ABSTRACT

This program builds upon the monitoring and calibration of the FGS-to-SI alignment program (14452 - HST Cycle 23- Focal Plane Calibration (SI-FGS Alignment)). HST 14452 performs back-to-back PSA/MIRRORA & PSA/MIRRORB ACQ/IMAGEs, from which all the results herein are bootstrapped.

The FGS-to-SI program is repeated twice a year (every cycle) and we will use its COS exposures as the baseline for this TA co-alignment program.

Proposal 14440 (STScI Edit Number: 2, Created: Friday, July 29, 2016 12:34:30 PM EST) - Overview

The historical list of FCS-to-SI proposals, & cycles, are:

11878 (C17) ->12399 (C18) ->12781 (C19) ->13171 (C20) ->13616 (C21) ->14035 (C22) ->14452 (C23)

The order in which the alignment is checked is : STIS->WFC3->ACS->COS

The FGS-to-SI program (14452) performs a PSA/MIRRORA ACQ/IMAGE on a target that should be centered in the aperture. This verifies the COS NUV PSA aperture position in the SIAF. After this PSA+MIRRORA ACQ/IMAGE, a PSA+MIRRORB ACQ/IMAGE is then performed. This exposure bootstraps the PSA+MIRRORB centering to the PSA+MIRRORA SIAF verification. This allows us to monitor the properties of the PSA+MIRRORB image in a controlled way on a centered target. No spectra are taken in 14452 due to time constraints, but we are currently planning on adding in PSA/MIRRORA and PSA/MIRRORB lamp images.

Visits 01 & 02 of this program extend the COS SIAF/FGS-to-SI verification of Visit 02 of 14452 to the other two ACQ/IMAGE combinations (BOA+MIRRORA & BOA+MIRRORB) by bootstrapping from the PSA+MIRRORB verification to co-align all the COS TA imaging modes. The details of the observations are given in the observing section.

Visit 01 of this program bootstraps off Visit 02 of 14452 to co-align the PSA+MIRRORB ACQ/IMAGE mode to the BOA+MIRRORA. We prefer that Visit 01 of this program executes within 45 days of Visit 02 of 14452, to ensure that no long term instrument or telescope focus changes impact our results.

Visit 02 of this program follows the style of Visit 01, and bootstraps from the BOA+MIRRORA mode to the BOA+MIRRORB TA imaging mode. Visit 02 should also occur within 45 days of visit 02 of 14452 and within 45 days of Visit 01 of this program.

Visit 3 of this program is an on-hold, contingency visit that would be used to replace the 14452 Visit 02 in case this program is, for whatever reason, not executed as planned. In this case the 1st ACQ/IMAGE is PSA/MIRRORA and the 2nd ACQ/Image is PSA/MIRRORB. This visit also takes several lamp images to measure the WCA-to-PSA imaging offset FSW patchable constants.

In all visits, lamp+target images are taken before and after the TA imaging mode that is being co-aligned (the second ACQ/IMAGE of the program.)

All visits in this program are single orbit visits, this program is very similar to the C22 version (13972). Due to the change in OSM2 Home position, some NUV spectra have been re-ordered for efficiency AND some NUV cenwaves were changed to those that are known to have good stripe B

WCA spectra.

OBSERVING DESCRIPTION

The process is to perform back-to-back ACQ/IMAGES in two different modes (e.g., PSA/MIRRORB then BOA/MIRRORA). This will allow us to test the cross-calibration to ensure that all TA modes are centering the target to the same point in the aperture. Lamp+target exposures are interleaved throughout the visit to measure and verify the imaging TA AD (along-dispersion and XD (cross-dispersion) WCA-to-PSA offsets. Images will usually use the PtNe#2 (P2) lamp, as it is the primary TA lamp, but some images will use PtNe#1 (P1) to monitor the lamps in imaging mode.

Program 14452 contains a back-to-back PSA/MIRRORA & PSA/MIRRORB ACQ/Images on the target 206W3, should visit 02 of 14452 not execute, we will activate Visit 03 as a replacement.

Visit 01 of this program takes back-to-back PSA/MIRRORB & BOA/MIRRORA ACQ/Images and images (with flashes) and also takes G230L, G285M, G130M, and G140L spectra to test the WCA-to-PSA offsets.

Visit 02 of this program takes back-to-back BOA/MIRRORA & BOA/MIRRORB ACQ/Images and images (with flashes) and also takes G225M, G185M, and G160M spectra to test the WCA-to-PSA offsets. To test Ywalk, we also take G160M/1600 exposures at +/- 0.7"

Visit 02 of this program also takes a "family portrait" of all the P1/P2 MIRRORA/B WCA lamp images to track any drifting of the centroids, or changes in the lamps.

Visit 03 is an on-hold contingency visit in case, for whatever reason, visit 2 of 14452, does not execute as planned in the fall of 2016. This visit (which is not expected to be executed) would compare the PSA/MIRRORA and PSA/MIRRORB imaging WCA-to-PSA offsets and those of several important FUV cenwaves, G140L/1280, G130M/1309, & G160M/1600.

All lamp+target images now use the QESIPARMS USECURRENT and CURRENT to specifically set the lamp and current values.

See the comment of the first exposure of Visit 03 for a description of the expected count rates, exposure times, & buffer times (for the lamps).

<p>Comments: COS.sa.433964 gives S/N=40 in 2 s, we go for 21s. BT=2/3*1270 = 800 (we use 700 just to be safe) Based upon the data from 13124, we expect 3800 counts in 30s in the B-stripe. We set the lamp to the exposure time to get more counts.</p>

<p>Comments: COS.sp.744073 gives S/N=30 in the XD (per stripe) in 151 seconds, BT=2/3 * 2470 = ~1600. Normal Tagflashing is not sufficient for our WCA needs, so we go for 100s. To allow for lamp counts, we drop the BT down to 1400.</p>

<p>Comments: COS.sp.433966, BT=2/3*442=295, We use 220 just to be safe. We previously used a 30s lamp flash and got 4750 counts. We have reduced that to match the exposure time (25s). This should give us ~4000 counts, which is plenty for our purposes</p>								
12	PSA/G140L (2) WD-1657+343 /1280/3 (COS.sp.433 967)	COS/FUV, TIME-TAG, PSA	G140L 1280 A	FP-POS=3; BUFFER-TIME=40 0; FLASH=YES	QESIPARM USELA MP LINE2; QESIPARM CURR ENT MEDIUM	Sequence 1-12 Non-I nt in PSA/B & BOA/ A (01)	10 Secs (10 Secs) [==>]	[1]
<p>Comments: COS.sp.433967, BT=2/3*647<430 ET=17s, Normal TAGFLASH. In 13124, we got 71K in 30s, we need <10K to get an excellent centroid, so we are taking this exposure time down to 10s, The lamp duration is 7s (2700 counts).</p>

The ETC gives 12 seconds to reach S/N=60 with this target in the BOA/MIRRORA mode. We observed this target in 13124, with 2961 counts in 12s (target +background in 50x50 box). We will need to follow this with a P2/LOW/WCA/A image.</i></p>

This is 1 count in 10s, so we ignore this for the PSA.</i></p> <p><i>For the WCA images, we will be working a 50x300 box, so the rate here is 18 hz, but we are using a median to find the center, so it is not a straightforward S/N situation. We are interested in measuring the centroid in presence of the noise and 2500 lamp counts are sufficient for our needs for WCA/P2/LOW/B. Since, we are defining the WCA-to-PSA offset for WCA/P1/LOW/B and WCA/P2/MED/B, we will shoot for 3000 lamp counts.</i></p> <p><i>For the Buffer Time, we are shooting for S/N = 50. in both the target and the lamp.
