ABSTRACT

This program obtains COS FUV PtNe lamp template data at LP6 for the wavelength calibration of LP6 data. Dispersion coefficients vary with absolute focus position, which is different for different lifetime positions. Because lamp template reference files in use at other lifetime positions (LP1, LP3, LP4, LP5) have different disperson solutions than what will be observed at LP6, we must create new lamp template reference files using PtNe spectra observed at the LP6 WCA location using LP6 focus values.

OBSERVING DESCRIPTION

First, a long (1800 s) lamp exposure is used to wait for the OSM to settle before lamp template data are taken. The PtNe wavecal lamp is regularly flashed during this long exposure (30 seconds ON, 90 seconds OFF), using special engineering mode flash durations. These data will be used to understand the OSM drift in the time period before the lamp template data are taken.

Observations are being taken using the G160M grating at cenwaves 1533, 1577, 1589, 1600, 1611, and 1623, each at all 4 FP-POS. Each exposure is 210 s long, during which the PtNe lamp is flashed ON for 30 seconds, then OFF for 30 seconds, resulting in a cumulative lamp ON time of 120 s over the 210 s exposure. The ON/OFF cycling is done to ensure that the lamp does not get too hot, which could reduce its lifetime.

The buffer time is set at 210 seconds in order to maximize the time between successive exposures (buffer-time=exposure time, so the full data buffer will be read out). This is done to enable cooling of the PtNe lamp between exposures, since the lamp is ON for both the first and last 30 s of every 210 s exposure.

All exposures are completed in a single visit that consists of 2 internal orbits.

The structure of this program is based on programs 11488 (SMOV LP1 lamp templates), 14856 (LP3 lamp templates), 15369 (LP4 lamp templates), and 16469 (LP5 lamp templates).
