

How the Survey was Conducted

Nature of the Sample: Marist Poll of 1,296 National Adults

This survey of 1,296 adults was conducted November 14th through November 16th, 2022 by the Marist Poll. Adults 18 years of age and older residing in the United States were contacted on landline or mobile numbers and interviewed by telephone using live interviewers. Survey questions were available in English or Spanish. Mobile telephone numbers were randomly selected based upon a list of telephone exchanges from throughout the nation. The exchanges were selected to ensure that each region was represented in proportion to its population. Mobile phones are treated as individual devices. To increase coverage, this mobile sample was supplemented by respondents reached through random dialing of landline phone numbers. Within each landline household, a single respondent is selected through a random selection process to increase the representativeness of traditionally under-covered survey populations. The samples were then combined and balanced to reflect the 2020 American Community Survey 5-year estimates for age, gender, income, race, and region. Results are statistically significant within ± 4.3 percentage points. There are 1,199 registered voters. The results for this subset are statistically significant within ± 4.5 percentage points. There are 517 Republican and Republican leaning independents and 572 Democrats and Democratic leaning independents. The results for these subsets are statistically significant within ± 6.9 percentage points and ± 6.5 percentage points, respectively. Tables include results for subgroups to only display crosstabs with an acceptable sampling error. It should be noted that although you may not see results listed for a certain group, it does not mean interviews were not completed with those individuals. It simply means the sample size is too small to report. The error margin was adjusted for sample weights and increases for cross-tabulations.
