

WEEKLY WEATHER AND CROP BULLETIN

U.S. DEPARTMENT OF COMMERCE
National Oceanic and Atmospheric Administration
National Weather Service

U.S. DEPARTMENT OF AGRICULTURE
National Agricultural Statistics Service
and World Agricultural Outlook Board

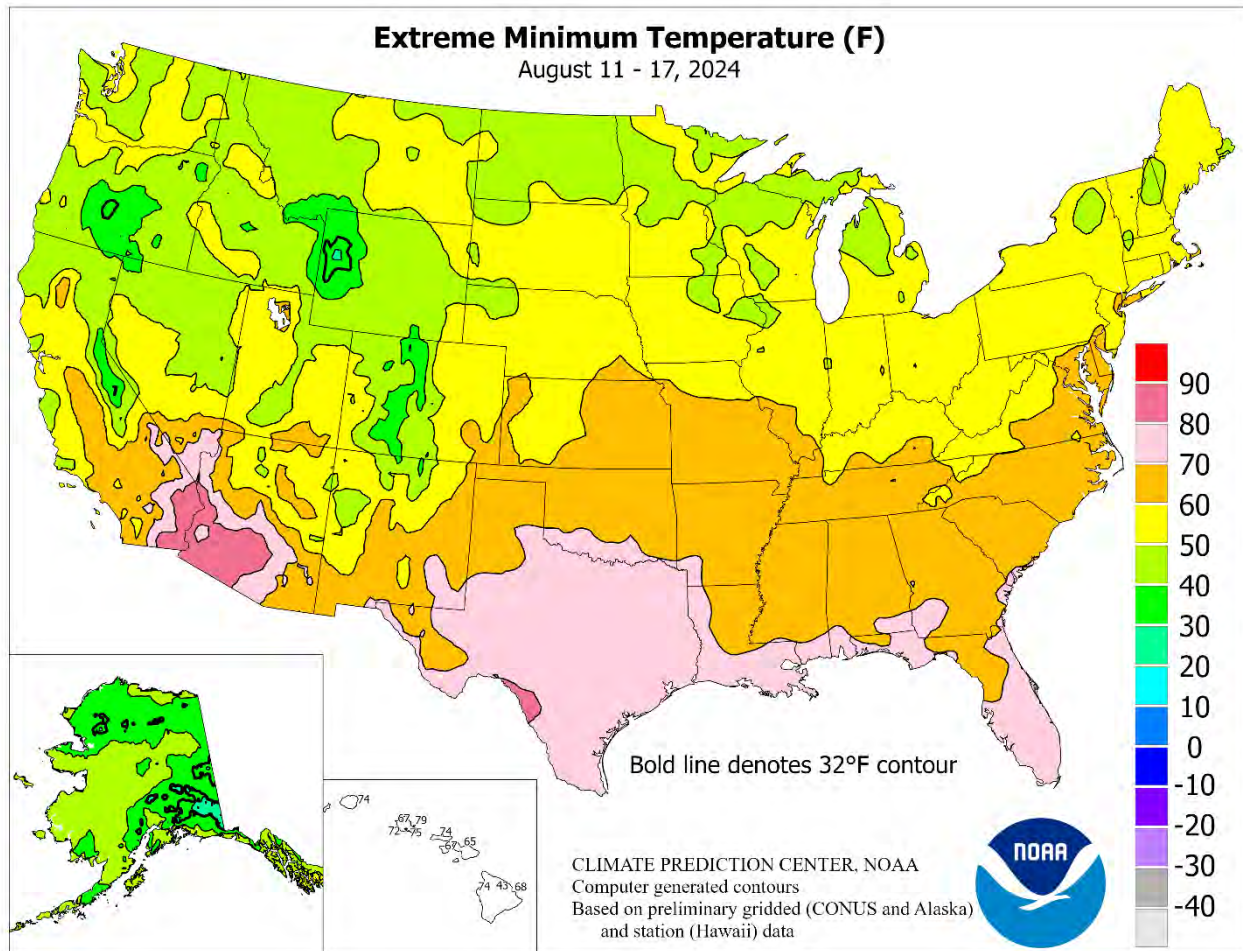

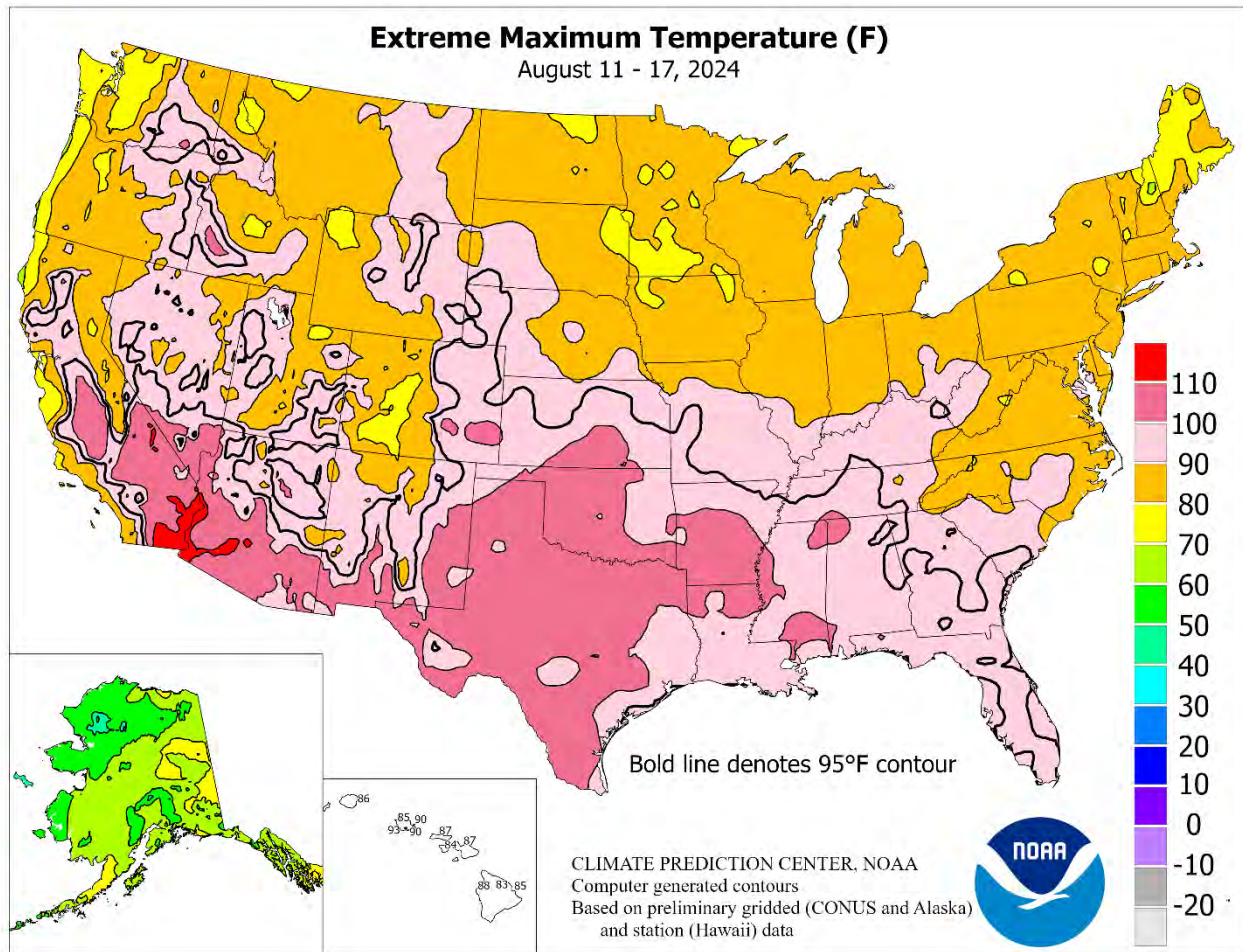

HIGHLIGHTS August 11 – 17, 2024

Highlights provided by USDA/WAOB

Streaks of **Midwestern** rain, mainly during the second half of the week, provided much-needed moisture for filling summer crops. The **Corn Belt**, parts of which had been trending dry in recent weeks, also benefited from another week of mild weather, with temperatures remaining well below stressful levels for corn and soybeans. Locally heavy showers extended to other regions, including the **Plains, East, and Southwest**. Despite isolated reports of flash flooding and severe weather, including large hail and high winds, most immature crops benefited from the late-

(Continued from front cover)

summer thunderstorms. However, there was a sharp cutoff between local downpours in **Oklahoma** and hot, dry weather in **Texas** and environs. Elsewhere, cooler conditions prevailed in much of the **West**, although dry weather persisted across **California** and the **Great Basin**. At week's end, showers associated with a cold front overspread the **Pacific Northwest**, boosting topsoil moisture and aiding wildfire containment efforts. Still, more than 50 active **Western** wildfires were in various stages of containment, with those fires accounting for 2.2 of 5.4 million year-to-date burned acres across the country. With much of the **western U.S.** getting a reprieve from elevated temperatures, weekly readings averaged as much as 5°F below normal in scattered locations across the **Pacific Northwest**. Similar temperatures (up to 5°F below normal) affected the **western Corn Belt**. In contrast, broiling temperatures returned across the **south-central U.S.**, with weekly readings averaging at least 5°F above normal in much of **southern New Mexico**, **southwestern Oklahoma**, and the **northwestern half of Texas**.

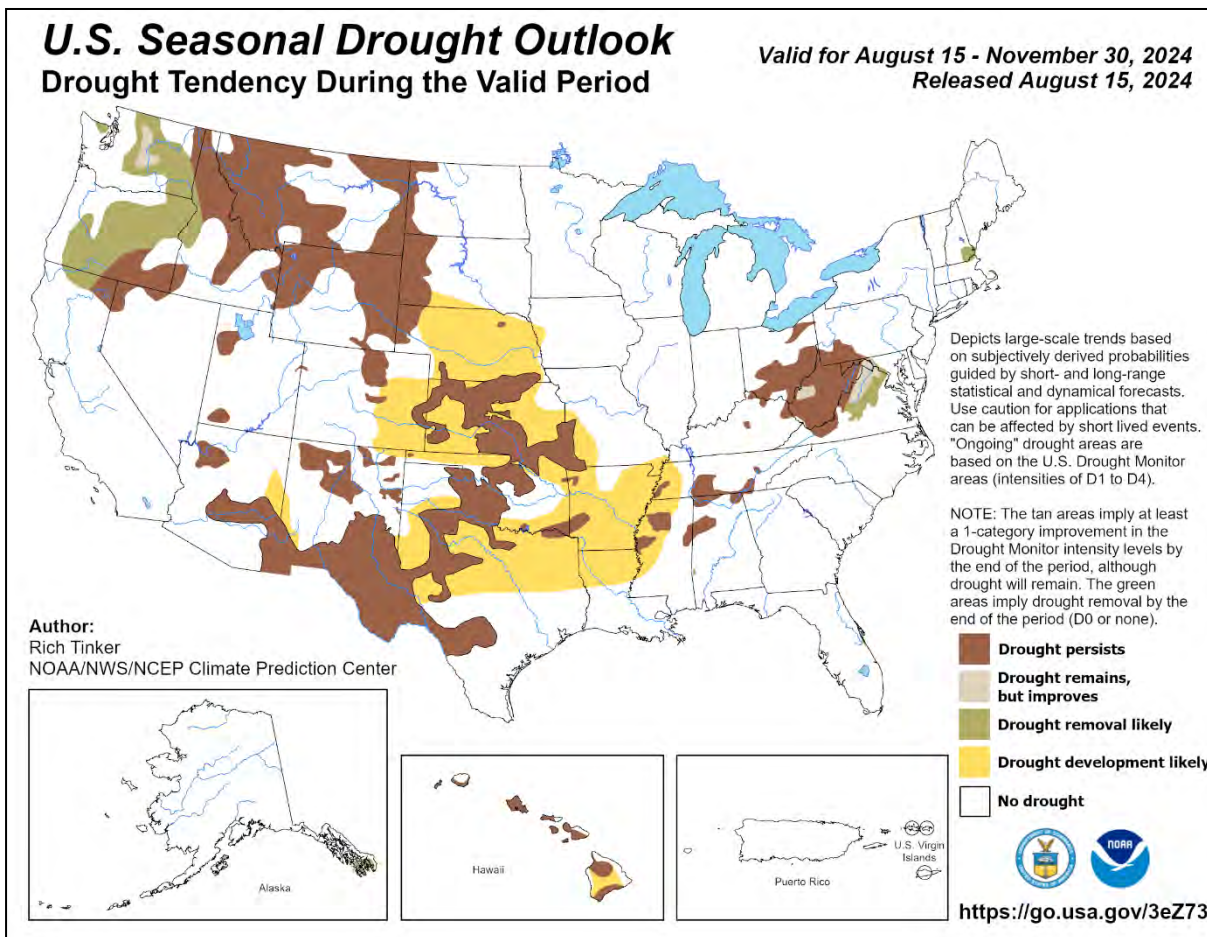

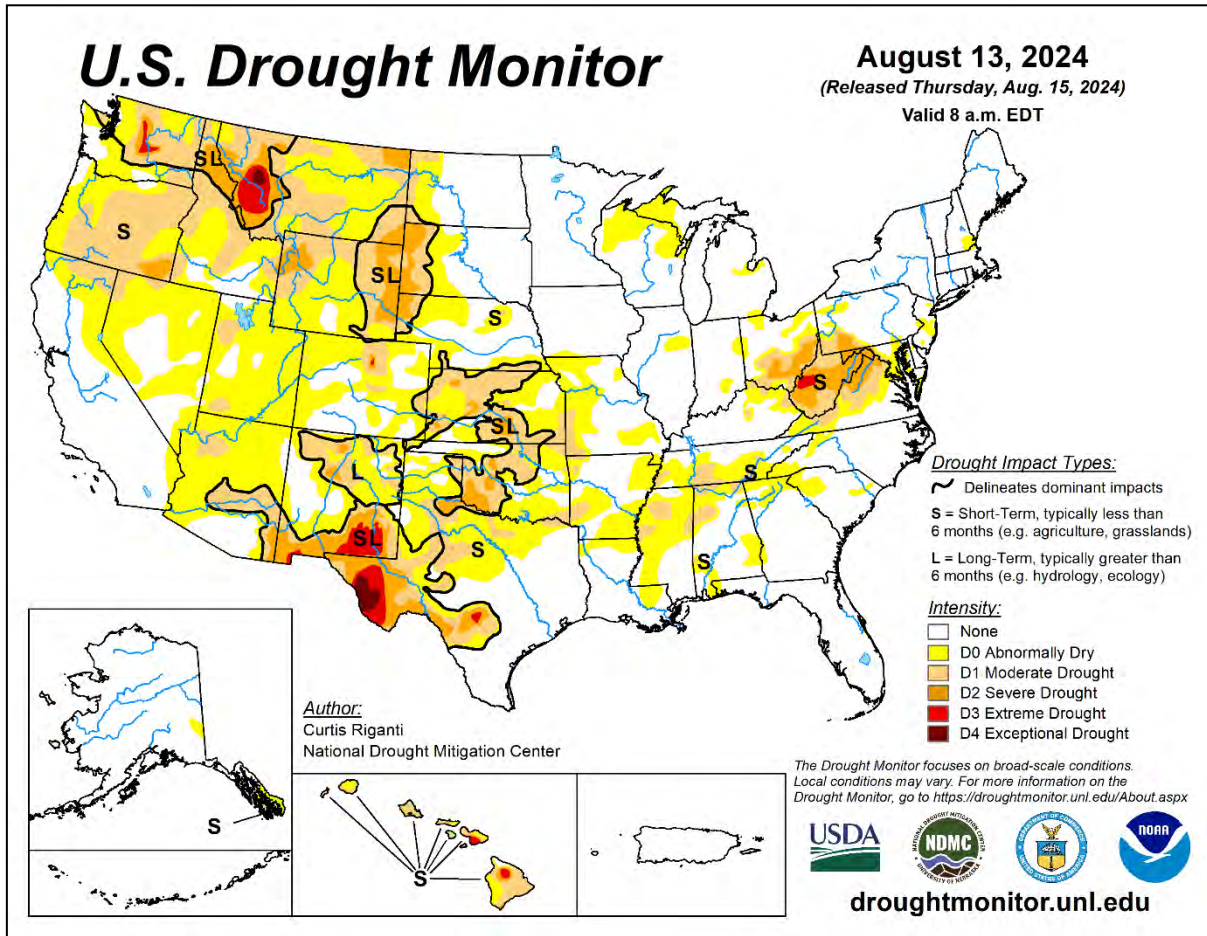

Cool weather was already in place across the **Midwest** as the week began, when **Dubuque, IA**, posted a daily-record low of 48°F on August 11. In contrast, heat persisted across the **Deep South**. In **Florida**, for example, record-setting highs for August 13 included 98°F in **Apalachicola** and 97°F in **Punta Gorda**. With a high of 99°F, **Apalachicola** set another record on August 14. Elsewhere near the **Gulf Coast** on the 14th, daily-record highs soared to 101°F in **Mobile, AL**, and 98°F in **Gulfport, MS**. High temperatures in **Gulfport** reached exactly 100°F on August 2, 6, 7, and 18. Until August 2023, when there were 7 days of triple-digit heat, the total of 4 days with highs of 100°F or greater would have tied **Gulfport's** August record, set in 1924 and 2010. Meanwhile in **southern Florida**, record-setting highs for August 15 rose to 98°F in **Miami** and 96°F in **Key West**. **Miami's** reading also tied a monthly record, most recently attained on August 1, 1990. The only time **Miami's** temperature topped 98°F was July 21, 1942, when a reading of 100°F occurred. Late in the week, heat persisted in the **Deep South** and intensified in **Texas**. On August 16-17, **Baton Rouge, LA**, collected consecutive daily-record highs (99 and 100°F, respectively). **El Paso, TX**, also closed with week with consecutive daily-record highs, reaching 105°F on both August 16 and 17. Elsewhere in **Texas**, record-setting highs for August 16 climbed to 107°F in **Childress** and 106°F in **Borger**. In **Abilene, TX**, where rainfall during the 67-day period from June 12 – August 17 totaled just 0.20 inch, temperatures have reached 100°F or higher each day during August, except the 9th. **Del Rio, TX**, last remained below the 100-degree mark on July 27.

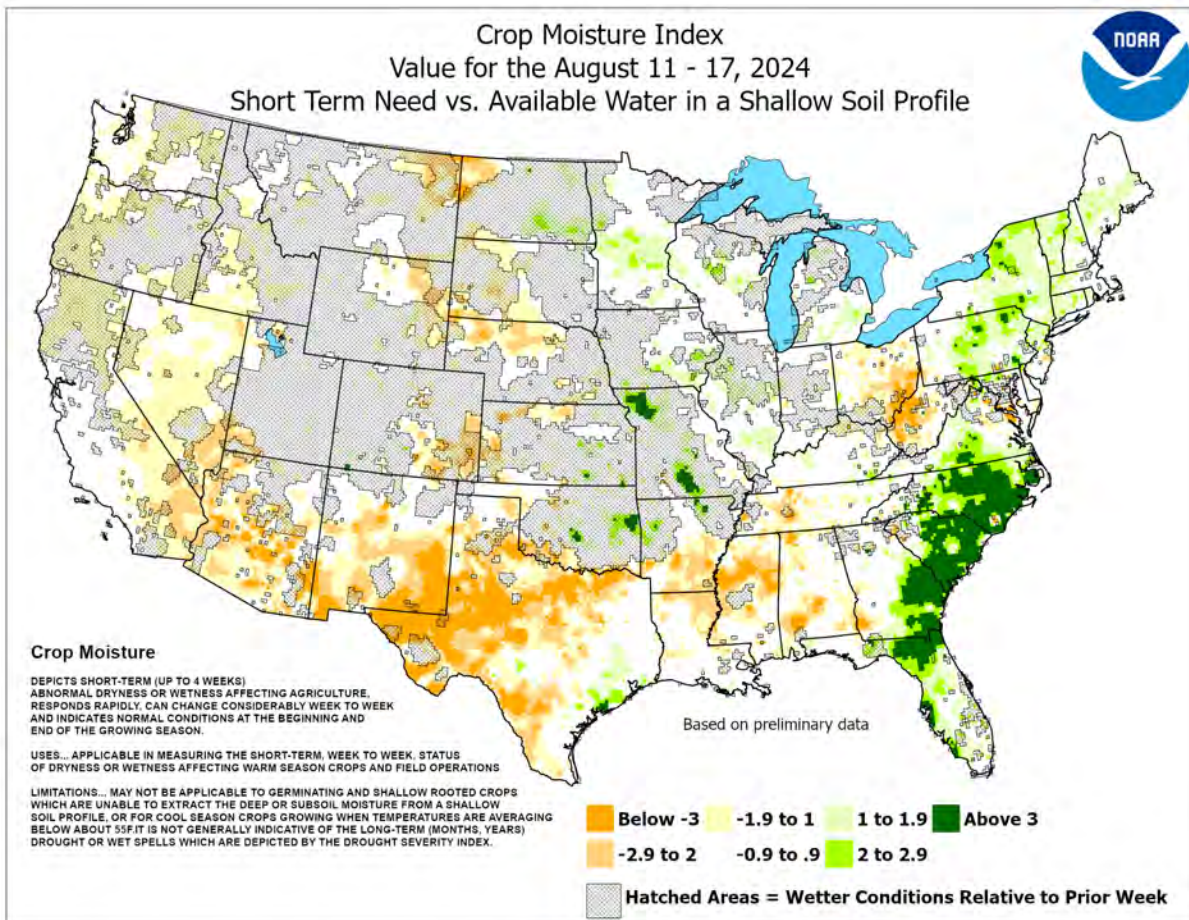

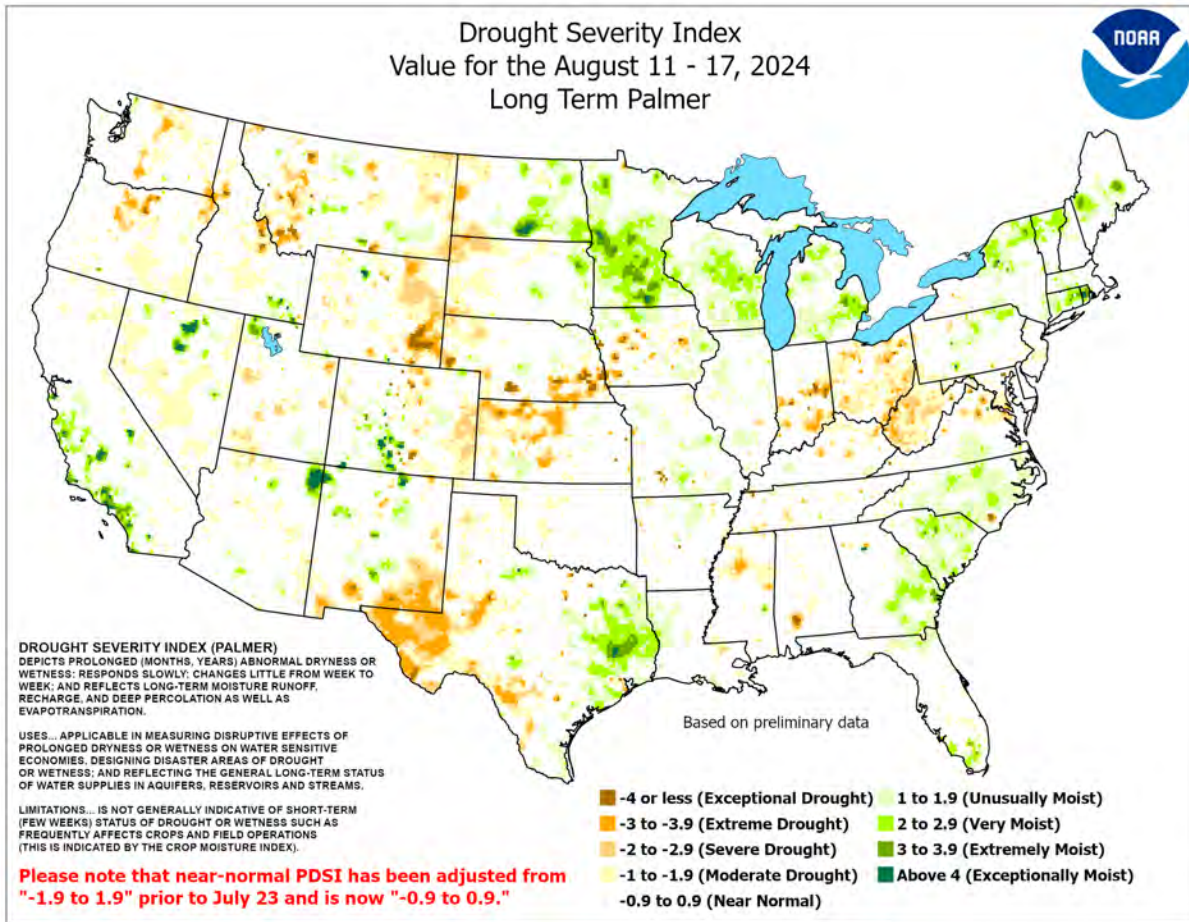

As the week began, downpours dotted the **central Plains** and neighboring areas. **Oklahoma City, OK**, experienced its wettest August day on record, with a 6.59-inch sum on the 11th; previously, the record had been 5.06 inches on August 14, 2018. Elsewhere in **Oklahoma**, August 11-12 rainfall totals included 6.60 inches in **Muskogee**; 4.41 inches in **Jenks**, south of **Tulsa**; and 3.53 inches in **McAlester**. Isolated downpours also occurred across **Florida's** peninsula, where **Sarasota-Bradenton** netted a daily-record sum (3.00 inches) for August 11. A few days later, monsoon-related showers were generally heaviest in **Utah**, where 72-hour totals (from August 11-14) at the **Hans Flat Ranger Station** in The Maze section

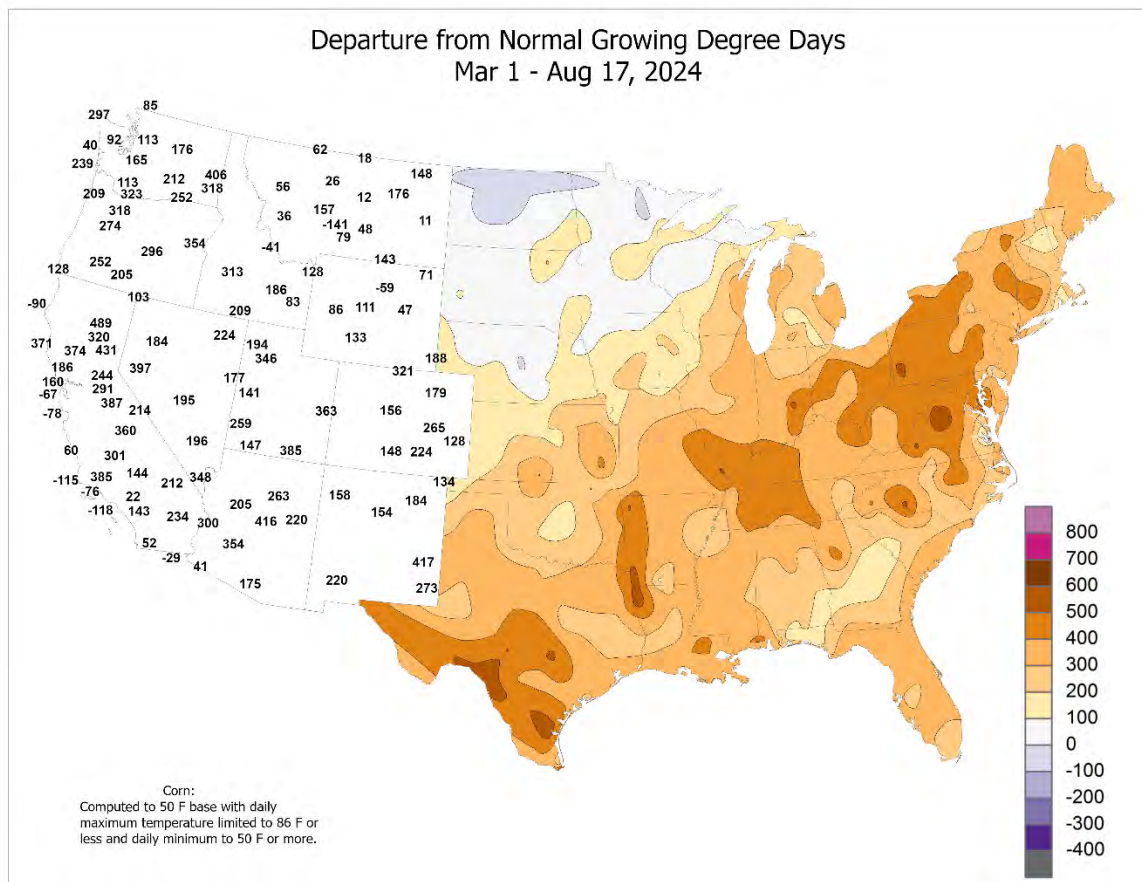

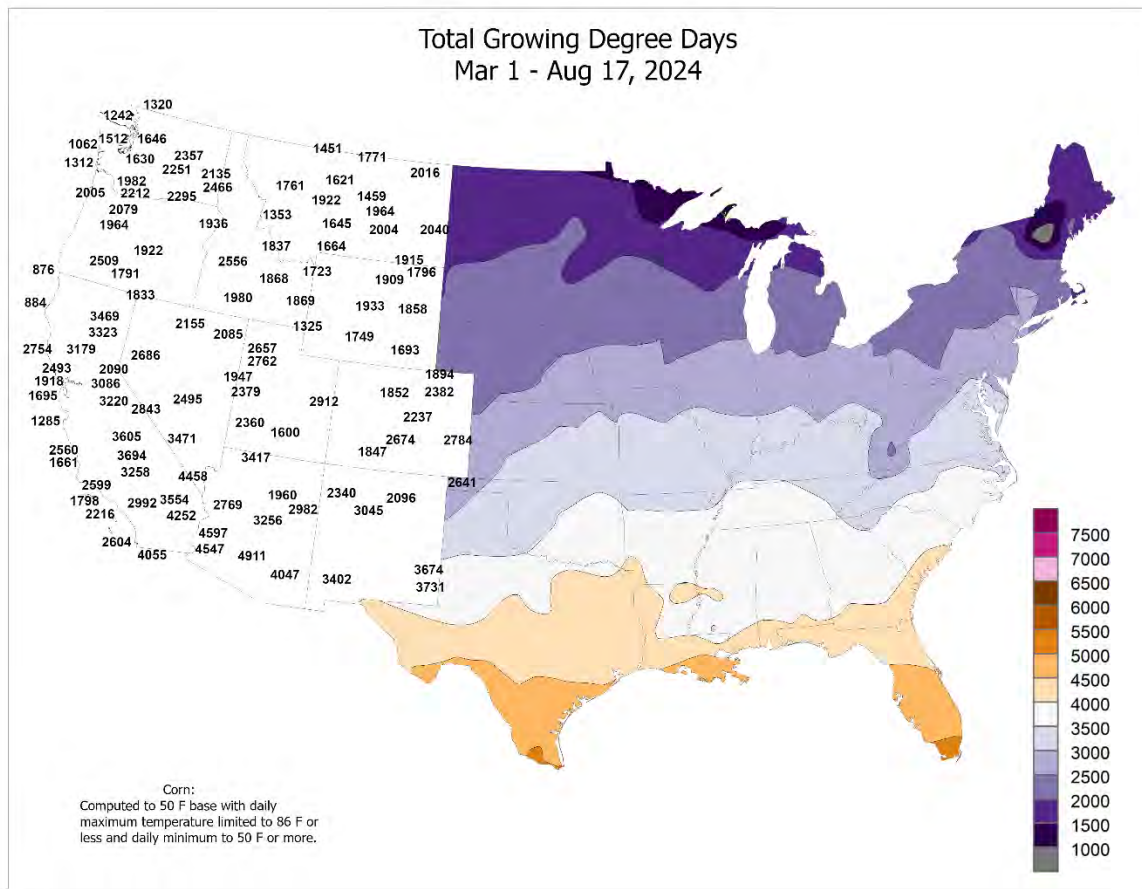

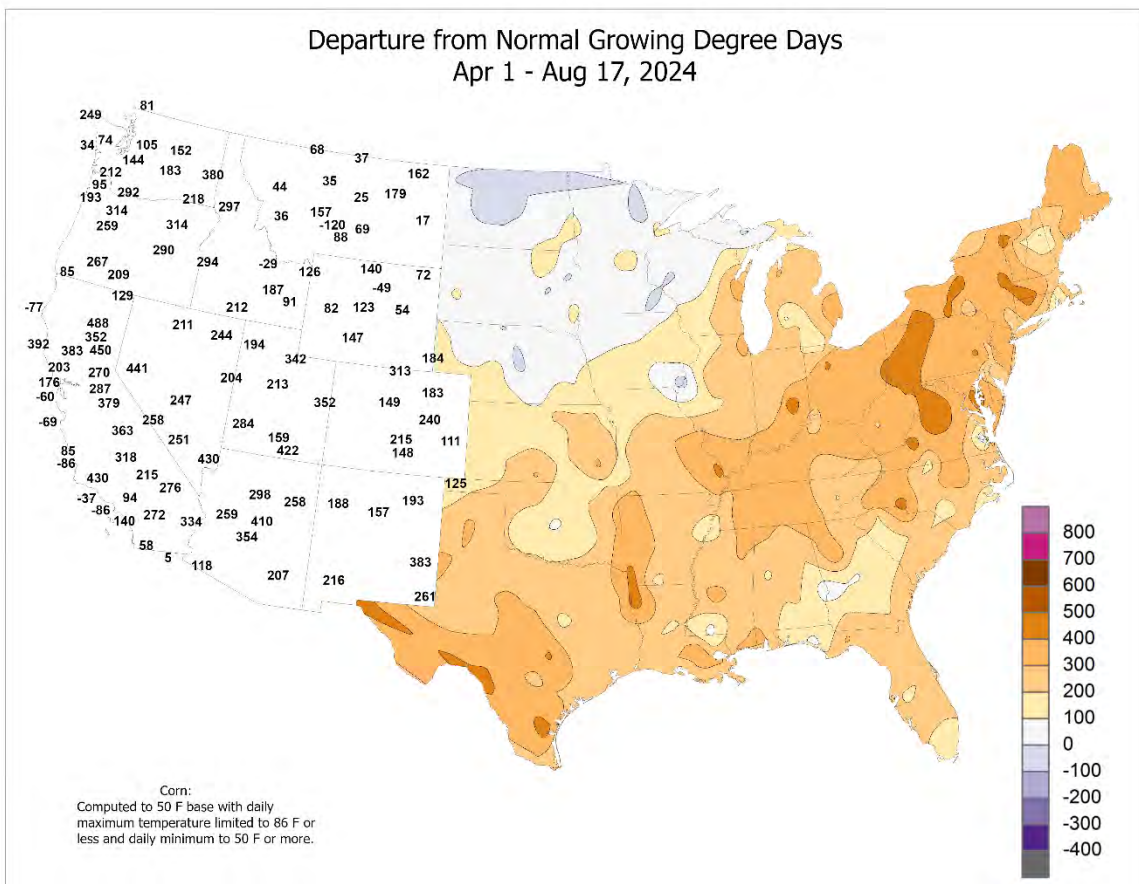

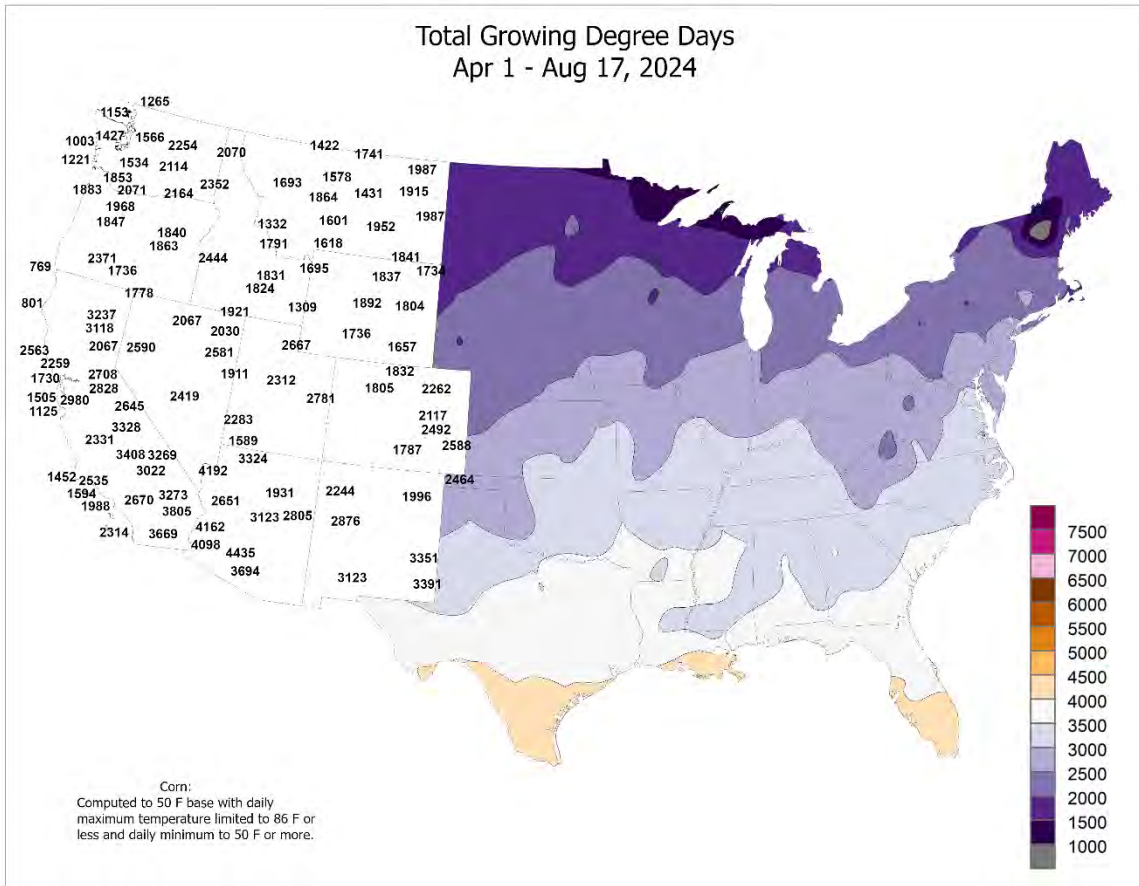

of **Canyonlands National Park** reached 2.82 inches. By the middle of the week, thunderstorms overspread portions of the **Plains** and **Midwest**, with daily-record totals for August 14 being set in **Aberdeen, SD** (2.87 inches), and **West Plains, MO** (2.44 inches). **West Plains** went on to measure another daily record (2.47 inches) on August 16, lifting the weekly sum to 6.54 inches. Meanwhile, daily-record amounts across the **North** included 1.65 inches (on August 15) in **Grand Forks, ND**, and 2.10 inches (on August 16) in **Marquette, MI**. Elsewhere on the 16th, **London, KY**, also netted a daily-record sum (1.82 inches). **Outside the contiguous U.S.**, Tropical Storm Ernesto passed over the **U.S. Virgin Islands (USVI)** late August 13 while packing sustained winds near 65 mph. That evening, wind gusts were clocked to 70 mph at **King Airport on St. Thomas** and 65 mph at **Rohlson Airport on St. Croix**. In neighboring **Puerto Rico**, a gust to 74 mph was recorded early on the 14th at former **Roosevelt Roads Naval Station**. Storm-total rainfall broadly reached 4 to 8 inches or more across both **Puerto Rico** and the **USVI**, while some storm-surge flooding was reported on south-facing shores, especially in the latter territory. At week's end, precipitation overspread the **Pacific Northwest**. Record-setting rainfall totals for August 17 included 0.58 inch in **Olympia, WA**, and 0.50 inch in **Hillsboro, OR**.

Much of **Alaska** experienced another very wet week, while near- or above-normal temperatures were confined to **eastern and northern sections of the state**. Daily-record totals were observed in several **Alaskan** locations, including **St. Paul Island** (1.17 inches on August 14) and **McGrath** (0.90 inch on August 15). Through August 17, month-to-date precipitation ranged from 200 to 300 percent of normal in locations such as **Bethel** (4.00 inches), **Anchorage** (3.72 inches), and **Kotzebue** (3.46 inches). With an August 1-17 total of 5.63 inches, **Nome's** total was 306 percent of normal. In contrast, month-to-date amounts in **southeastern Alaska** were as low as 0.02 inch (less than one-half of one percent of normal) in **Ketchikan** and 0.31 inch (10 percent) in **Juneau**. The driest August on record in **Juneau** occurred in 1979, when 0.56 inch fell. Farther south, **Hawaii's** dry summer continued. With 2 weeks left in meteorological summer, June 1 – August 17 rainfall at the state's major airport observation sites ranged from 0.11 inch (8 percent of normal) in **Honolulu, Oahu**, to 11.64 inches (51 percent) in **Hilo**, on the **Big Island**.

National Agricultural Summary

August 12 – 18, 2024

Weekly National Agricultural Summary provided by USDA/NASS

HIGHLIGHTS

Much of the Eastern Seaboard, Deep South, and Southwest were drier than normal, while parts of the Midwest, Mississippi Valley, Pacific Northwest, Great Plains, and Rockies recorded at least twice the normal amount of weekly precipitation. Some locations in Missouri and Oklahoma recorded at least 6 inches of rain during the week. Meanwhile, most of the southern half of the nation was warmer than normal during the week, with parts of

New Mexico, Oklahoma, and Texas recording temperatures 6°F or more above normal. In contrast, most of the mid-Atlantic, as well as large parts of the Midwest, coastal New England, Ohio Valley, Pacific Northwest, central and northern Plains, and Rockies, were cooler than normal. A few locations in northern California, the Dakotas, and Oregon recorded weekly temperatures 4°F or more below normal.

Corn: By August 18, ninety-seven percent of the nation's corn acreage had reached the silking stage, 1 percentage point behind both last year and the 5-year average. Seventy-four percent of the corn acreage was at or beyond the dough stage, equal to last year but 3 percentage points ahead of average. During the week, corn dough progress advanced by 10 percentage points or more in 14 of the 18 estimating states. By August 18, thirty percent of this year's corn acreage was denting, equal to last year but 4 percentage points ahead of average. Five percent of the nation's corn acreage was mature by August 18, two percentage points ahead of both last year and the average. On August 18, sixty-seven percent of the nation's corn acreage was rated in good to excellent condition, unchanged from the previous week but 9 percentage points above the previous year. In Iowa, the largest corn-producing state, 77 percent of the corn crop was rated in good to excellent condition.

Soybeans: By August 18, ninety-five percent of the nation's soybean acreage had reached the blooming stage, equal to both last year and the 5-year average. Nationally, 81 percent of the soybean acreage had begun setting pods, 3 percentage points behind last year but 1 point ahead of average. On August 18, sixty-eight percent of the nation's soybean acreage was rated in good to excellent condition, equal to the previous week but 9 percentage points above the previous year.

Winter Wheat: Ninety-six percent of the 2024 winter wheat acreage had been harvested by August 18, one percentage point ahead of both last year and the 5-year average. Winter wheat harvest progress was complete or nearing completion in all estimating states except Idaho, Montana, Oregon, and Washington.

Cotton: By August 18, eighty-four percent of the nation's cotton acreage had begun setting bolls, 6 percentage points ahead of last year and 3 points ahead of the 5-year average. Nineteen percent of the nation's cotton had open bolls, 2 percentage points ahead of both last year and the average. On August 18, forty-two percent of the 2024 cotton acreage was rated in good to excellent condition, 4 percentage points below the previous week but 9 points above the previous year.

Sorghum: By August 18, eighty-three percent of the nation's sorghum acreage had reached the headed stage, 5 percentage points ahead of last year and 3 points ahead of the 5-year average. Sorghum headed progress advanced by 23 percentage points during the week

in South Dakota. Thirty-nine percent of the nation's sorghum acreage was at or beyond the coloring stage by August 18, three percentage points ahead of last year and 4 points ahead of average. Nineteen percent of the nation's sorghum acreage was mature, 1 percentage point ahead of last year but equal to the average. Forty-nine percent of the nation's sorghum acreage was rated in good to excellent condition on August 18, two percentage points below both the previous week and the previous year.

Rice: By August 18, ninety-four percent of the nation's rice acreage had reached the headed stage, 2 percentage points ahead of the previous year and 5 points ahead of the 5-year average. Nationally, 21 percent of the rice acreage was harvested by August 18, four percentage points ahead of last year and 8 points ahead of average. On August 18, seventy-nine percent of the nation's rice acreage was rated in good to excellent condition, equal to the previous week but 11 percentage points above the previous year.

Small Grains: Sixty-seven percent of the nation's oat acreage had been harvested by August 18, equal to last year but 3 percentage points behind the 5-year average. Oat harvest progress advanced 12 percentage points or more during the week in Minnesota, North Dakota, Pennsylvania, and Wisconsin.

By August 18, producers had harvested 30 percent of the nation's barley crop, 13 percentage points behind both last year and the 5-year average. Barley harvest progress advanced by 18 percentage points or more during the week in four of the five estimating states. On August 18, sixty-nine percent of the nation's barley acreage was rated in good to excellent condition, equal to the previous week but 20 percentage points above the same time last year.

By August 18, thirty-one percent of the nation's spring wheat had been harvested, 4 percentage points behind the previous year and 5 points behind the 5-year average. Spring wheat harvest progress advanced by 16 percentage points or more during the week in four of the six estimating states. On August 18, seventy-three percent of the nation's spring wheat was rated in good to excellent condition, 1 percentage point above the previous week and 35 points above the previous year.

Other Crops: On August 18, sixty-eight percent of the nation's peanut acreage was rated in good to excellent condition, equal to the previous week but 1 percentage point above the same time last year.

International Weather and Crop Summary

August 11-17, 2024

International Weather and Crop Highlights and Summaries provided by USDA/WAOB

HIGHLIGHTS

EUROPE: An expanding heat wave across southern Europe further lowered yield prospects for late-filling summer crops and exacerbated drought in southeastern growing areas.

WESTERN FSU: Dry but cool weather sustained drought concerns and summer crop yield losses in southern portions of the region.

EASTERN FSU: Continued unseasonably wet weather over the spring grain belt gave way to sunny and hot conditions over cotton areas farther south.

MIDDLE EAST: Dry and hot weather in Turkey promoted summer crop maturation and drydown.

SOUTH ASIA: Monsoon showers continued to maintain or improve moisture conditions for kharif crops in India.

EAST ASIA: Wet weather in southern China broke a recent heat wave, while seasonable showers benefited summer crops in the north and northeast.

SOUTHEAST ASIA: Seasonably wet weather across the region continued to benefit rice and other crops.

AUSTRALIA: Rain in the east helped maintain good to excellent yield prospects for wheat and other winter crops.

ARGENTINA: Cool, dry weather prompted slow vegetative growth of winter grains.

BRAZIL: Sunny albeit cool weather overspread southern wheat areas, although freezes were confined to outlying production areas.

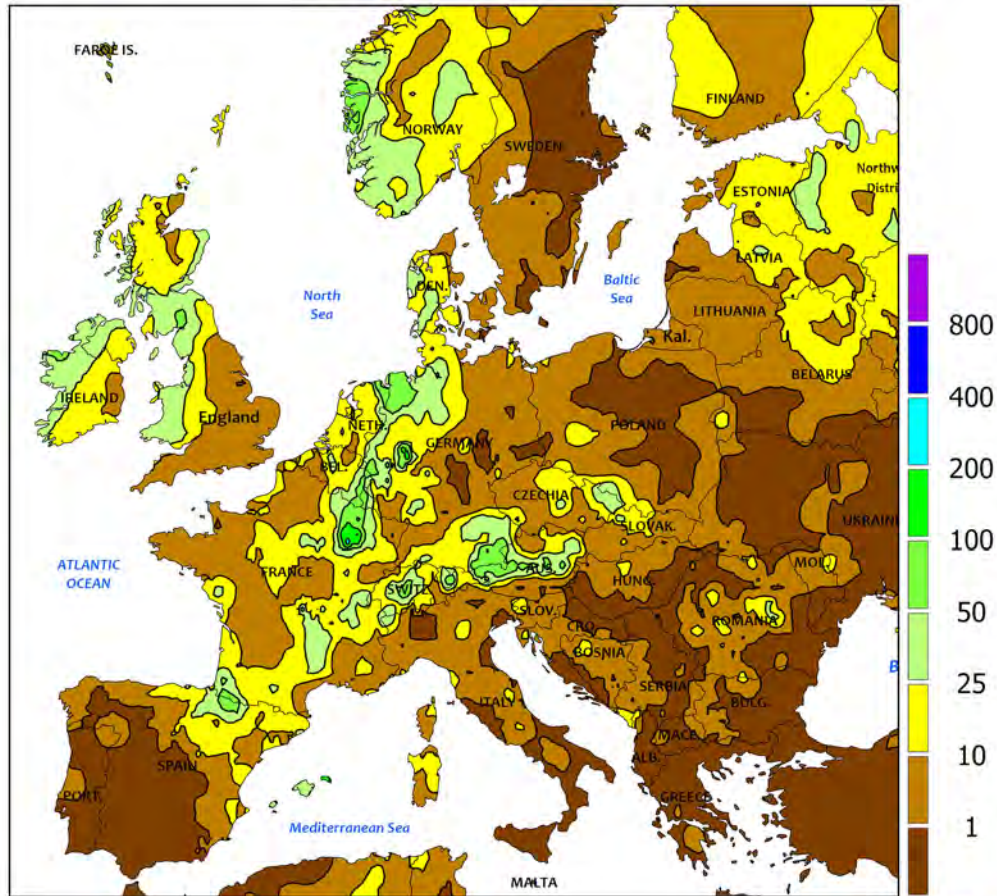

MEXICO: Beneficial showers continued throughout key southern and northwestern farming areas.

CANADIAN PRAIRIES: Light showers benefited immature spring crops, although early-planted crops were already maturing.

SOUTHEASTERN CANADA: Warm, showery weather maintained overall favorable conditions for summer crops and pastures.

EUROPE
Total Precipitation(mm)
August 11 - 17, 2024

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

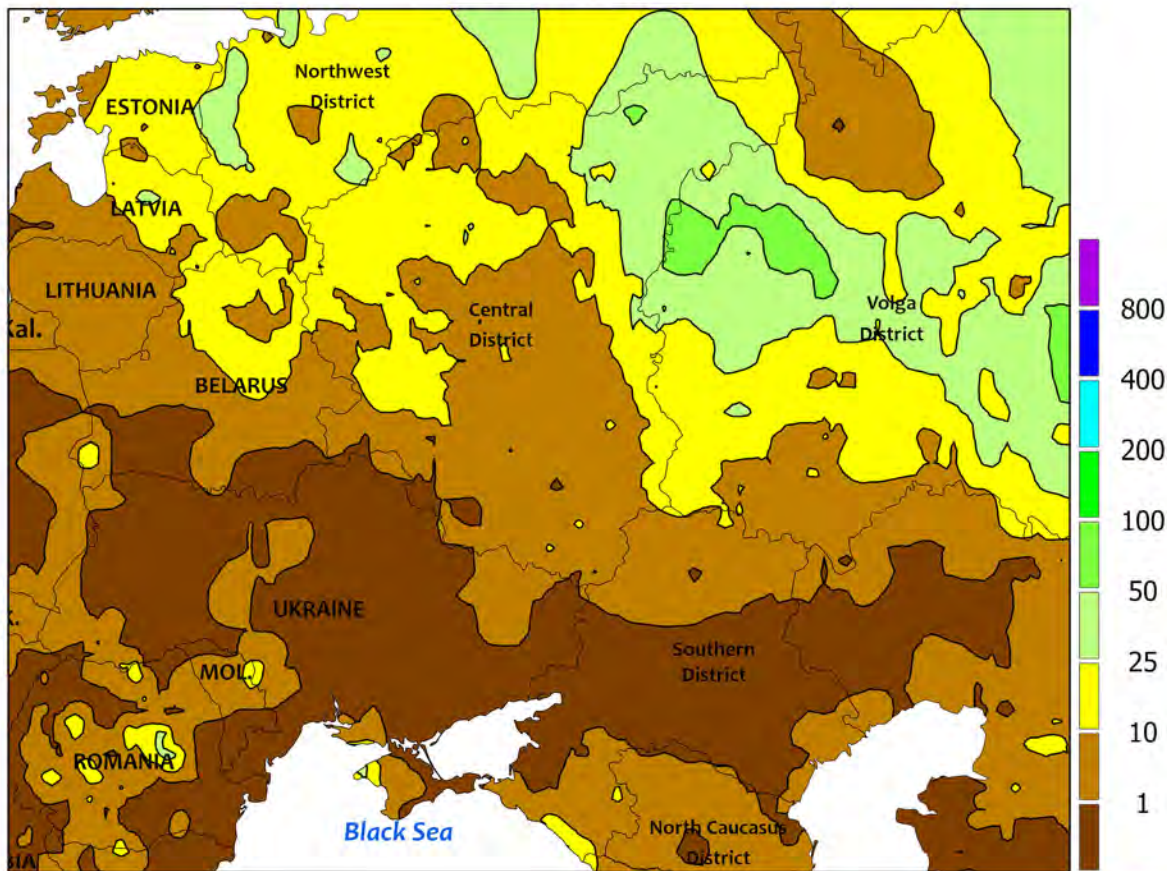

EUROPE

An intensifying heat wave shifted eastward across southern Europe, exacerbating southeastern drought and further lowering yield prospects for late-filling summer crops. Early-week heat in Spain (38-41°C) and southwestern France (35-39°C) lowered yield prospects for filling corn, sunflowers, and soybeans. A cold front brought cooler temperatures to these croplands during the latter half of the monitoring period, though rain associated with the front (5-50 mm) was limited to France and northeastern Spain. Similar heat (upper 30s degrees C) was slower to abate in Italy, where abnormal warmth for much of the week (up to 5°C above normal) hastened summer crops toward maturity. For the second time

this summer, an intense heat wave in southeastern Europe (38-41°C) further lowered yield prospects for late-filling summer crops and exacerbated drought and soil moisture losses for upcoming winter crop planting. Many primary croplands of southeastern Europe have reported locally less than 25 percent-of-normal rainfall over the past 60 days. Similar heat and drought in Greece hastened cotton toward maturity up to three weeks ahead of normal. Likewise, above-normal temperatures (2-5°C above normal) from Germany eastward stressed filling summer crops, though most of these more northern growing areas have received near- to above-normal rainfall for much of the summer.

WESTERN FSU
Total Precipitation(mm)
August 11 - 17, 2024

Data availability may be affected by the current geopolitical situation in Ukraine

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

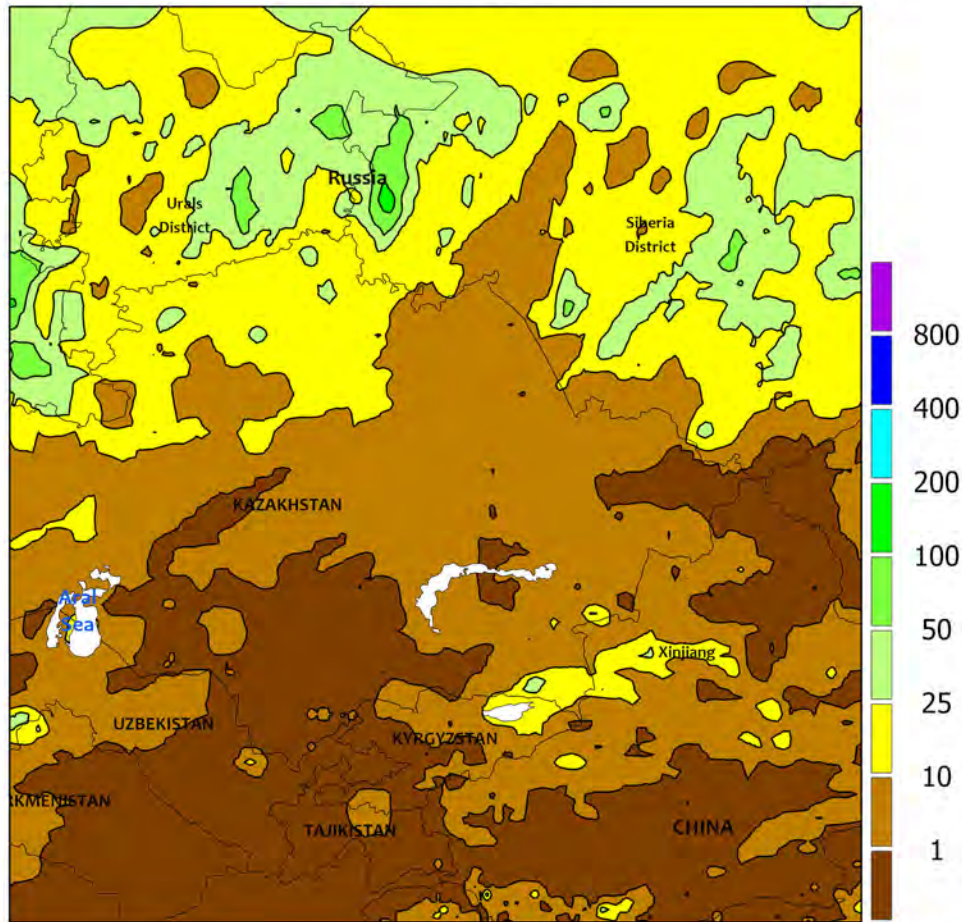

WESTERN FSU

Dry but cool weather prevailed, favoring filling summer crops in the north but maintaining or worsening drought across the southern half of the region. Measurable rainfall (5-25 mm, locally more) was mostly confined to northern portions of Russia and Belarus, sustaining adequate to abundant moisture supplies for filling spring grains and summer crops. Meanwhile, mostly dry weather exacerbated drought across Ukraine and southwestern Russia, with many of these

croplands reporting less than 50 percent of normal rainfall over the past 60 days. While corn, sunflowers, and soybeans were approaching or at maturity in the south, soil moisture was severely limited for upcoming winter crop planting and establishment. Temperatures during the monitoring period averaged near normal in Ukraine and up to 5°C below normal in west-central Russia, though heat (upper 30s degrees C) was encroaching from eastern Europe at week's end.

EASTERN FSU
Total Precipitation(mm)
August 11 - 17, 2024

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

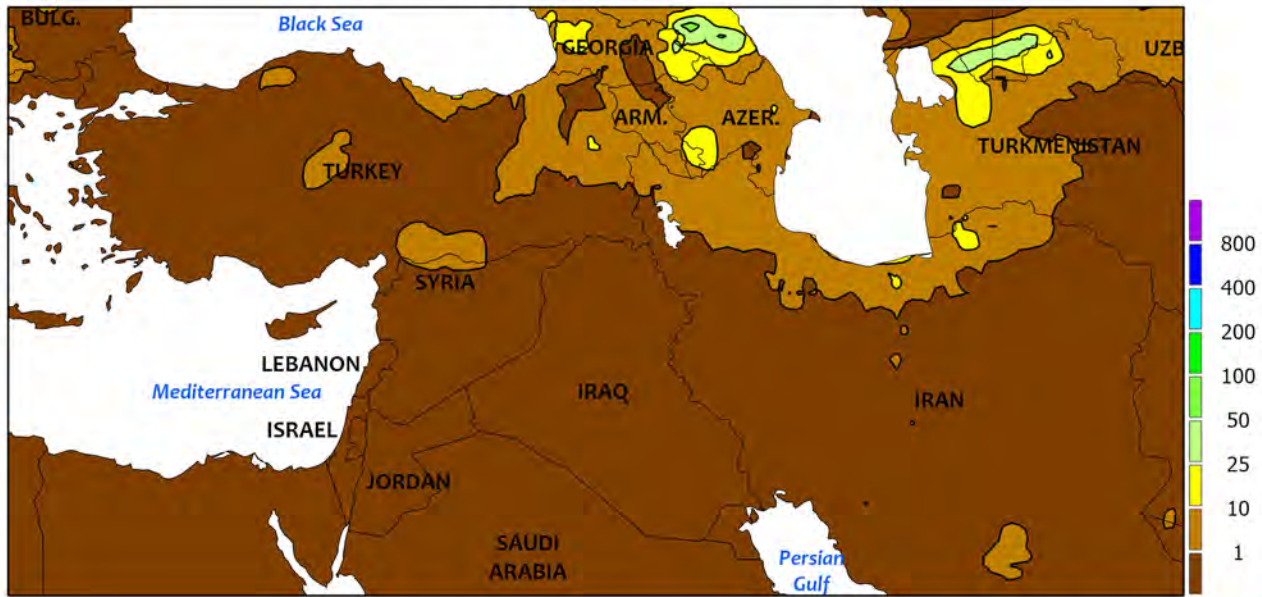

EASTERN FSU

Unseasonable wetness in the spring grain belt contrasted with sunny and hot weather over cotton areas in the south. Widespread showers and thunderstorms (10-70 mm) persisted across northern Kazakhstan and central Russia. The wet weather has been virtually unrelenting during the current growing campaign; since May 1, rainfall in northern Kazakhstan's top 3 spring grain oblasts has exceeded 200 percent of normal and has been the highest of the past 30 years by far. Concerns have mounted in recent weeks regarding grain quality and potential yield losses due to the persistent excessive wetness, and producers need drier weather to realize the current

overall favorable yield prospects. The cloudy, showery weather was accompanied by temperatures up to 4°C below normal in western and central spring grain areas, while late-season warmth (2-4°C above normal) accelerated spring wheat maturation in Russia's Siberia District. Farther south across the Commonwealth of Independent States (CIS), seasonably dry but hot conditions (40-45°C) favored the development of open boll to maturing cotton. Cotton in the CIS has mostly avoided extreme temperatures during the current growing campaign, though late-season heat has accelerated the crop toward maturity up to one week ahead of normal.

MIDDLE EAST
Total Precipitation(mm)
August 11 - 17, 2024

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

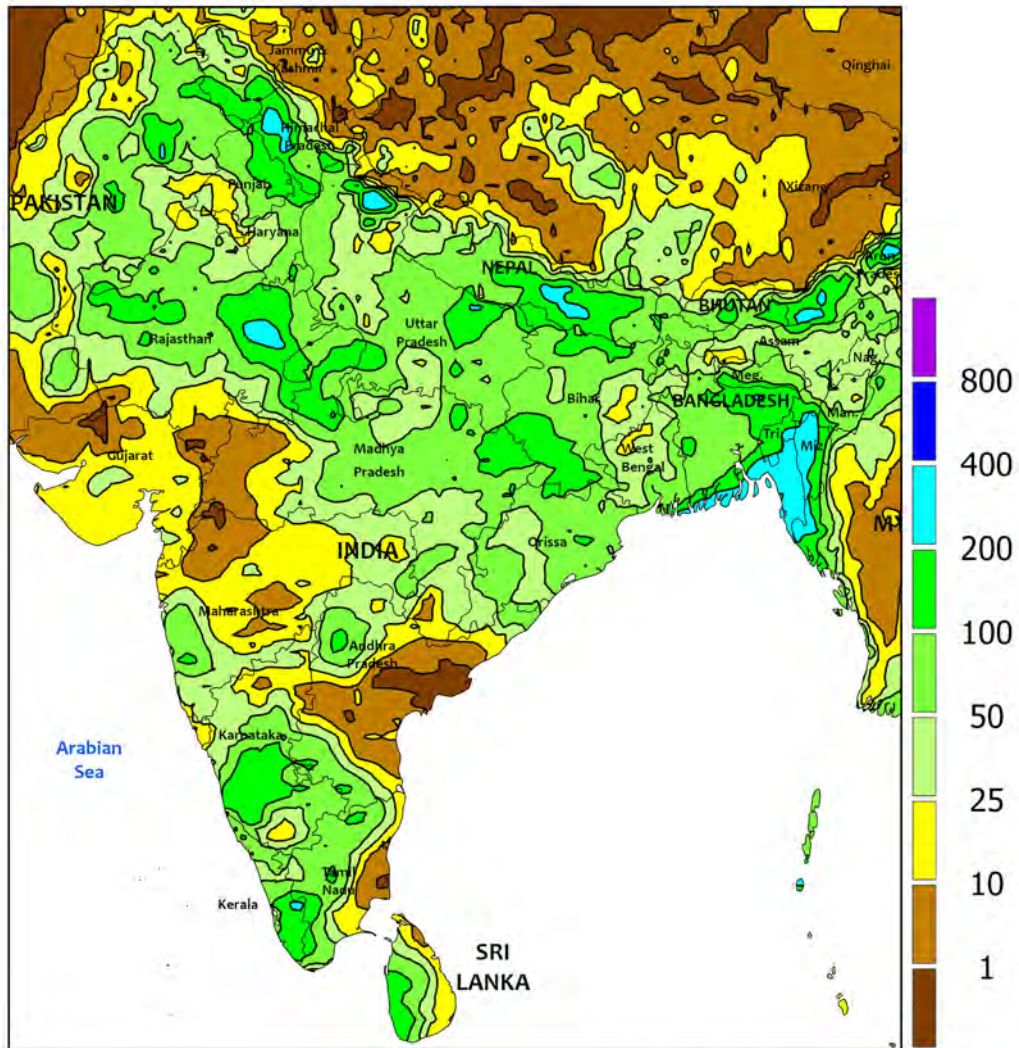

MIDDLE EAST

Seasonably dry and hot weather prevailed across Turkey. Mostly sunny skies in Turkey promoted summer crop maturation and drydown. Abnormal warmth continued over western (2-4°C above normal) and southeastern (1-2°C above normal) Turkey, with daytime highs in western portions of the country reaching 44°C. Since June 1, average

temperatures have been the highest on record in both the Aegean (2.4°C above normal) and Thrace (2.7°C above normal) Regions. While summer crops in Turkey are heavily irrigated, the latest satellite-derived Vegetation Health Index continued to depict poor crop vigor in the northwest (Thrace), a key sunflower area.

SOUTH ASIA
Total Precipitation(mm)
August 11 - 17, 2024

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

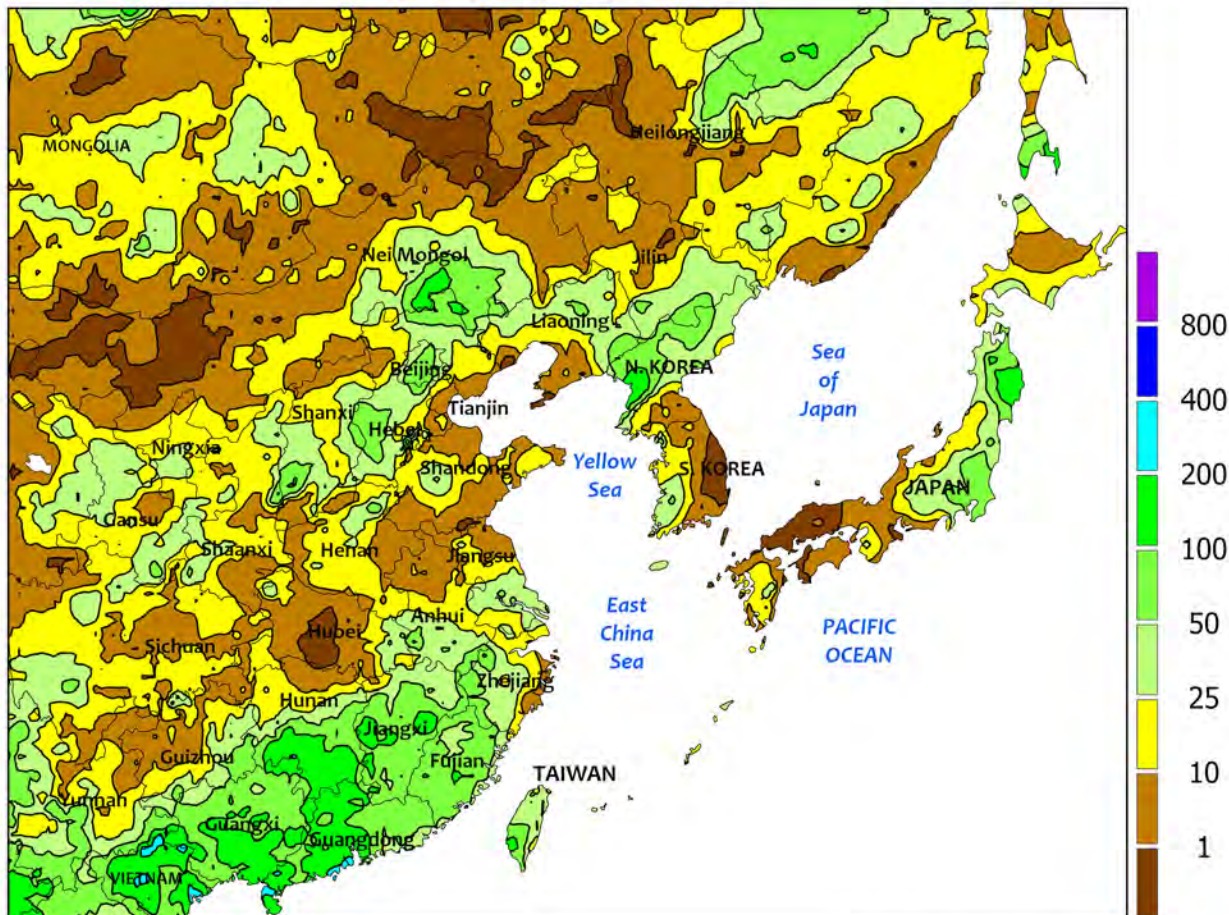

SOUTH ASIA

Monsoon showers flared across much of the region during the recent reporting period. Some of the highest rainfall totals (over 50 mm) were centered around the Ganges River Basin in northern and northeastern India, extending into Bangladesh to the east and Pakistan to the northwest. The accumulations further improved moisture conditions for rice in India after a bout of early-season dryness and inconsistent rains in July.

For the remainder of India, rainfall amounts ranged mainly between 10 and 50 mm, maintaining ample soil moisture for cotton, oilseeds, and coarse grains. The pace of planting has slowed (typical for mid-August) with planted area higher for most crops compared to last year at the same time; cotton area is notably lower than last year as a result of farmers switching to other crops.

EASTERN ASIA
Total Precipitation(mm)
August 11 - 17, 2024

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

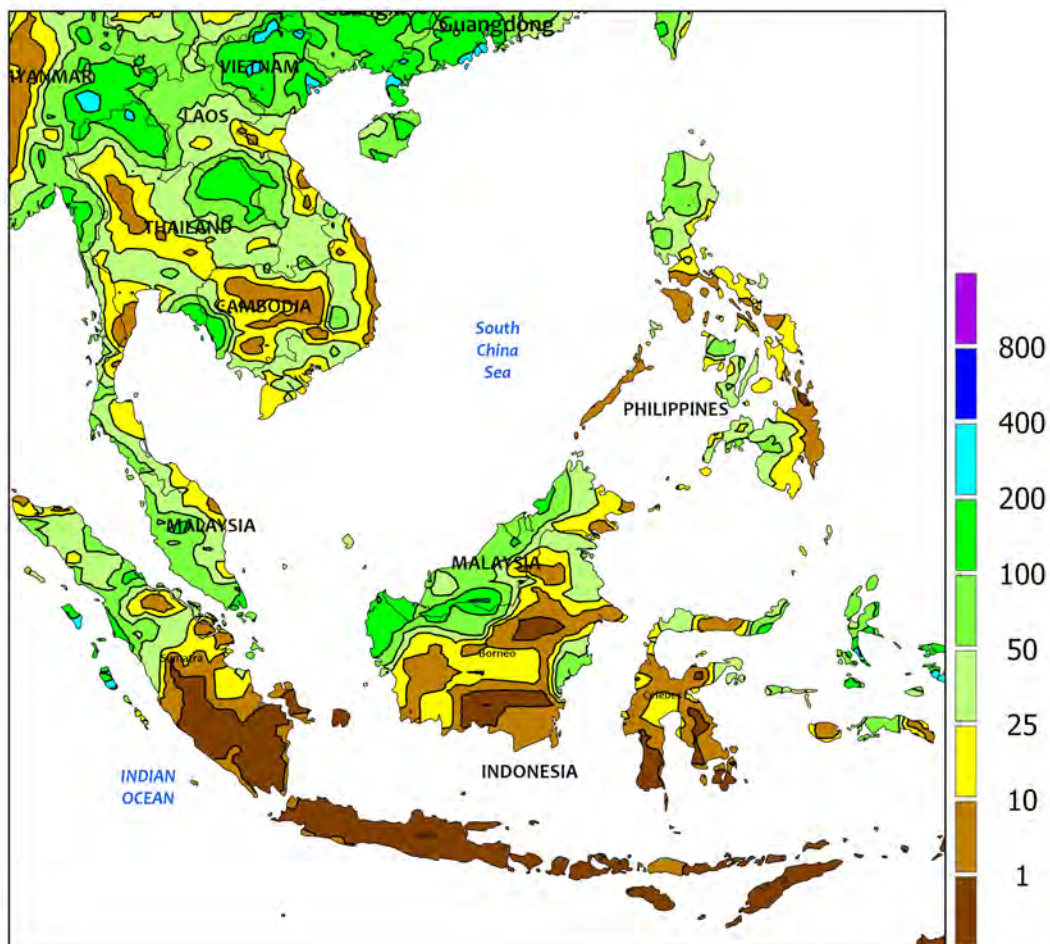

EASTERN ASIA

Lighter showers prevailed across northern and northeastern growing areas of China after recent deluges, while rainfall intensified in the south. The southern rains (over 50 mm) helped break the most recent heat wave to plague rice and other crops in this area (12 consecutive days above 40°C). While some crop damage was irreversible, the recent weather improvements helped stave off further yield reductions. With the southerly shift in rain, hot weather (near 40°C, around 5°C above normal) appeared within the Yangtze Valley, where rainfall totals were less than 25 mm, causing crop stress but not sustained long enough to result in lasting damage. Meanwhile, showers returned to more seasonable levels (up to 25 mm) on the North China Plain into the northeast following some recent drenchings,

maintaining ample to locally excessive soil moisture for oilseeds and coarse grains. In other parts of the region, early-week downpours (50-150 mm) in northern sections of North Korea contributed to extreme wetness and flooding. Rainfall totals since July 1 have topped 1,200 mm (250 percent of normal and a 30-year high for the period). The extreme wetness in northern North Korea quickly transitioned into more favorable moisture conditions along the border with South Korea, deteriorating into moderate drought in southern South Korea. In Japan, a series of overlapping tropical cyclones close to the northeastern shoreline produced heavy rainfall (50-150 mm or more) in some northern coastal areas and more beneficial amounts (25-50 mm) in major rice areas farther inland.

SOUTHEAST ASIA
 Total Precipitation(mm)
 August 11 - 17, 2024

CLIMATE PREDICTION CENTER, NOAA
 Computer generated contours
 Based on preliminary data

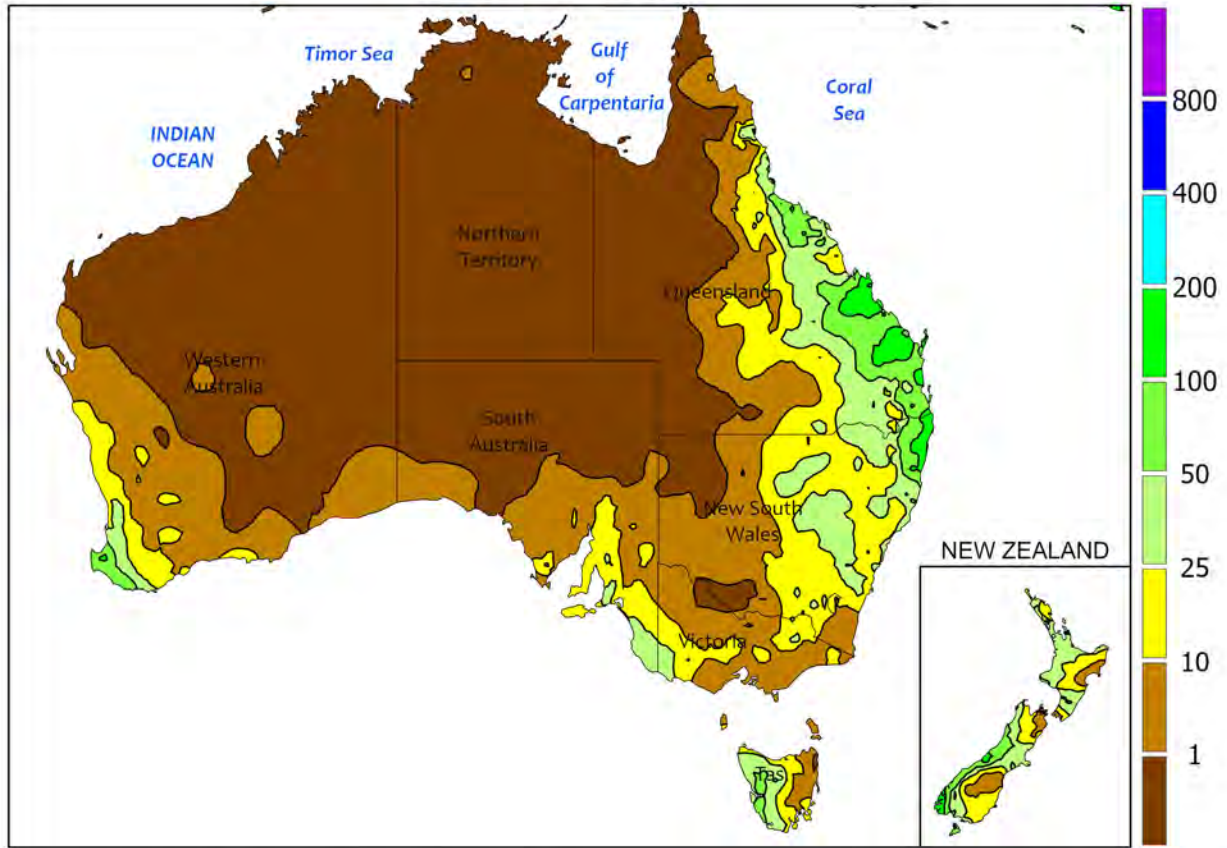

SOUTHEAST ASIA

Monsoon showers flared along a frontal boundary pushing southward through Indochina during the period. The highest totals (50-200 mm) occurred in northern reaches of Thailand, Laos, and Vietnam, with lesser amounts (less than 50 mm) prevailing in southern locations. Seasonal rainfall has been trending near to above normal as of late in Thailand and environs, maintaining favorable moisture for rice and other

crops while also recharging reservoirs for irrigation. Meanwhile, seasonable showers (25-50 mm or more) across the Philippines supported rice, corn, and other crops, with few places experiencing any moisture shortages for the season. Similarly, rainfall in Malaysia and adjacent portions of Indonesia sustained good yield potential for trees currently in the flowering to early fruiting stages of development.

AUSTRALIA
Total Precipitation(mm)
August 11 - 17, 2024

Gridded data from the Australian Bureau of Meteorology: www.bom.gov.au/

<https://creativecommons.org/licenses/by/3.0/au/legalcode>

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

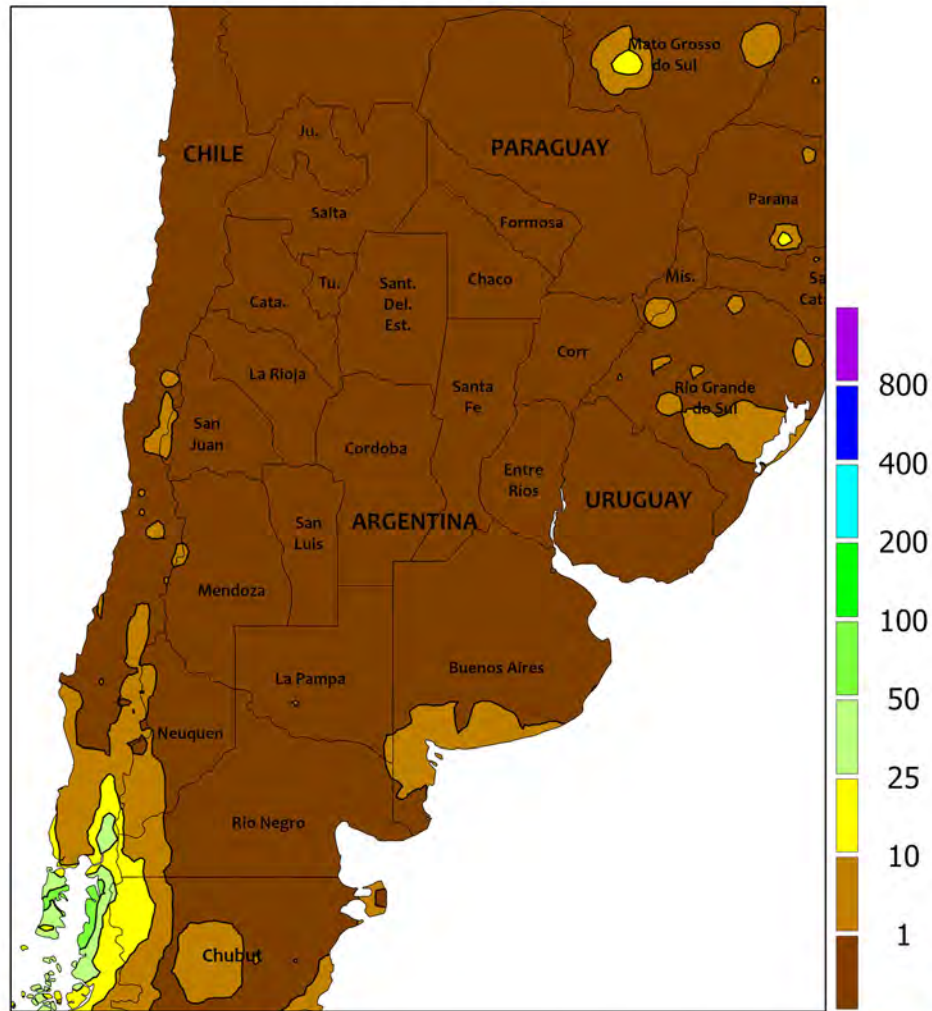

AUSTRALIA

Widespread showers (10-30 mm) in eastern Australia helped maintain good to excellent yield prospects for wheat and other winter crops. Additionally, the rain benefited summer crops by further increasing topsoil moisture and reservoir levels in advance of upcoming planting, which typically ramps up through September and October each year. Elsewhere in the wheat belt, scattered showers (5-25 mm) in the south and west

aided local winter grain and oilseed development. Pockets of dryness persisted in parts of Victoria, however, where more rain would be welcome to help spur local wheat, barley, and canola development. Unseasonably warm weather prevailed throughout the wheat belt, accelerating winter crop growth. Temperatures averaged 2 to 4°C above normal, with maximum temperatures mostly in the lower to middle 20s degrees C.

ARGENTINA
Total Precipitation(mm)
August 11 - 17, 2024

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

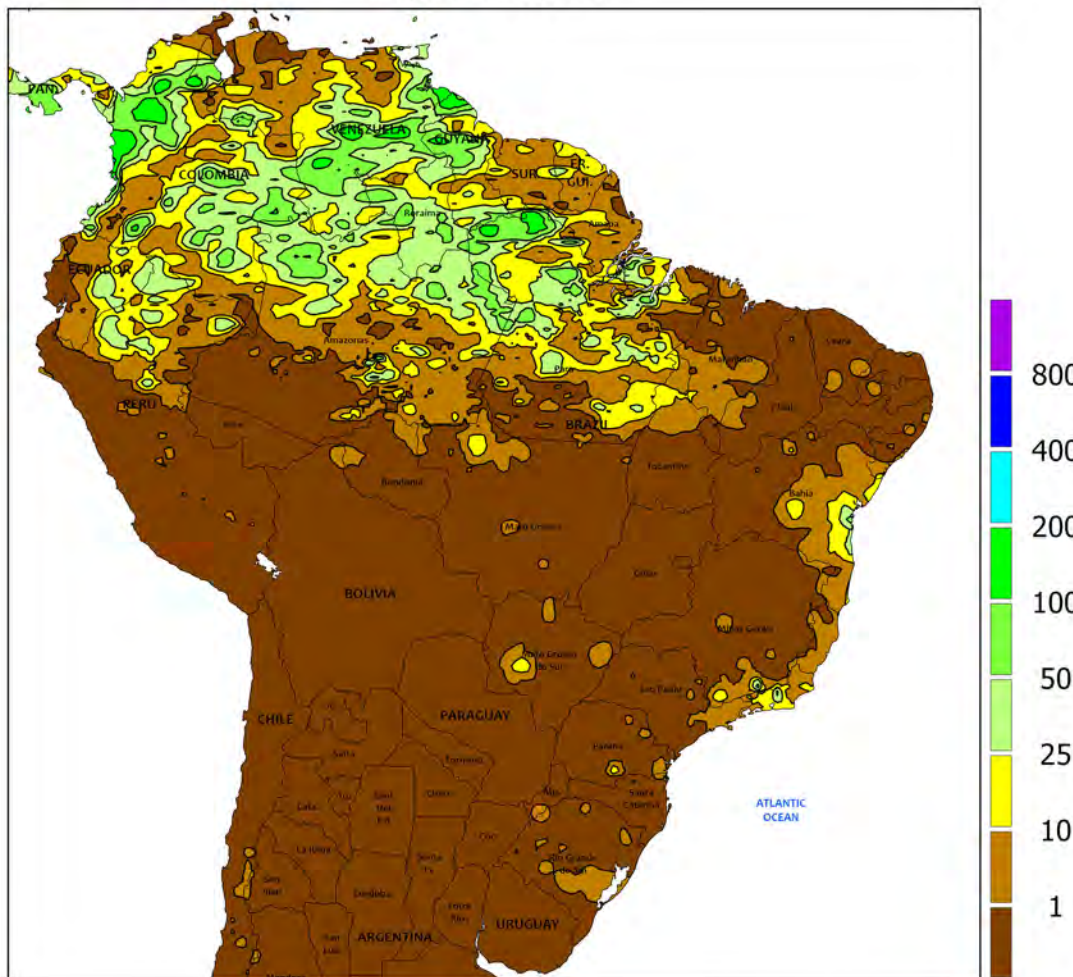

ARGENTINA

Dry, seasonable cool weather dominated the region. Measurable rainfall (1-5 mm) was confined to southern delegations in Buenos Aires, otherwise complete dryness prevailed. Weekly temperatures averaged within 1°C of normal, with highest daytime temperatures ranging from the upper 10s (degrees C) in southern farming areas to the lower 30s in delegations

closest to the border with Paraguay. Despite the relatively warmer weather in the north, freezes were again reported as far north as Chaco and Santiago del Estero. Winter grains in many northern and western production areas – including Córdoba – will require a timely onset of spring rainfall as seasonal warming fosters a more rapid pace of winter grain development.

BRAZIL
Total Precipitation(mm)
August 11 - 17, 2024

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

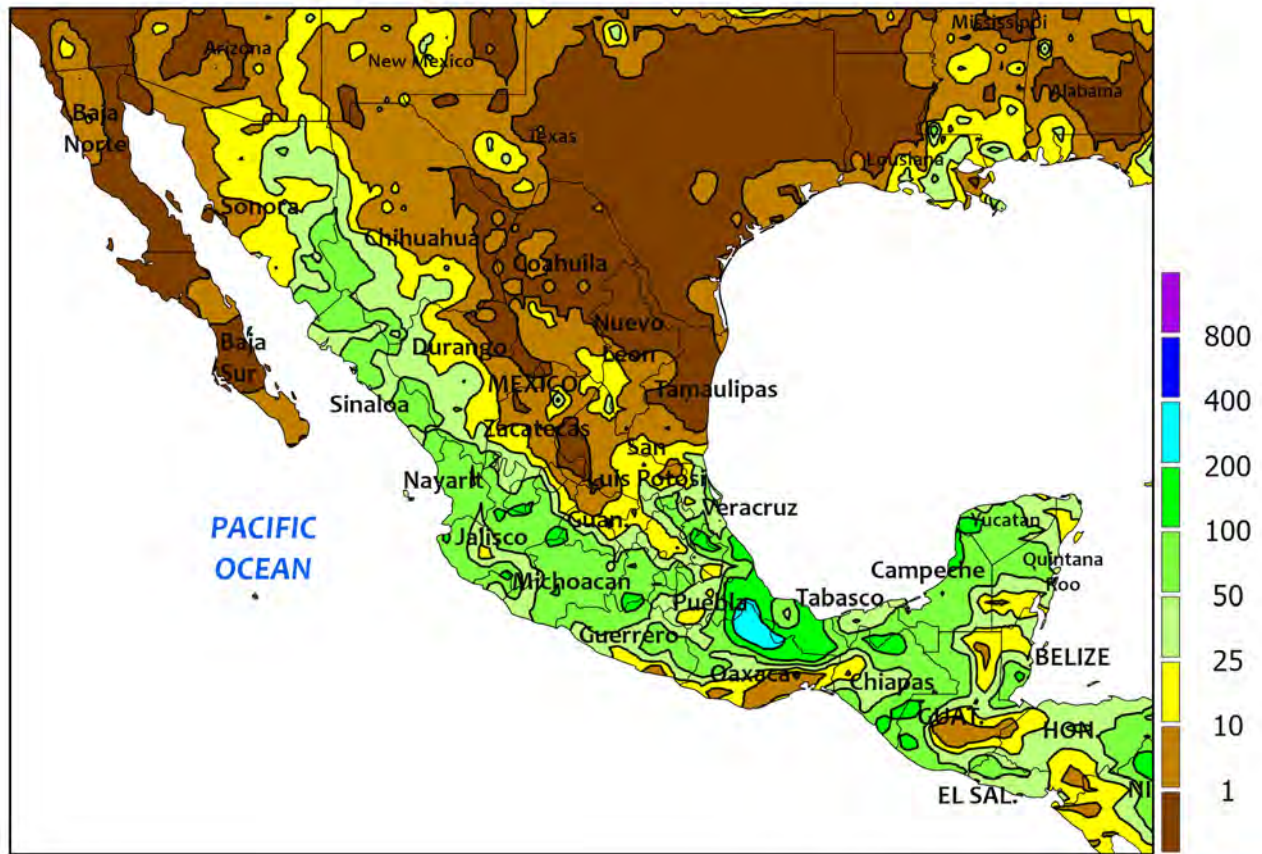

BRAZIL

Sunny, albeit cool, weather prevailed across the southern wheat belt, fostering a generally slow pace of crop development. Weekly average temperatures ranged from 1 to 3°C below normal; nighttime lows dropped into the low single digits (degrees C) as far north as Paraná, though freezes were confined to outlying production areas, likely having limited if any impacts on wheat in temperature-sensitive stages of development. According to the government of Rio Grande do

Sul, wheat was 8 percent flowering as of August 15, compared with the 5-year average of 13 percent. In Paraná, nearly 80 percent of wheat had reached flowering as of August 12 and over 20 percent was either mature or harvested; meanwhile, second-crop corn was 92 percent harvested. Farther north, seasonable warmth and dryness continued. According to the government of Mato Grosso, cotton was 57 percent harvested on August 16 versus 76 percent on average.

MEXICO
 Total Precipitation(mm)
 August 11 - 17, 2024

CLIMATE PREDICTION CENTER, NOAA
 Computer generated contours
 Based on preliminary data

MEXICO

Seasonal showers provided further drought relief to farmlands in southern and northwestern Mexico. Rainfall totaled 25 to 100 mm – locally higher – across the southern Plateau (Jalisco to Puebla) and the southeast, including the Yucatán Peninsula. Temperatures were seasonable, with highest daytime temperatures mostly ranging from the middle 20s (degrees C) to the lower 30s, promoting growth of corn and other summer crops in the absence of stressful

heat. The rainfall extended northward through Veracruz and environs, but unseasonable warmth and dryness (daytime highs approaching 40°C) dominated the northeast, taxing already limited moisture reserves to meet increased demand for crops and livestock. Meanwhile, monsoon showers continued in northwestern watersheds, with rainfall totaling 10 to more than 50 mm from Nayarit northward through Sonora and western Chihuahua.

CANADIAN PRAIRIES

Total Precipitation(mm)

August 11 - 17, 2024

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

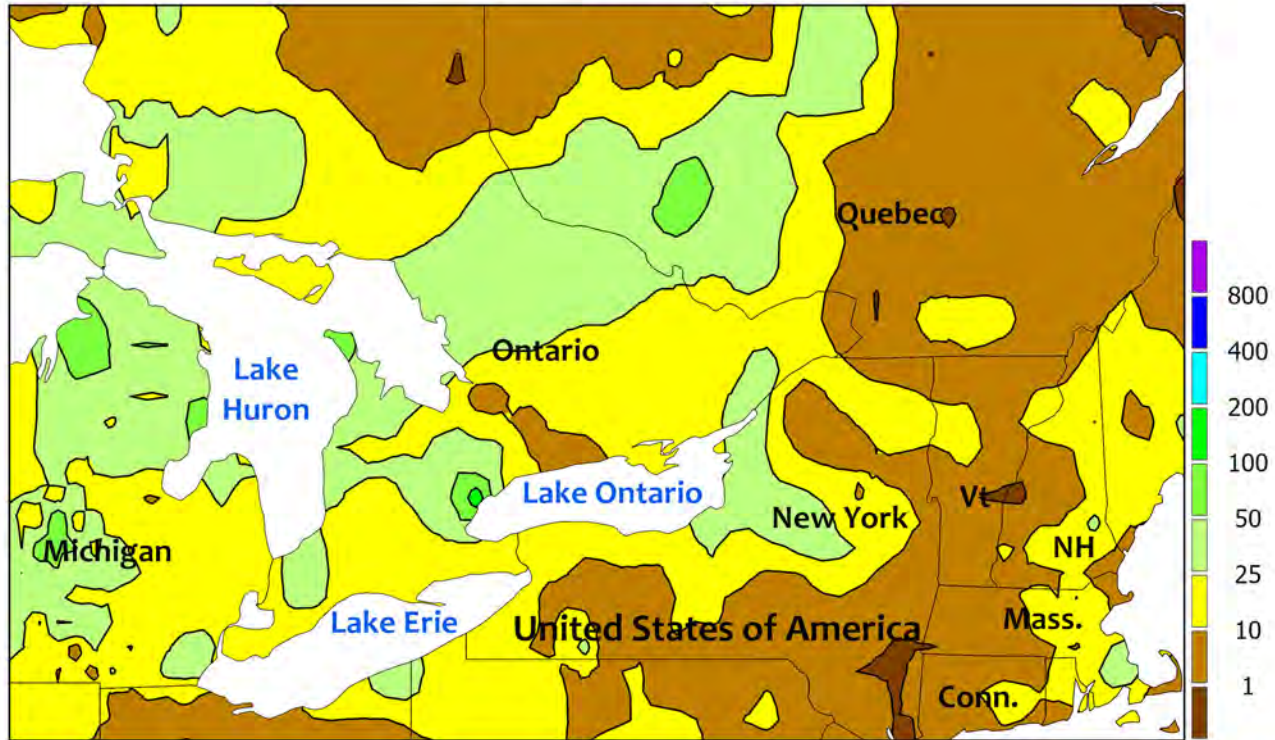

CANADIAN PRAIRIES

Warm, showery weather benefited immature spring grains and oilseeds in northern farming areas, but the moisture came too late for crops already nearing maturity. Rainfall was generally light (1-15 mm) across the Prairies, although pockets of heavier rain (greater than 25 mm) were scattered throughout Alberta and Manitoba. In contrast to last week's cool down, weekly temperatures averaged 1 to 3°C above

normal in most agricultural districts, with daytime temperatures reaching the upper 20s and lower 30s (degrees C) and nighttime lows mostly staying above 5°C. According to the government of Saskatchewan, crops were 6 percent harvested as of August 12, on par with the 5-year average pace (5 percent), led by the southwestern region with 16 percent harvested.

SOUTHEASTERN CANADA
Total Precipitation(mm)
August 11 - 17, 2024

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

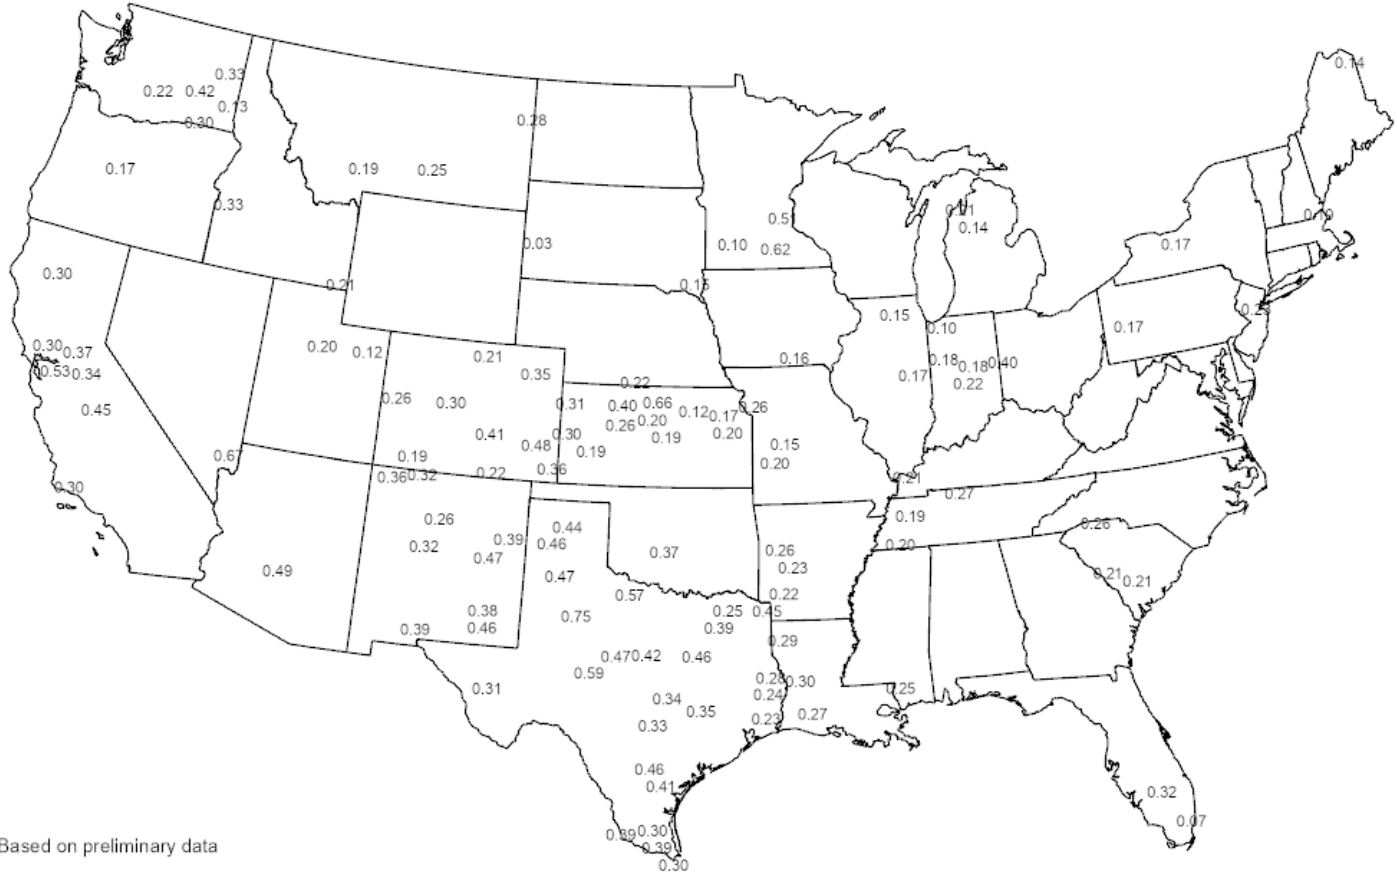

SOUTHEASTERN CANADA

Showers and summer warmth maintained overall favorable conditions for crops and pastures. Weekly average temperatures ranged from near to slightly below normal in Ontario's southwestern farming areas to as much as 2°C above normal in Quebec. Despite the disparity, highest daytime temperatures were fairly uniform, reaching the upper 20s and lower 30s

(degrees C) regionwide. Similarly, nighttime lows stayed at or above 10°C in most agricultural districts, including locations in traditionally cooler northern farmlands. Favorably drier weather (rainfall totaling below 10 mm) returned to Quebec's eastern agricultural areas in the wake of last week's tropical showers, while light to moderate rain (10-50 mm) fell farther west.

Average Pan Evaporation (inches/day)

August 11 - 17, 2024
