## **ABSTRACT**

This program uses the deuterium lamp to illuminate the regions of the detector being used to collect spectra during Cycle 24. The data obtained will be used to create gain maps of the detector. Because of the strongly varying intensity of the lamp as a function of wavelength, G130M/1309 data will be obtained for Segment A, and G160M/1600 will be used for Segment B.

Gain map data will be obtained both before and after any change is made to any nominal high voltage value on either segment, before and after any lifetime move, and at semi-regular intervals for modes which have remained at the same voltage for a long time.

Obtaining a gain map at all HV transitions will help to improve the modeling of the modal gain as a function of time and extracted charge, since it will provide data that cover the full time span of each high voltage at each LP. Improving these models will allow better predictions of the future lifetime of the detector.

## **OBSERVING DESCRIPTION**

This program will obtain spectra from the deuterium lamp with enough counts to permit the construction of a gain map covering the region where the spectra fall at the current lifetime position. In order to efficiently illuminate the two segments, the G130M/1309 setting will be used for Segment A, and G160M/1600 will be used for Segment B. Both segments can safely remain on with either setting.

Gain maps should be taken before and after any high voltage change, before and after any change in Lifetime Position, and at ~6 month and ~1 year intervals when the default HV does not change. They should be obtained at the appropriate HV levels and detector locations.

The initial plan for Cycle 24 includes 5 one-orbit visits, and three one-orbit contingency visits:

- \* Visits A1 and A2 are contingency visits which will be taken at LIFE\_ADJ=3 before and after a change to the Segment A HV for the standard observing modes or G130M/1222.
- \* Visits B1 and B2 data will be taken at LIFE\_ADJ=3 before and after a change to the Segment B HV for the standard observing modes.
- \* Visit C1 data will be taken at LIFE\_ADJ=3 either before a change to the G130M/1222 Segment A HV, or after about a year from the Cycle 23

Proposal 14519 (STScI Edit Number: 4, Created: Wednesday, January 11, 2017 9:05:17 PM EST) - Overview

deuterium exposure taken with the 1222 HV values (14439 C1 on 1/17/16).

\*Visits D1 and D2 will be taken at LIFE\_ADJ=2 either before a change to the Blue Modes (G130M/1055 & 1096) Segment A HV, or after about 6 months and 1 year from the Cycle 23 gain map at this position (14439 D1 on 4/25/16)

\*Visit D3 is a contingency visit at LIFE\_ADJ=2 which will only be needed if the Blue Mode Segment A HV is changed and D1 and D2 have already been executed.

If the standard HV on Segment B changes more than once during Cycle 24, additional contingency orbits will be needed.

The procedure for collecting this data in each visit is:

\* Adjust the HV values if necessary.

\* Adjust the aperture in the cross dispersion direction so that the deuterium lamp will illuminate the appropriate region on Segment A when using G130M/1309.

\* Take a 400 second deuterium lamp exposure using both detector segments.

\* Adjust the aperture to a second cross-dispersion location to obtain additional coverage on Segment A and take another 400 second deuterium lamp exposure.

\* Adjust the aperture in the cross dispersion direction so that the deuterium lamp will illuminate the appropriate region on Segment B when using G160M/1600.

\* Take a 400 second deuterium lamp exposure using both detector segments.

\* Adjust the aperture to a second cross-dispersion location to obtain additional coverage on Segment B and take another 400 second deuterium lamp

exposure.

\*Return the HV values to the nominal values for the standard modes, if necessary.

Note that because TRANS resets its aperture zero point when FCA exposures are taken, the aperture is explicitly moved using "QESIPARM XSTEPS", as was done in Program 13970, 14439, etc.

For reference, the soft and hard stops for the apertures are listed below. All aperture moves should be kept within these ranges.

MEB1:

SOFT STOPS = -275 to 275

HARD STOPS = -282 to 285

MEB2:

SOFT STOPS = -275 to 275

HARD STOPS = -284 to 283

Summary table:

| Visit    | LP | Grating/Segment | Y Position | LAPXSTP | XAPER |
|----------|----|-----------------|------------|---------|-------|
| D1,D2    | 2  | G130M/A         | 1          | -213    | -395  |
| D1,D2    | 2  | G130M/A         | 2          | -267*   | -449  |
| D1,D2    | 2  | G160M/B         | 1          | -225    | -407  |
| D1,D2    | 2  | G160M/B         | 2          | -267*   | -449  |
| B1,B2,C1 | 3  | G130M/A         | 1          | -72     | -254  |

Proposal 14519 (STScI Edit Number: 4, Created: Wednesday, January 11, 2017 9:05:17 PM EST) - Overview

|          |   |         |   |      |      |
|----------|---|---------|---|------|------|
| B1,B2,C1 | 3 | G130M/A | 2 | -128 | -310 |
