Graph	Priority	
!! Ping	Local Probe (Local Probe) » Linux / macOS / Unix » 192.0.2.0	Down	14 h 22 m		Request timed out (ICMP error...	Ping Time No data	★★★★★	<input type="checkbox"/>
!! Ping	Local Probe (Local Probe) » Linux / macOS / Unix » 192.0.2.1	Down	2 d 14 h 22 m		Request timed out (ICMP error...	Ping Time No data	★★★★★	<input type="checkbox"/>
!! Ping	Local Probe (Local Probe) » Linux / macOS / Unix » 192.0.2.2	Down	14 h 23 m		Request timed out (ICMP error...	Ping Time No data	★★★★★	<input type="checkbox"/>
!! Ping	Local Probe (Local Probe) » Linux / macOS / Unix » 192.0.2.3	Down	14 d		Request timed out (ICMP error...	Ping Time No data	★★★★★	<input type="checkbox"/>
!! Ping	Local Probe (Local Probe) » Linux / macOS / Unix » 192.0.2.4	Down	5 d 21 h 23 m		Request timed out (ICMP error...	Ping Time No data	★★★★★	<input type="checkbox"/>

Alarms List

There are two ways to display the alarms list. Either click the Alarms tab of a probe, group, or device, or click Alarms in the [main menu bar](#)<sup>[237]</sup>.

### Alarms (Object Tab)

Probe, group, device, and sensor pages have tabs that you can use to navigate between the different options. For example, you can view your network's status, view monitoring results, or change settings.

Tabs Bar for Groups and Probes

Click the Alarms tab of a probe, group, or device to show a table list of all sensors on the selected object that show the Down, Down (Partial), Down (Acknowledged), Warning, or Unusual [status](#)<sup>[181]</sup>. This list is a subset of the entries that are available via the Alarms | All option in the main menu bar.

**i** The Alarms tab is not available for sensors.

### Alarms (Main Menu Bar)

Click Alarms in the main menu bar to show a table list of all sensors in your installation that show the Down, Down (Partial), Down (Acknowledged), Warning, or Unusual status. You can also show these sensors as gauges or only show a subset of sensors in specific states. Hover over Alarms to show further options:

Option	Description
All	Open a list of all sensors that are in the Down, Down (Partial), Down (Acknowledged), Warning, or Unusual status.
Show as Gauges	Open a page with the gauges of all sensors that are in the Down, Down (Partial), Down (Acknowledged), Warning, or Unusual status. The size of the gauges corresponds to the sensor's priority.
Errors Only	Open a list of all sensors that are in the Down, Down (Partial), or Down (Acknowledged) status.
Warnings Only	Open a list of all sensors that are in the Warning status.
Unusuals Only	Open a list of all sensors that are in the Unusual status.

## Acknowledge Alarm

An acknowledged alarm shows the Down (Acknowledged) status. It does not [trigger](#)<sup>[2693]</sup> any more [notifications](#)<sup>[2735]</sup>.

- i** If the alarm condition clears, the sensor usually returns to the Up status with the next sensor scan.
- i** If a sensor in the Down (Acknowledged) status was paused and resumed, it shows the Down status again.

To acknowledge an alarm, right-click a sensor that shows the Down status. From the [context menu](#)<sup>[229]</sup>, select Acknowledge Alarm, then select a time span, optionally enter a message, and click OK. The message appears in the last message value of the sensor.

The time spans that you can select are: Acknowledge Indefinitely, acknowledge For 5 Minutes, For 15 Minutes, For 1 Hour, For 3 Hours, For 1 Day, or Until. If you select Until, provide the following information:

Field	Description
Selected Objects	Shows the sensors for which you want to acknowledge the alarm. You can acknowledge alarms for more than one sensor using <a href="#">multi-edit</a> <sup>[2718]</sup> .
Message	Enter a text, for example, the reason why you acknowledge the alarm. Enter a string or leave the field empty.
Until	Select the date when the Down (Acknowledged) status ends. Use the date time picker to enter the date and time.

Field	Description
	<p>ⓘ If the alarm condition still exists after the specified date, the sensor shows the Down status again.</p> <p>ⓘ To return the sensor to the Down status before the specified date, you can Pause and then Resume the sensor via the <a href="#">context menu</a>.</p>

ⓘ By default, only read/write [users](#) or administrators can acknowledge alarms. However, you can give read-only users the right to acknowledge alarms, too. See the system administration settings, section [User Accounts](#).

## More

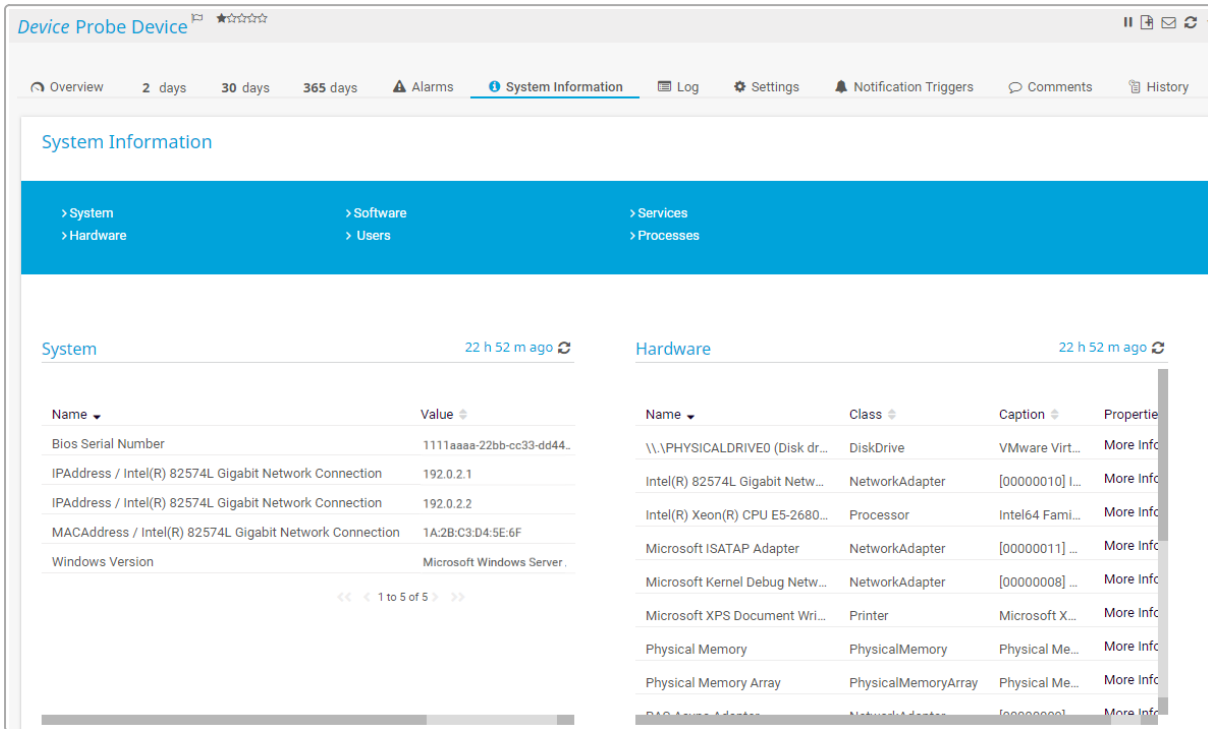

### ■ KNOWLEDGE BASE

Which audible notifications are available in the PRTG web interface and in the PRTG app for desktop?

- <https://kb.paessler.com/en/topic/26303>

## 6.10 System Information

With the [System Information](#) feature, you can see what is going on in the systems that you have in your network. To see the system information for a device, click the device's System Information tab.

System Information Tab on a Windows Device

The system information shows

- basic system data of your device like the BIOS serial number or MAC and IP addresses,
- all connected hardware types and their properties,
- the software you have installed, including version and vendor information,
- the users that are connected to your system and their domains,
- a list of all active or stopped Windows system services including their properties, and
- a list of all processes that are running on your system, including their ID and start time.

System information is available for all devices that run with an [officially supported Windows operating system](#). You can also retrieve system information from devices that run with Linux or Unix, and from all other devices that have the Simple Network Management Protocol (SNMP) enabled.

☁ You cannot use this feature on the hosted probe of a PRTG Hosted Monitor instance. You can use this feature on remote probes.

### Prerequisites

You already meet the main prerequisites for retrieving system information if you already monitor a device with sensors that use Windows Management Instrumentation (WMI) or the Simple Network Management Protocol (SNMP). PRTG automatically displays the data on the respective device's System Information tab. To retrieve all available system information, enable both WMI and SNMP on the device.

**i** The System Information feature is enabled by default. To retrieve the data, PRTG automatically uses the [credentials for Windows systems](#)<sup>[606]</sup> and the [credentials for SNMP devices](#)<sup>[615]</sup> that you entered in the device settings or that the device [inherits](#)<sup>[132]</sup> from a parent object like the root group. Consider this when you monitor devices that are outside of your local network, especially when you use [SNMP v1](#) or [SNMP v2c](#), which do not provide encryption.

Meet the following prerequisites if you do not yet use WMI or SNMP sensors:

Option	Description
Valid credentials	Specify valid credentials for Windows systems and for SNMP devices in the <a href="#">device settings</a> <sup>[597]</sup> .
Remote Registry Windows service	Enable the Remote Registry service on the target computer, for example, via <a href="#">services.msc</a> , and set the Startup Type to Automatic.
Remote Procedure Call (RPC) Windows service	Enable the RPC Windows service on the target computer, for example, via <a href="#">services.msc</a> , and set the Startup Type to Automatic.
WMI	<p>Enable WMI on both the probe system and the target system. In particular, configure the firewall of the target system to allow WMI.</p> <p>■ For more information, see section <a href="#">Monitoring via WMI</a><sup>[3004]</sup> and the Knowledge Base: <a href="#">My WMI sensors don't work. What can I do?</a></p>
SNMP	<p>Enable SNMP on the target system. PRTG automatically uses the SNMP Compatibility Options as defined in the <a href="#">device settings</a><sup>[597]</sup> or as inherited from a parent object like the root group.</p> <p>■ For more information, see section <a href="#">Monitoring via SNMP</a><sup>[2997]</sup> and the Knowledge Base: <a href="#">My SNMP sensors don't work. What can I do?</a></p>

**i** It is not necessary to meet every single prerequisite but then some tables do not show all data or they can even remain empty. For example, if you do not enable SNMP on the target device, you get less information for the System table.

The first data usually comes in after a few minutes. If PRTG cannot retrieve some data, for example, because of a misconfiguration, the respective System Information table shows an error message.

■ For more information, see the Knowledge Base: [How can PRTG get data for System Information tables?](#)

**i** System information for your devices is only for informational purposes. We cannot guarantee that the data displayed in PRTG fully corresponds to the device parameters.

Software
31 S Ago

No Data Available

- *Error: The sensor could not connect to the Remote Registry Windows service of the target system. To resolve this issue, make sure that the service is running. Also make sure that you entered correct Credentials for Windows Systems in the device settings. For more information, see <https://kb.paessler.com/en/topic/67824>. (code: PE255)*
- *Error: SNMP No Response*

Error Messages: No Data Available

### System Information (Device Tab)

Probe, group, device, and sensor pages have tabs that you can use to navigate between the different options. For example, you can view your network's status, view monitoring results, or change settings.

Tabs Bar for Devices

Select a device and click the System Information tab.

**i** The System Information feature is enabled by default. If you do not see the System Information tab, you need to enable System Information in the device settings under Advanced Network Analysis. You can also inherit the setting from an object that is higher in the [object hierarchy](#) <sup>[132]</sup>.

### Advanced Network Analysis

<b>Unusual Detection</b> <small>i</small>	<input checked="" type="radio"/> Enable (default)
	<input type="radio"/> Disable
<b>Similar Sensors Detection</b> <small>i</small>	<input checked="" type="radio"/> Enable (default)
	<input type="radio"/> Disable
<b>System Information</b> <small>i</small>	<input checked="" type="radio"/> Enable (default)
	<input type="radio"/> Disable

Advanced Network Analysis

### Analyze Your Systems

On the System Information tab, PRTG displays a table for each system information category for the device.

Category	System Information	Request Method (WMI or SNMP)
System	Shows system data of the device like the BIOS serial number, IP addresses, MAC addresses, and the Windows version.	WMI and SNMP
Hardware	Shows hardware that is connected to the device like disk drives, CD/DVD, video controllers, processors, network adapters, sound devices, printers, and memory. You can see the Class and the Caption of a hardware device. In the Properties column, you get more information about the hardware, for example, the description.	WMI and SNMP
Software	Shows the installed software and the Version number of the device. In the Properties column, you get more information about the software, for example, the size.  ⓘ PRTG uses <a href="#">Uninstall</a> registry keys to retrieve the list of installed software, so the displayed software might differ from the software that the target Windows system shows under Programs and Features.  ⓘ The System Information scan for software on the probe device uses the credentials of the probe system and ignores credentials that you specified on the Settings tab.	WMI and SNMP
Users	Shows the user accounts that are connected to the device and their Domain.	WMI
Services	Shows the available Windows services on the device. You can see the State of the service (running, stopped) and the start type (Startup Type automatic, manual, or disabled). In the Properties column, you can get more information about a service, for example, the description.	WMI
Processes	Shows the processes that are running on the device as listed on the <a href="#">Processes</a> tab of the Windows Task Manager. You can also see the Start Time (only WMI) and Process ID of a process.	WMI and SNMP

You can sort each [table list](#)<sup>[218]</sup> via the column headers.

Click  in the upper-right corner of a table to retrieve new information for this System Information category. The time stamp shows the time that has passed since the last table refresh.

31 S Ago   
Table Refresh

PRTG automatically retrieves data for the tables System, Hardware, and Software once every 24 hours. The tables Users, Services, and Processes refresh each time you open the System Information tab. PRTG also updates all system information tables when the PRTG core server is restarted, for example, after an update.

- ⓘ PRTG can perform up to 24 system information scans at the same time, so it can take some time until you see data in the tables after a server restart.

## Data Storage

PRTG stores data files with the retrieved system information in the corresponding \System Information Database subfolders of the [PRTG data directory](#)<sup>[3214]</sup>.

- ⓘ If you delete a device, the system information files of this device remain in these subfolders unless you manually delete them.

PRTG uses the following subfolders for System Information data.

Subfolder	Description
hardware	Data for the Hardware table
loggedonusers	Data for the Users table
processes	Data for the Processes table
services	Data for the Services table
software	Data for the Software table
system	Data for the System table

## 6.11 Logs

Logs show all past activities and events in your monitoring setup. With the logs, you can, for example, review past user activities, system events, or check whether messages were sent. In a typical setup, a huge amount of log data is produced. Because PRTG records the activity of every single object, you can use this information to check if your setup works as required.

You can choose from several filters to navigate the log entries.

For more information, see section [Working with Table Lists](#) <sup>218</sup>.

**Log Entries** Items: 50  
Show Filters

Date Time	Parent	Type	Object	Status	Message
05/10/2023 14:08:58	Probe Device	Local Folder (BETA)	Local Folder	Up	0 #

List with Log Entries

There are two ways to open the logs list. Either click the Log tab of a probe, group, device, or sensor, or click Logs in the [main menu bar](#) <sup>246</sup>.

### Log (Object Tab)

Probe, group, device, and sensor pages have tabs that you can use to navigate between the different options. For example, you can view your network's status, view monitoring results, or change settings.

Tabs Bar for Groups and Probes

Click the Log tab to show a table list with all log information for the selected object. This is a more detailed log than the system log that is available via the Logs | All option in the main menu bar.

### Logs (Main Menu Bar)

Click Logs in the main menu bar to show a table list of all system log entries in your installation. Hover over Logs for further options:

Option	Description
All	Open a list with log information about all objects in your installation. The list begins with the most recent log entry.
Status Changes	<p>Open a list with log information about specific status changes. Hover over Status Changes to choose from the following sensor states:</p> <ul style="list-style-type: none"> <li>▪ Up &amp; Down</li> <li>▪ Down</li> <li>▪ Warning</li> <li>▪ Unusual</li> <li>▪ Up</li> <li>▪ Paused/Resumed</li> <li>▪ Acknowledged Alarms</li> </ul>
System Events	<p>Open a list with log information about specific system event types. Hover over System Events to choose from the following event types:</p> <ul style="list-style-type: none"> <li>▪ Report Related</li> <li>▪ Cluster Related  <span style="color: #00AEEF;"> ⓘ This event type only appears if you have a cluster.</span></li> <li>▪ Auto-Discovery Related</li> <li>▪ Notifications Related</li> <li>▪ Status Message Related</li> </ul>
Object History	<p>Open a list with log information about changes to the PRTG setup and deletions of subordinate system objects. The Object History has several tabs. To view the changes to all related settings and deletions of objects, use the following tabs:</p> <ul style="list-style-type: none"> <li>▪ My Account</li> <li>▪ System Administration</li> <li>▪ Notification Templates</li> <li>▪ Schedules</li> <li>▪ User Accounts</li> <li>▪ User Groups</li> <li>▪ Reports</li> <li>▪ Libraries</li> <li>▪ Maps</li> </ul>

Option	Description
	<p> You can also navigate to a corresponding page, for example, you can select Setup   Account Settings   My Account from the main menu bar, and click  in the <a href="#">page header bar</a><sup>[170]</sup> to directly go to the related object history tab.</p>

## 6.12 Tickets

PRTG has its own ticket system. A ticket includes information about recent events in your PRTG installation that need a closer look. Each ticket is a task for a particular user or user group.

Tickets							
							Items: <span>▼</span> 50
							Show Filters <span>▼</span>
Last modified <span>▼</span>	Priority <span>↕</span>	Ticket ID <span>↕</span>	Subject	Assigned to <span>↕</span>	Status <span>↕</span>	Object <span>↕</span>	<input type="checkbox"/>
14/08/2023 15:16:57	★★★★☆	#5	🔔 Automatic update successful	PRTG Administrators	○	System	<input type="checkbox"/>
14/08/2023 15:11:31	★★★☆☆	#4	🔔 Software update is available	PRTG Administrators	○	System	<input type="checkbox"/>
31/07/2023 16:29:40	★★★★☆	#3	🔔 We recommend at least Win...	PRTG Administrators	○	System	<input type="checkbox"/>
27/07/2023 16:36:09	★★★☆☆	#2	🔔 Auto-Discovery finished for '1...	PRTG Administrators	○	Local Probe	<input type="checkbox"/>
27/07/2023 16:26:36	★★★★☆	#1	🔔 Welcome to PRTG!	PRTG Administrators	○	Root	<input type="checkbox"/>

List of Tickets

Each task has a life cycle in the ticket system. The task's life cycle starts when a ticket is created. The users who are responsible then take care of this issue. Once the issue has been resolved, the ticket can be closed and the life cycle of the task ends. PRTG automatically creates tickets, for example, when the [auto-discovery](#) [254] has finished, and you can create tickets for every kind of issue as well. In addition, you can set up [notifications](#) [2735] that open a ticket when an issue occurs.

Every ticket has a unique ID, a priority, and a status. You can open, resolve, or close a ticket.

PRTG can also [send an email](#) [217] to you whenever a ticket is assigned to you or if one of your tickets has been changed.

❗ Except for administrator groups, you can disable the ticket system for particular user groups under Setup | System Administration | User Groups. You can also [disable ticket emails](#) [217] for every user account.

### Ticket Types

There are three types of tickets:

Type	Description
User Tickets	User tickets are created by users, for example, to assign monitoring-related tasks to a particular <a href="#">user account</a> [2901] or <a href="#">user group</a> [2912].
ToDo Tickets	<p>ToDo tickets are created by PRTG to show important system information and to inform you about specific system events. ToDo tickets are assigned to the predefined <a href="#">PRTG Administrators</a> group. You cannot change the user group to which PRTG assigns ToDo tickets and you cannot disable ToDo tickets.</p> <p>❗ Users that belong to an administrator group do not receive new ToDo tickets and notifications about changes by default, only the predefined <a href="#">PRTG System Administrator</a> user does. You cannot change this behavior.</p>

Type	Description
	<p>See the following examples for cases in which PRTG creates a ToDo ticket:</p> <ul style="list-style-type: none"> <li>▪ The auto-discovery created new devices or sensors. <ul style="list-style-type: none"> <li>ⓘ In the ticket, PRTG only lists the device templates that it used to create the sensors.</li> </ul> </li> <li>▪ A new probe has connected to the PRTG core server and you must acknowledge it.</li> <li>▪ A new cluster node has connected to the cluster and you must acknowledge it.</li> <li>▪ A new version of the software is available.</li> <li>▪ A new report is ready for review.</li> <li>▪ In a few other situations, for example, the system is running out of disk space, there are license issues, or an error occurs.</li> </ul> <p>ⓘ The related object of ToDo tickets is System.</p>
Notification Tickets	Notification tickets are created via notifications that you set in the <a href="#">notification template settings</a> <sup>[2808]</sup> .

## Ticket States

Tickets can have three different states:

Sym bol	State	Description
	Open	New tickets are open as long as the issue that is described in the ticket exists.
	Resolved	The issue that is described in the ticket does not persist any longer because a user resolved it.
	Closed	A user resolved the ticket, the solution to the issue was reviewed for correctness, and the ticket does not require any other action.

## Tickets (Main Menu)

ⓘ This option is only available in the main menu bar if the user group to which the logged in user belongs is allowed to use the ticket system. You can disable a user group's access to the ticket system in the user group settings under Setup | System Administration | User Groups. **Read-only** users never have access to the ticket system and cannot see the Tickets option in the main menu bar.

You have several options to display a list of tickets that is filtered to your needs. In the main menu bar, click Tickets to show all open tickets that are assigned to you. Hover over Tickets to show other available filter options:

Option	Description
My Tickets	Click to show all open tickets that are assigned to you. Hover over My Tickets to show other options to filter these tickets according to their status: Open, Resolved, Closed, or All.
All Tickets	Click to show all open tickets of all users. Hover over All Tickets to show other options to filter these tickets according to their status: Open, Resolved, Closed, or All.
ToDo Tickets	<p>Click to show all open tickets of the ToDo <a href="#">type</a><sup>[213]</sup>. Hover over ToDo Tickets to show other options to filter these tickets according to their status: Open, Resolved, Closed, or All.</p> <p>Click Open to show all open ToDo tickets. Hover over Open to show other options to filter these tickets according to their event type: All, Report Related, Auto-Discovery Related, Probe Related, Cluster Related, System Errors, or New Software Version.</p>

## Add a User Ticket

From the main menu bar, select Tickets | Add Ticket, or hover over  and click Add Ticket. This opens the Add Ticket dialog.

Step 1: Select the object to which the new ticket is related via the [object selector](#)<sup>[222]</sup>. Click OK.

**i** You can skip step 1 if you use an object's [context menu](#)<sup>[229]</sup> in the device tree to open the ticket.

Step 2: Provide the following information and click OK to create a user ticket:

- Subject: Enter a subject for the ticket that indicates the topic of the issue.
- Assigned to: From the dropdown list, select a user or a user group that is responsible for this issue.
- Priority: Define a [priority](#)<sup>[224]</sup> from the lowest priority (☆☆☆☆) to the top priority (★★★★★).
- Comments: Enter a message. This message should describe the issue in detail.

After you open a new user ticket, a corresponding list of tickets appears. In this [table list](#)<sup>[218]</sup>, you can sort the items by clicking the column headers. Additionally, several search options are available in the filter directly above the table:

Option	Description
Status	all, open, resolved, closed

Option	Description
Type	Tickets, User Tickets, ToDo Tickets, Notification Tickets
Assigned To	<p>Show only tickets that are assigned to a specific user or user group:</p> <ul style="list-style-type: none"> <li>▪ anyone: Apply no user filter and show all tickets.</li> <li>▪ me: Show tickets that are assigned to you (the user who is logged in).</li> <li>▪ Groups: Show tickets that are assigned to a specific user group. The displayed user groups are specific to your setup.</li> <li>▪ Users: Show tickets that are assigned to a specific user. The displayed users are specific to your setup.</li> <li>▪ Disallowed: Display users or user groups that do not have access rights to the selected object. This is for your information only. You cannot select disallowed users or user groups.</li> </ul>
Related To	<p>Specify the relationship to a monitoring object. Select groups, probes, devices, or sensors with the object selector.</p> <p><b>i</b> ToDo tickets are related to System.</p>
Changed Between	Define a time span to view tickets that changed during this time. Use the date time picker to enter the date and time.

Click the subject of a ticket to open the ticket.

ToDo Ticket #4 ★★☆☆☆ ✉

[14/08/2023 15:11:31] The new PRTG version 23.3.88.1122 has been downloaded and will be installed right now. We will stop and restart the PRTG services.

An Open ToDo Ticket with Instructions

## Actions

The following actions are available for a specific ticket:

Action	Description
Edit (✎)	Open a dialog where you can change the subject and the priority of the ticket, as well as assign the ticket to a different user. You can optionally add a message to this ticket. Click OK to apply your changes.
Assign (👤)	Open a dialog where you can give the ticket to a different user or user group. Select a user or a user group via the dropdown list. You can optionally add a message to this ticket. Click OK to apply your changes.
Resolve (✔)	Open a dialog where you can resolve the ticket. The status <b>resolved</b> indicates that the issue that is described in this ticket does not persist anymore. You can optionally add a message to this ticket that indicates, for example, what was done to resolve the issue. Click OK to apply your changes.
Close (🔒)	Open a dialog where you can close the ticket after the issue was resolved and reviewed. You can optionally add a message to this ticket. Click OK to apply your changes.
Reopen (🔄)	Open a dialog where you can reopen a ticket after it was resolved or closed. Do so, for example, if the solution to the issue was not correct. You can optionally add a message to this ticket that indicates, for example, why you have opened the ticket again. Click OK to apply your changes.

ⓘ Only user group members that have the respective [access rights](#)<sup>[145]</sup> can view and edit tickets that are related to a certain monitoring object.

## Tickets as Emails

You can receive all tickets that are assigned to you or to your user group as emails. PRTG also notifies you via email each time a ticket that is assigned to you or to your user group is edited. This way, you are always informed about new notifications (if you enabled this setting), important system information (if you are an administrator), or the communication between other users.

You can disable the setting Email Notifications in the user account settings under Setup | System Administration | User Accounts. If you select Do not receive any emails from the ticket system for a specific user account, this particular user does not receive ticket emails anymore.

ⓘ If you defined to receive tickets as emails and you are the predefined [PRTG System Administrator](#) user, you receive emails for ToDo tickets as well, although ToDo tickets are usually opened by the [PRTG System Administrator](#) user.

## 6.13 Working with Table Lists

In the PRTG web interface, you often see table lists, for example, sensor or device lists. Table lists are also available in [libraries](#) [2738], [maps](#) [2776], [reports](#) [2754], [notifications](#) [2735], and [schedules](#) [2846], as well as in [logs](#) [210] and [tickets](#) [213]. All of these table lists are similar in layout and functionality.

Sensor	Probe Group Device	Status	Last Value	Message	Graph	Priority	Fav.	Perf. Impact	
✓ Ping	Local Probe (Local Probe) » Linux / macOS / Unix » 192.0.2.0	Up	0 msec	OK	Ping Time 0 msec	★★★★★	🔖	📊	<input type="checkbox"/>
✓ Ping	Local Probe (Local Probe) » Linux / macOS / Unix » 192.0.2.1	Up	1 msec	OK	Ping Time 1 msec	★★★★★	🔖	📊	<input type="checkbox"/>
✓ Ping	Local Probe (Local Probe) » Linux / macOS / Unix » 192.0.2.2	Up	0 msec	OK	Ping Time 0 msec	★★★★★	🔖	📊	<input type="checkbox"/>
✓ Ping	Local Probe (Local Probe) » Sensors » 192.0.2.3	Up	0 msec	OK	Ping Time 0 msec	★★★★★	🔖	📊	<input type="checkbox"/>
✓ Ping	Local Probe (Local Probe) » Linux / macOS / Unix » 192.0.2.4	Up	0 msec	OK	Ping Time 0 msec	★★★★★	🔖	📊	<input type="checkbox"/>

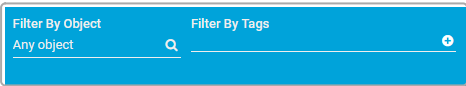

Example of a Table List

### Table List Options

See the following table for ways to work with table lists:

Feature	Display	Description
Paging		The content of a table list is displayed on several pages. Click the respective paging button at the end of a list to view other pages or to go to the beginning or the end of the list.
New Window		Click the respective button to open the table list in a new window.
Date Range		Use the date and time picker to show table list entries within a specific time period. Click the first field to select a start date and the second field to select an end date. Click Done to apply the selected date and time.

Feature	Display	Description
Select Range		<p>When you view <a href="#">log</a> lists, click <b>Select Range</b> in the upper-left corner of the table list to select the time period for which you want to show log entries. Choose from Today, Yesterday, and several other time periods. Select Unlimited to disable this filter again.</p> <p><b>■</b> For more information, see section <a href="#">Date Ranges</a> <sup>[220]</sup>.</p>
Items		<p>Click <b>Items</b> in the upper-right corner of a table list to select how many rows are shown on each page. You can choose between 50, 100, 500, and 1000.</p>
Sorting		<p>Click a column header to sort the list items by the respective category. You can click all column headers that include arrow icons to sort the list, for example, by Status, Last Value, Priority, and more. The sorting options vary depending on the content of the table list.</p>
Show XML		<p>Click the respective button to download the selected page in XML format. Your browser usually shows a download dialog.</p>
Filtering		<p>You can filter table lists via the <b>Show Filters</b> option directly above a list. The filter options vary depending on the content of the table list.</p> <p>Use the filter options, for example, to show specific objects in the list. Click <b>Any object</b> in the <b>Filter By Object</b> section to select an object from the device tree with the <a href="#">object selector</a> <sup>[221]</sup>.</p>

Feature	Display	Description
		<p>Enter one or more <a href="#">tags</a> <sup>138</sup> into the field Filter By Tags to filter the list for corresponding objects. You can use the plus sign (+) and the minus sign (-) to categorize tags as <a href="#">must have this tag</a> or <a href="#">does not need this tag</a>.</p> <p><b>i</b> For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

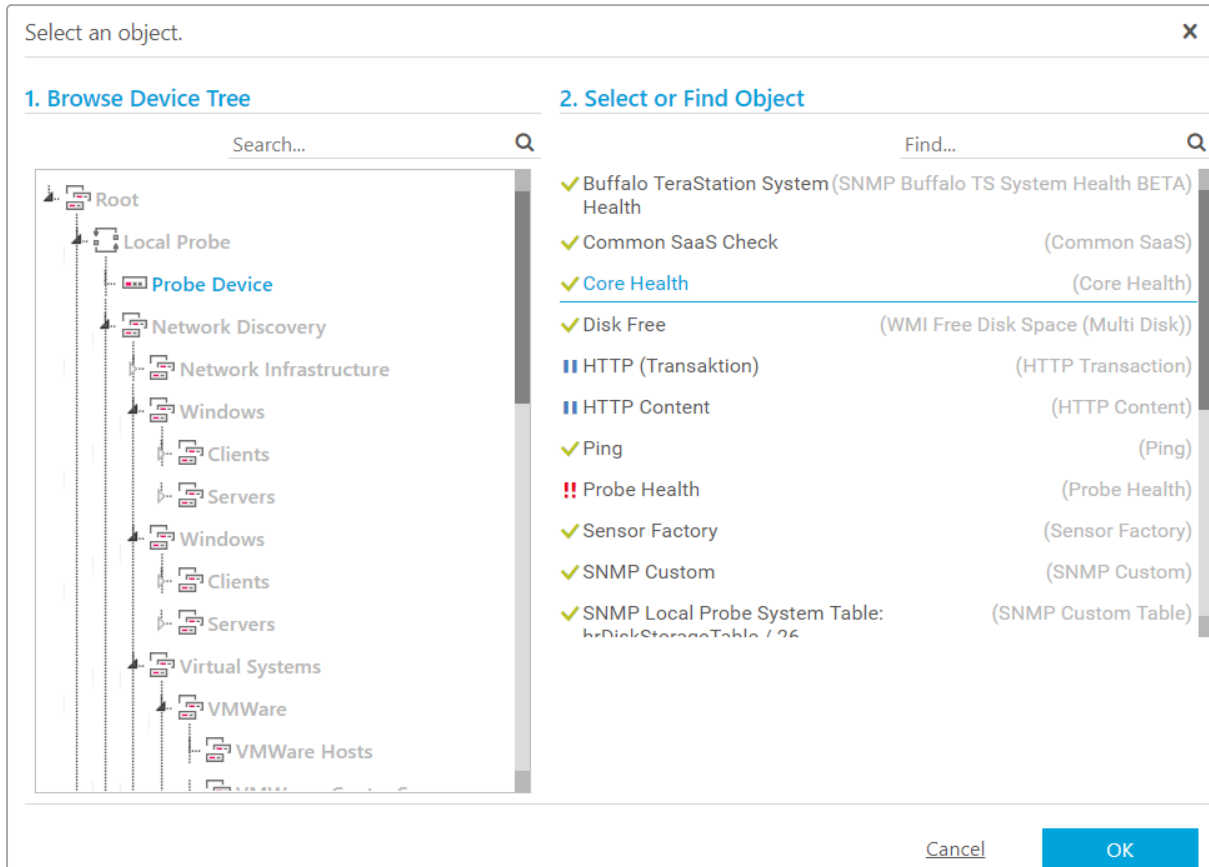

### Date Ranges

Range	Description	Example (Based on 14.01.2023)
Today	Start: 00:00 of today End: 00:00 of tomorrow	2023-01-14 (00:00) - 2023-01-15 (00:00)
Yesterday	Start: 00:00 of yesterday End: 00:00 of today	2023-01-13 (00:00) - 2023-01-14 (00:00)
7 days	Start: 00:00 of 7 days ago End: 00:00 of tomorrow	2023-01-07 (00:00) - 2023-01-15 (00:00)
30 days	Start: 00:00 of the same day last month End: 00:00 of tomorrow	2022-12-14 (00:00) - 2023-01-15 (00:00)
6 months	Start: 00:00 of the same day 6 months ago End: 00:00 of tomorrow	2022-07-14 (00:00) - 2023-01-15 (00:00)
12 months	Start: 00:00 of the same day 12 months ago End: 00:00 of tomorrow	2022-01-14 (00:00) - 2023-01-15 (00:00)

Range	Description	Example (Based on 14.01.2023)
Unlimited	Start: 00:00 of the same day 7 years ago ( <a href="#">historic data</a> <sup>1851</sup> for logs is limited to 750 days)  End: 00:00 of tomorrow	2016-01-14 (00:00) - 2023-01-15 (00:00)

## 6.14 Object Selector

For some features, you need to select an object, for example, when you want to create historic data reports. In this case, PRTG uses the object selector with which you can browse all objects in your installation to select an object in two steps.

Object Selector

### Step 1: Browse Device Tree

On the left-hand side, you see your specific device tree setup with all probes, groups, and devices. Click  to collapse an object. Click  to expand the object again and show its subobjects.

Click a device to view its sensors on the right-hand side.

You can also directly search for an object in the device tree. To do so, enter a probe name, group name, or device name into the Search box on the left-hand side. You can also use a substring for the search.

### Step 2: Select or Find Object

Select a device on the left-hand side to see the sensors on this device on the right-hand side. PRTG displays the name of the sensor as well as the sensor type. Hover over a sensor to view its parent objects.

You can also directly search for a sensor in the sensor list. To do so, enter the sensor name, group name, device name, or tag into the Find box on the right-hand side.

Select a sensor and click OK.

## 6.15 Priority and Favorites

You can set priorities for all your monitoring objects and also mark devices or sensors as favorites. Both settings affect how PRTG displays your objects.

- ① PRTG stores priority and favorites settings for the entire installation. The settings are not user specific.

### Priority for All Objects

The priority setting affects the order by which PRTG lists your objects in [table lists](#)<sup>[218]</sup>. PRTG lists objects with a higher priority first. Furthermore, a device displays gauges for sensors with a high priority on its Overview tab.

To change the priority settings, right-click an object to open its [context menu](#)<sup>[229]</sup> and select Priority/Favorite. You can choose from the top priority with 5 stars (★★★★★) to the lowest priority with one star (★☆☆☆☆). By default, PRTG sets all objects to the medium priority with 3 stars (★★★☆☆). In the [page header bar](#)<sup>[170]</sup> and in table lists, you can directly set a priority via the star icons.

Context Menu: Priority

- ① For a sensor, select a priority of 4 or 5 stars to display its the gauge of its primary channel on the Overview tab of its parent device.
- ① For a map, select a priority of 5 stars to display it as a menu item under Home in the [main menu bar](#)<sup>[237]</sup>.

### Favorites for Devices and Sensors

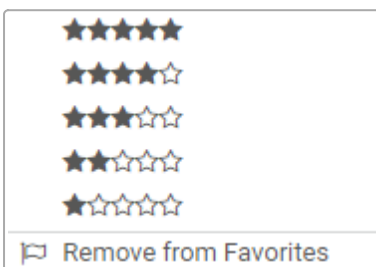

To open a list of all your favorite devices or sensors, select Devices | Favorite Devices or Sensors | Favorite Sensors from the main menu bar. These lists are sorted by priority as well.

You can mark any device or sensor as a favorite to add it to the favorites list. Right-click an object to open its context menu. Select Priority/Favorite | Add to Favorites. PRTG adds a dark gray flag icon (🚩) next to the object's name in the device tree to mark the object as a favorite.

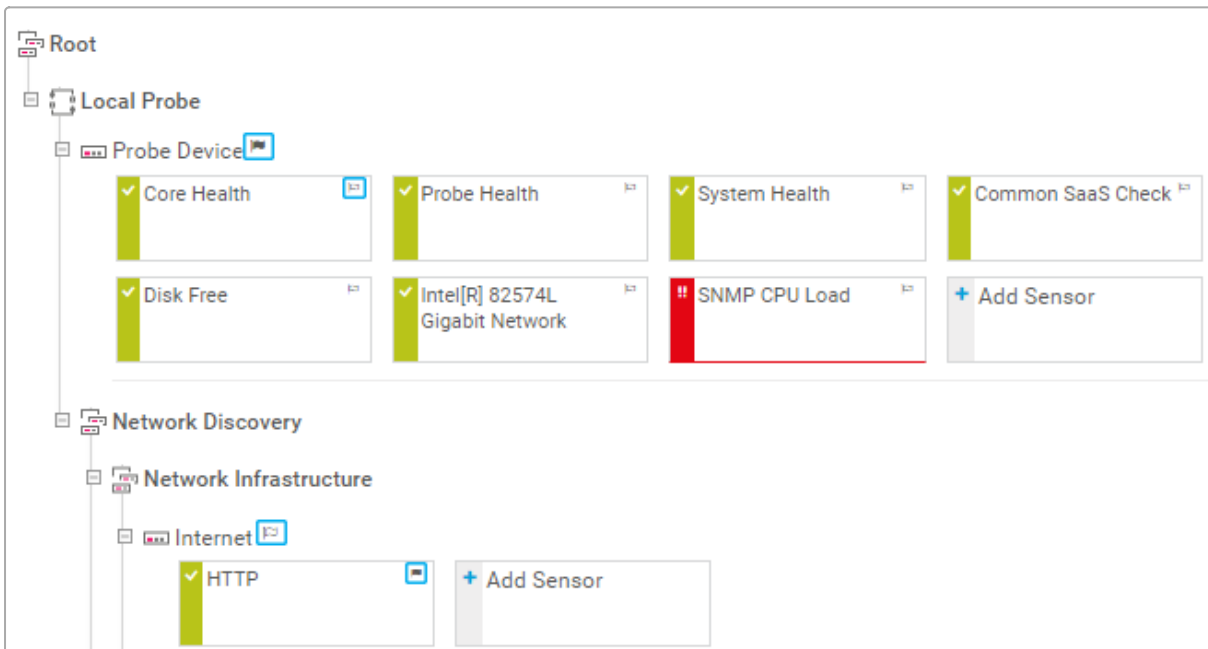

Context Menu:  
Priority/Favorites (Add)

To remove an object from the favorites list, select Priority/Favorite | Remove from Favorites from the context menu. The flag icon turns transparent (  ).

Context Menu: Priority/Favorites  
(Remove)

There is also the option to add a device or sensor to your favorites with one click in the device tree. Click the flag icon to the right of the respective object name. To make an object a favorite, click  . The flag turns dark gray. To remove an object from your favorites, click  . The flag turns transparent.

One-Click Adding to Favorites in the Device Tree

## Priority and Favorites in the Page Header Bar

You can also add any device or sensor to your favorites on the respective object's Overview tab. To do so, click  in the page header bar of a device or  in the page header bar of a sensor. Click  for a device or  for a sensor to remove the respective object from your favorites.

One-Click Favorite and Priority in the Page Header Bar

It is also possible to set the priority of an object via the five stars in the page header bar. ★★★★★ means top priority, ★☆☆☆☆ means lowest priority.

## 6.16 Pause

Several options are available to pause monitoring. You can pause monitoring for a single sensor or for an entire device, group, or probe.

### Pause by Intention (Manually or by Schedule)

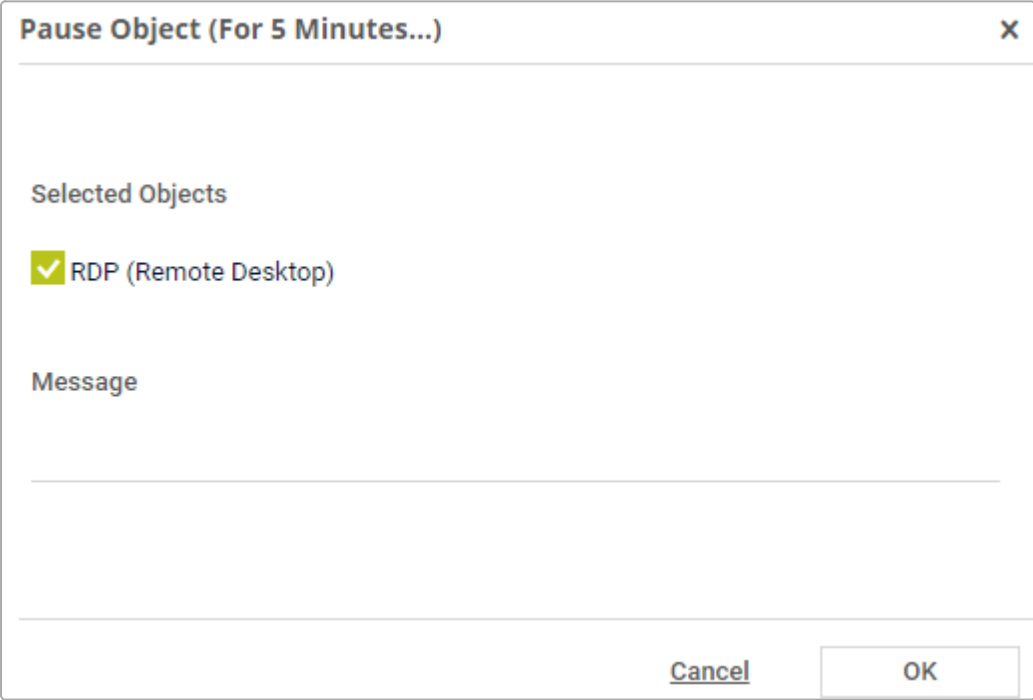

Navigate to an object in the [device tree](#)<sup>164</sup> and select Pause from the [context menu](#)<sup>229</sup>.

You can select Pause Indefinitely, or you can pause the object For 5 Minutes, For 15 Minutes, For 1 Hour, For 3 Hours, For 1 Day, or Until a specific date. If you select Until, you can additionally define a time period. Use the date time picker to enter the date and time. The object automatically resumes monitoring after this time period.

You can also set up a One-time Maintenance Window to automatically pause an object at a specified time. In the dialog that appears, define the start and end date of the maintenance window. Use the date time picker to enter the date and time.

- ❶ To cancel an active maintenance window before the defined end date, change the time entry under Maintenance Ends to a date in the past.
- ❷ If you select  from an object's [hover popup](#)<sup>235</sup>, the object is paused indefinitely until you resume monitoring again.

When you select a pause option, a dialog appears in which you can optionally enter a message. PRTG shows the message in the object's status message as long as the object is in the Paused status. Confirm with OK to pause the object.

**Pause Object (For 5 Minutes...)** X

Selected Objects

RDP (Remote Desktop)

Message

Cancel OK

Pause Message Prompt

You can also pause monitoring via [schedules](#)<sup>[2846]</sup>. If you pause a master sensor by schedule or manually, you do not trigger a status change by [dependency](#)<sup>[228]</sup>.

■ For more information, see the Knowledge Base: [Why will dependent objects not automatically pause when I pause the master object?](#)

ⓘ While a sensor is in the Paused [status](#)<sup>[181]</sup>, it does not collect any monitoring data, it does not change its status, and it does not trigger any [notifications](#)<sup>[142]</sup>. An object also keeps the Paused status after a restart of PRTG.

## Pause by Hierarchy

If you pause monitoring for an object in the device tree, PRTG pauses all objects underneath in the [object hierarchy](#)<sup>[132]</sup> as well. For example, if you pause a group, PRTG also pauses all sensors on all devices in this group. After you pause an object, you can resume monitoring at any time by selecting Resume from the context menu.

ⓘ You cannot resume monitoring for single child objects that are paused by a parent object. You can only resume the object that you originally set to the Paused status.

## Pause by Dependency

There is a way to automatically pause objects by dependency. If you have a master sensor, for example, a master [Ping](#) sensor for a device, PRTG can automatically pause all dependent sensors on the device if the master sensor shows the Down status.

■ For more information, see section [Dependencies](#)<sup>[140]</sup>.

## More

### ■ KNOWLEDGE BASE

Why will dependent objects not automatically pause when I pause the master object?

- <https://kb.paessler.com/en/topic/76351>

## 6.17 Context Menus

Right-click an object to view a context menu with many options for direct access to monitoring data and functions.

**i** To view your browser's context menu, press the Ctrl key (Google Chrome) or the Shift key (Mozilla Firefox) while right-clicking. You then see the context menu of your browser instead of the context menu of PRTG. This is not possible with Internet Explorer.

### Context Menus

**i** Which options are available depends on the type of object that you select.

Action	Description
Scan Now	Perform an immediate scan of the object. This queries data for all objects underneath in the <a href="#">object hierarchy</a> <sup>[132]</sup> .
Details	Show the Overview tab of the object.  ■ For more information about the Overview tab, see the Knowledge Base: <a href="#">What options do I have to review my monitoring data in detail?</a>
Edit	<b>i</b> Which options are available depends on the type of object that you select.  Hover over Edit to show the Edit menu. The following actions are available: <ul style="list-style-type: none"> <li>▪ Settings: Open a dialog to edit the <a href="#">object settings</a><sup>[201]</sup>.</li> <li>▪ Notification Triggers: Open the <a href="#">Notification Triggers</a><sup>[229]</sup> tab of the object.</li> <li>▪ Access Rights: Open a dialog to edit the <a href="#">access rights</a><sup>[145]</sup> for the object.</li> <li>▪ Rename: Open a dialog to edit the name of the object.</li> <li>▪ Management: Open the Management <a href="#">tab</a><sup>[418]</sup> of the object.</li> </ul>
Acknowledge Alarm	<b>This option is only available in the sensor context menu when you select a sensor in the Down or Down (Partial) status.</b>  You can acknowledge an alarm for the sensor. A sensor with an acknowledged alarm shows the Down (Acknowledged) status and does not <a href="#">trigger</a> <sup>[2693]</sup> any more <a href="#">notifications</a> <sup>[2735]</sup> . The following actions are available: <ul style="list-style-type: none"> <li>▪ Acknowledge Indefinitely</li> <li>▪ Acknowledge the alarm for a certain period of time:</li> </ul>

Action	Description
	<ul style="list-style-type: none"> <li>▫ For 5 Minutes</li> <li>▫ For 15 Minutes</li> <li>▫ For 1 Hour</li> <li>▫ For 3 Hours</li> <li>▫ For 1 Day</li> <li>▫ Until: Define a custom time period to acknowledge the alarm. Use the date time picker to enter the date and time.</li> </ul> <p><b>i</b> If the alarm condition still exists after this time period, the sensor shows the Down status again.</p> <p><b>i</b> When the alarm condition clears, the sensor usually returns to the Up status immediately with the next sensor scan.</p> <p><b>■</b> For more information about acknowledging an alarm, see section <a href="#">Alarms</a><sup>[203]</sup>.</p>
Add Sensor	<p>Open a dialog that guides you through the process of adding a new sensor to the device.</p> <p><b>■</b> For more information, see section <a href="#">Add a Sensor</a><sup>[414]</sup>.</p>
Auto-Discovery	<p>This option is only available for auto-discovery groups or devices that have the auto-discovery feature <a href="#">enabled</a><sup>[529]</sup>.</p> <p>Hover over Auto-Discovery to show the Auto-Discovery menu. The following actions are available:</p> <ul style="list-style-type: none"> <li>▫ Run Auto-Discovery: Immediately start a search to automatically add new sensors to the device. The search runs in the background and uses the options you set for the Auto-Discovery Level in the device settings under Auto-Discovery Settings. If there are new sensors, you see them after a few minutes. <ul style="list-style-type: none"> <li><b>■</b> For more information, see section <a href="#">Auto-Discovery</a><sup>[255]</sup>.</li> </ul> </li> <li><b>i</b> If you set the option No auto-discovery for the Auto-Discovery Level in the device settings and start the auto-discovery from the context menu, PRTG runs it with the standard device identification and changes the device setting to Standard auto-discovery (default).</li> <li>▫ Run Auto-Discovery with Template: Open a dialog to start an automatic search with a standard, detailed, or custom device template. <ul style="list-style-type: none"> <li><b>i</b> If you select this option from the context menu, the options you set for the Auto-Discovery Level in the object settings do not apply.</li> </ul> </li> </ul> <p><b>☁</b> This option is not available on the hosted probe of a PRTG Hosted Monitor instance.</p>

Action	Description
Create Device Template	<p>This option is only available for devices.</p> <p>Open a dialog that guides you through the process of creating a new device template. The template is then available for the auto-discovery.</p> <p>■ For more information, see section <a href="#">Create Device Template</a><sup>[2725]</sup>.</p>
Recommend Now	<p>This option is only available if the <a href="#">Recommended Sensors Detection</a><sup>[2874]</sup> is enabled.</p> <p>Start an analysis to get sensor recommendations for the device. When PRTG finishes the analysis of the device, you see the recommended sensors in a table list on the device's Overview tab where you can directly add the respective sensors.</p>
Add Group	<p>This option is only available for probes and groups.</p> <p>Open a dialog that guides you through the process of adding a new group.</p> <p>■ For more information, see section <a href="#">Add a Group</a><sup>[313]</sup>.</p>
Add Auto-Discovery Group	<p>This option is only available for probes and groups.</p> <p>Open a dialog that guides you through the process of adding a new auto-discovery group. PRTG creates a new group and runs an auto-discovery in your network to automatically add devices and sensors.</p> <p>■ For more information, see section <a href="#">Add an Auto-Discovery Group</a><sup>[258]</sup>.</p> <p>☁ This option is not available on the hosted probe of a PRTG Hosted Monitor instance.</p>
Add Device	<p>This option is only available for probes and groups.</p> <p>Open a dialog that guides you through the process of adding a new device.</p> <p>■ For more information, see section <a href="#">Add a Device</a><sup>[363]</sup>.</p>
Sort Alphabetically	<p>Sort direct child objects in alphabetical order.</p> <p>ⓘ PRTG stores the sorting order in the monitoring configuration. You cannot undo it.</p>
Delete	<p>Delete the object. PRTG asks for confirmation before it actually deletes an object.</p>

Action	Description
	<p> You cannot delete local probes or hosted probes.</p>
Clone	<p>Open a dialog that guides you through the process of cloning the object.</p> <p> For more information, see section <a href="#">Clone Object</a><sup>[2714]</sup>.</p>
Move	<p> Which options are available depends on the type of object that you select.</p> <p>Hover over Move to open the Move menu. The following actions are available:</p> <ul style="list-style-type: none"> <li>▪ Top: Move the object to the top of the parent object.</li> <li>▪ Up: Move the object one entry up.</li> <li>▪ Down: Move the object one entry down.</li> <li>▪ Bottom: Move the object to the bottom of the parent object.</li> <li>▪ Rename: Open a dialog to edit the name of the object.</li> <li>▪ Management: Open the Management <a href="#">tab</a><sup>[418]</sup> of the object.</li> <li>▪ To Other Group: Move the object to a different group.</li> </ul>
Pause or Resume	<p>Hover over Pause to open the Pause menu. The following actions are available:</p> <ul style="list-style-type: none"> <li>▪ If the object already shows the Paused <a href="#">status</a><sup>[181]</sup> or if it shows the Down status because of a <a href="#">simulated error</a>, the Resume option appears. Click Resume to restart monitoring on the object. Use the date time picker to enter the date and time. The object automatically resumes monitoring after this time period.</li> <li>▪ You can also set up a One-time Maintenance Window to automatically pause the object at a specified time. In the dialog that appears, define the start and end date of the maintenance window. Use the date time picker to enter the date and time.</li> </ul> <p> To cancel an active maintenance window before the defined end date, change the time entry under Maintenance Ends to a date in the past.</p> <ul style="list-style-type: none"> <li>▪ If the object already shows the Paused <a href="#">status</a><sup>[181]</sup> or if it shows the Down status because of a <a href="#">simulated error</a>, the Resume option appears. Click Resume to restart monitoring on the object.</li> </ul>
Simulate Error Status	<p><a href="#">This option is only available for sensors.</a></p> <p>Manually set the sensor to the Down status. If the sensor already shows the Down status because of a <a href="#">simulated error</a>, the Resume option appears. Click Resume to restart monitoring.</p>

Action	Description
	<p> The Simulate Error Status option does not work for sensors that run on mini probes.</p>
Priority	<p>Hover over Priority to open the Priority menu. Define the priority of the object.</p> <p> For more information, see section <a href="#">Priority and Favorites</a> <sup>224</sup>.</p>
Historic Data	<p>Hover over Historic Data to open the Historic Data menu. The following actions are available:</p> <ul style="list-style-type: none"> <li>▪ Open the historic data tabs for the specified time interval: Last 2 days, Last 30 days, or Last 365 days. <ul style="list-style-type: none"> <li> For more information, see the Knowledge Base: <a href="#">What options do I have to review my monitoring data in detail?</a></li> </ul> </li> <li>▪ Create Report: Open a dialog to add a new report. <ul style="list-style-type: none"> <li> When you create a report via the context menu, PRTG automatically includes the selected probe in the report.</li> </ul> </li> </ul> <p> For more information, see the Paessler website: <a href="#">How to set up reports in PRTG in 5 easy steps</a>.</p>
Device Tools	<p><a href="#">This option is only available for devices.</a></p> <p>Hover over Device Tools to open the Device Tools menu. The following actions are available:</p> <p> This option is not available on the hosted probe of a PRTG Hosted Monitor instance.</p> <ul style="list-style-type: none"> <li>▪ Go to Service URL: Open the service page that you defined in the <a href="#">device settings</a> <sup>597</sup>. If no service URL is available for the device, you can enter an address in the dialog that appears.</li> <li>▪ New Window with HTTP: Open a new browser window with HTTP and the IP address or Domain Name System (DNS) name of the device.</li> <li>▪ New Window with HTTPS: Open a new browser window with HTTPS and the IP address or DNS name of the device.</li> <li>▪ New Window with FTP: Open a new browser window with the File Transfer Protocol (FTP) and the IP address or DNS name of the device.</li> <li>▪ Remote Desktop: Download an .rdp file. When you execute this file, a remote desktop starts with the IP address or DNS name of the device. <ul style="list-style-type: none"> <li> In Firefox, you must use <a href="#">mstsc.exe (Microsoft Terminal Service)</a> to open the file.</li> </ul> </li> <li>▪ Traceroute: Start a traceroute on the device. PRTG displays the route and measures transit delays of packets across the IP network.</li> </ul>

Action	Description
	<ul style="list-style-type: none"> <li>Install Remote Probe: Open a dialog to install a classic remote probe on the device. For more information, see section <a href="#">Classic Remote Probe Setup via Device Tools</a> <sup>3202</sup>.</li> <li> This option is only available on devices on local probes.</li> <li> This option is not available in PRTG Hosted Monitor.</li> </ul>
Find Duplicates	<p>This option is only available for devices.</p> <p>In your configuration, search for devices with the same IP address or DNS name as the selected device.</p>
Send Link by Email	<p>Send a link to the object by email. Click to create a new email with your system's standard email client. The email contains a direct link to the Overview tab of the object.</p>
Add Ticket	<p>Open the Add Ticket dialog.</p> <ul style="list-style-type: none"> <li> For more information, see section <a href="#">Tickets</a> <sup>215</sup>.</li> </ul>

- <https://www.paessler.com/support/how-to/reports>

## 6.18 Hover Popup

When you rest the mouse pointer over an object's icon in the [device tree](#)<sup>[164]</sup> or in [table lists](#)<sup>[218]</sup>, for example, a hover popup window appears and shows details about this object. The hover popup contains information from the object's Overview tab as well as several graphs. The exact information that PRTG provides depends on the type of object.

For more information about the Overview tab, see the Knowledge Base: [What options do I have to review my monitoring data in detail?](#)

Hover Popup Example: Core Health Sensor

**i** The hover popup only appears if your browser window that shows the PRTG web interface is the active window on your desktop. The hover popup disappears with every (automatic) page refresh.

### Quick Action Buttons

In the top-right corner of the hover popup window, you can see several quick action buttons with which you can view or edit the object. These are the most important options from the object's [context menu](#)<sup>[229]</sup>.

**i** The available buttons depend on the type of object that you hover over.

Action	Description
Details (🔍)	Show the Overview tab of the object.

Action	Description
Settings (🔧)	Open the object's settings.
Notification Triggers (🔔)	Show the Notification Triggers tab of the object.
Rename (📄)	Open a dialog to edit the name of the object.
Pause Indefinitely (⏸)	Indefinitely pause the object and all objects underneath in the <a href="#">object hierarchy</a> <sup>[132]</sup> . If you want to resume monitoring, you must manually resume the paused object.
Resume (▶)	Resume monitoring for the object and all objects underneath in the object hierarchy.
Delete (🗑)	Delete the object. PRTG asks for confirmation before it actually deletes an object.
Scan Now (🔄)	Perform an immediate scan of the object. This queries data for all objects underneath in the object hierarchy.
Add to Favorites (🚩)	Make the object a <a href="#">favorite</a> <sup>[224]</sup> and add it to your favorites list.
Remove from Favorites (🚩)	Remove the object from your favorites list.

## 6.19 Main Menu Structure

You can access all functions via the main menu bar. In this section, you find information about the most important menu items. You can either directly click a menu item or you can hover over it to show more options.

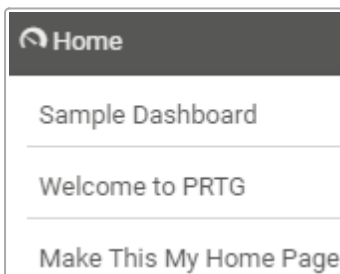

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

In this section:

- [Home](#) <sup>237</sup>
- [Devices](#) <sup>238</sup>
- [Libraries](#) <sup>240</sup>
- [Sensors](#) <sup>241</sup>
- [Alarms](#) <sup>244</sup>
- [Maps](#) <sup>244</sup>
- [Reports](#) <sup>245</sup>
- [Logs](#) <sup>246</sup>
- [Tickets](#) <sup>247</sup>
- [Setup](#) <sup>249</sup>
- [Search Box](#) <sup>251</sup>
- [Logout](#) <sup>251</sup>

### Home

Click to open your home page. The default home page is the Welcome [page](#) <sup>164</sup>. Hover over Home to show other options.

Main Menu: Home

Option	Description
Sample Dashboard	<p>Open a preconfigured dashboard to view monitoring data in a different layout. This dashboard is one of the default <a href="#">maps</a> [2776] that PRTG automatically creates with a new installation.</p> <p><b>i</b> The Home menu shows maps that have a 5-star <a href="#">priority</a> [224] (★★★★★) To show a map here, give it 5 stars on the Maps overview via the <a href="#">main menu bar</a> [244]. You can include up to 10 map entries in the menu. For more information, see section <a href="#">Home Menu</a> [2778].</p> <p><b>i</b> You can change the appearance of the default dashboard with the <a href="#">Map Designer</a> [2780]. To not show the sample dashboard in the menu, define a priority that is lower than 5 stars for this map.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
Switch Cluster Node	<p><b>This option is only available if PRTG runs in a failover cluster</b> [128].</p> <p>Show available cluster nodes. Hover over Switch Cluster Node to show other options. Follow the menu path that is specific to your setup to select a different cluster node. The current master node is shown in bold letters. Click a cluster node's name to leave the current cluster node, to connect to the other cluster node, and to show the same page there.</p> <p>☁ This option is not available in PRTG Hosted Monitor.</p>
Welcome to PRTG	<p>Open the Welcome page that shows the Paessler news feed and various information about your PRTG installation. It also provides links to major sections of the PRTG web interface.</p> <p><b>i</b> This is the default home page of the PRTG web interface.</p>
Make This My Home Page	<p>Change the page that is loaded when you click Home in the main menu bar. Select this option on any page to set its URL as your home page. This setting is user sensitive. The default home page is <a href="#">/welcome.htm</a>.</p> <p><b>i</b> You can also change the home page under Home Page URL in the <a href="#">My Account</a> [2801] settings.</p>

## Devices

Click to show the device tree. Hover over Devices to show other options.

Devices
All
Favorite Devices
Device List
Dependencies
Add Group
Add Auto-Discovery Group
Add Device

Main Menu: Devices

Option	Description
All	Open the Overview tab of the <a href="#">root group</a> [132] that shows the <a href="#">device tree</a> [164].
Favorite Devices	Open a <a href="#">table list</a> [218] of all devices that you marked as <a href="#">favorites</a> [224]. Click  to show a printable list of the QR codes of all your favorite devices.  <i>i</i> To mark any device as a favorite device, select Priority/Favorite   Add to Favorites from its context menu, or click  on a device's Overview tab.
Device List	Open a list of all devices in your setup.
Dependencies	Open an overview list of the <a href="#">dependencies</a> [140] configured for the objects in your setup. You can select dependencies and define master dependencies in the Schedules, Dependencies, and Maintenance Window <a href="#">object settings</a> [201] (not available for the root group).
Add Group	Start a dialog that guides you through the process of adding a new group to your setup.   For more information, see section <a href="#">Create Objects Manually</a> [257].  <i>i</i> You can also create new groups by selecting Add Group from a probe's or group's context menu.
Add Auto-Discovery Group	Start a dialog that guides you through the process of adding a new auto-discovery group to your setup. PRTG creates a new group and runs an auto-discovery in your network to automatically add devices and sensors to this group.   For more information, see section <a href="#">Add an Auto-Discovery Group</a> [258].

Option	Description
	<p><b>i</b> You can also create new auto-discovery groups by selecting Add Auto-Discovery Group from a probe's or group's context menu.</p> <p><b>☁</b> This option is not available on the hosted probe of a PRTG Hosted Monitor instance.</p>
Add Device	<p>Start a dialog that guides you through the process of adding a new device to a group. During the process, you can choose if PRTG runs an auto-discovery for the new device to automatically add sensors.</p> <p><b>■</b> For more information, see section <a href="#">Create Objects Manually</a> <sup>257</sup>.</p> <p><b>i</b> You can also create new devices by selecting Add Device from a group's context menu.</p>

## Libraries

Click to open the Libraries list where you can view or add custom device tree views of your network status and monitoring data. Hover over Libraries to show other options.

**■** For more information, see section [Libraries](#) <sup>2738</sup>.

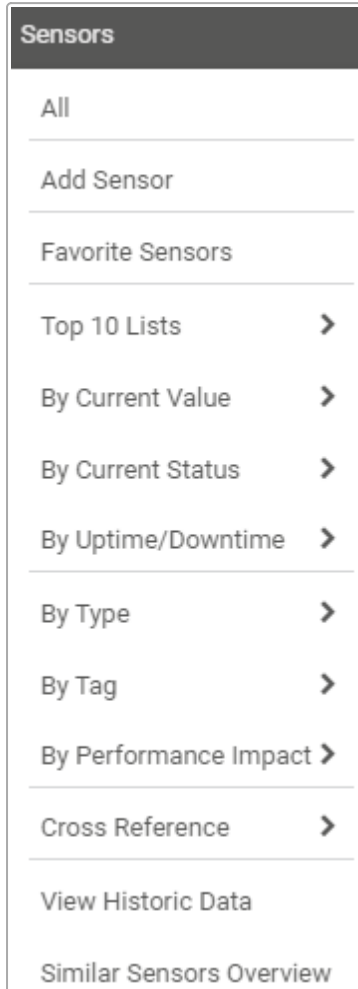

Main Menu: Libraries

Option	Description
All	Open the Libraries list where you can view or add custom device tree views of your network status and monitoring data.
Add Library	Open a dialog to create a new library.
Select Library	Open a library. Hover over Select Library to show more options. Follow the alphabetical menu path that is specific to your setup to view your libraries. Click a library to open it.

## Sensors

Click to open a list of all [sensors](#)<sup>[134]</sup>. Hover over Sensors in the main menu bar to show other options.

Main Menu: Sensors

Option	Description
All	<p>Open a table list of all <a href="#">sensors</a><sup>[134]</sup>. In list, you can sort the items via the column headers.</p> <p><b>i</b> The column Last Value shows only the last value of the sensor's <a href="#">primary channel</a>.</p>
Add Sensor	<p>Start a dialog that guides you through the process of adding a new sensor to a device. For more information, see section <a href="#">Add a Sensor</a><sup>[414]</sup>. During the process, you can also choose to create a new device via the <a href="#">Add a Device</a><sup>[363]</sup> dialog, which you can also open directly from the <a href="#">Devices menu</a><sup>[238]</sup>.</p>

Option	Description
Favorite Sensors	<p>Open a list of all sensors that you marked as favorites.</p> <p> To mark any sensor as a favorite sensor, select Priority/Favorite   Add to Favorites from its context menu or click  on a sensor's Overview tab.</p>
Top 10 Lists	<p>Open a dashboard view with different top 10 lists that show the highest uptime or downtime, ping response times, the bandwidth usage, website response times, the CPU usage, the disk usage, the memory usage, and the system uptime. Click to show top 10 lists for all sensors. Hover over Top 10 Lists to show other options. Follow the menu path that is specific to your setup to only view top 10 lists for a specific probe or group.</p> <p> The shown sensors are selected by default tags.</p>
By Current Value	<p>Open a list of sensors filtered by value. Hover over By Current Value to show other options. Follow the menu path to view lists of sensors with the Fastest Value or the Slowest Value for</p> <ul style="list-style-type: none"> <li>▪ Ping</li> <li>▪ Port</li> <li>▪ Web Pages</li> <li>▪ IMAP/POP3/SMTP</li> <li>▪ FTP</li> </ul> <p>as well as a list of sensors with the Highest Value or the Lowest Value regarding</p> <ul style="list-style-type: none"> <li>▪ Bandwidth</li> <li>▪ CPU</li> <li>▪ Disk</li> <li>▪ Memory</li> </ul> <p> The shown sensors are selected by default tags.</p>
By Current Status	<p>Open a list of sensors filtered by status. Hover over By Current Status to show other options. Follow the menu path to view lists of all sensors in a specific status.</p> <p> For more information, see section <a href="#">Sensor States</a>  181.</p>
By Uptime/Downtime	<p>Open a list of sensors filtered by different parameters. Hover over By Uptime/Downtime to show other options. Follow the menu path to view lists of all sensors sorted by</p>

Option	Description
	<ul style="list-style-type: none"> <li>▪ Best Uptime (%)</li> <li>▪ Highest Uptime (Time)</li> <li>▪ Worst Downtime (%)</li> <li>▪ Highest Downtime (Time)</li> </ul>
By Type	<p>Open a list of sensors filtered by <a href="#">sensor type</a><sup>[3232]</sup>. Hover over By Type to show other options. Follow the alphabetical menu path that is specific to your setup to view a sensor list that contains only sensors of one specific sensor type.</p>
By Tag	<p>Open a list of sensors filtered by <a href="#">tag</a><sup>[138]</sup>. Hover over By Tag to show other options. Follow the alphabetical menu path that is specific to your setup to see available tags. Select a tag to view a list that contains only sensors marked with this tag.</p> <p> If you have more than 1,000 tags, no tags are shown here. For more information, see section <a href="#">Tags</a><sup>[139]</sup>.</p>
By Performance Impact	<p>Open a list of sensors filtered by <a href="#">performance impact</a><sup>[2952]</sup>. Follow the menu path to view a sensor list that contains only sensors with a specific level of impact on the performance of the probe:</p> <ul style="list-style-type: none"> <li>▪ Very High</li> <li>▪ High</li> <li>▪ Medium</li> <li>▪ Low</li> <li>▪ Very Low</li> </ul> <p> For an overview list of all sensors, including their performance impact, see section <a href="#">Available Sensor Types</a><sup>[3232]</sup>.</p>
Cross Reference	<p>Open the sensor cross reference to show information about all sensors including <a href="#">priority and favorite</a><sup>[224]</sup> status, <a href="#">scanning interval</a><sup>[450]</sup>, <a href="#">access rights</a><sup>[145]</sup>, <a href="#">notification trigger settings</a><sup>[201]</sup>, <a href="#">schedules</a><sup>[141]</sup>, and <a href="#">dependencies</a><sup>[140]</sup>. Click to show a sensor cross reference for all sensors. Hover over Cross Reference to show other options. Follow the menu path that is specific to your setup to view cross reference information for sensors by type or tag.</p>
View Historic Data	<p>Open a dialog to generate historic sensor data reports.</p> <p> For more information, see section <a href="#">Historic Data Reports</a><sup>[185]</sup>.</p>
Similar Sensors Overview	<p>Open an overview with a list of similar sensors.</p>

Option	Description
	 For more information, see section <a href="#">Similar Sensors</a>  192

## Alarms

Click to open a list of all sensors that show the Down, Down (Partial), Down (Acknowledged), Warning, or Unusual status. Hover over Alarms to show other options.

**Alarms**

---

All

---

Show as Gauges

---

Errors Only

---

Warnings Only

---

Unusuals Only

Main Menu: Alarms

Option	Description
All	Open a list of all sensors that are in the Down, Down (Partial), Down (Acknowledged), Warning, or Unusual status.
Show as Gauges	Open a page with the gauges of all sensors that are in the Down, Down (Partial), Down (Acknowledged), Warning, or Unusual status. The size of the gauges corresponds to the sensor's priority.
Errors Only	Open a list of all sensors that are in the Down, Down (Partial), or Down (Acknowledged) status.
Warnings Only	Open a list of all sensors that are in the Warning status.
Unusuals Only	Open a list of all sensors that are in the Unusual status.

## Maps

Click to open the Maps overview where you can view or add custom views of your network status and monitoring data. Hover over Maps to show other options.

For more information, see section [Maps](#)<sup>[2776]</sup>.

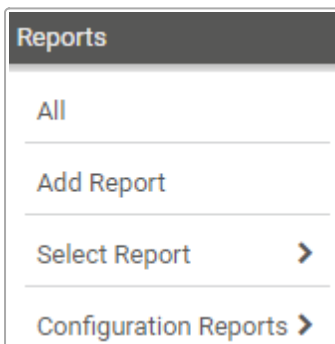

Main Menu: Maps

Option	Description
All	Open the Maps list where you can view or add custom views of your network status and monitoring data.
Add Map	Open a dialog to create a new map.
Select Map	Hover over Select Map to show a list of your maps. Click a map to open it.

## Reports

Click to open the Reports overview where you can view or add reports about your monitoring data. Hover over Reports to show other options.

For more information, see section [Reports](#)<sup>[2754]</sup>.

Main Menu: Reports

Option	Description
All	Open the Reports list where you can view or add reports about your monitoring data.

Option	Description
Add Report	Open a dialog to create a new report.
Select Report	Hover over Select Report to show a list of your reports about monitoring data. Click a report to open it.
Configuration Reports	Hover over Configuration Reports to see the available <a href="#">configuration reports</a> <sup>[2757]</sup> . Select an item to create reports for maps, reports, users and user groups, and system configuration to document changes to the configuration.

## Logs

Click to show log information for all objects in your configuration. Hover over Logs to show other options.

■ For more information, see section [Logs](#)<sup>[210]</sup>.

ⓘ Logs for monitoring objects, such as sensors, are available as long as you define Log File Records in the Historic Data Purging settings under Setup | System Administration | Core & Probes.

Main Menu: Logs

Option	Description
All	Open a list with log information about all objects in your installation. The list begins with the most recent log entry.
Status Changes	Open a list with log information about specific status changes. Hover over Status Changes to choose from the following sensor states: <ul style="list-style-type: none"> <li>▪ Up &amp; Down</li> <li>▪ Down</li> <li>▪ Warning</li> <li>▪ Unusual</li> </ul>

Option	Description
	<ul style="list-style-type: none"> <li>▪ Up</li> <li>▪ Paused/Resumed</li> <li>▪ Acknowledged Alarms</li> </ul>
System Events	<p>Open a list with log information about specific system event types. Hover over System Events to choose from the following event types:</p> <ul style="list-style-type: none"> <li>▪ Report Related</li> <li>▪ Cluster Related               <ul style="list-style-type: none"> <li> ⓘ This event type only appears if you have a cluster.</li> </ul> </li> <li>▪ Auto-Discovery Related</li> <li>▪ Notifications Related</li> <li>▪ Status Message Related</li> </ul>
Object History	<p>Open a list with log information about changes to the PRTG setup and deletions of subordinate system objects. The Object History has several tabs. To view the changes to all related settings and deletions of objects, use the following tabs:</p> <ul style="list-style-type: none"> <li>▪ My Account</li> <li>▪ System Administration</li> <li>▪ Notification Templates</li> <li>▪ Schedules</li> <li>▪ User Accounts</li> <li>▪ User Groups</li> <li>▪ Reports</li> <li>▪ Libraries</li> <li>▪ Maps</li> </ul> <p> ⓘ You can also navigate to a corresponding page, for example, you can select Setup   Account Settings   My Account from the main menu bar, and click ⓘ in the <a href="#">page header bar</a><sup>[170]</sup> to directly go to the related object history tab.</p>

## Tickets

Click to show all open tickets that are assigned to you. Hover over Tickets to show other options.

■ For more information, see section [Tickets](#)<sup>[213]</sup>.

Main Menu: Tickets

Option	Description
My Tickets	Open a list of all open tickets that are assigned to you. Hover over My Tickets to show other options to filter these tickets according to their status.
All Tickets	Open a list of all open tickets of all users. Hover over All Tickets to show other options to filter these tickets according to their status.
All Tickets	Open a list of open tickets of the type <b>ToDo</b> . Hover over All Tickets to show other options to filter these tickets according to their status.
Add Ticket	Open the Add Ticket dialog to create a <b>user ticket</b> . <span style="color: blue;">■</span> For more information about available options, see section <a href="#">Tickets</a> <sup>213</sup> .

## Setup

Click to show the setup page. Hover over Setup to show other options.

■ For more information, see section [Setup](#) <sup>2799</sup>.

Option	Description
Contact Support	Open the <a href="#">Contact Paessler Support / Send Your Feedback to Paessler</a> form.

## Search Box

Main Menu: Search Box

Click the Search box to find objects in your monitoring setup. Enter your search term and press the Enter key. PRTG performs a string search in your entire monitoring setup, including groups, devices, sensors, libraries, maps, reports, tickets, and object comments, as well as in the PRTG Manual. You see all search results on a new page.

- ① You can only search for names that are actually displayed. To search for a specific user, for example, use their display name. You cannot search for the user's login name or email address.
- ① PRTG uses different logical operators for the search in tickets and for the search in other objects. For the ticket search, PRTG uses the logical operator **OR**. If you search for a string like 'operating system', for example, you receive results for all tickets that contain either 'operating' **or** 'system' or both. For all other objects, PRTG uses the logical operator **AND**. So you receive results for all other objects that contain both 'operating' **and** 'system'.

## 7.1 Auto-Discovery

The auto-discovery automatically creates a set of sensors for all of the devices that are in your network. The auto-discovery is primarily intended for devices that are in the same network as your probes.

**i** Unless you skip the auto-discovery during the installation process, PRTG runs an initial auto-discovery as soon as you finish the installation of PRTG. It automatically shows you the devices that are available in your network as well as suitable sensors for monitoring.

### How the Auto-Discovery Works

The auto-discovery has three steps:

1. Scan a network segment for devices via ping (at the group level only).
2. Assess the device type for all of the devices that it discovered in step 1 (via the Simple Network Management Protocol (SNMP), Windows Management Instrumentation (WMI), and other protocols).
3. Create sensor sets that match the discovered device types from step 2. It does this based on built-in device templates that have recommended sensors for many device types. Optionally, it can also create sensor sets via device templates that users [created](#)<sup>[2725]</sup>.

You can use [auto-discovery groups](#)<sup>[258]</sup> to use the auto-discovery for a range of IP addresses or for individual devices that you manually created. You can run the auto-discovery one time, on demand via the context menu, or via schedule at every hour, day, or week. If you run the auto-discovery at group level daily or weekly, it automatically creates new devices when they connect to the network and it adds suitable sensors.

**i** PRTG creates a notifying [ticket](#)<sup>[213]</sup> when it discovers at least one new device or sensor. You also receive a ticket if an error occurs. By default, PRTG also sends tickets via email. You can change this in the [My Account](#)<sup>[2807]</sup> settings.

**i** HTTP sensors' names indicate the protocol that they use to access the target device ([HTTP](#), [HTTP \(8080\)](#), and [HTTPS](#)). This distinguishes HTTP sensors from each other if the auto-discovery adds more than one HTTP sensor to a device.

### Restrictions

Note the following restrictions of the auto-discovery:

- PRTG cannot discover devices that are not reachable via ping. This is because step 1 scans for devices via ping. If, for example, a firewall blocks echo requests, PRTG cannot discover a device behind the firewall.
- Define credentials for objects that are higher in the [object hierarchy](#)<sup>[132]</sup>, for example, in the settings of the parent device. If possible, we recommend that you define these settings in the [root group](#)<sup>[420]</sup>.
- If a device has more than one IP address, it might show up more than once in the auto-discovery results, even though PRTG tries to identify these situations.
- Auto-discovery on group level does not create new sensors on devices that already exist, but only on newly discovered devices. If you want to automatically add sensors to a device, run the auto-discovery on the device via its [context menu](#)<sup>[229]</sup>.

- Frequent auto-discoveries of large network segments can lead to performance issues. Because of this we recommend that you only schedule regular auto-discoveries where necessary.
  - For more information, see the Knowledge Base: [Why can automatic auto-discoveries evoke performance issues?](#)
- PRTG automatically adds suitable device icons to discovered devices. PRTG uses a device's MAC address for this purpose, which it determines via the Address Resolution Protocol (ARP). This only works via IPv4 and not via IPv6. Usually, ARP works only in the local network unless your router supports ARP and you configure it accordingly.
- The auto-discovery does not apply the [user group setting](#)<sup>[2914]</sup> Allowed Sensors. Therefore, the auto-discovery adds all sensors that are defined in the used device templates.

## Run the Auto-Discovery Now

You can run an auto-discovery at any time on a specific device. To do so, right-click the device and select Auto-Discovery | Run Auto-Discovery from the context menu. PRTG immediately starts to search for new sensors to add to the device. If you use the auto-discovery for an auto-discovery group, PRTG adds devices with suitable sensors, if it finds any. If you use it for a device, PRTG adds new sensors, if found. In the corresponding [page header bar](#)<sup>[170]</sup>, you can always see when PRTG ran the last auto-discovery on a selected group or device.

☁ Auto-discovery for groups is not available on hosted probes.

❗ The auto-discovery also adds manually deleted devices or sensors again. If you do not want this to happen, you must always create objects [manually](#)<sup>[257]</sup>.

## Auto-Discovery in Progress

While the auto-discovery is in progress, you might experience a lower system performance than usual, because PRTG is working in the background to discover your network. Depending on the IP address ranges defined (up to 65,536 addresses), the discovery might run for up to several days before it is complete. You can review the status of the discovery process as follows:

- In the device tree, next to the group or device name, you can see a percentage value that shows the progress of the auto-discovery.
- During the auto-discovery, the PRTG web interface displays a box in the lower-right corner that shows the number of active auto-discovery tasks.
- To stop an auto-discovery, right-click the group or device, and select Pause | For 5 Minutes from the context menu. PRTG [pauses](#)<sup>[227]</sup> monitoring for 5 minutes and stops the auto-discovery tasks.

## Disable Initial Auto-Discovery

To disable the initial auto-discovery for a fresh PRTG installation, run the installer in a command prompt and add `/NoInitialAutoDisco=1` as a parameter. This might be useful for performance reasons or if you prefer to manually add devices and sensors to your installation.

## 7.2 Create Objects Manually

We recommend that you use the [auto-discovery](#)<sup>[254]</sup> feature to create a basic monitoring setup for your network. Afterward, you can manually add devices that were not discovered, or [arrange](#)<sup>[2712]</sup> detected devices in groups.

In this section

- [Add an Auto-Discovery Group](#)<sup>[258]</sup>
- [Add a Group](#)<sup>[313]</sup>
- [Add a Device](#)<sup>[363]</sup>
- [Add a Sensor](#)<sup>[414]</sup>

### Add a Remote Probe

■ For more information, see section [Add Remote Probe](#)<sup>[3196]</sup>.

## 7.2.1 Add an Auto-Discovery Group

There are several ways to manually add an auto-discovery group:

- Select Devices | Add Auto-Discovery Group from the [main menu bar](#)<sup>[238]</sup>. A dialog appears that guides you through the process of starting an automatic detection of devices and sensors in your network.
- Hover over  and select Add Auto-Discovery Group from the menu.
- Select Add Auto-Discovery Group from the [context menu](#)<sup>[229]</sup> of the probe or group to which you want to add the new auto-discovery group. This skips step 1 and leads you directly to [step 2](#)<sup>[261]</sup>.

 This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

 You cannot use this feature on the hosted probe of a PRTG Hosted Monitor instance. You can use this feature on remote probes.

In this section:

- [Add an Auto-Discovery Group](#)<sup>[259]</sup>
- [Step 1: Select a Parent](#)<sup>[260]</sup>
- [Step 2: Define Auto-Discovery Group Settings](#)<sup>[261]</sup>

## Add an Auto-Discovery Group

The Add an Auto-Discovery Group dialog appears when you add a new auto-discovery group to a parent group. It only shows the settings that are required to create the auto-discovery group. Therefore, you do not see all settings in this dialog.

- ① You can change all settings on the Settings tab of the auto-discovery group later. For more information, see section [Group Settings](#)  526.

## Step 1: Select a Parent

### Add an Auto-Discovery Group (Step 1 of 2)

**Select a Parent**  
Select a parent object for the auto-discovery group.

[PRTG Manual: Add an Auto-Discovery Group](#)

**Add a New Auto-Discovery Group**  
To automate the monitoring setup, define an auto-discovery level and a list of device IP addresses/DNS names. PRTG will automatically create devices and add suitable sensors.

**Select a Probe or Group to Add the New Auto-Discovery Group to**

Select a probe or group from the list. You can add a new auto-discovery group faster by right-clicking a probe or group in the device tree and selecting **Add Auto-Discovery Group** from the context menu.

Search...

- Root
  - Local Probe
    - 1st group
      - MAIL
        - Group
      - ROUTER/SWITCHES
      - VMWARE
      - SNMP
        - Servers
      - DATABASES
      - MISC
        - CLOUD
      - Services
      - WINDOWS
      - eHealth

Add Auto-Discovery Group Assistant Step 1

Select the probe or group that you want to add the new auto-discovery group to. Click OK.

## Step 2: Define Auto-Discovery Group Settings

### Add an Auto-Discovery Group to Local Probe ✕

Enter the group settings followed by the auto-discovery preferences. PRTG then automatically creates devices within the group and adds suitable sensors. Specify credentials and access rights for the group, if necessary. All devices in this group inherit these settings.

Auto-Discovery Settings

Setting	Description
Auto-Discovery Level	<p>Select the level of detail for the <a href="#">auto-discovery</a> <sup>[254]</sup>:</p> <ul style="list-style-type: none"> <li>▪ No auto-discovery: Select this option if you only want to manually create devices and sensors.</li> <li>▪ Standard auto-discovery (default): Create a set of standard sensors for standard monitoring. This option works fine for most installations.</li> <li>▪ Detailed auto-discovery: Create all standard sensors and additional sensors from detailed variants of device templates. As a result, you might get many sensors. This option is suitable for small network segments and whenever you want to monitor the maximum number of sensors available.</li> <li>▪ Auto-discovery with specific device templates: Customize the auto-discovery and select or combine standard, detailed, and custom device templates. Select one or more templates from the Device Templates list.</li> </ul> <p> Auto-discoveries can be resource intensive. They are primarily intended for devices on the same network as your probes.</p>
Device Templates	<p><b>This setting is only visible if you select Auto-discovery with specific device templates <a href="#">above</a>.</b></p> <p>Select one or more device templates by enabling a check box in front of the template name. PRTG uses the device templates that you select for the auto-discovery on the device:</p> <ul style="list-style-type: none"> <li>▪ ADSL</li> <li>▪ Buffalo TeraStation NAS</li> <li>▪ Cisco ASA VPN</li> <li>▪ Cisco Device (Generic)</li> <li>▪ Dell EqualLogic</li> <li>▪ Dell MDi Disk</li> <li>▪ DNS Server</li> <li>▪ Environment Jakarta</li> <li>▪ Environment Poseidon</li> <li>▪ FTP Server</li> <li>▪ Generic Device (Ping Only)</li> <li>▪ Generic Device (SNMP Enabled)</li> <li>▪ Generic Device (SNMP Enabled, Detailed)</li> <li>▪ HTTP Web Server</li> <li>▪ Hyper-V Host Server</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ IPMI-enabled Device</li> <li>▪ Juniper NS Device</li> <li>▪ Linux/UNIX Device (SNMP or SSH Enabled)</li> <li>▪ Mail Server (Generic)</li> <li>▪ Mail Server (MS Exchange)</li> <li>▪ Microsoft SharePoint 2010</li> <li>▪ MQTT Round Trip</li> <li>▪ NAS LenovoEMC</li> <li>▪ NAS QNAP</li> <li>▪ NAS Synology</li> <li>▪ NetApp</li> <li>▪ NTP Server</li> <li>▪ OPC UA</li> <li>▪ Printer (Generic)</li> <li>▪ Printer (HP)</li> <li>▪ RDP Server</li> <li>▪ RMON-compatible Device</li> <li>▪ Server (Cisco UCS)</li> <li>▪ Server (Compaq/HP Agents)</li> <li>▪ Server (Dell)</li> <li>▪ Server (Fujitsu)</li> <li>▪ Server (IBM)</li> <li>▪ SNMP Rittal CMC III Hardware Status</li> <li>▪ SonicWall</li> <li>▪ SSL Security Check</li> <li>▪ Switch (Cisco Catalyst)</li> <li>▪ Switch (Cisco IOS Based)</li> <li>▪ Switch (HP Procurve)</li> <li>▪ UNIX/Linux Device</li> <li>▪ UPS Health (APC)</li> <li>▪ UPS Health (Generic)</li> <li>▪ UPS Health (Liebert)</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ VMware ESXi / vCenter Server</li> <li>▪ Web Server</li> <li>▪ Windows (Detailed via WMI)</li> <li>▪ Windows (via Remote PowerShell)</li> <li>▪ Windows (via WMI)</li> <li>▪ Windows IIS (via SNMP)</li> <li>▪ XenServer Hosts</li> <li>▪ XenServer Virtual Machines</li> </ul> <p>Once the auto-discovery is finished, PRTG creates a new <a href="#">ticket</a><sup>[213]</sup> and lists the device templates that it used to create new sensors.</p>
Schedule	<p>Select when PRTG runs the auto-discovery:</p> <ul style="list-style-type: none"> <li>▪ Once (default): Run the auto-discovery only once. PRTG adds new devices and sensors once. If you select this option, you must manually <a href="#">start the auto-discovery</a><sup>[255]</sup>.</li> <li>▪ Hourly: Run the auto-discovery for new devices and sensors every 60 minutes. <ul style="list-style-type: none"> <li>ⓘ Use this option with caution. Frequent auto-discoveries might cause performance issues, in particular when PRTG scans large network segments every hour.</li> </ul> </li> <li>▪ Daily: Run the auto-discovery for new devices and sensors every 24 hours. The first auto-discovery runs immediately. All other discoveries start at the time that you define in the <a href="#">Monitoring</a><sup>[2875]</sup> settings, section Auto-Discovery.</li> <li>▪ Weekly: Run the auto-discovery for new devices and sensors every 7 days. The first auto-discovery runs immediately. All other discoveries start at the time that you define in the Monitoring settings, section Auto-Discovery.</li> </ul> <p>ⓘ For performance reasons, PRTG sets Schedule to Once (default) on all devices that the scheduled auto-discovery creates.</p>
Auto-Discovery Scanning Method	<p>Select how you want to define the IP address range for the auto-discovery:</p> <ul style="list-style-type: none"> <li>▪ Class C base IP address with start/end (IPv4) (default): Enter an IPv4 class C address range.</li> <li>▪ List of individual IP addresses and DNS names (IPv4): Enter a list of individual IPv4 addresses or Domain Name System (DNS) names.</li> <li>▪ IP address and subnet (IPv4): Enter an IPv4 address and subnet mask.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ IP address with octet range (IPv4): Enter an IPv4 address range for every IP octet individually. With this, you can define very customizable IP address ranges.</li> <li>▪ List of individual IP addresses and DNS names (IPv6): Enter a list of individual IPv6 addresses or DNS names.</li> <li>▪ Use computers from the Active Directory (maximum 1000 computers): Search in the Active Directory for computers to perform the auto-discovery.               <ul style="list-style-type: none"> <li>ⓘ Make sure that you specify your Active Directory domain in the <a href="#">Core &amp; Probes</a> settings.</li> </ul> </li> </ul> <p>ⓘ PRTG can only discover subnets with up to 65,536 IP addresses. If you define a range with a higher number of addresses, the discovery stops before it is completed.</p>
IPv4 Base	<p><i>This setting is only visible if you select Class C base IP address with start/end (IPv4) (default) <a href="#">above</a>.</i></p> <p>Enter a class C network as the IP base for the auto-discovery. Enter the first three octets of an IPv4 address, for example, <a href="#">192.168.0</a>.</p>
IPv4 Range Start	<p><i>This setting is only visible if you select Class C base IP address with start/end (IPv4) (default) <a href="#">above</a>.</i></p> <p>Enter the IP octet of the class C network (specified above) from which PRTG starts the auto-discovery. This completes the IP base to an IPv4 address. For example, enter <a href="#">1</a> to discover from <a href="#">192.168.0.1</a> onwards.</p>
IPv4 Range End	<p><i>This setting is only visible if you select Class C base IP address with start/end (IPv4) (default) <a href="#">above</a>.</i></p> <p>Enter the IP octet of the class C network (specified above) at which PRTG stops the auto-discovery. This completes the IP base to an IPv4 address. For example, enter <a href="#">254</a> to discover up to <a href="#">192.168.0.254</a>.</p>
IPv4/DNS Name List IPv6/DNS Name List	<p><i>This setting is only visible if you select List of individual IP addresses and DNS names (IPv4) or List of individual IP addresses and DNS names (IPv6) <a href="#">above</a>.</i></p> <p>Enter a list of IP addresses or DNS names that the auto-discovery scans. Enter each address on a separate line.</p>
IPv4 and Subnet (IPv4)	<p><i>This setting is only visible if you select IP address and subnet (IPv4) <a href="#">above</a>.</i></p>

Setting	Description
	<p>Enter an expression in the format address/subnet, for example, <a href="#">192.168.3.0/255.255.255.0</a>. You can also use the short form like <a href="#">192.168.3.0/24</a>. If you want to include multiple addresses and subnets, enter them as a list separated by a comma, for example, <a href="#">192.168.3.0/255.255.255.0, 192.169.0.0/255.255.255.0</a>. PRTG scans the complete host range (without network and broadcast address) that is defined by the IP address and the subnet mask.</p>
<p>IP Address with Octet Range</p>	<p><a href="#">This setting is only visible if you select IP address with octet range (IPv4) above.</a></p> <p>Enter an expression in the format a1.a2.a3.a4, where <a href="#">a1</a>, <a href="#">a2</a>, <a href="#">a3</a>, and <a href="#">a4</a> are each a number between 0-255, or a range with two numbers and a hyphen like <a href="#">1-127</a>. PRTG calculates all permutations of all ranges. For example, <a href="#">10.0.1-10.1-100</a> results in 1,000 IP addresses that PRTG scans during the auto-discovery.</p>
<p>Organizational Unit</p>	<p><a href="#">This setting is only visible if you select Use computers from the Active Directory (maximum 1000 computers) above.</a></p> <p>Enter an <a href="#">organizational unit (OU)</a> to restrict the Active Directory search to computers that are part of this OU. For top-level OUs, use the distinguished name (DN) format without <a href="#">OU=</a> and without the domain components (DCS). If you leave this field empty, there are not any restrictions.</p> <p>Example:</p> <ul style="list-style-type: none"> <li>▪ For the DN <a href="#">OU=Domain Controllers,DC=example,DC=com</a>, enter only <a href="#">Domain Controllers</a>.</li> </ul> <p>If you have sub-OUs, use the DN format without the leading <a href="#">OU=</a> and without the DCS.</p> <p>Examples:</p> <ul style="list-style-type: none"> <li>▪ For the DN <a href="#">OU=webserver,OU=production,DC=example,DC=com</a>, enter only <a href="#">webserver,OU=production</a>.</li> <li>▪ For the DN <a href="#">OU=intranet,OU=webserver,OU=production,DC=example,DC=com</a>, enter only <a href="#">intranet,OU=webserver,OU=production</a>.</li> </ul> <p><b>i</b> Make sure that the OU contains computer accounts. If the OU is empty, you receive an error message.</p> <p><b>i</b> Do not enter the domain components. PRTG automatically uses the domain components from the domain name you enter in the <a href="#">Core &amp; Probes</a> <small>[2897]</small> settings.</p>

Setting	Description
Name Resolution	<p>Select how to monitor newly discovered devices. This only affects <a href="#">new</a> devices. This does not change the setting for other devices. Depending on your selection, the IP Address/DNS Name field of an <a href="#">added device</a><sup>599</sup> shows the DNS name or IP address that PRTG uses to access the target device:</p> <ul style="list-style-type: none"> <li>▪ Use DNS names (default): Monitor newly discovered devices via their DNS names (if available) We recommend that you use this option.</li> <li>▪ Use IP addresses: Monitor newly discovered devices via their IP addresses.</li> </ul> <p><b>i</b> This setting does not affect how PRTG shows the devices in the device tree.</p>
Handling of Already Known Devices	<p>Select how to handle known devices:</p> <ul style="list-style-type: none"> <li>▪ Skip auto-discovery for existing devices/IP addresses (default): Do not rescan existing devices or IP addresses. PRTG only adds devices with new IP addresses or DNS names. PRTG does not add devices that already exist in your configuration for example, in other groups. We recommend that you use this option.</li> <li>▪ Perform auto-discovery for existing devices/IP addresses: Rescan devices that have existing IP addresses with every auto-discovery. PRTG adds devices that already exist in other groups to this group and runs the auto-discovery on the newly added devices. <ul style="list-style-type: none"> <li><b>i</b> The auto-discovery does not run on devices that already exist in the group. If you want to run the auto-discovery for these devices, you must manually start the auto-discovery on them.</li> </ul> </li> </ul> <p><b>i</b> In certain cases, the IP resolution might not work and might result in PRTG not adding a device if it has the same local IP address as it does in a different LAN.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)<sup>420</sup> if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)<sup>136</sup>.

Compatibility mode (deprecated)

Setting	Description
User Name	Enter the user name for access to the Linux/Solaris/macOS system via Secure Shell (SSH) and Web-based Enterprise Management (WBEM). Usually, you use credentials with administrator rights.
Authentication Method	<p>Select the authentication method for the login:</p> <ul style="list-style-type: none"> <li>▪ Password (default): Provide the password for the login.</li> <li>▪ Private key: Provide an RSA private key for authentication.</li> </ul> <p> PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.</p> <p> PRTG only supports RSA keys. It does not support DSA keys.</p> <p> For more information, see section <a href="#">Monitoring via SSH</a><sup>[8007]</sup>.</p>
Password	<p><b>This setting is only visible if you select Password (default) above.</b></p> <p>Enter a password for access to the Linux/Solaris/macOS system via SSH and WBEM. Usually, you use credentials with administrator rights.</p>
Private Key	<p><b>This setting is only visible if you select Private key above.</b></p> <p>Paste the entire RSA private key, including the <b>BEGIN</b> and <b>END</b> lines. Make sure that a corresponding public key exists on the target device.</p> <p> PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.</p> <p> PRTG only supports RSA keys. It does not support DSA keys.</p> <p> For more information, see section <a href="#">Monitoring via SSH</a><sup>[8007]</sup>.</p> <p> If you do not insert a private key for the first time but if you want to <b>change</b> the private key, you need to <a href="#">restart the PRTG core server service</a><sup>[2919]</sup> for the private key change to take effect.</p>
WBEM Protocol	<p>Select the protocol that you want to use for the connection to the system via WBEM:</p> <ul style="list-style-type: none"> <li>▪ HTTP: Use an unsecure connection for WBEM.</li> <li>▪ HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection for WBEM.</li> </ul> <p> This setting is only relevant if you use WBEM sensors.</p>
WBEM Port	Select if you want to use one of the default ports for the connection to the system via WBEM or if you want to set a custom port:

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Default: Use one of the default ports. The default port for unsecure connections is <a href="#">5988</a> and the default port for secure connections is <a href="#">5989</a>.</li> <li>▪ Custom: Use a custom port.</li> </ul> <p> This setting is only relevant if you use WBEM sensors.</p>
Custom WBEM Port	<p>This setting is only visible if you select Custom above.</p> <p>Enter a custom WBEM port. Enter an integer.</p>
SSH Port	<p>Enter the port for SSH connections. Enter an integer. The default port is <a href="#">22</a>.</p> <p> By default, PRTG automatically uses this setting for all <a href="#">SSH sensors</a> <small>(3232)</small> unless you define a different port number in the sensor settings.</p>
SSH Rights Elevation	<p>Select the rights that you want to use to run the command on the target system:</p> <ul style="list-style-type: none"> <li>▪ Run the command as the connecting user (default): Use the rights of the user who establishes the SSH connection.</li> <li>▪ Run the command as a different user using 'sudo' (with password): Use the rights of a different user with a password required for <a href="#">sudo</a> to run commands on the target system, for example, as a root user.</li> <li>▪ Run the command as a different user using 'sudo' (without password): Use the rights of a different user without a password required for <a href="#">sudo</a> to run commands on the target system, for example, as a root user.</li> <li>▪ Run the command as a different user using 'su': Use the rights of a different user with <a href="#">su</a> to run commands on the target system.</li> </ul>
Target System User Name	<p>This setting is only visible if you select an option that includes <a href="#">sudo</a> or <a href="#">su</a> above.</p> <p>Enter a user name to run the specified command on the target system as a different user than the root user. If you leave this field empty, you run the command as a root user. Make sure that you set the Linux password even if you use a public key or a private key for authentication. This is not necessary if the user is allowed to run the command without a password.</p>
Password	<p>This setting is only visible if you select an option that includes <a href="#">sudo</a> or <a href="#">su</a> with password above.</p> <p>Enter the password to run the <a href="#">sudo</a> command or the <a href="#">su</a> command.</p>

Setting	Description
SSH Connection Mode	<p>Select the connection mode that you want to use to <a href="#">access data with SSH sensors</a> <sup>3007</sup>:</p> <ul style="list-style-type: none"> <li>▪ Default: This is the default connection mode for SSH sensors. It provides the best performance and security.</li> <li>▪ Compatibility mode (deprecated): Use this only if the default connection mode does not work on the target system. The compatibility mode is the connection mode that PRTG used in previous versions and it is deprecated.</li> </ul> <p><b>i</b> We strongly recommend that you use the default connection mode.</p> <p><b>i</b> You can also individually select the connection mode for each SSH sensor in the sensor settings.</p>

## Credentials for VMware/XenServer

Credentials for SNMP Devices

Setting	Description
SNMP Version	<p>Select the Simple Network Management Protocol (SNMP) version for the connection to the target SNMP device:</p> <ul style="list-style-type: none"> <li>▪ <b>SNMP v1:</b> Use SNMP v1 for the connection. SNMP v1 only offers clear-text data transmission. <ul style="list-style-type: none"> <li>ⓘ SNMP v1 does not support 64-bit counters. This might result in invalid data when you monitor traffic via SNMP.</li> </ul> </li> <li>▪ <b>SNMP v2c (default):</b> Use SNMP v2c for the connection. SNMP v2c also only offers clear-text data transmission but it supports 64-bit counters.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ SNMP v3: Use SNMP v3 for the connection. SNMP v3 provides secure authentication and data encryption.</li> <li>ⓘ SNMP v3 has performance limitations because of the use of encryption. The main limiting factor is CPU power. Also keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3. If you see an increase in <a href="#">Interval Delay</a> or <a href="#">Open Requests</a> with the <a href="#">Probe Health</a> sensor, distribute the load over <a href="#">multiple probes</a> <small>[6198]</small>. SNMP v1 and SNMP v2c do not have this limitation.</li> </ul>
Community String	<p>This setting is only visible if you select SNMP v1 or SNMP v2c (default) above.</p> <p>Enter the community string of your device. This is like a clear-text password for simple authentication.</p> <p>ⓘ We recommend that you use the default value.</p>
Authentication Method	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Select the authentication method:</p> <ul style="list-style-type: none"> <li>▪ MD5 (default): Use message-digest algorithm 5 (MD5) for authentication.</li> <li>▪ SHA: Use Secure Hash Algorithm (SHA) for authentication.</li> <li>▪ SHA-224: Use SHA-224 for authentication.</li> <li>▪ SHA-256: Use SHA-256 for authentication.</li> <li>▪ SHA-384: Use SHA-384 for authentication.</li> <li>▪ SHA-512: Use SHA-512 for authentication.</li> </ul> <p>ⓘ If you do not want to use authentication but you need SNMP v3, for example, because your device requires <a href="#">context</a>, you can leave the Password field empty. In this case, PRTG uses <a href="#">SNMP_SEC_LEVEL_NOAUTH</a> and it entirely deactivates authentication.</p> <p>ⓘ The authentication method that you select must match the authentication method of your device.</p>
User Name	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Enter the user name for access to the target SNMP device.</p> <p>ⓘ The user name that you enter must match the user name of your device.</p>

Setting	Description
Password	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Enter the password for access to the target SNMP device.</p> <p> The password that you enter must match the password of your device.</p>
Encryption Type	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Select an encryption type:</p> <ul style="list-style-type: none"> <li>▪ DES (default): Use Data Encryption Standard (DES) as the encryption algorithm.</li> <li>▪ AES: Use Advanced Encryption Standard (AES) as the encryption algorithm.</li> <li>▪ AES-192: Use AES-192 as the encryption algorithm.</li> <li>▪ AES-256: Use AES-256 as the encryption algorithm.</li> </ul> <p> The encryption type that you select must match the encryption type of your device.</p>
Encryption Key	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Enter an encryption key. If you provide a key, PRTG encrypts SNMP data packets with the encryption algorithm that you selected above. Enter a string or leave the field empty.</p> <p> The encryption key that you enter must match the encryption key of your device. If the encryption keys do not match, you do not get an error message.</p>
Context Name	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Enter a context name only if the configuration of the device requires it. <b>Context</b> is a collection of management information that is accessible by an SNMP device. Enter a string.</p>
SNMP Port	<p>Enter the port for the connection to the SNMP target device. Enter an integer. The default port is <b>161</b>.</p> <p> We recommend that you use the default value.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer. The maximum timeout value is <b>300</b> seconds (5 minutes).</p>

Access Key	Enter the Amazon Web Services (AWS) access key.
Secret Key	Enter the AWS secret key.

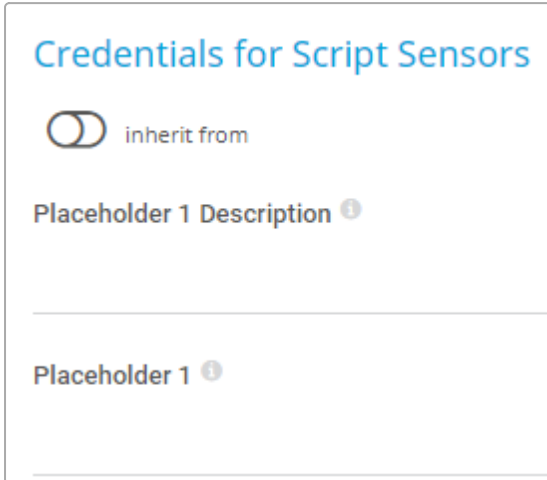

### Credentials for Script Sensors

Click  to interrupt the [inheritance](#) <sup>136</sup>.

ⓘ The settings you define in this section apply to the following sensors:

- [EXE/Script](#)
- [EXE/Script Advanced](#)
- [Python Script Advanced](#)

- [Script v2](#)
- [SSH Script](#)
- [SSH Script Advanced](#)

Credentials for Script Sensors

Setting	Description
Placeholder 1 Description	Enter a description for Placeholder 1, for example information about the purpose or content of the placeholder.
Placeholder 1	Enter a value for the placeholder. PRTG inserts the value for the script execution if you add <code>%scriptplaceholder1</code> in the argument list. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 2 Description	Enter a description for Placeholder 2, for example information about the purpose or content of the placeholder.
Placeholder 2	Enter a value for the placeholder. PRTG inserts the value for the script execution if you add <code>%scriptplaceholder2</code> in the argument list. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 3 Description	Enter a description for Placeholder 3, for example information about the purpose or content of the placeholder.
Placeholder 3	Enter a value for the placeholder. PRTG inserts the value for the script execution if you add <code>%scriptplaceholder3</code> in the argument list. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 4 Description	Enter a description for Placeholder 4, for example information about the purpose or content of the placeholder.

Setting	Description
Placeholder 4	Enter a value for the placeholder. PRTG inserts the value for the script execution if you add <code>%scriptplaceholder4</code> in the argument list. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 5 Description	Enter a description for Placeholder 5, for example information about the purpose or content of the placeholder.
Placeholder 5	Enter a value for the placeholder. PRTG inserts the value for the script execution if you add <code>%scriptplaceholder5</code> in the argument list. PRTG does not display the value in the sensor log or the sensor's settings.

### Credentials for Cisco Meraki

Click  to interrupt the [inheritance](#)<sup>[136]</sup>.

## 7.2.2 Add a Group

There are several ways to manually add a group:

- Select Devices | Add Group from the [main menu bar](#)<sup>[238]</sup>. A dialog appears that guides you through the process of adding a new group.
- Hover over  and select Add Group from the menu.
- Select Add Group from the [context menu](#)<sup>[229]</sup> of the probe or group to which you want to add the new group. This skips step 1 and leads you directly to [step 2](#)<sup>[316]</sup>.

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

## Add a Group

The Add a Group dialog appears when you add a new group to a parent group. It only shows the settings that are required to create the group. Therefore, you do not see all settings in this dialog.

- ① You can change all settings on the Settings tab of the group later. For more information, see section [Group Settings](#)  526.

## Step 1: Select a Parent

**Add a Group** [Close]

### Select a Parent

Select a parent object for the group.

**PRTG Manual: Add a Group**

### Add a New Group

Organize your network devices in PRTG using **groups**. You can create as many groups and subgroups as you like.

If you want to automate the monitoring setup for a group of network devices, add an **auto-discovery group** to your group or probe. To do so, use the context menu of groups or probes or select **Devices | Add Auto-Discovery Group** from the main menu bar.

### Select a Probe or Group to Add the New Group to

Select a probe or group from the list. You can create new groups faster by right-clicking a probe or group in the device tree and selecting **Add Group** from the context menu.

Search... [Search Icon]

- Root
  - Local Probe
    - 1st group
      - MAIL
        - Group
      - ROUTER/SWITCHES
      - VMWARE
      - SNMP
        - Servers
      - DATABASES
      - MISC
        - CLOUD
      - Services
      - WINDOWS

[Cancel] [OK]

Add Group Assistant Step 1

Select the probe or group that you want to add the new group to. Click OK.

## Step 2: Define Group Settings

### Add a Group to Local Probe ✕

---

#### Define Group Settings

Specify credentials and access rights for your group, if necessary. All devices in this group will inherit these settings.

**PRTG Manual: Add a Group**

#### Add a New Group

Organize your network devices in PRTG using **groups**. You can create as many groups and subgroups as you like.

If you want to automate the monitoring setup for a group of network devices, add an **auto-discovery group** to your group or probe. To do so, use the context menu of groups or probes or select **Devices | Add Auto-Discovery Group** from the main menu bar.

## Basic Group Settings

### Basic Group Settings

**Group Name** ⓘ

Group

---

**Tags** ⓘ

+

Basic Group Settings

Setting	Description
Group Name	<p>Enter a name to identify the group. By default, PRTG shows this name in the <a href="#">device tree</a><sup>[164]</sup>, as well as in <a href="#">alarms</a><sup>[202]</sup>, <a href="#">logs</a><sup>[210]</sup>, <a href="#">notifications</a><sup>[2735]</sup>, <a href="#">reports</a><sup>[2754]</sup>, <a href="#">maps</a><sup>[2776]</sup>, <a href="#">libraries</a><sup>[2738]</sup>, and <a href="#">tickets</a><sup>[213]</sup>.</p> <p>ⓘ If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically <a href="#">inherited</a><sup>[138]</sup>.</p> <p>ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (&lt;&gt;).</p> <p>ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>

## Auto-Discovery

### Auto-Discovery Settings

**Auto-Discovery Level** ⓘ

- No auto-discovery (default)
- Default auto-discovery (recommended)
- Detailed auto-discovery
- Auto-discovery with specific device templates

Auto-Discovery Settings

Setting	Description
Auto-Discovery Level	<p>Select the level of detail for the <a href="#">auto-discovery</a><sup>[254]</sup>:</p> <ul style="list-style-type: none"> <li>▪ No auto-discovery: Select this option if you only want to manually create devices and sensors.</li> <li>▪ Standard auto-discovery (default): Create a set of standard sensors for standard monitoring. This option works fine for most installations.</li> <li>▪ Detailed auto-discovery: Create all standard sensors and additional sensors from detailed variants of device templates. As a result, you might get many sensors. This option is suitable for small network segments and whenever you want to monitor the maximum number of sensors available.</li> <li>▪ Auto-discovery with specific device templates: Customize the auto-discovery and select or combine standard, detailed, and custom device templates. Select one or more templates from the Device Templates list.</li> </ul> <p>ⓘ Auto-discoveries can be resource intensive. They are primarily intended for devices on the same network as your probes.</p>
Schedule	<p>Select when PRTG runs the auto-discovery:</p> <ul style="list-style-type: none"> <li>▪ Once (default): Run the auto-discovery only once. PRTG adds new devices and sensors once. If you select this option, you must manually <a href="#">start the auto-discovery</a><sup>[255]</sup>.</li> <li>▪ Hourly: Run the auto-discovery for new devices and sensors every 60 minutes. <ul style="list-style-type: none"> <li>ⓘ Use this option with caution. Frequent auto-discoveries might cause performance issues, in particular when PRTG scans large network segments every hour.</li> </ul> </li> <li>▪ Daily: Run the auto-discovery for new devices and sensors every 24 hours. The first auto-discovery runs immediately. All other discoveries start at the time that you define in the <a href="#">Monitoring</a><sup>[2875]</sup> settings, section Auto-Discovery.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Weekly: Run the auto-discovery for new devices and sensors every 7 days. The first auto-discovery runs immediately. All other discoveries start at the time that you define in the Monitoring settings, section Auto-Discovery.</li> </ul> <p><b>i</b> For performance reasons, PRTG sets Schedule to Once (default) on all devices that the scheduled auto-discovery creates.</p>
Device Templates	<p><b>This setting is only visible if you select</b> Auto-discovery with specific device templates <a href="#">above</a>.</p> <p>Select one or more device templates by enabling a check box in front of the template name. PRTG uses the device templates that you select for the auto-discovery on the device:</p> <ul style="list-style-type: none"> <li>▪ ADSL</li> <li>▪ Buffalo TeraStation NAS</li> <li>▪ Cisco ASA VPN</li> <li>▪ Cisco Device (Generic)</li> <li>▪ Dell EqualLogic</li> <li>▪ Dell MDi Disk</li> <li>▪ DNS Server</li> <li>▪ Environment Jakarta</li> <li>▪ Environment Poseidon</li> <li>▪ FTP Server</li> <li>▪ Generic Device (Ping Only)</li> <li>▪ Generic Device (SNMP Enabled)</li> <li>▪ Generic Device (SNMP Enabled, Detailed)</li> <li>▪ HTTP Web Server</li> <li>▪ Hyper-V Host Server</li> <li>▪ IPMI-enabled Device</li> <li>▪ Juniper NS Device</li> <li>▪ Linux/UNIX Device (SNMP or SSH Enabled)</li> <li>▪ Mail Server (Generic)</li> <li>▪ Mail Server (MS Exchange)</li> <li>▪ Microsoft SharePoint 2010</li> <li>▪ MQTT Round Trip</li> <li>▪ NAS LenovoEMC</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ NAS QNAP</li> <li>▪ NAS Synology</li> <li>▪ NetApp</li> <li>▪ NTP Server</li> <li>▪ OPC UA</li> <li>▪ Printer (Generic)</li> <li>▪ Printer (HP)</li> <li>▪ RDP Server</li> <li>▪ RMON-compatible Device</li> <li>▪ Server (Cisco UCS)</li> <li>▪ Server (Compaq/HP Agents)</li> <li>▪ Server (Dell)</li> <li>▪ Server (Fujitsu)</li> <li>▪ Server (IBM)</li> <li>▪ SNMP Rittal CMC III Hardware Status</li> <li>▪ SonicWall</li> <li>▪ SSL Security Check</li> <li>▪ Switch (Cisco Catalyst)</li> <li>▪ Switch (Cisco IOS Based)</li> <li>▪ Switch (HP Procurve)</li> <li>▪ UNIX/Linux Device</li> <li>▪ UPS Health (APC)</li> <li>▪ UPS Health (Generic)</li> <li>▪ UPS Health (Liebert)</li> <li>▪ VMware ESXi / vCenter Server</li> <li>▪ Web Server</li> <li>▪ Windows (Detailed via WMI)</li> <li>▪ Windows (via Remote PowerShell)</li> <li>▪ Windows (via WMI)</li> <li>▪ Windows IIS (via SNMP)</li> <li>▪ XenServer Hosts</li> <li>▪ XenServer Virtual Machines</li> </ul>

Setting	Description
	Once the auto-discovery is finished, PRTG creates a new <a href="#">ticket</a> <sup>[213]</sup> and lists the device templates that it used to create new sensors.

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)<sup>[420]</sup> if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#)<sup>[136]</sup>.

## Credentials for Windows Systems

Click  to interrupt the [inheritance](#)<sup>[136]</sup>.

Credentials for Windows Systems

Setting	Description
Domain or Computer Name	<p>Enter the domain or computer name of the user account with which you want to access the Windows system. PRTG uses this account for Windows Management Instrumentation (WMI) sensors and other Windows sensors.</p> <p>If you want to use a Windows local user account on the target device, enter the computer name. If you want to use a Windows domain user account (recommended), enter the domain name. PRTG automatically adds a prefix to use the NT LAN Manager (NTLM) protocol if you do not explicitly define it. Do not leave this field empty.</p>
User Name	Enter the user name for access to the Windows system. Usually, you use credentials with administrator rights.
Password	Enter the password for access to the Windows system. Usually, you use credentials with administrator rights.

- Run the command as a different user using 'sudo' (without password)
- Run the command as a different user using 'su'

SSH Connection Mode <sup>i</sup>

- Default
- Compatibility mode (deprecated)

Setting	Description
User Name	Enter the user name for access to the Linux/Solaris/macOS system via Secure Shell (SSH) and Web-based Enterprise Management (WBEM). Usually, you use credentials with administrator rights.
Authentication Method	<p>Select the authentication method for the login:</p> <ul style="list-style-type: none"> <li>▪ Password (default): Provide the password for the login.</li> <li>▪ Private key: Provide an RSA private key for authentication.</li> </ul> <p> PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.</p> <p> PRTG only supports RSA keys. It does not support DSA keys.</p> <p> For more information, see section <a href="#">Monitoring via SSH</a><sup>[8007]</sup>.</p>
Password	<p><b>This setting is only visible if you select Password (default) above.</b></p> <p>Enter a password for access to the Linux/Solaris/macOS system via SSH and WBEM. Usually, you use credentials with administrator rights.</p>
Private Key	<p><b>This setting is only visible if you select Private key above.</b></p> <p>Paste the entire RSA private key, including the <b>BEGIN</b> and <b>END</b> lines. Make sure that a corresponding public key exists on the target device.</p> <p> PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.</p> <p> PRTG only supports RSA keys. It does not support DSA keys.</p> <p> For more information, see section <a href="#">Monitoring via SSH</a><sup>[8007]</sup>.</p> <p> If you do not insert a private key for the first time but if you want to <b>change</b> the private key, you need to <a href="#">restart the PRTG core server service</a><sup>[2919]</sup> for the private key change to take effect.</p>
WBEM Protocol	<p>Select the protocol that you want to use for the connection to the system via WBEM:</p> <ul style="list-style-type: none"> <li>▪ HTTP: Use an unsecure connection for WBEM.</li> <li>▪ HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection for WBEM.</li> </ul> <p> This setting is only relevant if you use WBEM sensors.</p>
WBEM Port	Select if you want to use one of the default ports for the connection to the system via WBEM or if you want to set a custom port:

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Default: Use one of the default ports. The default port for unsecure connections is <a href="#">5988</a> and the default port for secure connections is <a href="#">5989</a>.</li> <li>▪ Custom: Use a custom port.</li> </ul> <p> This setting is only relevant if you use WBEM sensors.</p>
Custom WBEM Port	<p>This setting is only visible if you select Custom above.</p> <p>Enter a custom WBEM port. Enter an integer.</p>
SSH Port	<p>Enter the port for SSH connections. Enter an integer. The default port is <a href="#">22</a>.</p> <p> By default, PRTG automatically uses this setting for all <a href="#">SSH sensors</a> <small>3232</small> unless you define a different port number in the sensor settings.</p>
SSH Rights Elevation	<p>Select the rights that you want to use to run the command on the target system:</p> <ul style="list-style-type: none"> <li>▪ Run the command as the connecting user (default): Use the rights of the user who establishes the SSH connection.</li> <li>▪ Run the command as a different user using 'sudo' (with password): Use the rights of a different user with a password required for <a href="#">sudo</a> to run commands on the target system, for example, as a root user.</li> <li>▪ Run the command as a different user using 'sudo' (without password): Use the rights of a different user without a password required for <a href="#">sudo</a> to run commands on the target system, for example, as a root user.</li> <li>▪ Run the command as a different user using 'su': Use the rights of a different user with <a href="#">su</a> to run commands on the target system.</li> </ul>
Target System User Name	<p>This setting is only visible if you select an option that includes <a href="#">sudo</a> or <a href="#">su</a> above.</p> <p>Enter a user name to run the specified command on the target system as a different user than the root user. If you leave this field empty, you run the command as a root user. Make sure that you set the Linux password even if you use a public key or a private key for authentication. This is not necessary if the user is allowed to run the command without a password.</p>
Password	<p>This setting is only visible if you select an option that includes <a href="#">sudo</a> or <a href="#">su</a> with password above.</p> <p>Enter the password to run the <a href="#">sudo</a> command or the <a href="#">su</a> command.</p>

Setting	Description
SSH Connection Mode	<p>Select the connection mode that you want to use to <a href="#">access data with SSH sensors</a> <sup>3007</sup>:</p> <ul style="list-style-type: none"> <li>▪ Default: This is the default connection mode for SSH sensors. It provides the best performance and security.</li> <li>▪ Compatibility mode (deprecated): Use this only if the default connection mode does not work on the target system. The compatibility mode is the connection mode that PRTG used in previous versions and it is deprecated.</li> </ul> <p><b>i</b> We strongly recommend that you use the default connection mode.</p> <p><b>i</b> You can also individually select the connection mode for each SSH sensor in the sensor settings.</p>

## Credentials for VMware/XenServer

Click  to interrupt the [inheritance](#) <sup>136</sup>.

Credentials for SNMP Devices

Setting	Description
SNMP Version	<p>Select the Simple Network Management Protocol (SNMP) version for the connection to the target SNMP device:</p> <ul style="list-style-type: none"> <li>SNMP v1: Use SNMP v1 for the connection. SNMP v1 only offers clear-text data transmission. <ul style="list-style-type: none"> <li>ⓘ SNMP v1 does not support 64-bit counters. This might result in invalid data when you monitor traffic via SNMP.</li> </ul> </li> <li>SNMP v2c (default): Use SNMP v2c for the connection. SNMP v2c also only offers clear-text data transmission but it supports 64-bit counters.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ SNMP v3: Use SNMP v3 for the connection. SNMP v3 provides secure authentication and data encryption.</li> <li>ⓘ SNMP v3 has performance limitations because of the use of encryption. The main limiting factor is CPU power. Also keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3. If you see an increase in <a href="#">Interval Delay</a> or <a href="#">Open Requests</a> with the <a href="#">Probe Health</a> sensor, distribute the load over <a href="#">multiple probes</a> <small>[3198]</small>. SNMP v1 and SNMP v2c do not have this limitation.</li> </ul>
Community String	<p><a href="#">This setting is only visible if you select SNMP v1 or SNMP v2c (default) above.</a></p> <p>Enter the community string of your device. This is like a clear-text password for simple authentication.</p> <p>ⓘ We recommend that you use the default value.</p>
Authentication Method	<p><a href="#">This setting is only visible if you select SNMP v3 above.</a></p> <p>Select the authentication method:</p> <ul style="list-style-type: none"> <li>▪ MD5 (default): Use message-digest algorithm 5 (MD5) for authentication.</li> <li>▪ SHA: Use Secure Hash Algorithm (SHA) for authentication.</li> <li>▪ SHA-224: Use SHA-224 for authentication.</li> <li>▪ SHA-256: Use SHA-256 for authentication.</li> <li>▪ SHA-384: Use SHA-384 for authentication.</li> <li>▪ SHA-512: Use SHA-512 for authentication.</li> </ul> <p>ⓘ If you do not want to use authentication but you need SNMP v3, for example, because your device requires <a href="#">context</a>, you can leave the Password field empty. In this case, PRTG uses <a href="#">SNMP_SEC_LEVEL_NOAUTH</a> and it entirely deactivates authentication.</p> <p>ⓘ The authentication method that you select must match the authentication method of your device.</p>
User Name	<p><a href="#">This setting is only visible if you select SNMP v3 above.</a></p> <p>Enter the user name for access to the target SNMP device.</p> <p>ⓘ The user name that you enter must match the user name of your device.</p>

Setting	Description
Password	<p><a href="#">This setting is only visible if you select SNMP v3 above.</a></p> <p>Enter the password for access to the target SNMP device.</p> <p> The password that you enter must match the password of your device.</p>
Encryption Type	<p><a href="#">This setting is only visible if you select SNMP v3 above.</a></p> <p>Select an encryption type:</p> <ul style="list-style-type: none"> <li>▪ DES (default): Use Data Encryption Standard (DES) as the encryption algorithm.</li> <li>▪ AES: Use Advanced Encryption Standard (AES) as the encryption algorithm.</li> <li>▪ AES-192: Use AES-192 as the encryption algorithm.</li> <li>▪ AES-256: Use AES-256 as the encryption algorithm.</li> </ul> <p> The encryption type that you select must match the encryption type of your device.</p>
Encryption Key	<p><a href="#">This setting is only visible if you select SNMP v3 above.</a></p> <p>Enter an encryption key. If you provide a key, PRTG encrypts SNMP data packets with the encryption algorithm that you selected above. Enter a string or leave the field empty.</p> <p> The encryption key that you enter must match the encryption key of your device. If the encryption keys do not match, you do not get an error message.</p>
Context Name	<p><a href="#">This setting is only visible if you select SNMP v3 above.</a></p> <p>Enter a context name only if the configuration of the device requires it. <b>Context</b> is a collection of management information that is accessible by an SNMP device. Enter a string.</p>
SNMP Port	<p>Enter the port for the connection to the SNMP target device. Enter an integer. The default port is <b>161</b>.</p> <p> We recommend that you use the default value.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer. The maximum timeout value is <b>300</b> seconds (5 minutes).</p>

inherit from

**Authentication Method** 

None (default)

Basic authentication

Bearer authentication

Credentials for REST API

Setting	Description
Authentication Method	Select the authentication method for access to the Representational State Transfer (REST) application programming interface (API): <ul style="list-style-type: none"> <li>▪ None (default): Use no authentication.</li> <li>▪ Basic authentication: Use basic authentication.</li> <li>▪ Bearer authentication: Use an OAuth2 bearer token.</li> </ul>
User Name	<a href="#">This setting is only visible if you select Basic authentication above.</a> Enter the user name for access to the REST API.
Password	<a href="#">This setting is only visible if you select Basic authentication above.</a> Enter the password for access to the REST API.
Bearer Token	<a href="#">This setting is only visible if you select Bearer authentication above.</a> Enter a bearer token for access to the REST API.
Placeholder 1 Description	Enter a description for Placeholder 1, for example information about the purpose or content of the placeholder.

Setting	Description
Placeholder 1	Enter a value for the placeholder. PRTG inserts the value for the REST API request if you add <code>%restplaceholder1</code> in the Request URL, POST Body, and Custom Headers fields of the REST Custom v2 sensor. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 2 Description	Enter a description for Placeholder 2, for example information about the purpose or content of the placeholder.
Placeholder 2	Enter a value for the placeholder. PRTG inserts the value for the REST API request if you add <code>%restplaceholder2</code> in the Request URL, POST Body, and Custom Headers fields of the REST Custom v2 sensor. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 3 Description	Enter a description for Placeholder 3, for example information about the purpose or content of the placeholder.
Placeholder 3	Enter a value for the placeholder. PRTG inserts the value for the REST API request if you add <code>%restplaceholder3</code> in the Request URL, POST Body, and Custom Headers fields of the REST Custom v2 sensor. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 4 Description	Enter a description for Placeholder 4, for example information about the purpose or content of the placeholder.
Placeholder 4	Enter a value for the placeholder. PRTG inserts the value for the REST API request if you add <code>%restplaceholder4</code> in the Request URL, POST Body, and Custom Headers fields of the REST Custom v2 sensor. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 5 Description	Enter a description for Placeholder 5, for example information about the purpose or content of the placeholder.
Placeholder 5	Enter a value for the placeholder. PRTG inserts the value for the REST API request if you add <code>%restplaceholder5</code> in the Request URL, POST Body, and Custom Headers fields of the REST Custom v2 sensor. PRTG does not display the value in the sensor log or the sensor's settings.

## 7.2.3 Add a Device

There are several ways to manually add a device:

- Select Devices | Add Device from the [main menu bar](#)<sup>[238]</sup>. A dialog appears that guides you through the process of adding a new device.
- Hover over  and select Add Device from the menu.
- Select Add Device from the [context menu](#)<sup>[229]</sup> of the group to which you want to add the new device. This skips step 1 and leads you directly to [step 2](#)<sup>[366]</sup>.

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

In this section:

- [Add a Device](#)<sup>[364]</sup>
- [Step 1: Select a Parent](#)<sup>[365]</sup>

## Add a Device

The Add a Device dialog appears when you add a new device to a group. It only shows the settings that are required to create the device. Therefore, you do not see all settings in this dialog.

- ⓘ You can change all settings on the Settings tab of the device later. For more information, see section [Device Settings](#)  597.

## Step 1: Select a Parent

**Add a Device** [X]

### Select a Parent

Select parent object for the device.

**PRTG Manual: Add a Device**

### Add a New Device

In PRTG, devices have one or more sensors. Devices are organized in groups. Devices and their sensors can use various inherited settings, such as scanning intervals or credentials.

### Select a Group from the List

Select a group from the list. You can create new devices faster by right-clicking a group in the device tree and selecting **Add Device** from the context menu.

Search... [Q]

- Root
  - Local Probe
    - 1st group
      - MAIL
        - Group
      - ROUTER/SWITCHES
      - VMWARE
      - SNMP
        - Servers
      - DATABASES
      - MISC
        - CLOUD
      - Services
      - WINDOWS

Cancel **OK**

Add Device Assistant Step 1

Select the group that you want to add the new device to. Click **OK**.

## Step 2: Define Device Settings

**Add Device to Group Local Probe**
✕

---

### Add a New Device

Define a device name and IP address, options for auto-discovery, and credential settings for Windows, Linux, VMware/XenServer, SNMP, and specific vendors, if necessary.

**PRTG Manual: Add a Device**

## Auto-Discovery Settings

### Auto-Discovery Settings

**Auto-Discovery Level** ⓘ

- No auto-discovery (default)
- Default auto-discovery (recommended)
- Detailed auto-discovery
- Auto-discovery with specific device templates

Auto-Discovery Settings

Setting	Description
Auto-Discovery Level	<p>Select the level of detail for the <a href="#">auto-discovery</a> [254]:</p> <ul style="list-style-type: none"> <li>▪ No auto-discovery: Select this option if you only want to manually create devices and sensors.</li> <li>▪ Standard auto-discovery (default): Create a set of standard sensors for standard monitoring. This option works fine for most installations.</li> <li>▪ Detailed auto-discovery: Create all standard sensors and additional sensors from detailed variants of device templates. As a result, you might get many sensors. This option is suitable for small network segments and whenever you want to monitor the maximum number of sensors available.</li> <li>▪ Auto-discovery with specific device templates: Customize the auto-discovery and select or combine standard, detailed, and custom device templates. Select one or more templates from the Device Templates list.</li> </ul> <p>ⓘ Auto-discoveries can be resource intensive. They are primarily intended for devices on the same network as your probes.</p>
Schedule	<p>Select when PRTG runs the auto-discovery:</p> <ul style="list-style-type: none"> <li>▪ Once (default): Run the auto-discovery only once. PRTG adds new devices and sensors once. If you select this option, you must manually <a href="#">start the auto-discovery</a> [255].</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Hourly: Run the auto-discovery for new devices and sensors every 60 minutes.  <span style="color: red;">❗</span> Use this option with caution. Frequent auto-discoveries might cause performance issues, in particular when PRTG scans large network segments every hour.</li> <li>▪ Daily: Run the auto-discovery for new devices and sensors every 24 hours. The first auto-discovery runs immediately. All other discoveries start at the time that you define in the <a href="#">Monitoring</a> settings, section Auto-Discovery.</li> <li>▪ Weekly: Run the auto-discovery for new devices and sensors every 7 days. The first auto-discovery runs immediately. All other discoveries start at the time that you define in the Monitoring settings, section Auto-Discovery.</li> </ul> <p><span style="color: red;">❗</span> For performance reasons, PRTG sets Schedule to Once (default) on all devices that the scheduled auto-discovery creates.</p>
<p>Device Templates</p>	<p><span style="color: blue;">This setting is only visible if you select</span> Auto-discovery with specific device templates <a href="#">above</a>.</p> <p>Select one or more device templates by enabling a check box in front of the template name. PRTG uses the device templates that you select for the auto-discovery on the device:</p> <ul style="list-style-type: none"> <li>▪ ADSL</li> <li>▪ Buffalo TeraStation NAS</li> <li>▪ Cisco ASA VPN</li> <li>▪ Cisco Device (Generic)</li> <li>▪ Dell EqualLogic</li> <li>▪ Dell MDi Disk</li> <li>▪ DNS Server</li> <li>▪ Environment Jakarta</li> <li>▪ Environment Poseidon</li> <li>▪ FTP Server</li> <li>▪ Generic Device (Ping Only)</li> <li>▪ Generic Device (SNMP Enabled)</li> <li>▪ Generic Device (SNMP Enabled, Detailed)</li> <li>▪ HTTP Web Server</li> <li>▪ Hyper-V Host Server</li> <li>▪ IPMI-enabled Device</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Juniper NS Device</li> <li>▪ Linux/UNIX Device (SNMP or SSH Enabled)</li> <li>▪ Mail Server (Generic)</li> <li>▪ Mail Server (MS Exchange)</li> <li>▪ Microsoft SharePoint 2010</li> <li>▪ MQTT Round Trip</li> <li>▪ NAS LenovoEMC</li> <li>▪ NAS QNAP</li> <li>▪ NAS Synology</li> <li>▪ NetApp</li> <li>▪ NTP Server</li> <li>▪ OPC UA</li> <li>▪ Printer (Generic)</li> <li>▪ Printer (HP)</li> <li>▪ RDP Server</li> <li>▪ RMON-compatible Device</li> <li>▪ Server (Cisco UCS)</li> <li>▪ Server (Compaq/HP Agents)</li> <li>▪ Server (Dell)</li> <li>▪ Server (Fujitsu)</li> <li>▪ Server (IBM)</li> <li>▪ SNMP Rittal CMC III Hardware Status</li> <li>▪ SonicWall</li> <li>▪ SSL Security Check</li> <li>▪ Switch (Cisco Catalyst)</li> <li>▪ Switch (Cisco IOS Based)</li> <li>▪ Switch (HP Procurve)</li> <li>▪ UNIX/Linux Device</li> <li>▪ UPS Health (APC)</li> <li>▪ UPS Health (Generic)</li> <li>▪ UPS Health (Liebert)</li> <li>▪ VMware ESXi / vCenter Server</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Web Server</li> <li>▪ Windows (Detailed via WMI)</li> <li>▪ Windows (via Remote PowerShell)</li> <li>▪ Windows (via WMI)</li> <li>▪ Windows IIS (via SNMP)</li> <li>▪ XenServer Hosts</li> <li>▪ XenServer Virtual Machines</li> </ul> <p>Once the auto-discovery is finished, PRTG creates a new <a href="#">ticket</a> and lists the device templates that it used to create new sensors.</p>

### Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

### Credentials for Windows Systems

Click  to interrupt the [inheritance](#).

 The settings you define in this section apply to the following sensors:

<ul style="list-style-type: none"> <li>▪ <a href="#">Active Directory Replication Errors</a></li> <li>▪ <a href="#">Event Log (Windows API)</a></li> <li>▪ <a href="#">Exchange Backup (PowerShell)</a></li> <li>▪ <a href="#">Exchange Database (PowerShell)</a></li> <li>▪ <a href="#">Exchange Database DAG (PowerShell)</a></li> <li>▪ <a href="#">Exchange Mail Queue (PowerShell)</a></li> <li>▪ <a href="#">Exchange Mailbox (PowerShell)</a></li> </ul>	<ul style="list-style-type: none"> <li>▪ <a href="#">Windows MSMQ Queue Length</a></li> <li>▪ <a href="#">Windows Network Card</a></li> <li>▪ <a href="#">Windows Pagefile</a></li> <li>▪ <a href="#">Windows Physical Disk I/O</a></li> <li>▪ <a href="#">Windows Print Queue</a></li> <li>▪ <a href="#">Windows Process</a></li> <li>▪ <a href="#">Windows SMTP Service Received</a></li> <li>▪ <a href="#">Windows SMTP Service Sent</a></li> <li>▪ <a href="#">Windows System Uptime</a></li> </ul>	<ul style="list-style-type: none"> <li>▪ <a href="#">WMI Memory</a></li> <li>▪ <a href="#">WMI Microsoft SQL Server 2005 (Deprecated)</a></li> <li>▪ <a href="#">WMI Microsoft SQL Server 2008</a></li> <li>▪ <a href="#">WMI Microsoft SQL Server 2012</a></li> <li>▪ <a href="#">WMI Microsoft SQL Server 2014</a></li> <li>▪ <a href="#">WMI Microsoft SQL Server 2016</a></li> <li>▪ <a href="#">WMI Microsoft SQL Server 2017</a></li> </ul>

You cannot use password-protected keys.</p> <p> PRTG only supports RSA keys. It does not support DSA keys.</p> <p> For more information, see section <a href="#">Monitoring via SSH</a><sup>[8007]</sup>.</p> <p> If you do not insert a private key for the first time but if you want to <b>change</b> the private key, you need to <a href="#">restart the PRTG core server service</a><sup>[2919]</sup> for the private key change to take effect.</p>
WBEM Protocol	<p>Select the protocol that you want to use for the connection to the system via WBEM:</p> <ul style="list-style-type: none"> <li>▪ HTTP: Use an unsecure connection for WBEM.</li> <li>▪ HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection for WBEM.</li> </ul> <p> This setting is only relevant if you use WBEM sensors.</p>
WBEM Port	Select if you want to use one of the default ports for the connection to the system via WBEM or if you want to set a custom port:

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Default: Use one of the default ports. The default port for unsecure connections is <a href="#">5988</a> and the default port for secure connections is <a href="#">5989</a>.</li> <li>▪ Custom: Use a custom port.</li> </ul> <p> This setting is only relevant if you use WBEM sensors.</p>
Custom WBEM Port	<p>This setting is only visible if you select Custom above.</p> <p>Enter a custom WBEM port. Enter an integer.</p>
SSH Port	<p>Enter the port for SSH connections. Enter an integer. The default port is <a href="#">22</a>.</p> <p> By default, PRTG automatically uses this setting for all <a href="#">SSH sensors</a> <small>(3232)</small> unless you define a different port number in the sensor settings.</p>
SSH Rights Elevation	<p>Select the rights that you want to use to run the command on the target system:</p> <ul style="list-style-type: none"> <li>▪ Run the command as the connecting user (default): Use the rights of the user who establishes the SSH connection.</li> <li>▪ Run the command as a different user using 'sudo' (with password): Use the rights of a different user with a password required for <a href="#">sudo</a> to run commands on the target system, for example, as a root user.</li> <li>▪ Run the command as a different user using 'sudo' (without password): Use the rights of a different user without a password required for <a href="#">sudo</a> to run commands on the target system, for example, as a root user.</li> <li>▪ Run the command as a different user using 'su': Use the rights of a different user with <a href="#">su</a> to run commands on the target system.</li> </ul>
Target System User Name	<p>This setting is only visible if you select an option that includes <a href="#">sudo</a> or <a href="#">su</a> above.</p> <p>Enter a user name to run the specified command on the target system as a different user than the root user. If you leave this field empty, you run the command as a root user. Make sure that you set the Linux password even if you use a public key or a private key for authentication. This is not necessary if the user is allowed to run the command without a password.</p>
Password	<p>This setting is only visible if you select an option that includes <a href="#">sudo</a> or <a href="#">su</a> with password above.</p> <p>Enter the password to run the <a href="#">sudo</a> command or the <a href="#">su</a> command.</p>

Setting	Description
SSH Connection Mode	<p>Select the connection mode that you want to use to <a href="#">access data with SSH sensors</a> <sup>3007</sup>:</p> <ul style="list-style-type: none"> <li>▪ Default: This is the default connection mode for SSH sensors. It provides the best performance and security.</li> <li>▪ Compatibility mode (deprecated): Use this only if the default connection mode does not work on the target system. The compatibility mode is the connection mode that PRTG used in previous versions and it is deprecated.</li> </ul> <p><b>i</b> We strongly recommend that you use the default connection mode.</p> <p><b>i</b> You can also individually select the connection mode for each SSH sensor in the sensor settings.</p>

Credentials for VMw are/XenServer

Setting	Description
User Name	Enter the user name for access to VMware ESXi, vCenter Server, or Citrix XenServer. Usually, you use credentials with administrator rights.
Password	Enter the password for access to VMware ESXi, vCenter Server, or Citrix XenServer. Usually, you use credentials with administrator rights.  <span>i</span> Single sign-on (SSO) passwords for vSphere do not support special characters. For more information, see the VMware sensors sections.
VMware Protocol	Select the protocol for the connection to VMware ESXi, vCenter Server, or Citrix XenServer: <ul style="list-style-type: none"> <li>▪ HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection.</li> <li>▪ HTTP: Use an unsecure connection.</li> </ul>
Session Handling	Select if you want to reuse a session for VMware sensors:

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Reuse a session for multiple scans (default): Select this option if you want a VMware sensor to reuse a single session for multiple sensor scans to query data. With this option, the sensor does not need to log in and out for each sensor scan. We recommend that you use this option because it reduces network load and log entries on the target device. This can increase performance.</li> <li>▪ Create a new session for each scan: If you select this option, PRTG does not reuse a session and a VMware sensor has to log in and out for each sensor scan. This can decrease performance.</li> </ul>

Credentials for SNMP Devices

Setting	Description
SNMP Version	<p>Select the Simple Network Management Protocol (SNMP) version for the connection to the target SNMP device:</p> <ul style="list-style-type: none"> <li>SNMP v1: Use SNMP v1 for the connection. SNMP v1 only offers clear-text data transmission. <ul style="list-style-type: none"> <li>ⓘ SNMP v1 does not support 64-bit counters. This might result in invalid data when you monitor traffic via SNMP.</li> </ul> </li> <li>SNMP v2c (default): Use SNMP v2c for the connection. SNMP v2c also only offers clear-text data transmission but it supports 64-bit counters.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ SNMP v3: Use SNMP v3 for the connection. SNMP v3 provides secure authentication and data encryption.</li> <li>ⓘ SNMP v3 has performance limitations because of the use of encryption. The main limiting factor is CPU power. Also keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3. If you see an increase in <a href="#">Interval Delay</a> or <a href="#">Open Requests</a> with the <a href="#">Probe Health</a> sensor, distribute the load over <a href="#">multiple probes</a> <small>[3198]</small>. SNMP v1 and SNMP v2c do not have this limitation.</li> </ul>
Community String	<p><a href="#">This setting is only visible if you select SNMP v1 or SNMP v2c (default) above.</a></p> <p>Enter the community string of your device. This is like a clear-text password for simple authentication.</p> <p>ⓘ We recommend that you use the default value.</p>
Authentication Method	<p><a href="#">This setting is only visible if you select SNMP v3 above.</a></p> <p>Select the authentication method:</p> <ul style="list-style-type: none"> <li>▪ MD5 (default): Use message-digest algorithm 5 (MD5) for authentication.</li> <li>▪ SHA: Use Secure Hash Algorithm (SHA) for authentication.</li> <li>▪ SHA-224: Use SHA-224 for authentication.</li> <li>▪ SHA-256: Use SHA-256 for authentication.</li> <li>▪ SHA-384: Use SHA-384 for authentication.</li> <li>▪ SHA-512: Use SHA-512 for authentication.</li> </ul> <p>ⓘ If you do not want to use authentication but you need SNMP v3, for example, because your device requires <a href="#">context</a>, you can leave the Password field empty. In this case, PRTG uses <a href="#">SNMP_SEC_LEVEL_NOAUTH</a> and it entirely deactivates authentication.</p> <p>ⓘ The authentication method that you select must match the authentication method of your device.</p>
User Name	<p><a href="#">This setting is only visible if you select SNMP v3 above.</a></p> <p>Enter the user name for access to the target SNMP device.</p> <p>ⓘ The user name that you enter must match the user name of your device.</p>

Setting	Description
Password	<p>This setting is only visible if you select <a href="#">SNMP v3 above</a>.</p> <p>Enter the password for access to the target SNMP device.</p> <p> The password that you enter must match the password of your device.</p>
Encryption Type	<p>This setting is only visible if you select <a href="#">SNMP v3 above</a>.</p> <p>Select an encryption type:</p> <ul style="list-style-type: none"> <li>▪ DES (default): Use Data Encryption Standard (DES) as the encryption algorithm.</li> <li>▪ AES: Use Advanced Encryption Standard (AES) as the encryption algorithm.</li> <li>▪ AES-192: Use AES-192 as the encryption algorithm.</li> <li>▪ AES-256: Use AES-256 as the encryption algorithm.</li> </ul> <p> The encryption type that you select must match the encryption type of your device.</p>
Encryption Key	<p>This setting is only visible if you select <a href="#">SNMP v3 above</a>.</p> <p>Enter an encryption key. If you provide a key, PRTG encrypts SNMP data packets with the encryption algorithm that you selected above. Enter a string or leave the field empty.</p> <p> The encryption key that you enter must match the encryption key of your device. If the encryption keys do not match, you do not get an error message.</p>
Context Name	<p>This setting is only visible if you select <a href="#">SNMP v3 above</a>.</p> <p>Enter a context name only if the configuration of the device requires it. <b>Context</b> is a collection of management information that is accessible by an SNMP device. Enter a string.</p>
SNMP Port	<p>Enter the port for the connection to the SNMP target device. Enter an integer. The default port is <b>161</b>.</p> <p> We recommend that you use the default value.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer. The maximum timeout value is <b>300</b> seconds (5 minutes).</p>

Setting	Description
User Name	Enter the user name for access to the Redfish system.
Password	Enter the password for access to the Redfish system.
Protocol	<p>Select the protocol that you want to use for the connection to the Redfish system:</p> <ul style="list-style-type: none"> <li>▪ HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection.</li> <li>▪ HTTP: Use an unsecure connection.</li> </ul>
Port	Enter the port for the connection to the Redfish system. The default port for secure connections is 443.

## Credentials for REST API

Click  to interrupt the [inheritance](#) 136.

 The settings you define in this section apply to the following sensor:

- [REST Custom v2](#)

### Credentials for REST API

inherit from

**Authentication Method** 

None (default)

Basic authentication

Bearer authentication

Credentials for REST API

Setting	Description
Authentication Method	<p>Select the authentication method for access to the Representational State Transfer (REST) application programming interface (API):</p> <ul style="list-style-type: none"> <li>▪ None (default): Use no authentication.</li> <li>▪ Basic authentication: Use basic authentication.</li> <li>▪ Bearer authentication: Use an OAuth2 bearer token.</li> </ul>
User Name	<p><a href="#">This setting is only visible if you select Basic authentication above.</a></p> <p>Enter the user name for access to the REST API.</p>
Password	<p><a href="#">This setting is only visible if you select Basic authentication above.</a></p> <p>Enter the password for access to the REST API.</p>
Bearer Token	<p><a href="#">This setting is only visible if you select Bearer authentication above.</a></p> <p>Enter a bearer token for access to the REST API.</p>
Placeholder 1 Description	<p>Enter a description for Placeholder 1, for example information about the purpose or content of the placeholder.</p>

Setting	Description
Placeholder 1	Enter a value for the placeholder. PRTG inserts the value for the REST API request if you add <code>%restplaceholder1</code> in the Request URL, POST Body, and Custom Headers fields of the REST Custom v2 sensor. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 2 Description	Enter a description for Placeholder 2, for example information about the purpose or content of the placeholder.
Placeholder 2	Enter a value for the placeholder. PRTG inserts the value for the REST API request if you add <code>%restplaceholder2</code> in the Request URL, POST Body, and Custom Headers fields of the REST Custom v2 sensor. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 3 Description	Enter a description for Placeholder 3, for example information about the purpose or content of the placeholder.
Placeholder 3	Enter a value for the placeholder. PRTG inserts the value for the REST API request if you add <code>%restplaceholder3</code> in the Request URL, POST Body, and Custom Headers fields of the REST Custom v2 sensor. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 4 Description	Enter a description for Placeholder 4, for example information about the purpose or content of the placeholder.
Placeholder 4	Enter a value for the placeholder. PRTG inserts the value for the REST API request if you add <code>%restplaceholder4</code> in the Request URL, POST Body, and Custom Headers fields of the REST Custom v2 sensor. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 5 Description	Enter a description for Placeholder 5, for example information about the purpose or content of the placeholder.
Placeholder 5	Enter a value for the placeholder. PRTG inserts the value for the REST API request if you add <code>%restplaceholder5</code> in the Request URL, POST Body, and Custom Headers fields of the REST Custom v2 sensor. PRTG does not display the value in the sensor log or the sensor's settings.

## 7.2.4 Add a Sensor

There are several ways to manually add a sensor:

- Select Sensors | Add Sensor from the [main menu bar](#)<sup>[241]</sup>. A dialog appears that guides you through the process of adding a new sensor.
- Hover over  and select Add Sensor from the menu.
- Select Add Sensor from the [context menu](#)<sup>[229]</sup> of a device to which you want to add the new sensor. This skips step 1 and leads you directly to [step 2](#)<sup>[416]</sup>.
- Click the Add Sensor button at the end of a device's sensor list on the device tree screen or above the geographical map on the right.

**i** This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

### Preparation: Select a Device

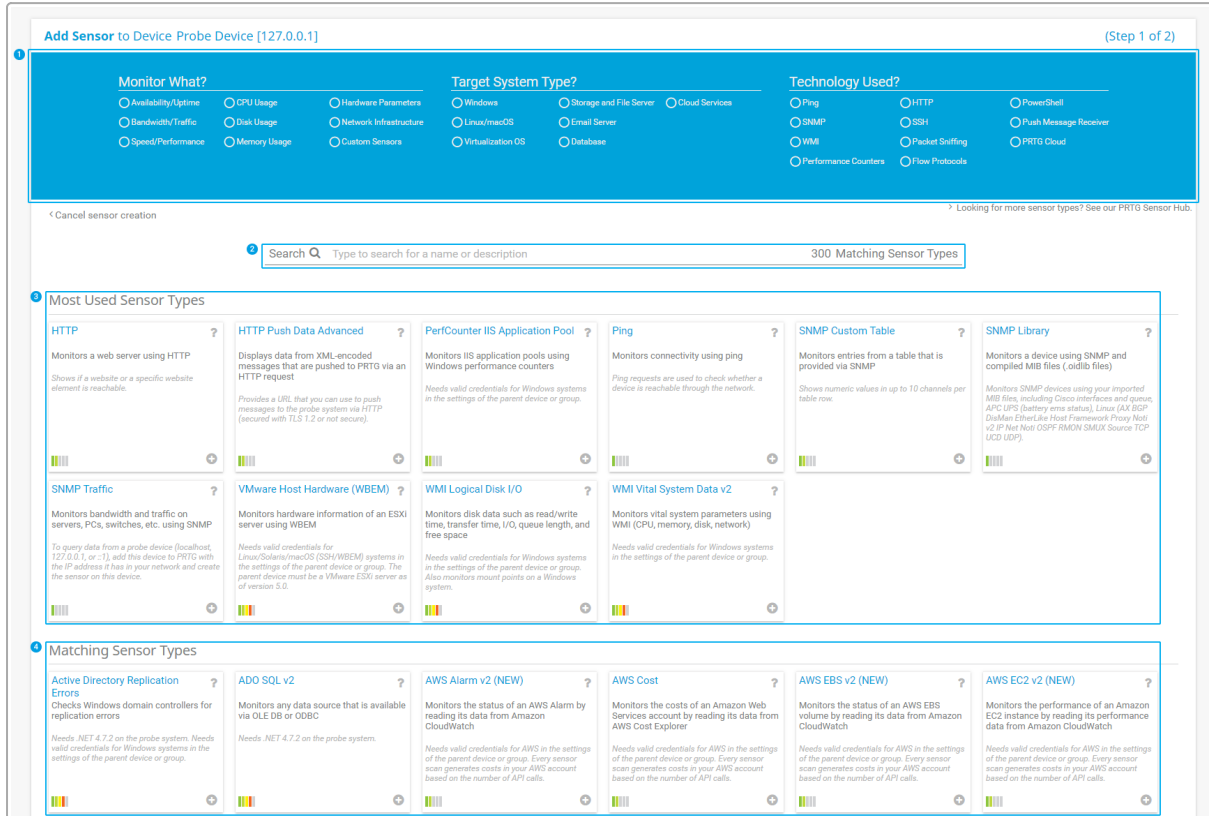

Add Sensor Assistant

1. Select Add sensor to a device.
2. Select the device you want to add the new sensor to.
3. Click Continue.

The Add Sensor dialog appears.

## Step 1: Choose Sensor

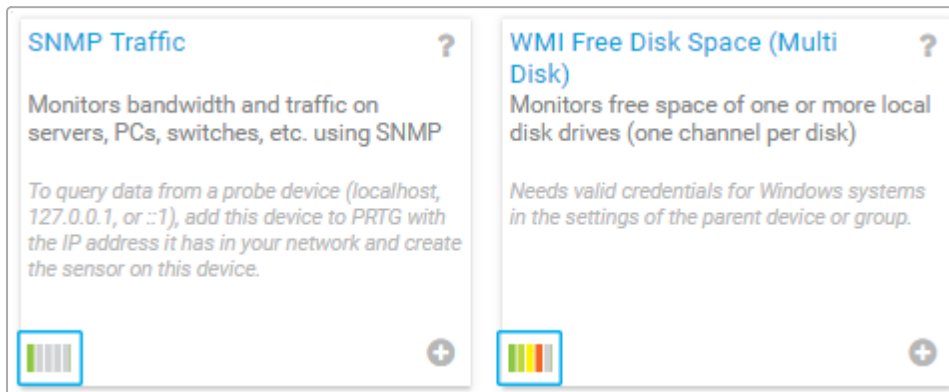

Add Sensor Dialog

In the Add Sensor dialog, the following actions are available:

- 1 Choose appropriate criteria to filter the sensors.
  - Select the type of parameter that you want to monitor via Monitor What?
  - Specify the type of target system that you want to monitor and see what sensors are available for this type of hardware via Target System Type?
  - Select the technology that you want to use for monitoring (for example SNMP or WMI) via Technology Used?
- 2 Enter (parts of) the name into the search box.
- 3 Go through the list of the most used sensor types.
  - ⓘ PRTG suggests sensors for the selected device. This recommendation is automatically calculated based on the current user's sensor usage. It shows the ten most commonly used sensors if there are already enough sensors for the recommendation to use.
- 4 Go through the list of all matching sensor types.
  - If you cannot find a suitable sensor, search for custom sensors in our [PRTG Sensor Hub](#). To do so, click Looking for more sensor types? above the search box or below the list of sensors.
  - For more information, see section [Available Sensor Types](#) <sup>[3263]</sup>, section PRTG Sensor Hub.
- Click the sensor box to select the sensor.

- ❶ If you are unsure which sensor provides the information that you need, we recommend that you use the filter categories to reduce the amount of matching sensor types.
- ❶ Also consider whether a sensor's [performance impact](#)<sup>[2952]</sup> is high or low. To do so, check the bar in the lower-left corner of the sensor box. For more information, see the Knowledge Base: [How can I speed up PRTG—especially for large installations?](#) (especially section 4 - Sensor Type and Monitoring).
- For an overview list of all sensors, including their performance impact, see section [Available Sensor Types](#)<sup>[3232]</sup>.

Sensor with Very Low Performance Impact and with High Performance Impact

- For more information about a sensor, click **?** to see the section of the respective sensor.

## Step 2: Define Sensor Settings

The [Add Sensor](#)<sup>[414]</sup> dialog appears when you manually add a new sensor to a device. It only shows the settings that are required to create the sensor. You can change nearly all settings on the sensor's Settings tab after creation.

- ❶ Enable check boxes in front of the respective lines to select the items. Use the check box in the table header to select all items or to cancel the selection. In large tables, use the search function in the upper-right corner.

Then, the sensor settings dialog opens where you can define the [sensor settings](#) and create the sensor.

- ❶ The settings that you select during sensor creation are valid for all sensors that you create when you finish the dialog.

## 7.3 Manage Device Tree

In the device tree, click the Management tab to enter a different view of your devices and sensors. While in this view, you can move monitoring objects via drag-and-drop. You can also select objects to view and edit their settings. Any changes that you make in this view immediately take effect. To arrange objects in the tree, you have the following options.

### Move or Clone a Sensor

You can change the position of a sensor on the same device or you can clone a sensor to a different device:

- On the same device, drag any sensor and drop it where you want it. The sensor moves to this position and the other sensors line up underneath it.
- Drag any sensor from a device and drop it on a different device to clone a sensor. This creates the same sensor with the same settings on the new device. The original sensor does not change.
  - ① Cloned sensors initially show the Paused [status](#)<sup>[227]</sup> to give you the chance to change any settings before monitoring starts. Check the settings and [resume](#)<sup>[227]</sup> monitoring.
  - ① You cannot clone **fixed** objects such as the root group, a probe device, or PRTG system-internal sensors.
  - ① To clone entire groups or devices, use the [clone object](#)<sup>[2714]</sup> feature in the object's [context menu](#)<sup>[229]</sup>.

### Move a Group or Device

You can change the position of a group or a device via drag-and-drop:

- On the same probe or group, drag any group or device and move it up or down the device tree. A small red arrow appears that shows the future position. When you drop the group or device, it moves to this position and the other probes, groups, and devices line up underneath it.
- Drag any group or device from one probe or group and drop it on a different probe or group. A small red arrow appears that shows the future position. When you drop the group or device, it moves to the new probe or group and the other groups and devices line up underneath it. This way, you can change the probe that a group or device is part of or you can add groups or devices to other groups.
- ① You cannot move the local probe, the hosted probe, or remote probes.

### Multi-Edit Object Settings

You can use multi-edit for object settings:

- Hold down the Ctrl key and select multiple objects of the same type, for example, multiple groups, devices, or sensors.
- In the dialog that appears, select the properties that you want to edit, change the respective settings, and click Save. The changes are applied to all selected objects.

The dialog is the same as described in section [Multi-Edit](#)<sup>[2720]</sup>.

### Related Topics

For other ways to arrange objects, see

- [Move Objects](#)  27121
- [Create Device Template](#)  27251
- [Clone Object](#)  27144

## 7.4 Root Group Settings

The root group is the highest instance in the object hierarchy and it is the parent to most other objects. Therefore, most objects inherit settings from the root group. So, before you create your own sensors, it is a good idea to review the root group's settings to make sure that they suit your needs.

- ❗ If necessary, you can override every setting for every single child object. To do so, disable the respective inherit from option of an object.

### Root Group Settings

The following settings are available on the Settings tab. All of the settings that you define here can be inherited to all other objects in your setup.

- ❗ This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

## Basic Group Settings

### Basic Group Settings

**Group Name** ⓘ

Root

---

**Monitoring Status** ⓘ

Started (default)

Paused

Basic Group Settings

Setting	Description
Group Name	<p>Enter a name to identify the group. By default, PRTG displays it in the <a href="#">device tree</a><sup>164</sup>.</p> <p>ⓘ If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Monitoring Status	<p>Select the monitoring status of the group:</p> <ul style="list-style-type: none"> <li>▪ Started (default): Monitor the group.</li> <li>▪ Paused: Pause monitoring for the group. All sensors on all devices in the group are in the Paused <a href="#">status</a><sup>227</sup> until you change this setting.</li> </ul>

## Location

**Location**

Location (for Geo Maps) ⓘ

Location

Setting	Description
Location (for Geo Maps)	<p>If you want to use <a href="#">Geo Maps</a><sup>2731</sup>, enter a location in the first line. Geographical maps then display objects like devices or groups with a status icon using a color code similar to the <a href="#">sensor status icons</a><sup>181</sup> (green–yellow–orange–red). You can enter a full postal address, city and country only, or latitude and longitude. It is possible to enter any text before, between, and after the coordinates, as PRTG automatically parses latitude and longitude, for example, enter <a href="#">49.452778 11.077778</a>, or <a href="#">enter 49.452778 any 11.077778 text</a>.</p> <p>A minus sign (-) in the first line hides an object from a geographical map. In this case, you can enter location information in line two and following.</p> <p>You can define a specific label for each location. Enter a string denoting the label in the first line and provide the coordinates in the second line. This geographical marker then shows the object with the label in the geographical map.</p> <p>ⓘ The preview map always has a road map layout regardless of the map layout you set in <a href="#">User Interface</a><sup>2859</sup>.</p>

## Credentials for Windows Systems

ⓘ The settings you define in this section apply to the following sensors:

Credentials for Windows Systems

Setting	Description
Domain or Computer Name	<p>Enter the domain or computer name of the user account with which you want to access the Windows system. PRTG uses this account for Windows Management Instrumentation (WMI) sensors and other Windows sensors.</p> <p>If you want to use a Windows local user account on the target device, enter the computer name. If you want to use a Windows domain user account (recommended), enter the domain name. PRTG automatically adds a prefix to use the NT LAN Manager (NTLM) protocol if you do not explicitly define it. Do not leave this field empty.</p>
User Name	<p>Enter the user name for access to the Windows system. Usually, you use credentials with administrator rights.</p>
Password	<p>Enter the password for access to the Windows system. Usually, you use credentials with administrator rights.</p>

### Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems

ⓘ The settings you define in this section apply to the following sensors:

- [SFTP Secure File Transfer Protocol](#)
- [SSH Disk Free](#)

- [SSH INodes Free](#)
- [SSH Load Average](#)
- [SSH Meminfo](#)
- [SSH Remote Ping](#)
- [SSH SAN Enclosure](#)
- [SSH SAN Logical Disk](#)
- [SSH SAN Physical Disk](#)
- [SSH SAN System Health](#)
- [SSH Script](#)
- [SSH Script Advanced](#)
- [VMware Host Hardware \(WBEM\)](#)

SSH Connection Mode ⓘ

- Default
- Compatibility mode (deprecated)

Credentials for Linux/Solaris/macOS (SSH/WBEM) Systems

Setting	Description
User Name	Enter the user name for access to the Linux/Solaris/macOS system via Secure Shell (SSH) and Web-based Enterprise Management (WBEM). Usually, you use credentials with administrator rights.
Authentication Method	<p>Select the authentication method for the login:</p> <ul style="list-style-type: none"> <li>▪ Password: Provide the password for the login.</li> <li>▪ Private key: Provide an RSA private key for authentication.</li> </ul> <p> PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.</p> <p> PRTG only supports RSA keys. It does not support DSA keys.</p> <p> For more information, see section <a href="#">Monitoring via SSH</a><sup>[3007]</sup>.</p>
Password	<p>This setting is only visible if you select Password above.</p> <p>Enter a password for access to the Linux/Solaris/macOS system via SSH and WBEM. Usually, you use credentials with administrator rights.</p>
Private Key	<p>This setting is only visible if you select Private key above.</p> <p>Paste the entire RSA private key, including the <b>BEGIN</b> and <b>END</b> lines. Make sure that a corresponding public key exists on the target device.</p> <p> PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.</p> <p> PRTG only supports RSA keys. It does not support DSA keys.</p> <p> For more information, see section <a href="#">Monitoring via SSH</a><sup>[3007]</sup>.</p> <p> If you do not insert a private key for the first time but if you want to <a href="#">change</a> the private key, you need to <a href="#">restart the PRTG core server service</a><sup>[2919]</sup> for the private key change to take effect.</p>
WBEM Protocol	<p>Select the protocol that you want to use for the connection to the system via WBEM:</p> <ul style="list-style-type: none"> <li>▪ HTTP: Use an unsecure connection for WBEM.</li> <li>▪ HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection for WBEM.</li> </ul> <p> This setting is only relevant if you use WBEM sensors.</p>
WBEM Port	Select if you want to use one of the default ports for the connection to the system via WBEM or if you want to set a custom port:

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Default: Use one of the default ports. The default port for unsecure connections is <a href="#">5988</a> and the default port for secure connections is <a href="#">5989</a>.</li> <li>▪ Custom: Use a custom port.</li> </ul> <p> This setting is only relevant if you use WBEM sensors.</p>
Custom WBEM Port	<p>This setting is only visible if you select Custom above.</p> <p>Enter a custom WBEM port. Enter an integer.</p>
SSH Port	<p>Enter the port for SSH connections. Enter an integer. The default port is <a href="#">22</a>.</p> <p> By default, PRTG automatically uses this setting for all <a href="#">SSH sensors</a> unless you define a different port number in the sensor settings.</p>
SSH Rights Elevation	<p>Select the rights that you want to use to run the command on the target system:</p> <ul style="list-style-type: none"> <li>▪ Run the command as the connecting user (default): Use the rights of the user who establishes the SSH connection.</li> <li>▪ Run the command as a different user using 'sudo' (with password): Use the rights of a different user with a password required for <a href="#">sudo</a> to run commands on the target system, for example, as a root user.</li> <li>▪ Run the command as a different user using 'sudo' (without password): Use the rights of a different user without a password required for <a href="#">sudo</a> to run commands on the target system, for example, as a root user.</li> <li>▪ Run the command as a different user using 'su': Use the rights of a different user with <a href="#">su</a> to run commands on the target system.</li> </ul>
Target System User Name	<p>This setting is only visible if you select an option that includes <a href="#">sudo</a> or <a href="#">su</a> above.</p> <p>Enter a user name to run the specified command on the target system as a different user than the root user. If you leave this field empty, you run the command as a root user. Make sure that you set the Linux password even if you use a public key or a private key for authentication. This is not necessary if the user is allowed to run the command without a password.</p>
Password	<p>This setting is only visible if you select an option that includes <a href="#">sudo</a> or <a href="#">su</a> with password above.</p> <p>Enter the password to run the <a href="#">sudo</a> command or the <a href="#">su</a> command.</p>

Setting	Description
SSH Connection Mode	<p>Select the connection mode that you want to use to <a href="#">access data with SSH sensors</a> <small>6007</small>:</p> <ul style="list-style-type: none"> <li>▪ Default: This is the default connection mode for SSH sensors. It provides the best performance and security.</li> <li>▪ Compatibility mode (deprecated): Use this only if the default connection mode does not work on the target system. The compatibility mode is the connection mode that PRTG used in previous versions and it is deprecated.</li> </ul> <p><b>i</b> We strongly recommend that you use the default connection mode.</p> <p><b>i</b> You can also individually select the connection mode for each SSH sensor in the sensor settings.</p>

### Credentials for VMware/XenServer

**i** The settings you define in this section apply to the following sensors:

- [Citrix XenServer Host](#)
- [Citrix XenServer Virtual Machine](#)
- [VMware Datastore \(SOAP\)](#)
- [VMware Host Hardware \(WBEM\)](#)
- [VMware Host Hardware Status \(SOAP\)](#)
- [VMware Host Performance \(SOAP\)](#)
- [VMware Virtual Machine \(SOAP\)](#)

## Credentials for VMware/XenServer

User Name i

johnqpublic

Password i

.....

VMware Protocol i

- HTTPS (default)  
 HTTP

Session Handling i

- Reuse a session for multiple scans (default)  
 Create a new session for each scan

Credentials for VMware/XenServer

Setting	Description
User Name	Enter the user name for access to VMware ESXi, vCenter Server, or Citrix XenServer. Usually, you use credentials with administrator rights.
Password	Enter the password for access to VMware ESXi, vCenter Server, or Citrix XenServer. Usually, you use credentials with administrator rights.  <span>i</span> Single sign-on (SSO) passwords for vSphere do not support special characters. For more information, see the VMware sensors sections.
VMware Protocol	Select the protocol for the connection to VMware ESXi, vCenter Server, or Citrix XenServer: <ul style="list-style-type: none"> <li>▪ HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection.</li> <li>▪ HTTP: Use an unsecure connection.</li> </ul>

Setting	Description
Session Handling	<p>Select if you want to reuse a session for VMware sensors:</p> <ul style="list-style-type: none"> <li>▪ Reuse a session for multiple scans (default): Select this option if you want a VMware sensor to reuse a single session for multiple sensor scans to query data. With this option, the sensor does not need to log in and out for each sensor scan. We recommend that you use this option because it reduces network load and log entries on the target device. This can increase performance.</li> <li>▪ Create a new session for each scan: If you select this option, PRTG does not reuse a session and a VMware sensor has to log in and out for each sensor scan. This can decrease performance.</li> </ul>

## Credentials for SNMP Devices

**i** The settings you define in this section apply to the following sensors:

<ul style="list-style-type: none"> <li>▪ <a href="#">Cisco IP SLA</a></li> <li>▪ <a href="#">SNMP APC Hardware</a></li> <li>▪ <a href="#">SNMP Buffalo TS System Health</a></li> <li>▪ <a href="#">SNMP Cisco ADSL</a></li> <li>▪ <a href="#">SNMP Cisco ASA VPN Connections</a></li> <li>▪ <a href="#">SNMP Cisco ASA VPN Traffic</a></li> <li>▪ <a href="#">SNMP Cisco ASA VPN Users</a></li> <li>▪ <a href="#">SNMP Cisco CBQoS</a></li> <li>▪ <a href="#">SNMP Cisco System Health</a></li> <li>▪ <a href="#">SNMP Cisco UCS Blade</a></li> <li>▪ <a href="#">SNMP Cisco UCS Chassis</a></li> <li>▪ <a href="#">SNMP Cisco UCS Physical Disk</a></li> <li>▪ <a href="#">SNMP Cisco UCS System Health</a></li> <li>▪ <a href="#">SNMP CPU Load</a></li> <li>▪ <a href="#">SNMP Custom</a></li> <li>▪ <a href="#">SNMP Custom Advanced</a></li> <li>▪ <a href="#">SNMP Custom String</a></li> </ul>	<ul style="list-style-type: none"> <li>▪ <a href="#">SNMP Fujitsu System Health v2</a></li> <li>▪ <a href="#">SNMP Hardware Status</a></li> <li>▪ <a href="#">SNMP HP LaserJet Hardware</a></li> <li>▪ <a href="#">SNMP HPE BladeSystem Blade</a></li> <li>▪ <a href="#">SNMP HPE BladeSystem Enclosure Health</a></li> <li>▪ <a href="#">SNMP HPE ProLiant Logical Disk</a></li> <li>▪ <a href="#">SNMP HPE ProLiant Memory Controller</a></li> <li>▪ <a href="#">SNMP HPE ProLiant Network Interface</a></li> <li>▪ <a href="#">SNMP HPE ProLiant Physical Disk</a></li> <li>▪ <a href="#">SNMP HPE ProLiant System Health</a></li> <li>▪ <a href="#">SNMP IBM System X Logical Disk</a></li> <li>▪ <a href="#">SNMP IBM System X Physical Disk</a></li> <li>▪ <a href="#">SNMP IBM System X Physical Memory</a></li> </ul>	<ul style="list-style-type: none"> <li>▪ <a href="#">SNMP NetApp Enclosure</a></li> <li>▪ <a href="#">SNMP NetApp I/O</a></li> <li>▪ <a href="#">SNMP NetApp License</a></li> <li>▪ <a href="#">SNMP NetApp Logical Unit</a></li> <li>▪ <a href="#">SNMP NetApp Network Interface</a></li> <li>▪ <a href="#">SNMP NetApp System Health</a></li> <li>▪ <a href="#">SNMP Nutanix Cluster Health</a></li> <li>▪ <a href="#">SNMP Nutanix Hypervisor</a></li> <li>▪ <a href="#">SNMP Poseidon Environment</a></li> <li>▪ <a href="#">SNMP Printer</a></li> <li>▪ <a href="#">SNMP QNAP Logical Disk</a></li> <li>▪ <a href="#">SNMP QNAP Physical Disk</a></li> <li>▪ <a href="#">SNMP QNAP System Health</a></li> <li>▪ <a href="#">SNMP Rittal CMC III Hardware Status</a></li> <li>▪ <a href="#">SNMP RMON</a></li> <li>▪ <a href="#">SNMP SonicWall System Health</a></li> <li>▪ <a href="#">SNMP SonicWall VPN Traffic</a></li> <li>▪ <a href="#">SNMP Synology Logical Disk</a></li> </ul>

### SNMP Port i

161

### Timeout (Sec.) i

5

Credentials for SNMP Devices

Setting	Description
SNMP Version	<p>Select the Simple Network Management Protocol (SNMP) version for the connection to the target SNMP device:</p> <ul style="list-style-type: none"> <li>▪ <b>SNMP v1:</b> Use SNMP v1 for the connection. SNMP v1 only offers clear-text data transmission. <ul style="list-style-type: none"> <li><span style="color: red;">i</span> SNMP v1 does not support 64-bit counters. This might result in invalid data when you monitor traffic via SNMP.</li> </ul> </li> <li>▪ <b>SNMP v2c (default):</b> Use SNMP v2c for the connection. SNMP v2c also only offers clear-text data transmission but it supports 64-bit counters.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ SNMP v3: Use SNMP v3 for the connection. SNMP v3 provides secure authentication and data encryption.</li> <li>ⓘ SNMP v3 has performance limitations because of the use of encryption. The main limiting factor is CPU power. Also keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3. If you see an increase in <a href="#">Interval Delay</a> or <a href="#">Open Requests</a> with the <a href="#">Probe Health</a> sensor, distribute the load over <a href="#">multiple probes</a><sup>[6198]</sup>. SNMP v1 and SNMP v2c do not have this limitation.</li> </ul>
Community String	<p><a href="#">This setting is only visible if you select SNMP v1 or SNMP v2c (default) above.</a></p> <p>Enter the community string of your device. This is like a clear-text password for simple authentication.</p> <p>ⓘ We recommend that you use the default value.</p>
Authentication Method	<p><a href="#">This setting is only visible if you select SNMP v3 above.</a></p> <p>Select the authentication method:</p> <ul style="list-style-type: none"> <li>▪ MD5 (default): Use message-digest algorithm 5 (MD5) for authentication.</li> <li>▪ SHA: Use Secure Hash Algorithm (SHA) for authentication.</li> <li>▪ SHA-224: Use SHA-224 for authentication.</li> <li>▪ SHA-256: Use SHA-256 for authentication.</li> <li>▪ SHA-384: Use SHA-384 for authentication.</li> <li>▪ SHA-512: Use SHA-512 for authentication.</li> </ul> <p>ⓘ If you do not want to use authentication but you need SNMP v3, for example, because your device requires <a href="#">context</a>, you can leave the Password field empty. In this case, PRTG uses <a href="#">SNMP_SEC_LEVEL_NOAUTH</a> and it entirely deactivates authentication.</p> <p>ⓘ The authentication method that you select must match the authentication method of your device.</p>
User Name	<p><a href="#">This setting is only visible if you select SNMP v3 above.</a></p> <p>Enter the user name for access to the target SNMP device.</p> <p>ⓘ The user name that you enter must match the user name of your device.</p>

Setting	Description
Password	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Enter the password for access to the target SNMP device.</p> <p><b>i</b> The password that you enter must match the password of your device.</p>
Encryption Type	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Select an encryption type:</p> <ul style="list-style-type: none"> <li>▪ DES (default): Use Data Encryption Standard (DES) as the encryption algorithm.</li> <li>▪ AES: Use Advanced Encryption Standard (AES) as the encryption algorithm.</li> <li>▪ AES-192: Use AES-192 as the encryption algorithm.</li> <li>▪ AES-256: Use AES-256 as the encryption algorithm.</li> </ul> <p><b>i</b> The encryption type that you select must match the encryption type of your device.</p>
Encryption Key	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Enter an encryption key. If you provide a key, PRTG encrypts SNMP data packets with the encryption algorithm that you selected above. Enter a string or leave the field empty.</p> <p><b>i</b> The encryption key that you enter must match the encryption key of your device. If the encryption keys do not match, you do not get an error message.</p>
Context Name	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Enter a context name only if the configuration of the device requires it. <b>Context</b> is a collection of management information that is accessible by an SNMP device. Enter a string.</p>
SNMP Port	<p>Enter the port for the connection to the SNMP target device. Enter an integer. The default port is <b>161</b>.</p> <p><b>i</b> We recommend that you use the default value.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer. The maximum timeout value is <b>300</b> seconds (5 minutes).</p>

## Credentials for Database Management Systems

**Placeholder 1** **i**

Credentials for Script Sensors

Setting	Description
Placeholder 1 Description	Enter a description for Placeholder 1, for example information about the purpose or content of the placeholder.
Placeholder 1	Enter a value for the placeholder. PRTG inserts the value for the script execution if you add <code>%scriptplaceholder1</code> in the argument list. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 2 Description	Enter a description for Placeholder 2, for example information about the purpose or content of the placeholder.
Placeholder 2	Enter a value for the placeholder. PRTG inserts the value for the script execution if you add <code>%scriptplaceholder2</code> in the argument list. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 3 Description	Enter a description for Placeholder 3, for example information about the purpose or content of the placeholder.
Placeholder 3	Enter a value for the placeholder. PRTG inserts the value for the script execution if you add <code>%scriptplaceholder3</code> in the argument list. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 4 Description	Enter a description for Placeholder 4, for example information about the purpose or content of the placeholder.
Placeholder 4	Enter a value for the placeholder. PRTG inserts the value for the script execution if you add <code>%scriptplaceholder4</code> in the argument list. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 5 Description	Enter a description for Placeholder 5, for example information about the purpose or content of the placeholder.
Placeholder 5	Enter a value for the placeholder. PRTG inserts the value for the script execution if you add <code>%scriptplaceholder5</code> in the argument list. PRTG does not display the value in the sensor log or the sensor's settings.

## Windows Compatibility Options

If you experience problems when you monitor via Windows sensors, use the following compatibility options for troubleshooting.

## Windows Compatibility Options

### Preferred Data Source <sup>i</sup>

- Performance counters and WMI as fallback
- Performance counters only
- WMI only (default)

### Timeout Method <sup>i</sup>

- Use 1.5× scanning interval (default)
- Set manually

Windows Compatibility Options

Setting	Description
Preferred Data Source	<p><sup>i</sup> This setting only applies to hybrid sensors that use both performance counters and Windows Management Instrumentation (WMI).</p> <p>Define the method that Windows sensors use to query data:</p> <ul style="list-style-type: none"> <li>▪ Performance counters and WMI as fallback: Try to query data via performance counters. If this is not possible, establish a connection via WMI.</li> <li>▪ Performance counters only: Query data via performance counters only. If this is not possible, the sensor returns no data.</li> <li>▪ WMI only (default): Query data via WMI only. If this is not possible, the sensor returns no data.</li> </ul>
Timeout Method	<p>Select the time that the sensor waits for the return of the WMI query before the sensor cancels the query and shows an error message:</p> <ul style="list-style-type: none"> <li>▪ Use 1.5× scanning interval (default): Multiply the scanning interval of the sensor by 1.5 and use the resulting value.</li> <li>▪ Set manually: Manually enter a timeout value.</li> </ul> <p><sup>i</sup> We recommend that you use the default value.</p> <p><sup>i</sup> If you experience ongoing timeout errors, try increasing the timeout value.</p>
Timeout (Sec.)	<p>This setting is only visible if you select <a href="#">Set manually</a> above.</p>

Setting	Description
	Enter the time the sensor waits for the return of its WMI query before it cancels it and shows an error message. Enter an integer. The maximum timeout value is <b>900</b> seconds (15 minutes).

## SNMP Compatibility Options

If you experience problems when you monitor via Simple Network Management Protocol (SNMP) sensors, use the following compatibility options for troubleshooting.

## SNMP Compatibility Options

### SNMP Delay (ms)

0

### Failed Requests

- Retry (default)
- Do not retry

### Overflow Values

- Ignore (default)
- Handle overflow values as valid results

### Zero Values

- Ignore (default)
- Handle zero values as valid results for delta sensors

### 32-bit/64-bit Counters

- Use 64-bit counters if available (default)
- Use 32-bit counters only

### Request Mode

- Use multi get (default)
- Use single get

### Walk Mode

- Use GETBULK requests (default)
- Use GETNEXT requests

### Port Name Template

Setting	Description
SNMP Delay (ms)	<p>Enter the time in milliseconds (ms) that PRTG waits between two SNMP requests. You can define a delay between 0 and 100. Enter an integer.</p> <ul style="list-style-type: none"> <li><b>i</b> We recommend that you use the default value.</li> <li><b>i</b> If you experience SNMP connection failures, try increasing the delay.</li> </ul>
Failed Requests	<p>Select if an SNMP sensor tries again after a request fails:</p> <ul style="list-style-type: none"> <li>▪ <b>Retry (default):</b> Try again if an SNMP request fails. This can prevent false error messages because of temporary timeout failures.</li> <li>▪ <b>Do not retry:</b> Do not retry if an SNMP request fails. If you select this option, an SNMP sensor shows a Down status earlier.</li> </ul>
Overflow Values	<p>Select how PRTG handles overflow values. Some devices do not correctly handle internal buffer overflows. This can cause false peaks. PRTG can handle overflow values in two ways:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore (default):</b> Ignore overflow values and do not include them in the monitoring data. We recommend that you use this option.</li> <li>▪ <b>Handle overflow values as valid results:</b> Regard all overflow values as regular data and include them in the monitoring data.</li> </ul> <p><b>i</b> If you experience problems because of strange peaks in your data graphs, change this option. Peaks might indicate that the target device resets counters without an overflow. PRTG interprets such behavior as overflow that results in data peaks. Select the option Ignore (default) in this case. For more information, see the Knowledge Base: <a href="#">What is the Overflow Values setting in the SNMP Compatibility Options?</a></p>
Zero Values	<p>Select how PRTG handles zero values. Some devices send incorrect zero values. This can cause false peaks. PRTG can handle zero values in two ways:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore (default):</b> Ignore zero values and do not include them in the monitoring data. We recommend that you use this option.</li> </ul> <p><b>i</b> If you experience problems, try changing this option.</p> <ul style="list-style-type: none"> <li>▪ <b>Handle zero values as valid results for delta sensors:</b> Regard all zero values as regular data and include them in the monitoring data.</li> </ul>
32-bit/64-bit Counters	<p>Select the type of traffic counters that PRTG searches for on a device:</p> <ul style="list-style-type: none"> <li>▪ <b>Use 64-bit counters if available (default):</b> The interface scan uses 64-bit traffic counters, if available. This can avoid buffer overflows in the devices.</li> </ul> <p><b>i</b> We recommend that you use the default value.</p> <p><b>i</b> If you experience problems, try changing this option.</p>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Use 32-bit counters only: The interface scan always uses 32-bit traffic counters, even if 64-bit counters are available. This can make monitoring more reliable for some devices.</li> </ul>
Request Mode	<p>Select the request method that PRTG uses for SNMP sensors:</p> <ul style="list-style-type: none"> <li>▪ Use multi get (default): Bundle multiple SNMP requests into one request. We recommend that you use this option.</li> </ul> <p><b>i</b> If you experience problems, try changing this option.</p> <ul style="list-style-type: none"> <li>▪ Use single get: Use one request for each SNMP value. This can increase compatibility with older devices.</li> </ul> <p><b>i</b> PRTG uses <a href="#">paging</a> for SNMP requests. This means that if a sensor must query more than 20 object identifiers (OID), it automatically polls the OIDs in packages of 20 OIDs each.</p>
Walk Mode	<p>Select the kind of SNMP walk that PRTG uses for SNMP sensors:</p> <ul style="list-style-type: none"> <li>▪ Use GETBULK requests (default): Request the next <b>x</b> OIDs in one SNMP request. The default value is <b>10</b>. It is dynamic based on the response size.</li> </ul> <p><b>i</b> This option only works with devices that support SNMP as of version v2c. Make sure that you set the correct SNMP Version in the Credentials for SNMP Devices settings of the parent device or inherit it from objects that are higher in the <a href="#">object hierarchy</a> <sup>[132]</sup>.</p> <ul style="list-style-type: none"> <li>▪ Use GETNEXT requests: Request one OID at a time. This can increase compatibility with older devices or with devices that have insufficient SNMP BULKWALK support.</li> </ul>
Port Name Template	<p>Select how PRTG displays the name of SNMP sensors. Enter a template that uses several variables. When you add new sensors, PRTG scans the interface for available counters at certain OIDs. At each OID, several fields with interface descriptions are usually available. They are different for every device and OID. PRTG uses the information in these fields to name the sensors. If a field is empty or if it is not available, PRTG adds an empty string to the name. By default, the port name template is <a href="#">([port]) [ifalias] [ifsensor]</a>, which creates a name like <b>(001) Ethernet1 Traffic</b>. You can use and combine any field names that are available at an OID of your device, for example:</p> <ul style="list-style-type: none"> <li>▪ [port]: The port number of the monitored interface.</li> <li>▪ [ifalias]: The 'alias' name for the monitored interface as specified by a network manager, providing a non-volatile handling.</li> <li>▪ [ifname]: The textual name of the monitored interface as assigned by the local device.</li> <li>▪ [ifdescr]: A textual string containing information about the target device or interface, for example, manufacturer, product name, or version.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ [ifspeed]: An estimate of the monitored interface's current bandwidth (Kbit/s).</li> <li>▪ [ifsensor]: The type of the sensor, this is <a href="#">Traffic</a> or <a href="#">RMON</a>. This helps to differentiate between <a href="#">SNMP Traffic</a> and <a href="#">SNMP RMON</a> sensors.</li> </ul> <p> For more information about SNMP sensor names, see the Knowledge Base: <a href="#">How can I change the defaults for names automatically generated for new SNMP sensors?</a></p>
Port Name Update	<p>Select how PRTG reacts if you change the names of ports in your physical device (for example, a switch or router):</p> <ul style="list-style-type: none"> <li>▪ Keep port names (use this if you edit the names in PRTG) (default): Do not automatically adjust sensor names. This is the best option if you want to manually change names in PRTG.</li> <li>▪ Automatically update sensor names if port names change in the device: If PRTG detects port name changes in your physical device, it tries to automatically adjust the sensor names accordingly.</li> </ul> <p> For more information about automatic name updates, see the Knowledge Base: <a href="#">Automatically update port name and number for SNMP Traffic sensors when the device changes them.</a></p>
Port Identification	<p>Select the field that PRTG uses for SNMP interface identification:</p> <ul style="list-style-type: none"> <li>▪ Automatic identification (default): Try the ifAlias field first to identify an SNMP interface and then try ifDescr. <ul style="list-style-type: none"> <li> PRTG does not automatically try ifName.</li> </ul> </li> <li>▪ Use IfAlias: For most devices, ifAlias is the best field to use for unique interface names.</li> <li>▪ Use IfDescr: Use this option if the port order of your device changes after a restart, and if no ifAlias field is available. For example, this is the best option for Cisco ASA devices. <ul style="list-style-type: none"> <li> If you use this option, it is important that your device returns unique interface names in the ifDescr field.</li> </ul> </li> <li>▪ Use IfName: You can also use this option if no unique ifAlias is available. <ul style="list-style-type: none"> <li> If you use this option, it is important that your device returns unique interface names in the ifName field.</li> </ul> </li> <li>▪ Do not update ports: Use this option to disable the automatic port identification.</li> </ul>
Start Interface Index	<p> This setting only applies to <a href="#">SNMP Traffic sensors</a> and to <a href="#">Cisco IP SLA sensors</a>.</p> <p>Enter the index at which PRTG starts to query the interface range during sensor creation. Enter <b>0</b> for the automatic mode.</p>

Setting	Description
	<p><b>i</b> We recommend that you use the default value.</p>
End Interface Index	<p><b>i</b> This setting only applies to <a href="#">SNMP Traffic sensors</a> and to <a href="#">Cisco IP SLA sensors</a>.</p> <p>Enter the index at which PRTG stops querying the interface range during sensor creation. Enter <b>0</b> for the automatic mode.</p> <p><b>i</b> We recommend that you use the default value.</p>

## Proxy Settings

**i** The settings you define in this section apply to the following sensors:

<ul style="list-style-type: none"> <li>▪ <a href="#">AWS Alarm v2</a></li> <li>▪ <a href="#">AWS Cost</a></li> <li>▪ <a href="#">AWS EBS v2</a></li> <li>▪ <a href="#">AWS EC2 v2</a></li> <li>▪ <a href="#">AWS ELB v2</a></li> <li>▪ <a href="#">AWS RDS v2</a></li> <li>▪ <a href="#">Cisco Meraki License</a></li> <li>▪ <a href="#">Cisco Meraki Network Health</a></li> <li>▪ <a href="#">Cloud HTTP v2</a></li> <li>▪ <a href="#">Cloud Ping v2</a></li> <li>▪ <a href="#">Dell EMC Unity Enclosure Health v2</a></li> <li>▪ <a href="#">Dell EMC Unity File System v2</a></li> <li>▪ <a href="#">Dell EMC Unity Storage Capacity v2</a></li> <li>▪ <a href="#">Dell EMC Unity Storage LUN v2</a></li> <li>▪ <a href="#">Dell EMC Unity Storage Pool v2</a></li> <li>▪ <a href="#">Dell EMC Unity VMware Datastore v2</a></li> <li>▪ <a href="#">FortiGate System Statistics</a></li> </ul>	<ul style="list-style-type: none"> <li>▪ <a href="#">HPE 3PAR Common Provisioning Group</a></li> <li>▪ <a href="#">HPE 3PAR Drive Enclosure</a></li> <li>▪ <a href="#">HPE 3PAR Virtual Volume</a></li> <li>▪ <a href="#">HTTP</a></li> <li>▪ <a href="#">HTTP v2</a></li> <li>▪ <a href="#">HTTP Advanced</a></li> <li>▪ <a href="#">HTTP Apache ModStatus PerfStats</a></li> <li>▪ <a href="#">HTTP Apache ModStatus Totals</a></li> <li>▪ <a href="#">HTTP Content</a></li> <li>▪ <a href="#">HTTP Data Advanced</a></li> <li>▪ <a href="#">HTTP Transaction</a></li> <li>▪ <a href="#">Microsoft 365 Mailbox</a></li> <li>▪ <a href="#">Microsoft 365 Service Status</a></li> <li>▪ <a href="#">Microsoft 365 Service Status Advanced</a></li> <li>▪ <a href="#">Microsoft Azure SQL Database</a></li> <li>▪ <a href="#">Microsoft Azure Storage Account</a></li> <li>▪ <a href="#">Microsoft Azure Subscription Cost</a></li> </ul>	<ul style="list-style-type: none"> <li>▪ <a href="#">NetApp Aggregate v2</a></li> <li>▪ <a href="#">NetApp I/O v2</a></li> <li>▪ <a href="#">NetApp LIF v2</a></li> <li>▪ <a href="#">NetApp LUN v2</a></li> <li>▪ <a href="#">NetApp NIC v2</a></li> <li>▪ <a href="#">NetApp Physical Disk v2</a></li> <li>▪ <a href="#">NetApp SnapMirror v2</a></li> <li>▪ <a href="#">NetApp System Health v2</a></li> <li>▪ <a href="#">NetApp Volume v2</a></li> <li>▪ <a href="#">Redfish Power Supply</a></li> <li>▪ <a href="#">Redfish Virtual Disk</a></li> <li>▪ <a href="#">Redfish Power Supply</a></li> <li>▪ <a href="#">REST Custom</a></li> <li>▪ <a href="#">REST Custom v2</a></li> <li>▪ <a href="#">Soffico Orchestra Channel Health</a></li> <li>▪ <a href="#">Soffico Orchestra Scenario</a></li> <li>▪ <a href="#">Veeam Backup Job Status</a></li> <li>▪ <a href="#">Veeam Backup Job Status Advanced</a></li> <li>▪ <a href="#">Zoom Service Status</a></li> </ul>

- [FortiGate VPN Overview](#)
- [Microsoft Azure Virtual Machine](#)

The proxy settings determine how a sensor connects to a URL. You can enter data for an HTTP proxy server that sensors use when they connect via HTTP or HTTPS.

- ⓘ This setting only applies to sensors and how they monitor. For more information on how to change the proxy settings for the PRTG core server, see section [Core & Probes](#).
- ⓘ The [SSL Certificate](#) sensor and the [SSL Security Check](#) sensor do not support HTTP proxies but you can configure connections via SOCKS proxies in the sensors' settings:

## Proxy Settings

**IP Address/DNS Name** ⓘ

192.0.2.0

---

**Port** ⓘ

8080

---

**User Name** ⓘ

johnqpublic

---

**Password** ⓘ

.....

Proxy Settings

Setting	Description
IP Address/DNS Name	Enter the IP address or Domain Name System (DNS) name of the proxy server. If you leave this field empty, sensors do not use a proxy.  ⓘ PRTG currently supports only HTTP proxies.
Port	Enter the port number of the proxy. The default port is <b>8080</b> . Enter an integer.

Setting	Description
User Name	If the proxy requires authentication, enter the user name for the proxy login. Enter a string or leave the field empty.  Only basic authentication is available.
Password	If the proxy requires authentication, enter the password for the proxy login. Enter a string or leave the field empty.  Only basic authentication is available.

### Scanning Interval

#### Scanning Interval

**Scanning Interval** ⓘ

60 seconds

---

**If a Sensor Query Fails** ⓘ

Set sensor to warning status for 1 interval, then set to down status (default)

Scanning Interval

Setting	Description
Scanning Interval	Select a scanning interval from the dropdown list that determines the amount of time that the sensor waits between two scans: <ul style="list-style-type: none"> <li>▪ 30 seconds</li> <li>▪ 60 seconds</li> <li>▪ 5 minutes</li> <li>▪ 10 minutes</li> <li>▪ 15 minutes</li> <li>▪ 30 minutes</li> <li>▪ 1 hour</li> <li>▪ 4 hours</li> <li>▪ 6 hours</li> <li>▪ 12 hours</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ 24 hours</li> </ul> <p><b>i</b> You can change the available intervals in the <a href="#">system administration</a> <sup>[2870]</sup> of PRTG Network Monitor.</p>
<p>If a Sensor Scanning Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor scanning fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down <a href="#">status</a> <sup>[181]</sup>. This can avoid false alarms if the target device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status.</p> <p>The following options are available:</p> <ul style="list-style-type: none"> <li>▪ Set sensor to down status immediately: Set the sensor to the Down status immediately after the first request fails.</li> <li>▪ Set sensor to warning status for 1 interval, then set to down status (default): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status.</li> <li>▪ Set sensor to warning status for 2 intervals, then set to down status: Set the sensor to the Down status only after the third request fails.</li> <li>▪ Set sensor to warning status for 3 intervals, then set to down status: Set the sensor to the Down status only after the fourth request fails.</li> <li>▪ Set sensor to warning status for 4 intervals, then set to down status: Set the sensor to the Down status only after the fifth request fails.</li> <li>▪ Set sensor to warning status for 5 intervals, then set to down status: Set the sensor to the Down status only after the sixth request fails.</li> </ul> <p><b>i</b> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p><b>i</b> If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p> <p><b>i</b> If a channel uses <a href="#">lookup</a> <sup>[3181]</sup> values, the sensor immediately shows the Down status. None of the interval options apply.</p>

## Schedules, Dependencies, and Maintenance Window

### Schedules, Dependencies, and Maintenance Window

Schedules, dependencies, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all child objects and the inheritance cannot be disabled. Below you can set additional schedules, dependencies, or maintenance windows that will be used in parallel to any inherited setting.

#### Schedule ?

None

#### Maintenance Window ?

- Do not set up a one-time maintenance window (default)
- Set up a one-time maintenance window

Schedules, Dependencies, and Maintenance Window

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week:</p> <ul style="list-style-type: none"> <li>▪ None</li> <li>▪ Saturdays</li> <li>▪ Sundays</li> <li>▪ Weekdays</li> <li>▪ Weekdays Eight-To-Eight (08:00 - 20:00)</li> <li>▪ Weekdays Nights (17:00 - 09:00)</li> <li>▪ Weekdays Nights (20:00 - 08:00)</li> <li>▪ Weekdays Nine-To-Five (09:00 - 17:00)</li> <li>▪ Weekends</li> </ul> <p><span>?</span> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section <a href="#">Schedules</a> <small>2848</small>.</p>
Maintenance Window	<p>Select if you want to set up a one-time maintenance window:</p> <ul style="list-style-type: none"> <li>▪ Do not set up a one-time maintenance window (default): Do not set up a one-time maintenance window. Monitoring is always active.</li> <li>▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring for the selected object and all child objects. You can define a time span for the pause below.</li> </ul> <p><span>?</span> To close an active one-time maintenance window before the end date, select Do not set up a one-time maintenance window (default).</p>

Setting	Description
Maintenance Begins	<p><b>This setting is only visible if you select</b> Set up a one-time maintenance window <a href="#">above</a>.</p> <p>Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p><b>This setting is only visible if you select</b> Set up a one-time maintenance window <a href="#">above</a>.</p> <p>Use the date time picker to enter the end date and time of the one-time maintenance window.</p>

### Access Rights

## Access Rights

**User Group Access** ⓘ

<span style="font-size: 0.8em;">User Group</span>	<span style="font-size: 0.8em;">Rights</span>
PRTG Users Group	Full access

Revert children's access rights to inherited

Access Rights

Setting	Description
User Group Access	<p>Select the <a href="#">user groups</a> <sup>[2912]</sup> that have access to the object. You see a table with user groups and group access rights. The table contains all user groups in your setup. For each user group, you can choose from the following group access rights:</p> <ul style="list-style-type: none"> <li>▪ Inherited: Inherit the access rights settings of the parent object.</li> <li>▪ No access: Users in this user group cannot see or edit the object. The object neither shows up in lists nor in the device tree. <ul style="list-style-type: none"> <li>ⓘ There is one exception: If a user in this user group has access to a child object, the parent object is visible in the device tree but users in this user group cannot access it.</li> </ul> </li> <li>▪ Read access: Users in this group can see the object and view its monitoring results. They cannot edit any settings.</li> <li>▪ Write access: Users in this group can see the object, view its monitoring results, and edit its settings. They cannot edit its access rights settings.</li> <li>▪ Full access: Users in this group can see the object, view its monitoring results, edit its settings, and edit its access rights settings.</li> </ul> <p>To automatically set all child objects to inherit this object's access rights, select the Revert access rights of child objects to "inherited" option.</p> <p><span style="color: blue;">■</span> For more information on access rights, see section <a href="#">Access Rights Management</a> <sup>[145]</sup>.</p>

### Channel Unit Configuration

Channel Unit Configuration	
Channel Unit Types ⓘ	
Channel Type	Unit
Bytes (Bandwidth)	MB
	Mbit <span style="float: right;">v / second</span>
Bytes (Memory)	GB
Bytes (Disk)	GB
Bytes (File)	MB

Channel Unit Configuration

Setting	Description
Channel Unit Types	<p>For each type of channel, select the unit in which PRTG displays the data. If you define this setting on probe, group, or device level, you can inherit these settings to all sensors underneath. You can set units for the following channel types (if available):</p> <ul style="list-style-type: none"> <li>▪ Bandwidth</li> <li>▪ Memory</li> <li>▪ Disk</li> <li>▪ File</li> <li>▪ Custom</li> </ul> <p><b>i</b> Custom channel types are only available on sensor level.</p> <p><b>i</b> Which channel units are available depends on the sensor type and the available parameters. If no configurable channels are available, this field shows <a href="#">No configurable channels</a>.</p>

### Advanced Network Analysis

#### Advanced Network Analysis

**Unusual Detection** ⓘ

Enable (default)  
 Disable

**Similar Sensors Detection** ⓘ

## 7.5 Probe Settings

The following settings are available on the Settings tab of a probe.

- ❗ We recommend that you define as many settings as possible in the [root group settings](#) so that you can inherit them to all other objects in the [object hierarchy](#).
- ❗ This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

In this section:

**Priority** ⓘ

★ ★ ★ ☆ ☆

Basic Probe Settings

Setting	Description
Probe Name	Enter a name to identify the probe. By default, PRTG shows this name in the <a href="#">device tree</a> <sup>164</sup> , as well as in <a href="#">alarms</a> <sup>202</sup> , <a href="#">logs</a> <sup>210</sup> , <a href="#">notifications</a> <sup>2735</sup> , <a href="#">reports</a> <sup>2754</sup> , <a href="#">maps</a> <sup>2776</sup> , <a href="#">libraries</a> <sup>2738</sup> , and <a href="#">tickets</a> <sup>213</sup> .

Setting	Description
	<p> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({}). For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically <a href="#">inherited</a><sup>138</sup>.</p> <p> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (&lt;&gt;).</p> <p> For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>
Monitoring Status	<p>Select the monitoring status of the probe:</p> <ul style="list-style-type: none"> <li>Started (default): Monitor the probe.</li> <li>Paused: Pause monitoring for the probe. All sensors on all devices on the probe are in the Paused <a href="#">status</a><sup>227</sup> until you change this setting.</li> </ul>
Priority	<p>Select a <a href="#">priority</a><sup>224</sup> for the probe. This setting determines the position of the probe in lists. The highest priority is at the top of a list. You can choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)<sup>420</sup> if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)<sup>136</sup>.

## Location

Click  to interrupt the [inheritance](#)<sup>136</sup>.

### Location

inherit from

Location (for Geo Maps) ⓘ

Location

Setting	Description
Location (for Geo Maps)	<p>If you want to use <a href="#">Geo Maps</a><sup>[2731]</sup>, enter a location in the first line. Geographical maps then display objects like devices or groups with a status icon using a color code similar to the <a href="#">sensor status icons</a><sup>[181]</sup> (green–yellow–orange–red). You can enter a full postal address, city and country only, or latitude and longitude. It is possible to enter any text before, between, and after the coordinates, as PRTG automatically parses latitude and longitude, for example, enter <a href="#">49.452778 11.077778</a>, or <a href="#">enter 49.452778 any 11.077778 text</a>.</p> <p>A minus sign (-) in the first line hides an object from a geographical map. In this case, you can enter location information in line two and following.</p> <p>You can define a specific label for each location. Enter a string denoting the label in the first line and provide the coordinates in the second line. This geographical marker then shows the object with the label in the geographical map.</p> <p>ⓘ The preview map always has a road map layout regardless of the map layout you set in <a href="#">User Interface</a><sup>[2859]</sup>.</p>

Default

Compatibility mode (deprecated)

Setting	Description
User Name	Enter the user name for access to the Linux/Solaris/macOS system via Secure Shell (SSH) and Web-based Enterprise Management (WBEM). Usually, you use credentials with administrator rights.
Authentication Method	<p>Select the authentication method for the login:</p> <ul style="list-style-type: none"> <li>▪ Password (default): Provide the password for the login.</li> <li>▪ Private key: Provide an RSA private key for authentication.</li> </ul> <p> PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.</p> <p> PRTG only supports RSA keys. It does not support DSA keys.</p> <p> For more information, see section <a href="#">Monitoring via SSH</a><sup>[3007]</sup>.</p>
Password	<p>This setting is only visible if you select Password (default) above.</p> <p>Enter a password for access to the Linux/Solaris/macOS system via SSH and WBEM. Usually, you use credentials with administrator rights.</p>
Private Key	<p>This setting is only visible if you select Private key above.</p> <p>Paste the entire RSA private key, including the <b>BEGIN</b> and <b>END</b> lines. Make sure that a corresponding public key exists on the target device.</p> <p> PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.</p> <p> PRTG only supports RSA keys. It does not support DSA keys.</p> <p> For more information, see section <a href="#">Monitoring via SSH</a><sup>[3007]</sup>.</p> <p> If you do not insert a private key for the first time but if you want to <a href="#">change</a> the private key, you need to <a href="#">restart the PRTG core server service</a><sup>[2919]</sup> for the private key change to take effect.</p>
WBEM Protocol	<p>Select the protocol that you want to use for the connection to the system via WBEM:</p> <ul style="list-style-type: none"> <li>▪ HTTP: Use an unsecure connection for WBEM.</li> <li>▪ HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection for WBEM.</li> </ul> <p> This setting is only relevant if you use WBEM sensors.</p>
WBEM Port	Select if you want to use one of the default ports for the connection to the system via WBEM or if you want to set a custom port:

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Default: Use one of the default ports. The default port for unsecure connections is <a href="#">5988</a> and the default port for secure connections is <a href="#">5989</a>.</li> <li>▪ Custom: Use a custom port.</li> </ul> <p><b>i</b> This setting is only relevant if you use WBEM sensors.</p>
Custom WBEM Port	<p>This setting is only visible if you select Custom above.</p> <p>Enter a custom WBEM port. Enter an integer.</p>
SSH Port	<p>Enter the port for SSH connections. Enter an integer. The default port is <a href="#">22</a>.</p> <p><b>i</b> By default, PRTG automatically uses this setting for all <a href="#">SSH sensors</a> unless you define a different port number in the sensor settings.</p>
SSH Rights Elevation	<p>Select the rights that you want to use to run the command on the target system:</p> <ul style="list-style-type: none"> <li>▪ Run the command as the connecting user (default): Use the rights of the user who establishes the SSH connection.</li> <li>▪ Run the command as a different user using 'sudo' (with password): Use the rights of a different user with a password required for <a href="#">sudo</a> to run commands on the target system, for example, as a root user.</li> <li>▪ Run the command as a different user using 'sudo' (without password): Use the rights of a different user without a password required for <a href="#">sudo</a> to run commands on the target system, for example, as a root user.</li> <li>▪ Run the command as a different user using 'su': Use the rights of a different user with <a href="#">su</a> to run commands on the target system.</li> </ul>
Target System User Name	<p>This setting is only visible if you select an option that includes <a href="#">sudo</a> or <a href="#">su</a> above.</p> <p>Enter a user name to run the specified command on the target system as a different user than the root user. If you leave this field empty, you run the command as a root user. Make sure that you set the Linux password even if you use a public key or a private key for authentication. This is not necessary if the user is allowed to run the command without a password.</p>
Password	<p>This setting is only visible if you select an option that includes <a href="#">sudo</a> or <a href="#">su</a> with password above.</p> <p>Enter the password to run the <a href="#">sudo</a> command or the <a href="#">su</a> command.</p>

Setting	Description
SSH Connection Mode	<p>Select the connection mode that you want to use to <a href="#">access data with SSH sensors</a> <sup>6007</sup>.</p> <ul style="list-style-type: none"> <li>▪ Default: This is the default connection mode for SSH sensors. It provides the best performance and security.</li> <li>▪ Compatibility mode (deprecated): Use this only if the default connection mode does not work on the target system. The compatibility mode is the connection mode that PRTG used in previous versions and it is deprecated.</li> </ul> <p> We strongly recommend that you use the default connection mode.</p> <p> You can also individually select the connection mode for each SSH sensor in the sensor settings.</p>

## Credentials for VMware/XenServer

Click  to interrupt the [inheritance](#) <sup>136</sup>.

 The settings you define in this section apply to the following sensors:

Credentials for SNMP Devices

Setting	Description
SNMP Version	<p>Select the Simple Network Management Protocol (SNMP) version for the connection to the target SNMP device:</p> <ul style="list-style-type: none"> <li>SNMP v1: Use SNMP v1 for the connection. SNMP v1 only offers clear-text data transmission. <ul style="list-style-type: none"> <li>ⓘ SNMP v1 does not support 64-bit counters. This might result in invalid data when you monitor traffic via SNMP.</li> </ul> </li> <li>SNMP v2c (default): Use SNMP v2c for the connection. SNMP v2c also only offers clear-text data transmission but it supports 64-bit counters.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ SNMP v3: Use SNMP v3 for the connection. SNMP v3 provides secure authentication and data encryption.</li> <li>ⓘ SNMP v3 has performance limitations because of the use of encryption. The main limiting factor is CPU power. Also keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3. If you see an increase in <a href="#">Interval Delay</a> or <a href="#">Open Requests</a> with the <a href="#">Probe Health</a> sensor, distribute the load over <a href="#">multiple probes</a> <sup>[6198]</sup>. SNMP v1 and SNMP v2c do not have this limitation.</li> </ul>
Community String	<p><a href="#">This setting is only visible if you select SNMP v1 or SNMP v2c (default) above.</a></p> <p>Enter the community string of your device. This is like a clear-text password for simple authentication.</p> <p>ⓘ We recommend that you use the default value.</p>
Authentication Method	<p><a href="#">This setting is only visible if you select SNMP v3 above.</a></p> <p>Select the authentication method:</p> <ul style="list-style-type: none"> <li>▪ MD5 (default): Use message-digest algorithm 5 (MD5) for authentication.</li> <li>▪ SHA: Use Secure Hash Algorithm (SHA) for authentication.</li> <li>▪ SHA-224: Use SHA-224 for authentication.</li> <li>▪ SHA-256: Use SHA-256 for authentication.</li> <li>▪ SHA-384: Use SHA-384 for authentication.</li> <li>▪ SHA-512: Use SHA-512 for authentication.</li> </ul> <p>ⓘ If you do not want to use authentication but you need SNMP v3, for example, because your device requires <a href="#">context</a>, you can leave the Password field empty. In this case, PRTG uses <a href="#">SNMP_SEC_LEVEL_NOAUTH</a> and it entirely deactivates authentication.</p> <p>ⓘ The authentication method that you select must match the authentication method of your device.</p>
User Name	<p><a href="#">This setting is only visible if you select SNMP v3 above.</a></p> <p>Enter the user name for access to the target SNMP device.</p> <p>ⓘ The user name that you enter must match the user name of your device.</p>

Setting	Description
Password	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Enter the password for access to the target SNMP device.</p> <p> The password that you enter must match the password of your device.</p>
Encryption Type	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Select an encryption type:</p> <ul style="list-style-type: none"> <li>▪ DES (default): Use Data Encryption Standard (DES) as the encryption algorithm.</li> <li>▪ AES: Use Advanced Encryption Standard (AES) as the encryption algorithm.</li> <li>▪ AES-192: Use AES-192 as the encryption algorithm.</li> <li>▪ AES-256: Use AES-256 as the encryption algorithm.</li> </ul> <p> The encryption type that you select must match the encryption type of your device.</p>
Encryption Key	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Enter an encryption key. If you provide a key, PRTG encrypts SNMP data packets with the encryption algorithm that you selected above. Enter a string or leave the field empty.</p> <p> The encryption key that you enter must match the encryption key of your device. If the encryption keys do not match, you do not get an error message.</p>
Context Name	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Enter a context name only if the configuration of the device requires it. <b>Context</b> is a collection of management information that is accessible by an SNMP device. Enter a string.</p>
SNMP Port	<p>Enter the port for the connection to the SNMP target device. Enter an integer. The default port is <b>161</b>.</p> <p> We recommend that you use the default value.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer. The maximum timeout value is <b>300</b> seconds (5 minutes).</p>

Setting	Description
User Name	Enter the user name for access to the Veeam Backup Enterprise Manager.
Password	Enter the password for access to the Veeam Backup Enterprise Manager.
Port	Enter the port for the connection to the Veeam Backup Enterprise Manager. The default port for secure connections is <a href="#">9398</a> .

### Windows Compatibility Options

Click  to interrupt the [inheritance](#)<sup>136</sup>.

If you experience problems when you monitor via Windows sensors, use the following compatibility options for troubleshooting.

## Windows Compatibility Options

inherit from

### Preferred Data Source <sup>i</sup>

- Performance counters and WMI as fallback
- Performance counters only
- WMI only (default)

### Timeout Method <sup>i</sup>

- Use 1.5x scanning interval (default)
- Set manually

Windows Compatibility Options

Setting	Description
Preferred Data Source	<p><sup>i</sup> This setting only applies to hybrid sensors that use both performance counters and Windows Management Instrumentation (WMI).</p> <p>Define the method that Windows sensors use to query data:</p> <ul style="list-style-type: none"> <li>▪ Performance counters and WMI as fallback: Try to query data via performance counters. If this is not possible, establish a connection via WMI.</li> <li>▪ Performance counters only: Query data via performance counters only. If this is not possible, the sensor returns no data.</li> <li>▪ WMI only (default): Query data via WMI only. If this is not possible, the sensor returns no data.</li> </ul>
Timeout Method	<p>Select the time that the sensor waits for the return of the WMI query before the sensor cancels the query and shows an error message:</p> <ul style="list-style-type: none"> <li>▪ Use 1.5x scanning interval (default): Multiply the scanning interval of the sensor by 1.5 and use the resulting value.</li> <li>▪ Set manually: Manually enter a timeout value.</li> </ul> <p><sup>i</sup> We recommend that you use the default value.</p> <p><sup>i</sup> If you experience ongoing timeout errors, try increasing the timeout value.</p>

Setting	Description
Timeout (Sec.)	<p>This setting is only visible if you select <a href="#">Set manually</a> <a href="#">above</a>.</p> <p>Enter the time the sensor waits for the return of its WMI query before it cancels it and shows an error message. Enter an integer. The maximum timeout value is <b>900</b> seconds (15 minutes).</p>

## SNMP Compatibility Options

Click  to interrupt the [inheritance](#)<sup>136</sup>.

If you experience problems when you monitor via Simple Network Management Protocol (SNMP) sensors, use the following compatibility options for troubleshooting.

## SNMP Compatibility Options

inherit from

SNMP Delay (ms) <sup>i</sup>

0

---

Failed Requests <sup>i</sup>

Retry (default)

Do not retry

Overflow Values <sup>i</sup>

Ignore (default)

Handle overflow values as valid results

Zero Values <sup>i</sup>

Ignore (default)

Handle zero values as valid results for delta sensors

32-bit/64-bit Counters <sup>i</sup>

Use 64-bit counters if available (default)

Use 32-bit counters only

Request Mode <sup>i</sup>

Use multi get (default)

Use single get

Walk Mode <sup>i</sup>

Use GETBULK requests (default)

Use GETNEXT requests

Setting	Description
SNMP Delay (ms)	<p>Enter the time in milliseconds (ms) that PRTG waits between two SNMP requests. You can define a delay between 0 and 100. Enter an integer.</p> <ul style="list-style-type: none"> <li><span data-bbox="485 450 512 488">i</span> We recommend that you use the default value.</li> <li><span data-bbox="536 501 563 539">i</span> If you experience SNMP connection failures, try increasing the delay.</li> </ul>
Failed Requests	<p>Select if an SNMP sensor tries again after a request fails:</p> <ul style="list-style-type: none"> <li><span data-bbox="485 667 496 683">▪</span> <b>Retry (default):</b> Try again if an SNMP request fails. This can prevent false error messages because of temporary timeout failures.</li> <li><span data-bbox="485 757 496 772">▪</span> <b>Do not retry:</b> Do not retry if an SNMP request fails. If you select this option, an SNMP sensor shows a Down status earlier.</li> </ul>
Overflow Values	<p>Select how PRTG handles overflow values. Some devices do not correctly handle internal buffer overflows. This can cause false peaks. PRTG can handle overflow values in two ways:</p> <ul style="list-style-type: none"> <li><span data-bbox="485 981 496 996">▪</span> <b>Ignore (default):</b> Ignore overflow values and do not include them in the monitoring data. We recommend that you use this option.</li> <li><span data-bbox="485 1070 496 1086">▪</span> <b>Handle overflow values as valid results:</b> Regard all overflow values as regular data and include them in the monitoring data.</li> </ul> <p><span data-bbox="485 1144 512 1182">i</span> If you experience problems because of strange peaks in your data graphs, change this option. Peaks might indicate that the target device resets counters without an overflow. PRTG interprets such behavior as overflow that results in data peaks. Select the option Ignore (default) in this case. For more information, see the Knowledge Base: <a href="#">What is the Overflow Values setting in the SNMP Compatibility Options?</a></p>
Zero Values	<p>Select how PRTG handles zero values. Some devices send incorrect zero values. This can cause false peaks. PRTG can handle zero values in two ways:</p> <ul style="list-style-type: none"> <li><span data-bbox="485 1503 496 1518">▪</span> <b>Ignore (default):</b> Ignore zero values and do not include them in the monitoring data. We recommend that you use this option.</li> </ul> <p><span data-bbox="485 1585 512 1624">i</span> If you experience problems, try changing this option.</p> <ul style="list-style-type: none"> <li><span data-bbox="485 1637 496 1653">▪</span> <b>Handle zero values as valid results for delta sensors:</b> Regard all zero values as regular data and include them in the monitoring data.</li> </ul>
32-bit/64-bit Counters	<p>Select the type of traffic counters that PRTG searches for on a device:</p> <ul style="list-style-type: none"> <li><span data-bbox="485 1805 496 1821">▪</span> <b>Use 64-bit counters if available (default):</b> The interface scan uses 64-bit traffic counters, if available. This can avoid buffer overflows in the devices.</li> </ul> <p><span data-bbox="485 1910 512 1948">i</span> We recommend that you use the default value.</p> <p><span data-bbox="536 1962 563 2000">i</span> If you experience problems, try changing this option.</p>

Setting	Description
	<ul style="list-style-type: none"> <li>Use 32-bit counters only: The interface scan always uses 32-bit traffic counters, even if 64-bit counters are available. This can make monitoring more reliable for some devices.</li> </ul>
Request Mode	<p>Select the request method that PRTG uses for SNMP sensors:</p> <ul style="list-style-type: none"> <li>Use multi get (default): Bundle multiple SNMP requests into one request. We recommend that you use this option.</li> </ul> <p><b>i</b> If you experience problems, try changing this option.</p> <ul style="list-style-type: none"> <li>Use single get: Use one request for each SNMP value. This can increase compatibility with older devices.</li> </ul> <p><b>i</b> PRTG uses <a href="#">paging</a> for SNMP requests. This means that if a sensor must query more than 20 object identifiers (OID), it automatically polls the OIDs in packages of 20 OIDs each.</p>
Walk Mode	<p>Select the kind of SNMP walk that PRTG uses for SNMP sensors:</p> <ul style="list-style-type: none"> <li>Use GETBULK requests (default): Request the next <b>x</b> OIDs in one SNMP request. The default value is <b>10</b>. It is dynamic based on the response size.</li> </ul> <p><b>i</b> This option only works with devices that support SNMP as of version v2c. Make sure that you set the correct SNMP Version in the Credentials for SNMP Devices settings of the parent device or inherit it from objects that are higher in the <a href="#">object hierarchy</a><sup>132</sup>.</p> <ul style="list-style-type: none"> <li>Use GETNEXT requests: Request one OID at a time. This can increase compatibility with older devices or with devices that have insufficient SNMP BULKWALK support.</li> </ul>
Port Name Template	<p>Select how PRTG displays the name of SNMP sensors. Enter a template that uses several variables. When you add new sensors, PRTG scans the interface for available counters at certain OIDs. At each OID, several fields with interface descriptions are usually available. They are different for every device and OID. PRTG uses the information in these fields to name the sensors. If a field is empty or if it is not available, PRTG adds an empty string to the name. By default, the port name template is <b>([port]) [ifalias] [ifsensor]</b>, which creates a name like <b>(001) Ethernet1 Traffic</b>. You can use and combine any field names that are available at an OID of your device, for example:</p> <ul style="list-style-type: none"> <li>[port]: The port number of the monitored interface.</li> <li>[ifalias]: The 'alias' name for the monitored interface as specified by a network manager, providing a non-volatile handling.</li> <li>[ifname]: The textual name of the monitored interface as assigned by the local device.</li> <li>[ifdescr]: A textual string containing information about the target device or interface, for example, manufacturer, product name, or version.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ [ifspeed]: An estimate of the monitored interface's current bandwidth (Kbit/s).</li> <li>▪ [ifsensor]: The type of the sensor, this is <a href="#">Traffic</a> or <a href="#">RMON</a>. This helps to differentiate between <a href="#">SNMP Traffic</a> and <a href="#">SNMP RMON</a> sensors.</li> </ul> <p> For more information about SNMP sensor names, see the Knowledge Base: <a href="#">How can I change the defaults for names automatically generated for new SNMP sensors?</a></p>
Port Name Update	<p>Select how PRTG reacts if you change the names of ports in your physical device (for example, a switch or router):</p> <ul style="list-style-type: none"> <li>▪ Keep port names (use this if you edit the names in PRTG) (default): Do not automatically adjust sensor names. This is the best option if you want to manually change names in PRTG.</li> <li>▪ Automatically update sensor names if port names change in the device: If PRTG detects port name changes in your physical device, it tries to automatically adjust the sensor names accordingly.</li> </ul> <p> For more information about automatic name updates, see the Knowledge Base: <a href="#">Automatically update port name and number for SNMP Traffic sensors when the device changes them.</a></p>
Port Identification	<p>Select the field that PRTG uses for SNMP interface identification:</p> <ul style="list-style-type: none"> <li>▪ Automatic identification (default): Try the ifAlias field first to identify an SNMP interface and then try ifDescr. <ul style="list-style-type: none"> <li> PRTG does not automatically try ifName.</li> </ul> </li> <li>▪ Use IfAlias: For most devices, ifAlias is the best field to use for unique interface names.</li> <li>▪ Use IfDescr: Use this option if the port order of your device changes after a restart, and if no ifAlias field is available. For example, this is the best option for Cisco ASA devices. <ul style="list-style-type: none"> <li> If you use this option, it is important that your device returns unique interface names in the ifDescr field.</li> </ul> </li> <li>▪ Use IfName: You can also use this option if no unique ifAlias is available. <ul style="list-style-type: none"> <li> If you use this option, it is important that your device returns unique interface names in the ifName field.</li> </ul> </li> <li>▪ Do not update ports: Use this option to disable the automatic port identification.</li> </ul>
Start Interface Index	<p> This setting only applies to <a href="#">SNMP Traffic sensors</a> and to <a href="#">Cisco IP SLA sensors</a>.</p> <p>Enter the index at which PRTG starts to query the interface range during sensor creation. Enter <b>0</b> for the automatic mode.</p>

Setting	Description
	<p> We recommend that you use the default value.</p>
End Interface Index	<p> This setting only applies to <a href="#">SNMP Traffic sensors</a> and to <a href="#">Cisco IP SLA sensors</a>.</p> <p>Enter the index at which PRTG stops querying the interface range during sensor creation. Enter 0 for the automatic mode.</p> <p> We recommend that you use the default value.</p>

#### Scanning Interval

inherit from

**Scanning Interval** 

60 seconds ▼

---

**If a Sensor Query Fails** 

Set sensor to warning status for 1 interval, then set to down status (default) ▼

Scanning Interval

Setting	Description
Scanning Interval	Select a scanning interval from the dropdown list that determines the amount of time that the sensor waits between two scans: <ul style="list-style-type: none"> <li>▪ 30 seconds</li> <li>▪ 60 seconds</li> <li>▪ 5 minutes</li> <li>▪ 10 minutes</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ 15 minutes</li> <li>▪ 30 minutes</li> <li>▪ 1 hour</li> <li>▪ 4 hours</li> <li>▪ 6 hours</li> <li>▪ 12 hours</li> <li>▪ 24 hours</li> </ul> <p><b>i</b> You can change the available intervals in the <a href="#">system administration</a> [2870] of PRTG Network Monitor.</p>
<p>If a Sensor Scanning Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor scanning fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down <a href="#">status</a> [181]. This can avoid false alarms if the target device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status.</p> <p>The following options are available:</p> <ul style="list-style-type: none"> <li>▪ Set sensor to down status immediately: Set the sensor to the Down status immediately after the first request fails.</li> <li>▪ Set sensor to warning status for 1 interval, then set to down status (default): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status.</li> <li>▪ Set sensor to warning status for 2 intervals, then set to down status: Set the sensor to the Down status only after the third request fails.</li> <li>▪ Set sensor to warning status for 3 intervals, then set to down status: Set the sensor to the Down status only after the fourth request fails.</li> <li>▪ Set sensor to warning status for 4 intervals, then set to down status: Set the sensor to the Down status only after the fifth request fails.</li> <li>▪ Set sensor to warning status for 5 intervals, then set to down status: Set the sensor to the Down status only after the sixth request fails.</li> </ul> <p><b>i</b> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p><b>i</b> If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p>

Setting	Description
	<p><b>i</b> If a channel uses <a href="#">lookup</a> values, the sensor immediately shows the Down status. None of the interval options apply.</p>

### Cluster Monitoring Exclusion

Click  to interrupt the [inheritance](#).

Setting	Description
Exclude Cluster Nodes	<p>This setting is only visible if you have a <a href="#">failover cluster</a>.</p> <p>Sometimes you want to keep a cluster node from monitoring the sensors that run on this probe, group, or device, for example, if a device is not reachable from every cluster node. Select the cluster nodes that you do not want to include in sensor scans. By default, all objects underneath the probe <a href="#">inherit</a> this setting.</p>

### Schedules, Dependencies, and Maintenance Window

**i** You cannot interrupt the inheritance for schedules, dependencies, and maintenance windows. The corresponding settings from the parent objects are always active. However, you can define additional schedules, dependencies, and maintenance windows. They are active at the same time as the parent objects' settings.

## Schedules, Dependencies, and Maintenance Window

inherit from

Schedules, dependencies, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all child objects and the inheritance cannot be disabled. Below you can set additional schedules, dependencies, or maintenance windows that will be used in parallel to any inherited setting.

### Schedule ⓘ

 Select a sensor

Schedules, Dependencies, and Maintenance Window

Setting	Description
Schedule	<p>Select a schedule from the list. You can use schedules to monitor during a certain time span (days or hours) every week:</p> <ul style="list-style-type: none"> <li>▪ None</li> <li>▪ Saturdays</li> <li>▪ Sundays</li> <li>▪ Weekdays</li> <li>▪ Weekdays Eight-To-Eight (08:00 - 20:00)</li> <li>▪ Weekdays Nights (17:00 - 09:00)</li> <li>▪ Weekdays Nights (20:00 - 08:00)</li> <li>▪ Weekdays Nine-To-Five (09:00 - 17:00)</li> <li>▪ Weekends</li> </ul> <p><b>i</b> You can create schedules, edit schedules, or pause monitoring for a specific time span. For more information, see section <a href="#">Schedules</a> [2848].</p>
Maintenance Window	Select if you want to set up a one-time maintenance window:

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Do not set up a one-time maintenance window (default): Do not set up a one-time maintenance window. Monitoring is always active.</li> <li>▪ Set up a one-time maintenance window: Set up a one-time maintenance window and pause monitoring for the selected object and all child objects. You can define a time span for the pause below.</li> </ul> <p><b>i</b> To cancel an active maintenance window before the defined end date, change the time entry under Maintenance Ends to a date in the past.</p>
Maintenance Begins	<p><b>This setting is only visible if you select</b> Set up a one-time maintenance window <a href="#">above</a>.</p> <p>Use the date time picker to enter the start date and time of the one-time maintenance window.</p>
Maintenance Ends	<p><b>This setting is only visible if you select</b> Set up a one-time maintenance window <a href="#">above</a>.</p> <p>Use the date time picker to enter the end date and time of the one-time maintenance window.</p>
Dependency Type	<p>Select a dependency type. You can use dependencies to pause monitoring for an object depending on the status of a different object:</p> <ul style="list-style-type: none"> <li>▪ Use parent (default): Use the dependency type of the parent object.</li> <li>▪ Select a sensor: Use the dependency type of the parent object. Additionally, pause the current object if a specific sensor is in the Down status or in the Paused status because of another dependency.</li> </ul> <p><b>i</b> You do not trigger a status change by dependency if you manually pause a master sensor or if you pause it by schedule.</p> <p><b>i</b> To test your <a href="#">dependencies</a> , select Simulate Error Status from the context menu of an object that other objects depend on. A few seconds later, all dependent objects are paused. You can check all dependencies under Devices   Dependencies in the main menu bar.</p>
Dependency	<p><b>This setting is only visible if you select</b> Select a sensor <a href="#">above</a>.</p> <p>Click  and use the <a href="#">object selector</a>  to select a sensor on which the current object will depend.</p>
Dependency Delay (Sec.)	<p><b>This setting is only visible if you select</b> Select a sensor <a href="#">above</a>.</p> <p>Define a time span in seconds for the dependency delay.</p>

Setting	Description
	After the master sensor for this dependency returns to the Up status, PRTG additionally delays the monitoring of the dependent objects by the time span you define. This can prevent false alarms, for example, after a server restart or to give systems more time for all services to start. Enter an integer.

Enable (default)  
 Disable

Advanced Network Analysis

Setting	Description
Unusual Detection	<p>Select if you want to use the <a href="#">unusual detection</a> for sensors:</p> <ul style="list-style-type: none"> <li>▪ <b>Enable (default):</b> Activates the unusual detection for this object and, by default, for all objects underneath in the <a href="#">object hierarchy</a>. Sensors that are affected by this setting show the Unusual status if PRTG detects unusual activity.</li> <li>▪ <b>Disable:</b> Does not activate the unusual detection. PRTG ignores unusual values for sensors that are affected by this setting. These sensors do not show the Unusual status.</li> </ul> <p><b>i</b> You can configure the behavior of the unusual detection or completely disable it in the <a href="#">system settings</a>.</p>
Similar Sensors Detection	<p>Select if you want to activate the <a href="#">similar sensors</a> analysis:</p> <ul style="list-style-type: none"> <li>▪ <b>Enable (default):</b> Activates the similar sensors detection for this object and, by default, for all objects underneath in the object hierarchy. PRTG considers all sensors that are affected by this setting during the similarity analysis.</li> <li>▪ <b>Disable:</b> Does not activate the similar sensors detection. PRTG does not consider sensors that are affected by this setting during the similarity analysis.</li> </ul> <p><b>i</b> You can configure the depth of the analysis of the similar sensors detection or completely disable it in the <a href="#">system settings</a>.</p>
System Information	<p>Select if you want to retrieve and show <a href="#">system information</a> for your devices:</p> <ul style="list-style-type: none"> <li>▪ <b>Enable (default):</b> Activates the system information feature for this object and, by default, for all objects underneath in the hierarchy.</li> <li>▪ <b>Disable:</b> Does not activate the system information feature.</li> </ul> <p><b>i</b> The System Information feature is enabled by default. To retrieve the data, PRTG automatically uses the <a href="#">credentials for Windows systems</a> and the <a href="#">credentials for SNMP devices</a> that you entered in the device settings or that the device <a href="#">inherits</a> from a parent object like the root group. Consider this when you monitor devices that are outside of your local network, especially when you use <b>SNMP v1</b> or <b>SNMP v2c</b>, which do not provide encryption.</p> <p><b>☁</b> This setting is not available on the hosted probe of a PRTG Hosted Monitor instance.</p>

## Administrative Probe Settings

Define the IP address to use for outgoing monitoring requests.

- If more than one IP is available on the system, you can specify the IP address that PRTG uses for the outgoing monitoring requests of certain sensors.

- This setting is for sensors that use the following connection types: HTTP, Domain Name System (DNS), File Transfer Protocol (FTP), Internet Message Access Protocol (IMAP), Post Office Protocol version 3 (POP3), port, remote desktop, Simple Mail Transfer Protocol (SMTP), and Simple Network Management Protocol (SNMP).
  - The setting is valid for all monitoring requests that this probe sends.
  - This setting is useful for devices that expect a certain IP address when they are queried.
  - The default setting is auto. PRTG automatically selects an IP address.
- i** This feature does not support all sensors for technical reasons.
- i** If you change this setting, some sensors might stop working. For example, sensors might show the Down status if the selected IP address is blocked on the way to or directly on the target device.

## Administrative Probe Settings

**Outgoing IPv4** **i**

auto

192.0.2.0

192.0.2.1

192.0.2.3

**Outgoing IPv6** **i**

auto

2001:db8:3333:4444:5555:6666:7777:8888

2001:db8:3333:4444:CCCC:DDDD:EEEE:FFFF

2001:db8::1234:5678

Administrative Probe Settings

Setting	Description
Outgoing IPv4	Define the IP address for outgoing requests that use the IPv4 protocol. The list shows all available IP addresses on the system. Choose a specific IP address or select auto.
Outgoing IPv6	Define the IP address for outgoing requests that use the IPv6 protocol. The list shows all available IP addresses on the system. Choose a specific IP address or select auto.

Setting	Description
	<p> For more information, see section <a href="#">IPv6 Support</a><sup>[150]</sup>.</p>
Cluster Connectivity	<p>This setting is only visible if you have a <a href="#">failover cluster</a><sup>[128]</sup>.</p> <p>Define if the remote probe connects to all cluster nodes or only to the primary master node:</p> <ul style="list-style-type: none"> <li>▪ Remote probe sends data only to primary master node: The remote probe only connects to the primary master node. You are not able to review monitoring data on failover nodes. Consider this option if you have bandwidth limitations in your network or if the remote probe cannot access your failover nodes.</li> <li>▪ Remote probe sends data to all cluster nodes: The remote probe connects to all cluster nodes and sends monitoring data to the failover nodes in addition to the primary master node. The remote probe is visible on all of your cluster nodes as soon as it automatically connects to the correct IP addresses and ports of the failover nodes. If the primary master node fails, you can still see monitoring data of the remote probe.</li> </ul> <p> PRTG does not notify you if a remote probe is disconnected from a cluster node. Therefore, explicitly check on a cluster node if remote probes are connected (for example, via the device tree in the PRTG web interface on a cluster node).</p>

### Scheduled Restart Settings

 This setting is not available on the hosted probe of a PRTG Hosted Monitor instance.

## Scheduled Restart Settings

**Restart Options** 

- No scheduled system or service restart
- Scheduled restart of PRTG services
- Scheduled system restart (default)

Scheduled Restart Settings

Setting	Description
Restart Options	<p>Define if you want to schedule an automatic restart:</p> <ul style="list-style-type: none"> <li>▪ No scheduled system or service restart: Do not automatically perform a scheduled restart of services. We recommend that you manually restart the PRTG core server system every few weeks. You can initiate a restart of the PRTG probe service in the <a href="#">Administrative Tools</a> in the PRTG web interface.</li> <li>▪ Scheduled restart of PRTG services: Restart the PRTG probe service on the probe system. If you select this option on the local probe, the PRTG core server service restarts as well. Define a schedule under Restart Schedule.</li> <li>▪ Scheduled system restart (recommended): Define a schedule under Restart Schedule. We recommend that you restart probe systems once a month for best performance.</li> </ul>
Restart Schedule	<p>This setting is only visible if you select a schedule option above.</p> <p>Choose how often you want to restart the PRTG probe service or the probe system:</p> <ul style="list-style-type: none"> <li>▪ Once per week: Select a day and a time below.</li> <li>▪ Once per month (recommended): Select a day of the month and a time below.</li> </ul>
Day	<p>Select a day of the week (<a href="#">Monday</a> to <a href="#">Sunday</a>) or month (<a href="#">1st</a> to <a href="#">30th</a> or <a href="#">Last</a>). If you select Last, PRTG restarts the PRTG core server system on the last day of the month, regardless of how many days the month has.</p>
Time	<p>This setting is only visible if you select a schedule option above.</p> <p>Select a time for the planned restart.</p> <p><b>i</b> You get a Windows warning message 10 minutes before the restart to inform you about the restart if you are logged in to PRTG. The actual restart time can differ by up to 30 minutes from the time you enter here.</p>

**i** Save your settings. If you change tabs or use the main menu without saving, all changes to the settings are lost.

## 7.6 Group Settings

The following settings are available on the Settings tab of a group.

- ❗ This documentation does not refer to the settings of the root group. For more information, see section [Root Group Settings](#)<sup>[420]</sup>.
- ❗ We recommend that you define as many settings as possible in the [root group settings](#)<sup>[420]</sup> so that you can inherit them to all other objects in the [object hierarchy](#)<sup>[132]</sup>.
- ❗ This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

In this section:

**Priority** 

★ ★ ★ ☆ ☆

Basic Group Settings

Setting	Description
Group Name	<p>Enter a name to identify the group. By default, PRTG shows this name in the <a href="#">device tree</a><sup>[164]</sup>, as well as in <a href="#">alarms</a><sup>[202]</sup>, <a href="#">logs</a><sup>[210]</sup>, <a href="#">notifications</a><sup>[2735]</sup>, <a href="#">reports</a><sup>[2754]</sup>, <a href="#">maps</a><sup>[2776]</sup>, <a href="#">libraries</a><sup>[2738]</sup>, and <a href="#">tickets</a><sup>[213]</sup>.</p> <p><b>i</b> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({}). For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Monitoring Status	<p>Select the monitoring status of the group:</p> <ul style="list-style-type: none"> <li>▪ Started (default): Monitor the group.</li> <li>▪ Paused: Pause monitoring for the group. All sensors on all devices in the group are in the Paused <a href="#">status</a><sup>[227]</sup> until you change this setting.</li> </ul>
Parent Tags	<p>Shows the <a href="#">tags</a><sup>[138]</sup> that this group <a href="#">inherits</a><sup>[138]</sup> from its parent <a href="#">probe</a><sup>[133]</sup>.</p> <p><b>i</b> This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically <a href="#">inherited</a><sup>[138]</sup>.</p> <p><b>i</b> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (&lt;&gt;).</p> <p><b>i</b> For performance reasons, it can take some minutes until you can filter for new tags that you added.</p>
Priority	<p>Select a <a href="#">priority</a><sup>[224]</sup> for the group. This setting determines the position of the group in lists. The highest priority is at the top of a list. You can choose from the lowest priority (★☆☆☆☆) to the highest priority (★★★★★).</p>

## Auto-Discovery Settings

### Auto-Discovery Settings

**Auto-Discovery Level** ⓘ

- No auto-discovery (default)
- Default auto-discovery (recommended)
- Detailed auto-discovery
- Auto-discovery with specific device templates

Auto-Discovery Settings

Setting	Description
Auto-Discovery Level	<p>Select the level of detail for the <a href="#">auto-discovery</a> <sup>254</sup>:</p> <ul style="list-style-type: none"> <li>▪ No auto-discovery: Select this option if you only want to manually create devices and sensors.</li> <li>▪ Standard auto-discovery (default): Create a set of standard sensors for standard monitoring. This option works fine for most installations.</li> <li>▪ Detailed auto-discovery: Create all standard sensors and additional sensors from detailed variants of device templates. As a result, you might get many sensors. This option is suitable for small network segments and whenever you want to monitor the maximum number of sensors available.</li> <li>▪ Auto-discovery with specific device templates: Customize the auto-discovery and select or combine standard, detailed, and custom device templates. Select one or more templates from the Device Templates list.</li> </ul> <p> ⓘ Auto-discoveries can be resource intensive. They are primarily intended for devices on the same network as your probes.</p>
Device Templates	<p><b>This setting is only visible if you select</b> Auto-discovery with specific device templates <a href="#">above</a>.</p> <p>Select one or more device templates by enabling a check box in front of the template name. PRTG uses the device templates that you select for the auto-discovery on the device:</p> <ul style="list-style-type: none"> <li>▪ ADSL</li> <li>▪ Buffalo TeraStation NAS</li> <li>▪ Cisco ASA VPN</li> <li>▪ Cisco Device (Generic)</li> <li>▪ Dell EqualLogic</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Dell MDi Disk</li> <li>▪ DNS Server</li> <li>▪ Environment Jakarta</li> <li>▪ Environment Poseidon</li> <li>▪ FTP Server</li> <li>▪ Generic Device (Ping Only)</li> <li>▪ Generic Device (SNMP Enabled)</li> <li>▪ Generic Device (SNMP Enabled, Detailed)</li> <li>▪ HTTP Web Server</li> <li>▪ Hyper-V Host Server</li> <li>▪ IPMI-enabled Device</li> <li>▪ Juniper NS Device</li> <li>▪ Linux/UNIX Device (SNMP or SSH Enabled)</li> <li>▪ Mail Server (Generic)</li> <li>▪ Mail Server (MS Exchange)</li> <li>▪ Microsoft SharePoint 2010</li> <li>▪ MQTT Round Trip</li> <li>▪ NAS LenovoEMC</li> <li>▪ NAS QNAP</li> <li>▪ NAS Synology</li> <li>▪ NetApp</li> <li>▪ NTP Server</li> <li>▪ OPC UA</li> <li>▪ Printer (Generic)</li> <li>▪ Printer (HP)</li> <li>▪ RDP Server</li> <li>▪ RMON-compatible Device</li> <li>▪ Server (Cisco UCS)</li> <li>▪ Server (Compaq/HP Agents)</li> <li>▪ Server (Dell)</li> <li>▪ Server (Fujitsu)</li> <li>▪ Server (IBM)</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ SNMP Rittal CMC III Hardware Status</li> <li>▪ SonicWall</li> <li>▪ SSL Security Check</li> <li>▪ Switch (Cisco Catalyst)</li> <li>▪ Switch (Cisco IOS Based)</li> <li>▪ Switch (HP Procurve)</li> <li>▪ UNIX/Linux Device</li> <li>▪ UPS Health (APC)</li> <li>▪ UPS Health (Generic)</li> <li>▪ UPS Health (Liebert)</li> <li>▪ VMware ESXi / vCenter Server</li> <li>▪ Web Server</li> <li>▪ Windows (Detailed via WMI)</li> <li>▪ Windows (via Remote PowerShell)</li> <li>▪ Windows (via WMI)</li> <li>▪ Windows IIS (via SNMP)</li> <li>▪ XenServer Hosts</li> <li>▪ XenServer Virtual Machines</li> </ul> <p>Once the auto-discovery is finished, PRTG creates a new <a href="#">ticket</a><sup>[213]</sup> and lists the device templates that it used to create new sensors.</p>
Schedule	<p>Select when PRTG runs the auto-discovery:</p> <ul style="list-style-type: none"> <li>▪ Once (default): Run the auto-discovery only once. PRTG adds new devices and sensors once. If you select this option, you must manually <a href="#">start the auto-discovery</a><sup>[255]</sup>.</li> <li>▪ Hourly: Run the auto-discovery for new devices and sensors every 60 minutes. <ul style="list-style-type: none"> <li>ⓘ Use this option with caution. Frequent auto-discoveries might cause performance issues, in particular when PRTG scans large network segments every hour.</li> </ul> </li> <li>▪ Daily: Run the auto-discovery for new devices and sensors every 24 hours. The first auto-discovery runs immediately. All other discoveries start at the time that you define in the <a href="#">Monitoring</a><sup>[267]</sup> settings, section Auto-Discovery.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Weekly: Run the auto-discovery for new devices and sensors every 7 days. The first auto-discovery runs immediately. All other discoveries start at the time that you define in the Monitoring settings, section Auto-Discovery.</li> </ul> <p><b>i</b> For performance reasons, PRTG sets Schedule to Once (default) on all devices that the scheduled auto-discovery creates.</p>
<p>IP Address Selection Method</p>	<p>Select how you want to define the IP address range for the auto-discovery:</p> <ul style="list-style-type: none"> <li>▪ Class C base IP address with start/end (IPv4) (default): Enter an IPv4 class C address range.</li> <li>▪ List of individual IP addresses and DNS names (IPv4): Enter a list of individual IPv4 addresses or Domain Name System (DNS) names.</li> <li>▪ IP address and subnet (IPv4): Enter an IPv4 address and subnet mask.</li> <li>▪ IP address with octet range (IPv4): Enter an IPv4 address range for every IP octet individually. With this, you can define very customizable IP address ranges.</li> <li>▪ List of individual IP addresses and DNS names (IPv6): Enter a list of individual IPv6 addresses or DNS names.</li> <li>▪ Use computers from the Active Directory (maximum 1000 computers): Search in the Active Directory for computers to perform the auto-discovery. <ul style="list-style-type: none"> <li><b>i</b> Make sure that you specify your Active Directory domain in the <a href="#">Core &amp; Probes</a> settings.</li> </ul> </li> </ul> <p><b>i</b> PRTG can only discover subnets with up to 65,536 IP addresses. If you define a range with a higher number of addresses, the discovery stops before it is completed.</p>
<p>IPv4 Base</p>	<p><b>This setting is only visible if you select Class C base IP address with start/end (IPv4) (default) above.</b></p> <p>Enter a class C network as the IP base for the auto-discovery. Enter the first three octets of an IPv4 address, for example, <b>192.168.0</b>.</p>
<p>IPv4 Range Start</p>	<p><b>This setting is only visible if you select Class C base IP address with start/end (IPv4) (default) above.</b></p> <p>Enter the IP octet of the class C network (specified above) from which PRTG starts the auto-discovery. This completes the IP base to an IPv4 address. For example, enter <b>1</b> to discover from <b>192.168.0.1</b> onwards.</p>
<p>IPv4 Range End</p>	<p><b>This setting is only visible if you select Class C base IP address with start/end (IPv4) (default) above.</b></p>

Setting	Description
	Enter the IP octet of the class C network (specified above) at which PRTG stops the auto-discovery. This completes the IP base to an IPv4 address. For example, enter <b>254</b> to discover up to <b>192.168.0.254</b> .
IPv4/DNS Name List IPv6/DNS Name List	<p>This setting is only visible if you select List of individual IP addresses and DNS names (IPv4) or List of individual IP addresses and DNS names (IPv6) above.</p> <p>Enter a list of IP addresses or DNS names that the auto-discovery scans. Enter each address on a separate line.</p>
IPv4 and Subnet (IPv4)	<p>This setting is only visible if you select IP address and subnet (IPv4) above.</p> <p>Enter an expression in the format address/subnet, for example, <b>192.168.3.0/255.255.255.0</b>. You can also use the short form like <b>192.168.3.0/24</b>. If you want to include multiple addresses and subnets, enter them as a list separated by a comma, for example, <b>192.168.3.0/255.255.255.0, 192.169.0.0/255.255.255.0</b>. PRTG scans the complete host range (without network and broadcast address) that is defined by the IP address and the subnet mask.</p>
IP Address with Octet Range	<p>This setting is only visible if you select IP address with octet range (IPv4) above.</p> <p>Enter an expression in the format <b>a1.a2.a3.a4</b>, where <b>a1</b>, <b>a2</b>, <b>a3</b>, and <b>a4</b> are each a number between 0-255, or a range with two numbers and a hyphen like <b>1-127</b>. PRTG calculates all permutations of all ranges. For example, <b>10.0.1-10.1-100</b> results in 1,000 IP addresses that PRTG scans during the auto-discovery.</p>
Organizational Unit	<p>This setting is only visible if you select Use computers from the Active Directory (maximum 1000 computers) above.</p> <p>Enter an <b>organizational unit (OU)</b> to restrict the Active Directory search to computers that are part of this OU. For top-level OUs, use the distinguished name (DN) format without <b>OU=</b> and without the domain components (DCS). If you leave this field empty, there are not any restrictions.</p> <p>Example:</p> <ul style="list-style-type: none"> <li>For the DN <b>OU=Domain Controllers,DC=example,DC=com</b>, enter only <b>Domain Controllers</b>.</li> </ul> <p>If you have sub-OUs, use the DN format without the leading <b>OU=</b> and without the DCS.</p> <p>Examples:</p>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ For the DN <code>OU=webserver,OU=production,DC=example,DC=com</code>, enter only <code>webserver,OU=production</code>.</li> <li>▪ For the DN <code>OU=intranet,OU=webserver,OU=production,DC=example,DC=com</code>, enter only <code>intranet,OU=webserver,OU=production</code>.</li> </ul> <p><b>i</b> Make sure that the OU contains computer accounts. If the OU is empty, you receive an error message.</p> <p><b>i</b> Do not enter the domain components. PRTG automatically uses the domain components from the domain name you enter in the <a href="#">Core &amp; Probes</a> settings.</p>
Name Resolution	<p>Select how to monitor newly discovered devices. This only affects <a href="#">new devices</a>. This does not change the setting for other devices. Depending on your selection, the IP Address/DNS Name field of an <a href="#">added device</a> shows the DNS name or IP address that PRTG uses to access the target device:</p> <ul style="list-style-type: none"> <li>▪ Use DNS names (default): Monitor newly discovered devices via their DNS names (if available) We recommend that you use this option.</li> <li>▪ Use IP addresses: Monitor newly discovered devices via their IP addresses.</li> </ul> <p><b>i</b> This setting does not affect how PRTG shows the devices in the device tree.</p>
Device Rescan	<p>Select how to handle known devices:</p> <ul style="list-style-type: none"> <li>▪ Skip auto-discovery for existing devices/IP addresses (default): Do not rescan existing devices or IP addresses. PRTG only adds devices with new IP addresses or DNS names. PRTG does not add devices that that already exist in your configuration for example, in other groups. We recommend that you use this option.</li> <li>▪ Perform auto-discovery for existing devices/IP addresses: Rescan devices that have existing IP addresses with every auto-discovery. PRTG adds devices that already exist in other groups to this group and runs the auto-discovery on the newly added devices. <ul style="list-style-type: none"> <li><b>i</b> The auto-discovery does not run on devices that already exist in the group. If you want to run the auto-discovery for these devices, you must manually start the auto-discovery on them.</li> </ul> </li> </ul> <p><b>i</b> In certain cases, the IP resolution might not work and might result in PRTG not adding a device if it has the same local IP address as it does in a different LAN.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)<sup>[420]</sup> if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#)<sup>[136]</sup>.

## Location

Click  to interrupt the [inheritance](#)<sup>[136]</sup>.

**Location**

inherit from

Location (for Geo Maps) <sup>?</sup>

Location

Setting	Description
Location (for Geo Maps)	<p>If you want to use <a href="#">Geo Maps</a><sup>[2731]</sup>, enter a location in the first line. Geographical maps then display objects like devices or groups with a status icon using a color code similar to the <a href="#">sensor status icons</a><sup>[181]</sup> (green–yellow–orange–red). You can enter a full postal address, city and country only, or latitude and longitude. It is possible to enter any text before, between, and after the coordinates, as PRTG automatically parses latitude and longitude, for example, enter <a href="#">49.452778 11.077778</a>, or <a href="#">enter 49.452778 any 11.077778 text</a>.</p> <p>A minus sign (-) in the first line hides an object from a geographical map. In this case, you can enter location information in line two and following.</p> <p>You can define a specific label for each location. Enter a string denoting the label in the first line and provide the coordinates in the second line. This geographical marker then shows the object with the label in the geographical map.</p>

Setting	Description
	<p> The preview map always has a road map layout regardless of the map layout you set in <a href="#">User Interface</a><sup>[2859]</sup>.</p>

## Credentials for Windows Systems

Click  to interrupt the [inheritance](#)<sup>[136]</sup>.

 The settings you define in this section apply to the following sensors:

Credentials for Windows Systems

Setting	Description
Domain or Computer Name	<p>Enter the domain or computer name of the user account with which you want to access the Windows system. PRTG uses this account for Windows Management Instrumentation (WMI) sensors and other Windows sensors.</p> <p>If you want to use a Windows local user account on the target device, enter the computer name. If you want to use a Windows domain user account (recommended), enter the domain name. PRTG automatically adds a prefix to use the NT LAN Manager (NTLM) protocol if you do not explicitly define it. Do not leave this field empty.</p>

Setting	Description
User Name	Enter the user name for access to the Windows system. Usually, you use credentials with administrator rights.
Password	Enter the password for access to the Windows system. Usually, you use credentials with administrator rights.

Authentication Method <sup>i</sup>

- Password (default)
- Private key

Password <sup>i</sup>

.....

WBEM Protocol <sup>i</sup>

- HTTP
- HTTPS (default)

WBEM Port <sup>i</sup>

- Default
- Custom

SSH Port <sup>i</sup>

22

SSH Rights Elevation <sup>i</sup>

- Run the command as the connecting user (default)
- Run the command as a different user using 'sudo' (with password)
- Run the command as a different user using 'sudo' (without password)
- Run the command as a different user using 'su'

SSH Connection Mode <sup>i</sup>

- Default
- Compatibility mode (deprecated)

Setting	Description
User Name	Enter the user name for access to the Linux/Solaris/macOS system via Secure Shell (SSH) and Web-based Enterprise Management (WBEM). Usually, you use credentials with administrator rights.
Authentication Method	<p>Select the authentication method for the login:</p> <ul style="list-style-type: none"> <li>▪ Password: Provide the password for the login.</li> <li>▪ Private key: Provide an RSA private key for authentication.</li> </ul> <p> PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.</p> <p> PRTG only supports RSA keys. It does not support DSA keys.</p> <p> For more information, see section <a href="#">Monitoring via SSH</a><sup>[3007]</sup>.</p>
Password	<p>This setting is only visible if you select Password above.</p> <p>Enter a password for access to the Linux/Solaris/macOS system via SSH and WBEM. Usually, you use credentials with administrator rights.</p>
Private Key	<p>This setting is only visible if you select Private key above.</p> <p>Paste the entire RSA private key, including the <b>BEGIN</b> and <b>END</b> lines. Make sure that a corresponding public key exists on the target device.</p> <p> PRTG can only handle keys in the OpenSSH format that are not encrypted. You cannot use password-protected keys.</p> <p> PRTG only supports RSA keys. It does not support DSA keys.</p> <p> For more information, see section <a href="#">Monitoring via SSH</a><sup>[3007]</sup>.</p> <p> If you do not insert a private key for the first time but if you want to <a href="#">change</a> the private key, you need to <a href="#">restart the PRTG core server service</a><sup>[2919]</sup> for the private key change to take effect.</p>
WBEM Protocol	<p>Select the protocol that you want to use for the connection to the system via WBEM:</p> <ul style="list-style-type: none"> <li>▪ HTTP: Use an unsecure connection for WBEM.</li> <li>▪ HTTPS (default): Use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection for WBEM.</li> </ul> <p> This setting is only relevant if you use WBEM sensors.</p>
WBEM Port	Select if you want to use one of the default ports for the connection to the system via WBEM or if you want to set a custom port:

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Default: Use one of the default ports. The default port for unsecure connections is <a href="#">5988</a> and the default port for secure connections is <a href="#">5989</a>.</li> <li>▪ Custom: Use a custom port.</li> </ul> <p><b>i</b> This setting is only relevant if you use WBEM sensors.</p>
Custom WBEM Port	<p>This setting is only visible if you select Custom above.</p> <p>Enter a custom WBEM port. Enter an integer.</p>
SSH Port	<p>Enter the port for SSH connections. Enter an integer. The default port is <a href="#">22</a>.</p> <p><b>i</b> By default, PRTG automatically uses this setting for all <a href="#">SSH sensors</a> unless you define a different port number in the sensor settings.</p>
SSH Rights Elevation	<p>Select the rights that you want to use to run the command on the target system:</p> <ul style="list-style-type: none"> <li>▪ Run the command as the connecting user (default): Use the rights of the user who establishes the SSH connection.</li> <li>▪ Run the command as a different user using 'sudo' (with password): Use the rights of a different user with a password required for <a href="#">sudo</a> to run commands on the target system, for example, as a root user.</li> <li>▪ Run the command as a different user using 'sudo' (without password): Use the rights of a different user without a password required for <a href="#">sudo</a> to run commands on the target system, for example, as a root user.</li> <li>▪ Run the command as a different user using 'su': Use the rights of a different user with <a href="#">su</a> to run commands on the target system.</li> </ul>
Target System User Name	<p>This setting is only visible if you select an option that includes <a href="#">sudo</a> or <a href="#">su</a> above.</p> <p>Enter a user name to run the specified command on the target system as a different user than the root user. If you leave this field empty, you run the command as a root user. Make sure that you set the Linux password even if you use a public key or a private key for authentication. This is not necessary if the user is allowed to run the command without a password.</p>
Password	<p>This setting is only visible if you select an option that includes <a href="#">sudo</a> or <a href="#">su</a> with password above.</p> <p>Enter the password to run the <a href="#">sudo</a> command or the <a href="#">su</a> command.</p>

Setting	Description
SSH Connection Mode	<p>Select the connection mode that you want to use to <a href="#">access data with SSH sensors</a> <sup>6007</sup>.</p> <ul style="list-style-type: none"> <li>▪ Default: This is the default connection mode for SSH sensors. It provides the best performance and security.</li> <li>▪ Compatibility mode (deprecated): Use this only if the default connection mode does not work on the target system. The compatibility mode is the connection mode that PRTG used in previous versions and it is deprecated.</li> </ul> <p><b>i</b> We strongly recommend that you use the default connection mode.</p> <p><b>i</b> You can also individually select the connection mode for each SSH sensor in the sensor settings.</p>

### Credentials for VMware/XenServer

Click  to interrupt the [inheritance](#) <sup>136</sup>.

Credentials for SNMP Devices

Setting	Description
SNMP Version	<p>Select the Simple Network Management Protocol (SNMP) version for the connection to the target SNMP device:</p> <ul style="list-style-type: none"> <li>SNMP v1: Use SNMP v1 for the connection. SNMP v1 only offers clear-text data transmission. <ul style="list-style-type: none"> <li><span>?</span> SNMP v1 does not support 64-bit counters. This might result in invalid data when you monitor traffic via SNMP.</li> </ul> </li> <li>SNMP v2c (default): Use SNMP v2c for the connection. SNMP v2c also only offers clear-text data transmission but it supports 64-bit counters.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ SNMP v3: Use SNMP v3 for the connection. SNMP v3 provides secure authentication and data encryption.</li> <li>ⓘ SNMP v3 has performance limitations because of the use of encryption. The main limiting factor is CPU power. Also keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3. If you see an increase in <a href="#">Interval Delay</a> or <a href="#">Open Requests</a> with the <a href="#">Probe Health</a> sensor, distribute the load over <a href="#">multiple probes</a><sup>[6198]</sup>. SNMP v1 and SNMP v2c do not have this limitation.</li> </ul>
Community String	<p>This setting is only visible if you select SNMP v1 or SNMP v2c (default) above.</p> <p>Enter the community string of your device. This is like a clear-text password for simple authentication.</p> <p>ⓘ We recommend that you use the default value.</p>
Authentication Method	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Select the authentication method:</p> <ul style="list-style-type: none"> <li>▪ MD5 (default): Use message-digest algorithm 5 (MD5) for authentication.</li> <li>▪ SHA: Use Secure Hash Algorithm (SHA) for authentication.</li> <li>▪ SHA-224: Use SHA-224 for authentication.</li> <li>▪ SHA-256: Use SHA-256 for authentication.</li> <li>▪ SHA-384: Use SHA-384 for authentication.</li> <li>▪ SHA-512: Use SHA-512 for authentication.</li> </ul> <p>ⓘ If you do not want to use authentication but you need SNMP v3, for example, because your device requires <a href="#">context</a>, you can leave the Password field empty. In this case, PRTG uses <a href="#">SNMP_SEC_LEVEL_NOAUTH</a> and it entirely deactivates authentication.</p> <p>ⓘ The authentication method that you select must match the authentication method of your device.</p>
User Name	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Enter the user name for access to the target SNMP device.</p> <p>ⓘ The user name that you enter must match the user name of your device.</p>

Setting	Description
Password	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Enter the password for access to the target SNMP device.</p> <p><b>i</b> The password that you enter must match the password of your device.</p>
Encryption Type	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Select an encryption type:</p> <ul style="list-style-type: none"> <li>▪ DES (default): Use Data Encryption Standard (DES) as the encryption algorithm.</li> <li>▪ AES: Use Advanced Encryption Standard (AES) as the encryption algorithm.</li> <li>▪ AES-192: Use AES-192 as the encryption algorithm.</li> <li>▪ AES-256: Use AES-256 as the encryption algorithm.</li> </ul> <p><b>i</b> The encryption type that you select must match the encryption type of your device.</p>
Encryption Key	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Enter an encryption key. If you provide a key, PRTG encrypts SNMP data packets with the encryption algorithm that you selected above. Enter a string or leave the field empty.</p> <p><b>i</b> The encryption key that you enter must match the encryption key of your device. If the encryption keys do not match, you do not get an error message.</p>
Context Name	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Enter a context name only if the configuration of the device requires it. <b>Context</b> is a collection of management information that is accessible by an SNMP device. Enter a string.</p>
SNMP Port	<p>Enter the port for the connection to the SNMP target device. Enter an integer. The default port is <b>161</b>.</p> <p><b>i</b> We recommend that you use the default value.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer. The maximum timeout value is <b>300</b> seconds (5 minutes).</p>

### Windows Compatibility Options

Click  to interrupt the [inheritance](#)<sup>136</sup>.

If you experience problems when you monitor via Windows sensors, use the following compatibility options for troubleshooting.

## Windows Compatibility Options

inherit from

### Preferred Data Source <sup>i</sup>

- Performance counters and WMI as fallback
- Performance counters only
- WMI only (default)

### Timeout Method <sup>i</sup>

- Use 1.5x scanning interval (default)
- Set manually

Windows Compatibility Options

Setting	Description
Preferred Data Source	<p><sup>i</sup> This setting only applies to hybrid sensors that use both performance counters and Windows Management Instrumentation (WMI).</p> <p>Define the method that Windows sensors use to query data:</p> <ul style="list-style-type: none"> <li>▪ Performance counters and WMI as fallback: Try to query data via performance counters. If this is not possible, establish a connection via WMI.</li> <li>▪ Performance counters only: Query data via performance counters only. If this is not possible, the sensor returns no data.</li> <li>▪ WMI only (default): Query data via WMI only. If this is not possible, the sensor returns no data.</li> </ul>
Timeout Method	<p>Select the time that the sensor waits for the return of the WMI query before the sensor cancels the query and shows an error message:</p> <ul style="list-style-type: none"> <li>▪ Use 1.5x scanning interval (default): Multiply the scanning interval of the sensor by 1.5 and use the resulting value.</li> <li>▪ Set manually: Manually enter a timeout value.</li> </ul> <p><sup>i</sup> We recommend that you use the default value.</p> <p><sup>i</sup> If you experience ongoing timeout errors, try increasing the timeout value.</p>

Setting	Description
Timeout (Sec.)	<p>This setting is only visible if you select <a href="#">Set manually</a> <a href="#">above</a>.</p> <p>Enter the time the sensor waits for the return of its WMI query before it cancels it and shows an error message. Enter an integer. The maximum timeout value is <b>900</b> seconds (15 minutes).</p>

### SNMP Compatibility Options

Click  to interrupt the [inheritance](#)<sup>136</sup>.

If you experience problems when you monitor via Simple Network Management Protocol (SNMP) sensors, use the following compatibility options for troubleshooting.

## SNMP Compatibility Options

inherit from

SNMP Delay (ms) <sup>i</sup>

0

---

Failed Requests <sup>i</sup>

Retry (default)

Do not retry

Overflow Values <sup>i</sup>

Ignore (default)

Handle overflow values as valid results

Zero Values <sup>i</sup>

Ignore (default)

Handle zero values as valid results for delta sensors

32-bit/64-bit Counters <sup>i</sup>

Use 64-bit counters if available (default)

Use 32-bit counters only

Request Mode <sup>i</sup>

Use multi get (default)

Use single get

Walk Mode <sup>i</sup>

Use GETBULK requests (default)

Use GETNEXT requests

Setting	Description
SNMP Delay (ms)	<p>Enter the time in milliseconds (ms) that PRTG waits between two SNMP requests. You can define a delay between 0 and 100. Enter an integer.</p> <ul style="list-style-type: none"> <li><span data-bbox="485 450 512 488">i</span> We recommend that you use the default value.</li> <li><span data-bbox="536 501 563 539">i</span> If you experience SNMP connection failures, try increasing the delay.</li> </ul>
Failed Requests	<p>Select if an SNMP sensor tries again after a request fails:</p> <ul style="list-style-type: none"> <li><span data-bbox="485 667 496 683">▪</span> <b>Retry (default):</b> Try again if an SNMP request fails. This can prevent false error messages because of temporary timeout failures.</li> <li><span data-bbox="485 752 496 768">▪</span> <b>Do not retry:</b> Do not retry if an SNMP request fails. If you select this option, an SNMP sensor shows a Down status earlier.</li> </ul>
Overflow Values	<p>Select how PRTG handles overflow values. Some devices do not correctly handle internal buffer overflows. This can cause false peaks. PRTG can handle overflow values in two ways:</p> <ul style="list-style-type: none"> <li><span data-bbox="485 981 496 996">▪</span> <b>Ignore (default):</b> Ignore overflow values and do not include them in the monitoring data. We recommend that you use this option.</li> <li><span data-bbox="485 1066 496 1081">▪</span> <b>Handle overflow values as valid results:</b> Regard all overflow values as regular data and include them in the monitoring data.</li> </ul> <p><span data-bbox="485 1144 512 1182">i</span> If you experience problems because of strange peaks in your data graphs, change this option. Peaks might indicate that the target device resets counters without an overflow. PRTG interprets such behavior as overflow that results in data peaks. Select the option Ignore (default) in this case. For more information, see the Knowledge Base: <a href="#">What is the Overflow Values setting in the SNMP Compatibility Options?</a></p>
Zero Values	<p>Select how PRTG handles zero values. Some devices send incorrect zero values. This can cause false peaks. PRTG can handle zero values in two ways:</p> <ul style="list-style-type: none"> <li><span data-bbox="485 1503 496 1518">▪</span> <b>Ignore (default):</b> Ignore zero values and do not include them in the monitoring data. We recommend that you use this option.</li> </ul> <p><span data-bbox="485 1581 512 1619">i</span> If you experience problems, try changing this option.</p> <ul style="list-style-type: none"> <li><span data-bbox="485 1637 496 1653">▪</span> <b>Handle zero values as valid results for delta sensors:</b> Regard all zero values as regular data and include them in the monitoring data.</li> </ul>
32-bit/64-bit Counters	<p>Select the type of traffic counters that PRTG searches for on a device:</p> <ul style="list-style-type: none"> <li><span data-bbox="485 1805 496 1821">▪</span> <b>Use 64-bit counters if available (default):</b> The interface scan uses 64-bit traffic counters, if available. This can avoid buffer overflows in the devices.</li> </ul> <p><span data-bbox="485 1912 512 1951">i</span> We recommend that you use the default value.</p> <p><span data-bbox="536 1964 563 2002">i</span> If you experience problems, try changing this option.</p>

Setting	Description
	<ul style="list-style-type: none"> <li>Use 32-bit counters only: The interface scan always uses 32-bit traffic counters, even if 64-bit counters are available. This can make monitoring more reliable for some devices.</li> </ul>
Request Mode	<p>Select the request method that PRTG uses for SNMP sensors:</p> <ul style="list-style-type: none"> <li>Use multi get (default): Bundle multiple SNMP requests into one request. We recommend that you use this option.</li> </ul> <p><b>i</b> If you experience problems, try changing this option.</p> <ul style="list-style-type: none"> <li>Use single get: Use one request for each SNMP value. This can increase compatibility with older devices.</li> </ul> <p><b>i</b> PRTG uses <a href="#">paging</a> for SNMP requests. This means that if a sensor must query more than 20 object identifiers (OID), it automatically polls the OIDs in packages of 20 OIDs each.</p>
Walk Mode	<p>Select the kind of SNMP walk that PRTG uses for SNMP sensors:</p> <ul style="list-style-type: none"> <li>Use GETBULK requests (default): Request the next <b>x</b> OIDs in one SNMP request. The default value is <b>10</b>. It is dynamic based on the response size.</li> </ul> <p><b>i</b> This option only works with devices that support SNMP as of version v2c. Make sure that you set the correct SNMP Version in the Credentials for SNMP Devices settings of the parent device or inherit it from objects that are higher in the <a href="#">object hierarchy</a><sup>132</sup>.</p> <ul style="list-style-type: none"> <li>Use GETNEXT requests: Request one OID at a time. This can increase compatibility with older devices or with devices that have insufficient SNMP BULKWALK support.</li> </ul>
Port Name Template	<p>Select how PRTG displays the name of SNMP sensors. Enter a template that uses several variables. When you add new sensors, PRTG scans the interface for available counters at certain OIDs. At each OID, several fields with interface descriptions are usually available. They are different for every device and OID. PRTG uses the information in these fields to name the sensors. If a field is empty or if it is not available, PRTG adds an empty string to the name. By default, the port name template is <b>([port]) [ifalias] [ifsensor]</b>, which creates a name like <b>(001) Ethernet1 Traffic</b>. You can use and combine any field names that are available at an OID of your device, for example:</p> <ul style="list-style-type: none"> <li>[port]: The port number of the monitored interface.</li> <li>[ifalias]: The 'alias' name for the monitored interface as specified by a network manager, providing a non-volatile handling.</li> <li>[ifname]: The textual name of the monitored interface as assigned by the local device.</li> <li>[ifdescr]: A textual string containing information about the target device or interface, for example, manufacturer, product name, or version.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ [ifspeed]: An estimate of the monitored interface's current bandwidth (Kbit/s).</li> <li>▪ [ifsensor]: The type of the sensor, this is <a href="#">Traffic</a> or <a href="#">RMON</a>. This helps to differentiate between <a href="#">SNMP Traffic</a> and <a href="#">SNMP RMON</a> sensors.</li> </ul> <p> For more information about SNMP sensor names, see the Knowledge Base: <a href="#">How can I change the defaults for names automatically generated for new SNMP sensors?</a></p>
Port Name Update	<p>Select how PRTG reacts if you change the names of ports in your physical device (for example, a switch or router):</p> <ul style="list-style-type: none"> <li>▪ Keep port names (use this if you edit the names in PRTG) (default): Do not automatically adjust sensor names. This is the best option if you want to manually change names in PRTG.</li> <li>▪ Automatically update sensor names if port names change in the device: If PRTG detects port name changes in your physical device, it tries to automatically adjust the sensor names accordingly.</li> </ul> <p> For more information about automatic name updates, see the Knowledge Base: <a href="#">Automatically update port name and number for SNMP Traffic sensors when the device changes them.</a></p>
Port Identification	<p>Select the field that PRTG uses for SNMP interface identification:</p> <ul style="list-style-type: none"> <li>▪ Automatic identification (default): Try the ifAlias field first to identify an SNMP interface and then try ifDescr. <ul style="list-style-type: none"> <li> PRTG does not automatically try ifName.</li> </ul> </li> <li>▪ Use IfAlias: For most devices, ifAlias is the best field to use for unique interface names.</li> <li>▪ Use IfDescr: Use this option if the port order of your device changes after a restart, and if no ifAlias field is available. For example, this is the best option for Cisco ASA devices. <ul style="list-style-type: none"> <li> If you use this option, it is important that your device returns unique interface names in the ifDescr field.</li> </ul> </li> <li>▪ Use IfName: You can also use this option if no unique ifAlias is available. <ul style="list-style-type: none"> <li> If you use this option, it is important that your device returns unique interface names in the ifName field.</li> </ul> </li> <li>▪ Do not update ports: Use this option to disable the automatic port identification.</li> </ul>
Start Interface Index	<p> This setting only applies to <a href="#">SNMP Traffic sensors</a> and to <a href="#">Cisco IP SLA sensors</a>.</p> <p>Enter the index at which PRTG starts to query the interface range during sensor creation. Enter <b>0</b> for the automatic mode.</p>

Setting	Description
	<p> We recommend that you use the default value.</p>
End Interface Index	<p> This setting only applies to <a href="#">SNMP Traffic sensors</a> and to <a href="#">Cisco IP SLA sensors</a>.</p> <p>Enter the index at which PRTG stops querying the interface range during sensor creation. Enter 0 for the automatic mode.</p> <p> We recommend that you use the default value.</p>

Proxy Settings

Setting	Description
IP Address/DNS Name	Enter the IP address or Domain Name System (DNS) name of the proxy server. If you leave this field empty, sensors do not use a proxy.

Setting	Description
	 PRTG currently supports only HTTP proxies.
Port	Enter the port number of the proxy. The default port is <b>8080</b> . Enter an integer.
User Name	If the proxy requires authentication, enter the user name for the proxy login. Enter a string or leave the field empty.   Only basic authentication is available.
Password	If the proxy requires authentication, enter the password for the proxy login. Enter a string or leave the field empty.   Only basic authentication is available.

### Scanning Interval

Click  to interrupt the [inheritance](#) .

#### Scanning Interval

inherit from

**Scanning Interval** 

60 seconds ▼

---

**If a Sensor Query Fails** 

Set sensor to warning status for 1 interval, then set to down status (default) ▼

Scanning Interval

Setting	Description
Scanning Interval	Select a scanning interval from the dropdown list that determines the amount of time that the sensor waits between two scans: <ul style="list-style-type: none"> <li>▪ 30 seconds</li> <li>▪ 60 seconds</li> <li>▪ 5 minutes</li> <li>▪ 10 minutes</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ 15 minutes</li> <li>▪ 30 minutes</li> <li>▪ 1 hour</li> <li>▪ 4 hours</li> <li>▪ 6 hours</li> <li>▪ 12 hours</li> <li>▪ 24 hours</li> </ul> <p><b>i</b> You can change the available intervals in the <a href="#">system administration</a> [2870] of PRTG Network Monitor.</p>
<p>If a Sensor Scanning Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor scanning fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down <a href="#">status</a> [187]. This can avoid false alarms if the target device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status.</p> <p>The following options are available:</p> <ul style="list-style-type: none"> <li>▪ Set sensor to down status immediately: Set the sensor to the Down status immediately after the first request fails.</li> <li>▪ Set sensor to warning status for 1 interval, then set to down status (default): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status.</li> <li>▪ Set sensor to warning status for 2 intervals, then set to down status: Set the sensor to the Down status only after the third request fails.</li> <li>▪ Set sensor to warning status for 3 intervals, then set to down status: Set the sensor to the Down status only after the fourth request fails.</li> <li>▪ Set sensor to warning status for 4 intervals, then set to down status: Set the sensor to the Down status only after the fifth request fails.</li> <li>▪ Set sensor to warning status for 5 intervals, then set to down status: Set the sensor to the Down status only after the sixth request fails.</li> </ul> <p><b>i</b> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p><b>i</b> If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p>

Setting	Description
	<p> If a channel uses <a href="#">lookup</a> values, the sensor immediately shows the Down status. None of the interval options apply.</p>

## Schedules, Dependencies, and Maintenance Window

Click  to interrupt the [inheritance](#).

### Schedules, Dependencies, and Maintenance Window

 inherit from

*Schedules, dependencies, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all child objects and the inheritance cannot be disabled. Below you can set additional schedules, dependencies, or maintenance windows that will be used in parallel to any inherited setting.*

How can I change the defaults for names automatically generated for new SNMP sensors?

- <https://kb.paessler.com/en/topic/7363>

Automatically update port name and number for SNMP Traffic sensors when the device changes them

- <https://kb.paessler.com/en/topic/25893>

## 7.7 Device Settings

The following settings are available on the Settings tab of a device.

- ❗ We recommend that you define as many settings as possible in the [root group settings](#) so that you can inherit them to all other objects in the [object hierarchy](#).

For device settings, you can also use multi-edit. This enables you to change the settings of many devices at the same time.

- For more information, see section [Multi-Edit](#).

- ❗ This documentation refers to an administrator that accesses the PRTG web interface on a master node. Other user accounts, interfaces, or failover nodes might not have all of the options in the way described here. In a cluster, note that failover nodes are read-only by default.

Basic Device Settings

Setting	Description
Device Name	<p>Enter a name to identify the device. By default, PRTG shows this name in the <a href="#">device tree</a><sup>[164]</sup>, as well as in <a href="#">alarms</a><sup>[202]</sup>, <a href="#">logs</a><sup>[210]</sup>, <a href="#">notifications</a><sup>[2735]</sup>, <a href="#">reports</a><sup>[2754]</sup>, <a href="#">maps</a><sup>[2776]</sup>, <a href="#">libraries</a><sup>[2738]</sup>, and <a href="#">tickets</a><sup>[213]</sup>.</p> <p><b>i</b> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Monitoring Status	<p>Select the monitoring status of the device:</p> <ul style="list-style-type: none"> <li>Started (default): Monitor the device.</li> <li>Paused: Pause monitoring for the device. All sensors on the device are in the Paused <a href="#">status</a><sup>[227]</sup> until you change this setting.</li> </ul>
IP Version	<p>Select the IP protocol that PRTG uses to connect to the device:</p> <ul style="list-style-type: none"> <li>IPv4: Use IP version 4 for all requests to the device.</li> <li>IPv6: Use IP version 6 for all requests to the device.</li> </ul> <p><b>i</b> The setting is valid for all sensors that you create on the device.</p>
IPv4 Address/DNS Name	<p><a href="#">This setting is only visible if you select IPv4 above.</a></p> <p>Enter the IP address or Domain Name System (DNS) name for the device. Most sensors that you create on this device inherit this setting and try to connect to this address for monitoring.</p> <p><b>i</b> Some sensors have their own setting for the IP address/DNS name to which they connect.</p>
IPv6 Address/DNS Name	<p><a href="#">This setting is only visible if you select IPv6 above.</a></p> <p>Enter the IP address or Domain Name System (DNS) name for the device. Most sensors that you create on this device inherit this setting and try to connect to this address for monitoring.</p> <p><b>i</b> Some sensors have their own setting for the IP address/DNS name to which they connect.</p>
Parent Tags	<p>Shows <a href="#">tags</a><sup>[138]</sup> that this device <a href="#">inherits</a><sup>[138]</sup> from its parent <a href="#">group</a><sup>[133]</sup> and its parent <a href="#">probe</a><sup>[133]</sup>.</p> <p><b>i</b> This setting is for your information only. You cannot change it.</p>

Setting	Description
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically <a href="#">inherited</a><sup>138</sup>.</p> <ul style="list-style-type: none"> <li><b>i</b> We recommend that you use the default value. You can also add additional tags.</li> <li><b>i</b> It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (&lt;&gt;).</li> <li><b>i</b> For performance reasons, it can take some minutes until you can filter for new tags that you added.</li> </ul>
Priority	<p>Select a <a href="#">priority</a><sup>224</sup> for the device. This setting determines the position of the group in lists. The highest priority is at the top of a list. You can choose from the lowest priority (☆☆☆☆☆) to the highest priority (★★★★★).</p>

### Additional Device Information

#### Additional Device Information

**Device Icon** ⓘ

**Service URL** ⓘ

---

Additional Device Information

Setting	Description
Device Icon	Select a device icon. PRTG shows it in the device tree.
Service URL	Specify a URL to open directly when you select Device Tools   Go to Service URL from the <a href="#">context menu</a> <sup>[229]</sup> of the device. For example, you can configure this option to open the address <a href="http://www.example.com/service.html">http://www.example.com/service.html</a> . Enter a valid URL or leave the field empty.

### Auto-Discovery Settings

## Device Identification and Auto-Discovery

**Auto-Discovery Level** ⓘ

- No auto-discovery
- Standard auto-discovery (default)
- Detailed auto-discovery
- Auto-discovery with specific device templates

Auto-Discovery Settings

Setting	Description
Auto-Discovery Level	<p>Select the level of detail for the <a href="#">auto-discovery</a><sup>[254]</sup>:</p> <ul style="list-style-type: none"> <li>▪ <b>No auto-discovery:</b> Select this option if you only want to manually create devices and sensors.</li> <li>▪ <b>Standard auto-discovery (default):</b> Create a set of standard sensors for standard monitoring. This option works fine for most installations.</li> <li>▪ <b>Detailed auto-discovery:</b> Create all standard sensors and additional sensors from detailed variants of device templates. As a result, you might get many sensors. This option is suitable for small network segments and whenever you want to monitor the maximum number of sensors available.</li> <li>▪ <b>Auto-discovery with specific device templates:</b> Customize the auto-discovery and select or combine standard, detailed, and custom device templates. Select one or more templates from the Device Templates list.</li> </ul>

Setting	Description
	<p><b>i</b> Auto-discoveries can be resource intensive. They are primarily intended for devices on the same network as your probes.</p>
<p>Schedule</p>	<p>Select when PRTG runs the auto-discovery:</p> <ul style="list-style-type: none"> <li>▪ Once (default): Run the auto-discovery only once. PRTG adds new devices and sensors once. If you select this option, you must manually <a href="#">start the auto-discovery</a> <sup>[255]</sup>.</li> <li>▪ Hourly: Run the auto-discovery for new devices and sensors every 60 minutes. <ul style="list-style-type: none"> <li><b>i</b> Use this option with caution. Frequent auto-discoveries might cause performance issues, in particular when PRTG scans large network segments every hour.</li> </ul> </li> <li>▪ Daily: Run the auto-discovery for new devices and sensors every 24 hours. The first auto-discovery runs immediately. All other discoveries start at the time that you define in the <a href="#">Monitoring</a> <sup>[2875]</sup> settings, section Auto-Discovery.</li> <li>▪ Weekly: Run the auto-discovery for new devices and sensors every 7 days. The first auto-discovery runs immediately. All other discoveries start at the time that you define in the Monitoring settings, section Auto-Discovery.</li> </ul> <p><b>i</b> For performance reasons, PRTG sets Schedule to Once (default) on all devices that the scheduled auto-discovery creates.</p>
<p>Device Templates</p>	<p><a href="#">This setting is only visible if you select</a> Auto-discovery with specific device templates <a href="#">above</a>.</p> <p>Select one or more device templates by enabling a check box in front of the template name. PRTG uses the device templates that you select for the auto-discovery on the device:</p> <ul style="list-style-type: none"> <li>▪ ADSL</li> <li>▪ Buffalo TeraStation NAS</li> <li>▪ Cisco ASA VPN</li> <li>▪ Cisco Device (Generic)</li> <li>▪ Dell EqualLogic</li> <li>▪ Dell MDi Disk</li> <li>▪ DNS Server</li> <li>▪ Environment Jakarta</li> <li>▪ Environment Poseidon</li> <li>▪ FTP Server</li> <li>▪ Generic Device (Ping Only)</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Generic Device (SNMP Enabled)</li> <li>▪ Generic Device (SNMP Enabled, Detailed)</li> <li>▪ HTTP Web Server</li> <li>▪ Hyper-V Host Server</li> <li>▪ IPMI-enabled Device</li> <li>▪ Juniper NS Device</li> <li>▪ Linux/UNIX Device (SNMP or SSH Enabled)</li> <li>▪ Mail Server (Generic)</li> <li>▪ Mail Server (MS Exchange)</li> <li>▪ Microsoft SharePoint 2010</li> <li>▪ MQTT Round Trip</li> <li>▪ NAS LenovoEMC</li> <li>▪ NAS QNAP</li> <li>▪ NAS Synology</li> <li>▪ NetApp</li> <li>▪ NTP Server</li> <li>▪ OPC UA</li> <li>▪ Printer (Generic)</li> <li>▪ Printer (HP)</li> <li>▪ RDP Server</li> <li>▪ RMON-compatible Device</li> <li>▪ Server (Cisco UCS)</li> <li>▪ Server (Compaq/HP Agents)</li> <li>▪ Server (Dell)</li> <li>▪ Server (Fujitsu)</li> <li>▪ Server (IBM)</li> <li>▪ SNMP Rittal CMC III Hardware Status</li> <li>▪ SonicWall</li> <li>▪ SSL Security Check</li> <li>▪ Switch (Cisco Catalyst)</li> <li>▪ Switch (Cisco IOS Based)</li> <li>▪ Switch (HP Procurve)</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ UNIX/Linux Device</li> <li>▪ UPS Health (APC)</li> <li>▪ UPS Health (Generic)</li> <li>▪ UPS Health (Liebert)</li> <li>▪ VMware ESXi / vCenter Server</li> <li>▪ Web Server</li> <li>▪ Windows (Detailed via WMI)</li> <li>▪ Windows (via Remote PowerShell)</li> <li>▪ Windows (via WMI)</li> <li>▪ Windows IIS (via SNMP)</li> <li>▪ XenServer Hosts</li> <li>▪ XenServer Virtual Machines</li> </ul> <p>Once the auto-discovery is finished, PRTG creates a new <a href="#">ticket</a><sup>[213]</sup> and lists the device templates that it used to create new sensors.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#)<sup>[420]</sup> if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#)<sup>[136]</sup>.

## Location

Click  to interrupt the [inheritance](#)<sup>[136]</sup>.

### Location

inherit from

Location (for Geo Maps) ⓘ

Location

Setting	Description
Location (for Geo Maps)	<p>If you want to use <a href="#">Geo Maps</a><sup>[2731]</sup>, enter a location in the first line. Geographical maps then display objects like devices or groups with a status icon using a color code similar to the <a href="#">sensor status icons</a><sup>[181]</sup> (green–yellow–orange–red). You can enter a full postal address, city and country only, or latitude and longitude. It is possible to enter any text before, between, and after the coordinates, as PRTG automatically parses latitude and longitude, for example, enter <a href="#">49.452778 11.077778</a>, or <a href="#">enter 49.452778 any 11.077778 text</a>.</p> <p>A minus sign (-) in the first line hides an object from a geographical map. In this case, you can enter location information in line two and following.</p> <p>You can define a specific label for each location. Enter a string denoting the label in the first line and provide the coordinates in the second line. This geographical marker then shows the object with the label in the geographical map.</p> <p>ⓘ The preview map always has a road map layout regardless of the map layout you set in <a href="#">User Interface</a><sup>[2859]</sup>.</p>

5

Credentials for SNMP Devices

Setting	Description
SNMP Version	<p>Select the Simple Network Management Protocol (SNMP) version for the connection to the target SNMP device:</p> <ul style="list-style-type: none"> <li>▪ <b>SNMP v1:</b> Use SNMP v1 for the connection. SNMP v1 only offers clear-text data transmission. <ul style="list-style-type: none"> <li>ⓘ SNMP v1 does not support 64-bit counters. This might result in invalid data when you monitor traffic via SNMP.</li> </ul> </li> <li>▪ <b>SNMP v2c (default):</b> Use SNMP v2c for the connection. SNMP v2c also only offers clear-text data transmission but it supports 64-bit counters.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ SNMP v3: Use SNMP v3 for the connection. SNMP v3 provides secure authentication and data encryption.</li> <li>ⓘ SNMP v3 has performance limitations because of the use of encryption. The main limiting factor is CPU power. Also keep in mind that SNMP v3, unlike SNMP v1 and v2c, does not scale with more CPU power. Because of this limitation, PRTG can only handle a limited number of requests per second so that you can use only a limited number of sensors using SNMP v3. If you see an increase in <a href="#">Interval Delay</a> or <a href="#">Open Requests</a> with the <a href="#">Probe Health</a> sensor, distribute the load over <a href="#">multiple probes</a> <small>[6198]</small>. SNMP v1 and SNMP v2c do not have this limitation.</li> </ul>
Community String	<p>This setting is only visible if you select SNMP v1 or SNMP v2c (default) above.</p> <p>Enter the community string of your device. This is like a clear-text password for simple authentication.</p> <p>ⓘ We recommend that you use the default value.</p>
Authentication Method	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Select the authentication method:</p> <ul style="list-style-type: none"> <li>▪ MD5 (default): Use message-digest algorithm 5 (MD5) for authentication.</li> <li>▪ SHA: Use Secure Hash Algorithm (SHA) for authentication.</li> <li>▪ SHA-224: Use SHA-224 for authentication.</li> <li>▪ SHA-256: Use SHA-256 for authentication.</li> <li>▪ SHA-384: Use SHA-384 for authentication.</li> <li>▪ SHA-512: Use SHA-512 for authentication.</li> </ul> <p>ⓘ If you do not want to use authentication but you need SNMP v3, for example, because your device requires <a href="#">context</a>, you can leave the Password field empty. In this case, PRTG uses <a href="#">SNMP_SEC_LEVEL_NOAUTH</a> and it entirely deactivates authentication.</p> <p>ⓘ The authentication method that you select must match the authentication method of your device.</p>
User Name	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Enter the user name for access to the target SNMP device.</p> <p>ⓘ The user name that you enter must match the user name of your device.</p>

Setting	Description
Password	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Enter the password for access to the target SNMP device.</p> <p> The password that you enter must match the password of your device.</p>
Encryption Type	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Select an encryption type:</p> <ul style="list-style-type: none"> <li>▪ DES (default): Use Data Encryption Standard (DES) as the encryption algorithm.</li> <li>▪ AES: Use Advanced Encryption Standard (AES) as the encryption algorithm.</li> <li>▪ AES-192: Use AES-192 as the encryption algorithm.</li> <li>▪ AES-256: Use AES-256 as the encryption algorithm.</li> </ul> <p> The encryption type that you select must match the encryption type of your device.</p>
Encryption Key	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Enter an encryption key. If you provide a key, PRTG encrypts SNMP data packets with the encryption algorithm that you selected above. Enter a string or leave the field empty.</p> <p> The encryption key that you enter must match the encryption key of your device. If the encryption keys do not match, you do not get an error message.</p>
Context Name	<p>This setting is only visible if you select SNMP v3 above.</p> <p>Enter a context name only if the configuration of the device requires it. <b>Context</b> is a collection of management information that is accessible by an SNMP device. Enter a string.</p>
SNMP Port	<p>Enter the port for the connection to the SNMP target device. Enter an integer. The default port is <b>161</b>.</p> <p> We recommend that you use the default value.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer. The maximum timeout value is <b>300</b> seconds (5 minutes).</p>

**Authentication Method** 

None (default)

Basic authentication

Bearer authentication

Credentials for REST API

Setting	Description
Authentication Method	Select the authentication method for access to the Representational State Transfer (REST) application programming interface (API): <ul style="list-style-type: none"> <li>▪ None (default): Use no authentication.</li> <li>▪ Basic authentication: Use basic authentication.</li> <li>▪ Bearer authentication: Use an OAuth2 bearer token.</li> </ul>
User Name	<a href="#">This setting is only visible if you select Basic authentication above.</a> Enter the user name for access to the REST API.
Password	<a href="#">This setting is only visible if you select Basic authentication above.</a> Enter the password for access to the REST API.
Bearer Token	<a href="#">This setting is only visible if you select Bearer authentication above.</a> Enter a bearer token for access to the REST API.
Placeholder 1 Description	Enter a description for Placeholder 1, for example information about the purpose or content of the placeholder.

Setting	Description
Placeholder 1	Enter a value for the placeholder. PRTG inserts the value for the REST API request if you add <code>%restplaceholder1</code> in the Request URL, POST Body, and Custom Headers fields of the REST Custom v2 sensor. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 2 Description	Enter a description for Placeholder 2, for example information about the purpose or content of the placeholder.
Placeholder 2	Enter a value for the placeholder. PRTG inserts the value for the REST API request if you add <code>%restplaceholder2</code> in the Request URL, POST Body, and Custom Headers fields of the REST Custom v2 sensor. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 3 Description	Enter a description for Placeholder 3, for example information about the purpose or content of the placeholder.
Placeholder 3	Enter a value for the placeholder. PRTG inserts the value for the REST API request if you add <code>%restplaceholder3</code> in the Request URL, POST Body, and Custom Headers fields of the REST Custom v2 sensor. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 4 Description	Enter a description for Placeholder 4, for example information about the purpose or content of the placeholder.
Placeholder 4	Enter a value for the placeholder. PRTG inserts the value for the REST API request if you add <code>%restplaceholder4</code> in the Request URL, POST Body, and Custom Headers fields of the REST Custom v2 sensor. PRTG does not display the value in the sensor log or the sensor's settings.
Placeholder 5 Description	Enter a description for Placeholder 5, for example information about the purpose or content of the placeholder.
Placeholder 5	Enter a value for the placeholder. PRTG inserts the value for the REST API request if you add <code>%restplaceholder5</code> in the Request URL, POST Body, and Custom Headers fields of the REST Custom v2 sensor. PRTG does not display the value in the sensor log or the sensor's settings.

Password	Enter the password for access to the Veeam Backup Enterprise Manager.
Port	Enter the port for the connection to the Veeam Backup Enterprise Manager. The default port for secure connections is <a href="#">9398</a> .

### Windows Compatibility Options

Click  to interrupt the [inheritance](#)<sup>136</sup>.

If you experience problems when you monitor via Windows sensors, use the following compatibility options for troubleshooting.

## Windows Compatibility Options

inherit from

### Preferred Data Source ⓘ

- Performance counters and WMI as fallback
- Performance counters only
- WMI only (default)

### Timeout Method ⓘ

- Use 1.5× scanning interval (default)
- Set manually

Windows Compatibility Options

Setting	Description
Preferred Data Source	<p><span>ⓘ</span> This setting only applies to hybrid sensors that use both performance counters and Windows Management Instrumentation (WMI).</p> <p>Define the method that Windows sensors use to query data:</p> <ul style="list-style-type: none"> <li>▪ Performance counters and WMI as fallback: Try to query data via performance counters. If this is not possible, establish a connection via WMI.</li> <li>▪ Performance counters only: Query data via performance counters only. If this is not possible, the sensor returns no data.</li> <li>▪ WMI only (default): Query data via WMI only. If this is not possible, the sensor returns no data.</li> </ul>
Timeout Method	<p>Select the time that the sensor waits for the return of the WMI query before the sensor cancels the query and shows an error message:</p> <ul style="list-style-type: none"> <li>▪ Use 1.5× scanning interval (default): Multiply the scanning interval of the sensor by 1.5 and use the resulting value.</li> <li>▪ Set manually: Manually enter a timeout value.</li> </ul> <p><span>ⓘ</span> We recommend that you use the default value.</p> <p><span>ⓘ</span> If you experience ongoing timeout errors, try increasing the timeout value.</p>

Setting	Description
Timeout (Sec.)	<p>This setting is only visible if you select <a href="#">Set manually</a> <a href="#">above</a>.</p> <p>Enter the time the sensor waits for the return of its WMI query before it cancels it and shows an error message. Enter an integer. The maximum timeout value is <b>900</b> seconds (15 minutes).</p>

## SNMP Compatibility Options

Click  to interrupt the [inheritance](#)<sup>136</sup>.

If you experience problems when you monitor via Simple Network Management Protocol (SNMP) sensors, use the following compatibility options for troubleshooting.

## SNMP Compatibility Options

inherit from

SNMP Delay (ms) <sup>i</sup>

0

---

Failed Requests <sup>i</sup>

Retry (default)

Do not retry

Overflow Values <sup>i</sup>

Ignore (default)

Handle overflow values as valid results

Zero Values <sup>i</sup>

Ignore (default)

Handle zero values as valid results for delta sensors

32-bit/64-bit Counters <sup>i</sup>

Use 64-bit counters if available (default)

Use 32-bit counters only

Request Mode <sup>i</sup>

Use multi get (default)

Use single get

Walk Mode <sup>i</sup>

Use GETBULK requests (default)

Use GETNEXT requests

Setting	Description
SNMP Delay (ms)	<p>Enter the time in milliseconds (ms) that PRTG waits between two SNMP requests. You can define a delay between 0 and 100. Enter an integer.</p> <ul style="list-style-type: none"> <li><span data-bbox="485 450 512 488">i</span> We recommend that you use the default value.</li> <li><span data-bbox="536 501 563 539">i</span> If you experience SNMP connection failures, try increasing the delay.</li> </ul>
Failed Requests	<p>Select if an SNMP sensor tries again after a request fails:</p> <ul style="list-style-type: none"> <li><span data-bbox="485 669 496 685">▪</span> <b>Retry (default):</b> Try again if an SNMP request fails. This can prevent false error messages because of temporary timeout failures.</li> <li><span data-bbox="485 752 496 768">▪</span> <b>Do not retry:</b> Do not retry if an SNMP request fails. If you select this option, an SNMP sensor shows a Down status earlier.</li> </ul>
Overflow Values	<p>Select how PRTG handles overflow values. Some devices do not correctly handle internal buffer overflows. This can cause false peaks. PRTG can handle overflow values in two ways:</p> <ul style="list-style-type: none"> <li><span data-bbox="485 983 496 999">▪</span> <b>Ignore (default):</b> Ignore overflow values and do not include them in the monitoring data. We recommend that you use this option.</li> <li><span data-bbox="485 1066 496 1081">▪</span> <b>Handle overflow values as valid results:</b> Regard all overflow values as regular data and include them in the monitoring data.</li> </ul> <p><span data-bbox="485 1144 512 1182">i</span> If you experience problems because of strange peaks in your data graphs, change this option. Peaks might indicate that the target device resets counters without an overflow. PRTG interprets such behavior as overflow that results in data peaks. Select the option Ignore (default) in this case. For more information, see the Knowledge Base: <a href="#">What is the Overflow Values setting in the SNMP Compatibility Options?</a></p>
Zero Values	<p>Select how PRTG handles zero values. Some devices send incorrect zero values. This can cause false peaks. PRTG can handle zero values in two ways:</p> <ul style="list-style-type: none"> <li><span data-bbox="485 1505 496 1520">▪</span> <b>Ignore (default):</b> Ignore zero values and do not include them in the monitoring data. We recommend that you use this option.</li> </ul> <p><span data-bbox="485 1583 512 1621">i</span> If you experience problems, try changing this option.</p> <ul style="list-style-type: none"> <li><span data-bbox="485 1639 496 1655">▪</span> <b>Handle zero values as valid results for delta sensors:</b> Regard all zero values as regular data and include them in the monitoring data.</li> </ul>
32-bit/64-bit Counters	<p>Select the type of traffic counters that PRTG searches for on a device:</p> <ul style="list-style-type: none"> <li><span data-bbox="485 1805 496 1821">▪</span> <b>Use 64-bit counters if available (default):</b> The interface scan uses 64-bit traffic counters, if available. This can avoid buffer overflows in the devices.</li> </ul> <p><span data-bbox="485 1912 512 1951">i</span> We recommend that you use the default value.</p> <p><span data-bbox="536 1964 563 2002">i</span> If you experience problems, try changing this option.</p>

Setting	Description
	<ul style="list-style-type: none"> <li>Use 32-bit counters only: The interface scan always uses 32-bit traffic counters, even if 64-bit counters are available. This can make monitoring more reliable for some devices.</li> </ul>
Request Mode	<p>Select the request method that PRTG uses for SNMP sensors:</p> <ul style="list-style-type: none"> <li>Use multi get (default): Bundle multiple SNMP requests into one request. We recommend that you use this option.</li> </ul> <p><b>i</b> If you experience problems, try changing this option.</p> <ul style="list-style-type: none"> <li>Use single get: Use one request for each SNMP value. This can increase compatibility with older devices.</li> </ul> <p><b>i</b> PRTG uses <a href="#">paging</a> for SNMP requests. This means that if a sensor must query more than 20 object identifiers (OID), it automatically polls the OIDs in packages of 20 OIDs each.</p>
Walk Mode	<p>Select the kind of SNMP walk that PRTG uses for SNMP sensors:</p> <ul style="list-style-type: none"> <li>Use GETBULK requests (default): Request the next <b>x</b> OIDs in one SNMP request. The default value is <b>10</b>. It is dynamic based on the response size.</li> </ul> <p><b>i</b> This option only works with devices that support SNMP as of version v2c. Make sure that you set the correct SNMP Version in the Credentials for SNMP Devices settings of the parent device or inherit it from objects that are higher in the <a href="#">object hierarchy</a><sup>132</sup>.</p> <ul style="list-style-type: none"> <li>Use GETNEXT requests: Request one OID at a time. This can increase compatibility with older devices or with devices that have insufficient SNMP BULKWALK support.</li> </ul>
Port Name Template	<p>Select how PRTG displays the name of SNMP sensors. Enter a template that uses several variables. When you add new sensors, PRTG scans the interface for available counters at certain OIDs. At each OID, several fields with interface descriptions are usually available. They are different for every device and OID. PRTG uses the information in these fields to name the sensors. If a field is empty or if it is not available, PRTG adds an empty string to the name. By default, the port name template is <b>([port]) [ifalias] [ifsensor]</b>, which creates a name like <b>(001) Ethernet1 Traffic</b>. You can use and combine any field names that are available at an OID of your device, for example:</p> <ul style="list-style-type: none"> <li>[port]: The port number of the monitored interface.</li> <li>[ifalias]: The 'alias' name for the monitored interface as specified by a network manager, providing a non-volatile handling.</li> <li>[ifname]: The textual name of the monitored interface as assigned by the local device.</li> <li>[ifdescr]: A textual string containing information about the target device or interface, for example, manufacturer, product name, or version.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ [ifspeed]: An estimate of the monitored interface's current bandwidth (Kbit/s).</li> <li>▪ [ifsensor]: The type of the sensor, this is <a href="#">Traffic</a> or <a href="#">RMON</a>. This helps to differentiate between <a href="#">SNMP Traffic</a> and <a href="#">SNMP RMON</a> sensors.</li> </ul> <p> For more information about SNMP sensor names, see the Knowledge Base: <a href="#">How can I change the defaults for names automatically generated for new SNMP sensors?</a></p>
Port Name Update	<p>Select how PRTG reacts if you change the names of ports in your physical device (for example, a switch or router):</p> <ul style="list-style-type: none"> <li>▪ Keep port names (use this if you edit the names in PRTG) (default): Do not automatically adjust sensor names. This is the best option if you want to manually change names in PRTG.</li> <li>▪ Automatically update sensor names if port names change in the device: If PRTG detects port name changes in your physical device, it tries to automatically adjust the sensor names accordingly.</li> </ul> <p> For more information about automatic name updates, see the Knowledge Base: <a href="#">Automatically update port name and number for SNMP Traffic sensors when the device changes them.</a></p>
Port Identification	<p>Select the field that PRTG uses for SNMP interface identification:</p> <ul style="list-style-type: none"> <li>▪ Automatic identification (default): Try the ifAlias field first to identify an SNMP interface and then try ifDescr. <ul style="list-style-type: none"> <li> PRTG does not automatically try ifName.</li> </ul> </li> <li>▪ Use IfAlias: For most devices, ifAlias is the best field to use for unique interface names.</li> <li>▪ Use IfDescr: Use this option if the port order of your device changes after a restart, and if no ifAlias field is available. For example, this is the best option for Cisco ASA devices. <ul style="list-style-type: none"> <li> If you use this option, it is important that your device returns unique interface names in the ifDescr field.</li> </ul> </li> <li>▪ Use IfName: You can also use this option if no unique ifAlias is available. <ul style="list-style-type: none"> <li> If you use this option, it is important that your device returns unique interface names in the ifName field.</li> </ul> </li> <li>▪ Do not update ports: Use this option to disable the automatic port identification.</li> </ul>
Start Interface Index	<p> This setting only applies to <a href="#">SNMP Traffic sensors</a> and to <a href="#">Cisco IP SLA sensors</a>.</p> <p>Enter the index at which PRTG starts to query the interface range during sensor creation. Enter <b>0</b> for the automatic mode.</p>

Setting	Description
	<p> We recommend that you use the default value.</p>
End Interface Index	<p> This setting only applies to <a href="#">SNMP Traffic sensors</a> and to <a href="#">Cisco IP SLA sensors</a>.</p> <p>Enter the index at which PRTG stops querying the interface range during sensor creation. Enter 0 for the automatic mode.</p> <p> We recommend that you use the default value.</p>

Set sensor to warning status for 1 interval, then set to down status (default) ▼

Scanning Interval

Setting	Description
Scanning Interval	Select a scanning interval from the dropdown list that determines the amount of time that the sensor waits between two scans: <ul style="list-style-type: none"> <li>▪ 30 seconds</li> <li>▪ 60 seconds</li> <li>▪ 5 minutes</li> <li>▪ 10 minutes</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ 15 minutes</li> <li>▪ 30 minutes</li> <li>▪ 1 hour</li> <li>▪ 4 hours</li> <li>▪ 6 hours</li> <li>▪ 12 hours</li> <li>▪ 24 hours</li> </ul> <p><b>i</b> You can change the available intervals in the <a href="#">system administration</a> [2870] of PRTG Network Monitor.</p>
<p>If a Sensor Scanning Fails</p>	<p>Select the number of scanning intervals that the sensor has time to reach and to check a device again if a sensor scanning fails. Depending on the option that you select, the sensor can try to reach and to check a device again several times before the sensor shows the Down <a href="#">status</a> [187]. This can avoid false alarms if the target device only has temporary issues. For previous scanning intervals with failed requests, the sensor shows the Warning status.</p> <p>The following options are available:</p> <ul style="list-style-type: none"> <li>▪ Set sensor to down status immediately: Set the sensor to the Down status immediately after the first request fails.</li> <li>▪ Set sensor to warning status for 1 interval, then set to down status (default): Set the sensor to the Warning status after the first request fails. If the second request also fails, the sensor shows the Down status.</li> <li>▪ Set sensor to warning status for 2 intervals, then set to down status: Set the sensor to the Down status only after the third request fails.</li> <li>▪ Set sensor to warning status for 3 intervals, then set to down status: Set the sensor to the Down status only after the fourth request fails.</li> <li>▪ Set sensor to warning status for 4 intervals, then set to down status: Set the sensor to the Down status only after the fifth request fails.</li> <li>▪ Set sensor to warning status for 5 intervals, then set to down status: Set the sensor to the Down status only after the sixth request fails.</li> </ul> <p><b>i</b> Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval before they show the Down status. It is not possible to immediately set a WMI sensor to the Down status, so the first option does not apply to these sensors. All other options can apply.</p> <p><b>i</b> If you define error limits for a sensor's channels, the sensor immediately shows the Down status. None of the interval options apply.</p>

Setting	Description
	<p> If a channel uses <a href="#">lookup</a> values, the sensor immediately shows the Down status. None of the interval options apply.</p>

## Schedules, Dependencies, and Maintenance Window

Click  to interrupt the [inheritance](#).

### Schedules, Dependencies, and Maintenance Window

 inherit from

*Schedules, dependencies, and maintenance windows always pause all sensors inside a group or device. This pausing is always inherited to all child objects and the inheritance cannot be disabled. Below you can set additional schedules, dependencies, or maintenance windows that will be used in parallel to any inherited setting.*

## 7.8 Sensor Settings

There is a dedicated section for every sensor with details about the available settings.

### Basic Sensor Settings

Every sensor has the same basic settings.

### Basic Sensor Settings

**Sensor Name** ⓘ

**Tags** ⓘ  X +

**Priority** ⓘ ★★★★☆

Basic Sensor Settings

Setting	Description
Sensor Name	<p>Enter a name to identify the sensor. By default, PRTG shows this name in the <a href="#">device tree</a>, as well as in <a href="#">alarms</a>, <a href="#">logs</a>, <a href="#">notifications</a>, <a href="#">reports</a>, <a href="#">maps</a>, <a href="#">libraries</a>, and <a href="#">tickets</a>.</p> <p> ⓘ If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Parent Tags	<p>The <a href="#">tags</a> that the sensor <a href="#">inherits</a> from its parent <a href="#">device</a>, parent <a href="#">group</a>, and parent <a href="#">probe</a>.</p> <p> ⓘ This setting is for your information only. You cannot change it.</p>
Tags	<p>Enter one or more tags. Confirm each tag with the Spacebar key, a comma, or the Enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case-sensitive. Tags are automatically <a href="#">inherited</a>.</p> <p> ⓘ It is not possible to enter tags with a leading plus (+) or minus (-) sign, nor tags with parentheses (()) or angle brackets (&lt;&gt;).</p> <p> ⓘ For performance reasons, it can take some minutes until you can filter for new tags that you added.</p> <p> ⓘ Every sensor has <a href="#">default tags</a>. For more information, see the specific sensor settings section.</p>

Setting	Description
Priority	Select a priority for the sensor. This setting determines the position of the sensor in lists. The highest priority is at the top of a list. Choose from the lowest priority ( ★☆☆☆☆ ) to the highest priority ( ★★★★★ ).

■ For more information, see section [Available Sensor Types](#).

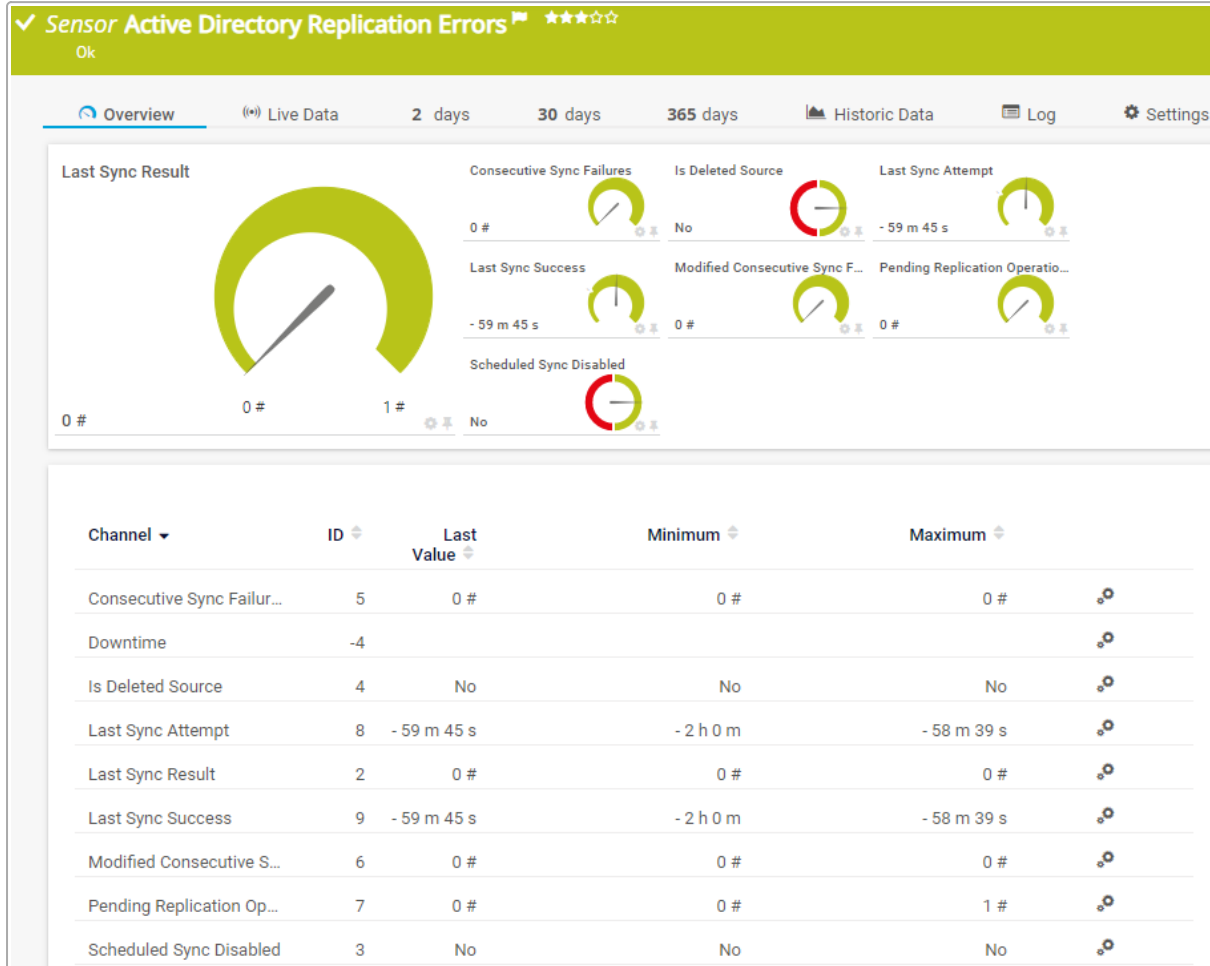

■ For sensor settings, multi-edit is also available. This lets you to change properties of many sensors at the same time. For more information, see section [Multi-Edit](#).

To detect unexpected correlations between your network components, PRTG provides a [similar sensors](#) analysis.

ⓘ Usually, a sensor connects to the IP Address/DNS Name of the parent device. See the [device settings](#) for details. For some sensors, you can explicitly define the monitoring target in the sensor settings.

## 7.8.1 Active Directory Replication Errors Sensor

The Active Directory Replication Errors sensor checks a Windows domain controller (DC) for replication errors.

Active Directory Replication Errors Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>673</sup>.

### Sensor in Other Languages

- Dutch: Active Directory Replicatie Fouten
- French: Active Directory erreurs de réplication
- German: Active Directory Replikationsfehler
- Japanese: AD レプリケーションエラー監視
- Portuguese: Erros de replicação Active Directory
- Russian: Ошибки репликации Active Directory
- Simplified Chinese: 活动目录复制错误
- Spanish: Errores de replicación Active Directory

## Remarks

Consider the following [remarks](#) <sup>670</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
Member of Windows domain	This sensor only works if the probe system is part of the domain whose Active Directory you want to monitor.
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node. If the sensor shows the error PE087, additionally install .NET 3.5 on the probe system.</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
Windows Server	We recommend Windows Server 2016 on the probe system for best performance of this sensor.
Parent device	This sensor requires that the parent device is a DC.
Credentials	<p>This sensor requires credentials for Windows systems. Otherwise, the sensor cannot correctly connect.</p> <p> We recommend that you use Windows domain credentials. If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target system.</p>
IPv6	This sensor supports IPv6.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Basic Sensor Settings

## Sensor Settings

### Sensor Settings

**Replication Neighbor** ⓘ Example

---

**Naming Context** ⓘ Configuration (default)

Sensor Settings

Setting	Description
Replication Neighbor	The replication neighbor whose replication connection this sensor monitors.
Naming Context	<p>Select the Active Directory naming context that you want to monitor:</p> <ul style="list-style-type: none"> <li>▪ Configuration (default): Includes information about partitions, sites, services, or the Active Directory schema.</li> <li>▪ Schema: Includes the information by which objects, classes, and attributes that are used in the Active Directory are defined.</li> <li>▪ DomainDnsZones: Includes information about the domain controllers that are in the domain.</li> <li>▪ Domain: Includes domain information that is replicated to this domain's domain controllers, for example information about computers or users. <ul style="list-style-type: none"> <li><span style="color: red;">ⓘ</span> The probe system must be part of the domain whose naming context you want to monitor.</li> </ul> </li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>ForestDnsZones: Includes information about domain controllers in the forest.</li> </ul> <p><b>i</b> You cannot change this value after sensor creation.</p>

## Debug Options

**Debug Options**

**Result Handling** **i**
 Discard result (default)  
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>Discard result (default): Do not store the sensor result.</li> <li>Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

**Primary Channel** **i** Downtime

---

**Graph Type** **i**
 Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are</p>

Setting	Description
	<p>available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Setting	Description
Consecutive Sync Failures	The number of consecutive synchronization failures
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status

Setting	Description
Is Deleted Source	If the source is deleted <ul style="list-style-type: none"> <li>▪ Up status: No</li> <li>▪ Down status: Yes</li> </ul>
Last Sync Attempt	The time of the last synchronization attempt
Last Sync Result	The result of the last synchronization  This channel is the primary channel by default.
Last Sync Success	The time of the last synchronization success
Modified Consecutive Sync Failures	The number of modified, consecutive synchronization failures
Pending Replication Operations	The number of pending replication operations
Scheduled Sync Disabled	If the scheduled synchronization is disabled <ul style="list-style-type: none"> <li>▪ Up status: No</li> <li>▪ Down status: Yes</li> </ul>

 Use transaction and commit on success

Data Processing ⓘ *Only execute query (default)*

Result Handling ⓘ  Discard result (default)  
 Store result

Sensor Display

Setting	Description
SQL Query File	<p>Select the SQL query file that includes a valid SQL statement that the sensor executes on the server with every scanning interval. The list contains SQL scripts from the \Custom Sensors\sql subfolder of the <a href="#">PRTG program directory</a> on the probe system. Store your script there. If you use the script on a cluster probe, you must store the script on all cluster nodes.</p> <p>A correct expression in the file could be: <code>SELECT AVG(UnitPrice) FROM Products</code>. If you want to use transactions, separate the individual steps with semicolons ";".</p> <p> ⓘ Note that with each request, PRTG transfers the full result set, so use filters and limits in your query.</p> <p> ⓘ The demo script Demo Serveruptime.sql is available by default. You can use it to monitor the uptime of the target server.</p> <p> ■ See also the Knowledge Base: <a href="#">Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?</a></p> <p> ⓘ You cannot change this value after sensor creation.</p>
Input Parameter Handling	<p>Define if you want to pass a parameter to the SQL query file:</p> <ul style="list-style-type: none"> <li>▪ Do not use input parameter (default): Execute the SQL query file without using variables.</li> <li>▪ Use input parameter: Execute an SQL query file that contains a variable. Provide the parameter that you want to use in the query below.</li> </ul>

Setting	Description
Input Parameter	<p><b>This setting is only visible if you select Use input parameter above.</b></p> <p>Enter the parameter that you want to pass to the SQL query file. This parameter replaces the variables <code>@prtg</code>, <code>:prtg</code>, or <code>?</code> in the SQL query, considering the general rules for SQL variables.</p> <p>You can also use PRTG placeholders for custom sensors (command-line parameters) as input parameters, for example, <code>%sensorid</code> or <code>%deviceid</code>. For more information, see section <a href="#">Custom Sensors</a>.</p> <p><b>i</b> Provide strings as they are and do not surround them with quotation marks. PRTG automatically and correctly inserts string parameters into the query.</p>
Transaction Handling	<p>Define if you want to use transactions and if they affect the database content:</p> <ul style="list-style-type: none"> <li>▪ Do not use transaction (default): Do not execute transactions.</li> <li>▪ Use transaction and always roll back: The query does not change data in the database. In the SQL query file, separate the single steps of the transaction with semicolons.</li> <li>▪ Use transaction and commit on success: The query changes data in the database. The changes only apply if all execution steps succeed without any errors. In the SQL query file, separate the single steps of the transaction with semicolons.</li> </ul>
Data Processing	<p>Define whether the sensor processes data from the database:</p> <ul style="list-style-type: none"> <li>▪ Only execute query (default): Only show information about the number of affected rows and the execution time of the query. Affected rows are rows that were changed by the query (for example, created, deleted, or edited).</li> <li>▪ Count table rows: Execute a <code>SELECT</code> statement and monitor how many rows of the data table this statement returns.</li> <li>▪ Process data table: Read and analyze the data table. If you select this option, the sensor counts rows with <code>SELECT</code> statements as well.</li> </ul> <p><b>i</b> You cannot change this value after sensor creation.</p>
DBNull Handling	<p><b>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</b></p> <p>Define the sensor behavior if the query returns <code>DBNull</code>:</p> <ul style="list-style-type: none"> <li>▪ Error: Show the Down status if the query returns <code>DBNull</code>.</li> <li>▪ Number 0: Recognize the result <code>DBNull</code> as a valid value and interpret it as the number <code>0</code>.</li> </ul>

Setting	Description
<p>Select Channel Value by</p>	<p><b>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</b></p> <p>Define how to select the desired cell in the database table:</p> <ul style="list-style-type: none"> <li>▪ Column number: Determine the channel value by using the value in row 0 of the column whose number you specify in Channel #x Column Number.</li> <li>▪ Column name: Determine the channel value by using the value in row 0 of the column whose name you specify in Channel #x Column Name.</li> <li>▪ Row number: Determine the channel value by using the value in column 0 of the row whose number you specify in Channel #x Row Number.</li> <li>▪ Key value pair: Determine the channel value by searching in column 0 for the key you specify in Channel #x Key and by returning the value in column 1 of the same row where the key value was found.</li> </ul> <p><b>i</b> Defining how the desired cell in the database table is selected is necessary to configure the cells that are used in the channels.</p> <p><b>i</b> The option you select here also defines the method of how to optionally determine a value for the sensor message. For more information, see setting Use Data Table Value in Message.</p> <p><b>■</b> For an example for channel value selection, see section <a href="#">Monitoring Databases</a>.</p>
<p>Channel #2 - #10</p>	<p><b>This setting is only visible if you select Process data table above.</b></p> <p>You can define up to 10 channels. You must define at least one channel, so you see all available settings for <b>Channel #1</b>. Specify how to handle all other possible channels:</p> <ul style="list-style-type: none"> <li>▪ Disable: Do not create this channel.</li> <li>▪ Enable: Create this channel.</li> </ul> <p><b>i</b> It is not possible to enable or disable channels after sensor creation.</p>
<p>Channel #x Name</p>	<p><b>This setting is only visible if you select Process data table above.</b></p> <p>Enter a name for the channel. Enter a string. The sensor dynamically generates channels with this name as identifier.</p> <p><b>i</b> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>

Setting	Description
Channel #x Column Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Column number for the setting Select Channel Value by.</p> <p>Provide the number of the column to use to determine the channel value in row 0. Enter an integer.</p>
Channel #x Column Name	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Column name for the setting Select Channel Value by.</p> <p>Provide the name of the column to use to determine the channel value in row 0. Enter an integer.</p>
Channel #x Row Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Row number for the setting Select Channel Value by.</p> <p>Provide the number of the column to use to determine the channel value in row 0. Enter an integer.</p>
Channel #x Key	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation and if you select Key value pair for the setting Select Channel Value by.</p> <p>Provide the key to search for in column 0 of the data table. The value in column 1 of the same row where the key value was found to use to determine the channel value. Enter a string.</p>
Channel #x Mode	<p>This setting is only visible if you select Process data table above.</p> <p>Define how to display the determined value in the channel:</p> <ul style="list-style-type: none"> <li>▪ Absolute (default): Show the value as the sensor retrieves it from the data table.</li> <li>▪ Difference: The sensor calculates and shows the difference between the last and the current value returned from the data table. <ul style="list-style-type: none"> <li>ⓘ This mode is not compatible with the unit Lookup.</li> <li>ⓘ This mode only works if the difference between the last and the current value is positive and increases with each scanning interval. This mode does not support negative and decreasing values.</li> </ul> </li> <li>▪ Absolute (recommended): Show the value as the sensor retrieves it from the data table.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Difference: The sensor calculates and shows the difference between the last and the current value returned from the data table.</li> <li>ⓘ This mode is not compatible with the unit Lookup.</li> <li>ⓘ This mode only works if the difference between the last and the current value is positive and increases with each scanning interval. This mode does not support negative and decreasing values.</li> <li>ⓘ You cannot change this value after sensor creation.</li> </ul>
<p>Channel #x Unit</p>	<p>This setting is only visible if you select Process data table above.</p> <p>Define the unit of the channel value:</p> <ul style="list-style-type: none"> <li>▪ BytesBandwidth</li> <li>▪ BytesMemory</li> <li>▪ BytesDisk</li> <li>▪ Temperature</li> <li>▪ Percent</li> <li>▪ TimeResponse</li> <li>▪ TimeSeconds</li> <li>▪ TimeHours</li> <li>▪ Count</li> <li>▪ CPU</li> <li>▪ BytesFile</li> <li>▪ SpeedDisk</li> <li>▪ SpeedNet</li> <li>▪ Custom</li> <li>▪ Lookup</li> </ul> <p>■ For more information about the available units, see section <a href="#">Custom Sensors</a>.</p> <p>ⓘ To use <a href="#">lookups</a> with this channel, select Lookup and define the lookup file in Channel #x Lookup. Do not use Custom if you use lookups with this sensor.</p> <p>ⓘ It is not possible to use the unit Lookup in combination with the Difference mode. You are not able to create the sensor in this case.</p>
<p>Channel #x Custom Unit</p>	<p>This setting is only visible if you select the channel unit Custom above.</p> <p>Define a unit for the channel value. Enter a string.</p>

Setting	Description
Channel #x Lookup	<p>This setting is only visible if you select the channel unit <a href="#">Lookup</a> above.</p> <p>Select a <a href="#">lookup</a> file that you want to use with this channel.</p>
Use Data Table Value in Message	<p>This setting is only visible if you select <a href="#">Process data table</a> for the setting <a href="#">Data Processing</a> during sensor creation.</p> <p>Define if the sensor message shows a value from the data table:</p> <ul style="list-style-type: none"> <li>▪ <b>Disable:</b> Do not use a custom sensor message.</li> <li>▪ <b>Enable:</b> Define a custom sensor message with a defined value of the data table. Define the value selection below.</li> </ul> <p><b>i</b> The method of how to determine a value for the sensor message is defined in the setting <a href="#">Select Channel Value by</a> above.</p>
Message Column Number	<p>This setting is only visible if you select <a href="#">Process data table</a> for the setting <a href="#">Data Processing</a> during sensor creation, if you select <a href="#">Column name</a> for the setting <a href="#">Select Channel Value by</a>, and if you select <a href="#">Enable</a> above.</p> <p>Enter the number of a column. The sensor message shows the value in row 0 of this column. Enter an integer.</p>
Message Column Name	<p>This setting is only visible if you select <a href="#">Process data table</a> for the setting <a href="#">Data Processing</a> during sensor creation, if you select <a href="#">Column name</a> for the setting <a href="#">Select Channel Value by</a>, and if you select <a href="#">Enable</a> above.</p> <p>Enter the name of a column. The sensor message shows the value in row 0 of this column. Enter a string.</p> <p><b>i</b> Columns start with index 0.</p>
Message Row Number	<p>This setting is only visible if you select <a href="#">Process data table</a> for the setting <a href="#">Data Processing</a> during sensor creation, if you select <a href="#">Row number</a> for the setting <a href="#">Select Channel Value by</a>, and if you select <a href="#">Enable</a> above.</p> <p>Enter the name of a column. The sensor message shows the value in row 0 of this column. Enter the number of a row. The sensor message shows the value in column 0 of this row. Enter an integer.</p> <p><b>i</b> Rows start with index 0.</p>
Message Key	<p>This setting is only visible if you select <a href="#">Process data table</a> for the setting <a href="#">Data Processing</a> during sensor creation, if you select <a href="#">Key value pair</a> for the setting <a href="#">Select Channel Value by</a>, and if you select <a href="#">Enable</a> above.</p>

Setting	Description
	Enter a key to search for in column 0 of the data table. The sensor message shows the value in column 1 of the row where the key was found. Enter a string.
Message	<p><b>This setting is only visible if you select Enable above.</b></p> <p>Define the sensor message. Enter a string. Use the placeholder {0} at the position where you want to display the value.</p> <p>Example: <b>The message is {0}</b></p> <p><b>i</b> PRTG does not support the number sign (#) in sensor messages. If a message contains a number sign, PRTG clips the message at this point.</p>
If Message Changes	<p><b>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</b></p> <p>Define what the sensor does when its message changes:</p> <ul style="list-style-type: none"> <li>Ignore (default): Do nothing.</li> <li>Trigger 'change' notification: Send an internal message that indicates a change. <ul style="list-style-type: none"> <li><b>i</b> In combination with a <a href="#">change trigger</a>, you can use this to <a href="#">trigger a notification</a> if a change occurs.</li> </ul> </li> </ul>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>Discard result (default): Do not store the sensor result.</li> <li>Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel **i** Downtime

---

Graph Type **i** 
 Show channels independently (default)
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Affected Rows	The number of rows that were addressed by the query (including <b>SELECT</b> statements if you process data tables)

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Execution Time	The execution time of the entire request (including connection buildup, query execution, transaction handling, disconnection)  <span style="font-size: 1.2em;">i</span> This channel is the primary channel by default.
Query Execution Time	The execution time of the specified query

## SQL Variables

You can use the following variables in the SQL query file to be replaced by an input parameter. This is useful if you have various SQL sensors with queries that differ in only one parameter.

- Microsoft SQL, MySQL, PostgreSQL: @prtg
- Oracle SQL: :prtg
- ADO SQL: ? (question mark)

i @prtg, :prtg, and ? are common SQL query parameters and they are used in a parameterized SQL query. This means that the query and the parameter are forwarded without any changes to the database. This leads to some restrictions on the database side. For example, you cannot use variables as placeholders for table names or as lists in IN operators.

Examples for variables usage:

```
SELECT * FROM Table WHERE name = @prtg
SELECT @prtg FROM Table
```

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
API Requests	The number of API requests
Average CPU Utilization (%)	The CPU usage of the PRTG application server process (%)
Core Messages	The number of messages that the PRTG application server receives from the PRTG core server
CPU Utilization of Garbage Collector (%)	The CPU usage of the PRTG application server garbage collector (%)
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Dropped API Requests	<p>The number of API requests per second that were dropped due to timeouts</p> <p><b>i</b> This channel has default limits:</p> <ul style="list-style-type: none"> <li>▪ Upper error limit: <b>5</b></li> <li>▪ Upper warning limit: <b>1</b></li> </ul>
Free Memory (%)	The free system memory of the PRTG application server system (%)
Health	<p>The sums of the PRTG application server state as a value between 100% (healthy) and 0% (unhealthy). Investigate if values are frequently under 100%.</p> <p><b>i</b> This channel is the primary channel by default.</p>
Heap Size (%)	The heap size of the memory that the PRTG application server uses (%)
Process Memory Usage	The memory usage of the PRTG application server process
Response Time	The average response time of the new API
Response Time 95th Percentile	The 95th percentile of the response time of the new API
Routines	The number of concurrently running routines in the PRTG application server
Sessions	The number of active user sessions

Channel	Description
Stack Size (%)	The relative stack size of the memory that the PRTG application server uses (%)

## 7.8.4 AWS Alarm v2 Sensor

The AWS Alarm v2 sensor monitors the status of an Amazon Web Services (AWS) alarm by reading its data from Amazon CloudWatch via the [AWS API](#).

- i If you use the same Identity and Access Management (IAM) policy that you use for this sensor, you must update it. For more information, see the Knowledge Base: [How do I set permissions for the Amazon Web Services \(AWS\) API key to use certain sensors in PRTG?](#)
- i If you monitor an AWS alarm that is based on a metric math expression, this sensor does not create an additional channel that monitors the math expression.

AWS Alarm v2 Sensor

- For a list of regions that this sensor supports, see section [Supported AWS Regions and Their Codes](#).
- For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: AWS Alarm v2
- French: Alarme AWS v2
- German: AWS Alarm v2
- Japanese: AWS Alarm v2
- Portuguese: Alarme da AWS v2
- Russian: Аварийный сигнал AWS v2

- Simplified Chinese: AWS 警报 v2
- Spanish: Alarma AWS v2

## Remarks

Consider the following [remarks](#) <sup>694</sup> and requirements for this sensor:

Remark	Description
Permissions for the AWS API key	This sensor requires permissions for the <a href="#">AWS API key</a> .  ■ For more information, see the Knowledge Base: <a href="#">How do I set permissions for the Amazon Web Services (AWS) API key to use certain sensors in PRTG?</a>
Credentials	This sensor requires credentials for AWS.
Alarms	This sensor supports <a href="#">MetricAlarm</a> and <a href="#">CompositeAlarm</a> .
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">low</a> performance impact.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Pricing	Amazon can charge you based on the number of API calls that the sensor sends to the Amazon servers. For more information, see <a href="#">Amazon CloudWatch Pricing – Amazon Web Services (AWS)</a> .
Add Sensor dialog	It can take up to several minutes before objects appear in the Add Sensor dialog.
Scanning interval	This sensor has a fixed minimum scanning interval for performance reasons. You cannot use a shorter scanning interval. Consequently, shorter scanning intervals in the <a href="#">Monitoring</a> settings are not available for this sensor.  <ul style="list-style-type: none"> <li>▪ The minimum scanning interval of this sensor is <a href="#">1 minute</a>.</li> <li>▪ The recommended scanning interval of this sensor is <a href="#">5 minutes</a>.</li> </ul>

## Basic Sensor Settings

### Basic Sensor Settings

**Sensor Name** ⓘ Example Name

---

**Tags** ⓘ exampletag ✕ ⊕

---

**Priority** ⓘ ★★☆☆☆

Basic Sensor Settings

The sensor has the following [default tags](#) that are automatically predefined in the sensor's settings when you add the sensor:

- alarm
- aws
- cloudwatch
- cloudwatchsensor

■ For more information about basic sensor settings, see section [Sensor Settings](#) <sup>667</sup>.

## AWS Alarm Specific

### AWS Alarm Specific

**Name** ⓘ Example

**Type** ⓘ Metric

**Description** ⓘ No description

**Region** ⓘ US East (Ohio)

AWS Alarm Specific

Setting	Description
Name	The name of the AWS alarm that this sensor monitors.
Type	The type of the AWS alarm that this sensor monitors.
Description	The description of the AWS alarm that this sensor monitors.
Region	The region in which the AWS alarm that this sensor monitors occurs.

Setting	Description
	<p>■ For a list of regions that this sensor supports, see section <a href="#">Supported AWS Regions and Their Codes</a>.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select Stack channels on top of each other above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Debug Options

Debug Options

**Result Handling** ⓘ

Discard result (default)

Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Alarm State	<p>The alarm status</p> <p>ⓘ This channel is the primary channel by default.</p>

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
[Metric]	The metric on which the alarm is based

### 7.8.5 AWS Cost Sensor

The AWS Cost sensor monitors the cost of an Amazon Web Services (AWS) account by reading its data from the [AWS Cost Explorer API](#).

AWS Cost Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

#### Sensor in Other Languages

- Dutch: AWS Kosten
- French: Coût AWS
- German: AWS Kosten
- Japanese: AWS Cost
- Portuguese: Custo da AWS
- Russian: Затраты AWS

- Simplified Chinese: AWS 成本
- Spanish: Costo AWS

## Remarks

Consider the following [remarks](#) <sup>700</sup> and requirements for this sensor:

Remark	Description
AWS Cost Explorer	This sensor requires that you activate the <a href="#">AWS Cost Explorer</a> in your AWS account.
IAM User and Role Access to Billing Information	This sensor requires that you enable <a href="#">IAM User and Role Access to Billing Information</a> in your AWS account.
Permissions for the AWS API key	<p>This sensor requires permissions for the <a href="#">AWS API key</a>.</p> <p> The AWS API key requires the following permissions to query data from the AWS API:</p> <ul style="list-style-type: none"> <li>▪ "ce:GetCostAndUsage"</li> <li>▪ "ce:GetCostForecast"</li> <li>▪ "ce:GetDimensionValues"</li> <li>▪ "ce:GetCostAndUsageWithResources"</li> <li>▪ "ce:GetUsageForecast"</li> </ul> <p> For more information, see the Knowledge Base: <a href="#">How do I set permissions for the Amazon Web Services (AWS) API key to use certain sensors in PRTG?</a></p>
Credentials	This sensor requires credentials for AWS.
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">low</a> performance impact.
Sensor creation	After sensor creation, the first data is available after 24 hours. Forecast data is available after a few days.
Scanning interval	<p>This sensor has a fixed minimum scanning interval for performance reasons. You cannot use a shorter scanning interval. Consequently, shorter scanning intervals in the <a href="#">Monitoring</a> settings are not available for this sensor.</p> <ul style="list-style-type: none"> <li>▪ The minimum scanning interval of this sensor is <a href="#">1 hour</a>.</li> </ul>

Remark	Description
	<ul style="list-style-type: none"> <li>The recommended scanning interval of this sensor is <b>6 hours</b>. You can use a shorter scanning interval but it could create extra costs.</li> </ul>
Pricing	Amazon charges you for each API call that this sensor sends to the Amazon servers. For more information, see <a href="#">AWS Cost Management Pricing   Amazon Simple Storage Service</a> .
Sensor creation	You can only set up this sensor for one AWS account per PRTG installation.
Knowledge Base	<p>Knowledge Base: <a href="#">What settings do I have to define in my AWS account to set up the AWS Cost sensor?</a></p> <p>Knowledge Base: <a href="#">How do I set permissions for the Amazon Web Services (AWS) API key to use certain sensors in PRTG?</a></p>

## Basic Sensor Settings

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Amortized Monthly	The amortized cost per month
Amortized Yearly	The amortized cost per year

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Forecast Amortized Monthly	The forecast for amortized cost per month
Forecast Amortized Yearly	The forecast for amortized cost per year
Forecast Monthly	The forecast for cost per month
Forecast Net Amortized Monthly	The forecast for net amortized cost per month
Forecast Net Amortized Yearly	The forecast for net amortized cost per year
Forecast Net Unblended Monthly	The forecast for net unblended cost per month
Forecast Net Unblended Yearly	The forecast for net unblended cost per year
Forecast Unblended Monthly	The forecast for unblended cost per month
Forecast Unblended Yearly	The forecast for unblended cost per year
Forecast Yearly	The forecast for cost per year
Monthly Cost	The monthly cost  This channel is the primary channel by default.
Net Amortized Monthly	The net amortized cost per month
Net Amortized Yearly	The net amortized cost per year
Net Unblended Monthly	The net unblended cost per month
Net Unblended Yearly	The net unblended cost per year

Channel	Description
Unblended Monthly	The unblended cost per month
Unblended Yearly	The unblended cost per year
Yearly Cost	The cost per year

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

## Supported Metrics

The AWS ELB v2 sensor supports the following metrics:

- ActiveConnectionCount (Sum)
- ActiveFlowCount (Average)
- ConsumedLCUs (Sum)
- HealthyHostCount (Minimum)
- HTTPCode\_ELB\_4XX\_Count (Sum)
- HTTPCode\_ELB\_5XX\_Count (Sum)
- HTTPCode\_Target\_4XX\_Count (Sum)
- HTTPCode\_Target\_5XX\_Count (Sum)

- NewConnectionCount (Sum)
- NewFlowCount (Sum)
- PeakBytesPerSecond (Maximum)
- RuleEvaluations (Sum)
- TargetConnectionErrorCount (Sum)
- TargetResponseTime (Average)
- TCP\_Client\_Reset\_Count (Sum)
- TCP\_ELB\_Reset\_Count (Sum)
- TCP\_Target\_Reset\_Count (Sum)
- UnhealthyHostCount (Maximum)

### Supported Dimensions

The AWS ELB v2 sensor supports the following dimensions:

- Load Balancer

### Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Active Connection Count	The number of concurrent active TCP connections
Active Flow Count	The number of concurrent flows
Consumed LCU's	The number of LCU used by the load balancer
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
ELB 4XX Count	The number of HTTP 4XX client error codes
ELB 5XX Count	The number of HTTP 5XX server error codes
Healthy Host Count	The number of targets that are considered healthy
New Connection Count	The number of new TCP connections

Channel	Description
New Flow Count	The number of new flows
Peak Bytes	The highest average throughput
Processed Bytes	The number of bytes processed
Rule Evaluations	The number of rules processed
Target 4XX Count	The number of HTTP response codes generated by the targets
Target 5XX Count	The number of HTTP response codes generated by the targets
Target Connection Error Count	The number of connections that were not successfully established
Target Response Time	The response time of the target
TCP Client Reset Count	The number of RST packets sent from a client to a target
TCP ELB Reset Count	The number of RST packets generated by the load balancer
TCP Target Reset Count	The number of RST packets sent from a target to a client
Unhealthy Host Count	The number of targets that are considered unhealthy

### 7.8.9 AWS RDS v2 Sensor

The AWS RDS v2 sensor monitors the performance of a Amazon Web Services (AWS) Relational Database Service (RDS) database by reading its data from Amazon CloudWatch via the [AWS API](#).

**i** If you use the same Identity and Access Management (IAM) policy that you use for this sensor, you must update it. For more information, see the Knowledge Base: [How do I set permissions for the Amazon Web Services \(AWS\) API key to use certain sensors in PRTG?](#)

AWS RDS v2 Sensor

- For a list of metrics that this sensor supports, see section [Supported Metrics](#)<sup>[732]</sup>.
- For a list of dimensions that this sensor supports, see section [Supported Dimensions](#)<sup>[733]</sup>.
- For a list of regions that this sensor supports, see section [Supported AWS Regions and Their Codes](#).

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[733]</sup>.

### Sensor in Other Languages

- Dutch: AWS RDS v2
- French: AWS RDS v2
- German: AWS RDS v2
- Japanese: AWS RDS v2
- Portuguese: AWS RDS v2
- Russian: AWS RDS v2
- Simplified Chinese: AWS RDS v2
- Spanish: AWS RDS v2

### Remarks

Consider the following [remarks](#)<sup>[729]</sup> and requirements for this sensor:

Remark	Description
Permissions for the AWS API key	This sensor requires permissions for the <a href="#">AWS API key</a> . ■ For more information, see the Knowledge Base: <a href="#">How do I set permissions for the Amazon Web Services (AWS) API key to use certain sensors in PRTG?</a>
Credentials	This sensor requires credentials for AWS.
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">low</a> performance impact.
Pricing	Amazon can charge you based on the number of API calls that the sensor sends to the Amazon servers. For more information, see <a href="#">Amazon CloudWatch Pricing – Amazon Web Services (AWS)</a> .
Add Sensor dialog	It can take up to several minutes before objects appear in the Add Sensor dialog.
Scanning interval	This sensor has a fixed minimum scanning interval for performance reasons. You cannot use a shorter scanning interval. Consequently, shorter scanning intervals in the <a href="#">Monitoring</a> settings are not available for this sensor. ■ The minimum scanning interval of this sensor is <a href="#">5 minutes</a> .

Remark	Description
	<ul style="list-style-type: none"> <li>The recommended scanning interval of this sensor is <b>5 minutes</b>.</li> </ul>

### Basic Sensor Settings

#### Basic Sensor Settings

For more information, see section [Inheritance of Settings](#).

## Supported Metrics

The AWS RDS v2 sensor supports the following metrics:

- BinLogDiskUsage (MB)
- CPUUtilization (Average)
- CPUCreditUsage (Average)
- CPUCreditBalance (Average)
- DatabaseConnections (Count)
- DiskQueueDepth (Count)
- FreeableMemory (MB)
- FreeStorageSpace (MB)

- NetworkReceiveThroughput (Byte/Second)
- NetworkTransmitThroughput (Byte/Second)
- ReadIOPS (Count/Second)
- ReadLatency (Milliseconds)
- ReadThroughput (Byte/Second)
- ReplicaLag (Milliseconds)
- SwapUsage (MB)
- WriteIOPS (Count/Second)
- WriteLatency (Milliseconds)
- WriteThroughput (Byte/Second)

### Supported Dimensions

The AWS RDS v2 sensor supports the following dimensions:

- DBInstanceIdentifier

### Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Bin Log Disk Usage	The bin log disk usage
CPU Credit Balance	The CPU credit balance
CPU Credit Usage	The CPU credit usage
CPU Utilization	The CPU usage <b>i</b> This channel is the primary channel by default.
Database Connections	The average number of database connections in use
Disk Queue Depth	The number of outstanding read and write requests waiting to access the disk
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status

Channel	Description
Free Storage Space	The amount of available storage space
Freeable Memory	The freeable memory
Network Receive Throughput	The incoming (receive) network traffic
Network Transmit Throughput	The outgoing (transmit) network traffic
Read IOPS	The average number of disk read IOPS
Read Latency	The read latency
Read Throughput	The average number of bytes read from disk
Replica Lag	The amount of time a read replica DB instance lags behind the source DB instance
Swap Usage	The swap usage
Write IOPS	The average number of disk write IOPS
Write Latency	The average amount of time taken per disk read and write operation
Write Throughput	The number of disk write operations

## 7.8.11 Business Process Sensor

The Business Process sensor gives you a summarized status of entire business processes while monitoring several process components. This means that you can create a customized sensor with channels based on data from other sensors ("source sensors") that are specific to your network.

**i** If you want to process values from other sensors and you want to perform calculations with these values, for example, use the [Sensor Factory](#)<sup>[1757]</sup> sensor.

Business Process Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[747]</sup>.

### Sensor in Other Languages

- Dutch: Bedrijfs Proces
- French: Processus métier
- German: Business Process
- Japanese: ビジネスプロセス
- Portuguese: Processo empresarial
- Russian: Бизнес-процесс
- Simplified Chinese: 业务进程

- Spanish: Proceso empresarial

## Remarks

Consider the following [remarks](#)<sup>[741]</sup> and requirements for this sensor:

Remark	Description
Channels	This sensor does not officially support more than <a href="#">50 channels</a> .
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">medium</a> performance impact.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Knowledge Base	Knowledge Base: <a href="#">How does the Business Process sensor calculate summarized sensor states?</a>

## Basic Sensor Settings

### Basic Sensor Settings

**Sensor Name** ⓘ Example Name

---

**Tags** ⓘ  X +

---

**Priority** ⓘ ★★☆☆☆

Basic Sensor Settings

The sensor has the following [default tags](#) that are automatically predefined in the sensor's settings when you add the sensor:

- businessprocesssensor
- factorysensor

■ For more information about basic sensor settings, see section [Sensor Settings](#)<sup>[667]</sup>.

## Business Process Specific Settings

**Business Process Specific Settings**

**States and Conditions**

Step 1. The sensor maps object states to object conditions. The following object states are mapped to the "up" condition:

Up, Warning, Unusual, Down (Partial), Unknown (Collecting)

The following object states are mapped to the "down" condition:

Down, Unknown (None), Paused, Down (Acknowledged)

See the [PRTG Manual](#) for the reasoning behind this behavior.  
A probe, group, or device that you add to a channel is in the "up" condition as long as none of its sensors are in the "down" condition.

Step 2. The Business Process sensor compares the percentage of the "up" conditions of the objects in a channel with the thresholds you define. If the percentage of objects in the "up" condition is smaller than indicated by your warning or error threshold, the channel will be in an overall "warning" or "down" status respectively.

Step 3. The Global State channel of the Business Process sensor always shows the "most severe" status that at least one of your channels has.

Channel Name	Error	Warning	Objects	
Channel 1	50	25	<span style="color: green;">✔</span> Battery: SMP D... <span style="color: blue;">✕</span>	⊕
Channel 2	50	75	<span style="color: green;">✔</span> SSH Disk Free <span style="color: blue;">✕</span>	⊕
Channel 3	50	75	<span style="color: gray;">?</span> CPU Load <span style="color: blue;">✕</span>	⊕
Enter Channel Name	50	75		

Business Process Specific Settings

Setting	Description
Channel Name	<p>Enter a name for the channel. To add a new channel to this sensor, click the Enter Channel Name field, enter a name for the channel, and confirm with the Enter or Tab key.</p> <p><b>i</b> It might take several sensor scans until new channel names or changes to channel names become visible.</p>
Error Threshold %	<p>Set a percentage limit to define when the channel displays the Down status. Enter an integer. The default value is <b>50%</b>.</p> <p><b>i</b> This value depends on how many objects you feed into a Business Process channel.</p> <p>If the percentage of source objects in the "up" condition is less than the error threshold defines, the channel and the Global State channel of the Business Process sensor show the Down status.</p> <p>PRTG maps the following <a href="#">sensor states</a> to the "up" condition ▲ for a Business Process channel:</p> <ul style="list-style-type: none"> <li>▪ Up</li> <li>▪ Warning</li> <li>▪ Unusual</li> <li>▪ Down (Partial)</li> </ul>

Setting	Description
	<p>PRTG maps all other sensor states to the "down" condition ▼ (see <a href="#">Up and Down Conditions</a><sup>[744]</sup>).</p> <p>For example, if you define 4 source sensors for a channel, an error threshold of 50% means that 3 source sensors must be in the "down" condition to set this channel to the Down status. So, 50% means that more than half of the source sensors must <b>not</b> be in the "up" condition to set the sensor to the Down status.</p> <p>■ For more information, an illustration of the business process mechanisms, and some use cases for the Business Process sensor, see the table <a href="#">below</a><sup>[744]</sup> and the Knowledge Base: <a href="#">How can I use the Business Process sensor?</a></p>
Warning Threshold %	<p>Set a percentage limit to define when the channel displays the Warning status. Enter an integer. The default value is 75%.</p> <p>ⓘ This value depends on how many objects you feed into a Business Process channel.</p> <p>If the percentage of source objects in the "up" condition is less than the threshold defines, the channel and the Global State channel of the Business Process sensor show the Warning status.</p> <p>PRTG maps the following sensor states to the "up" condition ▲ for a Business Process channel:</p> <ul style="list-style-type: none"> <li>▪ Up</li> <li>▪ Warning</li> <li>▪ Unusual</li> <li>▪ Down (Partial)</li> </ul> <p>PRTG maps all other sensor states to the "down" condition ▼ (see <a href="#">Up and Down Conditions</a><sup>[744]</sup>).</p> <p>For example, if you define 4 source sensors for a channel, a warning threshold of 75% means that all 4 source sensors must be in the "down" condition to set this channel to the Warning status. So, 75% means that more than three out of four of the source sensors must <b>not</b> be in the "up" condition to set the sensor to the Warning status.</p> <p>■ For more information, an illustration of the business process mechanisms, and some use cases for the Business Process sensor, see the table <a href="#">below</a><sup>[744]</sup> and the Knowledge Base: <a href="#">How can I use the Business Process sensor?</a></p>
Objects	<p>Enter the objects that you want to have in a channel by clicking 🍀. This way, you can select the desired objects from the device tree with the <a href="#">object selector</a>. You can also start to type the object's ID, name, or a tag. PRTG then suggests the possible objects.</p>

Setting	Description
	<p>You can add sensors, devices, groups, and probes to a channel. Each object you add is weighted equally, no matter if it is a single sensor or a device with many sensors. To give more weight to a specific object, add it several times. For example, add the object twice to give double weight to it, add it three times to give it triple weight.</p> <p> A probe, group, or device is in the "up" condition ▲ as long as it does not contain any sensors in the "down" condition ▼.</p>

## Up and Down Conditions

The Business Process "up" ▲ and "down" ▼ conditions are different from the normal Up and Down sensor states. This is necessary for the Business Process sensor to calculate summarized states and to show a calculated result for an entire business process. This table illustrates which sensor status leads to which Business Process condition.

### The Relation Between Object States And Business Process Conditions

Channel Object Status	Business Process Condition	Reason: Why does a specific sensor status correspond to a specific Business Process condition?
 Up	Up ▲	The monitored object works, so everything is fine.
 Warning	Up ▲	The sensor might show a warning, but the monitored object still works.
 Down (Partial)	Up ▲	This status is available in a cluster and is displayed if at least one cluster node reports the sensor as in the Up status and at least one cluster node reports it as in the Down status. With at least one Up report, the monitored object is supposed to be working and meets the Business Process "up" condition.
 Unusual	Up ▲	The sensor might show unusual values, but the monitored object works.
 Collecting	Up ▲	The sensor is still waiting for more monitoring data to definitely decide on the sensor status, but so far the monitored object works. This PRTG internal status is visualized as the Unknown status in the PRTG web interface.
 Down	Down ▼	The monitored object does not work.

Channel Object Status	Business Process Condition		Reason: Why does a specific sensor status correspond to a specific Business Process condition?
Unknown	Down		The sensor does not know if the monitored object works, for example because it has not yet received any data or because it has not received any data for a certain amount of time.
None	Down		The sensor has not yet received any monitoring data from the monitored object. This PRTG internal status is visualized as the Unknown status in the PRTG web interface.
Paused	Down		The monitored object does not work and monitoring has been paused, for example actively by the user, by inheritance, or by schedules. It might be convenient to exclude regularly or frequently paused objects from your business process monitoring, so you do not give more weight than necessary to a Business Process "down" condition because of issues you already know about.
Down (Acknowledged)	Down		The monitored object does not work and someone already knows.

**i** If you encounter issues with your Business Process sensor and want to [contact the Paessler support team](#), send us your [exact configuration](#). Click in the upper-right corner of the Business Process Specific Settings table to copy your configuration:

### Business Process Specific Settings

**States and Conditions** *Step 1. The sensor maps object states to object conditions. The following object states are mapped to the "up" condition:*  
Up, Warning, Unusual, Down (Partial), Unknown (Collecting)

*The following object states are mapped to the "down" condition:*  
Down, Unknown (None), Paused, Down (Acknowledged)

*See the PRTG Manual for the reasoning behind this behavior. A probe, group, or device that you add to a channel is in the "up" condition as long as none of its sensors are in the "down" condition.*

*Step 2. The Business Process sensor compares the percentage of the "up" conditions of the objects in a channel with the thresholds you define. If the percentage of objects in the "up" condition is smaller than indicated by your warning or error threshold, the channel will be in an overall "warning" or "down" status respectively.*

*Step 3. The Global State channel of the Business Process sensor always shows the "most severe" status that at least one of your channels has.*

## 7.8.12 Cisco IP SLA Sensor

The Cisco IP SLA sensor monitors Voice over IP (VoIP) network parameters using IP service level agreements (SLA) from Cisco via the Simple Network Management Protocol (SNMP).

Cisco IP SLA Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: Cisco IP SLA
- French: Cisco IP SLA
- German: Cisco IP SLA
- Japanese: Cisco IP SLA

- Portuguese: Cisco IP SLA
- Russian: Cisco IP SLA
- Simplified Chinese: Cisco IP SLA
- Spanish: Cisco IP SLA

## Remarks

Consider the following [remarks](#) <sup>749</sup> and requirements for this sensor:

Remark	Description
IPv4	This sensor only supports IPv4.
Performance impact	This sensor has a <a href="#">low</a> performance impact.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Object identifiers (OID)	If the object identifiers (OID) that this sensor uses are not available on the target device, the sensor shows the error message: <a href="#">No such object (SNMP error # 222)</a> . If this occurs, open the SNMP Compatibility Options <a href="#">setting</a> of the parent device or group and set the Request Mode to Use single get.
Sensor creation	If there is a very large number of IP SLAs available during sensor creation, we recommend that you limit the result set by using the Start Interface Index and End Interface Index options in the SNMP Compatibility Options setting of the parent device or group.

## Basic Sensor Settings

### Basic Sensor Settings

**Sensor Name** ⓘ

**Tags** ⓘ  ✕ +

**Priority** ⓘ  ★★☆☆☆

Basic Sensor Settings

The sensor has the following [default tags](#) that are automatically predefined in the sensor's settings when you add the sensor:

- ipslasensor

■ For more information about basic sensor settings, see section [Sensor Settings](#)<sup>667</sup>.

## IP SLA Specific

**IP SLA Specific**

**ID** ⓘ 23

**Type** ⓘ *path-jitter*

**Name (Tag)** ⓘ *Example*

**Owner** ⓘ *(Not defined)*

**Frequency** ⓘ 60

IP SLA Specific

Setting	Description
ID	<p>The ID of the SLA that this sensor monitors.</p> <p>This sensor can support the following operations with the specified type IDs:</p> <ul style="list-style-type: none"> <li>▪ echo (1)</li> <li>▪ pathEcho (2)</li> <li>▪ fileIO (3)</li> <li>▪ script (4)</li> <li>▪ udpEcho (5)</li> <li>▪ tcpConnect (6)</li> <li>▪ http (7)</li> <li>▪ dns (8)</li> <li>▪ jitter (9)</li> <li>▪ dlsn (10)</li> <li>▪ dhcp (11)</li> <li>▪ ftp (12)</li> <li>▪ icmp-jitter (16)</li> <li>▪ path-jitter (23)</li> </ul>

Setting	Description
	<p><b>i</b> The numbers are the IDs of the SLA types as reported by the target device. PRTG translates them into the corresponding strings. These IDs are independent of the IDs that you see in the Add Sensor dialog. If the target device returns other values, this sensor shows an error message that says that it cannot find the type.</p> <p><b>i</b> Packet loss values are summarized but have no explicit channel for source-destination or destination-source values.</p>
Type	The type of the SLA that this sensor monitors.
Name (Tag)	The name of the SLA that this sensor monitors.
Owner	The owner of the SLA that this sensor monitors.
Frequency	The frequency of the SLA that this sensor monitors.

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>

Setting	Description
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Avg. Jitter	The average jitter
Avg. Jitter Destination - Source	The average jitter between destination and source
Avg. Jitter Source - Destination	The average jitter between source and destination
Avg. Latency Destination - Source	The average latency between destination and source
Avg. Latency Source - Destination	The average latency between source and destination
Average Round Trip Time (RTT)	<p>The average RTT</p> <p> This channel is the primary channel by default.</p>

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
ICPIF	The ICPIF
Late Packets	The number of late packets
Max. Latency Destination - Source	The maximum latency between destination and source
Max. Latency Source - Destination	The maximum latency between source and destination
Max. RTT	The maximum RTT
Min. Latency Destination - Source	The minimum latency between destination and source
Min. Latency Source - Destination	The minimum latency between source and destination
Min. RTT	The minimum RTT
MOS	The MOS
Packets Lost	The number of lost packets
Packets Lost %	The number of lost packets (%)
Packets Out of Sequence	The number of out-of-sequence packets

## 7.8.16 Citrix XenServer Host Sensor

The Citrix XenServer Host sensor monitors a Xen host server via HTTP.

Citrix XenServer Host Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: Citrix XenServer Host
- French: Citrix XenServer serveur hôte
- German: Citrix XenServer Host
- Japanese: Citrix XenServer ホスト
- Portuguese: Host Citrix XenServer
- Russian: Узел Citrix XenServer
- Simplified Chinese: Citrix XenServer 主机

- Spanish: Host Citrix XenServer

## Remarks

Consider the following [remarks](#) <sup>772</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <b>high</b> performance impact. We recommend that you use no more than <b>200</b> of this sensor on each probe.
.NET 4.7.2 or later	This sensor requires <b>.NET 4.7.2 or later</b> from Microsoft on the probe system. In a cluster, install it on every cluster node.   If the framework is missing, you cannot create this sensor.   For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a>
Parent device	<ul style="list-style-type: none"> <li>▪ This sensor requires that the parent device is a Citrix XenServer as of version 5.0.</li> <li>▪ This sensor requires that the parent device represents one host server of your XenServer pool.</li> </ul>
Credentials	This sensor requires credentials for VMware/XenServer.
TLS 1.2	This sensor does not fully support Transport Layer Security (TLS) 1.2 connections. You cannot add it to XenServers with the security protocol setting "TLS 1.2 only".
IPv4	This sensor only supports IPv4.
Add Sensor dialog	PRTG also includes hosts that do not run in the Add Sensor dialog.

## Monitoring a XenServer Pool

In a XenServer pool, there is one "pool master" that manages the pool. Incoming queries on any host are automatically forwarded to the pool master. If you want to monitor your VMs or host servers, create respective sensors on a device that represents **one** host server of your pool. Internal processes make sure that monitoring takes place and continues independently from the physical host.

-  In the device tree, the sensors for VMs always remain on the host you originally created them on, also if they are currently running on a different host.

## 7.8.17 Citrix XenServer Virtual Machine Sensor

The Citrix XenServer Virtual Machine sensor monitors a virtual machine (VM) on a XenServer via HTTP.

Citrix XenServer Virtual Machine Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: Citrix XenServer Virtuele Machine
- French: Citrix XenServer machine virtuelle
- German: Citrix XenServer Virtuelle Maschine
- Japanese: Citrix XenServer 仮想マシン
- Portuguese: Máquina virtual Citrix XenServer
- Russian: Виртуальная машина Citrix XenServer
- Simplified Chinese: Citrix XenServer 虚拟机
- Spanish: Máquina virtual Citrix XenServer

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node.</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
Parent device	<ul style="list-style-type: none"> <li>▪ This sensor requires that the parent device is a Citrix XenServer as of version 5.0.</li> <li>▪ This sensor requires that the parent device represents one host server of your XenServer pool.</li> </ul>
Credentials	This sensor requires credentials for VMware/XenServer.
TLS 1.2	This sensor does not fully support Transport Layer Security (TLS) 1.2 connections. You cannot add it to XenServers with the security protocol setting "TLS 1.2 only".
IPv4	This sensor only supports IPv4.
Add Sensor dialog	PRTG requests a full list of all VMs that are configured on the Citrix XenServer, including VMs that do not run. Therefore, it might take a few seconds before the Add Sensor dialog loads.

## Monitoring a XenServer Pool

In a XenServer pool, there is one "pool master" that manages the pool. Incoming queries on any host are automatically forwarded to the pool master. If you want to monitor your VMs or host servers, create respective sensors on a device that represents [one](#) host server of your pool. Internal processes make sure that monitoring takes place and continues independently from the physical host.

 In the device tree, the sensors for VMs always remain on the host you originally created them on, also if they are currently running on a different host.

Setting	Description
URL	<p>Select if you want to inherit the URL from the parent device or if you want to enter a custom URL:</p> <ul style="list-style-type: none"> <li>▪ Inherit (default)</li> <li>▪ Custom</li> </ul>
Custom URL	<p><b>This setting is only visible if you select Custom above.</b></p> <p>Enter the URL that you want to monitor.</p> <p> The URL must be valid and <a href="#">URL encoded</a>.</p> <p> You can enter a URL that leads to a web page, for example, to measure the page source code's loading time, or you can enter the URL of an image or other page asset to measure this element's availability and loading time.</p> <p> PRTG uses a smart URL replacement with which you can use the parent device's IP address or Domain Name System (DNS) name setting as part of the URL. For more information, see section <a href="#">Smart URL Replacement</a><sup>[788]</sup>.</p>
Request Method	<p>Select an HTTP request method to determine how the sensor requests the URL:</p> <ul style="list-style-type: none"> <li>▪ GET (default): Directly request the web page. We recommend that you use this setting for a simple check of a web page.</li> <li>▪ POST: Send post form data to the URL.</li> <li>▪ HEAD: Only request the HTTP header from the server without the actual web page. <ul style="list-style-type: none"> <li> This setting saves bandwidth because it transfers less data. However, we do not recommend this setting because the measured request time is not the request time that the users experience and you might not be notified of slow results or timeouts.</li> </ul> </li> </ul>
Postdata	<p><b>This setting is only visible if you select POST above.</b></p> <p>Enter the data part for the POST request.</p>
Region	<p>Select the regions from which you want to check the service:</p> <ul style="list-style-type: none"> <li>▪ Asia Pacific (Singapore)</li> <li>▪ Asia Pacific (Sydney)</li> <li>▪ Europe (Ireland)</li> <li>▪ US East (Northern Virginia)</li> <li>▪ US West (Northern California)</li> </ul>

Setting	Description
	<b>i</b> PRTG creates two channels for every region that you select.
Timeout (Sec.)	Enter a timeout in seconds for the ping. If the reply takes longer than this value, PRTG cancels the request and shows an error message. Enter an integer. You can enter a value between <b>1</b> and <b>30</b> seconds.

## Sensor Display

**Sensor Display**

Primary Channel **i** Downtime

Graph Type **i**  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.  <b>i</b> You can set a different primary channel later by clicking <b>⌵</b> below a channel gauge on the sensor's Overview tab.
Graph Type	Define how this sensor shows different channels: <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a> ).
Stack Unit	<b>This setting is only visible if you select Stack channels on top of each other above.</b>  Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

## Debug Options

Debug Options

**Result Handling** ⓘ

Discard result (default)

Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can only enter the protocol followed by a colon and three forward slashes (this means that you can enter either [http://](#) or [https://](#), or even a simple forward slash / as the equivalent for [http://](#)). PRTG automatically fills in the parent device's IP Address/DNS Name in front of the third forward slash.

Whether this results in a valid URL or not depends on the IP address or Domain Name System (DNS) name of the parent device. In combination with cloning devices, you can use smart URL replacement to create many similar devices.

For example, if you create a device with the DNS name [www.example.com](#) and you add an HTTP sensor to it, you can provide values in the following ways:

- If you enter [https://](#) in the URL field, PRTG automatically creates the URL [https://www.example.com/](#)

- If you enter [/help](#) in the URL field, PRTG automatically creates and monitor the URL <http://www.example.com/help>
- It is also possible to provide a port number in the URL field. It is taken over by the device's DNS name and is internally added, for example, <http://:8080/>

**i** Smart URL replacement does not work for sensors that run on the probe device.

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Asia Pacific (Singapore)	The response time of the target server at the location <b>i</b> This channel has default limits: <ul style="list-style-type: none"> <li>▪ Upper error limit: <a href="#">5000 msec</a></li> <li>▪ Upper warning limit: <a href="#">3333 msec</a></li> </ul>

## 7.8.20 Cluster Health Sensor

The Cluster Health sensor monitors the health of a [failover cluster](#) and indicates the system health status of PRTG.

Cluster Health Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: Cluster Status
- French: État du cluster
- German: Cluster-Zustand
- Japanese: クラスターの正常性
- Portuguese: Funcionamento do cluster
- Russian: Работоспособность кластера
- Simplified Chinese: 群集健康状况
- Spanish: Salud de clúster

## Remarks

Consider the following [remarks](#)<sup>[801]</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <b>very low</b> performance impact.
Sensor creation	PRTG automatically creates this sensor with a cluster installation. You cannot manually delete it or add it.
Down status	If at least one cluster node is disconnected, this sensor shows the Down <a href="#">status</a> by default.
Cluster node states	You can review the states of each cluster node on this sensor's Overview tab.
Cluster node data	You can choose the cluster node for which you want to show data (or for all cluster nodes) on the monitoring data review tabs. For more information, see the Knowledge Base: <a href="#">What options do I have to review my monitoring data in detail?</a>

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Age of Code	<p>The time that has passed since the last update of your PRTG core server. Update regularly to get the best security and stability for PRTG, as well as the latest features. We recommend that you use the <a href="#">auto-update</a> to automatically get new versions.</p>

Channel	Description
	<p><b>i</b> This channel has a default limit:</p> <ul style="list-style-type: none"> <li>Upper warning limit: <a href="#">7776000 seconds</a></li> </ul>
Committed Memory	The amount of memory committed to the PRTG core server as reported by the memory manager
Configuration Last Saved	<p>The time passed since the configuration file was last saved successfully. PRTG saves the configuration every 24 hours. If the configuration cannot be saved, PRTG creates a ticket as soon as the saving process has failed, and warns you via this channel after 26 hours. None of your changes to PRTG can be saved if this happens. In this case, restart your PRTG core server to save the file.</p> <p><b>i</b> This channel has a default limit:</p> <ul style="list-style-type: none"> <li>Upper warning limit: <a href="#">93600 seconds</a></li> </ul>
CPU Load	The CPU load (%). Extensive CPU load can lead to false, incomplete, and incorrect monitoring results. This value should usually stay below 50%.
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Free Page File Memory	The amount of free page file memory that is available on the system. Page file memory is aggregated RAM and the size of page file. It is the maximum amount of memory that is available on the system to be used for all running processes. If it gets too low, the system can break down, and at least some applications throw <a href="#">Out of memory</a> errors.
Free Physical Memory	The amount of free physical memory that is available on the system. This is the RAM that is physically built into the computer. If it gets too low, the system becomes very slow and PRTG no longer works in a useful way. Some sensors might not be displayed correctly and show the Unknown status.
Free Virtual Memory	The address space on the system that PRTG can access. PRTG cannot use more memory than reported here, which is independent from free page file and physical memory. On a 32-bit operating system, the maximum is <a href="#">2 GB</a> ( <a href="#">3 GB</a> with special settings under Windows). On a 64-bit operating system, it is <a href="#">4 GB</a> if PRTG runs as a 32-bit version, and <a href="#">unlimited</a> if it runs as a 64-bit version (PRTG core server only). If the free virtual memory gets too low, PRTG throws <a href="#">Out of memory</a> errors or the message <a href="#">not enough storage to process this command</a> . This message is visible in the Core log.

Channel	Description
Handles	The counter for the data structures of the operating system. It is responsible for internal resource management. Investigate obviously increasing values that occur repeatedly.
Health	The sum of the PRTG core server state as a value between 100% (healthy) and 0% (failing). Investigate frequent or repeated health values below 100%.   This channel is the primary channel by default.
Maintenance Days	The remaining maintenance days of your PRTG Network Monitor license. If your maintenance is going to expire soon, act in time to make sure that you continue to get updates and access to new features for PRTG Network Monitor.   PRTG Hosted Monitor shows a fixed value here for technical reasons.   This channel has default limits: <ul style="list-style-type: none"> <li>▪ Lower error limit: 0</li> <li>▪ Lower warning limit: 30</li> </ul>
Notifications in Send Queue	The number of notifications that are in the send queue
Number of State Objects	The number of user-specific state objects that are found in the memory of the PRTG core server system
Probe Messages per Second	The number of messages sent from all probes to the PRTG core server
Raw Data Buffer	The amount of raw data that is temporarily stored on the physical memory during I/O operations on the disk. Usually, this value should be 0 (or very low). Investigate increasing values.
Threads	The number of program parts that are running simultaneously. This number can increase with heavy load. Usually, this number should not exceed 100.

### 7.8.23 Core Health (Autonomous) Sensor

The Core Health (Autonomous) sensor is a probe-independent sensor that monitors internal PRTG parameters. It shows the status of the PRTG core server and checks various parameters of the PRTG core server that have an impact on the stability of the system.

**i** The Core Health (Autonomous) sensor has the same functionality as the [Core Health](#) sensor. The only difference is that the Core Health (Autonomous) sensor runs independently of the probe. This means that if the probe disconnects, this sensor still monitors the status of the PRTG core server.

Core Health (Autonomous) Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

#### Sensor in Other Languages

- Dutch: Core Health (autonom)
- French: État du serveur central (autonome)
- German: Serverzustand (Autonom)
- Japanese: コアの正常性 (自律)

- Portuguese: Funcionamento do servidor central (autônomo)
- Russian: Работоспособность базового сервера (автономно)
- Simplified Chinese: 核心健康状况 (自主程序)
- Spanish: Salud de servidor central (autónomo)

## Remarks

Consider the following [remarks](#) <sup>815</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">very low</a> performance impact.
Limits	This sensor has predefined <a href="#">limits</a> for several metrics.
Sensor creation	PRTG automatically creates this sensor. You cannot delete it.
Sensor creation	You cannot add this sensor to a probe.
Memory information	You can also find information related to PRTG core server system memory under Setup   PRTG Status.

Raw Data Buffer	The amount of raw data that is temporarily stored on the physical memory during I/O operations on the disk. Usually, this value should be 0 (or very low). Investigate increasing values.

Channel	Description
Threads	The number of program parts that are running simultaneously. This number can increase with heavy load. Usually, this number should not exceed 100.

## 7.8.24 Dell EMC Unity Enclosure Health v2 Sensor

The Dell EMC Unity Enclosure Health v2 sensor monitors the health of a disk-array enclosure (DAE) or a physical or virtual disk processor enclosure (DPE) on a Dell EMC storage system via the Representational State Transfer (REST) application programming interface (API).

Dell EMC Unity Enclosure Health v2 Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) <sup>824</sup>.

### Sensor in Other Languages

- Dutch: Dell EMC Unity Enclosure Health v2
- French: Dell EMC Unity état du boîtier v2
- German: Dell EMC Unity Zustand des Gehäuses v2
- Japanese: Dell EMC Unity Enclosure Health v2
- Portuguese: Saúde do sistema Dell EMC Unity v2
- Russian: Работоспособность дисковой полки Dell EMC Unity v2
- Simplified Chinese: Dell EMC Unity 外壳运行状况 v2
- Spanish: Dell EMC Unity salud del gabinete v2

## Remarks

Consider the following [remarks](#) <sup>821</sup> and requirements for this sensor:

Remark	Description
Credentials	This sensor requires credentials for Dell EMC.
Unity OE 5.x	This sensor only supports systems from the Dell EMC Unity family with <a href="#">Unity OE 5.x</a> .
REST API	Dell EMC systems that provide a REST API are <a href="#">EMC Unity Family</a> , <a href="#">EMC Unity All Flash</a> , <a href="#">EMC Unity Hybrid</a> , and <a href="#">EMC UnityVSA</a> .
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">very low</a> performance impact.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Scanning interval	<ul style="list-style-type: none"> <li>▪ The minimum scanning interval of this sensor is <a href="#">1 minute</a>.</li> <li>▪ The recommended scanning interval of this sensor is <a href="#">5 minutes</a>.</li> </ul>
Multi-platform probe	You can add this sensor to a multi-platform probe.

 Discard result (default)
   
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>Discard result (default): Do not store the sensor result.</li> <li>Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Free Size	The free size
Free Size %	The free size (%)  This channel has default limits: <ul style="list-style-type: none"> <li>▪ Lower error limit: <a href="#">10%</a></li> <li>▪ Lower warning limit: <a href="#">25%</a></li> </ul>
Health Status	The health status <ul style="list-style-type: none"> <li>▪ Up status: OK, OK But Minor Warning</li> <li>▪ Warning status: Degraded, Minor Issue</li> <li>▪ Down status: Major Issue, Critical Issue, Non Recoverable</li> <li>▪ Unknown status: Unknown</li> </ul>  This channel is the primary channel by default.
Metadata Subscribed Size	The subscribed metadata size
Metadata Used Size	The used metadata size
Preallocated Size	The preallocated size
Preallocated Size %	The preallocated size (%)

Channel	Description
Snapshot Subscribed Size	The subscribed snapshot size
Snapshot Used Size	The used snapshot size
Subscribed Size	The subscribed size
Subscribed Size %	The subscribed size (%)
Total Size	The total size
Used Size	The used size
Used Size %	The used size (%)

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

This sensor shows the status and mode of the physical disk in the channels as reported in the [Modular Disk Storage Manager](#). Status and mode combined indicate the particular status of a redundant array of independent disks (RAID) controller physical disk. The table below provides you with the status description according to the Dell documentation:

Status Channel	Mode Channel	Description
Up status: Optimal	Unassigned	The physical disk in the indicated slot is unused and available to be configured
	Assigned	The physical disk in the indicated slot is configured as part of a disk group

Status Channel	Mode Channel	Description
	Hot Spare Standby	The physical disk in the indicated slot is configured as a hot spare
	Hot Spare In Use	The physical disk in the indicated slot is in use as a hot spare within a disk group
Down status: Failed	<ul style="list-style-type: none"> <li>▪ Assigned</li> <li>▪ Unassigned</li> <li>▪ Hot Spare In Use</li> <li>▪ Hot Spare Standby</li> </ul>	The physical disk in the indicated slot has failed because of an unrecoverable error, an incorrect drive type or drive size, or by its operational state being set to failed
Up status: Replaced	Assigned	The physical disk in the indicated slot has been replaced and is ready to be, or is actively being, configured into a disk group
Down status: Pending Failure	<ul style="list-style-type: none"> <li>▪ Assigned</li> <li>▪ Unassigned</li> <li>▪ Hot Spare In Use</li> <li>▪ Hot Spare Standby</li> </ul>	A S.M.A.R.T. error has been detected on the physical disk in the indicated slot
Warning status: None	None	The indicated slot is empty, or the array cannot detect the physical disk
Down status: Undefined

## 7.8.32 DHCP Sensor

The DHCP sensor monitors a Dynamic Host Configuration Protocol (DHCP) server. It sends a broadcast message to the network and waits for a DHCP server to respond.

**i** This sensor shows the address of the server and the offered IP address in the sensor message. You can check the server's response via [regular expressions](#).

DHCP Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: DHCP
- French: DHCP
- German: DHCP
- Japanese: DHCP
- Portuguese: DHCP
- Russian: DHCP
- Simplified Chinese: DHCP
- Spanish: DHCP

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Sensor creation	You can create this sensor only on a <a href="#">probe device</a> .
Static IP address	The probe device where you create this sensor must have a static IP address. It cannot get its IP address from DHCP because this can cause a DHCP failure that results in a severe issue for the probe device so that you risk losing monitoring data.
IPv4	This sensor only supports IPv4.
Performance impact	This sensor has a <a href="#">low</a> performance impact.
DHCP unavailable	This sensor shows a timeout error if no DHCP is available, or if you use more than two DHCP sensors per device.
Link-local address	Adding this sensor on a link-local address is valid and is not prohibited. However, as this is a local IP address, the sensor does not receive any data and shows a timeout error.
Add Sensor dialog	Choose the network card on the probe system that is used to send the broadcast message in the Add Sensor dialog.
Knowledge Base	Knowledge Base: <a href="#">How can I monitor a DHCP server in a specific network if there are several DHCP networks?</a>
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

If Server Changes ⓘ  Ignore (default)  
 Write log entry

If IP Address Changes ⓘ  Ignore (default)  
 Write log entry

DHCP Specific

Setting	Description
MAC Address	The MAC address of the network adapter that sends the broadcast message to the network.
Client IP Address	Specify if you want to check the returned client IP address with a regular expression (regex): <ul style="list-style-type: none"> <li>Do not check the IP address using a regular expression: The IP address only appears in the sensor message without further processing.</li> <li>Check the IP address using a regular expression: Enter the regex that you want to use below.</li> </ul>
Client IP Address Must Include (Down Status if Not Included)	<p><b>This setting is only visible if you select</b> Check the IP address using a regular expression <a href="#">above</a>.</p> <p>In the response of the DHCP server, search by using a regex. If the response for the client IP address <b>does not contain</b> this string, the sensor shows the Down <a href="#">status</a>.</p> <p> For example, enter <code>10\.\0\.\5\.\.*</code> to make sure that any answering DHCP server returns any client IP address starting with <code>10.0.5.</code> If it does not, the sensor shows the Down status. Leave this field empty if you do not want to use it.</p>

Setting	Description
	<p><b>i</b> PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more information, see section <a href="#">Regular Expressions</a>.</p>
Client IP Address Must Not Include (Down Status if Included)	<p><b>This setting is only visible if you select</b> Check the IP address using a regular expression <a href="#">above</a>.</p> <p>In the response of the DHCP server, search by using a regex. If the response for the client IP address <b>contains</b> this string, this sensor shows the Down status. See the example above. Leave this field empty if you do not want to use it.</p> <p><b>i</b> PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more information, see section <a href="#">Regular Expressions</a>.</p>
Server IP Address	<p>Specify if you want to check the returned server IP address with a regex:</p> <ul style="list-style-type: none"> <li>▪ Do not check the IP address using a regular expression: The IP address only appears in the sensor message without further processing.</li> <li>▪ Check the IP address using a regular expression: Enter the regex that you want to use below.</li> </ul>
Server IP Address Must Include (Down Status if Not Included)	<p><b>This setting is only visible if you select</b> Check the IP address using a regular expression <a href="#">above</a>.</p> <p>In the response of the DHCP server, search by using a regex. If the response for the server IP address <b>does not contain</b> this string, this sensor shows the Down status. See the example above. Leave this field empty if you do not want to use it.</p> <p><b>i</b> PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more information, see section <a href="#">Regular Expressions</a>.</p>
Server IP Address Must Not Include (Down Status if Included)	<p><b>This setting is only visible if you select</b> Check the IP address using a regular expression <a href="#">above</a>.</p> <p>In the response of the DHCP server, search by using a regex. If the response for the server IP address <b>contains</b> this string, this sensor shows the Down status. See the example above. Leave this field empty if you do not want to use it.</p> <p><b>i</b> PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more information, see section <a href="#">Regular Expressions</a>.</p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer. The maximum timeout value is <b>900</b> seconds (15 minutes).</p>

Setting	Description
	<p><b>i</b> If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
If Server Changes	<p>If there is more than one DHCP server in the network that can respond to the broadcast message, the sensor can receive a response from a different DHCP server compared to the last scan of the sensor. In this case, PRTG can write an entry to the system <a href="#">logs</a>. Define what PRTG does if DHCP servers change:</p> <ul style="list-style-type: none"> <li>Ignore (default): Do nothing.</li> <li>Write log entry: Write an entry to the system logs whenever the DHCP server changes between two sensor scans.</li> </ul> <p><b>i</b> Regardless of this setting, entries are always added to the <a href="#">sensor log</a>.</p>
If IP Address Changes	<p>If the IP address offered by the DHCP server changes between two sensor scans, PRTG can write an entry to the system logs. Define what PRTG does if IP addresses change:</p> <ul style="list-style-type: none"> <li>Ignore (default): Do nothing.</li> <li>Write log entry: Write an entry to the system logs whenever the DHCP server offers a different IP address compared to the last sensor scan.</li> </ul> <p><b>i</b> Regardless of this setting, entries are always added to the <a href="#">sensor log</a>.</p>

## Sensor Display

**Sensor Display**

Primary Channel **i**    Downtime

---

Graph Type **i**     Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking <b>⚙</b> below a channel gauge on the sensor's Overview tab.</p>

Setting	Description
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>Show channels independently (default): Show a graph for each channel.</li> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> <li><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Lease Time	The lease time reported by the server
Response Time	<p>The response time</p> <p><b>i</b> This channel is the primary channel by default.</p>

### 7.8.33 DICOM Bandwidth Sensor

The DICOM Bandwidth sensor monitors the bandwidth usage of a C-STORE request to a Digital Imaging and Communications in Medicine (DICOM) capable device. It sends one or more DICOM images and files that you have stored in a folder on a local disk or share and checks if the DICOM device can handle the C-STORE request.

**i** You can use this sensor to test your picture archiving and communication system (PACS), for example.

DICOM Bandwidth Sensor

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>873</sup>.

#### Sensor in Other Languages

- Dutch: DICOM Bandbreedte
- French: Bande passante (DICOM)
- German: DICOM-Bandbreite

	<ul style="list-style-type: none"> <li>Any (depends on the DNS server configuration)</li> </ul>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer. The maximum timeout value is <b>900</b> seconds (15 minutes).</p> <p><b>i</b> If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p> <p><b>i</b> The timeout value must be shorter than the scanning interval of the sensor.</p>
Filter Usage	<p>Define if the sensor checks for a specific filter value in the response:</p> <ul style="list-style-type: none"> <li>Do not use a filter (default): Do not check the response.</li> <li>Use a filter: Use a filter to check the response. Define the filter value below.</li> </ul>
Filter Value	<p><b>This setting is only visible if you select Use a filter above.</b></p> <p>Enter one or more filter values. For an A record, the filter value can be an IP address like <b>127.0.0.1</b>, for example. The filter value can also contain a wildcard (*) to match any content, for example <b>127.*.1</b>. You can specify multiple filter values by using a comma as separator, for example <b>172.217.*.1,172.217.*.2</b>.</p>
Port	<p>Enter the number of the port to which this sensor connects. This must be the port on which the parent device answers queries. The default port is <b>53</b>.</p> <p><b>i</b> We recommend that you use the default value.</p> <p><b>i</b> This sensor connects to the IP address or the DNS name of the <a href="#">parent device</a>.</p>

## Sensor Display

**Sensor Display**

Primary Channel **i** Downtime

---

Graph Type **i**  Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><a href="#">This setting is only visible if you select</a> Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Debug Options

**Debug Options**

**Result Handling** 
 Discard result (default)  
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p>

Setting	Description
	<p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Matched Record Count	The number of matched records (if you use a filter)
Record Count	The number of records
Records Resolved	<p>If records were resolved</p> <ul style="list-style-type: none"> <li>▪ Up status: Yes</li> <li>▪ Down status: No</li> </ul>
Response Time	<p>The response time</p> <p><b>i</b> This channel is the primary channel by default.</p>

## More

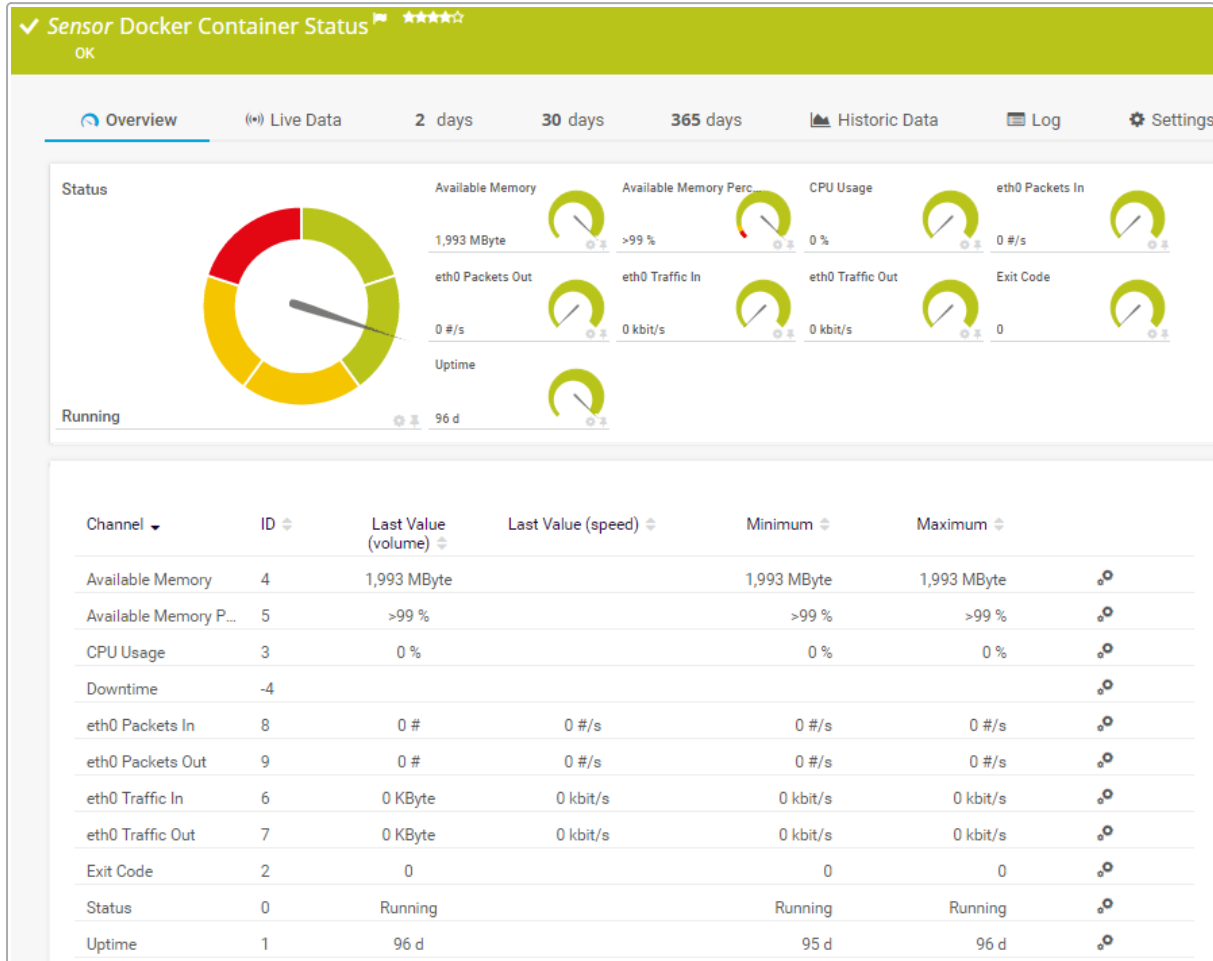

### KNOWLEDGE BASE

What security features does PRTG include?

- <https://kb.paessler.com/en/topic/61108>

## 7.8.37 Docker Container Status Sensor

The Docker Container Status sensor monitors the status of a Docker container.

Docker Container Status Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: Docker Container Status
- French: Statut de conteneur Docker
- German: Docker-Container-Zustand
- Japanese: Docker コンテナの状態
- Portuguese: Status do contêiner Docker
- Russian: Статус контейнера Docker
- Simplified Chinese: Docker 容器状态
- Spanish: Estado de contenedor Docker.

## Remarks

Consider the following [remarks](#)<sup>895</sup> and requirements for this sensor:

Remark	Description
Certificate and private key	This sensor requires certificates and private keys to monitor Docker.  For more information on how to create a Docker certificate, see the Knowledge Base: <a href="#">How can I create private key and certificate for the Docker sensor?</a>
Parent device	This sensor requires that the parent device is the Docker machine on which the container that you want to monitor runs.
Authentication	This sensor requires an authentication with a certificate and a private key before you can add it. Provide the Port (usually <b>2376</b> ), Private Key, and Certificate and click OK.
IPv4	This sensor only supports IPv4.
Performance impact	This sensor has a <b>low</b> performance impact.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Limits	This sensor has predefined <a href="#">limits</a> for several metrics.

## Basic Sensor Settings

### 7.8.38 Enterprise Virtual Array Sensor

The Enterprise Virtual Array sensor monitors an HPE Storage Enterprise Virtual Array (EVA) via the [sssu.exe](#) from [HPE P6000 Command View Software](#) (previously known as HP Command View EVA Software).

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>903</sup>.

#### Sensor in Other Languages

- Dutch: Enterprise Virtual Array
- French: Enterprise Virtual Array
- German: Enterprise Virtual Array
- Japanese: Enterprise Virtual Array
- Portuguese: Enterprise Virtual Array
- Russian: Enterprise Virtual Array
- Simplified Chinese: Enterprise Virtual Array
- Spanish: Enterprise Virtual Array

#### Remarks

Consider the following [remarks](#)<sup>900</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
HPE P6000 Command View Software	This sensor requires the <a href="#">HPE P6000 Command View Software</a> on the probe system, or the alternative described in the Knowledge Base: <a href="#">Do I really have to install the whole Command View on the probe to use the EVA sensor?</a>
Credentials	This sensor requires that you explicitly specify the credentials for the EVA in the sensor settings.
IPv6	This sensor supports IPv6.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Add Sensor

Setting	Description
Scanning Mode	<p>Specify the depth of the meta-scan:</p> <ul style="list-style-type: none"> <li>▪ Basic mode: We recommend that you use this scanning mode. Various modules of your EVA are available for monitoring.</li> <li>▪ Detailed mode: PRTG scans for each disk of your EVA. It lists every disk in the module selection.</li> </ul>

## Basic Sensor Settings

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

This sensor can show the status of several HPE EVA modules:

- System controllers
- Enclosures
- Disks
- Disk groups
- Folders
- Hosts
- Snapshots
- Data replication
- Cabinets

- If the devices have measuring tools for fans and temperature, this sensor displays corresponding data as well.

For these EVA components, this sensor can show the following:

- Operational status
- Predicted failures
- Accessible media
- Allocation in percent
- Availability for VRaids in bytes
- Exaggerated bytes
- Group host access
- Number of grouped and ungrouped disks
- Age of snapshots
- License status

### 7.8.39 Event Log (Windows API) Sensor

#### Important Notice

This sensor might not work anymore after Windows updates of June 2021. For more information, see the Knowledge Base: [My Event Log \(Windows API\) sensors fail after installing Windows updates. What can I do?](#)

The Event Log (Windows API) sensor monitors event log entries via the Windows application programming interface (API).

Event Log (Windows API) Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

#### Sensor in Other Languages

- Dutch: Event Log (Windows API)
- French: Journal des événements (API Windows)
- German: Ereignisprotokoll (Windows API)
- Japanese: イベントログ (Windows API)
- Portuguese: Log de eventos (Windows API)
- Russian: Журнал событий (API Windows)
- Simplified Chinese: 事件日志 (Windows API)
- Spanish: Registro de eventos (Windows API)

## Remarks

Consider the following [remarks](#)<sup>[906]</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a very high performance impact. We recommend that you use no more than <b>50</b> of this sensor on each probe.
IPv6	This sensor supports IPv6.

## 7.8.40 Exchange Backup (PowerShell) Sensor

The Exchange Backup (PowerShell) sensor monitors backups of an Exchange server via Remote PowerShell.

Exchange Backup (PowerShell) Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: Exchange Backup (PowerShell)
- French: Exchange sauvegarde (PowerShell)
- German: Exchange-Sicherung (PowerShell)
- Japanese: Exchange バックアップ (PowerShell)
- Portuguese: Backup Exchange (PowerShell)
- Russian: Резервная копия Exchange (PowerShell)
- Simplified Chinese: Exchange 备份 (PowerShell)
- Spanish: Copia de seguridad Exchange (PowerShell)

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
Exchange user account permissions	<p>This sensor requires Exchange user account permissions.</p> <p><b>i</b> This sensor requires a user account that must be either in the Exchange management role group <a href="#">View-Only Organization Management</a> or be in a group with the following assigned management roles:</p> <ul style="list-style-type: none"> <li>▫ <a href="#">Monitoring</a></li> <li>▫ <a href="#">View-Only Configuration</a></li> <li>▫ <a href="#">View-Only Recipients</a></li> </ul>
Remote PowerShell and Remote Exchange Management Shell	<p>This sensor requires <a href="#">Remote PowerShell</a> and <a href="#">Remote Exchange Management Shell</a> on the target system and <a href="#">PowerShell</a> on the probe system. Also make sure you have at least <a href="#">PowerShell 2.0</a> installed on the probe system.</p> <p><b>i</b> In larger environments, the default memory limit for the remote shell might be insufficient. This might result in the error message <a href="#">The WSMAN provider host process did not return a proper response</a>. In this case, increase the memory limit for Remote PowerShell.</p> <p><b>■</b> For more information, see the Knowledge Base: <a href="#">How do I enable and use remote commands in Windows PowerShell?</a> and <a href="#">How can I increase memory for Remote PowerShell?</a></p>
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node.</p> <p><b>i</b> If the framework is missing, you cannot create this sensor.</p> <p><b>■</b> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
Parent device	This sensor requires that the parent device is the Exchange server (as of version 2016) that hosts the database that you want to monitor.
Credentials	This sensor requires credentials for Windows systems.
FQDN	<p>This sensor requires the <a href="#">fully qualified domain name (FQDN)</a> of the Exchange server in the settings of the parent device. In the <a href="#">device settings</a> of the Exchange server, provide the FQDN instead of the IP address.</p> <p><b>■</b> For more information, see the Knowledge Base: <a href="#">I have problems with the PowerShell Exchange sensors, what can I do?</a></p>

Remark	Description
IPv4	This sensor only supports IPv4.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Knowledge Base	Knowledge Base: <a href="#">Where can I find more information about PowerShell sensors?</a>
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

- Russian: DAG базы данных Exchange (PowerShell)
- Simplified Chinese: Exchange 数据库 DAG (PowerShell)
- Spanish: Base de datos DAG Exchange (PowerShell)

## Remarks

Consider the following [remarks](#) <sup>927</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
Exchange user account permissions	<p>This sensor requires Exchange user account permissions.</p> <p><b>i</b> This sensor requires a user account that must be either in the Exchange management role group <a href="#">View-Only Organization Management</a> or be in a group with the following assigned management roles:</p> <ul style="list-style-type: none"> <li>▫ <a href="#">Monitoring</a></li> <li>▫ <a href="#">View-Only Configuration</a></li> <li>▫ <a href="#">View-Only Recipients</a></li> </ul>
Valid DAG	This sensor requires that the Exchange server is part of a valid DAG. For more information, see the Knowledge Base: <a href="#">Why doesn't PRTG show available databases when adding the Exchange Database DAG (PowerShell) sensor?</a>
Remote PowerShell and Remote Exchange Management Shell	<p>This sensor requires <a href="#">Remote PowerShell</a> and <a href="#">Remote Exchange Management Shell</a> on the target system and <a href="#">PowerShell</a> on the probe system. Also make sure you have at least <a href="#">PowerShell 2.0</a> installed on the probe system.</p> <p><b>i</b> In larger environments, the default memory limit for the remote shell might be insufficient. This might result in the error message <a href="#">The WSMAN provider host process did not return a proper response</a>. In this case, increase the memory limit for Remote PowerShell.</p> <p><b>■</b> For more information, see the Knowledge Base: <a href="#">How do I enable and use remote commands in Windows PowerShell?</a> and <a href="#">How can I increase memory for Remote PowerShell?</a></p>
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node.</p> <p><b>i</b> If the framework is missing, you cannot create this sensor.</p> <p><b>■</b> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
Parent device	This sensor requires that the parent device is the Exchange server (as of version 2016) that hosts the database that you want to monitor.
Credentials	This sensor requires credentials for Windows systems.

Remark	Description
FQDN	<p>This sensor requires the <a href="#">fully qualified domain name (FQDN)</a> of the Exchange server in the settings of the parent device. In the <a href="#">device settings</a> of the Exchange server, provide the FQDN instead of the IP address.</p> <p>■ For more information, see the Knowledge Base: <a href="#">I have problems with the PowerShell Exchange sensors, what can I do?</a></p>
IPv4	This sensor only supports IPv4.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Target device	Make sure that the Exchange database is mounted on the target device. Otherwise, you might not be able to properly add this sensor.
Knowledge Base	<ul style="list-style-type: none"> <li>Knowledge Base: <a href="#">Where can I find more information about PowerShell sensors?</a></li> <li>Knowledge Base: <a href="#">How can I monitor additional values of Exchange databases?</a></li> </ul>
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

### 7.8.43 Exchange Mail Queue (PowerShell) Sensor

The Exchange Mail Queue (PowerShell) sensor monitors the number of items in the outgoing mail queue of an Exchange server via Remote PowerShell.

Exchange Mail Queue (PowerShell) Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

#### Sensor in Other Languages

- Dutch: Exchange Mail Wachtrij (PowerShell)
- French: Exchange file d'attente de messagerie (PowerShell)
- German: Exchange-Nachrichtenwarteschlange (PowerShell)
- Japanese: Exchange Mail キュー (PowerShell)
- Portuguese: Fila de e-mails Exchange (PowerShell)
- Russian: Очередь почтовых сообщений Exchange (PowerShell)
- Simplified Chinese: Exchange 邮件队列 (PowerShell)
- Spanish: Cola de correo Exchange (PowerShell)

#### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
Exchange user account permissions	<p>This sensor requires Exchange user account permissions.</p> <p><b>i</b> This sensor requires a user account that must be either in the Exchange management role group <a href="#">View-Only Organization Management</a> or be in a group with the following assigned management roles:</p> <ul style="list-style-type: none"> <li>▫ <a href="#">Monitoring</a></li> <li>▫ <a href="#">View-Only Configuration</a></li> <li>▫ <a href="#">View-Only Recipients</a></li> </ul>
Remote PowerShell and Remote Exchange Management Shell	<p>This sensor requires <a href="#">Remote PowerShell</a> and <a href="#">Remote Exchange Management Shell</a> on the target system and <a href="#">PowerShell</a> on the probe system. Also make sure you have at least <a href="#">PowerShell 2.0</a> installed on the probe system.</p> <p><b>i</b> In larger environments, the default memory limit for the remote shell might be insufficient. This might result in the error message <a href="#">The WSMAN provider host process did not return a proper response</a>. In this case, increase the memory limit for Remote PowerShell.</p> <p><b>■</b> For more information, see the Knowledge Base: <a href="#">How do I enable and use remote commands in Windows PowerShell?</a> and <a href="#">How can I increase memory for Remote PowerShell?</a></p>
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node.</p> <p><b>i</b> If the framework is missing, you cannot create this sensor.</p> <p><b>■</b> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
Parent device	This sensor requires that the parent device is the Exchange server (as of version 2016) that hosts the database that you want to monitor.
FQDN	<p>This sensor requires the <a href="#">fully qualified domain name (FQDN)</a> of the Exchange server in the settings of the parent device. In the <a href="#">device settings</a> of the Exchange server, provide the FQDN instead of the IP address.</p> <p><b>■</b> For more information, see the Knowledge Base: <a href="#">I have problems with the PowerShell Exchange sensors, what can I do?</a></p>
Authentication	This sensor only supports <a href="#">Kerberos authentication</a> .

Remark	Description
IPv4	This sensor only supports IPv4.
Knowledge Base	<ul style="list-style-type: none"> <li>Knowledge Base: <a href="#">Where can I find more information about PowerShell sensors?</a></li> <li>Knowledge Base: <a href="#">What types of Exchange transport queues are there?</a></li> </ul>
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

### Basic Sensor Settings

Sensor Settings

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel **i** Downtime

---

Graph Type **i**  Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking <b>+</b> below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p>

Setting	Description
	Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Poisonous Mails	The number of poisonous mails
Queued Mails	The number of queued mails  This channel is the primary channel by default.
Retrying Mails	The number of retrying mails
Unreachable Mails	The number of unreachable mails

## 7.8.46 EXE/Script Sensor

The EXE/Script sensor runs an executable file (.exe) or a script (batch file, VBScript, PowerShell) on the probe system. This option is available as part of the PRTG API.

**i** If you want to execute a custom Windows Management Instrumentation Query Language (WQL) script, use the [WMI Custom](#) <sup>[2482]</sup> sensor.

EXE/Script Sensor

**■** For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) <sup>[959]</sup>.

### Sensor in Other Languages

- Dutch: EXE/Script
- French: Script/EXE
- German: Programm/Skript
- Japanese: EXE/スクリプト
- Portuguese: EXE/Script
- Russian: EXE/скрипт
- Simplified Chinese: EXE/脚本
- Spanish: EXE/Script

### Remarks

Consider the following [remarks](#) <sup>[951]</sup> and requirements for this sensor:

Remark	Description
Remote PowerShell	<p>This sensor requires that Remote PowerShell is enabled on the target system and PowerShell 3.0 on both the probe system and the target system.</p> <p> Also make sure that you have at least <a href="#">PowerShell 3.0</a> installed on both the probe system and the target system. If you receive an error message regarding issues with the WinRM connection, make sure that remote commands have been enabled in PowerShell. For more information, see the Knowledge Base: <a href="#">How do I enable and use remote commands in Windows PowerShell?</a></p>
File storage	<p>The sensor requires the executable or script file to be stored on the probe system. In a cluster, copy the file to every cluster node.</p>
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node.</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
Windows Server	<p>We recommend Windows Server 2016 on the probe system for best performance of this sensor.</p>
IPv6	<p>This sensor supports IPv6.</p>
Performance impact	<p>This sensor has a <a href="#">low</a> performance impact.</p>
Knowledge Base	<ul style="list-style-type: none"> <li>▪ Knowledge Base: <a href="#">What is the Mutex Name in the EXE/Script sensor settings?</a></li> <li>▪ Knowledge Base: <a href="#">How can I test if parameters are correctly transmitted to my script when using an EXE/Script sensor?</a></li> <li>▪ Knowledge Base: <a href="#">How can I show special characters with EXE/Script sensors?</a></li> <li>▪ Knowledge Base: <a href="#">Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?</a></li> </ul>
Hosted probe	<p> You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.</p>
Custom scripts on Windows Consumer Editions	<p>To run a script in PRTG on this sensor, you have to open Windows PowerShell with administrator rights and enter the following command: <a href="#">powershell.exe Set-ExecutionPolicy -ExecutionPolicy RemoteSigned -Scope LocalMachine</a></p>

## Add Sensor

Setting	Description
Channel Name	<p>Enter a name for the channel. Enter a string. This is for display purposes only.</p> <p><b>i</b> You can change this value later in the <a href="#">channel settings</a> of this sensor.</p>
Unit String	<p>Enter the unit for the values that this sensor returns. Enter a string.</p> <p><b>i</b> PRTG uses the unit string for display purposes and shows it in graphs, data tables, and gauges.</p> <p><b>i</b> You can change this value later in the <a href="#">channel settings</a> of this sensor.</p>

 Store result in case of error

Sensor Settings

Setting	Description
EXE/Script	<p>Select an executable file from the list. The sensor executes it with every scanning interval.</p> <p>The list contains all files in the corresponding \Custom Sensors\EXE subfolder of the <a href="#">PRTG program directory</a> on the probe system. For a file to appear in this list, store the file ending in .bat, .cmd, .exe, .ps1, or .vbs into this subfolder.</p> <p><b>i</b> To show the expected sensor values and states, your files must use the correct format for the returned values (in this case, <a href="#">value:message</a> to standard output). The exit code of the file determines the <a href="#">sensor status</a>.</p> <p><b>i</b> If you use a PowerShell script (.ps1) and if the PowerShell Security Enhancement <a href="#">experimental feature</a> is enabled, scripts that use the <a href="#">write-host</a> cmdlet to provide their output to PRTG do not work. Use the <a href="#">write-output</a> cmdlet instead.</p>

Setting	Description
	<ul style="list-style-type: none"> <li> If you use custom sensors on the <a href="#">cluster probe</a>, copy your files to every cluster node.</li> <li> For more information on how to create custom sensors and for the return format, see section <a href="#">Custom Sensors</a>.</li> <li> You cannot change this value after sensor creation.</li> </ul>
Parameters	<p>If your executable or script file catches command-line parameters, you can define them here. You can use placeholders as well. Enter a string or leave the field empty.</p> <ul style="list-style-type: none"> <li> For a full list of all placeholders, see section <a href="#">Custom Sensors</a>.</li> <li> You cannot use environmental variables in this setting. Define environmental variables directly in your script or update the environmental variable values on your system.</li> <li> You need to escape special characters and whitespaces in your parameters and surround them with double quotation marks (""). See section <a href="#">Escape Special Characters and Whitespaces in Parameters</a> for details.</li> </ul>
Environment	<p>Select whether PRTG command-line parameters are also available as environment parameters:</p> <ul style="list-style-type: none"> <li>▪ Default environment: Do not provide values of PRTG placeholders in the environment. Select this secure option if you are not sure.</li> <li>▪ Set placeholders as environment values: Define if command-line parameters of PRTG are also available as environment parameters in your executable or script. For example, you can read and use the current host value of the parent device from within your script. This option can pose a security risk because credentials are exposed in several variables. It is not possible to use the environment variables in the parameters setting for batch scripts (.bat) for security reasons.</li> </ul> <ul style="list-style-type: none"> <li> For a full list of all available variables, see section <a href="#">Custom Sensors</a>.</li> </ul>
Security Context	<p>Define the Windows user account that the sensor uses to run the executable or script file:</p> <ul style="list-style-type: none"> <li>▪ Use security context of PRTG probe service: Run the file under the same Windows user account that the probe system runs under. By default, this is the Windows system user account.</li> <li>▪ Use Windows credentials from parent device: Use the Windows user account in the <a href="#">parent device settings</a>.</li> </ul>
Mutex Name	<p>Define a mutual exclusion (mutex) name for the process. Enter a string or leave the field empty.</p>

Setting	Description
	<p><b>i</b> PRTG executes all EXE/Script sensors that have the same mutex serially, not simultaneously. This is useful if you use a lot of sensors and you want to avoid high resource usage caused by simultaneously running processes.</p> <p><b>■</b> See the Knowledge Base: <a href="#">What is the Mutex Name in the EXE/Script sensor settings?</a></p>
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer. The maximum timeout value is <b>900</b> seconds (15 minutes).</p> <p><b>i</b> If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
Value Type	<p>Define the type of the values that your executable or script file returns:</p> <ul style="list-style-type: none"> <li>▪ Integer: An integer is expected as return value. If the script returns a float, PRTG displays the value <b>0</b>.</li> <li>▪ Float: A float is expected as return value, with a dot (.) between the predecimal position and the decimal places. <ul style="list-style-type: none"> <li><b>i</b> The sensor also displays integers unless they produce a buffer overflow.</li> </ul> </li> <li>▪ Counter: Your script returns an integer that increases. PRTG shows the difference between the values of two sensor scans. <ul style="list-style-type: none"> <li><b>i</b> A counter <b>must</b> return an integer. It does not support float values.</li> <li><b>i</b> The sensor does not support string values. <ul style="list-style-type: none"> <li><b>i</b> You cannot change this value after sensor creation.</li> </ul> </li> </ul> </li> </ul>
If Value Changes	<p>Define what the sensor does when its value changes:</p> <ul style="list-style-type: none"> <li>▪ Ignore (default): Do nothing.</li> <li>▪ Trigger 'change' notification: Send an internal message that indicates a change. <ul style="list-style-type: none"> <li><b>i</b> In combination with a <a href="#">change trigger</a>, you can use this to <a href="#">trigger a notification</a> if a change occurs.</li> </ul> </li> </ul>
Result Handling	<p>Define what the sensor does with the result that the executable file gives back:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Store result in case of error: Store the last sensor result only if the sensor shows the Down status.</li> </ul> <p><b>i</b> Select this option if you do not want failures to be overwritten by a following success of the script.</p> <p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select Stack channels on top of each other above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Execution Time	The execution time  This channel is the primary channel by default.
[Value]	The value that the executable file or script file returns in one channel ■ For more information about the return value format, see section <a href="#">Custom Sensors</a> .

## 7.8.47 EXE/Script Advanced Sensor

The EXE/Script Advanced sensor runs an executable file (.exe) or a script (batch file, VBScript, PowerShell) on the probe system. This option is available as part of the PRTG API.

- i The return value of this sensor must be valid Extensible Markup Language (XML) or JavaScript Object Notation (JSON).
- i If you want to execute a custom Windows Management Instrumentation Query Language (WQL) script, use the [WMI Custom](#) <sup>[2482]</sup> sensor.

EXE/Script Advanced Sensor

## Remarks

Consider the following [remarks](#) <sup>962</sup> and requirements for this sensor:

Remark	Description
Remote PowerShell	<p>This sensor requires that Remote PowerShell is enabled on the target system and PowerShell 3.0 on both the probe system and the target system.</p> <p> Also make sure that you have at least <a href="#">PowerShell 3.0</a> installed on both the probe system and the target system. If you receive an error message regarding issues with the WinRM connection, make sure that remote commands have been enabled in PowerShell. For more information, see the Knowledge Base: <a href="#">How do I enable and use remote commands in Windows PowerShell?</a></p>
File storage	<p>The sensor requires the executable or script file to be stored on the probe system. In a cluster, copy the file to every cluster node.</p>
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node.</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
Windows Server	<p>We recommend Windows Server 2016 on the probe system for best performance of this sensor.</p>
Channels	<p>This sensor does not officially support more than <a href="#">50 channels</a>.</p>
IPv6	<p>This sensor supports IPv6.</p>
Performance impact	<p>This sensor has a <a href="#">medium</a> performance impact.</p>

## 7.8.48 File Sensor

The File sensor monitors a file located on the local disk on the probe system, parent device, or a file that is accessible via Server Message Block (SMB). You can monitor changes to the file content and file time stamp.

**i** In contrast to the [Folder](#)<sup>[983]</sup> sensor, you can also monitor changes to the actual content of a file.

File Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[974]</sup>.

Setting	Description
File Name	<p>Enter the full path to the file that this sensor monitors. For example, enter C:\Windows\file.txt. to monitor a file on the probe system.</p> <p>If you use a local path, the sensor only looks for the target file on the probe system, not on the parent device. To monitor a file on the parent device, use the dollar sign (\$) like C\$\User\username\file.txt.</p> <p>If the file is located on a network device, use the Universal Naming Convention (UNC) path <b>without</b> the server part (only enter share\folder\file.txt). The sensor inherits the server part (\\server\ from the <a href="#">parent device settings</a>. Enter a valid path and file name.</p> <p><b>ⓘ</b> To monitor Windows shares, the <a href="#">LanmanServer</a> service must run on the target system.</p> <p><b>ⓘ</b> The File sensor supports wildcards (*). For example, you can enter <a href="#">C:\Windows\*.txt</a> as File Name and select Show down status if file exists below if you want the sensor to show the Down <a href="#">status</a> if a .txt file exists in the defined directory.</p>
Sensor Behavior	<p>Define when the sensor shows the Down status:</p> <ul style="list-style-type: none"> <li>▪ Show down status if file does not exist: Show the Down status if the file <b>does not</b> exist.</li> <li>▪ Show down status if file exists: Show the Down status if the file <b>does</b> exist.</li> </ul>
If Content Changes	<p>Define what the sensor does if the content of the file changes (based on a checksum):</p> <ul style="list-style-type: none"> <li>▪ Ignore (default): Do nothing.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>Trigger 'change' notification: Send an internal message that indicates a change.                             <ul style="list-style-type: none"> <li><b>i</b> In combination with a <a href="#">change trigger</a>, you can use this to <a href="#">trigger a notification</a> if a change occurs.</li> </ul> </li> </ul>
If Time Stamp Changes	<p>Define what the sensor does if the time stamp of the file changes:</p> <ul style="list-style-type: none"> <li>Ignore (default): Do nothing.</li> <li>Trigger 'change' notification: Send an internal message that indicates a change.                             <ul style="list-style-type: none"> <li><b>i</b> In combination with a <a href="#">change trigger</a>, you can use this to <a href="#">trigger a notification</a> if a change occurs.</li> </ul> </li> </ul>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <ul style="list-style-type: none"> <li><b>i</b> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</li> </ul>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>Show channels independently (default): Show a graph for each channel.</li> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.                             <ul style="list-style-type: none"> <li><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p>

Setting	Description
	Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
File Size	The file size  This channel is the primary channel by default.
Last Modified	The time since the last modification of the file  The sensor shows a negative value if the date of a modified file is in the future.

- Spanish: Contenido de archivo

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
LanmanServer service	This sensor requires that the <a href="#">LanmanServer</a> service runs on the target system. <ul style="list-style-type: none"> <li><span>ⓘ</span> The display name of the service is <a href="#">Server</a>.</li> <li><span>ⓘ</span> To enable the service, log in to the respective system and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</li> </ul>
UTF-16 encoded files	This sensor does not support UTF-16 encoded files. Try a custom sensor like the <a href="#">EXE/Script</a> <sup>[951]</sup> sensor or the <a href="#">EXE/Script Advanced</a> <sup>[961]</sup> sensor.
Binary files	This sensor does not officially support binary files. If you want to monitor them anyway, select Always transmit the entire file in the <a href="#">sensor settings</a> <sup>[979]</sup> .
Unix line feeds	This sensor supports Unix line feeds.
IPv6	This sensor supports IPv6.
Linux system	To monitor files on a Linux system, the folder must be accessible via Server Message Block (SMB).
FQDN	Try the fully qualified domain name (FQDN) of the target system if the sensor does not get a connection with the IP address.
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

**Search String** ⓘ test

---

**Search Method** ⓘ  Simple string search  
 Regular expression

**File Transmission Handling** ⓘ  Only transmit new lines at the end of the file (default, BETA)  
 Always transmit the entire file

**File Encoding** ⓘ  Windows-1252 (default)  
 UTF-8  
 UTF-16

**Sensor Behavior** ⓘ  Show warning status when the string is not found  
 Show warning status when the string is found

**If Value Changes** ⓘ  Ignore (default)  
 Trigger 'change' notification

Sensor Specific

Setting	Description
File Name	<p>Enter the full path to the file that this sensor monitors. For example, enter C:\Windows\file.txt. to monitor a file on the probe system.</p> <p>If you use a local path, the sensor only looks for the target file on the probe system, not on the parent device. To monitor a file on the parent device, use the dollar sign (\$) like C\$\User\username\file.txt.</p> <p>If the file is located on a network device, use the Universal Naming Convention (UNC) path <b>without</b> the server part (only enter share\folder\file.txt). The sensor inherits the server part (\\server\ from the <a href="#">parent device settings</a>. Enter a valid path and file name.</p> <p><b>i</b> To monitor Windows shares, the <a href="#">LanmanServer</a> service must run on the target system.</p> <p><b>i</b> To monitor Linux files, the folder with these files must be accessible via SMB.</p>

Setting	Description
	<p><b>i</b> Note that it might produce a high amount of network traffic if you define that PRTG queries an entire file on your network with every scanning interval.</p>
Search String	<p>Define the string that you want to search the file for. You can enter a simple string in plain text or a <a href="#">regular expression (regex)</a>.</p> <p><b>i</b> The search string must be case-sensitive.</p>
Search Method	<p>Define the method with which you want to provide the search string:</p> <ul style="list-style-type: none"> <li>▪ Simple string search (default): Search for a simple string in plain text.</li> </ul> <p><b>i</b> The characters <code>*</code> and <code>?</code> work as placeholders. <code>*</code> stands for no number or any number of characters and <code>?</code> stands for exactly one character. You cannot change this behavior. The literal search for these characters is only possible with a regex.</p> <ul style="list-style-type: none"> <li>▪ Regular expression: Search with a regex.</li> </ul> <p><b>i</b> The pattern must be in <b>one</b> line and only the <b>last</b> matching line is returned.</p> <p><b>i</b> PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more information, see section <a href="#">Regular Expressions</a>.</p>
File Transmission Handling	<p>Define in which way the sensor transmits the target file to PRTG:</p> <ul style="list-style-type: none"> <li>▪ Only transmit new lines at the end of the file (default): Send the entire file to PRTG only with the first scanning interval. With the following scanning intervals, the sensor only transmits new lines at the end of the file. It does not send old lines but it still counts them. This option improves the performance of the sensor. <b>BETA</b> This option is in beta status. Do not expect that it works as expected in every usage scenario.</li> <li>▪ Always transmit the entire file: Send the entire file to PRTG with every scanning interval. If this results in too much traffic on the target system, we recommend that you choose Only transmit new lines at the end of the file (default) instead.</li> </ul> <p>This sensor can only transmit new lines in the following cases:</p> <ul style="list-style-type: none"> <li>▪ the file is bigger than in the previous scanning interval, and</li> <li>▪ the last line in the file is still in the same place in the file.</li> </ul> <p><b>i</b> This sensor supports Windows and Linux line endings (<b>CRLF</b> or <b>LF</b>).</p>
File Encoding	<p>Specify the encoding of the file that this sensor monitors:</p> <ul style="list-style-type: none"> <li>▪ Windows-1252 (default)</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>UTF-8</li> <li>UTF-16</li> </ul>
Sensor Behavior	<p>Define the condition for which the sensor shows the Warning <a href="#">status</a>:</p> <ul style="list-style-type: none"> <li>Show warning status when the string is not found (default): Show the Warning status if there is <b>no</b> match. Otherwise it remains in the Up status.</li> <li>Show warning status when the string is found: Show the Warning status if there <b>is</b> a match. Otherwise it remains in the Up status.</li> </ul>
If Value Changes	<p>Define what the sensor does if the value of the Last Occurrence (Line) channel changes:</p> <ul style="list-style-type: none"> <li>Ignore (default): Do nothing.</li> <li>Trigger 'change' notification: Send an internal message that indicates a change. <ul style="list-style-type: none"> <li><b>i</b> In combination with a <a href="#">change trigger</a>, you can use this to <a href="#">trigger a notification</a> if a change occurs.</li> </ul> </li> <li><b>i</b> This sensor does <b>not</b> trigger the notification when the number of Matches changes.</li> </ul>

## Debug Options

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking <b>+</b> below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select Stack channels on top of each other above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
ACK Status	The acknowledgment (ACK) status <ul style="list-style-type: none"> <li>▪ Up status: Accept</li> <li>▪ Down status: Error, Reject</li> </ul>
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Message Control ID OK	The message control ID status <ul style="list-style-type: none"> <li>▪ Up status: Yes</li> <li>▪ Down status: No</li> </ul>
Response Time	The response time <p>ⓘ This channel is the primary channel by default.</p>

## HTTP Specific

**HTTP Specific**

Timeout (Sec.) ⓘ 60

---

URL ⓘ https://example.com

---

Request Method ⓘ  GET (default)  
 POST  
 HEAD

Server Name Indication ⓘ example.com

SNI Inheritance ⓘ  Inherit SNI from parent device (default)  
 Do not inherit SNI from parent device

HTTP Specific

Setting	Description
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer. The maximum timeout value is 900 seconds (15 minutes).</p> <p> ⓘ If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
URL	<p>Enter the URL that the sensor connects to.</p> <p>If you enter an absolute URL, the sensor uses this address independently of the IP Address/DNS Name setting of the parent device. You can enter the URL of a web page (to measure the loading time of the page's source code), or enter the URL of an image or of a page asset to measure this element's availability and loading time.</p> <p> ⓘ The URL must be <a href="#">URL encoded</a>.</p> <p> ⓘ If you monitor an image or a page asset, this can create a high amount of memory load. We recommend that the size of the elements that you want to monitor does not exceed 200 MB.</p> <p> ■ PRTG uses a smart URL replacement with which you can use the parent device's IP address or Domain Name System (DNS) name setting as part of the URL. For more information, see section <a href="#">Smart URL Replacement</a><sup>[1042]</sup>.</p>
Request Method	<p>Select an HTTP request method to determine how the sensor requests the URL:</p> <ul style="list-style-type: none"> <li>▪ GET (default): Directly request the website. <ul style="list-style-type: none"> <li> ⓘ We recommend that you use this setting for a simple check of the web page.</li> </ul> </li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ POST: Send post form data to the URL. <ul style="list-style-type: none"> <li>❗ If you select this setting, you must enter the data in the Postdata field below.</li> <li>❗ If a POST request is redirected, all further requests are GET (default) requests.</li> </ul> </li> <li>▪ HEAD: Only request the HTTP header from the server without the actual web page. <ul style="list-style-type: none"> <li>❗ Although this saves bandwidth because it transfers less data, we do not recommend that you use this. This is because the measured request time is not the one that your users experience and you might not be notified of slow results or timeouts.</li> </ul> </li> </ul>
Postdata	<p>This setting is only visible if you select POST above.</p> <p>Enter the data part for the POST request.</p> <ul style="list-style-type: none"> <li>❗ No Extensible Markup Language (XML) is allowed here.</li> </ul>
Content Type	<p>This setting is only visible if you select POST above.</p> <p>Define the content type of the POST request:</p> <ul style="list-style-type: none"> <li>▪ Default (application/x-www-form-urlencoded): Use the default content type to encode the form data set for submission to the server.</li> <li>▪ Custom: Use a custom content type. Enter the content type below.</li> </ul>
Custom Content Type	<p>This setting is only visible if you select Custom above.</p> <p>Define the custom content type, for example, XML, JavaScript Object Notation (JSON), or HTTP.</p>
Server Name Indication	<p>The Server Name Indication (SNI) that the sensor automatically determines from the host address of the <a href="#">parent device</a> or from the target URL of the sensor.</p> <ul style="list-style-type: none"> <li>❗ The SNI must be a fully qualified domain name (FQDN). Make sure that it matches the configuration of the target server.</li> </ul> <p>■ For more information, see the Knowledge Base: <a href="#">My HTTP sensors fail to monitor websites which use SNI. What can I do?</a></p> <ul style="list-style-type: none"> <li>❗ This sensor implicitly supports SNI, an extension to the Transport Layer Security (TLS) protocol.</li> </ul>
SNI Inheritance	<p>Define if you want to inherit the SNI from the parent device:</p> <ul style="list-style-type: none"> <li>▪ Inherit SNI from parent device: Determine the SNI from the host address of the parent device.</li> <li>▪ Do not inherit SNI from parent device: Determine the SNI from the target URL as defined in the settings of this sensor.</li> </ul>

## Sensor Display

Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select Stack channels on top of each other above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can only enter the protocol followed by a colon and three forward slashes (this means that you can enter either <http://> or <https://>, or even a simple forward slash / as the equivalent for <http://>). PRTG automatically fills in the parent device's IP Address/DNS Name in front of the third forward slash.

Whether this results in a valid URL or not depends on the IP address or Domain Name System (DNS) name of the parent device. In combination with cloning devices, you can use smart URL replacement to create many similar devices.

For example, if you create a device with the DNS name [www.example.com](http://www.example.com) and you add an HTTP sensor to it, you can provide values in the following ways:

- If you enter <https://> in the URL field, PRTG automatically creates the URL <https://www.example.com/>
- If you enter [/help](http://www.example.com/help) in the URL field, PRTG automatically creates and monitor the URL <http://www.example.com/help>
- It is also possible to provide a port number in the URL field. It is taken over by the device's DNS name and is internally added, for example, <http://:8080/>

 Smart URL replacement does not work for sensors that run on the probe device.

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Loading Time	The web page or element loading time  This channel is the primary channel by default.

**Request Method** ⓘ

GET (default)

POST

HEAD

---

**Custom Headers** ⓘ

HTTP Specific

Setting	Description
Timeout per Request (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer. The maximum timeout value is 900 seconds (15 minutes).</p> <p>ⓘ If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p> <p>ⓘ The timeout is per request, not per sensor scan. If a request is redirected, the timeout begins again.</p>
Maximum Number of Redirects	<p>Enter the maximum number of times the sensor scan will follow an HTTP redirect request. The sensor will display the status of the last page before the number of redirects is exhausted. The default number of redirects the sensor will follow is 16. The maximum number of redirects the sensor will follow is 100. Enter 0 if you do not want the sensor to follow any redirects.</p>
URL	<p>Enter the URL that the sensor connects to.</p>

Setting	Description
	<p>If you enter an absolute URL, the sensor uses this address independently of the IP Address/DNS Name setting of the parent device. You can enter the URL of a web page (to measure the loading time of the page's source code), or enter the URL of an image or of a page asset to measure this element's availability and loading time.</p> <ul style="list-style-type: none"> <li><span style="color: red;">❗</span> The URL must be <a href="#">URL encoded</a>.</li> <li><span style="color: red;">❗</span> If you monitor an image or a page asset, this can create a high amount of memory load. We recommend that the size of the elements that you want to monitor does not exceed 200 MB.</li> <li><span style="color: red;">❗</span> The default URL is <a href="https://%host/">https://%host/</a>. PRTG replaces <a href="#">%host</a> with the IP address or DNS name of the parent device. PRTG does not display the value in the sensor log or the sensor's settings.</li> </ul>
Request Method	<p>Select an HTTP request method to determine how the sensor requests the URL:</p> <ul style="list-style-type: none"> <li>▪ GET (default): Directly request the website. <ul style="list-style-type: none"> <li><span style="color: red;">❗</span> We recommend that you use this setting for a simple check of the web page.</li> </ul> </li> <li>▪ POST: Send post form data to the URL. <ul style="list-style-type: none"> <li><span style="color: red;">❗</span> If you select this setting, you must enter the data in the POST Body field below.</li> <li><span style="color: red;">❗</span> If a POST request is redirected, all further requests are GET (default) requests.</li> </ul> </li> <li>▪ HEAD: Only request the HTTP header from the server without the actual web page. <ul style="list-style-type: none"> <li><span style="color: red;">❗</span> Although this saves bandwidth because it transfers less data, we do not recommend that you use this. This is because the measured request time is not the one that your users experience and you might not be notified of slow results or timeouts.</li> </ul> </li> </ul>
Content Type	<p><a href="#">This setting is only visible if you select POST above.</a></p> <p>Define the content type of the POST request. The default content type is <a href="#">application/x-www-form-urlencoded</a>.</p>
POST Body	<p><a href="#">This setting is only visible if you select POST above.</a></p> <p>Enter the data part for the POST request.</p> <ul style="list-style-type: none"> <li><span style="color: red;">❗</span> No Extensible Markup Language (XML) is allowed here.</li> </ul>
Custom Headers	<p>Enter a list of custom headers with their respective values that the HTTP request of the sensor contains. The syntax of a header-value pair is <a href="#">header1:value1</a>.</p>

Setting	Description
	<p><b>i</b> If you enter more than one header-value pair, enter each pair in one line: header1:value1 header2:value2 header3:value3</p> <p><b>i</b> Make sure that the HTTP header statement is valid. Otherwise, the sensor request cannot be successful.</p>

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click under the corresponding setting name to disable the inheritance and to display its options.

For more information, see section [Inheritance of Settings](#).

## Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can only enter the protocol followed by a colon and three forward slashes (this means that you can enter either [http://](#) or [https://](#), or even a simple forward slash / as the equivalent for [http://](#)). PRTG automatically fills in the parent device's IP Address/DNS Name in front of the third forward slash.

Whether this results in a valid URL or not depends on the IP address or Domain Name System (DNS) name of the parent device. In combination with cloning devices, you can use smart URL replacement to create many similar devices.

For example, if you create a device with the DNS name [www.example.com](#) and you add an HTTP sensor to it, you can provide values in the following ways:

- If you enter [https://](#) in the URL field, PRTG automatically creates the URL [https://www.example.com/](#)
- If you enter [/help](#) in the URL field, PRTG automatically creates and monitor the URL [http://www.example.com/help](#)

- It is also possible to provide a port number in the URL field. It is taken over by the device's DNS name and is internally added, for example, <http://:8080/>

**i** Smart URL replacement does not work for sensors that run on the probe device.

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Bytes Received	The number of bytes received
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Loading Time	The web page or element loading time <b>i</b> This channel is the primary channel by default.
Response Code	The response code of the target server

Advanced Sensor Data

Setting	Description
HTTP Version	Define the HTTP version that the sensor uses when it connects to the target URL: <ul style="list-style-type: none"> <li>HTTP 1.0: Use HTTP version 1.0.</li> <li>HTTP 1.1: Use HTTP version 1.1.</li> </ul>

Setting	Description
User Agent	<p>Choose which user agent string the sensor sends when it connects to the target URL:</p> <ul style="list-style-type: none"> <li>▪ Use the default string: Do not enter a specific user agent and use the default string. Usually, this is <a href="#">Mozilla/5.0 (compatible; PRTG Network Monitor (www.paessler.com); Windows)</a>.</li> <li>▪ Use a custom string: Use a custom user agent. Define the custom user agent below.</li> </ul>
Custom User Agent	<p><a href="#">This setting is only visible if you select Use a custom string above.</a></p> <p>Enter the string that the sensor uses as the user agent when it connects to the target URL.</p>
HTTP Headers	<p>Define if you want to send custom HTTP headers to the target URL:</p> <ul style="list-style-type: none"> <li>▪ Do not use custom HTTP headers: Do not use custom HTTP headers.</li> <li>▪ Use custom HTTP headers: Use custom headers. Define below.</li> </ul>
Custom HTTP Headers	<p><a href="#">This setting is only visible if you select Use custom HTTP headers above.</a></p> <p>Enter a list of custom HTTP headers and values that you want to transmit to the URL, each pair in one line. The syntax of a header-value pair is <a href="#">header1:value1</a></p> <ul style="list-style-type: none"> <li>❗ The sensor does not support the header field names <a href="#">user-agent</a>, <a href="#">content-length</a>, and <a href="#">host</a>.</li> <li>❗ Make sure that the HTTP header statement is valid. Otherwise, the sensor request cannot be successful.</li> </ul>
If Content Changes	<p>Define what the sensor does if the content of the web page changes:</p> <ul style="list-style-type: none"> <li>▪ Ignore (default): Do nothing.</li> <li>▪ Trigger 'change' notification: Send an internal message that indicates a change. <ul style="list-style-type: none"> <li>❗ In combination with a <a href="#">change trigger</a>, you can use this to <a href="#">trigger a notification</a> if a change occurs.</li> </ul> </li> </ul>
Require Keyword	<p>Define if the sensor checks the result at the URL for keywords:</p> <ul style="list-style-type: none"> <li>▪ Do not check for keyword (default): Do not search for keywords in the result.</li> <li>▪ Set sensor to warning status if keyword is missing: Check if a keyword exists in the result. If it exists, set the sensor to the Warning status.</li> <li>▪ Set sensor to down status if keyword is missing: Check if a keyword exists in the result. If it exists, set the sensor to the Down status.</li> </ul>

Setting	Description
	<p><b>i</b> The content check is only intended for HTML websites and might not work with other target URLs. For example, binary files are not supported.</p> <p><b>i</b> This sensor loads the source code at the URL. If you set up a content check, only this source code is checked for the keywords. The code is not necessarily identical to the code used to display the page when opening the same URL in a web browser. This is because a reload might be configured or certain information might be inserted after loading, for example, via JavaScript.</p> <p><b>i</b> PRTG does not follow links to embedded objects nor does it execute scripts. Only the first page at the URL is loaded and checked against the expressions configured.</p>
Response Must Include	<p><a href="#">This setting is only visible if you select Set sensor to warning status if keyword is missing</a> or <a href="#">Set sensor to down status if keyword is missing above</a>.</p> <p>Define the search string that must be part of the source code at the URL. You can enter a simple string in plain text or a <a href="#">regular expression (regex)</a>.</p> <p><b>i</b> If the source code does <b>not</b> include the search pattern, the sensor shows the status defined above.</p> <p><b>i</b> The search string must be case-sensitive.</p>
Search Method	<p>Define the method with which you want to provide the search string:</p> <ul style="list-style-type: none"> <li>▪ Simple string search (default): Search for a simple string in plain text.</li> </ul> <p><b>i</b> The characters <b>*</b> and <b>?</b> work as placeholders. <b>*</b> stands for no number or any number of characters and <b>?</b> stands for exactly one character. You cannot change this behavior. The literal search for these characters is only possible with a regex.</p> <p><b>i</b> You can also search for HTML tags.</p> <ul style="list-style-type: none"> <li>▪ Regular expression: Search with a regex.</li> </ul> <p><b>i</b> PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more information, see section <a href="#">Regular Expressions</a>.</p>
Exclude Keyword	<p>Define if the sensor checks the result at the URL for keywords:</p> <ul style="list-style-type: none"> <li>▪ Do not check for keyword (default): Do not search for keywords in the result.</li> <li>▪ Set sensor to warning status if keyword is found: Check if a keyword exists in the result. If it exists, set the sensor to the Warning status.</li> <li>▪ Set sensor to down status if keyword is found: Check if a keyword exists in the result. If it exists, set the sensor to the Warning status.</li> </ul>

Setting	Description
	<p> The content check is only intended for HTML websites and might not work with other target URLs. For example, binary files are not supported.</p>
Response Must Not Include	<p><a href="#">This setting is only visible if you select</a> Set sensor to warning status if keyword is found <a href="#">or</a> Set sensor to down status if keyword is found <a href="#">above</a>.</p> <p>Define the search string that must <b>not</b> be part of the source code at the specified URL. You can enter a simple string in plain text or a regular expression.</p> <p> The search string must be case-sensitive.</p> <p> If the data <b>does</b> include this string, the sensor shows the status defined above.</p>
Search Method	<p>Define the method with which you want to provide the search string:</p> <ul style="list-style-type: none"> <li>▪ Simple string search (default): Search for a simple string in plain text.</li> </ul> <p> The characters <b>*</b> and <b>?</b> work as placeholders. <b>*</b> stands for no number or any number of characters and <b>?</b> stands for exactly one character. You cannot change this behavior. The literal search for these characters is only possible with a regex.</p> <p> You can also search for HTML tags.</p> <ul style="list-style-type: none"> <li>▪ Regular expression: Search with a regex.</li> </ul> <p> PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more information, see section <a href="#">Regular Expressions</a>.</p>
Download Limit (KB)	<p>Enter the maximum amount of data (in kilobytes) that the sensor transfers per request.</p> <p> If you set content checks, be aware that they might be incomplete because only the content downloaded up to this limit is checked for search expressions.</p>
Result Handling	<p>Define what the sensor does with the data loaded at the URL:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last result of the requested data in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID]-A.txt, and Result of Sensor [ID].Data.txt. This setting is for debugging purposes, especially in combination with content checks. PRTG overwrites these files with each scanning interval.</li> </ul>

Setting	Description
	<p> For debugging, select Store result to write the source code file to disk and to look up what exactly PRTG gets when it calls the URL. If the URL does not point to a web page but to a binary file, for example, to an image, you usually do not check for content.</p> <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Authentication

**Authentication** Authentication 

Web page does not need authentication (default)  
 Web page needs authentication

Authentication

Setting	Description
Authentication	<p>Define if authentication is necessary on the web page:</p> <ul style="list-style-type: none"> <li>▪ Web page does not need authentication (default)</li> <li>▪ Web page needs authentication</li> </ul>
User Name	<p><b>This setting is only visible if you select Web page needs authentication above.</b></p> <p>If the proxy requires authentication, enter the user name for the proxy login. Enter a string.</p>
Password	<p><b>This setting is only visible if you select Web page needs authentication above.</b></p> <p>Enter a password.</p>
Authentication Method	<p><b>This setting is only visible if you select Web page needs authentication above.</b></p> <p>Select the authentication method that the URL uses:</p> <ul style="list-style-type: none"> <li>▪ HTTP authentication (default): Use simple HTTP authentication.             <ul style="list-style-type: none"> <li> This authentication method transmits credentials as plain text.</li> </ul> </li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>NT LAN Manager authentication: Use the Microsoft NT LAN Manager (NTLM) protocol for authentication.</li> <li>Digest access authentication: Use digest access authentication. This applies a hash function to the password, which is safer than HTTP authentication (default).</li> </ul>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>Show channels independently (default): Show a graph for each channel.</li> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can only enter the protocol followed by a colon and three forward slashes (this means that you can enter either [http://](#) or [https://](#), or even a simple forward slash / as the equivalent for [http://](#)). PRTG automatically fills in the parent device's IP Address/DNS Name in front of the third forward slash.

Whether this results in a valid URL or not depends on the IP address or Domain Name System (DNS) name of the parent device. In combination with cloning devices, you can use smart URL replacement to create many similar devices.

For example, if you create a device with the DNS name [www.example.com](#) and you add an HTTP sensor to it, you can provide values in the following ways:

- If you enter [https://](#) in the URL field, PRTG automatically creates the URL [https://www.example.com/](#)
- If you enter [/help](#) in the URL field, PRTG automatically creates and monitor the URL [http://www.example.com/help](#)
- It is also possible to provide a port number in the URL field. It is taken over by the device's DNS name and is internally added, for example, [http://:8080/](#)

 Smart URL replacement does not work for sensors that run on the probe device.

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Bytes Received	The number of bytes received
Download Bandwidth	The download speed
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Loading Time	The loading time

Channel	Description
	 This channel is the primary channel by default.
Time To First Byte	The time to the first byte

Setting	Description
	<p><b>i</b> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>Show channels independently (default): Show a graph for each channel.</li> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> <li><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Example

 For example, consider the URL <http://www.example.com/status.html> that returns a PHP script with the current system status in a simple HTML page as follows:

```
<html>
  <body>
    Description: Script gives back current status of disk free (%) and CPU usage (%).
    [85.5][12.0]
  </body>
</html>
```

You would configure the HTTP Content sensor using

- the Script URL from above,
- the value type Float,

- and the number of channels 2.

The sensor calls the URL with every scanning interval and only regards the two values in brackets [ ] and handles each of them in one channel. The additional description text and HTML tags are not necessary. In this example, they are added in case a human calls the URL.

- ❗ If you define the number of channels as 1, the sensor only reads the first value. The second value is ignored. Using 3 as the number of channels results in a sensor error message.

## Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can only enter the protocol followed by a colon and three forward slashes (this means that you can enter either <http://> or <https://>, or even a simple forward slash / as the equivalent for <http://>). PRTG automatically fills in the parent device's IP Address/DNS Name in front of the third forward slash.

Whether this results in a valid URL or not depends on the IP address or Domain Name System (DNS) name of the parent device. In combination with cloning devices, you can use smart URL replacement to create many similar devices.

For example, if you create a device with the DNS name [www.example.com](http://www.example.com) and you add an HTTP sensor to it, you can provide values in the following ways:

- If you enter <https://> in the URL field, PRTG automatically creates the URL <https://www.example.com/>
- If you enter [/help](http://www.example.com/help) in the URL field, PRTG automatically creates and monitor the URL <http://www.example.com/help>
- It is also possible to provide a port number in the URL field. It is taken over by the device's DNS name and is internally added, for example, <http://:8080/>

- ❗ Smart URL replacement does not work for sensors that run on the probe device.

## Channel List

- ❗ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
[Value]	The numeric values that an HTTP request returns in several channels

## 7.8.65 HTTP Data Advanced Sensor

The HTTP Data Advanced sensor accesses a web server and retrieves Extensible Markup Language (XML) encoded or JavaScript Object Notation (JSON) encoded data.

HTTP Data Advanced Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: HTTP Data Geavanceerd
- French: Données avancé (HTTP)
- German: HTTP Daten (Erweitert)
- Japanese: HTTP データアドバンスト
- Portuguese: Dados HTTP (avanzado)
- Russian: HTTP: Данные (расширенный)
- Simplified Chinese: HTTP 数据高级
- Spanish: Datos HTTP (avanzado)

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Return data	The requested web server must return XML-encoded or JSON-encoded data that matches the format as defined in the PRTG Manual: <a href="#">Custom Sensors</a> .
SRP ciphers	This sensor does not support Secure Remote Password (SRP) ciphers.
Smart URL replacement	This sensor supports <a href="#">smart URL replacement</a> <sup>11091</sup> .
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">medium</a> performance impact.
Performance	For best sensor performance, we recommend that you specify the content type on the target system, which is <a href="#">application/xml</a> or <a href="#">application/json</a> .
Knowledge Base	Knowledge Base: <a href="#">Which HTTP status code leads to which HTTP sensor status?</a>

## Basic Sensor Settings

Server Name Indication ⓘ example.com

---

SNI Inheritance ⓘ  Inherit SNI from parent device (default)  
 Do not inherit SNI from parent device

HTTP Specific

Setting	Description
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer. The maximum timeout value is <b>900</b> seconds (15 minutes).</p> <p>ⓘ If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
URL	<p>Enter the URL that the sensor connects to.</p> <p>If you enter an absolute URL, the sensor uses this address independently of the IP Address/DNS Name setting of the parent device. You can enter the URL of a web page (to measure the loading time of the page's source code), or enter the URL of an image or of a page asset to measure this element's availability and loading time.</p> <p>ⓘ The URL must be <a href="#">URL encoded</a>.</p> <p>ⓘ If you monitor an image or a page asset, this can create a high amount of memory load. We recommend that the size of the elements that you want to monitor does not exceed 200 MB.</p> <p>■ PRTG uses a smart URL replacement with which you can use the parent device's IP address or Domain Name System (DNS) name setting as part of the URL. For more information, see section <a href="#">Smart URL Replacement</a> <sup>1091</sup>.</p>
Request Method	<p>Select an HTTP request method to determine how the sensor requests the URL:</p> <ul style="list-style-type: none"> <li>▪ GET (default): Directly request the website.</li> </ul> <p>ⓘ We recommend that you use this setting for a simple check of the web page.</p>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ POST: Send post form data to the URL.               <ul style="list-style-type: none"> <li>❗ If you select this setting, you must enter the data in the Postdata field below.</li> <li>❗ If a POST request is redirected, all further requests are GET (default) requests.</li> </ul> </li> <li>▪ HEAD: Only request the HTTP header from the server without the actual web page.               <ul style="list-style-type: none"> <li>❗ Although this saves bandwidth because it transfers less data, we do not recommended that you use this. This is because the measured request time is not the one that your users experience and you might not be notified of slow results or timeouts.</li> </ul> </li> </ul>
Postdata	<p>This setting is only visible if you select POST above.</p> <p>Enter the data part for the POST request.</p> <p>❗ No Extensible Markup Language (XML) is allowed here.</p>
Content Type	<p>This setting is only visible if you select POST above.</p> <p>Define the content type of the POST request:</p> <ul style="list-style-type: none"> <li>▪ Default (application/x-www-form-urlencoded): Use the default content type to encode the form data set for submission to the server.</li> <li>▪ Custom: Use a custom content type. Enter the content type below.</li> </ul>
Custom Content Type	<p>This setting is only visible if you select Custom above.</p> <p>Define the custom content type, for example, XML, JavaScript Object Notation (JSON), or HTTP.</p>
Server Name Indication	<p>The Server Name Indication (SNI) that the sensor automatically determines from the host address of the <a href="#">parent device</a> or from the target URL of the sensor.</p> <p>❗ The SNI must be a fully qualified domain name (FQDN). Make sure that it matches the configuration of the target server.</p> <p>■ For more information, see the Knowledge Base: <a href="#">My HTTP sensors fail to monitor websites which use SNI. What can I do?</a></p> <p>❗ You cannot change this value after sensor creation.</p>
SNI Inheritance	<p>Define if you want to inherit the SNI from the parent device:</p> <ul style="list-style-type: none"> <li>▪ Inherit SNI from parent device: Determine the SNI from the host address of the parent device.</li> <li>▪ Do not inherit SNI from parent device: Determine the SNI from the target URL as defined in the settings of this sensor.</li> </ul>

Setting	Description
Result Handling	<p>Define what the sensor does with the data loaded at the URL:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last result of the requested data in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID]-A.txt, and Result of Sensor [ID].Data.txt. This setting is for debugging purposes, especially in combination with content checks. PRTG overwrites these files with each scanning interval.</li> </ul> <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

### Advanced Sensor Data

**Advanced Sensor Data**

HTTP Version ⓘ  HTTP 1.0  
 HTTP 1.1

User Agent ⓘ  Use the default string  
 Use a custom string

Use Custom HTTP Headers ⓘ  Do not use custom HTTP headers  
 Use custom HTTP headers

Advanced Sensor Data

Setting	Description
HTTP Version	<p>Define the HTTP version that the sensor uses when it connects to the target URL:</p> <ul style="list-style-type: none"> <li>▪ HTTP 1.0: Use HTTP version 1.0.</li> <li>▪ HTTP 1.1: Use HTTP version 1.1.</li> </ul>
User Agent	<p>Choose which user agent string the sensor sends when it connects to the target URL:</p> <ul style="list-style-type: none"> <li>▪ Use the default string: Do not enter a specific user agent and use the default string. Usually, this is <a href="#">Mozilla/5.0 (compatible; PRTG Network Monitor (www.paessler.com); Windows)</a>.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>Use a custom string: Use a custom user agent. Define the custom user agent below.</li> </ul>
Custom User Agent	<p>This setting is only visible if you select Use a custom string above.</p> <p>Enter the string that the sensor uses as the user agent when it connects to the target URL.</p>
HTTP Headers	<p>Define if you want to send custom HTTP headers to the target URL:</p> <ul style="list-style-type: none"> <li>Do not use custom HTTP headers: Do not use custom HTTP headers.</li> <li>Use custom HTTP headers: Use custom headers. Define below.</li> </ul>
Custom HTTP Headers	<p>This setting is only visible if you select Use custom HTTP headers above.</p> <p>Enter a list of custom HTTP headers and values that you want to transmit to the URL, each pair in one line. The syntax of a header-value pair is <code>header1:value1</code></p> <ul style="list-style-type: none"> <li> The sensor does not support the header field names <code>user-agent</code>, <code>content-length</code>, and <code>host</code>.</li> <li> Make sure that the HTTP header statement is valid. Otherwise, the sensor request cannot be successful.</li> </ul>

## Authentication

**Authentication**

Authentication   Web page does not need authentication (default)  Web page needs authentication

Authentication

Setting	Description
Authentication	<p>Define if authentication is necessary on the web page:</p> <ul style="list-style-type: none"> <li>Web page does not need authentication (default)</li> <li>Web page needs authentication</li> </ul>
User Name	<p>This setting is only visible if you select Web page needs authentication above.</p> <p>If the proxy requires authentication, enter the user name for the proxy login. Enter a string.</p>

Setting	Description
Password	<p>This setting is only visible if you select <a href="#">Web page needs authentication above</a>.</p> <p>Enter a password.</p>
Authentication Method	<p>This setting is only visible if you select <a href="#">Web page needs authentication above</a>.</p> <p>Select the authentication method that the URL uses:</p> <ul style="list-style-type: none"> <li>▪ HTTP authentication (default): Use simple HTTP authentication. <ul style="list-style-type: none"> <li>ⓘ This authentication method transmits credentials as plain text.</li> </ul> </li> <li>▪ NT LAN Manager authentication: Use the Microsoft NT LAN Manager (NTLM) protocol for authentication.</li> <li>▪ Digest access authentication: Use digest access authentication. This applies a hash function to the password, which is safer than HTTP authentication (default).</li> </ul>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic. <ul style="list-style-type: none"> <li>ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>

Setting	Description
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can only enter the protocol followed by a colon and three forward slashes (this means that you can enter either [http://](#) or [https://](#), or even a simple forward slash / as the equivalent for [http://](#)). PRTG automatically fills in the parent device's IP Address/DNS Name in front of the third forward slash.

Whether this results in a valid URL or not depends on the IP address or Domain Name System (DNS) name of the parent device. In combination with cloning devices, you can use smart URL replacement to create many similar devices.

For example, if you create a device with the DNS name [www.example.com](#) and you add an HTTP sensor to it, you can provide values in the following ways:

- If you enter [https://](#) in the URL field, PRTG automatically creates the URL [https://www.example.com/](#)
- If you enter [/help](#) in the URL field, PRTG automatically creates and monitor the URL [http://www.example.com/help](#)
- It is also possible to provide a port number in the URL field. It is taken over by the device's DNS name and is internally added, for example, [http://:8080/](#)

 Smart URL replacement does not work for sensors that run on the probe device.

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
[Value]	<p>The values that the web server returns in several channels</p> <p> This channel is the primary channel by default.</p> <p> For more information about the return value format, see section <a href="#">Custom Sensors</a>.</p>

## 7.8.66 HTTP Full Web Page Sensor

The HTTP Full Web Page sensor monitors the full download time of a web page including assets such as images. In the background, it opens the web page in a browser instance to perform the measurement. It does not follow links.

**i** Be careful with this sensor because it can generate a considerable amount of internet traffic if you use it with a short scanning interval.

HTTP Full Web Page Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[1093]</sup>.

### Sensor in Other Languages

- Dutch: HTTP Volledige Webpagina
- French: Page web complète (HTTP)
- German: HTTP (Komplette Webseite)
- Japanese: HTTP 完全ウェブページ監視
- Portuguese: Página completa HTTP
- Russian: HTTP: Полное время загрузки веб-страницы
- Simplified Chinese: HTTP 完整网页
- Spanish: Página web completa HTTP

### Remarks

Consider the following [remarks](#)<sup>[1093]</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a very high performance impact. We recommend that you use no more than <b>50</b> of this sensor on each probe.
SRP ciphers	This sensor does not support Secure Remote Password (SRP) ciphers.
Smart URL replacement	This sensor supports <a href="#">smart URL replacement</a> <sup>110991</sup> .
IPv6	This sensor supports IPv6.
Knowledge Base	<ul style="list-style-type: none"> <li>▪ Knowledge Base: <a href="#">What to do when I see a CreateUniqueTempDir() error message for my HTTP Full Web Page sensor?</a></li> <li>▪ Knowledge Base: <a href="#">HTTP Full Web Page sensor is unable to navigate. What can I do?</a></li> <li>▪ Knowledge Base: <a href="#">How can I change the size of PhantomJS full web page screenshots?</a></li> <li>▪ Knowledge Base: <a href="#">Why is my HTTP Full Web Page sensor generating so many temporary files?</a></li> <li>▪ Knowledge Base: <a href="#">Which HTTP status code leads to which HTTP sensor status?</a></li> </ul>
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

Password	<p><span style="color: blue;">This setting is only visible if you select PhantomJS (Headless Webkit) above.</span></p> <p>Enter the password for the web page.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select Stack channels on top of each other above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can only enter the protocol followed by a colon and three forward slashes (this means that you can enter either <http://> or <https://>, or even a simple forward slash / as the equivalent for <http://>). PRTG automatically fills in the parent device's IP Address/DNS Name in front of the third forward slash.

Whether this results in a valid URL or not depends on the IP address or Domain Name System (DNS) name of the parent device. In combination with cloning devices, you can use smart URL replacement to create many similar devices.

For example, if you create a device with the DNS name [www.example.com](http://www.example.com) and you add an HTTP sensor to it, you can provide values in the following ways:

- If you enter <https://> in the URL field, PRTG automatically creates the URL <https://www.example.com/>
- If you enter [/help](http://www.example.com/help) in the URL field, PRTG automatically creates and monitor the URL <http://www.example.com/help>
- It is also possible to provide a port number in the URL field. It is taken over by the device's DNS name and is internally added, for example, <http://:8080/>

 Smart URL replacement does not work for sensors that run on the probe device.

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Loading Time	The loading time of the full web page  This channel is the primary channel by default.

## 7.8.67 HTTP IoT Push Data Advanced Sensor

The HTTP IoT Push Data Advanced sensor displays data from messages that are received from Internet of Things (IoT) capable devices (for example, Sigfox devices) and that are pushed via an HTTPS request to PRTG. It provides a URL that you can use to push messages to the probe system via HTTPS (secured with TLS 1.3 and weak ciphers).

☁ This sensor is especially useful when you want to push data to a PRTG Hosted Monitor instance.

📘 For more information about the sensor usage, see section [How to Use](#)<sup>[1105]</sup>.

HTTP IoT Push Data Advanced Sensor

■ For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[1106]</sup>.

### Sensor in Other Languages

- Dutch: HTTP IoT Push Data Geavanceerd
- French: Données IoT avancé (HTTP Push)
- German: HTTP IoT Push-Daten (Erweitert)
- Japanese: HTTP IoT プッシュデータ(アドバンスト)
- Portuguese: Dados de push IoT (avançado) (HTTP)
- Russian: Дополнительные данные push-объекта HTTP IoT
- Simplified Chinese: HTTP IoT 高级推送数据
- Spanish: Datos push IoT (avanzado) (HTTP)

### Remarks

Consider the following [remarks](#)<sup>[1107]</sup> and requirements for this sensor:

Remark	Description
Fixed port	This sensor has a fixed port (5051). You cannot change it.
Fixed SSL/TLS version	This sensor has a fixed SSL/TLS version (HTTPS (secured with TLS 1.3 and weak ciphers)). You cannot change it.
Remote probe	If you want to add this sensor to a remote probe and use an HTTPS connection to send push notifications, you must import a Secure Sockets Layer (SSL) certificate into the \cert subfolder of the <a href="#">PRTG program directory</a> on the remote probe. However, this certificate does not have to match the certificate that you use on the PRTG core server. For more information about SSL certificates, see the Paessler website: <a href="#">How to use your own SSL certificate with the PRTG web server</a>
Cluster probe	This sensor does not support cluster probes. You can only set it up on local probes or remote probes.
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <b>low</b> performance impact.
Multiple channels	If you use this sensor with multiple channels, we recommend that you <b>simultaneously</b> push the data for <b>all</b> your channels to PRTG. You can push data to only one of your channels. However, all other channels record the value of <b>0</b> for this push message.
False alerts	This sensor might result in false alerts if the parent probe disconnects from the PRTG core server. In this case, the sensor shows the error message: <b>The latest push message that the sensor received is older than the specified time threshold allows. (code: PE222).</b>

## Basic Sensor Settings

### Basic Sensor Settings

**Sensor Name** ⓘ Example Name

---

**Tags** ⓘ exampletag ✕ ⊕

---

**Priority** ⓘ ★★★★★

Basic Sensor Settings

The sensor has the following **default tags** that are automatically predefined in the sensor's settings when you add the sensor:

- HttpPushSensor
- IoT
- PushData
- PushSensor
- Sigfox

■ For more information about basic sensor settings, see section [Sensor Settings](#) <sup>667</sup>.

## TLS Settings

**TLS Settings** TLS Port ⓘ 5051

TLS Settings

Setting	Description
TLS Port	The number of the port on which this sensor listens for incoming HTTPS requests. This is always <a href="#">5051</a> .

## HTTP Push Authentication

**HTTP Push Authentication** Identification Token ⓘ 12345678-ABCD-EFGH-87654321

HTTP Push Authentication

Setting	Description
Identification Token	<p>This is the token that PRTG uses to find the matching sensor for the incoming message. When you create the sensor, this token is <code>{_guid_}</code>.</p> <p>PRTG replaces this token with an automatically generated token after sensor creation. If you want to use a different identification token, you can edit it during or after sensor creation.</p> <p>ⓘ PRTG does not automatically replace the token if you change it already during sensor creation.</p>

## HTTP Push Data

**HTTP Push Data**

No Incoming Data ⓘ

Ignore and keep last status (default)  
 Switch to unknown status  
 Switch to down status after x minutes

HTTP Push Data

Setting	Description
No Incoming Data	<p>Define which <a href="#">status</a> the sensor shows if it does not receive a push message for at least two scanning intervals:</p> <ul style="list-style-type: none"> <li>▪ Ignore and keep last status (default): Keep the status as defined by the last message that the sensor received.               <ul style="list-style-type: none"> <li>ⓘ The parent probe must be connected to keep the last status. If the parent probe disconnects, the sensor shows the Unknown status. If the parent probe connects again, the sensor does not automatically switch from the Unknown status to the last status before the parent probe disconnects.</li> </ul> </li> <li>▪ Switch to unknown status: Show the Unknown status if the sensor does not receive a message for at least two scanning intervals.</li> <li>▪ Switch to down status after x minutes: Show the Down status if the sensor does not receive a message within a specific time span. Define the time threshold below.</li> </ul>
Time Threshold (Minutes)	<p><b>This setting is only visible if you select</b> Switch to down status after x minutes <b>above.</b></p> <p>Enter a time threshold in minutes. If this time elapses, the sensor shows the Down status if it does not receive a push message within this time span. Enter an integer. The maximum threshold is <b>1440</b> minutes.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ

Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## How to Use

This function is known as a [webhook](#). Basically, a webhook works like a push notification. Webhooks are usually triggered by an event (for example, a new comment on a blog post) and send according information to a specified URL. The HTTP IoT Push Data Advanced sensor then displays the data of pushed and received messages.

 The data that is pushed to this sensor must be valid XML or JSON.

 For more information about the return value format, see section [Custom Sensors](#).

The HTTP IoT Push Data Advanced sensor uses the following URLs depending on the type of HTTPS request:

- GET (default) requests: `https://<probe_ip>:5051/<token>?content=<valid XML_or_JSON>`

The XML-encoded value of the content parameter has to match the format defined in section [Custom Sensors](#).

- POST requests: `https://<probe_ip>:5051/<token>`

This HTTPS request method sends the XML-encoded or JSON-encoded HTTPS body as POST data. The body has to match the format defined in section [Custom Sensors](#). We strongly recommend the HTTPS content type `application/xml` or `application/json`.

Replace the parameters `<probe_ip>`, `<token>`, and `<valid XML_or_JSON>` (for GET requests) with the corresponding values:

- For PRTG Network Monitor, the probe IP is the IP address of the probe system.

☁ For PRTG Hosted Monitor instances, the probe IP is the Domain Name System (DNS) name of the instance.

- The port number is always `5051`. You cannot change this.
- You can define identification token in the sensor settings.
- The content of GET requests has to be valid XML or JSON in the PRTG API format.
  - ⓘ The content has to be URL encoded (for example, the whitespaces in the sample URL below). Most browsers do the URL-encoding automatically.

Minimum example for the GET method that returns one static channel value:

```
https://127.0.0.1:5051/XYZ123?
content=<prtg><result><channel>MyChannel</channel><value>10</value></result><text>this
%20is%20a%20message</text></prtg>
```

- ⓘ By default, values within the `<value>` tags in the returned XML or JSON must be `integers` for them to be processed. If `float` values are returned, you must explicitly define this value type as defined in section [Custom Sensors](#) with `<float>` tags, otherwise the sensor shows 0 values in affected channels. Example:

```
https://127.0.0.1:5051/XYZ123?
content=<prtg><result><channel>MyChannel</channel><value>10.45</value><float>1</float>
</result><text>this%20is%20a%20message</text></prtg>
```

- ⓘ You can use several sensors with the same port and identification token. In this case, push message data is shown in each of these sensors.

## Channel List

- ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
[Value]	<p>The data received from the message encoded in valid XML or JSON in several channels</p> <p> This channel is the primary channel by default.</p> <p> For more information about the return value format, see section <a href="#">Custom Sensors</a>.</p>

No Incoming Data	<p>Define which <a href="#">status</a> the sensor shows if it does not receive a push message for at least two scanning intervals:</p> <ul style="list-style-type: none"> <li>Ignore and keep last status (default): Keep the status as defined by the last message that the sensor received. <ul style="list-style-type: none"> <li>ⓘ The parent probe must be connected to keep the last status. If the parent probe disconnects, the sensor shows the Unknown status. If the parent probe connects again, the sensor does not automatically switch from the Unknown status to the last status before the parent probe disconnected.</li> </ul> </li> <li>Switch to unknown status: Show the Unknown status if the sensor does not receive a message for at least two scanning intervals.</li> <li>Switch to down status after x minutes: Show the Down status if the sensor does not receive a message within a specific time span. Define the time threshold below.</li> </ul>
Time Threshold (Minutes)	<p><b>This setting is only visible if you select</b> Switch to down status after x minutes <b>above.</b></p> <p>Enter a time threshold in minutes. If this time elapses, the sensor shows the Down status if it does not receive a push message within this time span. Enter an integer. The maximum threshold is <b>1440</b> minutes.</p>
Value Type	<p>Define the type of the value of the received data:</p> <ul style="list-style-type: none"> <li>Integer</li> <li>Float (with a dot . between the predecimal position and the decimal places)</li> </ul> <p>ⓘ If this setting does not match, the sensor shows the Down status.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## How to Use

This function is known as [webhook](#). Basically, a webhook works like a push notification. Webhooks are usually triggered by an event (for example, a new comment on a blog post) and send according information to a specified URL. The HTTP Push Data sensor then displays the data of pushed and received messages.

The HTTP Push Data sensor uses the following URL:

`http://<probe_ip>:<port_number>/<token>?value=<integer_or_float>&text=<text message>`

Replace the parameters `<probe_ip>`, `<port_number>`, `<token>`, and `<integer_or_float>` with the corresponding values. The `&text` parameter is optional: You can omit it.

- You can define the [port number](#) and [identification token](#) in the sensor settings.
- The [probe IP](#) is the IP address of the probe system with this sensor.
- The [value](#) can be an integer or a float value depending on the data of your application. You must set the value type accordingly in the sensor settings. This parameter is the sensor value.
  - ❶ If this parameter is missing, the sensor shows a [Down status](#).
- You can optionally add a custom text message by replacing the parameter `<text message>` with your custom text. The text is shown as the sensor message. If there is no value but only a text, the text is shown as an error message.
  - ❶ This text message has to be URL encoded (for example, the whitespaces in the sample URL below). Most browsers do URL-encoding automatically.

Example:

`http://192.0.2.0:5050/XYZ123?value=0&text=this%20is%20a%20message`

- ❶ You can use several sensors with the same port and identification token. In this case, the data of push messages is shown in each of these sensors.

## Channel List

- ❶ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
[Value]	The received value and an optional message in one channel ❶ This channel is the primary channel by default.

## 7.8.70 HTTP Push Data Advanced Sensor

The HTTP Push Data Advanced sensor displays data from received messages that are pushed via an HTTP request to PRTG. It provides a URL that you can use to push messages to the probe system via HTTP (secured with TLS 1.2 or not secure).

**i** For more information about the sensor usage, see section [How to Use](#)<sup>[1127]</sup>.

HTTP Push Data Advanced Sensor

**■** For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[1128]</sup>.

### Sensor in Other Languages

- Dutch: HTTP Push Data geavanceerd
- French: Données avancé (HTTP Push)
- German: HTTP Push-Daten (Erweitert)
- Japanese: HTTP プッシュデータ(アドバンスト)
- Portuguese: Dados de push HTTP avançado
- Russian: HTTP: Данные push-объекта (расширенный)
- Simplified Chinese: HTTP 高级推送数据
- Spanish: Datos push (avanzado) (HTTP)

### Remarks

Consider the following [remarks](#)<sup>[1122]</sup> and requirements for this sensor:

Remark	Description
Remote probe	If you want to add this sensor to a remote probe and use an HTTPS connection to send push notifications, you must import a Secure Sockets Layer (SSL) certificate into the \cert subfolder of the <a href="#">PRTG program directory</a> on the remote probe. However, this certificate does not have to match the certificate that you use on the PRTG core server. For more information about SSL certificates, see the Paessler website: <a href="#">How to use your own SSL certificate with the PRTG web server</a>
Cluster probe	This sensor does not support cluster probes. You can only set it up on local probes or remote probes.
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <b>low</b> performance impact.
Multiple channels	If you use this sensor with multiple channels, we recommend that you <b>simultaneously</b> push the data for <b>all</b> your channels to PRTG. You can push data to only one of your channels. However, all other channels record the value of <b>0</b> for this push message.
False alerts	This sensor might result in false alerts if the parent probe disconnects from the PRTG core server. In this case, the sensor shows the error message: <a href="#">The latest push message that the sensor received is older than the specified time threshold allows. (code: PE222)</a> .
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Basic Sensor Settings

### Basic Sensor Settings

**Sensor Name** ⓘ Example Name

---

**Tags** ⓘ exampletag ✕ ⊕

---

**Priority** ⓘ ★★★★★

Basic Sensor Settings

The sensor has the following **default tags** that are automatically predefined in the sensor's settings when you add the sensor:

- HttpPushSensor

- PushData
- PushSensor

For more information about basic sensor settings, see section [Sensor Settings](#) [667].

## HTTP Push

**HTTP Push**

TLS Settings ⓘ *HTTP (unsecure)*

Request Handling ⓘ  Discard request  
 Store request

HTTP Push

Setting	Description
TLS Settings	<p>Define the security of the incoming HTTP push requests:</p> <ul style="list-style-type: none"> <li>▪ HTTP (unsecure): Send push messages to the probe system via HTTP (not secure).</li> <li>▪ HTTPS low security (TLS 1.0 to 1.3 and weak ciphers): Send push messages to the probe system via HTTPS. The sensor supports connections secured with TLS 1.0 to TLS 1.3 and weak ciphers. It uses the SSL certificate that is delivered with PRTG or <a href="#">your own trusted SSL certificate</a> that you imported for the PRTG web server. <ul style="list-style-type: none"> <li>ⓘ If you install the sensor on a remote probe, make sure that you import the same SSL certificates to the remote probe that you use on the PRTG core server.</li> </ul> </li> <li>▪ HTTPS high security (TLS 1.2 to 1.3 and strong ciphers): Send push messages to the probe system via HTTPS. The sensor supports connections secured with TLS 1.2 to TLS 1.3 and strong ciphers. It uses the SSL certificate that is delivered with PRTG or <a href="#">your own trusted SSL certificate</a> that you imported for the PRTG web server. <ul style="list-style-type: none"> <li>ⓘ If you install the sensor on a remote probe, make sure that you import the same SSL certificates to the remote probe that you use on the PRTG core server.</li> </ul> </li> </ul> <p>ⓘ You cannot change this value after sensor creation.</p>

Setting	Description
Port	<p>This setting is only visible if you select HTTP (unsecure) <a href="#">above</a>.</p> <p>Enter the number of the port on which this sensor listens for incoming HTTP requests. The default port is <b>5050</b>.</p> <p><b>i</b> You cannot change this value after sensor creation.</p>
TLS Port	<p>This setting is only visible if you select HTTPS low security (TLS 1.0 to 1.3 and weak ciphers) or HTTPS high security (TLS 1.2 to 1.3 and strong ciphers) <a href="#">above</a>.</p> <p>Enter the number of the port on which this sensor listens for incoming HTTPS requests. The default port is <b>5051</b>.</p> <p><b>i</b> You cannot change this value after sensor creation.</p>
Request Method	<p>Select the request method of the webhook:</p> <ul style="list-style-type: none"> <li>▪ any: Do not use any filter for the request method.</li> <li>▪ GET (default): Select this method if the webhook uses GET.</li> <li>▪ POST: Select this method if the webhook sends POST data.</li> </ul> <p><b>i</b> POST data must be form-encoded request bodies with the same parameters as for GET requests.</p>
Identification Token	<p>This is the token that PRTG uses to find the matching sensor for the incoming message. When you create the sensor, this token is <code>{_guid_}</code>.</p> <p>PRTG replaces this token with an automatically generated token after sensor creation. If you want to use a different identification token, you can edit it during or after sensor creation.</p> <p><b>i</b> PRTG does not automatically replace the token if you change it already during sensor creation.</p>
Request Handling	<p>Define what PRTG does with the incoming messages:</p> <ul style="list-style-type: none"> <li>▪ Discard request: Do not store the pushed messages.</li> <li>▪ Store result: Store the last message received from the sensor in the <code>\Logs\sensors</code> subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Request for Sensor [ID].txt. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul>

## HTTP Push Data

**HTTP Push Data**

**No Incoming Data** ⓘ  Ignore and keep last status (default)  
 Switch to unknown status  
 Switch to down status after x minutes

HTTP Push Data

Setting	Description
No Incoming Data	<p>Define which <a href="#">status</a> the sensor shows if it does not receive a push message for at least two scanning intervals:</p> <ul style="list-style-type: none"> <li>▪ Ignore and keep last status (default): Keep the status as defined by the last message that the sensor received.               <ul style="list-style-type: none"> <li>ⓘ The parent probe must be connected to keep the last status. If the parent probe disconnects, the sensor shows the Unknown status. If the parent probe connects again, the sensor does not automatically switch from the Unknown status to the last status before the parent probe disconnects.</li> </ul> </li> <li>▪ Switch to unknown status: Show the Unknown status if the sensor does not receive a message for at least two scanning intervals.</li> <li>▪ Switch to down status after x minutes: Show the Down status if the sensor does not receive a message within a specific time span. Define the time threshold below.</li> </ul>
Time Threshold (Minutes)	<p><b>This setting is only visible if you select</b> Switch to down status after x minutes <b>above.</b></p> <p>Enter a time threshold in minutes. If this time elapses, the sensor shows the Down status if it does not receive a push message within this time span. Enter an integer. The maximum threshold is <b>1440</b> minutes.</p>

## Sensor Display

**Sensor Display**

**Primary Channel** ⓘ Downtime

---

**Graph Type** ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## How to Use

This function is known as [webhook](#). Basically, a webhook works like a [push notification](#). Webhooks are usually triggered by some event (for example, a new comment on a blog post) and send according information to a specified URL. The HTTP Push Data Advanced sensor then displays the data of pushed and received messages.

The data that is pushed to this sensor must be valid XML or JSON.

 For more information about the return value format, see section [Custom Sensors](#).

The HTTP Push Data Advanced sensor uses the following URLs depending on the type of HTTP request:

- GET (default) requests: `http://<probe_ip>:<port_number>/<token>?content=<valid XML_or_JSON>`

The XML encoded value of the content parameter has to match the format as defined in section [Custom Sensors](#).

- POST requests: `http://<probe_ip>:<port_number>/<token>`

This HTTP request method sends the XML or JSON encoded HTTP body as POST data. The body has to match the format as defined in section [Custom Sensors](#). For POST requests, use an HTTP content type other than `application/x-www-form-urlencoded`. We strongly recommend the HTTP content type `application/xml` or `application/json`.

Replace the parameters `<probe_ip>`, `<port_number>`, `<token>`, and `<valid XML_or_JSON>` (for GET requests) with the corresponding values:

- You can define [port number](#) and [identification token](#) in the sensor settings.
- The [probe IP](#) is the IP address of the probe system with this sensor.
- The content of GET requests has to be valid XML or JSON in the PRTG API format.
  - ❶ The content has to be URL encoded (for example, the whitespaces in the sample URL below). Most browsers do URL-encoding automatically.

Minimum example for the GET method that returns one static channel value:

```
http://127.0.0.1:5050/XYZ123?
content=<prtg><result><channel>MyChannel</channel><value>10</value></result><text>this%20is%20a%20message</text></prtg>
```

- ❶ By default, values within the `<value>` tags in the returned XML or JSON must be [integers](#) to be processed. If [float](#) values are returned, you must explicitly define this value type as defined in section [Custom Sensors](#) with `<float>` tags, otherwise the sensor shows **0** values in affected channels. Example:

```
http://127.0.0.1:5050/XYZ123?
content=<prtg><result><channel>MyChannel</channel><value>10.45</value><float>1</float></result><text>this%20is%20a%20message</text></prtg>
```

- ❶ You can use several sensors with the same port and identification token. In this case, the data of push messages is shown in each of these sensors.

## Channel List

- ❶ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status

Channel	Description
[Value]	<p>The data received from the message encoded in valid XML or JSON in several channels</p> <p> This channel is the primary channel by default.</p> <p> For more information about the return value format, see section <a href="#">Custom Sensors</a>.</p>

## 7.8.71 HTTP Transaction Sensor

The HTTP Transaction sensor monitors an interactive website, such as a web shop, by performing a transaction using a set of HTTP URLs. The sensor monitors whether logins or shopping carts work properly.

**i** This sensor implicitly supports SNI, an extension to the Transport Layer Security (TLS) protocol.

HTTP Transaction Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[1140]</sup>.

### Sensor in Other Languages

- Dutch: HTTP (Transactie)
- French: Transaction (HTTP)
- German: HTTP (Transaktion)

Authentication	<p>Define if authentication is necessary on the web page:</p> <ul style="list-style-type: none"> <li>▪ Web page does not need authentication (default)</li> <li>▪ Web page needs authentication</li> </ul>

Setting	Description
User Name	<p>This setting is only visible if you select Web page needs authentication above.</p> <p>If the proxy requires authentication, enter the user name for the proxy login. Enter a string.</p>
Password	<p>This setting is only visible if you select Web page needs authentication above.</p> <p>Enter a password.</p>
Authentication Method	<p>This setting is only visible if you select Web page needs authentication above.</p> <p>Select the authentication method that the URL uses:</p> <ul style="list-style-type: none"> <li>▪ HTTP authentication (default): Use simple HTTP authentication. <ul style="list-style-type: none"> <li> This authentication method transmits credentials as plain text.</li> </ul> </li> <li>▪ NT LAN Manager authentication: Use the Microsoft NT LAN Manager (NTLM) protocol for authentication.</li> <li>▪ Digest access authentication: Use digest access authentication. This applies a hash function to the password, which is safer than HTTP authentication (default).</li> </ul>

## Transaction URL

You can define up to 10 different transaction URLs, which are all called in a row. If the transaction can be completed, the sensor shows the Up status. Using this mechanism, you can set up extended monitoring with multiple URLs.

Enter settings for at least one transaction URL. You can use as many steps as necessary and disable the other steps.

**Transaction URL #1**

URL ⓘ

Request Method ⓘ  GET (default)  
 POST  
 HEAD

Require Keyword ⓘ  Do not check for keyword (default)  
 Set sensor to warning status if keyword is missing  
 Set sensor to down status if keyword is missing

Exclude Keyword ⓘ  Do not check for keyword (default)  
 Set sensor to warning status if keyword is found  
 Set sensor to down status if keyword is found

**Transaction URL #2**

Transaction Step #2 ⓘ  Disable step #2 (default)  
 Enable step #2

Transaction URL #x

Setting	Description
Transaction Step #x	<p>This setting is available for URL #2 through #10. Define if you want to use this step for the transaction check:</p> <ul style="list-style-type: none"> <li>▪ Disable step #x (default): Do not use this step. Choose this option if you do not need all 10 steps for the transaction check.</li> <li>▪ Enable step #x: Enable this step. Further options are available.</li> </ul>
URL	<p>Enter the URL that the sensor connects to. If you enter an absolute URL, the sensor uses this address independently of the IP Address/DNS Name setting of the parent device.</p> <p><b>ⓘ</b> The URL must not be <a href="#">URL encoded</a>.</p> <p><b>■</b> PRTG uses a smart URL replacement with which you can use the parent device's IP address or Domain Name System (DNS) name setting as part of the URL. For more information, see section <a href="#">Smart URL Replacement</a> [1139].</p>
Request Method	<p>Select an HTTP request method to determine how the sensor requests the URL:</p> <ul style="list-style-type: none"> <li>▪ GET (default): Directly request the website.</li> </ul> <p><b>ⓘ</b> We recommend that you use this setting for a simple check of the web page.</p>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ <b>POST:</b> Send post form data to the URL.               <ul style="list-style-type: none"> <li>❗ If you select this setting, you must enter the data in the Postdata field below.</li> <li>❗ If a POST request is redirected, all further requests are GET (default) requests.</li> </ul> </li> <li>▪ <b>HEAD:</b> Only request the HTTP header from the server without the actual web page.               <ul style="list-style-type: none"> <li>❗ Although this saves bandwidth because it transfers less data, we do not recommended that you use this. This is because the measured request time is not the one that your users experience and you might not be notified of slow results or timeouts.</li> </ul> </li> </ul>
Postdata	<p><a href="#">This setting is only visible if you select POST above.</a></p> <p>Enter the data part for the POST request.</p> <ul style="list-style-type: none"> <li>❗ No Extensible Markup Language (XML) is allowed here.</li> </ul>
Require Keyword	<p>Define if the sensor checks the result at the URL for keywords:</p> <ul style="list-style-type: none"> <li>▪ Do not check for keyword (default): Do not search for keywords in the result.</li> <li>▪ Set sensor to warning status if keyword is missing: Check if a keyword exists in the result. If it exists, set the sensor to the Warning status.</li> <li>▪ Set sensor to down status if keyword is missing: Check if a keyword exists in the result. If it exists, set the sensor to the Down status.</li> </ul> <ul style="list-style-type: none"> <li>❗ The content check is only intended for HTML websites and might not work with other target URLs.</li> </ul>
Response Must Include	<p><a href="#">This setting is only visible if you select Set sensor to warning status if keyword is missing or Set sensor to down status if keyword is missing above.</a></p> <p>Define the search string that must be part of the result at the URL.</p> <ul style="list-style-type: none"> <li>❗ If the result at the URL does <b>not</b> include the search pattern, the sensor shows the status defined above and displays this string along with the affected URL in the sensor message.</li> <li>❗ Only simple text search is available here.</li> <li>❗ The characters <b>*</b> and <b>?</b> work as placeholders. <b>*</b> stands for no number or any number of characters and <b>?</b> stands for exactly one character. You cannot change this behavior. The literal search for these characters is not possible.</li> </ul>
Exclude Keyword	<p>Define if the sensor checks the result at the URL for keywords:</p>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Do not check for keyword (default): Do not search for keywords in the result.</li> <li>▪ Set sensor to warning status if keyword is found: Check if a keyword exists in the result. If it exists, set the sensor to the Warning status.</li> <li>▪ Set sensor to down status if keyword is found: Check if a keyword exists in the result. If it exists, set the sensor to the Warning status.</li> </ul> <p><b>i</b> The content check is only intended for HTML websites and might not work with other target URLs.</p>
Response Must Not Include	<p>Define a string that must not be part of the result at the URL. If the data includes this string, the sensor shows the Down status and displays this string along with the affected URL in the sensor message. Enter a string.</p> <p><b>i</b> Only simple text search is available here.</p> <p><b>i</b> The characters * and ? work as placeholders. * stands for no number or any number of characters and ? stands for exactly one character. You cannot change this behavior. The literal search for these characters is not possible.</p>

## Sensor Display

**Sensor Display**

Primary Channel **i** Downtime

---

Graph Type **i** 
 Show channels independently (default)
   
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.                             <ul style="list-style-type: none"> <li> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can only enter the protocol followed by a colon and three forward slashes (this means that you can enter either [http://](#) or [https://](#), or even a simple forward slash / as the equivalent for [http://](#)). PRTG automatically fills in the parent device's IP Address/DNS Name in front of the third forward slash.

Whether this results in a valid URL or not depends on the IP address or Domain Name System (DNS) name of the parent device. In combination with cloning devices, you can use smart URL replacement to create many similar devices.

For example, if you create a device with the DNS name [www.example.com](#) and you add an HTTP sensor to it, you can provide values in the following ways:

- If you enter [https://](#) in the URL field, PRTG automatically creates the URL [https://www.example.com/](#)
- If you enter [/help](#) in the URL field, PRTG automatically creates and monitor the URL [http://www.example.com/help](#)
- It is also possible to provide a port number in the URL field. It is taken over by the device's DNS name and is internally added, for example, [http://:8080/](#)

 Smart URL replacement does not work for sensors that run on the probe device.

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Sum	The loading time of the complete transaction <b>i</b> This channel is the primary channel by default.
Time of URL [#]	The loading time of single URLs

## 7.8.72 HTTP XML/REST Value Sensor

The HTTP XML/REST Value sensor retrieves an .xml file from a URL and parses it.

HTTP XML/REST Value Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[1150]</sup>.

### Sensor in Other Languages

- Dutch: HTTP XML/REST Waarde
- French: Valeur XML/REST (HTTP)
- German: HTTP XML-/REST-Wert
- Japanese: HTTP XML/REST 値
- Portuguese: Valor HTTP XML/REST
- Russian: Значение HTTP XML/REST
- Simplified Chinese: HTTP XML/REST 值
- Spanish: Valor HTTP XML/REST

### Remarks

Consider the following [remarks](#)<sup>[1147]</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node. If the sensor shows the error PE087, additionally install .NET 3.5 on the probe system.</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
Windows Server	We recommend Windows Server 2016 on the probe system for best performance of this sensor.
SRP ciphers	This sensor does not support Secure Remote Password (SRP) ciphers.
Smart URL replacement	This sensor supports <a href="#">smart URL replacement</a> <sup>[1150]</sup> .
IPv6	This sensor supports IPv6.
Single node	This sensor can monitor only one single node in an .xml file and shows the value in one channel. To monitor more than one node of an .xml document, add one sensor for each target node.
Knowledge Base	<ul style="list-style-type: none"> <li>▪ Knowledge Base: <a href="#">Where can I find more information about the HTTP XML/REST Value sensor?</a></li> <li>▪ Knowledge Base: <a href="#">Which HTTP status code leads to which HTTP sensor status?</a></li> </ul>

## Add Sensor

Setting	Description
Channel Name	<p>Enter a name for the channel that displays the value at the URL.</p> <p> You can change this value later in the <a href="#">channel settings</a> of this sensor.</p>

Sensor Settings

Setting	Description
URL	<p>Enter the URL that returns the .xml file. If you enter an absolute URL, the sensor uses this address independently of the IP Address/DNS Name setting of the parent device.</p> <p> The URL must be <a href="#">URL encoded</a>.</p> <p> PRTG uses a smart URL replacement with which you can use the parent device's IP address or Domain Name System (DNS) name setting as part of the URL. For more information, see section <a href="#">Smart URL Replacement</a> <sup>[1150]</sup>.</p>
XML Node (and optional property)	<p>Enter the name of the node that this sensor checks, or enter a node name and a property name to check a property value. To obtain a value from nested tags, enter the tag names and separate them with a forward slash (/). For example, use <a href="#">myTag/myTagInside</a> as XML node value.</p> <p> You can also check values in JavaScript Object Notation (JSON). See section <a href="#">Checking JSON</a> <sup>[1148]</sup>.</p> <p> You can try to use XPath syntax here but it does not work in all cases and we do not provide any technical support for XPath issues. For more information about XPath, see the Knowledge Base: <a href="#">How can I use XPath with the HTTP XML/REST Value sensor?</a></p>
HTTP User Name	<p>If the URL requires authentication, enter the user name. Enter a string or leave the field empty.</p>
HTTP Password	<p>If the URL requires authentication, enter the password. Enter a string or leave the field empty.</p>
Sensor Value	<p>Define what value the sensor shows:</p> <ul style="list-style-type: none"> <li>▪ Use the value of the selected XML node: Return the value that the sensor finds at the XML node. If this is a non-numeric value, the sensor shows 0.</li> <li>▪ Use the number of occurrences of the selected XML node or its children/siblings: Return the number of occurrences found. Define further settings below.</li> </ul>
Count XML Nodes	<p><a href="#">This setting is only visible if you select Use the number of occurrences of the selected XML node or its children/siblings</a> <a href="#">above</a>.</p> <p>Define which count the sensor shows:</p> <ul style="list-style-type: none"> <li>▪ Occurrences of the selected XML node: Return how often the defined XML node occurs at the URL.</li> <li>▪ Child nodes of the selected XML node: Return the number of child nodes that exist below the node at the URL.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Sibling nodes of the selected XML node: Return the number of sibling nodes that exist next to the node at the URL.</li> </ul>
Name Space Handling	<p>Define whether to use namespaces in the .xml document or not:</p> <ul style="list-style-type: none"> <li>▪ Use name spaces: Process the value you enter in the XML Node (and optional property) field, possibly including namespace information.</li> <li>▪ Remove name spaces: Ignore namespace information in the .xml document and process the value you enter in the XML Node (and optional property) field as node names only.</li> </ul> <p> For more information see section <a href="#">About Namespaces</a> .</p>
Content Type	<p>Define what to include in the header of the request that the sensor sends to the URL:</p> <ul style="list-style-type: none"> <li>▪ Enable (default): This works for most web servers and is the recommended setting.</li> <li>▪ Disable: Only very few web servers cannot handle this content type and need this setting. Try this if you get an error message with the enabled option.</li> <li>▪ Custom: You can use a custom content type.</li> </ul>
Custom Content Type	<p><a href="#">This setting is only visible if you select Custom above.</a></p> <p>Enter a custom content type like <a href="#">text/xml</a> or <a href="#">text/html</a>.</p>
HTTP Headers	<p>Optionally enter a list of custom HTTP headers with their respective values that you want to transmit to the URL. The syntax of a list with header-value pairs is <a href="#">header1:value1 header2:value2 ... headerx:valuex</a></p> <p> The sensor does not accept header field names that include a dash (–) character. If you want to use such an HTTP header, leave out the dash in the name. For example, enter <a href="#">ContentType:value</a> instead of <a href="#">Content-Type:value</a>. Example: <a href="#">From:johnqpublic@example.com AcceptLanguage:en-us</a></p> <p> Make sure that the HTTP header statement is valid. Otherwise, the sensor request cannot be successful.</p>
Remove Characters	<p><a href="#">This setting is only visible if you select Use the value of the selected XML node above.</a></p> <p>Optionally enter a string that the sensor removes from the returned XML value.</p>

Setting	Description
	Use this to remove any unwanted characters from the result, for example to remove a thousands separator from numeric values. Enter a string or leave the field empty.
Decimal Delimiter	<p><b>This setting is only visible if you select</b> Use the value of the selected XML node <a href="#">above</a>.</p> <p>If the sensor value of the returned XML node is of the type <b>float</b>, you can define any character as the decimal delimiter. Enter one character or leave the field empty.</p>
Custom Message	Optionally enter a custom sensor message. Use <b>%1</b> as a placeholder to automatically fill in the returned XML value. Enter a string or leave the field empty.
If Channel Value Changes	<p>Define what the sensor does if the channel value changes:</p> <ul style="list-style-type: none"> <li>▪ Ignore (default): Do nothing.</li> <li>▪ Trigger 'change' notification: Send an internal message that indicates a change. <ul style="list-style-type: none"> <li>ⓘ In combination with a <a href="#">change trigger</a>, you can use this to <a href="#">trigger a notification</a> if a change occurs.</li> </ul> </li> </ul> <p>ⓘ The notification for this sensor can only be triggered if the returned value is a numeric value. This option does not support strings.</p>
Unit String	<p>Enter the unit for the values that this sensor returns. Enter a string.</p> <ul style="list-style-type: none"> <li>ⓘ PRTG uses the unit string for display purposes and shows it in graphs, data tables, and gauges.</li> <li>ⓘ You can change this value later in the <a href="#">channel settings</a> of this sensor.</li> </ul>

## Debug Options

**Debug Options**

Result Handling ⓘ

Discard result (default)  
 Store result

Debug Options

Setting	Description
Result Handling	Define what PRTG does with the sensor result:

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>ⓘ You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p>ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other above.</p>

Setting	Description
	Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Checking JSON

With the XML Node (and optional property) field, you can also check values that are returned in JSON notation under the defined URL.

**Example**

A JSON notated section might look like the following:

```
{
  "test": "Hello World",
  "object": {
    "value": "content",
    "AnotherValue": "AnotherContent"
  },
  "arraytest": [
    "one",
    "two"
  ]
}
```

Depending on your entries in the XML Node (and optional property) field, the sensor processes the respective values:

Entry in Sensor's "XML Node (and optional property)" Field (from Example Above)	Processed Value (from Example Above)
test	Hello World
object/value	content
object/AnotherValue	AnotherContent
object	contentAnotherContent
arraytest[1]	one
arraytest[2]	two

**i** The sensor converts whitespaces in JSON keys into underscores (\_). So, for example, if you look for the node `some node` in the JSON, you need to enter `some_node` into the node field. If you count the number of nodes (for example, `some_node`), both `some node` and `some_node` would be counted if they appear in the JSON.

**i** If a key exists more than once in the JSON, the value of the first appearance is returned (no difference between whitespace and underscore).

### About Namespaces

In an .xml document, tags might use namespaces.

 Example

A namespace notated section might look like the following:

```
<myNamespace:myNode>
  some information
</myNamespace:myNode>
```

If you set this sensor to Use name spaces (this is the default setting), it expects the full node name, including the namespace information, in the XML Node (and optional property) field. In the example above, this is [myNamespace:myNode](#).

If your node names are unique even without the namespace information, you can simplify the settings by setting this sensor to Remove name spaces. The sensor then expects the node name only in the XML Node (and optional property) field. In the example above, this is [myNode](#).

## Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can only enter the protocol followed by a colon and three forward slashes (this means that you can enter either [http://](#) or [https://](#), or even a simple forward slash [/](#) as the equivalent for [http://](#)). PRTG automatically fills in the parent device's IP Address/DNS Name in front of the third forward slash.

Whether this results in a valid URL or not depends on the IP address or Domain Name System (DNS) name of the parent device. In combination with cloning devices, you can use smart URL replacement to create many similar devices.

For example, if you create a device with the DNS name [www.example.com](#) and you add an HTTP sensor to it, you can provide values in the following ways:

- If you enter [https://](#) in the URL field, PRTG automatically creates the URL [https://www.example.com/](#)
- If you enter [/help](#) in the URL field, PRTG automatically creates and monitor the URL [http://www.example.com/help](#)
- It is also possible to provide a port number in the URL field. It is taken over by the device's DNS name and is internally added, for example, [http://:8080/](#)

 Smart URL replacement does not work for sensors that run on the probe device.

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Execution Time	The execution time
[Value]	The value of one defined XML node  This channel is the primary channel by default.

- German: Hyper-V Freigegebenes Clustervolume Freier Speicher
- Japanese: Hyper-V クラスタ共有ボリュームディスク空き容量
- Portuguese: Disco de volume compartilhado do cluster Hyper-V livre
- Russian: Свободное дисковое пространство общего тома кластера Hyper-V
- Simplified Chinese: Hyper-V 群集共享卷磁盘可用空间
- Spanish: Espacio libre en disco de volumen compartido en clúster Hyper-V

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node.</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
Remote PowerShell	<p>This sensor requires <a href="#">Remote PowerShell</a> on the target system.</p> <p> In larger environments, the default memory limit for the remote shell might be insufficient. This might result in the error message <a href="#">The WSMAN provider host process did not return a proper response</a>. In this case, increase the memory limit for Remote PowerShell.</p> <p> For more information, see the Knowledge Base: <a href="#">How do I enable and use remote commands in Windows PowerShell?</a> and <a href="#">How can I increase memory for Remote PowerShell?</a></p>
WSFC PowerShell Interface	<p>This sensor requires <a href="#">WSFC PowerShell Interface</a> on the target system.</p> <p> You can list all modules in the PowerShell console with the command <a href="#">Get-Module -ListAvailable</a>. Here, <a href="#">FailoverClusters</a> must appear. Under Windows Server 2008 (not officially supported) and Windows Server 2012 (not officially supported), the interface is part of the VMM Administrator Console, or the VMM 2012 Management Console.</p> <p> The interface is available everywhere the WSFC feature is installed: Windows Server 2008 R2 (SP1) Full and Core (not installed by default), Microsoft Hyper-V Server 2008 R2 (SP1), and Remote Server Administration Tools (RSAT) for Windows 10, Windows 8.1, Windows 8, and Windows 7 (SP1).</p>
Parent device	<p>This sensor requires that the parent device is a Windows server that runs Hyper-V.</p>
Credentials	<p>This sensor requires credentials for Windows systems.</p>
Unsupported characters	<p>Make sure that the resource names of your disks do not contain unsupported characters, especially avoid the number sign (#). In general, the sensor supports UTF-8 characters. We recommend that you do not rename resource disk names once you have set up monitoring. For more information, see the Knowledge Base: <a href="#">Why don't my Hyper-V sensors work after changing names?</a></p>
IPv6	<p>This sensor supports IPv6.</p>
Performance impact	<p>This sensor has a <a href="#">medium</a> performance impact.</p>

Remark	Description
Knowledge Base	<ul style="list-style-type: none"> <li>Knowledge Base: <a href="#">Why don't my Hyper-V sensors work after changing names?</a></li> <li>Knowledge Base: <a href="#">Where can I find more information about PowerShell sensors?</a></li> </ul>
Hosted probe	<p>☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.</p>

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking <b>+</b> below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other above.</p>

Setting	Description
	Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Free Bytes	The free space
Free Space	The free space (%)  This channel is the primary channel by default.
Total	The total space

## 7.8.74 Hyper-V Host Server Sensor

The Hyper-V Host Server sensor monitors a Microsoft Hyper-V host server via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#) of the parent device.

Hyper-V Host Server Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: Hyper-V Host Server
- French: Hyper-V serveur hôte
- German: Hyper-V Host Server
- Japanese: Hyper-V ホストサーバー
- Portuguese: Servidor host Hyper-V
- Russian: Сервер узла Hyper-V
- Simplified Chinese: Hyper-V 主机服务器
- Spanish: Servidor host Hyper-V

## Remarks

Consider the following [remarks](#) <sup>1159</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <b>high</b> performance impact. We recommend that you use no more than <b>200</b> of this sensor on each probe.
Windows version	This sensor requires <b>at least Windows Server 2008 R2</b> on the probe system (on every cluster node, if on a cluster probe).   <b>WoW64</b> must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.
Remote Registry Windows service	This sensor requires that the <b>Remote Registry</b> Windows service runs on the target system.   If this service does not run, a connection via performance counters is not possible. However, WMI connections might still work.   To enable the service, log in to the respective system and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.
Parent device	This sensor requires that the parent device is a Windows server that runs Hyper-V.
Credentials	This sensor requires credentials for Windows systems.   We recommend that you use Windows domain credentials. If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target system.  Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.
IPv6	This sensor supports IPv6.
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Hybrid Approach: Performance Counters and WMI

**i** By default, this sensor uses WMI to request monitoring data. You can change the default behavior to a [hybrid approach](#) in the Windows Compatibility Options of the parent [device's settings](#) on which you create this sensor: if you choose this option, the sensor first tries to query data via [Windows performance counters](#) and uses WMI as a fallback if performance counters are not available. When running in fallback mode, the sensor tries to connect via performance counters again after 24 hours.

**i** Sensors that use the WMI protocol have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.

**i** For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#).

## 7.8.75 Hyper-V Virtual Machine Sensor

The Hyper-V Virtual Machine sensor monitors a virtual machine (VM) that runs on a Microsoft Hyper-V host server via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#) of the parent device.

Hyper-V Virtual Machine Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>1167</sup>.

### Sensor in Other Languages

- Dutch: Virtuele Hyper-V-Machine
- French: Hyper-V machine virtuelle
- German: Hyper-V Virtuelle Maschine
- Japanese: Hyper-V 仮想マシン
- Portuguese: Máquina virtual Hyper-V
- Russian: Виртуальная машина Hyper-V
- Simplified Chinese: Hyper-V 虚拟机
- Spanish: Máquina virtual Hyper-V

### Remarks

Consider the following [remarks](#)<sup>1163</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
Windows version	<p>This sensor requires <a href="#">at least Windows Server 2008 R2</a> on the probe system (on every cluster node, if on a cluster probe).</p> <p><b>i</b> WoW64 must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.</p>
Remote Registry Windows service	<p>This sensor requires that the <a href="#">Remote Registry</a> Windows service runs on the target system.</p> <p><b>i</b> If this service does not run, a connection via performance counters is not possible. However, WMI connections might still work.</p> <p><b>i</b> To enable the service, log in to the respective system and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p>
Parent device	This sensor requires that the parent device is a Windows server that runs Hyper-V.
Credentials	<p>This sensor requires credentials for Windows systems.</p> <p><b>i</b> We recommend that you use Windows domain credentials. If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target system.</p> <p>Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.</p>
Live migration	This sensor does not support <a href="#">Live Migration</a> .
IPv6	This sensor supports IPv6.
VM monitoring	To monitor a VM with this sensor, disable User Account Control (UAC) in the control panel of the Windows operating system that runs on this VM. Otherwise, the sensor might change to the Down status and show the error message <a href="#">The virtual machine is not running or is powered off</a> .
Unsupported characters	Make sure that the names of your VMs do not contain unsupported characters, especially avoid the number sign (#). We recommend that you not rename VMs once you have set up monitoring. For more information, see the Knowledge Base: <a href="#">Why don't my Hyper-V sensors work after changing names?</a>

Remark	Description
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Hybrid Approach: Performance Counters and WMI

**i** By default, this sensor uses WMI to request monitoring data. You can change the default behavior to a [hybrid approach](#) in the Windows Compatibility Options of the parent [device's settings](#) on which you create this sensor: if you choose this option, the sensor first tries to query data via [Windows performance counters](#) and uses WMI as a fallback if performance counters are not available. When running in fallback mode, the sensor tries to connect via performance counters again after 24 hours.

**i** Sensors that use the WMI protocol have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.

**i** For a general introduction to the technology behind WMI, see section [Monitoring via WMI](#).

## 7.8.76 Hyper-V Virtual Network Adapter Sensor

The Hyper-V Virtual Network Adapter sensor monitors virtual network adapters that run on a Microsoft Hyper-V host server via Windows Management Instrumentation (WMI) or Windows performance counters, as configured in the [Windows Compatibility Options](#) of the parent device.

Hyper-V Virtual Network Adapter Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>1173</sup>.

### Sensor in Other Languages

- Dutch: Hyper-V Virtuele Netwerk Adapter
- French: Hyper-V carte réseau virtuelle
- German: Hyper-V Virtueller Netzwerkadapter
- Japanese: Hyper-V 仮想ネットワークアダプター
- Portuguese: Adaptador de rede virtual Hyper-V

- Russian: Виртуальный сетевой адаптер Hyper-V
- Simplified Chinese: Hyper-V 虚拟网络适配器
- Spanish: Adaptador de red virtual Hyper-V

## Remarks

Consider the following [remarks](#)<sup>1170</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
Windows version	<p>This sensor requires <a href="#">at least Windows Server 2008 R2</a> on the probe system (on every cluster node, if on a cluster probe).</p> <p><b>i</b> WoW64 must be installed on target systems that run Windows Server 2016. This allows 32-bit applications to be run on 64-bit systems. This is necessary because the PRTG probe service only runs with 32-bit support. Without it, WMI sensors do not work.</p>
Remote Registry Windows service	<p>This sensor requires that the <a href="#">Remote Registry</a> Windows service runs on the target system.</p> <p><b>i</b> If this service does not run, a connection via performance counters is not possible. However, WMI connections might still work.</p> <p><b>i</b> To enable the service, log in to the respective system and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.</p>
Parent device	This sensor requires that the parent device is a Windows server that runs Hyper-V.
Credentials	<p>This sensor requires credentials for Windows systems.</p> <p><b>i</b> We recommend that you use Windows domain credentials. If you use local credentials, make sure that the same Windows user accounts (with the same user name and password) exist on both the probe system and the target system.</p> <p>Otherwise, a connection via performance counters is not possible. However, WMI connections might still work.</p>
IPv6	This sensor supports IPv6.
Renaming VMs	We recommend that you do not rename virtual machines (VM) once you have set up monitoring. Renaming VMs also changes the internal virtual network adapter names, so monitoring might be interrupted. For more information about VM naming, see the Knowledge Base: <a href="#">Why don't my Hyper-V sensors work after changing names?</a>

Remark	Description
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Hybrid Approach: Performance Counters and WMI

**i** By default, this sensor uses WMI to request monitoring data. You can change the default behavior to a [hybrid approach](#) in the Windows Compatibility Options of the parent [device's settings](#) on which you create this sensor: if you choose this option, the sensor first tries to query data via [Windows performance counters](#) and uses WMI as a fallback if performance counters are not available. When running in fallback mode, the sensor tries to connect via performance counters again after 24 hours.

**i** Sensors that use the WMI protocol have a high impact on the system performance. Try to stay below 200 WMI sensors per [probe](#). Above this number, consider using multiple [remote probes](#) for load balancing.

The sensor has the following [default tags](#) that are automatically predefined in the sensor's settings when you add the sensor:

- wmihypervirtualstoragesensor

■ For more information about basic sensor settings, see section [Sensor Settings](#) <sup>667</sup>.

## Hyper-V Virtual Storage Device Settings

### Hyper-V Virtual Storage Device Settings

**Virtual Storage Device** ⓘ C:-ProgramData-Microsoft-Windows-Hyper-V-Ubuntu

---

**Host Operating System** *Windows Server 2012 and later*

---

**Result Handling** ⓘ  Discard result (default)  
 Store result

Hyper-V Virtual Storage Device Settings

Setting	Description
Virtual Storage Device	The unique identifier of the virtual storage device that this sensor monitors.
Host Operating System	The host operating system of the virtual storage device that this sensor monitors.
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel **i** Downtime

---

Graph Type **i**  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking <b>⚙</b> below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>

Setting	Description
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Errors	The number of errors
Read Bytes/Sec	The read speed  This channel is the primary channel by default.
Write Bytes/Sec	The write speed

## 7.8.78 IMAP Sensor

The IMAP sensor monitors an email server via the Internet Message Access Protocol (IMAP).

**i** The sensor can check the content of emails for certain keywords. This way, you can use the sensor to monitor backup solutions via emails that are sent by these solutions. For more information, see the Knowledge Base: [How can I monitor my backup software to be sure backup succeeded last night?](#)

IMAP Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: IMAP
- French: IMAP
- German: IMAP
- Japanese: IMAP
- Portuguese: IMAP
- Russian: IMAP
- Simplified Chinese: IMAP
- Spanish: IMAP

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
SRP ciphers	This sensor does not support Secure Remote Password (SRP) ciphers.
Microsoft 365 mailboxes	This sensor does not support Microsoft 365 mailboxes. If you want to monitor a Microsoft 365 mailbox, use the <a href="#">Microsoft 365 Mailbox</a> <sup>12521</sup> sensor.
IPv4	This sensor only supports IPv4.
Performance impact	This sensor has a <b>medium</b> performance impact.
Content checks	If you use content checks, we recommend that you use a dedicated IMAP account that is only checked by PRTG. Editing mails in the mailbox of the monitored IMAP account can lead to false alarms or malfunctions of this sensor.
Subfolder monitoring	This sensor might not work properly when monitoring subfolders of mailboxes. If it has to check subsequent emails with identical subjects, it might not recognize emails that come in later.
Daylight Saving Time	Emails that arrive during the Daylight Saving Time (winter time to summer time) change might not be processed properly. If you experience this issue, delete the respective emails.
Knowledge Base	<ul style="list-style-type: none"> <li>▪ Knowledge Base: <a href="#">My IMAP sensor does not process HTML emails correctly using regex. What can I do?</a></li> <li>▪ Knowledge Base: <a href="#">How can I monitor my backup software to be sure backup succeeded last night?</a></li> <li>▪ Knowledge Base: <a href="#">Can I analyze multipart emails using the IMAP sensor?</a></li> <li>▪ Knowledge Base: <a href="#">My IMAP sensor does not find emails when I check for message date. What can I do?</a></li> </ul>

Basic Sensor Settings

The sensor has the following [default tags](#) that are automatically predefined in the sensor's settings when you add the sensor:

- imapsensor
- mailsensor

■ For more information about basic sensor settings, see section [Sensor Settings](#) <sup>667</sup>.

## Connectivity

**Connectivity**

Timeout (Sec.) ⓘ 60

---

Port ⓘ 993

---

Transport-Level Security ⓘ

- Use transport-level security if available using StartTLS
- Use transport-level security if available
- Enforce transport-level security using StartTLS
- Enforce transport-level security (default)

Connectivity

Setting	Description
Timeout (Sec.)	<p>Enter a timeout in seconds for the request. Enter an integer. The maximum timeout value is <b>900</b> seconds (15 minutes).</p> <p> ⓘ If the reply takes longer than this value, the sensor cancels the request and shows a corresponding error message.</p>
Port	<p>Specify the port that the sensor uses for the IMAP connection. The default port for unsecure connections is <b>143</b> and the default port for secure connections is <b>993</b>. The actual setting depends on the server you connect to. Enter an integer.</p> <p> ⓘ We recommend that you use the default value.</p> <p> ⓘ If the connection is unsuccessful, try a different port number.</p>
Transport-Level Security	<p>Define how the sensor handles the security of the connection:</p> <ul style="list-style-type: none"> <li>▪ Use transport-level security if available using StartTLS: Try to connect to the server via a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection and StartTLS. If the server does not support this, the sensor tries to connect without connection security.</li> <li>▪ Use transport-level security if available: Try to connect to the server via an SSL/TLS-secured connection. If the server does not support this, the sensor tries to connect without connection security.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Enforce transport-level security using StartTLS: Try to connect to the server via an SSL/TLS-secured connection and StartTLS. If the server does not support this, the sensor shows the Down <a href="#">status</a>.</li> <li>▪ Enforce transport-level security (default): Try to connect to the server via an SSL/TLS-secured connection. If the server does not support this, the sensor shows the Down status.</li> </ul> <p><b>i</b> If the sensor connects to a server via StartTLS, the connection is first established without connection security. After the connection has been established, the sensor sends a certain command (<a href="#">StartTLS</a>) over the unsecured connection to negotiate a secure connection via SSL/TLS.</p> <p><b>i</b> If the sensor does <b>not</b> use StartTLS, the negotiation of a secure connection happens immediately (implicitly) so that no commands are sent in unencrypted plain text. If no secure connection is possible, no communication takes place.</p>

## Sensor Behavior

### Sensor Behavior

**Email Processing** **i**

Do not process emails (default)

Count emails in the mailbox

Process emails in the mailbox

**Result Handling** **i**

Discard result (default)

Store result

Sensor Behavior

Setting	Description
Email Processing	<p>Define if the sensor additionally checks the content of all incoming emails:</p> <ul style="list-style-type: none"> <li>▪ Do not process emails (default): Only check the availability of the IMAP server and check if a login is successful. Do not process any emails in the IMAP email account.</li> <li>▪ Count emails in the mailbox: Count the emails in the mailbox.</li> <li>▪ Process emails in the mailbox: Log in to the IMAP email account and check the emails that it contains. Define further options below.</li> </ul>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Authentication

### Authentication

**User Name** ⓘ

**Password** ⓘ

**Folder Name** ⓘ

Authentication

Setting	Description
User Name	Enter a user name for IMAP authentication. Enter a string.
Password	Enter a password for IMAP authentication. Enter a string. ⓘ The password must <b>not</b> contain spaces, percent signs (%), or the character combination !*.
Folder Name	Enter the name of a folder in the mailbox (for example, the IMAP folder) that the sensor checks. The default value is <a href="#">Inbox</a> . Unless you set a last message date check below, the sensor always looks at <a href="#">all</a> emails contained in the mailbox. ⓘ Make sure that you do not manually edit emails in this mailbox with a different email client because this can result in malfunctions of this sensor's email identification.

## Filter Emails in Inbox

ⓘ This settings section is only visible if you select Process emails in the mailbox.

### Filter Emails in Inbox

Only Include Emails with Matching "From" ⓘ  Do not check (default)  
 Check using simple string search  
 Check using regular expression

Only Include Emails with Matching "Subject" ⓘ  Do not check (default)  
 Check using simple string search  
 Check using regular expression

Only Include Emails with Matching Email Body ⓘ  Do not check (default)  
 Check using simple string search  
 Check using regular expression

Only Include Recent Emails ⓘ  Do not check message age (default)  
 Emails must be younger than

If No Email Matches the Above Filters ⓘ  Set sensor to up status (default)  
 Set sensor to warning status  
 Set sensor to down status

Filter Emails in Inbox

Setting	Description
Only Include Emails with Matching "From"	<p>Define if you want to check the "From" field of the emails:</p> <ul style="list-style-type: none"> <li>▪ Do not check (default): Do not process this field in emails.</li> <li>▪ Check using simple string search: Process this field in emails using a simple string in plain text.</li> <li>▪ Check using regular expression: Process this field in emails using a regular expression (regex).</li> </ul> <p> ⓘ In the search, the sensor scans all emails from the newest to the oldest.</p> <p> ⓘ PRTG supports Perl Compatible Regular Expression (PCRE) regex. For more information, see section <a href="#">Regular Expressions</a>.</p> <p> ⓘ The sensor finishes the scan with the first match. This means that after it finds a match in one email, the sensor does not perform any further checks in older emails.</p>
Search for	<p><b>This setting is only visible if you select</b> Check using simple string search <b>or</b> Check using regular expression <b>above</b>.</p> <p>Enter the email address or the <a href="#">regular expression</a> that the "From" field of the email must contain or match.</p>

Setting	Description
Only Include Emails with Matching "Subject"	<p>Define if you want to check the "Subject" field of the emails:</p> <ul style="list-style-type: none"> <li>▪ Do not check (default): Do not process this field in emails.</li> <li>▪ Check using simple string search: Process this field in emails using a simple string in plain text.</li> <li>▪ Check using regular expression: Process this field in emails using a regular expression (regex).</li> </ul> <p><b>i</b> In the search, the sensor scans all emails from the newest to the oldest.</p> <p><b>i</b> PRTG supports Perl Compatible Regular Expression (PCRE) regex. ## 7.8.79 IP on DNS Blacklist Sensor

The IP on DNS Blacklist sensor checks if the IP address of its parent device is listed on specific blacklist servers.

IP on DNS Blacklist Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[1197]</sup>.

### Sensor in Other Languages

- Dutch: IP op DNS Blacklist
- French: IP sur liste noire du DNS
- German: IP auf Schwarzer Liste des DNS
- Japanese: DNS ブラックリスト記載の IP
- Portuguese: IP em Blacklist DNS
- Russian: Черный список IP-адресов на DNS
- Simplified Chinese: DNS 黑名单 IP
- Spanish: IP en lista negra de DNS

### Remarks

Consider the following [remarks](#)<sup>[1194]</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node. If the sensor shows the error PE087, additionally install .NET 3.5 on the probe system.</p> <p> If the framework is missing, you cannot create this sensor.</p> <p> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
Windows Server	We recommend Windows Server 2016 on the probe system for best performance of this sensor.
IPv6	This sensor supports IPv6.
Parent device	If a Domain Name System (DNS) name is used as the host name of the parent device, PRTG resolves it to an IP address before querying blacklist servers.
Additional thresholds	During normal operation, there should be 0 hits and the sensor should show the Up <a href="#">status</a> . If the sensor can find the IP address on at least one of the blacklist servers, it shows the Warning status by default. You can set additional thresholds in the <a href="#">channel settings</a> .
Knowledge Base	Knowledge Base: <a href="#">Is there a list of anti spam black list servers?</a>

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select Stack channels on top of each other above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Execution Time	The execution time
Sum	The number of blacklist hits found  This channel is the primary channel by default.

## 7.8.80 IPFIX Sensor

The IPFIX sensor receives traffic data from an Internet Protocol Flow Information Export (IPFIX) compatible device and shows traffic by type. This sensor has several filter options to divide traffic into different channels.

**i** Make sure that the target device supports IPFIX if you want to use this sensor.

IPFIX Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#).

### Sensor in Other Languages

- Dutch: IPFIX
- French: IPFIX
- German: IPFIX

- Japanese: IPFIX
- Portuguese: IPFIX
- Russian: IPFIX
- Simplified Chinese: IPFIX
- Spanish: IPFIX

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a very high performance impact. We recommend that you use no more than <b>50</b> of this sensor on each probe.
IPFIX	This sensor requires that the IPFIX export is enabled on the target system. The target system must send the flow data stream to the IP address of the probe system.
Channels	This sensor does not officially support more than <b>50 channels</b> .
Cluster probe	This sensor does not support cluster probes. You can only set it up on local probes or remote probes.
IPv4	This sensor only supports IPv4.
Knowledge Base	Knowledge Base: <a href="#">What is the Active Flow Timeout in flow sensors?</a>
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

192.0.2.0

---

Active Flow Timeout (Minutes) ⓘ 10

---

Sampling Mode ⓘ  Disable (default)  
 Enable

---

Stream Data Handling ⓘ  Discard stream data (default)  
 Store stream data only for the 'Other' channel  
 Store all stream data

IPFIX Specific Settings

Setting	Description
Receive Packets on UDP Port	Enter the UDP port number on which PRTG receives the flow packets. It must match the UDP port number in the IPFIX export options of the hardware router device. Enter an integer.
Sender IP Address	Enter the IP address of the sending device that you want to receive the IPFIX data from. Enter an IP address to only receive data from a specific device or leave the field empty to receive data from any device on the specified port.
Receive Packets on IP Address	Select the IP addresses on which PRTG listens to IPFIX packets. The list of IP addresses is specific to your setup. To select an IP address, enable a check box in front of the respective line. The IP address that you select must match the IP address in the IPFIX export options of the hardware router device.

Setting	Description
Active Flow Timeout (Minutes)	<p>Enter a time span in minutes after which the sensor must receive new flow data. If the timeout elapses and the sensor receives no new data during this time, it shows the Unknown <a href="#">status</a>. Enter an integer. The maximum timeout is 60 minutes.</p> <p> We recommend that you set the timeout one minute longer than the timeout in the hardware router device.</p> <p> If you set this value too low, flow information might be lost.</p> <p> For more information, see the Knowledge Base: <a href="#">What is the Active Flow Timeout in flow sensors?</a></p>
Sampling Mode	<p>Define if you want to use the sampling mode:</p> <ul style="list-style-type: none"> <li>▪ Disable (default): Use the standard flow.</li> <li>▪ Enable: Use the sampling mode and specify the Sampling Rate below.</li> </ul> <p> This setting must match the setting in the xFlow exporter.</p>
Sampling Rate	<p><a href="#">This setting is only visible if you select Enable above.</a></p> <p>Enter a number that matches the sampling rate in the exporting device. If the number is different, monitoring results will be incorrect. Enter an integer.</p>
Stream Data Handling	<p>Define what PRTG does with the stream and packet data:</p> <ul style="list-style-type: none"> <li>▪ Discard stream data (default): Do not store the stream and packet data.</li> <li>▪ Store stream data only for the 'Other' channel: Only store stream and packet data that is not otherwise filtered and is therefore accounted to the default Other channel. PRTG stores this data in the \StreamLog subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Streams Sensor [ID] (1).csv. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> <li>▪ Store all stream data: Store all stream and packet data. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p> Use with caution. It can create huge data files. We recommend that you only use this setting for a short time.</p>

## Channel Configuration

**Channel Configuration**

Channel Selection ⓘ

Group	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	Content

Other Protocols	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	Various: Other UDP, Other TCP

**Note** You can change the default configuration for groups and channels. This way, you do not have to customize this setting each time that you add this sensor type. For details, see the Knowledge Base: [How can I change the default groups and channels for xFlow and Packet Sniffer sensors?](#)

Channel Configuration

Setting	Description
Channel Selection	<p>Define the categories that the sensor accounts the traffic to:</p> <ul style="list-style-type: none"> <li>▪ Web: Internet web traffic.</li> <li>▪ File Transfer: Traffic from FTP.</li> <li>▪ Mail: Internet mail traffic.</li> <li>▪ Chat: Traffic from chat and instant messaging.</li> <li>▪ Remote Control: Traffic from remote control applications such as RDP, SSH, Telnet, and Virtual Network Computing (VNC).</li> <li>▪ Infrastructure: Traffic from network services such as DHCP, DNS, Ident, ICMP, and SNMP.</li> <li>▪ NetBIOS: Traffic from NetBIOS communication.</li> <li>▪ Citrix: Traffic from Citrix applications.</li> <li>▪ Other Protocols: Traffic from various other protocols via UDP and TCP.</li> </ul> <p>For each group, you can select how many channels the sensor uses, that is, how detailed the sensor divides the traffic:</p> <ul style="list-style-type: none"> <li>▪ No (✘): Do not account traffic of this group in its own channel. The sensor accounts all traffic of this group to the default channel named Other.</li> <li>▪ Yes (✔): Count all traffic of this group and summarize it in one channel.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>Detail (🔍): Count all traffic of this group and further divide it into different channels. The traffic appears in several channels that you can see in the Content column. <ul style="list-style-type: none"> <li>ⓘ Extensive use of this option can cause load problems on the probe system. We recommend that you set specific, well-chosen filters for the data that you really want to analyze.</li> </ul> </li> </ul> <p>■ You can change the default configuration for groups and channels. For more information, see the Knowledge Base: <a href="#">How can I change the default groups and channels for flow and Packet Sniffer sensors?</a></p>

## Filtering

■ For more information, see section [Filter Rules](#) <sup>1206</sup>.

**Filtering**

**Filters** To include and exclude specific traffic, you can define filter rules based on the following format guidelines:

- field[filter]

**Fields:**

IP, Port, SourceIP, SourcePort, DestinationIP, DestinationPort, Protocol (values TCP, UDP, ICMP, OSPFIGP or any number), ToS, DSCP

**Additional IPFIX fields:**

Interface, ASI, InboundInterface, OutboundInterface, SourceASI, DestinationASI, MAC, SourceMAC, DestinationMAC, Mask, SourceMask, DestinationMask ('Masks' represent subnet masks in the form of a single number ('number of contiguous bits')), NextHop (IP Address), VLAN, SourceVLAN, DestinationVLAN ('VLANs' represent a VLAN identifier)

Include Filter ⓘ

Exclude Filter ⓘ

Filtering

Setting	Description
Include Filter	Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special <a href="#">syntax</a> .
Exclude Filter	First, the sensor considers the filters in Include Filter. From this subset, you can explicitly exclude traffic, using the same syntax.

However, there is an advanced procedure to do so.</p>

## Primary Toplist

**Primary Toplist**

Primary Toplist ⓘ Top Connections

Primary Toplist

Setting	Description
Primary Toplist	Define which Toplist is the primary Toplist of the sensor:

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Top Talkers</li> <li>▪ Top Connections</li> <li>▪ Top Protocols</li> <li>▪ <a href="#">[Any custom Toplists you add]</a></li> </ul> <p><b>i</b> PRTG shows the primary Toplist in maps when you add a Toplist object.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Toplists

For all Flow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

 For more information, see section [Toplists](#).

## Filter Rules

 For more information, see section [Filter Rules for Flow, IPFIX, and Packet Sniffer Sensors](#).

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Chat	The traffic from chat and instant messaging (IRC, AIM)
Citrix	The traffic from Citrix applications
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status

Channel	Description
FTP/P2P	The traffic from file transfer (FTP/P2P)
Infrastructure	The traffic from network services (DHCP, DNS, Ident, ICMP, SNMP)
Mail	The internet mail traffic (IMAP, POP3, SMTP)
NetBIOS	The traffic from NetBIOS communication
Other	The traffic from various other protocols (UDP, TCP)
Remote Control	The traffic from remote control applications (RDP, SSH, Telnet, Virtual Network Computing (VNC))
Total	The total traffic  This channel is the primary channel by default.
Various	The traffic from various other sources
WWW	The traffic from the web (HTTP, HTTPS)

	<ul style="list-style-type: none"> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel **ⓘ** Downtime

---

Graph Type **ⓘ**  Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking <b>⌵</b> below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select Stack channels on top of each other above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
[Value]	The value status, for example <ul style="list-style-type: none"> <li>▪ Fan RPM</li> <li>▪ Status of a power supply</li> <li>▪ Temperatures, for example, the system temperature or the peripheral temperature</li> <li>▪ Voltages</li> </ul>

### 7.8.83 jFlow v5 Sensor

The jFlow v5 sensor receives traffic data from a jFlow v5-compatible device and shows the traffic by type. This sensor has several filter options to divide traffic into different channels.

**i** Make sure that the sensor matches the jFlow version that your device exports.

jFlow v5 Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[1223]</sup>.

#### Sensor in Other Languages

- Dutch: jFlow v5
- French: jFlow v5
- German: jFlow v5
- Japanese: jFlow v5
- Portuguese: jFlow v5

- Russian: jFlow v5
- Simplified Chinese: jFlow v5
- Spanish: jFlow v5

## Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a very high performance impact. We recommend that you use no more than <b>50</b> of this sensor on each probe.
jFlow	This sensor requires that the jFlow export of the respective version is enabled on the target system. The target system must send the flow data stream to the IP address of the probe system.
Cluster probe	This sensor does not support cluster probes. You can only set it up on local probes or remote probes.
IPv4	This sensor only supports IPv4.
Clone sensor	If you clone this sensor to the <b>same</b> probe, PRTG keeps the <a href="#">selected IP addresses</a> on which it listens for Flow (NetFlow, jFlow, sFlow, IPFIX) packets. If you clone this sensor to a <b>different</b> probe, PRTG selects <b>all</b> available IP addresses by default.
Knowledge Base	<ul style="list-style-type: none"> <li>▪ Knowledge Base: <a href="#">What is the Active Flow Timeout in flow sensors?</a></li> <li>▪ Knowledge Base: <a href="#">How can I change the default groups and channels for flow and Packet Sniffer sensors?</a></li> </ul>
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

**Note** You can change the default configuration for groups and channels. This way, you do not have to customize this setting each time that you add this sensor type. For details, see the Knowledge Base: [How can I change the default groups and channels for xFlow and Packet Sniffer sensors?](#)

Channel Configuration

Setting	Description
Channel Selection	<p>Define the categories that the sensor accounts the traffic to:</p> <ul style="list-style-type: none"> <li>▪ Web: Internet web traffic.</li> <li>▪ File Transfer: Traffic from FTP.</li> <li>▪ Mail: Internet mail traffic.</li> <li>▪ Chat: Traffic from chat and instant messaging.</li> <li>▪ Remote Control: Traffic from remote control applications such as RDP, SSH, Telnet, and Virtual Network Computing (VNC).</li> <li>▪ Infrastructure: Traffic from network services such as DHCP, DNS, Ident, ICMP, and SNMP.</li> <li>▪ NetBIOS: Traffic from NetBIOS communication.</li> <li>▪ Citrix: Traffic from Citrix applications.</li> <li>▪ Other Protocols: Traffic from various other protocols via UDP and TCP.</li> </ul> <p>For each group, you can select how many channels the sensor uses, that is, how detailed the sensor divides the traffic:</p> <ul style="list-style-type: none"> <li>▪ No (✘): Do not account traffic of this group in its own channel. The sensor accounts all traffic of this group to the default channel named Other.</li> <li>▪ Yes (✔): Count all traffic of this group and summarize it in one channel.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>Detail (🔍): Count all traffic of this group and further divide it into different channels. The traffic appears in several channels that you can see in the Content column. <ul style="list-style-type: none"> <li>ⓘ Extensive use of this option can cause load problems on the probe system. We recommend that you set specific, well-chosen filters for the data that you really want to analyze.</li> </ul> </li> </ul> <p>■ You can change the default configuration for groups and channels. For more information, see the Knowledge Base: <a href="#">How can I change the default groups and channels for flow and Packet Sniffer sensors?</a></p>

## Filtering

■ For more information, see section [Filter Rules](#) <sup>1226</sup>.

**Filtering**

**Filters** To include and exclude specific traffic, you can define filter rules based on the following format guidelines:

- field[filter]

**Fields:**

IP, Port, SourceIP, SourcePort, DestinationIP, DestinationPort, Protocol (values TCP, UDP, ICMP, OSPFIGP or any number), ToS, DSCP

**Additional IPFIX fields:**

Interface, ASI, InboundInterface, OutboundInterface, SourceASI, DestinationASI, MAC, SourceMAC, DestinationMAC, Mask, SourceMask, DestinationMask ('Masks' represent subnet masks in the form of a single number ('number of contiguous bits')), NextHop (IP Address), VLAN, SourceVLAN, DestinationVLAN ('VLANs' represent a VLAN identifier)

Include Filter ⓘ

Exclude Filter ⓘ

Filtering

Setting	Description
Include Filter	Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special <a href="#">syntax</a> .
Exclude Filter	First, the sensor considers the filters in Include Filter. From this subset, you can explicitly exclude traffic, using the same syntax.

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select Stack channels on top of each other above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Primary Toplist

**Primary Toplist**

Primary Toplist ⓘ Top Connections

Primary Toplist

Setting	Description
Primary Toplist	Define which Toplist is the primary Toplist of the sensor:

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Top Talkers</li> <li>▪ Top Connections</li> <li>▪ Top Protocols</li> <li>▪ <a href="#">[Any custom Toplists you add]</a></li> </ul> <p><b>i</b> PRTG shows the primary Toplist in maps when you add a Toplist object.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Toplists

For all Flow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

■ For more information, see section [Toplists](#).

## Filter Rules

The following filter rules apply to all Flow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors.

■ For more information, see section [Filter Rules for Flow, IPFIX, and Packet Sniffer Sensors](#).

Field	Possible Filter Values
IP	IP address or DNS name
Port	Any number
SourceIP	IP address or DNS name
SourcePort	Any number
DestinationIP	IP address or DNS name

Field	Possible Filter Values
DestinationPort	Any number
Protocol	Transmission Control Protocol (TCP), User Datagram Protocol (UDP), Internet Control Message Protocol (ICMP), Open Shortest Path First (OSPF), any number
ToS	Type of Service (ToS): any number
DSCP	Differentiated Services Code Point (DSCP): any number

The following filter rules apply to jFlow v5 sensors only.

Field	Possible Filter Values
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP address of the sending device. Use this if you have several devices that send flow data on the same port, and you want to divide the traffic of each device into a different channel.  Possible values: IP address or DNS name
SourceASI	Any number
DestinationASI	Any number

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Chat	The traffic from chat and instant messaging (IRC, AIM)

Channel	Description
Citrix	The traffic from Citrix applications
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
FTP/P2P	The traffic from file transfer (FTP/P2P)
Infrastructure	The traffic from network services (DHCP, DNS, Ident, ICMP, SNMP)
Mail	The internet mail traffic (IMAP, POP3, SMTP)
NetBIOS	The traffic from NetBIOS communication
Other	The traffic from various other protocols (UDP, TCP)
Remote Control	The traffic from remote control applications (RDP, SSH, Telnet, Virtual Network Computing (VNC))
Total	The total traffic <span>ⓘ</span> This channel is the primary channel by default.
Various	The traffic from various other sources
WWW	The traffic from the web (HTTP, HTTPS)

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Primary Toplist

**Primary Toplist**

Primary Toplist ⓘ Top Connections

Primary Toplist

Setting	Description
Primary Toplist	Define which Toplist is the primary Toplist of the sensor:

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Top Talkers</li> <li>▪ Top Connections</li> <li>▪ Top Protocols</li> <li>▪ <a href="#">[Any custom Toplists you add]</a></li> </ul> <p><b>i</b> PRTG shows the primary Toplist in maps when you add a Toplist object.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Toplists

For all Flow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors, Toplists are available on the sensor's Overview tab. Using Toplists, you can review traffic data for small time periods in great detail.

 For more information, see section [Toplists](#).

## Filter Rules

The following filter rules apply to all Flow (NetFlow, jFlow, sFlow, IPFIX) and Packet Sniffer sensors.

 For more information, see section [Filter Rules for Flow, IPFIX, and Packet Sniffer Sensors](#).

Field	Possible Filter Values
IP	IP address or DNS name
Port	Any number
SourceIP	IP address or DNS name
SourcePort	Any number
DestinationIP	IP address or DNS name

Field	Possible Filter Values
DestinationPort	Any number
Protocol	Transmission Control Protocol (TCP), User Datagram Protocol (UDP), Internet Control Message Protocol (ICMP), Open Shortest Path First (OSPF), any number
ToS	Type of Service (ToS): any number
DSCP	Differentiated Services Code Point (DSCP): any number

The following filter rules apply to jFlow v5 sensors only.

Field	Possible Filter Values
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP address of the sending device. Use this if you have several devices that send flow data on the same port, and you want to divide the traffic of each device into a different channel.  Possible values: IP address or DNS name
SourceASI	Any number
DestinationASI	Any number

## Channel List

- i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
[Custom]	The traffic by type according to the channel definition

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Other	All traffic for which no channel is defined
Total	The total traffic  This channel is the primary channel by default.

## 7.8.85 LDAP Sensor

The LDAP sensor monitors directory services via the Lightweight Directory Access Protocol (LDAP). It connects to the server by trying a "bind".

**i** If the server does not respond or authentication fails, the sensor shows the Down status.

LDAP Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>1243</sup>.

### Sensor in Other Languages

- Dutch: LDAP
- French: LDAP
- German: LDAP
- Japanese: LDAP
- Portuguese: LDAP
- Russian: LDAP
- Simplified Chinese: LDAP
- Spanish: LDAP

### Remarks

Consider the following [remarks](#)<sup>1240</sup> and requirements for this sensor:

Remark	Description
LDAP	This sensor officially supports Microsoft implementations of LDAP. Other third-party LDAP implementations might work but are not officially supported.
DNS name	This sensor requires a DNS name in the <a href="#">settings of the parent device</a> if you use a Secure Sockets Layer (SSL)/Transport Layer Security (TLS) secured connection to the LDAP server.
Performance impact	This sensor has a <a href="#">medium</a> performance impact.
IPv4	This sensor only supports IPv4.

## Basic Sensor Settings

### Basic Sensor Settings

**Sensor Name** ⓘ Example Name

---

**Tags** ⓘ exampletag ✕ ⊕

---

**Priority** ⓘ ★★☆☆☆

Basic Sensor Settings

The sensor has the following **default tags** that are automatically predefined in the sensor's settings when you add the sensor:

- microsoft365
- microsoft365sensor

■ For more information about basic sensor settings, see section [Sensor Settings](#) <sup>667</sup>.

## Microsoft 365 Settings

**Microsoft 365 Specific**

Service ⓘ *Microsoft 365 suite*

Workload ID ⓘ *OSDPPlatform*

Microsoft 365 Settings

Setting	Description
API Request Retry	Enter a number how often the sensor queries the Microsoft Graph if an API query returns no result before the sensor shows the Down status. Enter an integer. The default value is <b>3</b> . The maximum value is <b>10</b> . If you enter <b>0</b> , the sensor does not retry to query the APIs.

## Sensor Display

**Sensor Display**

Primary Channel ⓘ *Downtime*

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking <b>⚙</b> below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>

Setting	Description
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Debug Options

**Debug Options**

Result Handling ⓘ

Discard result (default)  
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p><span style="font-size: 0.8em;">☁</span> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p><span style="font-size: 0.8em;">ⓘ</span> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Degraded Services	The number of degraded services
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Interrupted Services	The number of interrupted services
Operational Services	The number of operation services <b>i</b> This channel is the primary channel by default.
Warning State Services	The number of services in the warning status

Most Expensive Service Category	<p>This setting is only visible if you select <a href="#">Enable</a> above.</p> <p>Select the category for which you want to show the most expensive service in the sensor message:</p> <ul style="list-style-type: none"> <li>▪ Resource group</li> <li>▪ Resource type</li> <li>▪ Resource ID</li> <li>▪ Location</li> <li>▪ Service name</li> </ul>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p>This setting is only visible if you select <a href="#">Stack channels on top of each other</a> above.</p>

Setting	Description
	Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

## Debug Options

**Debug Options**

Result Handling ⓘ  Discard result (default)  
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Current Period Cost	The current period cost
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Forecast	The cost forecast
[Budget] Used	The used budget <b>i</b> This channel is the primary channel by default.
[Budget] Used %	The used budget (%)
Previous Period Cost	The previous period cost

- Russian: Microsoft SQL v2
- Simplified Chinese: Microsoft SQL v2
- Spanish: Microsoft SQL v2

### Remarks

Consider the following [remarks](#) and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
SQL query storage	This sensor requires that you store the SQL query in a file on the probe system. In a cluster, copy the file to every cluster node.  ■ For more information, see the Knowledge Base: <a href="#">Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?</a>
.NET 4.7.2 or later	This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node.  ❗ If the framework is missing, you cannot create this sensor.  ■ For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a>
Microsoft SQL server	This sensor supports Microsoft SQL server as of version 2005.
IPv6	This sensor supports IPv6.
Lookups	This sensor can use <a href="#">lookups</a> <sup>[1303]</sup> . Select Lookup as Channel #x Unit and define the lookup file in Channel #x Lookup.
Credentials	Define the credentials for database management systems in settings that are higher in the object hierarchy.
Knowledge Base	<ul style="list-style-type: none"> <li>▪ Knowledge Base: <a href="#">How to set up the SQL v2 sensors in PRTG? Is there a guide?</a></li> <li>▪ Knowledge Base: <a href="#">How can I monitor strings from an SQL database and show a sensor status depending on it?</a></li> <li>▪ Knowledge Base: <a href="#">How can I monitor error tables in SQL databases?</a></li> <li>▪ Knowledge Base: <a href="#">Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?</a></li> </ul>
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Basic Sensor Settings

### Basic Sensor Settings

**Sensor Name** ⓘ Example Name

---

**Tags** ⓘ exampletag ✕ ⊕

---

**Priority** ⓘ ★★☆☆☆

Basic Sensor Settings

The sensor has the following [default tags](#) that are automatically predefined in the sensor's settings when you add the sensor:

- sqlsensor

■ For more information about basic sensor settings, see section [Sensor Settings](#)<sup>667</sup>.

## Database Specific

### Database Specific

**Database** ⓘ MyDatabase

---

**SQL Server Instance** ⓘ  No instance name required (default)  
 Use instance name

**Instance Name** ⓘ SQLEXPRESS

---

**Encryption** ⓘ  Use server defaults (default)  
 Enforce encryption but do not validate server certificate  
 Enforce encryption and validate server certificate

Database Specific

Setting	Description
Database	Enter the name of the SQL database to which the sensor connects, for example, <a href="#">MyDatabase</a> . This is a logical entity on the database server where database objects exist.
SQL Server Instance	Define if you want to use an instance name for the database connection: <ul style="list-style-type: none"> <li>▪ No instance name required (default): Use the default instance for the connection.</li> <li>▪ Use instance name: Use a named instance. Specify the Instance Name below.</li> </ul>

Setting	Description
Instance Name	<p>This setting is only visible if you select Use instance name above.</p> <p>Enter the name of the instance that you want to monitor.</p>
Encryption	<p>Define the encryption usage for the database connection:</p> <ul style="list-style-type: none"> <li>Use server defaults (default): Only encrypt the database connection if the database server enforces encryption.</li> <li>Enforce encryption but do not validate server certificate: Make sure that the database connection is encrypted.</li> <li>Enforce encryption and validate server certificate: Force encryption and validate the database server certificate. This approach provides the highest level of security and can help prevent man-in-the-middle attacks, for example. <ul style="list-style-type: none"> <li> The sensor only validates the certificate if the database server enforces encryption.</li> </ul> </li> </ul>

## Data

**Data**

SQL Query File ⓘ *Demo Serveruptime.sql*

Input Parameter Handling ⓘ  Do not use input parameter (default)  
 Use input parameter

Transaction Handling ⓘ  Do not use transaction (default)  
 Use transaction and always roll back  
 Use transaction and commit on success

Data Processing ⓘ *Only execute query (default)*

Result Handling ⓘ  Discard result (default)  
 Store result

Data

Setting	Description
SQL Query File	<p>Select the SQL query file that includes a valid SQL statement that the sensor executes on the server with every scanning interval. The list contains SQL scripts from the \Custom Sensors\sql subfolder of the <a href="#">PRTG program directory</a> on the probe system. Store your script there. If you use the script on a cluster probe, you must store the script on all cluster nodes.</p>

Setting	Description
	<p>A correct expression in the file could be: <a href="#">SELECT AVG(UnitPrice) FROM Products</a>. If you want to use transactions, separate the individual steps with semicolons ";".</p> <ul style="list-style-type: none"> <li> Note that with each request, PRTG transfers the full result set, so use filters and limits in your query.</li> <li> The demo script Demo Serveruptime.sql is available by default. You can use it to monitor the uptime of the target server.</li> <li> See also the Knowledge Base: <a href="#">Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?</a></li> <li> You cannot change this value after sensor creation.</li> </ul>
Input Parameter Handling	<p>Define if you want to pass a parameter to the SQL query file:</p> <ul style="list-style-type: none"> <li>▪ Do not use input parameter (default): Execute the SQL query file without using variables.</li> <li>▪ Use input parameter: Execute an SQL query file that contains a variable. Provide the parameter that you want to use in the query below.</li> </ul>
Input Parameter	<p><a href="#">This setting is only visible if you select Use input parameter above.</a></p> <p>Enter the parameter that you want to pass to the SQL query file. This parameter replaces the variables <a href="#">@prtg</a>, <a href="#">:prtg</a>, or <a href="#">?</a> in the SQL query, considering the general rules for SQL variables.</p> <p>You can also use PRTG placeholders for custom sensors (command-line parameters) as input parameters, for example, <a href="#">%sensorid</a> or <a href="#">%deviceid</a>. For more information, see section <a href="#">Custom Sensors</a>.</p> <ul style="list-style-type: none"> <li> Provide strings as they are and do not surround them with quotation marks. PRTG automatically and correctly inserts string parameters into the query.</li> </ul>
Transaction Handling	<p>Define if you want to use transactions and if they affect the database content:</p> <ul style="list-style-type: none"> <li>▪ Do not use transaction (default): Do not execute transactions.</li> <li>▪ Use transaction and always roll back: The query does not change data in the database. In the SQL query file, separate the single steps of the transaction with semicolons.</li> <li>▪ Use transaction and commit on success: The query changes data in the database. The changes only apply if all execution steps succeed without any errors. In the SQL query file, separate the single steps of the transaction with semicolons.</li> </ul>
Data Processing	<p>Define whether the sensor processes data from the database:</p>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Only execute query (default): Only show information about the number of affected rows and the execution time of the query. Affected rows are rows that were changed by the query (for example, created, deleted, or edited).</li> <li>▪ Count table rows: Execute a <b>SELECT</b> statement and monitor how many rows of the data table this statement returns.</li> <li>▪ Process data table: Read and analyze the data table. If you select this option, the sensor counts rows with <b>SELECT</b> statements as well.</li> </ul> <p><b>i</b> You cannot change this value after sensor creation.</p>
DBNull Handling	<p><b>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</b></p> <p>Define the sensor behavior if the query returns <b>DBNull</b>:</p> <ul style="list-style-type: none"> <li>▪ Error: Show the Down status if the query returns <b>DBNull</b>.</li> <li>▪ Number 0: Recognize the result <b>DBNull</b> as a valid value and interpret it as the number <b>0</b>.</li> </ul>
Select Channel Value by	<p><b>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</b></p> <p>Define how to select the desired cell in the database table:</p> <ul style="list-style-type: none"> <li>▪ Column number: Determine the channel value by using the value in row 0 of the column whose number you specify in Channel #x Column Number.</li> <li>▪ Column name: Determine the channel value by using the value in row 0 of the column whose name you specify in Channel #x Column Name.</li> <li>▪ Row number: Determine the channel value by using the value in column 0 of the row whose number you specify in Channel #x Row Number.</li> <li>▪ Key value pair: Determine the channel value by searching in column 0 for the key you specify in Channel #x Key and by returning the value in column 1 of the same row where the key value was found.</li> </ul> <p><b>i</b> Defining how the desired cell in the database table is selected is necessary to configure the cells that are used in the channels.</p> <p><b>i</b> The option you select here also defines the method of how to optionally determine a value for the sensor message. For more information, see setting Use Data Table Value in Message.</p> <p><b>■</b> For an example for channel value selection, see section <a href="#">Monitoring Databases</a>.</p>

Setting	Description
Channel #2 - #10	<p>This setting is only visible if you select <a href="#">Process data table</a> <a href="#">above</a>.</p> <p>You can define up to 10 channels. You must define at least one channel, so you see all available settings for <a href="#">Channel #1</a>. Specify how to handle all other possible channels:</p> <ul style="list-style-type: none"> <li>▪ Disable: Do not create this channel.</li> <li>▪ Enable: Create this channel.</li> </ul> <p><b>i</b> It is not possible to enable or disable channels after sensor creation.</p>
Channel #x Name	<p>This setting is only visible if you select <a href="#">Process data table</a> <a href="#">for the setting</a> <a href="#">Data Processing during sensor creation</a>.</p> <p>Enter a name for the channel. Enter a string. The sensor dynamically generates channels with this name as identifier.</p> <p><b>i</b> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({}), for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Channel #x Column Number	<p>This setting is only visible if you select <a href="#">Process data table</a> <a href="#">for the setting</a> <a href="#">Data Processing during sensor creation</a> <a href="#">and if you select</a> <a href="#">Column number for the setting</a> <a href="#">Select Channel Value by</a>.</p> <p>Provide the number of the column to use to determine the channel value in row 0. Enter an integer.</p>
Channel #x Column Name	<p>This setting is only visible if you select <a href="#">Process data table</a> <a href="#">for the setting</a> <a href="#">Data Processing during sensor creation</a> <a href="#">and if you select</a> <a href="#">Column name for the setting</a> <a href="#">Select Channel Value by</a>.</p> <p>Provide the name of the column to use to determine the channel value in row 0. Enter an integer.</p>
Channel #x Row Number	<p>This setting is only visible if you select <a href="#">Process data table</a> <a href="#">for the setting</a> <a href="#">Data Processing during sensor creation</a> <a href="#">and if you select</a> <a href="#">Row number for the setting</a> <a href="#">Select Channel Value by</a>.</p> <p>Provide the number of the column to use to determine the channel value in row 0. Enter an integer.</p>
Channel #x Key	<p>This setting is only visible if you select <a href="#">Process data table</a> <a href="#">for the setting</a> <a href="#">Data Processing during sensor creation</a> <a href="#">and if you select</a> <a href="#">Key value pair for the setting</a> <a href="#">Select Channel Value by</a>.</p>

Setting	Description
	<p>Provide the key to search for in column 0 of the data table. The value in column 1 of the same row where the key value was found to use to determine the channel value. Enter a string.</p>
<p>Channel #x Mode</p>	<p><b>This setting is only visible if you select Process data table above.</b></p> <p>Define how to display the determined value in the channel:</p> <ul style="list-style-type: none"> <li>▪ Absolute (default): Show the value as the sensor retrieves it from the data table.</li> <li>▪ Difference: The sensor calculates and shows the difference between the last and the current value returned from the data table. <ul style="list-style-type: none"> <li>ⓘ This mode is not compatible with the unit Lookup.</li> <li>ⓘ This mode only works if the difference between the last and the current value is positive and increases with each scanning interval. This mode does not support negative and decreasing values.</li> </ul> </li> <li>▪ Absolute (recommended): Show the value as the sensor retrieves it from the data table.</li> <li>▪ Difference: The sensor calculates and shows the difference between the last and the current value returned from the data table. <ul style="list-style-type: none"> <li>ⓘ This mode is not compatible with the unit Lookup.</li> <li>ⓘ This mode only works if the difference between the last and the current value is positive and increases with each scanning interval. This mode does not support negative and decreasing values.</li> </ul> </li> </ul>
<p>Channel #x Unit</p>	<p><b>This setting is only visible if you select Process data table above.</b></p> <p>Define the unit of the channel value:</p> <ul style="list-style-type: none"> <li>▪ BytesBandwidth</li> <li>▪ BytesMemory</li> <li>▪ BytesDisk</li> <li>▪ Temperature</li> <li>▪ Percent</li> <li>▪ TimeResponse</li> <li>▪ TimeSeconds</li> <li>▪ TimeHours</li> <li>▪ Count</li> <li>▪ CPU</li> <li>▪ BytesFile</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ SpeedDisk</li> <li>▪ SpeedNet</li> <li>▪ Custom</li> <li>▪ Lookup</li> </ul> <p> For more information about the available units, see section <a href="#">Custom Sensors</a>.</p> <p> To use <a href="#">lookups</a> with this channel, select Lookup and define the lookup file in Channel #x Lookup. Do not use Custom if you use lookups with this sensor.</p> <p> It is not possible to use the unit Lookup in combination with the Difference mode. You are not able to create the sensor in this case.</p>
Channel #x Custom Unit	<p>This setting is only visible if you select <a href="#">Custom</a> above.</p> <p>Define a unit for the channel value. Enter a string.</p>
Channel #x Lookup	<p>This setting is only visible if you select <a href="#">Lookup</a> above.</p> <p>Select a <a href="#">lookup</a> file that you want to use with this channel.</p>
Use Data Table Value in Message	<p>This setting is only visible if you select <a href="#">Process data table</a> for the setting <a href="#">Data Processing during sensor creation</a>.</p> <p>Define if the sensor message shows a value from the data table:</p> <ul style="list-style-type: none"> <li>▪ <a href="#">Disable</a>: Do not use a custom sensor message.</li> <li>▪ <a href="#">Enable</a>: Define a custom sensor message with a defined value of the data table. Define the value selection below.</li> </ul> <p> The method of how to determine a value for the sensor message is defined in the setting <a href="#">Select Channel Value by</a> above.</p>
Message Column Number	<p>This setting is only visible if you select <a href="#">Process data table</a> for the setting <a href="#">Data Processing during sensor creation</a>, if you select <a href="#">Column name for the setting</a> <a href="#">Select Channel Value by</a>, and if you select <a href="#">Enable</a> above.</p> <p>Enter the number of a column. The sensor message shows the value in row 0 of this column. Enter an integer.</p>
Message Column Name	<p>This setting is only visible if you select <a href="#">Process data table</a> for the setting <a href="#">Data Processing during sensor creation</a>, if you select <a href="#">Column name for the setting</a> <a href="#">Select Channel Value by</a>, and if you select <a href="#">Enable</a> above.</p>

Setting	Description
	<p>Enter the name of a column. The sensor message shows the value in row 0 of this column. Enter a string.</p> <p><b>i</b> Columns start with index 0.</p>
Message Row Number	<p><a href="#">This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Row number for the setting Select Channel Value by, and if you select Enable above.</a></p> <p>Enter the name of a column. The sensor message shows the value in row 0 of this column. Enter the number of a row. The sensor message shows the value in column 0 of this row. Enter an integer.</p> <p><b>i</b> Rows start with index 0.</p>
Message Key	<p><a href="#">This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Key value pair for the setting Select Channel Value by, and if you select Enable above.</a></p> <p>Enter a key to search for in column 0 of the data table. The sensor message shows the value in column 1 of the row where the key was found. Enter a string.</p>
Message	<p><a href="#">This setting is only visible if you select Enable above.</a></p> <p>Define the sensor message. Enter a string. Use the placeholder <code>{0}</code> at the position where you want to display the value.</p> <p>Example: <a href="#">The message is {0}</a></p> <p><b>i</b> PRTG does not support the number sign (#) in sensor messages. If a message contains a number sign, PRTG clips the message at this point.</p>
If Message Changes	<p><a href="#">This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</a></p> <p>Define what the sensor does when its message changes:</p> <ul style="list-style-type: none"> <li>▪ Ignore (default): Do nothing.</li> <li>▪ Trigger 'change' notification: Send an internal message that indicates a change.</li> </ul> <p><b>i</b> In combination with a <a href="#">change trigger</a>, you can use this to <a href="#">trigger a notification</a> if a change occurs.</p>
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel **i** Downtime

---

Graph Type **i**  Show channels independently (default)

Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p><b>i</b> You can set a different primary channel later by clicking <b>⚙</b> below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>Show channels independently (default): Show a graph for each channel.</li> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select Stack channels on top of each other above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

**i** Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Affected Rows	The number of rows that were addressed by the query (including <a href="#">SELECT</a> statements if you process data tables)
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Execution Time	The execution time of the entire request (including connection buildup, query execution, transaction handling, disconnection)  <b>i</b> This channel is the primary channel by default.
Query Execution Time	The execution time of the specified query

## SQL Variables

You can use the following variables in the SQL query file to be replaced by an input parameter. This is useful if you have various SQL sensors with queries that differ in only one parameter.

- Microsoft SQL, MySQL, PostgreSQL: [@prtg](#)
- Oracle SQL: [:prtg](#)
- ADO SQL: [?](#) (question mark)

**i** [@prtg](#), [:prtg](#), and [?](#) are common SQL query parameters and they are used in a parameterized SQL query. This means that the query and the parameter are forwarded without any changes to the database. This leads to some restrictions on the database side. For example, you cannot use variables as placeholders for table names or as lists in IN operators.

Examples for variables usage:

```
SELECT * FROM Table WHERE name = @prtg
SELECT @prtg FROM Table
```

## 7.8.95 Modbus RTU Custom Sensor

The Modbus RTU Custom sensor connects to a Modbus Remote Terminal Unit (RTU) server and monitors up to ten returned numeric values.

Modbus RTU Custom Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>[1316]</sup>.

### Sensor in Other Languages

- Dutch: Modbus RTU Aangepast
- French: Modbus RTU personnalisé
- German: Modbus RTU (Benutzerdefiniert)
- Japanese: Modbus RTU カスタム
- Portuguese: Modbus RTU customizado
- Russian: Пользовательский Modbus RTU
- Simplified Chinese: Modbus RTU 自定义
- Spanish: Modbus RTU (personalizado)

### Remarks

Consider the following [remarks](#)<sup>[1309]</sup> and requirements for this sensor:

Remark	Description
Sensor creation	You can create this sensor only on a <a href="#">probe device</a> .
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">very low</a> performance impact.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Serial port	This sensor always uses the serial port of the probe device.
Knowledge Base	Knowledge Base: <a href="#">How can I apply Zoom Service Status sensors and Modbus sensors via device templates?</a>
Hosted probe	 You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.
Multi-platform probe	You can add this sensor to a multi-platform probe.

## Add Sensor

Setting	Description
Channel #1 - #10 Name	Enter a name for the channel.  You can change this value later in the <a href="#">channel settings</a> of this sensor.
Channel #1 - #10 Unit	Enter a unit for the channel.  You can change this value later in the <a href="#">channel settings</a> of this sensor.
Channel #2 - #10	You can define up to 10 channels. You must define at least one channel, so you see all available settings for <a href="#">Channel #1</a> . Specify how to handle all other possible channels: <ul style="list-style-type: none"> <li>▪ Disable (default): Do not create this channel.</li> <li>▪ Enable: Create this channel. Specify at least the name, type, and register number for this channel below.</li> </ul>  It is not possible to enable or disable channels after sensor creation.

## Basic Sensor Settings

- Russian: Цикл MQTT
- Simplified Chinese: MQTT 往返
- Spanish: Ida y vuelta MQTT

### Remarks

Consider the following [remarks](#)<sup>1326</sup> and requirements for this sensor:

Remark	Description
Credentials	This sensor requires credentials for MQTT.
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <b>low</b> performance impact.
New framework	This sensor was converted to a new framework. MQTT Round Trip sensors that were added before PRTG 20.2.59 do not work anymore. We recommend that you pause existing sensors to keep their historic data. To continue monitoring, please add a new MQTT Round Trip sensor.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Multi-platform probe	You can add this sensor to a multi-platform probe.

## Basic Sensor Settings

### Basic Sensor Settings

**Sensor Name** ⓘ Example Name

---

**Tags** ⓘ  ✕ +

---

**Priority** ⓘ ★★☆☆☆

Basic Sensor Settings

The sensor has the following **default tags** that are automatically predefined in the sensor's settings when you add the sensor:

- mqtt
- mqttroundtrip
- roundtrip

■ For more information about basic sensor settings, see section [Sensor Settings](#) <sup>667</sup>.

## MQTT Specific

**MQTT Specific**

Topic ⓘ PRTG/roundtrip/%sensorid

Connection Settings ⓘ  Use default settings  
 Use custom settings

MQTT Specific

Setting	Description
Topic	<p>Enter the topic for the round trip. The default is <a href="#">PRTG/roundtrip/%sensorid</a>.</p> <p> ⓘ PRTG replaces <a href="#">%sensorid</a> with the sensor's ID.</p>
Connection Settings	<p>Define the connection settings for the connection to the MQTT broker:</p> <ul style="list-style-type: none"> <li>▪ Use default settings: Use the default connection settings.</li> <li>▪ Use custom settings: Use a ClientID that you can specify below.</li> </ul>
ClientID	<p><a href="#">This setting is only visible if you select Use custom settings above.</a></p> <p>Enter the ClientID for the connection to the MQTT broker. The default is <a href="#">PRTG_%sensorid</a>.</p> <p> ⓘ PRTG replaces <a href="#">%sensorid</a> with the sensor's ID. For the subscribing client, PRTG automatically adds <a href="#">_subscriber</a> to the ClientID. For the publishing client, PRTG automatically adds <a href="#">_publisher</a> to the ClientID.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p>

Setting	Description
	<p><b>i</b> You can set a different primary channel later by clicking  below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>Show channels independently (default): Show a graph for each channel.</li> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.                     <p><b>i</b> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p> </li> </ul>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above</b>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Debug Options

**Debug Options**

**Result Handling** 
 Discard result (default)  
 Store result

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>Discard result: Do not store the sensor result.</li> <li>Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file name is Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites this file with each scanning interval.</li> </ul> <p> This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

■ For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Publisher Connection Time	The time it takes the publisher to connect
Round Trip Time	The RTT of the message (after both publisher and subscriber connect)  This channel is the primary channel by default.
Status	The round trip status <ul style="list-style-type: none"> <li>▪ Up status: Roundtrip Complete</li> <li>▪ Down status: Message Not Received, Message Not Sent, Publisher Could Not Connect, Subscriber Could Not Connect</li> </ul>
Subscriber Connection Time	The time it takes the subscriber to connect

MQTT Specific

Setting	Description
Topic	<p>Enter the topic that you want to monitor.</p> <p> ⓘ The sensor supports single-level (+) and multi-level (#) wildcards.</p>
Time Since Last Message	<p>Select if you want to add a channel that shows the time in seconds since the last message was received:</p> <ul style="list-style-type: none"> <li>▪ <b>Disable (default):</b> Do not create this channel.</li> <li>▪ <b>Enable:</b> Create this channel. The sensor remains in the Up status even if it received no messages during the last scan interval.</li> </ul> <p> ⓘ You can define a threshold notification trigger to receive notifications if no data is received for a certain amount of time.</p>
Last Message Handling	<p>Define what PRTG does with the last message received if there are no new messages in the following scanning interval:</p> <ul style="list-style-type: none"> <li>▪ <b>Dismiss (default):</b> The sensor dismisses the last message received after a new scan.</li> <li>▪ <b>Retain:</b> The sensor saves the last message received until a new message is received.</li> </ul>
Sensor Message JSONPath	<p>Optionally enter the path to the value in the JSON data. The sensor shows the received value as the sensor message.</p>

Setting	Description
	<p><b>i</b> The data must be in valid JSON format. For details about the format, see Channel #x JSONPath below.</p> <p><b>i</b> The sensor only shows the received value if the sensor is in the Up status. If the sensor changes to the Down status, the sensor message shows the error message instead.</p>
<p>Channel #x JSONPath</p>	<p>Enter the path to the numeric value in the received JSON structure that you want to monitor.</p> <p><b>i</b> The data must be in valid JSON format, for example like this:</p> <pre data-bbox="485 797 1347 974"> {   "Sensor1": {"Temp":25,"Unit":"°C"},   "Sensor2": {"Humidity":36,"Unit":"%"} } </pre> <p>To query temperature, enter the following JSONPath:</p> <pre data-bbox="485 1016 1347 1066">\$.Sensor1.Temp</pre> <p>To query humidity, enter the following JSONPath:</p> <pre data-bbox="485 1108 1347 1158">\$.Sensor2.Humidity</pre>
<p>Channel #x Value Type</p>	<p>Select the value type that the channel displays:</p> <ul style="list-style-type: none"> <li>▪ Absolute (integer): Integer64 values with or without an operational sign, such as 10 or 120 or -12 or 120.</li> <li>▪ Absolute (float): Double values, such as -5.80 or 8.23. <ul style="list-style-type: none"> <li><b>i</b> If you select Absolute (float), the sensor automatically shows all decimal places of the received value in the channel. You can define how many decimal places of the channel's data that you want to display in graphs and tables in the <a href="#">channel settings</a>.</li> </ul> </li> <li>▪ Delta (counter): Counter values. The sensor calculates the difference between the last and the current value. Enter an integer. The sensor additionally divides the delta value by a time period to indicate a speed value. <ul style="list-style-type: none"> <li><b>i</b> This mode only works if the difference between the last and the current value is positive and increases with each scanning interval. This mode does not support negative values and decreasing values.</li> </ul> </li> <li><b>i</b> Absolute (integer) and Absolute (float) support the extraction of numerical values from a received string. The sensor parses the numerical value from the beginning of the string until it encounters the first element that is not part of a numerical value, for example a letter. The sensor ignores whitespace characters.</li> <li><b>i</b> You cannot change this value after sensor creation.</li> </ul>

Setting	Description
Channel #2 - #10	<p>You can define up to 10 channels. You must define at least one channel, so you see all available settings for <a href="#">Channel #1</a>. Specify how to handle all other possible channels:</p> <ul style="list-style-type: none"> <li>▪ Disable (default): Do not create this channel.</li> <li>▪ Enable: Create this channel.</li> </ul> <p><b>i</b> If you select Disable (default), you can still see the channels, but they do not receive data anymore.</p>

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
CPU Load	<p>The CPU load (%) of the multi-platform probe. Extensive CPU load can lead to false, incomplete, and incorrect monitoring results. This value should usually stay below 50%.</p> <p><b>i</b> This channel is the primary channel by default.</p> <p><b>i</b> This channel has default limits:</p> <ul style="list-style-type: none"> <li>▪ Upper error limit: 90%</li> <li>▪ Upper warning limit: 80%</li> </ul>
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Memory Usage	The memory usage
Scans per Second	The number of scans per second
Uptime	The uptime

## 7.8.102 MySQL v2 Sensor

The MySQL v2 sensor monitors a database on a MySQL server and executes a query.

- ❶ The sensor can also process the data table and show the values that you define in individual channels.

MySQL v2 Sensor

- For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>1362</sup>.

### Sensor in Other Languages

- Dutch: MySQL v2
- French: MySQL v2
- German: MySQL v2
- Japanese: MySQL v2
- Portuguese: MySQL v2
- Russian: MySQL v2
- Simplified Chinese: MySQL v2
- Spanish: MySQL v2

### Remarks

Consider the following [remarks](#)<sup>1352</sup> and requirements for this sensor:

Remark	Description
Performance impact	This sensor has a <a href="#">high</a> performance impact. We recommend that you use no more than <a href="#">200</a> of this sensor on each probe.
SQL query storage	This sensor requires that you store the SQL query in a file on the probe system. In a cluster, copy the file to every cluster node.  ■ For more information, see the Knowledge Base: <a href="#">Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?</a>
.NET 4.7.2 or later	This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node.  ❗ If the framework is missing, you cannot create this sensor.  ■ For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a>
MySQL server	This sensor supports MySQL server versions as of 5.7.
IPv6	This sensor supports IPv6.
Lookups	This sensor can use <a href="#">lookups</a> <sup>[1359]</sup> . Select Lookup as Channel #x Unit and define the lookup file in Channel #x Lookup.
Credentials	Define the credentials for database management systems in settings that are higher in the object hierarchy.
Knowledge Base	<ul style="list-style-type: none"> <li>▪ Knowledge Base: <a href="#">How to set up the SQL v2 sensors in PRTG? Is there a guide?</a></li> <li>▪ Knowledge Base: <a href="#">How can I monitor strings from an SQL database and show a sensor status depending on it?</a></li> <li>▪ Knowledge Base: <a href="#">How can I monitor error tables in SQL databases?</a></li> <li>▪ Knowledge Base: <a href="#">Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?</a></li> </ul>
Hosted probe	☁ You cannot add this sensor to the hosted probe of a PRTG Hosted Monitor instance. If you want to use this sensor, add it to a remote probe device.

## Database Specific

### Database Specific

**Database** ⓘ

**SSL Mode** ⓘ

None

Preferred (default)

Required

Database Specific

Setting	Description
Database	<p>Enter the name of the MySQL database to which the sensor connects, for example, <a href="#">MyDatabase</a>. This is a logical entity on the database server where database objects exist.</p> <p>The database name of a MySQL server also reflects a physical directory structure where your database objects are stored. Enter the appropriate string, which is the same as you would supply when you invoke the <a href="#">mysql.exe</a> admin tool (with the command-line switch <code>-p</code>) or after you log in with <a href="#">mysql.exe</a> with the command <code>use</code>.</p>
SSL Mode	<p>Select the MySQL Secure Sockets Layer (SSL) mode for the connection:</p> <ul style="list-style-type: none"> <li>▪ None: Do not use SSL.</li> <li>▪ Preferred (default): Use SSL if the server supports it.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>Required: Always use SSL and deny the connection if the server does not support it. Do not perform a server certificate validation.</li> </ul> <p>The SSL mode options that you can choose are the same as the values of the MySQL <code>sslmode</code> parameter. PRTG sends it with the sensor requests.</p> <p><b>i</b> For more information about the MySQL SSL modes, refer to the MySQL documentation.</p>

## Data

**Data**

**SQL Query File** ⓘ *Demo Serveruptime.sql*

**Input Parameter Handling** ⓘ  Do not use input parameter (default)  
 Use input parameter

**Transaction Handling** ⓘ  Do not use transaction (default)  
 Use transaction and always roll back  
 Use transaction and commit on success

**Data Processing** ⓘ *Only execute query (default)*

**Result Handling** ⓘ  Discard result (default)  
 Store result

Data

Setting	Description
SQL Query File	<p>Select the SQL query file that includes a valid SQL statement that the sensor executes on the server with every scanning interval. The list contains SQL scripts from the \Custom Sensors\sql subfolder of the <a href="#">PRTG program directory</a> on the probe system. Store your script there. If you use the script on a cluster probe, you must store the script on all cluster nodes.</p> <p>A correct expression in the file could be: <code>SELECT AVG(UnitPrice) FROM Products</code>. If you want to use transactions, separate the individual steps with semicolons ";".</p> <p><b>i</b> Note that with each request, PRTG transfers the full result set, so use filters and limits in your query.</p> <p><b>i</b> The demo script Demo Serveruptime.sql is available by default. You can use it to monitor the uptime of the target server.</p>

Setting	Description
	<p>■ See also the Knowledge Base: <a href="#">Why do I have to store SQL sensor queries and custom scripts in files on the probe computer?</a></p> <p>ⓘ You cannot change this value after sensor creation.</p>
Input Parameter Handling	<p>Define if you want to pass a parameter to the SQL query file:</p> <ul style="list-style-type: none"> <li>▪ Do not use input parameter (default): Execute the SQL query file without using variables.</li> <li>▪ Use input parameter: Execute an SQL query file that contains a variable. Provide the parameter that you want to use in the query below.</li> </ul>
Input Parameter	<p><b>This setting is only visible if you select Use input parameter above.</b></p> <p>Enter the parameter that you want to pass to the SQL query file. This parameter replaces the variables <code>@prtg</code>, <code>:prtg</code>, or <code>?</code> in the SQL query, considering the general rules for SQL variables.</p> <p>You can also use PRTG placeholders for custom sensors (command-line parameters) as input parameters, for example, <code>%sensorid</code> or <code>%deviceid</code>. For more information, see section <a href="#">Custom Sensors</a>.</p> <p>ⓘ Provide strings as they are and do not surround them with quotation marks. PRTG automatically and correctly inserts string parameters into the query.</p>
Transaction Handling	<p>Define if you want to use transactions and if they affect the database content:</p> <ul style="list-style-type: none"> <li>▪ Do not use transaction (default): Do not execute transactions.</li> <li>▪ Use transaction and always roll back: The query does not change data in the database. In the SQL query file, separate the single steps of the transaction with semicolons.</li> <li>▪ Use transaction and commit on success: The query changes data in the database. The changes only apply if all execution steps succeed without any errors. In the SQL query file, separate the single steps of the transaction with semicolons.</li> </ul>
Data Processing	<p>Define whether the sensor processes data from the database:</p> <ul style="list-style-type: none"> <li>▪ Only execute query (default): Only show information about the number of affected rows and the execution time of the query. Affected rows are rows that were changed by the query (for example, created, deleted, or edited).</li> <li>▪ Count table rows: Execute a <b>SELECT</b> statement and monitor how many rows of the data table this statement returns.</li> <li>▪ Process data table: Read and analyze the data table. If you select this option, the sensor counts rows with <b>SELECT</b> statements as well.</li> </ul>

Setting	Description
	<p> You cannot change this value after sensor creation.</p>
DBNull Handling	<p><a href="#">This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</a></p> <p>Define the sensor behavior if the query returns <b>DBNull</b>:</p> <ul style="list-style-type: none"> <li>▪ Error: Show the Down status if the query returns <b>DBNull</b>.</li> <li>▪ Number 0: Recognize the result <b>DBNull</b> as a valid value and interpret it as the number <b>0</b>.</li> </ul>
Select Channel Value by	<p><a href="#">This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</a></p> <p>Define how to select the desired cell in the database table:</p> <ul style="list-style-type: none"> <li>▪ Column number: Determine the channel value by using the value in row 0 of the column whose number you specify in Channel #x Column Number.</li> <li>▪ Column name: Determine the channel value by using the value in row 0 of the column whose name you specify in Channel #x Column Name.</li> <li>▪ Row number: Determine the channel value by using the value in column 0 of the row whose number you specify in Channel #x Row Number.</li> <li>▪ Key value pair: Determine the channel value by searching in column 0 for the key you specify in Channel #x Key and by returning the value in column 1 of the same row where the key value was found.</li> </ul> <p> Defining how the desired cell in the database table is selected is necessary to configure the cells that are used in the channels.</p> <p> The option you select here also defines the method of how to optionally determine a value for the sensor message. For more information, see setting Use Data Table Value in Message.</p> <p> For an example for channel value selection, see section <a href="#">Monitoring Databases</a>.</p>
Channel #2 - #10	<p><a href="#">This setting is only visible if you select Process data table above.</a></p> <p>You can define up to 10 channels. You must define at least one channel, so you see all available settings for <b>Channel #1</b>. Specify how to handle all other possible channels:</p> <ul style="list-style-type: none"> <li>▪ Disable: Do not create this channel.</li> <li>▪ Enable: Create this channel.</li> </ul> <p> It is not possible to enable or disable channels after sensor creation.</p>

Setting	Description
Channel #x Name	<p>This setting is only visible if you select <a href="#">Process data table for the setting Data Processing during sensor creation</a>.</p> <p>Enter a name for the channel. Enter a string. The sensor dynamically generates channels with this name as identifier.</p> <p><b>i</b> If the name contains angle brackets (&lt;&gt;), PRTG replaces them with braces ({} for security reasons. For more information, see the Knowledge Base: <a href="#">What security features does PRTG include?</a></p>
Channel #x Column Number	<p>This setting is only visible if you select <a href="#">Process data table for the setting Data Processing during sensor creation</a> and if you select <a href="#">Column number for the setting Select Channel Value by</a>.</p> <p>Provide the number of the column to use to determine the channel value in row 0. Enter an integer.</p>
Channel #x Column Name	<p>This setting is only visible if you select <a href="#">Process data table for the setting Data Processing during sensor creation</a> and if you select <a href="#">Column name for the setting Select Channel Value by</a>.</p> <p>Provide the name of the column to use to determine the channel value in row 0. Enter an integer.</p>
Channel #x Row Number	<p>This setting is only visible if you select <a href="#">Process data table for the setting Data Processing during sensor creation</a> and if you select <a href="#">Row number for the setting Select Channel Value by</a>.</p> <p>Provide the number of the column to use to determine the channel value in row 0. Enter an integer.</p>
Channel #x Key	<p>This setting is only visible if you select <a href="#">Process data table for the setting Data Processing during sensor creation</a> and if you select <a href="#">Key value pair for the setting Select Channel Value by</a>.</p> <p>Provide the key to search for in column 0 of the data table. The value in column 1 of the same row where the key value was found to use to determine the channel value. Enter a string.</p>
Channel #x Mode	<p>This setting is only visible if you select <a href="#">Process data table above</a>.</p> <p>Define how to display the determined value in the channel:</p> <ul style="list-style-type: none"> <li>▪ Absolute (default): Show the value as the sensor retrieves it from the data table.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>▪ Difference: The sensor calculates and shows the difference between the last and the current value returned from the data table.               <ul style="list-style-type: none"> <li>ⓘ This mode is not compatible with the unit Lookup.</li> <li>ⓘ This mode only works if the difference between the last and the current value is positive and increases with each scanning interval. This mode does not support negative and decreasing values.</li> </ul> </li> <li>▪ Absolute (recommended): Show the value as the sensor retrieves it from the data table.</li> <li>▪ Difference: The sensor calculates and shows the difference between the last and the current value returned from the data table.               <ul style="list-style-type: none"> <li>ⓘ This mode is not compatible with the unit Lookup.</li> <li>ⓘ This mode only works if the difference between the last and the current value is positive and increases with each scanning interval. This mode does not support negative and decreasing values.</li> </ul> </li> <li>ⓘ You cannot change this value after sensor creation.</li> </ul>
Channel #x Unit	<p>This setting is only visible if you select <a href="#">Process data table</a> above.</p> <p>Define the unit of the channel value:</p> <ul style="list-style-type: none"> <li>▪ BytesBandwidth</li> <li>▪ BytesMemory</li> <li>▪ BytesDisk</li> <li>▪ Temperature</li> <li>▪ Percent</li> <li>▪ TimeResponse</li> <li>▪ TimeSeconds</li> <li>▪ TimeHours</li> <li>▪ Count</li> <li>▪ CPU</li> <li>▪ BytesFile</li> <li>▪ SpeedDisk</li> <li>▪ SpeedNet</li> <li>▪ Custom</li> <li>▪ Lookup</li> </ul> <p>■ For more information about the available units, see section <a href="#">Custom Sensors</a>.</p>

Setting	Description
	<p><b>i</b> To use <a href="#">lookups</a> with this channel, select Lookup and define the lookup file in Channel #x Lookup. Do not use Custom if you use lookups with this sensor.</p> <p><b>i</b> It is not possible to use the unit Lookup in combination with the Difference mode. You are not able to create the sensor in this case.</p>
Channel #x Custom Unit	<p>This setting is only visible if you select Custom above.</p> <p>Define a unit for the channel value. Enter a string.</p>
Channel #x Lookup	<p>This setting is only visible if you select Lookup above.</p> <p>Select a <a href="#">lookup</a> file that you want to use with this channel.</p>
Use Data Table Value in Message	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</p> <p>Define if the sensor message shows a value from the data table:</p> <ul style="list-style-type: none"> <li>▪ Disable: Do not use a custom sensor message.</li> <li>▪ Enable: Define a custom sensor message with a defined value of the data table. Define the value selection below.</li> </ul> <p><b>i</b> The method of how to determine a value for the sensor message is defined in the setting Select Channel Value by above.</p>
Message Column Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Column name for the setting Select Channel Value by, and if you select Enable above.</p> <p>Enter the number of a column. The sensor message shows the value in row 0 of this column. Enter an integer.</p>
Message Column Name	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Column name for the setting Select Channel Value by, and if you select Enable above.</p> <p>Enter the name of a column. The sensor message shows the value in row 0 of this column. Enter a string.</p> <p><b>i</b> Columns start with index 0.</p>
Message Row Number	<p>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Row number for the setting Select Channel Value by, and if you select Enable above.</p>

Setting	Description
	<p>Enter the name of a column. The sensor message shows the value in row 0 of this column. Enter the number of a row. The sensor message shows the value in column 0 of this row. Enter an integer.</p> <p><b>i</b> Rows start with index 0.</p>
<p>Message Key</p>	<p><b>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation, if you select Key value pair for the setting Select Channel Value by, and if you select Enable above.</b></p> <p>Enter a key to search for in column 0 of the data table. The sensor message shows the value in column 1 of the row where the key was found. Enter a string.</p>
<p>Message</p>	<p><b>This setting is only visible if you select Enable above.</b></p> <p>Define the sensor message. Enter a string. Use the placeholder <code>{0}</code> at the position where you want to display the value.</p> <p>Example: <code>The message is {0}</code></p> <p><b>i</b> PRTG does not support the number sign (<code>#</code>) in sensor messages. If a message contains a number sign, PRTG clips the message at this point.</p>
<p>If Message Changes</p>	<p><b>This setting is only visible if you select Process data table for the setting Data Processing during sensor creation.</b></p> <p>Define what the sensor does when its message changes:</p> <ul style="list-style-type: none"> <li>▪ Ignore (default): Do nothing.</li> <li>▪ Trigger 'change' notification: Send an internal message that indicates a change.</li> </ul> <p><b>i</b> In combination with a <a href="#">change trigger</a>, you can use this to <a href="#">trigger a notification</a> if a change occurs.</p>
<p>Result Handling</p>	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the <code>\Logs\sensors</code> subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are <code>Result of Sensor [ID].txt</code>, <code>Result of Sensor [ID].Data.txt</code>, and <code>Result of Sensor [ID].log</code>. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p><b>i</b> In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

Primary Channel ⓘ Downtime

---

Graph Type ⓘ  Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p> ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> <li>▪ Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.</li> </ul> <p> ⓘ You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</p>
Stack Unit	<p><b>This setting is only visible if you select</b> Stack channels on top of each other <b>above.</b></p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

ⓘ Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Affected Rows	The number of rows that were addressed by the query (including <b>SELECT</b> statements if you process data tables)
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Execution Time	The execution time of the entire request (including connection buildup, query execution, transaction handling, disconnection)  <span>ⓘ</span> This channel is the primary channel by default.
Query Execution Time	The execution time of the specified query

## SQL Variables

You can use the following variables in the SQL query file to be replaced by an input parameter. This is useful if you have various SQL sensors with queries that differ in only one parameter.

- Microsoft SQL, MySQL, PostgreSQL: [@prtg](#)
- Oracle SQL: [:prtg](#)
- ADO SQL: [?](#) (question mark)

ⓘ [@prtg](#), [:prtg](#), and [?](#) are common SQL query parameters and they are used in a parameterized SQL query. This means that the query and the parameter are forwarded without any changes to the database. This leads to some restrictions on the database side. For example, you cannot use variables as placeholders for table names or as lists in IN operators.

Examples for variables usage:

```
SELECT * FROM Table WHERE name = @prtg
SELECT @prtg FROM Table
```

## 7.8.103 NetApp Aggregate Sensor

### IMPORTANT INFORMATION

This sensor supports NetApp cDOT as of version 8.3 or ONTAP from versions 9.0 to 9.12. If you use ONTAP as of version 9.6, we recommend that you use the [NetApp Aggregate v2](#) <sup>[1372]</sup> sensor.

The NetApp Aggregate sensor monitors the status of a NetApp cDOT or ONTAP storage aggregate accessing the application programming interface (API) via the Simple Object Access Protocol (SOAP).

NetApp Aggregate Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) <sup>[1370]</sup>.

### Sensor in Other Languages

- Dutch: NetApp Aggregate
- French: NetApp agrégat de stockage
- German: NetApp Aggregat
- Japanese: NetApp の合計

- Portuguese: Agregado NetApp
- Russian: Статистическое выражение NetApp
- Simplified Chinese: NetApp 聚合
- Spanish: Agregado NetApp

## Remarks

Consider the following [remarks](#) <sup>11366</sup> and requirements for this sensor:

Remark	Description
Enabled ONTAPI access	<p>The ONTAPI user account that you use with this sensor requires access to the <a href="#">DATA ONTAP API (ONTAPI)</a> so that the sensor can request data from it. The access is enabled by default.</p> <p><b>i</b> If access is disabled, locally use the following command on the cluster console to enable ONTAPI access for the user:</p> <pre>services web&gt; modify -vserver clusterd -name ontapi -enabled true</pre> <p>For this sensor, read-only user rights are sufficient for the ONTAPI user account that you use to access ONTAPI. Modify or add this user with a suitable role in the console under Cluster   ClusterX   Configuration   Security   Users</p>
.NET 4.7.2 or later	<p>This sensor requires <a href="#">.NET 4.7.2 or later</a> from Microsoft on the probe system. In a cluster, install it on every cluster node.</p> <p><b>i</b> If the framework is missing, you cannot create this sensor.</p> <p><b>■</b> For more information, see the Knowledge Base: <a href="#">Which .NET version does PRTG require?</a></p>
NetApp versions	<p>This sensor supports NetApp cDOT as of version 8.3 and NetApp ONTAP as of version 9.0.</p>
IPv6	<p>This sensor supports IPv6.</p>
Performance impact	<p>This sensor has a <a href="#">very low</a> performance impact.</p>
Credentials	<p>You can define NetApp API credentials (User Name and Password) in the <a href="#">credentials for Windows systems</a> settings of the parent device. This way, you do not need to individually enter credentials for each NetApp sensor that you add to the same device.</p>
Lookups	<p>This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.</p>

## Basic Sensor Settings

Debug Options

Setting	Description
Result Handling	<p>Define what PRTG does with the sensor result:</p> <ul style="list-style-type: none"> <li>▪ Discard result (default): Do not store the sensor result.</li> <li>▪ Store result: Store the last sensor result in the \Logs\sensors subfolder of the <a href="#">PRTG data directory</a> on the probe system. The file names are Result of Sensor [ID].txt, Result of Sensor [ID].Data.txt, and Result of Sensor [ID].log. This setting is for debugging purposes. PRTG overwrites these files with each scanning interval.</li> </ul> <p>☁ This option is not available when the sensor runs on the hosted probe of a PRTG Hosted Monitor instance.</p> <p>ⓘ In a cluster, PRTG stores the result in the PRTG data directory of the master node.</p>

## Sensor Display

**Sensor Display**

**Primary Channel** ⓘ

Downtime

---

**Graph Type** ⓘ

Show channels independently (default)  
 Stack channels on top of each other

Sensor Display

Setting	Description
Primary Channel	<p>Select a channel from the list to define it as the primary channel. In the device tree, PRTG displays the last value of the primary channel below the sensor's name. The available options depend on what channels are available for this sensor.</p> <p>ⓘ You can set a different primary channel later by clicking ⚙ below a channel gauge on the sensor's Overview tab.</p>
Graph Type	<p>Define how this sensor shows different channels:</p> <ul style="list-style-type: none"> <li>▪ Show channels independently (default): Show a graph for each channel.</li> </ul>

Setting	Description
	<ul style="list-style-type: none"> <li>Stack channels on top of each other: Stack channels on top of each other to create a multi-channel graph. This generates a graph that visualizes the different components of your total traffic.                             <ul style="list-style-type: none"> <li> You cannot use this option in combination with manual Vertical Axis Scaling (available in the <a href="#">channel settings</a>).</li> </ul> </li> </ul>
Stack Unit	<p>This setting is only visible if you select Stack channels on top of each other <a href="#">above</a>.</p> <p>Select a unit from the list. PRTG stacks all channels with this unit on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.</p>

## Inherited Settings

By default, all of these settings are inherited from objects that are higher in the hierarchy. We recommend that you change them centrally in the [root group settings](#) if necessary. To change a setting for this object only, click  under the corresponding setting name to disable the inheritance and to display its options.

 For more information, see section [Inheritance of Settings](#).

## Channel List

 Which channels the sensor actually shows might depend on the target device, the available components, and the sensor setup.

Channel	Description
Aggregate State	<p>The aggregate status</p> <ul style="list-style-type: none"> <li>Up status: Online</li> <li>Warning status: Restrict</li> <li>Down status: Offline, Other Error</li> </ul>
Blocks Read	The number of blocks read
Blocks Written	The number of blocks written
Bytes Free	The free bytes in total
Bytes Free %	The free bytes (%)

Channel	Description
	 This channel is the primary channel by default.
Data Read	The data read speed
Data Written	The data write speed
Disks #	The number of disks on the aggregate
Downtime	In the channel table on the Overview tab, this channel never shows any values. PRTG uses this channel in graphs and reports to show the amount of time in which the sensor was in the Down status
Files	The number of files on the aggregate
Latency	The latency
User Reads	The number of user reads
User Writes	The number of user writes

## 7.8.104 NetApp Aggregate v2 Sensor

The NetApp Aggregate v2 sensor monitors the status of a NetApp storage aggregate via the Representational State Transfer (REST) application programming interface (API) using ONTAP as of version 9.6.

**i** This sensor was converted to a new framework so that it will continue to function after the changes of the ONTAP REST API.

NetApp Aggregate v2 Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#)<sup>1372</sup>.

### Sensor in Other Languages

- Dutch: NetApp Aggregaat v2
- French: NetApp agrégat de stockage v2
- German: NetApp Aggregat v2

- Spanish: Agregado NetApp v2

## Remarks

Consider the following [remarks](#)<sup>[1373]</sup> and requirements for this sensor:

Remark	Description
Credentials for NetApp	This sensor requires an <a href="#">ONTAP System Manager</a> user account with the role <a href="#">readonly</a> and with access to the <a href="#">HTTP</a> application with <a href="#">Password</a> authentication.
Permissions for the ONTAP REST API	<p>This sensor requires permissions for the <a href="#">ONTAP REST API</a>.</p> <p><b>i</b> This sensor requires the role <a href="#">readonly</a> with the following permissions for the <a href="#">ONTAP REST API</a>:</p> <p>Access level <a href="#">Read-Only</a>:</p> <ul style="list-style-type: none"> <li>▫ /api</li> <li>▫ /api/security/audit/destinations</li> </ul> <p>Access level <a href="#">Read/Write</a>:</p> <ul style="list-style-type: none"> <li>▫ /api/security/authentication/password</li> </ul> <p>Access level <a href="#">None</a>:</p> <ul style="list-style-type: none"> <li>▫ /api/security</li> </ul>
Credentials	This sensor requires credentials for NetApp.
Output	This sensor does not include system-owned root aggregates in the output.
NetApp versions	This sensor supports ONTAP as of version 9.6. If you want to use NetApp cDOT as of version 8.3 or ONTAP from version 9.0 to version 9.5, use the <a href="#">NetApp Aggregate</a> <sup>[1365]</sup> sensor. <sup>[1472]</sup>
IPv6	This sensor supports IPv6.
Performance impact	This sensor has a <a href="#">very low</a> performance impact.
Lookups	This sensor uses <a href="#">lookups</a> to determine the status values of one or more channels.
Limits	This sensor has predefined <a href="#">limits</a> for several metrics.
Scanning interval	The recommended scanning interval of this sensor is <a href="#">1 minute</a> .
Multi-platform probe	You can add this sensor to a multi-platform probe.

## Basic Sensor Settings

### Basic Sensor Settings

**Sensor Name** ⓘ Example Name

---

**Tags** ⓘ exampletag ✕ +

---

**Priority** ⓘ ★★☆☆☆

Basic Sensor Settings

The sensor has the following [default tags](#) that are automatically predefined in the sensor's settings when you add the sensor:

- aggregate
- netapp
- ontap
- rest

■ For more information about basic sensor settings, see section [Sensor Settings](#) <sup>667</sup>.

## NetApp Specific

### NetApp Specific

**Aggregate Name** ⓘ AGGR\_01\_NET\_AFF220\_01\_SSD

---

**Node Name** ⓘ net-aff220-01

NetApp Specific

Setting	Description
Aggregate Name	The name of the aggregate that this sensor monitors.
Node Name	The name of the node that contains the aggregate that this sensor monitors.

## 7.8.105 NetApp I/O Sensor

### IMPORTANT INFORMATION

This sensor supports NetApp cDOT as of version 8.3 or ONTAP from versions 9.0 to 9.12. If you use ONTAP as of version 9.11, we recommend that you use the [NetApp I/O v2](#) <sup>[1386]</sup> sensor. <sup>[1372]</sup>

The NetApp I/O sensor monitors input and output operations of a NetApp cDOT or ONTAP storage system accessing the application programming interface (API) via the Simple Object Access Protocol (SOAP).

NetApp I/O Sensor

For a detailed list and descriptions of the channels that this sensor can show, see section [Channel List](#) <sup>[1383]</sup>.

## Sensor in Other Languages

- Dutch: NetApp I/O
- French: NetApp E/S
- German: NetApp I/O
- Japanese: NetApp I/O
- Portuguese: E/S NetApp
- Russian: Ввод-вывод NetApp
